Comments (use back if needed):

Is there not enough science, data, evidence, or proof that fossil fuels are a large contributor to climate change? How is this even ~~still~~ under consideration?? Can you not see this is only being considered because of profit / jobs / short-sighted goals? The long-term effects - I'm talking centuries - of this project, of allowing coal mining and any fossil fuel or polluting activities, need to be considered and understood to affect the health of not only future generations but the ecological health of the world as a whole. The answer is clear when you look at the affects this project will have and what fossil fuel is already having on our very lives and purity of our lands, air, and water.

Science already sees that the burning of fossil fuels is negatively impacting our climate which affects the rest of the world, why can't we make an effort to move away from any further development of this industry on federal or any land and towards the development of cleaner and sustainable energy? The future is going to pay for what past generations have done so we have a moral and ethical obligation to pass this world onto them in the best condition possible, after all, is the future not the loved ones of your loved ones? Coal and other fossil fuel companies are not taking enough responsibility or cost on what they are doing to the land. What they are doing to the land, air, and water that we need to survive not only needs to be paid for in full but to see that money cannot completely reverse their damage. Everything on this planet has intrinsic value and cannot be compensated for by money. When the birds can no longer fly, fish no longer swim, and trees no longer stand, man will realize he cannot eat money. Thank you for listening but ^{this shouldn't even be proposed}

debated on at all.
