Subject: Please Ensure Sustainable Management for Greater Sage-Grouse

Dear Ms. Jones:

I am pleased that BLM is leading the effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West. However, I am concerned that BLM's preferred alternative does not comply with the best available science or with standards necessary to stabilize and recover grouse populations. I encourage BLM to adopt the conservation measures in Alternative C to ensure sustainable management and to conserve the species. These include recommendations to limit future development and to create protected areas.

A report by the U.S. Geological Survey and other peer-reviewed research indicate that conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. The Survey found that most priority sage-grouse habitat is already heavily degraded and that grouse are only persisting in large, relatively undisturbed blocks of habitat. The species' survival requires a plan that will effectively reduce the rate of its decline and stabilize its population.

For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. Protecting large expanses of important sage-grouse habitat—as outlined in Alternative C—will help stem the decline of many species of wildlife across the American West. This alternative will also begin restoring balance to an over-utilized and degraded landscape, while at the same time identifying areas most appropriate for development and those that need to be avoided.

Thank you for considering these comments.

For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. Protecting large expanses of important sage-grouse habitat—as outlined in Alternative C—will help stem the decline of many species of wildlife across the American West. This alternative will also begin restoring balance to an over-utilized and degraded landscape, while at the same time identifying areas most appropriate for development and those that need to be avoided.

Thank you for considering these comments.

Subject: Please Ensure Sustainable Management for Greater Sage-Grouse

Dear Ms. Jones:

I am pleased that BLM is leading the effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West. However, I am concerned that BLM's preferred alternative does not comply with the best available science or with standards necessary to stabilize and recover grouse populations. I encourage BLM to adopt the conservation measures in Alternative C to ensure sustainable management and to conserve the species. These include recommendations to limit future development and to create protected areas.

A report by the U.S. Geological Survey and other peer-reviewed research indicate that conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. The Survey found that most priority sage-grouse habitat is already heavily degraded and that grouse are only persisting in large, relatively undisturbed blocks of habitat. The species' survival requires a plan that will effectively reduce the rate of its decline and stabilize its population.

For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. It's good to know that BLM is leading the effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West. However, I am deeply concerned that BLM's preferred alternative does not comply with the best available science or with standards necessary to stabilize and recover grouse populations. I implore the BLM to adopt the conservation measures in Alternative C to ensure sustainable management and to conserve the species. These include recommendations to limit future development and to create protected areas.

A report by the U.S. Geological Survey and other peer-reviewed research indicate that conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. The Survey found that most priority sage-grouse habitat is already heavily degraded and that grouse are only persisting in large, relatively undisturbed blocks of habitat. The species' survival requires a plan that will effectively reduce the rate of its decline and stabilize its population.

For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. Protecting large expanses of important sage-grouse habitat—as outlined in Alternative C—will help stem the decline of many species of wildlife across the American West. This alternative will also begin restoring balance to an overused and degraded landscape and ecosystem, while at the same time identifying areas most appropriate for development and those that need to be avoided.

I urge you to choose life—for the Greater Sage-Grouse, for all the life in the ecosystems it inhabits, to halt the destruction of our country and our planet by allowing fossil fuel mining on public lands. The future and survival of the Earth is in the hands of our species.

With hope for life on Earth and the Earth who sustains us all,

Thank you for considering these comments, and for choosing the path of life.

Subject: Please Ensure Sustainable Management for Greater Sage-Grouse

Dear Ms. Jones:

I am pleased that BLM is leading the effort to conserve the Greater Sage-Grouse, one of the most iconic and imperiled bird species of the American West. However, I am concerned that BLM's preferred alternative does not comply with the best available science or with standards necessary to stabilize and recover grouse populations. I encourage BLM to adopt the conservation measures in Alternative C to ensure sustainable management and to conserve the species. These include recommendations to limit future development and to create protected areas.

A report by the U.S. Geological Survey and other peer-reviewed research indicate that conserving the Greater Sage-Grouse will require both protecting large areas of habitat and making significant changes in land management to reverse population declines of this wide-ranging species. The Survey found that most priority sage-grouse habitat is already heavily degraded and that grouse are only persisting in large, relatively undisturbed blocks of habitat. The species' survival requires a plan that will effectively reduce the rate of its decline and stabilize its population.

For years, fossil fuels production and other commercial uses have dominated public land management across sagebrush habitats, resulting in significant impacts to wildlife, public recreation, and air and water quality. Protecting large expanses of important sage-grouse habitat—as outlined in Alternative C—will help stem the decline of many species of wildlife across the American West. This alternative will also begin restoring balance to an over-utilized and degraded landscape, while at the same time identifying areas most appropriate for development and those that need to be avoided.

Thank you for considering these comments.
