

National Greater Sage-Grouse Planning Strategy

Northeast California Alturas Field Office Grazing Allotments

Grazing allotments are displayed for the Alturas Field Office. Boundaries may be fences, arbitrary lines, or natural barriers. Grazing can have localized effects on greater sage-grouse habitat depending on the condition of the habitat and the grazing practices used. Depending

on design and application, grazing practices can also be used as a tool to protect intact sagebrush habitat and increase habitat extent and continuity, which is beneficial to greater sage-grouse and its habitat.

- BLM grazing allotments
- USFS grazing allotments
- 75% breeding bird density
- 100% breeding bird density
