Based on the analysis presented at the beginning of the Social Impacts subsection for Section 4.23.4, Impacts of Alternative A, social impacts driven by economic changes, such as stresses on community resources and community cohesiveness from high rates of resource development, would be similar to Alternative A. The overall level of oil and gas development under Alternative D is only marginally (i.e., about 1% for conventional oil and gas wells) less than under Alternative A. In some localized areas, social impacts might be reduced in Alternative D compared to Alternative A due to provisions of Alternative D that provide greater protection of other resource values on BLM-administered land. Such protections may mitigate some of the social impacts of high levels of oil and gas development and production.

Mineral Development and Production Stakeholders generally would find this alternative conducive to their interests and values. They would find Alternative D less favorable than Alternative C in terms of operational constraints on development. However, Alternative D would be similar to Alternatives A and C in terms of the overall expected level of oil and gas development (marginally fewer wells would be drilled under Alternative D). This group would see Alternative D as providing many economic opportunities from mineral development that support their livelihoods and the economies of local communities, the state, and nation, and would see this alternative as allowing for continuation of the mineral development traditions and customs of many Wyoming residents and communities.

Renewable Energy Stakeholders would view this alternative as similar for their interests to Alternative A, less favorable than Alternative C, and considerably more favorable than Alternative B. A key factor in this perspective would be that Alternative D would have less acreage in ROW exclusion areas but more acreage in ROW avoidance areas than Alternative A, more acres in both types of areas than Alternative C, and much less acreage in ROW exclusion areas than Alternative B.

Livestock Grazing Stakeholders would view this alternative similarly to Alternative A, though perhaps somewhat less favorably. In terms of the quantitative economic impact estimates, this alternative generates the same amount of economic activity as Alternative A. In qualitative terms, Alternative D's provisions are similar in overall effect on livestock operators to those of Alternative A, but there could be some adjustments to livestock grazing use based on the results of Land Health Evaluations. This group would see Alternative D as somewhat less favorable than Alternative C, and more favorable than Alternative B, to their operations and to continuation of the livestock grazing customs and culture of the planning area.

Habitat and Resource Conservation Stakeholders would find this alternative more favorable than Alternative A or C, but less favorable than Alternative B. This view would be based in part on the somewhat lower level of oil and gas development in Alternative D compared to Alternative A or C. In addition, the greater levels of specific, often

area-focused, oil and gas development and operational constraints of Alternative D compared to Alternatives A and C would be seen by this group as more protective of natural and cultural resource values. They would be disappointed that Alternative D has fewer acres in ROW exclusion areas and ACECs than Alternative A. These stakeholders would find this alternative less favorable to their interests and values than Alternative B due to Alternative B's greater levels of area-specific and general resource protections.

Recreation Stakeholders overall would view Alternative D similarly to Alternative A; the recreation policies and levels of resource development are similar. However, views would vary by the type of recreationist. Those who prefer developed recreation opportunities would prefer Alternative A because Alternative D would have less acreage in SRMAs (135,549 vs. 298,110 acres). Recreationists interested in OHV riding opportunities would find Alternative D less preferable to Alternative A because it constrains where OHV users can ride. OHV riders would find Alternative D less preferable than Alternative C and much more preferable than Alternative B. Recreationists who favor quiet recreation and undeveloped open spaces would prefer Alternative D over Alternatives A and C due to Alternative D's greater controls on resource development and OHV use. However, they would prefer Alternative B over Alternative D because Alternative B provides much greater controls on both resource development and OHV use.

## 4.22.6 Proposed RMP

### Quantified Economic Impacts

The Proposed RMP is a combination of management actions from the range of alternatives (primarily from Alternative D and, to a lesser degree, Alternative B) and would have similar impacts as previously described under those alternatives. Appendix N summarizes the annual economic and fiscal impacts of the range of alternatives by program (resource use) and in total. In general, the Proposed RMP would result in increased socioeconomic impacts compared to Alternative B, but less than Alternative D; because of the similarity in management, the BLM anticipates that the Proposed RMP would result in economics effects closer to those predicted for Alternative D. For livestock grazing, oil and gas development, coal and soda ash production, and recreation, the BLM assumed that the 2016 level of use would also be the average level of use across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production. The increasing production levels were based on the RFD scenario.

Impacts from the Proposed RMP on livestock grazing within the planning area are described in further detail in Section 4.16. Availability of land for grazing is the same as under Alternative D. As a result, the socioeconomic impacts of the Proposed RMP are anticipated to be the same as Alternatives A, B, and D as they relate to impacts from livestock grazing, which can be found in Sections 4.22.2 (in Chapter 4), 4.22.3, and 4.22.5 above as well as Appendix N.4.

Impacts from the Proposed RMP on oil and gas development within the planning area are described in further detail in Section 4.11. The Proposed RMP's management actions as they relate to oil and gas development within the planning area would be composed primarily of actions from Alternative D, with some actions from Alternative B. As a result, the socioeconomic impact of the Proposed RMP's management actions on oil and gas development would be between those outlined in Alternatives B and D, which can be found in Sections 4.22.3 and 4.22.5 above as well as Appendix N.4.

Impacts from the Proposed RMP on coal and soda ash production within the planning area are described in further detail in Section 4.11. The Proposed RMP's impacts on coal and soda ash production is anticipated to be a combination of Alternatives A and D. As a result, the socioeconomic impacts in the planning area from management actions on coal and soda ash production are expected to remain the same as under Alternatives A, B, C and D, which can be found in Sections 4.22.2 (in Chapter 4) through 4.22.5 above as well as Appendix N.4.

Impacts from the Proposed RMP on recreation within the planning area are described in further detail in Section 4.17. Ranges in visitation are expected to remain the same as under Alternatives A, B, C, and D, and would not result in significant changes to the socioeconomic contribution of recreation to the planning area; details of the socioeconomic impacts can be found in Sections 4.22.2 (in Chapter 4) through 4.22.5 above as well as Appendix N.4.

Key high-level observations regarding the quantified economic impacts for the Proposed RMP compared to Alternative A include:

- Total economic output attributable to BLM-administered land in the RSFO across all programs ranged between $0.827 (Alternative B prediction) and $1.723 (Alternative D prediction) billion annually in 2016. Earnings total between $167 and $377 million annually. Employment totals are between 2,515 and 5,398 jobs annually. These values are less than the values for Alternatives A and C.
- Total quantified public revenues in 2016 ranged between 0.7% (Alternative D prediction) and 62.3% (Alternative B prediction) less for the Proposed RMP than for Alternative A. The state redistributes a small portion of total severance taxes and federal mineral royalties directly to the local communities where the revenues are generated.
- When considered on a net present value basis, the percentage reductions for all economic and public revenue indicators are similar to the 2016 percentage reductions noted above.
- The quantified impacts of coal and soda ash production, and recreation are the same under the Proposed RMP as under Alternative A.

## Other Market-Based Economic Impacts

As detailed in Sections 4.11 (oil and gas development, coal and soda ash production), 4.16 (livestock grazing), and 4.17 (recreation), the impacts of the Proposed RMP would be a combination of Alternatives D and (to a lesser extent) Alternative B; as a result, the additional market-based socioeconomic impacts related to the Proposed RMP would be a combination of those outlined in Sections 4.22.3 and 4.22.5.

As in Alternative A, various management actions under the Proposed RMP would generate economic activity due to the resulting expenditures made in the local and state economies by the BLM or by operators, although the level of economic activity from many of these actions would be small relative to the activity generated by resource uses.

## Impacts on Nonmarket Values

Many nonmarket values associated with ecosystem services would be greater under the Proposed RMP than under Alternative A. The Proposed RMP's greater focus on habitat conservation and lower levels of resource development would be more likely to support higher levels of ecological and other natural functions that provide various ecosystem services. The Proposed RMP's impact on nonmarket values would be a combination of the impacts on nonmarket values from Alternative D and (to lesser extent) Alternative B described above.

## Social Impacts

Based on the analysis presented at the beginning of the Social Impacts subsection for Section 4.22.2, Impacts of Alternative A, social impacts driven by economic changes, such as stresses on community resources and community cohesiveness from high rates of resource development, would be reduced in the Proposed RMP relative to Alternative A due to the lower levels of oil and gas development resulting. These impacts would be between those outlined in Alternative B and Alternative D. Livestock, coal and soda ash, and recreation stakeholders would view the Proposed RMP similarly to Alternative A, while oil and gas stakeholders would find

the Proposed RMP more conducive to their interests than Alternative B, but less conducive to their interests than Alternative D.

## 4.22.7 Environmental Justice Impacts

The Socioeconomic Baseline Report presents the methodology for screening the socioeconomic study area for potential EJ populations, and the results. Once potential EJ populations are identified, EJ impact analysis consists of determining if the subject populations would experience disproportionately high and adverse environmental or human health effects under one or more of the management alternatives. Environmental health effects may include cultural, economic, or social impacts when those impacts are interrelated to impacts on the natural or physical environment. EJ impacts would not vary across alternatives.

The following places in the socioeconomic study area were flagged as areas of potential concern from an EJ perspective, for the populations noted. Asterisks and bold italicized font indicate places that are located within or immediately adjacent to the RSFO. Places without this notation are within the socioeconomic study area but further from the RSFO boundary.

### Fremont County

- Arapahoe census-designated place (CDP) for Native American minority population and population in poverty (all ages, related children under 18, families).
- Atlantic City CDP for population in poverty (all ages, 65 and older, families).
- Boulder Flats CDP for population in poverty (all ages, related children under 18).
- Crowheart CDP for Native American minority population and population in poverty (all ages, related children under 18, families).
- Ethete CDP for Native American minority population and population in poverty (all ages, related children under 18, 65 and older, families).
- Fort Washakie CDP for Native American minority population and population in poverty (65 and older).
- Hudson Town for population in poverty (families).
- Johnstown CDP for Native American minority population.
- Shoshoni Town for population in poverty (all ages, related children under 18).
- In addition, the Wind River Indian Reservation is flagged because of its status as an Indian reservation.
- The county as a whole has a Native American minority population that exceeds the threshold value as defined above. However, the place-specific data, including the presence of the Indian Reservation, likely provide the relevant analytical focus for the Rock Springs RMP.

### Lincoln County

- Afton Town for population in poverty (related children under 18).
- Alpine Northeast CDP for population in poverty (all ages).
- Auburn CDP for population in poverty (all ages, related children under 18, families).
- Bedford CDP for population in poverty (65 and older).
- ***La Barge Town**** for population in poverty (related children under 18).

- Thayne Town for population in poverty (65 and older).
- Turnerville CDP for population in poverty (all ages, 65 and older).

## Sublette County

- Big Piney Town for population in poverty (related children under 18).
- Daniel CDP for population in poverty (all ages).

## Sweetwater County

- Bairoil Town for Hispanic minority population.
- ***Clearview Acres CDP**** for Hispanic minority population.
- ***James Town CDP**** for population in poverty (65 and older).
- Little America CDP for minority population (Some Other Race, and Hispanic).
- ***Purple Sage CDP**** for minority population (Some Other Race, and Hispanic) and population in poverty (all ages, related children under 18, families).
- Wamsutter Town for Hispanic minority population.
- ***Washam CDP**** for population in poverty (all ages, 65 and older, families).

## Uinta County

- No places flagged for minority populations or populations in poverty.

This planning-level effort does not approve or commit to any specific projects and therefore does not analyze the environmental, economic, or social impacts of unknown future projects. Without specific implementation-level (project-level) information, it is impossible to fully analyze the potential for EJ impacts. Further EJ analysis will be conducted during implementation for project-specific NEPA analyses. During implementation of a specific project or response to a project application, that process will consider reasonable mitigation measures within our authority, as well as other resource protection measures already in place that may benefit EJ communities. However, the following comments address the general potential for EJ impacts to occur.

For Fremont County, none of the alternatives would create disproportionately high and adverse environmental or human health effects on the identified communities or the county's population of Native Americans. Only a small portion of the RSFO is located within Fremont County, in a very sparsely populated portion of the county, and the communities identified above as having potential EJ populations are all located at a considerable distance from the RSFO. Thus, it is unlikely that direct environmental or human health effects (if any) of management actions in the RSFO would have disproportionate impacts on the identified populations. Further, the economic effects of management actions in the RSFO would be attenuated in Fremont County since most of the support for economic activity on BLM-administered lands in the northeastern portion of the RSFO comes from Sweetwater County, not Fremont County. For instance, this is shown by employment statistics of the U.S. Bureau of Labor Statistics. In 2010, a total of 3,123 people in Sweetwater County were employed in oil and gas industry sectors, while only 683 people were employed in these sectors in Fremont County.[8] It is likely that only a small portion of Fremont County workers serve the RSFO, and only a portion of those workers are Native Americans or lives in one of the identified

[8] *The following sectors under the North American Industry Classification System (NAICS) were included: 211 - Oil and Gas Extraction, 213111 - Drilling Oil and Gas Wells, and 213112 - Support Activities for Oil and Gas Operations*

communities. Most importantly, it is unlikely that any adverse impacts would fall disproportionately on the EJ populations within this workforce.

In Lincoln County, all the identified communities, with one exception, are located at considerable distance from the boundaries of the RSFO and thus would be unlikely to disproportionately experience any adverse impacts of RSFO management actions. The exception to this locational pattern is La Barge, which is located on the edge of the northwest corner of the RSFO, and in close proximately to an area within the RSFO (and outside the RSFO) that is experiencing very high levels of gas development. The only population in La Barge that met the EJ screening criteria is population of related children under the age of 18 that are in poverty. It is possible that gas development could have adverse health impacts on the EJ population of La Barge. However, in all alternatives any adverse impacts would affect all and any foregone benefits would either accrue to or be foregone for all populations, not just the potential EJ population identified in La Barge. There would be no disproportionality of impacts. Therefore, the impacts would not be considered EJ impacts.

In Sublette County, the community of Daniel is located at considerable distance from the RSFO and would be unlikely to experience any disproportionate adverse impacts from RSFO management actions. The community of Big Piney is within 10-15 miles of the RSFO boundary, in proximity to a portion of the RSFO that is experiencing very high levels of gas development. As with La Barge, the EJ population is related children under the age of 18 that are in poverty. A similar logic with respect to adverse health impacts would apply to Big Piney.

For Sweetwater County, the communities of Wamsutter and Bairoil are located at considerable distance from the boundaries of the RSFO and thus would be unlikely to disproportionately experience any adverse impacts. The community of Little America is also at some distance from the RSFO boundary. Four identified communities in Sweetwater County are located within the boundaries of the RSFO. The communities of Clearview Acres, James Town, and Purple Sage are located in the central portion of Sweetwater County between Rock Springs and Green River. They are not in proximity to any areas that would be expected to see high levels of resource development. The community of Washam is located in the southwest section of the county, not far from Flaming Gorge Reservoir. It is also not in proximity to any high resource development areas. Thus, based on the low likelihood of oil and gas resource development, the potential EJ populations in these four communities would be unlikely to disproportionately experience any adverse environmental (including economic) or human health impacts from RSFO management actions. However, future impacts to these EJ populations based on unforeseen future resource development or other actions (e.g., land authorizations, development of other minerals) cannot be ruled out in this planning-level EIS. The potential for impacts would need to be assessed at the implementation level.

Environmental justice guidance also directs the BLM to consider potential impacts on Tribes. The BLM has continued to consult and coordinate with Tribes to identify whether any Native American cultural values, religious beliefs, or traditional practices could be affected. The BLM has considered all input from persons or groups regardless of age, income status, race, or other social or economic characteristics. The outreach and public involvement activities taken by the RSFO for this planning effort are discussed in Chapter 5.

# APPENDIX V—CHAPTER 2 INTRODUCTION AND ACREAGE TABLES

## 2.2 DEVELOPMENT OF ALTERNATIVES

### 2.2.1 Purpose of Alternatives Development

The basic goal of alternatives development is to produce distinct potential management scenarios that:

- Address the identified major planning issues
- Explore opportunities to enhance management of resources and resource uses
- Resolve conflicts among resources and resource uses
- Meet the purpose of and need for the Resource Management Plan (RMP) revision

Pursuit of this goal provides the Bureau of Land Management (BLM) and the public with an appreciation for the diverse ways in which conflicts regarding resources and resource uses might be resolved and offers the decisionmaker a reasonable range of alternatives from which to make an informed decision.

### 2.2.2 Components of Alternatives

Alternatives include potential RMP decisions that consist of identifying and clearly defining goals and objectives (desired outcomes) for resources and resource uses, followed by developing allowable uses and management actions necessary for achieving the goals and objectives. Goals are broad statements of desired outcomes and are not quantifiable or measurable. Objectives are specific measurable desired conditions or outcomes intended to meet goals. Objectives may vary across alternatives, resulting in different allowable uses and management actions for some resources and resource uses.

Management actions and allowable uses are designed to achieve objectives. Management actions are measures that guide day-to-day and future activities. Allowable uses delineate which uses are permitted, restricted, or prohibited, and may include stipulations or restrictions. Allowable uses also identify lands where specific uses are excluded to protect resource values, or where certain lands are open or closed in response to legislative, regulatory, or policy requirements. Implementation decisions are site-specific on-the-ground actions, and although they can be addressed in RMPs, this plan does not propose any implementation-level decisions.

### 2.2.3 Alternatives Development Process

The BLM complied with the National Environmental Policy Act (NEPA) and the Council on Environmental Quality (CEQ) implementing regulations at 40 Code of Federal Regulations (CFR) 1500 in the development of alternatives for this final EIS, including seeking public input and analyzing reasonable alternatives. Where necessary to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives, the alternatives include management options for the planning area that would modify or amend decisions made in the Green River RMP and Jack Morrow Hills (JMH) Coordinated Activity Plan (CAP). Some decisions from these existing plans may still be considered acceptable and reasonable; in these instances, there is limited need to develop alternative management prescriptions. In some cases, management prescriptions are the same across all alternatives or may reflect only a decision to implement or not implement an action.

Many of the decisions from the existing Green River RMP and JMH CAP have been implemented. In some cases, implementation of these decisions established valid existing rights or other obligations that are important considerations in preparing the Rock Springs RMP. For example, many of the oil and gas resources in the planning area are leased. The presence of these valid existing rights influences, and sometimes limits, management choices. Specific to the oil and gas program, the alternatives in this final EIS address the availability and allocation of lands for future oil and gas leasing, potential lease stipulations, and additional mitigation to be considered and applied during the Application for Permit to Drill (APD) process.

The development of alternatives began with compiling Alternative A. Alternatives B and C were then developed, followed by the analysis of all three alternatives. The BLM and cooperating agencies reviewed the analysis of Alternatives A, B, and C and considered the information and conclusions contained in the analysis to develop Alternative D, which was developed last. Public input received during the scoping process was considered to ensure that all issues and concerns would be addressed, as appropriate, in developing the alternatives. Following and in consideration of public comments on the draft EIS, the BLM developed its Proposed RMP alternative, which was built off of management actions previously considered and analyzed in Alternatives A, B, C, and D. .

### 2.2.4 Overview of the Alternatives

Resources on lands administered by the BLM within the planning area are currently managed under the Green River RMP (1997) and JMH CAP (2006), as amended. Management under Alternative A represents a continuation of these management plans, which balances protection of resource values with the use and development of resources.

Alternative B emphasizes conservation of resource values with constraints on resource uses. Relative to all alternatives, Alternative B conserves the most land area for physical, biological, and cultural resources. Alternative B emphasizes the improvement and protection of habitat for wildlife and sensitive plant and animal species, improvement of riparian areas, and implementation of management actions that improve water quality and enhance protection of cultural resources.

Alternative C emphasizes resource uses (e.g., energy and mineral development and other commodity uses). Relative to all alternatives, Alternative C proposes the least restrictive management actions for energy and commodity development and the least protective management actions for physical, biological, and cultural resources while maintaining protections required by laws and regulations. Under this alternative, development and use of resources within the planning area would occur with intensive management of surface disturbing and disruptive activities.

Alternative D explores a management approach that is less restrictive for resource uses than Alternative B, while also having a greater conservation focus than Alternative C. This approach allows for opportunities to use and develop resources within the planning area while promoting environmental conservation.

The Proposed RMP provides the second most protection (less than Alternative B) for physical and natural resources and more protection than Alternatives A, C, and D. Socioeconomic impacts would be greater than under Alternatives A, C, and D with more areas closed for mineral development, but less than under Alternative B. Many management actions allow for flexibility to review activities on a case-by-case basis to determine impacts based on local conditions and to balance resource protection with resource uses.

## Table 2-3. Areas Proposed for Withdrawal from Mineral Location

| Area | Alternative A (No Action Alternative) | Alternative B | Alternative C | Alternative D | Proposed RMP |
|---|---|---|---|---|---|
| **PROPOSED WITHDRAWAL FROM MINERAL LOCATION** | | | | | |
| Big Game Migration Corridor Area of Critical Environmental Concern (ACEC) | -- | X | -- | -- | -- |
| Big Sandy Openings ACEC | -- | X | -- | -- | X |
| Boars Tusk | -- | X | -- | -- | X |
| Boars Tusk (90 acres) | X | -- | -- | -- | -- |
| Boyer Ranch House (formerly LaClede Stage Station) and Dug Springs Stage Station on the Overland Trail | X | X | -- | X | X |
| Cedar Canyon, LaBarge Bluffs, Tolar, and other significant rock art sites and ½-mile viewshed | X | -- | -- | -- | - |
| Cedar Canyon, LaBarge Bluffs, Sugarloaf, Tolar, White Mountain Petroglyphs, and other significant rock art sites and three-mile viewshed | -- | X | -- | -- | -- |
| Cedar Canyon, LaBarge Bluffs, Sugarloaf, Tolar, White Mountain Petroglyphs, and other significant rock art sites (viewshed not included) | -- | -- | -- | X | X- |
| Cedar Canyon ACEC | X | -- | -- | -- | -- |
| Crookston Ranch – Jack Morrow Hills (JMH) | X | -- | -- | -- | -- |
| Crookston Ranch Historic Site | -- | -- | -- | X | X |
| East Sand Dunes – Red Lake ACEC | -- | X | -- | -- | -- |
| Elk birthing areas (northern) – JMH | X | -- | -- | -- | -- |
| Emmons Cone | -- | -- | -- | X | -- |
| Four J Basin Portion of the Pine Mountain Management Area | X | X | -- | -- | -- |
| Greater Red Creek ACEC | -- | X | -- | -- | -- |
| Greater Red Creek ACEC – Currant Creek Watershed | X | -- | -- | -- | -- |
| Greater Red Creek ACEC – Red Creek Watershed | X | X | -- | -- | -- |
| Greater Sand Dunes ACEC (western portion) – JMH | X | -- | -- | -- | -- |
| Greater Sand Dunes ACEC | X | -- | -- | -- | -- |
| Killpecker Sand Dunes Special Recreation Management Area (SRMA) | -- | -- | X | X | X |
| Lands with Wilderness Characteristics | -- | X | -- | -- | -- |

| Area | Alternative A (No Action Alternative) | Alternative B | Alternative C | Alternative D | Proposed RMP |
|---|---|---|---|---|---|
| Little Firehole's Cottonwood Canyon area | -- | X | -- | X | -- |
| Little Mountain ACEC | -- | -- | -- | X | X |
| Monument Valley ACEC | -- | X | -- | -- | -- |
| Monument Valley Management Area | X | -- | -- | -- | -- |
| Oregon Buttes ACEC | -- | X | -- | -- | -- |
| Pilot Butte | -- | -- | -- | X | -- |
| Pine Springs ACEC | -- | X | -- | X | X |
| Pinnacles ACEC | -- | X | -- | -- | X |
| Pinnacles Geologic Feature | X | X | -- | X | X |
| Prehistoric Quarry Sites (48SU1263 and 48SU7632) | X | X | -- | X | X |
| Special status plant known locations (limber pine exception) | -- | X | -- | -- | X |
| Special Status Plants ACEC | X | X | -- | -- | X |
| Steamboat Mountain ACEC | -- | X | -- | -- | X |
| South Pass Historic Landscape ACEC | X | X | -- | X | X |
| South Pass Summit – JMH | X | -- | -- | -- | -- |
| South Wind River ACEC | -- | X | -- | -- | X |
| Sweetwater Bridge and Guard Station campgrounds | X | -- | X | X | X |
| Tri-Territory Marker | X | X | X | X | X |

# APPENDIX W—RESPONSES TO COMMENTS ON THE DRAFT EIS

This page intentionally left blank.

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #254-1 | To state that like trucks could present more environmental damage then wild fires is ludicous and not backed by date. Plan B is unacceptable due to it faulty science, disregard of local public sentiment and needs, and its blatant extremism. | The BLM is unable to clarify or provide comment for this statement without specific reference. Air Quality impacts can be found in Chapter 4.3 and Wildland Fire impacts are disclosed in Chapter 4.10. |
| 801 - Physical Resources-Air Quality (1000-1017) | #258-1 | PHYSICAL RESOURCE AIR QUALITY(1000-1017). All cases for Oil and Gas will be on a case by case decision basis. This will effectively halt any type of drilling project much like what is happening right now. | The case-by-case refers to the level of NEPA analysis required for oil and gas activities, which is current practice. |
| 801 - Physical Resources-Air Quality (1000-1017) | #258-3 | It is painfully obvious to see that the whole Alt B is slanted toward reducing CO2 emissions, but I challenge the accuracy of the chart that show Co2 emissions in Alt A as 3,499,257 compared to Alt B going down to 927,665. Clearly this is the golden calf that this administration is worshipping. I find this calculation to be totally out of reason and challenge some one to show their work on how these numbers arrived. | The emissions estimates for each alternative were calculated based on a number of assumptions and activity levels for multiple resources (See Appendix P). Detailed emission data are included in the Appendix. |
| 801 - Physical Resources-Air Quality (1000-1017) | #546-1 | Climate change and the loss of biodiversity are two huge, overlapping, and increasingly serious problems. I strongly urge BLM to make helping to solve these problems a top priority of this RMP revision. BLM has a timely opportunity with this RMP revision to provide positive leadership. The attached IPPC report describes why BLM should immediately stop approving any further fossil fuel leasing or other development. The attached scientific study describes how livestock grazing on public lands contributes to climate change along with the degradation of habitats for biodiversity. I hope that BLM will use this important information to make the best decisions for the future management of these valuable BLM lands and resources. | Impacts for all proposed alternatives can be found in Chapter 4, with cumulative impacts disclosed in Appendix T. |
| 801 - Physical Resources-Air Quality (1000-1017) | #8761-17 | The agency should adequately consider how changes in the output of the sun including the current hyperactive solar cycle and the earth's change magnetic field produce a significant amount of climate change that is not CO2 based. https://www.cnbc.com/2022/02/09/why-solar-geomagnetic-storms-destroy-satellites-like-spacex-starlink.html | Analysis regarding global output of the sun and the earth's magnetic field are outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air Quality (1000-1017) | #8761-20 | Paleo trends must be adequately considered such as found in the paper 1200 years of Upper Missouri River streamflow reconstructed from tree rings at https://www.sciencedirect.com/science/article/pii/S0277379119306985 | Paleontology impacts can be found in Chapter 4.13. |
| 801 - Physical Resources-Air Quality (1000-1017) | #9721-5 | Restricting the development of minerals within the project area will not reduce global demand for these products nor will it reduce global cumulative effects. It is likely that cumulative VOC's, HAP's and GHG's will be reduced locally. However, the cumulative global effects will be greater as the mineral resources will need to be extracted elsewhere. In that case the cumulative analysis must consider the worst case scenario regarding VOC's, HAP's, GHG's and others for foreign suppliers extracting and shipping those resources to meet the domestic demand. | A global scale cumulative analysis relating to foreign sources of emissions is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air Quality (1000-1017) | #9721-13 | If the RMP removes the ability to explore and produce minerals from the project area those resources will be acquired elsewhere. Therefore, your SC-GHG analysis specific to Alternative Bis inaccurately lower than actual due to sourcing minerals elsewhere on the global market. You must consider the SC- GHG from the global supplier with the greatest potential SC-GHG to account for resources removed from the market and acquired elsewhere due to closures this plan proposes. It is likely that Alternative B will have the least direct GHG emissions, but due to the global market and sourcing the materials elsewhere Alternative B may ultimately be the greatest contributor to indirect GHG emissions. | A global scale cumulative analysis relating to foreign sources of emissions is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air Quality (1000-1017) | #9774-4 | As determined through scientific studies, grazing on public lands has a significant effect on climate change. The greenhouse gas (GHG) emissions from cattle on public land equaled 12.4 million tons CO2/year. To further break down this statistic, examining the social cost of carbon (SCC) proves essential. SCC "is the cost of the damages created by one extra ton of carbon dioxide emissions." The Interagency Working Group (IWG) most recent figures from February 2021 estimate that the SCC is $51 per metric ton. The RMP/DEIS uses IWG figures. However, the EPA conducted a separate analysis from IWG where they project the SCC to be more than double IWG's projection. The BLM should use the EPA's estimates since they are most recent, and the IWG report was only meant to be a preliminary baseline. Additionally, the BLM, as a government agency, should utilize the EPA's guidelines since the EPA oversees the entire NEPA process. The IWG's SCC estimates are too conservative to fight the climate crisis adequately. 25 climate disasters in the United States exceeded $1 billion in damages in 2023 alone. The frequency of these incidents will increase as climate change worsens. | As this comment notes, there have been a variety of developments in the scientific literature since the IWG estimates were published, which the BLM considered for this planning effort and associated analysis. The IWG's estimates reflect the best available evidence given the particular analytical context of this planning effort and best facilitates sound decision-making for this planning process. |
| 801 - Physical Resources-Air Quality (1000-1017) | #9774-5 | We urge the BLM to continue with this alternative and to consider being stricter in their use of grazing to reduce GHG emissions further. To reduce GHG emissions, we recommend that the BLM limit AUMs. GHG emissions "from enteric fermentation and manure deposition on public lands were…2.1 million t CO2e for Wyoming." The SCC for this statistic using the more conservative IWG figures versus the EPA's less conservative figures would be 107.1 million and 252 million dollars, respectively. According to the US Geological Survey (USGS) and US Department of the Interior (DOI), "[Methane] (CH4), are…highest for Federal lands in Wyoming [at] 28 percent." | See Appendix P for the Technical Air Quality Report, which covers livestock grazing. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #9853-1 | While SVP supports the requirements to maintain healthy air resources, issues concerning air resources are largely irrelevant from the paleontological standpoint, except where surface disturbances, that may impact paleontological resources at or near ground surfaces (if any) are involved. Therefore, SVP prefers Alterative A for MA# 1010 (Page 2-7) in light of the fact that how ground disturbances will be handled is not clear in Alternative B. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | See Glossary for a definition of surface disturbance and surface disturbing activities. |
| 801 - Physical Resources-Air Quality (1000-1017) | #10324-11 | For both temperature and precipitation, the state ranked above average in temperatures and below average in precipitation between 1895 and the end of 2022.24 With this being said, there needs to be more of an emphasis on how Rock Springs will deal with the incoming threats of climate change, especially in order for this plan to be useful in the near future. Climate change has the potential to impact every single affected environment listed on the RMP, and therefore should be mentioned in every single affected environment section as to how each alternative would handle how climate change could affect these environments. There is quite a bit of climate change research going on, and a lot of information on how it will affect a variety of resources across the world, so I think it is important for the planning committee to take a look at how they will respond when the effects become apparent in their community. I would highly suggest looking at climate change more throughout the RMP, just to have a more concrete plan in place. Even though there are changes happening now, we as a state and the area of Rock Springs need to be prepared as to how they would handle new animals moving to the area to escape the warming, how water levels may change with decreased precipitation and how that could affect water to the community, ect. If this is not considered in the RMP more than it currently is, it is setting the area up for failure when the impacts become more severe. | See Section 1.4 for the Planning Criteria for the RMP. Impacted resources have appropriate stipulations, restrictions, and requirements to be protective of the resource. |
| 801 - Physical Resources-Air Quality (1000-1017) | #10517-2 | We are also concerned with the estimation of trona mining emissions in Appendix P.6.3. We would encourage the Bureau to include in its assumptions the likelihood that a change in resources for electricity generation for trona mines (for example, the adoption of nuclear reactors on-site). We also are concerned with the inclusion of commuting employees in the calculation of emissions related to trona production. Currently, most commuting is by multiple passenger buses; private single occupancy vehicles are not prevalent or really used for commuting. If Alternative B is adopted and trona production is curtailed to where the number of employees doesn't increase or actually decreases, then those employees would have to commute individually elsewhere for work (and likely farther than they otherwise would). Trying to speculate 1 43 U.S.C. § 1732(a). 2 43 U.S.C. § 1712(c)(i). 3 Plan, Volume 1, 2-25. 4 Plan, Volume 1, 3.15.4 (3-19). | New trona mining projects would be evaluated utilizing project-specific information at the time the NEPA analysis is conducted. For the purposes of the EIS analysis, generalized assumptions are made regarding oil and gas and mining development. See Appendix P. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-24 | 1010 Alternative A Surface disturbing activities will be managed to prevent violation of air quality regulations. It is unclear under Alterative B whether the "implementation of mitigation measures within BLM's authority to reduce air quality impacts" would be done in coordination with WDEQ. Alterative A is preferred because it is a continuation of existing practices which includes coordination with the WDEQ - ensuring preservation of state primacy over air quality. | See Glossary for a definition of surface disturbance and surface disturbing activities. Additionally, see Section 1.4 for Planning Criteria and Appendix E for applicable laws, regulations and policies that apply to this RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-25 | 1012 Alternative B with amended/ additional text Conduct conformity analyses and determinations for BLM actions in accordance with the Clean Air Act for all proposed projects located within designated non-attainment areas. The task force would like to add language to Alternative B to clarify state primacy over air quality. Revised management action with additional language in red: BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to conduct conformity analysis and determinations for BLM action in accordance with the Clean Air Act for all proposed projects located within designated non-attainment areas. | General Conformity applies only to Federal actions in nonattainment areas and is a requirement for Federal agencies only. See also Appendix E for a list of law, regulations, and policies that govern this RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-26 | 1013 Alternative B with amended/ additional text Determine, on a case-by-case basis and in accordance with the Rock Springs Air Resources Management Plan, the level of air analysis, including air quality modeling, necessary to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies for all project level EISs and Environmental Assessments. The task force would like to add language to Alternative B to clarify state primacy. Revised management action with additional language in red: BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to determine, on a case-by-case basis and in accordance with the Rock Springs Air Resources Management Plan, the level of air analysis, including air quality modeling, necessary to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies for all project level EISs and Environmental Assessments. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-27 | 1014 Alternative B with amended/ additional text Determine, on a case-by-case basis, the need for quantitative air quality analyses (including modeling) to assess the potential air quality impacts and/or the effectiveness of mitigation strategies of proposed actions. Make determination in consultation with state, local, federal, and tribal agencies. The task force would like to add language to Alternative B to clarify state primacy over air quality. Revised management action with additional language in red: BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to determine, on a case-by-case basis, the need for quantitative air quality analyses (including modeling) to assess the potential air quality impacts and/or the effectiveness of mitigation strategies of proposed actions. Make determination in consultation with state, local, federal, and tribal agencies. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-28 | 1015 Alternative B with amended/ additional text Support a quantitative air quality analysis to ensure the protection of air quality when impacts from the sum of BLM-authorized projects in the planning area approach a level of concern as determined in consultation with state, local, federal, and tribal agencies. The task force would like to add language to Alternative B to clarify state primacy over air quality. Revised management action with additional language in red: BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to support a quantitative air quality analysis to ensure the protection of air quality when impacts from the sum of BLM-authorized projects in the planning area approach a level of concern as determined in consultation with state, local, federal, and tribal agencies. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-29 | 1017 Alternative A Coordination with local and state agencies to control dust on unimproved dirt roads will occur where necessary. Alternative A is preferred because the language in Alterative B stating the BLM will "[r]equire dust abatement measures for all BLM authorized actives" is unclear and too broad of a statement. Alterative A is preferred because it includes a statement on coordination with local and state agencies and specificity that dust abatement will occur on unimproved dirt roads. | Management Action 1017 proposes a full range of alternatives and impacts for each is disclosed in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-30 | 1106, 1107, 1108 Alterative A from management action 1107 with amended/ additional text Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site- specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site- specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas, as needed. To achieve consistency across jurisdictions, particularly in the checkerboard, the task force suggests the BLM use the text from Management action 1107 in the final RMP with the additional text included in red for Management action 1106, 1107 and 1108: Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site-specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site- specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas, as needed. For mining activities with a mine permit issued by WDEQ-LQD, follow the soil handling and reclamation plan for hard to reclaim soils as outlined in the state mine permit. | A full range of alternatives are evaluated for these management actions that relate to erodible soils. Impacts from each of the alternatives are available in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13210-31 | 1109 Alternative D with amended/ additional text Apply, on a case-by-case basis, photo-point monitoring of channel crossings, culverts, borrow ditch outlets, and surface disturbance. The task force requests inclusion of additional language to Alternative D, drawn from Alternative B. This inclusion ensures that photo-point monitoring is applied only on disturbances greater than ½ an acre, and only on a case-by-case basis. Alterative D with revised text is preferred because Alternative B requires the broad application of photo-point monitoring regardless of nuanced circumstances. Alterative D, with revised text, created greater flexibility for the BLM as to when to require photo-point monitoring. Revised management action with additional language in red: For surface disturbances greater than ½ acre, apply, on a case-by-case basis, photo-point monitoring of channel crossings, culverts, borrow ditch outlets, and surface disturbance. | A full range of alternatives are evaluated for this management action. Impacts from each of the alternatives are available in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13287-33 | The DEIS addresses impacts of fossil fuel extraction on global climate change to a certain extent, but does a limited job of outlining the impacts by alternative of methane produced by cattle and sheep, and provides no analysis of the reduction in carbon sequestration that results from heavy livestock grazing. See DEIS at 4-10, 4-13. The Social Cost of Carbon (SCC) Public-lands livestock grazing has been shown to decrease carbon sequestration in habitats similar to the Rock Springs Field Office (Carter et al. 2011, Attachment 15, Kauffman et al. 2022, 2023 Attachments 16, 17). The agency must take the legally required hard look at greenhouse gas and carbon sequestration consequences of livestock grazing, by alternative, both direct and cumulative impacts on net carbon emissions. | An analysis for global carbon sequestration is outside the scope of this RMP. Emissions data by alternative for grazing activities is included in Appendix P. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13353-1 | MA 1012 We would like to offer the following amendment to the language in Alternative B. "BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to conduct conformity analysis and determinations for BLM action in accordance with the Clean Air Act for all proposed projects located within designated non- attainment areas." This change will clarify state primacy over air quality. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13353-2 | MA 1013 We would like to offer the following amendment to the language in Alternative B. "BLM shall work cooperatively with WY Department of Environmental Quality Air Quality Division to determine, on a case-by-case basis and in accordance with the Rock Springs Air Resources Management Plan, the level of air analysis, including air quality modeling, necessary to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies for all project level EISs and Environmental Assessments." This change will clarify state primacy over air quality. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |

|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-8 | MA#1010. Alternative B. 2-7 What "mitigation measures within BLM's authority" exist? Wyoming has primacy for air quality within Wyoming's borders. Please analyze in detail, disclose to the public, and define in the RMP what BLM's mitigation measures to reduce air quality impacts includes | Mitigation measures will vary on a case-by-case basis based on the magnitude of the pollutants of concern and the results of the NEPA air quality analysis. Until a site-specific NEPA analysis is completed, identification or need of additional air mitigation measures is unknown. See Appendix A for Best Management Practices |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-9 | MA#1010. Alternative B. 2-7 The RMP states that the BLM would "Implement measures within the BLM's authority to reduce air quality impacts from BLM actions and work cooperatively with industry...", but it does not state what mitigation measures are within BLM's authority. Please analyze in detail and disclose to the public all potential mitigation measures that the BLM anticipates using. | Mitigation measures will vary on a case-by-case basis based on the magnitude of the pollutants of concern and the results of the NEPA air quality analysis. Until a site-specific NEPA analysis is completed, identification or need of additional air mitigation measures is unknown. See Appendix A for Best Management Practices |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-10 | MA#1013. Alternative B, C, and D. 2-8 The Wyoming Department of Environmental Quality Air Quality Division has been delegated the authority by the EPA to oversee the implementation of the Clean Air Act in Wyoming. What additional analysis and mitigation is the BLM suggesting that they have the authority to require facilities do? Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Mitigation measures will vary on a case-by-case basis based on the magnitude of the pollutants of concern and the results of the NEPA air quality analysis. Until a site-specific NEPA analysis is completed, identification or need of additional air mitigation measures is unknown. See Appendix A for Best Management Practices |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-11 | MA#1017. Alternative B and D. 2-9 The Wyoming Department of Environmental Quality Air Quality Division has been delegated the authority by the EPA to oversee the implementation of the Clean Air Act in Wyoming. What additional dust abatement measures is the BLM suggesting that they have the authority to require facilities do? In addition, not all best management practices will work for all applications. For example, at trona mines, using traditional dust suppression chemicals on roadways is undesirable because it will cause impurities and issues in the quality of the soda ash being produced. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Mitigation measures will vary on a case-by-case basis based on the magnitude of the pollutants of concern and the results of the NEPA air quality analysis. Until a site-specific NEPA analysis is completed, identification or need of additional air mitigation measures is unknown. See Appendix A for Best Management Practices |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-61 | Literature Cited. Environmental Protection Agency (EPA). 2014. LC-15 The air emissions inventory is published every 3 years by the EPA, therefore there are 2017 and 2020 data sets currently available for use and instead the BLM used 2014 data. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-62 | Page LC-15. Literature Cited. EPA. 2016. Hazardous Air Pollutants. LC-15 On January 5, 2022, the EPA issued a final rule that added 1-bromopropane to the Clean Air Act's list of hazardous air pollutants. This chemical would not have been in the BLM's analysis of hazardous air pollutants when it was accessed and reviewed in 2016. | The BLM does not analyze individual HAPs as part of the RMP analysis. See Appendix P. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-71 | Literature Cited. EPA. 2018. EPA's Facility Levels Information on Greenhouse Gases Tool (FLIGHT). LC-16 This dataset is old and was accessed over 5 years ago. This dataset is revised annually with the previous year's data mid-year. 2022 data is currently available for use and should be used in the BLM's analysis. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-72 | Literature Cited. Meteorological Solutions Inc. 2018. LC-16 This uses meteorological data from 2017, which is 5 years old. This weather station (Moxa Arch) is operated by the Wyoming Department of Environmental Quality Air Quality Division and is still operational today. The most recent annual report from 2022 should be accessed and used to represent air quality and weather data from the area. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-74 | Literature Cited. Wyoming DEQ. 2015. LC-16 The Wyoming Ambient Air Monitoring Annual Network Plan is from 2015. This plan is revised annually. The most recent version available on DEQ AQD's website was published in June 2023. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-91 | Appendix P. P.6. Emissions Calculations. P-11 The 20-year period for emissions calculations estimates started in 2012. This 20-year period is now more than halfway over. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. | | | | have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-92 | Appendix P. P.6.1. Emissions Development Assumptions. P-12 The analysis uses the potential to emit rather than actual emissions to calculate actual emissions, which is very unlikely to occur. Much of the actual emissions data for large facilities is available to the public, including the BLM, through the EPA. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The BLM's emission estimates at the RMP level are intended to be conservative estimates based on broad assumptions, not to represent actual development or provide precise emissions estimates, but to disclose potential emissions based on resource development under the different alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13542-93 | Appendix P. P.6.3. Trona Mining Emissions Estimation. P-15 The emissions calculations section is using the 2012 Mineral Potential Report, which is reporting the total amount mined in 2010. The amount of trona being mined in the KSLA has increased in the 13 years since this data was collected. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #13564-1 | The Greenhouse Gas Emissions section of the RMP describes the higher emissions of Alternative C and the decreased emissions in Alternative B. However, when comparing the numbers given in Table 4-3.1-Total Federal Oil and Gas Greenhouse Gas Emissions, Alternative D offers the most moderate effects in all categories. Preservation of the land reduces the opportunity to manage it for conservation purposes such as fire and invasive species management. Conservation on the other hand will allow the land to be used now and continue to be used for future generations while also adapting to the ever-changing landscape. It is essential to use the tools necessary to help curb the effects of climate change while also working to conserve BLM land. | The EIS evaluates a full range of alternatives, each of which is detailed in Chapter 2, with the impacts from each presented in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13584-2 | According to Appendix P, emissions associated with the production of renewable energy are accounted for in the GHG inventory, but emissions reductions or offsets from production of renewable energy on BLM land are not addressed. | The BLM is unable to account for potential emission reductions from renewable energy at the RMP stage since that would require an assumption that emission reductions or offsets would occur, which may or may not be the future case. Any emission reductions would not likely be realized within the planning area, but outside the state and are therefore out of scope for the RMP analysis. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13585-65 | d. The BLM failed to take into consideration the emerging carbon capture, utilization, and storage (CCUS) technology in addressing air quality impacts and modeling. The failure to consider this new technology and how it will help reduce air quality impacts from resource development has resulted in an over exaggeration of air quality impacts and subsequently additional restrictions on development under Preferred Alternative B. The BLM must provide a supplemental EIS that incorporates discussion on CCUS and the impact this technology has on reducing air pollution. The BLM also should include a management action for air quality that addresses CCUS technology. See Attach. 10, Final Report Integrated Commercial Carbon Capture and Storage (CCS) Prefeasibility Study at Rock Springs Uplift, Wyoming. | The BLM can not factor in nor require the use of CCUS for future development. Should a project proponent voluntarily opt to use CCUS technology for future development, the BLM would assess the emissions reductions at the time the site-specific NEPA analysis is completed for the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-26 | Greenhouse Gas Emissions Appendix T, particularly Table T-7 and pages T-13 through T-15, of the Draft EIS is confusing and only estimates greenhouse gas emissions for Alternative C. Draft EIS, App'x T, pp. T-13 to T-16. BLM should provide the greenhouse gas emission estimates for all the proposed alternatives; not just the alternative that allows the maximum amount of development. | GHG emissions by Alternative are presented in Appendix P. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-27 | These federal Class I areas do not include any BLM wilderness study areas or BLM areas of critical environmental concern. In fact, there are no federal Class I areas located within the draft RMP planning area. All other areas of Wyoming, including the areas covered under this draft RMP and EIS, are classified as Class II areas. 42 USC § 7472 and 40 CFR § 52.2621. This means that economic growth may occur in those Class II areas in a manner consistent with preserving Wyoming's clean air resources. Congress recognized that primacy provides states with the ability to balance the state's economic growth with preservation of its clean air resources. See 42 USC § 7401; see also Wyo. Stat. Ann. § 35-11-102 (policy and purpose of the Wyoming Environmental Quality Act). | The EIS evaluates a full range of alternatives, each of which is detailed in Chapter 2, with the impacts from each presented in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-28 | Management actions 1010 through 1015 provided on pages 2-7 through 2-8 indicate that BLM will work directly with stakeholders to address air quality and identify mitigations strategies. BLM seems to dismiss the fact that WDEQ has been granted primacy for all air quality authority in Wyoming. BLM needs to be clear that BLM will coordinate with WDEQ and that WDEQ regulates air quality in Wyoming | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-29 | Air Quality Emissions The introductory paragraph on page 3-1 indicates that air quality emissions have been updated. However, the EPA's 2014 National Emissions Inventory (NEI) air quality emissions data used by BLM in its analysis is almost a decade old. (ex. App.T-7; LC-15, P-12) EPA releases its NEI every three years. The EPA released its 2017 NEI in 2020 and released its 2020 NEI in 2023. The DEQ/AQD recommends that BLM update its' air quality emissions data. The DEQ/AQD notes that it collects statewide emissions data from Wyoming sources. If BLM is interested in learning more about that data, please contact the DEQ/AQD. | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air | #13624-30 | Ozone Nonattainment Section 3-1 and Q.3 (and other sections and pages) discuss the "Upper Green River Basin ozone nonattainment area". EPA has several different ozone standards. EPA has designated all areas of Wyoming as attainment/unclassifiable for all of EPA's ozone standards, with the exception of its 2008 ozone standard. 40 | All references to the UGRB ozone nonattainment area will be updated to include 2008 in the descriptor. However, BLM's obligations under the General Conformity Rule still apply even after EPA re-designates the area as Maintenance from Non-attainment. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Quality (1000-1017) | | C.F.R. § 81.351. And, EPA has determined that the UGRB had attained the 2008 ozone standard. 40 C.F.R. § 52.2623. And, in 2015, EPA promulgated a more stringent ozone standard. EPA designated all areas of Wyoming, including the UGRB, as attainment/unclassifiable for the 2015 Ozone NAAQS. 40 C.F.R. § 81.351. Therefore, to avoid confusion, the DEQ/AQD recommends that whenever the BLM references the "Upper Green River Basin 2008 ozone nonattainment area" in the Draft RMP/EIS, it assures that "2008" has been included in the descriptor. | |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-32 | Appendix G, Table G.1 - Summary of Land Health Standards, Standard 6 "Air Quality" Page G-10 describes Standard #6 as "Air quality meets Wyoming standards". For each allotment listed in table G-1, BLM indicates that the air quality is "unknown", "meeting," or "unevaluated." To be consistent with the CAA, the DEQ/AQD suggests that all areas should be listed as "meeting". See 40 C.F.R. § 81.351 and § 52.2623. | See updated to Appendix G as appropriate. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-35 | Air Monitoring Section Q.5.4 discusses Air Monitoring and includes several references and weblinks to air monitoring networks. The DEQ/AQD suggests BLM include references to Wyoming DEQ/AQD's monitoring network. Information about Wyoming's network can be found at https://wyvisnet.com and in the DEQ/AQD's Annual Monitoring Network Plan for 2023, a copy of which is available on the DEQ's website. | WDEQ-AQD's monitoring network link will be added to Section Q.5.4 |
| 801 - Physical Resources-Air Quality (1000-1017) | #13624-36 | Rock Springs Planning Area and Overall Air Quality At the bottom of page T-8 and carrying over to T-9, BLM states that air quality in the Rock Springs planning area is good, "with the exception of ozone," and continues to state that "Sweetwater County is currently in nonattainment" for both the ozone NAAQS and WAAQS. That statement is incorrect. The WDEQ/AQD suggests that BLM correct it to read: "Air quality in the Rock Springs planning area is good". In 2012, EPA designated the Upper Green River Basin Area (UGRB) as a nonattainment area for the 2008 Ozone NAAQS. The UGRB 2008 ozone nonattainment area includes a portion of Sweetwater County. See 40 CFR § 81.351. In 2016, the EPA determined that the UGRB 2008 ozone marginal nonattainment area had attained the 2008 ozone NAAQS. See 40 CFR §52.2623. In 2018, the EPA designated all areas within Wyoming, including all areas within the RS RMP as attainment/unclassifiable for the 2015 ozone NAAQS." | See updated text in Appendix T. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13658-11 | The BLM creates management action 6001 related to carbon sequestration (CCS) in Table 2-1 but this is the only place in the document CCS is discussed. While there is a discussion about the Rock Springs uplift being suitable for CCS in the RFD, there is no explanation anywhere that provides reasoning for why Alternative B limits sequestration activities to the Rock Springs uplift. The RFD is also 13 years old and there have been significant advancements in knowledge and development of markets related to CCS since that time. BLM did not coordinate with the WDEQ or WOGCC in relation to CCS. Relatedly, there does not seem to be discussion of the effects of CCS projects or CO2 enhanced recovery projects on GHG emissions. While outdated, the RFD does identify 26 billion tons of CO2 storage potential. The Monell Unit CO2 flood in the project area also sequesters a significant volume of CO2 through enhanced oil recovery (EOR). It is estimated that approximately 90% of CO2 injected during tertiary recovery operations (EOR) remains in the ground. This does not appear to be accounted for in the GHG analysis. | Carbon sequestration is authorized by BLM as a right-of-way. See Section 4.19. CO2 emissions are covered in Appendix P and the Air Quality analysis. See also Appendix E for a list of laws, regulations, and policies that apply to the RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13658-12 | To cure the deficiencies related to CCS, the RSFO should prepare a supplemental EIS ensuring the following are completed: 1) coordinate with WDEO/WQD and WOGCC regarding CCS proposed management actions in the RMP; 2) if BLM decides to retain any management action that may limit CCS, provide justification for how limiting sequestration helps meet management objectives and how CCS potential in the management area will be impacted; 3) if RSFO decides to retain the Rock Springs Uplift as the sole area available for such activities, include a description and map illustrating the area designated as open to CCS; and 4) Evaluate and assess the impacts of the different alternatives on CCS projects, especially as it related to ROW exclusions preventing projects both inside and outside of the RSFO planning area by preventing roads and pipelines; and 5) Include the effects of enhanced recovery projects and CCS projects on GHG emissions for each alternative. | Carbon sequestration is authorized by BLM as a right-of-way. See Section 4.19. CO2 emissions are covered in Appendix P and the Air Quality analysis. See also Appendix E for a list of laws, regulations, and policies that apply to the RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13658-16 | Nowhere in the RMP did BLM analyze the potential for new technologies such as carbon capture and storage (CCS) to reduce GHG emissions from any source, but specifically from oil and gas sources. There is already one project immediately adjacent to the RSFO with approved Class VI injection wells with significant interest in the entire southwest Wyoming area for additional CCS projects. The GHG emissions and monetization through the use of social cost of GHGs evaluation completed by BLM is inappropriate, inaccurate, and incomplete. BLM must, at a minimum, consider the social costs of eliminating or reducing oil and gas production and the potential for CCS or other technologies to reduce GHG emissions from the various sources BLM used in the social cost of GHG emissions evaluation. | An analysis for global carbon sequestration is outside the scope of this RMP. Emissions data by alternative for all resources is included in Appendix P. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13658-18 | On page, 4-11 and 4-12, BLM presents calculations of direct emissions expected from oil and gas development. As previously mentioned, since BLM used an inappropriate RFD for oil and gas in this evaluation these emissions are likely grossly overstated (based on facts that the expected development and production used by BLM was much higher than the actual oil and gas development and production). BLM also did not rely on the recently issued EPA methane emissions rule in its evaluation of the emissions from oil and gas development. Using EPA's emissions estimating tool for fugitive emissions, which was created in 1995, is inappropriate when EPA's methane emissions rule was updated in 2023. These emissions calculations must be updated using more accurate data so that representative emissions are presented for consideration. | The emission estimates are intended to provide a point of comparison between the alternatives, not to represent an accurate assessment of what future emissions will actually be. The RFD is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if market conditions have changed in the intervening years since the RFD, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. |

|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #13658-19 | WOGCC understands the BLM's use of the term climate change to be global in scale. Avoiding the discussion related to a link between increased GHG emissions and climate change, the BLM, at a minimum, must demonstrate any alternative causes a global increase in GHG emissions to claim an effect. The BLM states that restricting oil and gas development in the planning area would reduce greenhouse gas emissions. For this to be true on a global scale BLM would need to demonstrate that the prevention of oil and gas production in the planning area would reduce global production of oil and gas or the analysis would have to compare the upstream GHG emissions from the planning area with the areas most likely to produce the oil and gas instead of the planning area. According to a recent study on upstream methane emissions, the Green River Basin in Wyoming has the lowest methane intensity in the US (Diana Burns and Emily Grubert 2021 Environ. Res. Lett. 16 044059). It is reasonable to assume that if producers in the planning area were not able to deploy capital to produce more oil and gas within the planning area they or other operators would deploy capital elsewhere to meet production demand. While statements that assert lower GHG emissions in the planning area are true, this cannot be tied to climate change by implying or stating that management actions will lower global GHG emissions without actually doing the analysis. Given that this administration has called on places like Argentina and Saudi Arabia to increase production it would be reasonable to compare upstream emissions from those countries. | A global scale cumulative analysis relating to foreign sources of emissions is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13665-23 | Energy demand in the United States and globally is expected to increase significantly in the coming years. See Energy Information Administration, Annual Energy Outlook (2022).20 If oil and gas cannot be produced efficiently and effectively in the United States, they will have to be imported from abroad, most likely from the OPEC countries that not only lack protective environmental controls but also have been-and continue to be-hostile to American and democratic interests around the world. See DOI-BLM-HQ-3100-2023-0001-EA at 26 (acknowledging that interruptions of domestic oil-and-gas lease sales result in greater dependence on foreign sources that are produced with less-protective environmental measures).21 Importing foreign petroleum also increases global emissions associated with shipping over long distances, risks ocean contamination from spills, increases emissions associated with transporting petroleum from coastal ports to inland destinations, and creates other needless hurdles to providing American consumers with petroleum. | Global supply and demand of fossil fuels and U.S. consumption of fossil fuels is outside the scope of analysis for this RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13665-32 | Realizing that honest disclosure of the negative impacts that can emanate from importing oil and gas in lieu of domestic production is critical to reasoned decision-making, federal agencies often employ "substitution" analyses in their NEPA review. BOEM, for example, recently pointed out that limiting federal offshore oil-and-gas production would mean that "[t]ankering across the Pacific, [Gulf of Mexico], or Atlantic Regions may increase substantially due to an expected increase in foreign oil imports." See 2023-2038 National Outer Continental Shelf Oil and Gas Leasing Program at 212-13.30 Similarly, in discussing the "no action" alternative to lease sales in another NEPA evaluation, BLM applied substitution analysis in a recent EA prepared specifically to evaluate the greenhouse-gas emissions impacts of oil-and-gas development, and observed that "[c]hoosing the No Action alternative [instead of the development-friendly alternative] would not prevent future leasing" or reduce greenhouse emissions associated with oil-and-gas consumption. See DOI-BLM-HQ-3100-2023-0001-EA at 10.31 BLM found just the opposite: reducing domestic supplies of oiland- gas "would likely lead to the import of more oil and natural gas from other countries, including countries with lower environmental and emission control standards than the United States." Id. at 26. | Global supply and demand of fossil fuels and U.S. consumption of fossil fuels is outside the scope of analysis for this RMP. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13720-15 | A.1.5 Noise The DRMP DEIS directs oil and gas operators to, "Limit noise to less than 10 decibels above ambient measures (20-24 dBA) at sunrise at the perimeter of a lek during active lek season." This is an incorrect characterization of ambient noise levels in undisturbed habitats in the Green River Basin, and makes the noise level ceiling 34 dBA. When sound levels exceeded 24 dBA in the Pinedale Anticline gas field, sage-grouse lek attendance fell by 89%. The importance of considering noise influences on sage-grouse cannot be overstated. Masking the sounds of communication used by mating Greater sage-grouse has been scientifically shown to deter attendance at their leks, influencing population declines. Grouse use leks to display elaborate acoustic and visual performances to attract and select mates. They also depend on vocal communication between females and nestlings during brood rearing. A key research paper from the National Park Service and Colorado State scientists (Barber, 2010) introduces two key, new metrics for measuring the effects of noise on animals. The first, "alerting distance," is the distance at which sounds can be heard: these may be sounds made by a species to alert others to danger, or sounds made by predators (which prey animals want to hear, so as to take cover). The second is "listening area," the full area around an animal in which it can hear other animals' calls, footsteps, and wingbeats. A key insight offered by this approach is that even moderate increases in background noise can drastically reduce an animal's listening area, and its ability to survive. To establish baseline sound levels, acousticians and bioacousticians (and many local governments) commonly measure decibels ("dBA"), with a standard called "L90." This is the sound level that is exceeded 90% of the time (or is the quietest 10% of the time) and is the sound measurement that does not include most human-caused sounds. The ambient sound level measures all current sounds, and is characterized by "L50", which is a median of natural and human-caused sounds. Best available science established by experts in acoustical measurement recommends the use of L90 to establish baseline noise. In a state/federal study, the Pinedale Office of the Bureau of Land Management (BLM) and the State of Wyoming have established baseline noise levels at sage-grouse leks in the Upper Green River Valley. BLM and the | Specific greater sage-grouse related actions regarding noise are outside the scope of this RMP and are being addressed under separate RMP Amendment (see Section 1.4 Planning Criteria). See also Appendix A for Best Management Practices, which includes actions for reducing noise. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | Wyoming Game and Fish Dept. contracted with professional bioacousticians to document specific noise conditions within the Pinedale Anticline Project Area (PAPA) and chosen reference areas. One of the objectives of this study was to determine baseline sound levels at sage- grouse leks in undisturbed sagebrush habitat. (Ambrose, Florian, & MacDonald, 2014) At the three reference leks in the 2013 study for the time period 0000-0500, a time not influenced by grouse display sounds, the baseline sound level (L90) was 14.2 dBA. The Sound Levels study clearly indicated that baseline noise levels at sage-grouse leks in undisturbed sagebrush habitat in the Upper Green River Valley were 14.2 dBA. Our understanding of noise impacts to sage-grouse have improved in recent years. Studies in Wyoming indicate that sage-grouse populations decrease as fossil gas is developed and noise increases in important habitats. "Peak male attendance relative to the baseline was lower on noise leks than paired control leks… (73% decrease in abundance compared with paired controls). These decreases were immediate and sustained." (Blickley, Blackwood, & Patricelli, 2012) At the BLM Pinedale Anticline (PA) Annual Meeting on April 25, 2019, professional bioacousticians stated that when sound levels exceeded 24 dBA on the PA, sage-grouse lek attendance fell by 89%. In previous Pinedale Anticline noise studies, on sage-grouse lek complexes with the most noise, sage-grouse lek attendance also dropped dramatically. In 2009, in the development complex called Duke's Triangle, lek attendance fell by 41% and in 2012 lek attendance fell by 60%, compared to the previous two-year averages. We respectfully request that BLM maintains a noise level ceiling that is not to exceed 10 decibels above baseline, which would make the noise level ceiling 24 decibels. This is a standard more protective of Wyoming sage-grouse populations in Core Areas. | |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-48 | It is well understood that NOx and VOCs emissions contribute to ozone formation, however, these statements should also include a disclaimer that the WDEQ concluded that the trona mines do not contribute to the ozone non-attainment area due to the wind trajectories. This information was concluded by the WDEQ and agreed to by the EPA in 2011 and was the basis for the ozone non-attainment boundary. | The disclaimer can not be included since future trona operations, mining methodologies, and locations are unknown at this time. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-49 | Likewise, the 1998 visibility study also concluded the trona mines had no impairment on the basin. Further, the WDEQ has recently completed the regional haze glide path review which does not indicate trona (or coal for that matter) as significant contributors to visibility degradation. | The BLM will disclose through the NEPA process for any future implementation level actions whether BLM-authorized activities have the potential to contribute to visibility impairment at Class I areas. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-50 | EPA regulates regional haze at Title 40 (Protection of Environment) of the Code of Federal Regulations (CFR, WY SIP) §51.308. Any effort by the BLM to regulate the same is redundant and an overreach. EPA and WDEQ's required regional haze glide path required visibility to improve through 2064, so any reference of regional haze impairment does not properly include the regulatory restrictions and should be struck from this plan or revised for accuracy. | The BLM does not regulate any emission sources as that is the purview of the WDEQ-AQD. The BLM will disclose through the NEPA process whether BLM-authorized activities have the potential to contribute to visibility impairment at Class I areas. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-102 | MA #1010 Alternative B Physical Resources (PR) - Air Quality (1000-1017) Implement mitigation measures within the BLM's authority to reduce air quality impacts from BLM actions and work cooperatively with industry and other permittees to adopt additional measures to minimize air quality impacts from BLM management actions. Industry position: Not acceptable Reason: The BLM should also work cooperatively with WDEQ-AQD to implement mitigation measures for BLM actions. The WDEQ-AQD is responsible for developing federally approvable plans and rules necessary to ensure the State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). | The BLM does work cooperatively with WDEQ and does not address regulated emissions sources that are under the purview of WDEQ and require CAA permits. BLM mitigation measures would apply to emissions sources that are not directly regulated by WDEQ such as fugitive dust, construction equipment emissions and drill rig emissions. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-103 | MA #1011 See MA #1010 Industry position: Not acceptable Reason: The BLM should also work cooperatively with WDEQ-AQD to implement mitigation measures for BLM actions. The WDEQ-AQD is responsible for developing federally approvable plans and rules necessary to ensure the State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). | The BLM does work cooperatively with WDEQ and does not address regulated emissions sources that are under the purview of WDEQ and require CAA permits. BLM mitigation measures would apply to emissions sources that are not directly regulated by WDEQ such as fugitive dust, construction equipment emissions and drill rig emissions. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-104 | MA #1012 Conduct conformity analyses and determinations for BLM actions in accordance with the Clean Air Act for all proposed projects located within designated non-attainment areas. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to ensure actions are in accordance with the Clean Air Act. | General Conformity is a CAA requirement that applies only to Federal agencies and Federal actions occurring in nonattainment or maintenance areas. The BLM is required by regulation to work with WDEQ and EPA if a proposed action in the nonattainment or maintenance area exceeds de minimis emissions thresholds and requires a formal Conformity Determination. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-105 | MA #1013 Determine, on a case-by-case basis and in accordance with the Rock Springs Air Resources Management Plan, the level of air analysis, including air quality modeling, necessary to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies for all project level EISs and Environmental Assessments. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to determine the level of air analysis and should use this information to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-106 | MA #1014 Alternative B Determine, on a case-by-case basis, the need for quantitative air quality analyses (including modeling) to assess the potential air quality impacts and/or the effectiveness of mitigation strategies of proposed actions. Make determination in consultation with state, local, federal, and tribal agencies. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |

| | | required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to determine the level of air analysis and should use this information to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies. Alternative D Determine, on a case-by-case basis, the need for quantitative air quality analyses (including modeling) to assess the potential air quality impacts and/or the effectiveness of mitigation strategies of proposed actions. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to determine the level of air analysis and should use this information to determine potential air quality impacts from proposed actions and subsequent potential mitigation strategies. | |
| 801 - Physical Resources-Air Quality (1000-1017) | #13751-107 | MA #1014 ALT B + C Support a quantitative air quality analysis to ensure the protection of air quality when impacts from the sum of BLM-authorized projects in the planning area approach a level of concern as determined in consultation with state, local, federal, and tribal agencies. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to determine the need for quantitative air quality analyses of proposed actions. ALT D Support a quantitative air quality analysis to ensure the protection of air quality when impacts from the sum of BLM-authorized projects in the planning area approach levels of concern. Industry position: Not acceptable Reason: The State of Wyoming retains primacy in regulating sources of air pollution as required under the Clean Air Act (CAA). The BLM should work cooperatively with the WDEQ-AQD to determine the level of air analysis and should use this information to determine the need for quantitative air quality analyses of proposed actions. | See Section 1.3 for the Planning Criteria and Appendix E for a list of laws and regulations that are compliant for all four alternatives. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13754-13 | The Wyoming Department of Environmental Quality has been granted primacy to regulate and enforce the provisions of the CAA from the U.S. Environmental Protection Agency. Any decisions on activities to regulate or enforce air quality must be deferred to Wyoming DEQ. The Associations understand that the BLM is currently required to consider air quality impacts in the course of an environmental review. Unfortunately, that analysis is deficient because it holds static energy generation sources and their commensurate emissions. In reality, several electricity generating units have announced plans to convert to natural gas. The BLM should carefully analyze the real-world emissions implications of these announced plans to determine true emissions estimates. | The BLM does not regulate any emission sources as that is the purview of the WDEQ-AQD. The BLM will disclose through the NEPA process whether BLM-authorized activities have the potential to contribute to air quality impacts. It is outside the scope of analysis for this RMP to estimate emissions reductions or timing for permitted EGUs in the planning area that may be converting to other fuel sources. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13767-1 | Alternative B of Management Action No. 6001 ("Alternative B"), the objective of which, as stated in Table 2-1 of the Draft RMP, is to "limit geologic sequestration exploration and site characterization projection and commercial sequestration projects and facilities to the Rock Springs Uplift." Further, one of the other stated goals for Management Action No. 6001 is to "improve air quality in the planning area as practicable." By limiting commercial sequestration projects and facilities to the Rock Springs Uplift, Alternative B eliminates Frontier's ability to capture any CO2 from the AOR and transport it via pipeline to the SCS Hub - and dispose of it into Class VI wells which have been constructed with funds granted by the Department of Energy. Instead, Alternative B assumes that the pore space formations underlying the Rock Springs Uplift is sufficient storage for the entirety of the AOR without any technical subsurface characterization study publicly available to support such an assumption and without regard to the location of each emissions site relative to the Rock Springs Uplift. | An analysis of global or regional carbon storage needs is outside the scope of this RMP. See Section 1.4 for Planning Criteria. A full range of alternatives for right-of-way access for carbon sequestration is proposed under management action 6001. See Chapter 4 for the impacts of each alternative. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13767-2 | Alternative B of the Draft RMP also aims to exclude 2,480,876 surface acres from use for rights of way, which would include BLM surface acres that are checkerboarded with private lands that host CO2 emission facilities in the AOR. Alternative B would effectively condemn pore space underlying these private lands by prohibiting these private emitters from implementing a point-source capture site at its respective facilities due to the fact that the continuous, checkerboarded BLM surface acreage will be excluded from rights of way to the federal pore space. Furthermore, the exclusion of rights of way would prevent any efforts to transport the CO2 via pipeline from its source to the storage site, whether it's the SCS Hub or the Rock Springs Uplift. These consequences make it difficult to comprehend how Alternative B "improves air quality" when almost 70 percent of the BLM surface acres are excluded from rights of way, dramatically reducing the potential for any commercial carbon sequestration projects from being commissioned in the AOR. | A full range of alternatives are analyzed for various rights-of-way restrictions and special management concerns. See Chapter 4 for impacts from each alternative. Also, Table 1-1 describes land and mineral ownership and jurisdictions within the Rock Springs planning area, including addressing in footnote 6 that impacts to areas with private or state ownership will be discussed in the cumulative impacts analysis section (Appendix T). |
| 801 - Physical Resources-Air Quality (1000-1017) | #13787-4 | Because soda ash is critical for the production of other essential products, production that cannot occur in the US will almost certainly move to foreign nations, most likely China, and will likely be produced using synthetic soda ash production technology. Over 40% of the worlds soda ash production already occurs in China and given the rarity of trona resources worldwide, the vast majority of that is synthetic soda ash production. Synthetic soda ash production uses salt, limestone, and ammonia to produce soda ash, rather than trona. This process is much more complicated and more energy intensive compared to natural soda ash production trona. US natural soda ash production from trona uses less than 50% of the energy and results in 37% less greenhouse gas emissions for each ton produced compared to synthetic soda ash production. Any reduction in ability to produce natural soda ash in the KSLA will not only move that production to foreign nations but will result in higher energy consumption and greenhouse gas emissions, all of which are in direct conflict to goals of the Biden Administration. | A global scale analysis relating to foreign sources of trona is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air | #13787-12 | Page 4-6 forth bullet of the Draft RMP/DEIS includes the following "The magnitude of and increases in estimated emissions from solid mineral development, including surface mining of coal and trona, at the level of development | The disclaimer can not be included since future trona operations, mining methodologies, and locations are unknown at this time. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Quality (1000-1017) | | predicted for all alternatives over the life of the plan have the potential to cause impacts related to fugitive dust and increased ozone formation, visibility degradation, and atmospheric deposition." Likewise on page 4-11 "The quantities of emissions estimated from fluid mineral development and solid mineral development activities are based on reasonably foreseeable estimates of development rates, well counts, production rates, and existing technologies. The estimated emissions should not be considered definitive and may not reflect actual emissions at the time of development, due to the unknown future demand for mineral development over the life of the plan. Although the quantity of emissions calculated for this category may not represent actual emissions from eventual development, the magnitude of estimated emissions of several pollutants for this source category is considerable. Emissions of PM10, VOCs, and NOX from this category have the highest potential to impact air quality under each of the alternatives. These impacts could include increased ambient concentrations of NOX and increased ozone formation in summer and winter." It is well understood that NOx and VOCs emissions contribute to ozone formation; however, these statements should also include a disclaimer that the WDEQ concluded that the trona mines do not contribute to the ozone non-attainment area due to the wind trajectories. This information was concluded by the WDEQ and agreed to by the EPA in 2011 and was the basis for the ozone non-attainment boundary. Likewise, the 1998 visibility study also concluded the trona mines had no impairment on the basin. Further, the WDEQ has recently completed the regional haze glide path review which does not indicate trona (or coal for that matter) as significant contributors to visibility degradation. EPA regulates regional haze at Title 40 (Protection of Environment) of the Code of Federal Regulations (CFR, WY SIP) §51.308. Any effort by the BLM to regulate the same is redundant and an overreach. | |
| 801 - Physical Resources-Air Quality (1000-1017) | #13787-13 | EPA and WDEQ's required regional haze glide path required visibility to improve through 2064, so any reference of regional haze impairment does not properly include the regulatory restrictions and should be struck from this plan or revised for accuracy. | The BLM is required by NEPA to disclose potential impacts to air resources and that includes impacts to AQRVs that may occur from a proposed action. WDEQ's regional haze glide path is a cumulative metric that would be addressed in the Cumulative impacts section of a project-specific NEPA analysis. Project-specific impacts to air quality and AQRVs would be disclosed in the NEPA document but do not constitute a regulatory analysis. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13787-16 | This process is much more complicated and more energy intensive compared to natural soda ash production trona. US natural soda ash production from trona uses less than 50% of the energy and results in 37% less greenhouse gas emissions for each ton produced compared to synthetic soda ash production. Any reduction in ability to produce natural soda ash in the KSLA will not only move that production to foreign nations, but will result in higher energy consumption and greenhouse gas emissions. | A global scale analysis relating to foreign sources of trona is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |

| 801 - Physical Resources-Air Quality (1000-1017) | #13793-2 | As you are aware, global demand for clean energy supplies is soaring, led by economic growth and fuel switching in China, Japan, South Korea, Taiwan and India and Europe's push to diversify from embargoed Russian natural gas. Natural gas from western basins in the U.S. can play a key role in meeting those energy needs by providing reliable, cleaner baseload power to displace higher carbon fuels and foster renewable energy deployment by balancing intermittency issues and supporting related supply chains. While WSTN shares the mission of reducing global greenhouse gas (GHG) emissions, our original vision is predicated on the fact that GHG emissions know no national or regional boundaries. When that reality is factored into GHG analyses, it is clear that not all emissions are additive to the global tally - some are reductive. Wyoming's in particular would be reductive if exported to Asian markets to displace coal-fired generation. A 2021 study commissioned by WSTN found that the export of Rockies-sourced liquefied natural gas from the North American West Coast to China, India, Japan, South Korea, and Taiwan would reduce net life cycle emissions by 42%-55% if used to replace coal-fired energy generation in those countries. As you consider alternatives that balance all legally designated uses of federal land in the decision area, WSTN encourages consideration of additional research showing that responsible, well-regulated natural gas production and exports can actually reduce global emissions, as evidenced by the study's findings, available here. | A global scale analysis for energy demand is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #13793-4 | Second, there is no realistic expectation that global and domestic natural gas demand is going away for decades, so the best option is to produce it with as low a methane intensity and as many environmentally responsible practices as possible. The regulatory and environmental requirements for natural gas and oil production on federal lands are the most environmentally advantageous sources for these natural resources. Throttling or outright stopping natural gas production on federal leasing areas will limit the best available product from being exported to meet the growing demand, which will in turn lead to a higher emissions cost. What is sold in the global environment matters because pollution knows no geographical boundaries. It is noteworthy that two Wyoming companies are producing some of the least methane-intense natural gas in the world - at roughly one-tenth the prevailing industry intensity - and are commanding a premium for this. These are precisely this type of operational and technological leaps forward that should be encouraged to help the U.S. in terms of economic, energy and national security. | A global scale analysis for energy demand is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13793-6 | The widespread removal of federal land from productive economic uses as proposed by Alternative B will chill investment and the accompanying employment and rural economic contributions that come from private investment. For example, Alternative B would lower the potential for future investment in carbon capture and storage related to natural gas production in the management area, and limit Wyoming's ability to keep leading the nation in advancement of this critical tool for decarbonization at scale - one supported by the Biden Administration. | A full range of alternatives are analyzed for various rights-of-way restrictions and special management concerns. See Chapter 4 for impacts from each alternative. Also, Table 1-1 describes land and mineral ownership and jurisdictions within the Rock Springs planning area, including addressing in footnote 6 that impacts to areas with private or state ownership will be discussed in the cumulative impacts analysis section (Appendix T). |
| 801 - Physical Resources-Air Quality (1000-1017) | #13811-2 | Furthermore, BLM has not provided sufficient justification for the shift. BLM states that a reduction in rights-of-way would reduce associated emissions-generating activities, but it then concedes that "[e]stimated emissions are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts."8 Alternative B's shift to exclusion areas would thus no better achieve BLM's conservation goals than the currently applicable Green River RMP, but it would have drastic socioeconomic effects on the Planning Area. | A full range of alternatives are analyzed for various rights-of-way restrictions and special management concerns. See Chapter 4 for impacts from each alternative. See Appendix N for socioeconomic report. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13845-12 | Executive Order (EO) 14008, entitled "Tackling the Climate Crisis at Home and Abroad" (January 2021), calls for a government-wide approach to the climate crisis, including by increasing resilience to the impacts of climate change by conserving our lands, waters, and biodiversity. Following the issuance of EO 14008, the Department of the Interior (DOI) released a series of updated climate policy Departmental Manuals (DM) on September 28, 2023. In particular, 604 DM 1, "Landscape-Level Management", outlines the department's policy, which also applies to its component Bureaus, including the BLM, to advance landscape-level approaches, including prioritizing landscapes for conservation. Furthermore, 523 DM 1, "Climate Policy", directs DOI to, among other actions, "…integrate climate change adaptation strategies into its policies, planning, programs, and operations, including, but not limited to, park, refuge, and public land management…"6 The manual further acknowledges the inherent uncertainty associated with climate change and directs DOI to utilize: (1) vulnerability assessments, (2) scenario planning, (3) adaptive management, and (4) other risk management or other decision-making approaches. Finally, as related to the Rock Springs RMP, the policy directs the inclusion of "…measurable goals and performance metrics in all management plans that address climate change adaptation, regularly assess and report on whether adaptive actions are achieving desired outcomes…"7 Pew recognizes that this guidance was not in place during most of the time that the Rock Springs RMP was being drafted, but appreciates that within the range of alternatives, the BLM has included conservation designations and management prescriptions that will contribute to climate resilience, protection of biodiversity, and wildlife connectivity. Protecting intact landscapes and rivers through LWCs, ACECs, WSAs, and Wild and Scenic Rivers can ensure these areas serve as climate refugia. Further, connectivity between intact landscapes must be maintained and enhanced. Additional recommendations around these allocations, designations, and connectivity are included in the relevant sections above. Finally, to track and understand changing conditions, a monitoring program is necessary. Tracking the impacts of climate change and how management is affecting landscapes, can inform BLM's approach to adaptive management. Recommendation: Pew encourages the BLM to adhere to these updated guidance manuals within its resource management planning process, including for the Rock Springs RMP. | See Section 1.4 Planning Criteria and Appendix E for a list of laws, regulations and policies that apply to the RMP. As future policies and rules are developed, the BLM will incorporate changes as appropriate. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13865-51 | Prohibitions on motorized travel and topsoil sale areas may inhibit the timely closure and reclamation of CCR impoundments or landfills and increase negative environmental impacts to public lands in the subject area. Raw materials for cover would potentially need to be sourced from areas outside the DEIS and trucked long distances to the site. The increase in truck traffic on established roads will negatively impact wildlife and air quality in the subject area. | A full range of alternatives regarding air quality, off-road vehicle travel, and rights-of-ways have been analyzed and impacts are disclosed from each alternative in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-56 | A. Analysis of air quality impacts is not compliant with NEPA. The Rock Springs draft EIS discussion and analysis of air quality impacts has substantial shortcomings and is non-compliant with the National Environmental Policy Act, the Clean Air Act (CAA), and the Federal Land Management Policy Act. In particular, BLM has not conducted any air quality modeling to determine what the impacts will be from activities authorized under the RMP, especially new oil and gas leasing and development. Nor does the draft EIS assess whether those air quality impacts will comply with National Ambient Air Quality Standards (NAAQSs) and other Clean Air Act requirements. | Modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no air quality impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air | #13899-57 | The draft EIS acknowledges that BLM management activities in the Rock Springs office will generate tens of thousands of tons of air pollution each year. It estimates the total annual emissions of seven different pollutants under each of the four draft EIS alternatives, and reports that estimate for three different time periods: year 1 of the | Air modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Quality (1000-1017) | | RMP, year 10, and year 20.119 For example, for ozone precursors, the draft EIS predicts that BLM-approved activities under Alternative B will emit nearly 34,000 tons per year (tpy) of volatile organic compounds (VOCs), and 14,000 tpy of Nitrogen Oxides (NOx), by year 20 of the RMP.120 VOC and NOx emissions under other draft EIS alternatives will be even greater.121 These emissions are "predicted to be predominantly attributable to . . . oil and gas development" authorized under the RMP.122 The draft EIS, however, never analyzes the reasonably foreseeable impacts of those emissions on ambient air quality. The draft EIS, for example, does not forecast how much ambient ozone levels will increase as a result of the 34,000 tpy of VOCs and 14,000 tpy of NOx BLM expects in year 20. Nor does the draft EIS determine whether RMP-related VOC and NOx emissions will prevent this region of Wyoming from complying with the ozone NAAQSs. This latter omission poses a particular concern because part of the planning area is already designated as a nonattainment area.123 And the draft EIS anticipates that "oil and gas development [activities] would increase in every year of the study period as additional wells come into production."124 | impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. BLM's emission estimates are developed to provide a conservative estimate of potential emissions based on resource allocations in each alternative. They do not represent a probable or likely emissions scenario based on proposed development. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-58 | Moreover, BLM acknowledges that the "Forest Service, National Park Service, and the U.S. Fish and Wildlife Service have [ ] expressed concerns regarding potential atmospheric deposition (i.e., acid rain) and visibility impacts within downwind PSD Class I and sensitive Class II areas under their administration throughout Wyoming."125 But the draft EIS does not evaluate how air pollution from BLM-authorized activities will degrade visibility and increase acid rain at the Fitzpatrick Wilderness Area to the north and the Mount Zirkel Wilderness Area to the south. Both of these are designated as Class I areas under the Clean Air Act and lie within 100 miles of the planning area.126 | Air modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-59 | All the draft EIS says about air quality impacts is that "BLM authorized oil and gas activities ... over the life of the plan have the potential to contribute to increased ambient concentrations of ozone," and "the potential to cause impacts related to visibility degradation and increased atmospheric deposition," with Alternative B likely causing smaller impacts than Alternatives A, C, and D.127 This level of generality does not satisfy NEPA because, as one court noted, it just "informs [BLM] and the public what they already know."128 Such a cursory statement could be made about any oil and gas proposal anywhere in the country. It does nothing to inform BLM and the public about the impacts of the proposed RMP. Courts have made clear that NEPA requires more than that.129 | Air modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-60 | Analyzing the foreseeable impacts to ambient ozone concentrations, visibility, and atmospheric deposition is not only feasible, but regularly done as part of preparing RMPs. In numerous other RMPs, BLM has conducted modeling to answer these questions.130 By contrast, "no air quality modeling has been conducted for this RMP"131. It is entirely feasible for the agency to have done modeling for the Rock Springs draft RMP as well. | Modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. BLM's emission estimates are developed to provide a conservative estimate of potential emissions based on resource allocations in each alternative. They do not represent a probable or likely emissions scenario based on proposed development. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-61 | Analysis of air quality impacts is not compliant with FLPMA or Clean Air Act BLM's treatment of air quality also does not satisfy FLPMA or the Clean Air Act. FLPMA requires that, in the "development and revision of land use plans, [BLM] shall . . . provide for compliance with applicable pollution control laws," including the ozone NAAQS.132 Likewise, FLPMA's implementing regulations provide that "each land use authorization shall contain terms and conditions which shall . . . require compliance with air . . . quality standards established pursuant to applicable Federal or State law."133 Indeed, Congress tasked BLM with the responsibility of managing public lands to protect the quality of "air and atmospheric" resources under FLPMA. | BLM's proposed management actions for Air Resources (pages 2-5-2-9) as well as the Air Quality Adaptive Management Strategy (Appendix Q) ensure that the BLM will provide for compliance with all applicable state and Federal air quality rules and regulations for any BLM authorized activities that occur in the planning area. The RMP does not authorize development to occur without subsequent site-specific NEPA analysis. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-62 | Under the Clean Air Act, federal agencies must not "engage in, support in any way or provide financial assistance for, license or permit, or approve, any activity which does not conform to a [state implementation plan (SIP) designed to ensure compliance with the National Ambient Air Quality Standards (NAAQS)]."135 An action conforms to a state implementation plan if it does not "cause or contribute to any new violation of any standard in any area; increase the frequency or severity of any existing violation of any standard in any area; or delay timely attainment of any standard or any required interim emission reductions or other milestones in any area."136 The draft EIS acknowledges these requirements.137 But BLM fails to demonstrate whether or how they will be achieved, or how projected future ozone formation from BLM-permitted oil and gas development under the RMP will impact the region's continued nonattainment with the ozone NAAQS. This does not satisfy FLPMA or the CAA. It also conflicts with NEPA's requirement to explain how the different alternatives "will or will not" comply with "other environmental laws and policies."138 | BLM's proposed management actions for Air Resources (pages 2-5-2-9) as well as the Air Quality Adaptive Management Strategy (Appendix Q) ensure that the BLM will provide for compliance with all applicable state and Federal air quality rules and regulations for any development that occurs in the planning area. The RMP does not authorize development to occur without subsequent site-specific NEPA analysis. Air quality modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-63 | The draft EIS states that it plans to implement an "air quality adaptive management strategy" in "lieu of emissions modeling."139 That does not excuse the agency's obligations under NEPA, FLPMA and the CAA. BLM's adoption of an RMP represents a set of critical decisions on how to manage the planning area, and NEPA requires the agency to take a hard look at the impacts of those decisions before making them.140 Moreover, the strategy does not commit to any modeling or analysis that would substitute for an RMP analysis of air quality impacts. | Modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. BLM's emission estimates are developed to provide a conservative estimate of potential emissions based on resource allocations |

|---|---|---|---|
| | | | in each alternative. They do not represent a probable or likely emissions scenario based on proposed development. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-64 | These regional analyses do not appear to isolate BLM's contribution to regional ozone and other air quality impacts, and thus cannot substitute for an RMP analysis.142 | Modeling is not a requirement for RMPs as they are high level planning documents that do not authorize new development but only establish areas that will be open to development. There are no activities that are authorized to occur as a result of this RMP, therefore no impacts are occurring as a result of this RMP revision. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. BLM's emission estimates are developed to provide a conservative estimate of potential emissions based on resource allocations in each alternative. They do not represent a probable or likely emissions scenario based on proposed development. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-65 | The adaptive management strategy also provides no mandate that implementation of the RMP will ensure compliance with the NAAQS and other air quality laws. The strategy is vaguely worded and rife with generalities, lacking any hard triggers for specific actions. BLM also states that the adaptive management strategy is not itself part of the RMP decision document143 and thus appears not to be mandatory under FLPMA. As such, the adaptive management strategy may not even be fully implemented. | The Adaptive Management Strategy discusses the framework for how the BLM will analyze and mitigate air resource impacts at the time development is proposed. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-66 | CLIMATE CHANGE A. Addressing climate impacts from greenhouse gas emissions We thank BLM for discussing in the draft EIS how greenhouse gas (GHG) emissions associated with coal, oil shale, and oil and gas leasing and development will substantially impact the planning area. Given the ever-increasing body of scientific knowledge of the impacts that a changing climate will have on human health, stress on community infrastructure, and critical ecosystem services, it is imperative that BLM move swiftly to reduce GHG emissions stemming from fossil fuel development and production on federal public lands. We commend BLM on the management actions in Alternative B that would have the effect of limiting GHG emissions - specifically, closing 2,186,218 acres to oil and gas leasing, 3,535,546 acres to coal leasing, and 2,122,282 acres to oil shale leasing development.144 This would have the effect, according to our analysis of BLM's GHG emissions estimates, of potentially reducing GHG emissions by around 41 percent across 20 years.145 We recommend that BLM consider additional measures to further limit mineral development, thereby further reducing GHG emissions and resulting climate impacts, pursuant to its authority under FLPMA. | The BLM has proposed a full range of alternatives for managing mineral development. Impacts from each alternative can be found in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-67 | New information over the last five years about the impacts of GHG emissions on climate, along with the Biden Administration's climate goals and commitments, are clear reasons to support management actions proposed in the draft RMP's Alternative B to limit the leasing and development of fossil fuels. Several successful challenges to RMPs for failing to properly consider climate impacts in the context of multiple NEPA analyses not only illustrate the importance of evaluating climate in NEPA documents, but also point to the importance of incorporating management direction and goals regarding GHG emissions directly into the RMP itself. | The BLM has proposed a full range of alternatives for managing mineral development. Impacts from each alternative can be found in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-68 | NEPA thus requires full and proper analysis of GHG emissions and the resulting climate change impacts.157 Combined with BLM's authority and conservation mandates under FLPMA, the agency can and should, in the Rock Springs RMP and EIS, address the contributions of oil and gas and coal leasing to climate change and the impacts adversely affecting the resource area. We therefore appreciate that BLM has conducted climate analysis in the draft EIS and support Alternative B's management decisions for oil, gas, and coal allocations that would result in the greatest GHG emissions reduction. | The BLM has proposed a full range of alternatives for managing mineral development. Impacts from each alternative can be found in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-69 | It is evident from the estimated SC-GHG emissions that Alternative B is the best choice, among the alternatives analyzed, to reduce GHG emissions and their contributions to climate impacts in the planning area. For this reason, among others discussed in these comments, we urge BLM to incorporate Alternative B's management actions for oil, gas, and coal leasing into the final RMP. | The BLM has proposed a full range of alternatives for managing mineral development. Impacts from each alternative can be found in Chapter 4. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-70 | BLM should adopt the Air Quality Adaptive Management Strategy and consider implementing an emissions management framework in the Rock Springs RMP. BLM is considering applying a Wyoming-specific Air Quality Adaptive Management Strategy (AQAMS).164 We agree with BLM's plan to regularly update the AQAMS with relevant scientific information so that project impacts are minimized. By doing so, BLM would be tracking and monitoring emissions to ensure that its decisions are fully informed and adapt to changing conditions. However, we are concerned that BLM appears to be waiting to conduct emissions modeling, stating that "not all of the data for these projects are known,"165 rather than providing a full accounting of projected future air quality emissions now in the EIS. Moreover, we urge BLM to incorporate an estimated downstream GHG monitoring and reporting mechanism into the AQAMS. | The Adaptive Management Strategy discusses the framework for how the BLM will analyze and mitigate air resource impacts at the time development is proposed. Air quality impacts are assessed at the time development is proposed and are dependent on a number of factors including timing, location, extent and type of development, and the magnitude of emissions from the project. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-71 | Additionally, to align with climate science, account for and mitigate GHG emissions and climate impacts to the resources of the management area, and help meet the Biden Administration's climate commitments, we recommend that BLM consider implementing an emissions management framework.166 Of primary importance is reducing GHG emissions stemming from future fossil energy production in the planning area. This framework should include achieving[...] net zero GHG emissions167 from fossil fuels in the planning area by 2030 and a continuing decline curve of fossil fuel development and production thereafter until zero emissions are realized. The | Please see Section 1.4 for the Planning Criteria for the RMP and Appendix E for a list of laws, regulations and policies that apply. An emissions management framework is outside the scope of this RMP. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | emissions management framework would entail calculating, tracking, and publicly disclosing lifecycle emissions of development and production (and potential development and production), which BLM could then use to guide land management and fossil fuel-related decisions. | |
| 801 - Physical Resources-Air Quality (1000-1017) | #13899-72 | BLM should incorporate in the EIS minimization tactics that include prioritizing development with minimal impact on natural systems, implementing technology-based measures to capture leaking emissions, managing and mitigating downstream GHG emissions, and enabling the option for implementing additional restrictions on fossil fuel development and production over time. | The BLM Air Quality Adaptive Management Strategy and Air Resource Management Actions will allow the BLM to apply additional mitigation measures or pollutant minimization practices if a projects air quality impacts result in air quality violations or unacceptable impacts to AQRVs. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13925-5 | management actions in Alternative B that purport to regulate air and water quality unlawfully attempt to preempt state programs. BLM lacks any regulatory authority over air or water quality. Congress delegated air and water quality authority to the Environmental Protection Agency, which in turn delegated it to the State of Wyoming or Wyoming Department of Enviornmental Quality (WDEQ). BLM can neither develop new standards or enforce the air or water quality rules. The draft RMP also fails to recognize WDEQ best management practices for nonpoint source water pollution. | The BLM does not regulate any emission sources as that is the purview of the WDEQ-AQD. The BLM will disclose through the NEPA process whether BLM-authorized activities have the potential to contribute to air quality impacts. The BLM does not develop new standards or conduct enforcement of air quality rules and regulations. Any additional mitigation measures that the BLM may require for resource protection are included as stipulations, conditions of approval or requirements in a decision related to the NEPA for a proposed project. Such mitigation is not in conflict with the regulatory authority of WDEQ. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13951-14 | Page 2-7; Physical Resources #1010 " Implement mitigation measures within the BLM's authority to reduce air quality impacts from BLM actions and work cooperatively with industry and other permittees to adopt additional measures to minimize air quality impacts from BLM management actions." -Alternative A is the best option because It is unclear under Alterative B whether the "implementation of mitigation measures within BLM's authority to reduce air quality impacts" would be done in coordination with WDEQ. Alterative A is preferred because it is a continuation of existing practices which includes coordination with the WDEQ - ensuring preservation of state primacy over air quality. | A full range of alternatives for air quality management has been proposed in the EIS. See Chapter 2 for details of the alternatives and Chapter 4 for the impacts of each alternative. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13951-15 | Page 2-9; Physical Resources #1017 "Require dust abatement measures for all BLM authorized activities and coordinate with local and state agencies to control dust on roads using BMPs (Appendix A)." -Alternative A is preferred because the language in Alterative B stating the BLM will "[r]equire dust abatement measures for all BLM authorized actives" is unclear and too broad of a statement. Alternative A is preferred because it includes a statement on coordination with local and state agencies and specificity that dust abatement will occur on unimproved dirt roads. | A full range of alternatives for air quality management has been proposed in the EIS. See Chapter 2 for details of the alternatives and Chapter 4 for the impacts of each alternative. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13951-16 | Page 2-12; Physical Resources #1114 "Implement practices, determined on a case-by-case basis, as needed to protect groundwater and prevent soil contamination. Prohibit pits that store liquids. Use closed-loop drilling systems for oil and gas operations where groundwater is within 50 feet of the surface. Dispose of hazardous materials (see Glossary) at Department of Environmental Quality (DEQ) or U.S. Environmental Protection Agency (EPA) approved disposal facilities." -Alternative B is not preferred because it includes additional requirements and restrictions beyond Appendix A that have not been justified by the BLM. Alternative D is preferred because of its case-by-case approach and its link to Appendix A (Project Design Features and Best Management Practices). | A full range of alternatives for groundwater management has been proposed in the EIS. See Chapter 2 for details of the alternatives and Chapter 4 for the impacts of each alternative. |
| 801 - Physical Resources-Air Quality (1000-1017) | #13953-14 | In exchange for this substantial loss of revenue and employment, the BLM estimates some reductions in environmental impacts associated with oil and gas development. In particular, the BLM focuses on a reduction in emissions for four criteria pollutants, including greenhouse gases ("GHG"). Table 4-3.1 shows direct federal oil and gas well development and GHG emissions across the alternatives. Alternative B is argued to align with the Department of the Interior's climate change priorities most closely. However, climate change is asserted to be global phenomenon, described as a long-term shift in global climate patterns. While the literature cited on climate change by the BLM in the Draft RMP is over a decade old and evidently no longer accessible,4 the basic tenants are that climate change is driven by "global anthropogenic CO2 emissions."5 Once emitted and mixed in the atmosphere, it is impossible to distinguish who emitted the GHGs, not to mention where the carbon was originally produced. We also know that oil and gas are widely traded international commodities that are produced by numerous countries around the globe. As commodities, the price of the oil in the market depends on global supply and global demand. Supply and demand ebb and flow, but the global projections for oil and gas consumption continue to rise as the middle class in the developing world expands. Therefore, unless the BLM can illustrate how reducing oil and gas development inside the RMP area will reduce the global demand for oil and gas, it is improbable that any real or meaningful reductions in GHG emissions or climate change impacts will result from more restrictive management. If oil and gas cannot be produced in places like the RMP area, the continued demand will dictate its production somewhere else. Based on the Environmental Performance Index produced by Yale University, the Institute for Energy Research reported that the average barrel of non-U.S. produced oil is produced in a country with an environmental score that 23.6% lower than that of the U.S. Therefore, producing oil and gas in the United States, and specifically in Wyoming under our current regulatory frameworks, is likely to have a net positive environmental impact for GHG emissions and broadly. Although this administration is unabashedly opposed to fossil fuels produced in the United States, purposefully stopping production on our public lands is cutting off our nose to spite our face. A supplemental EIS should be completed to evaluate the true environmental impact of reducing oil and gas development in the Rock Spring RMP area. | An analysis determining the global demand for oil and gas development is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. |

|---|---|---|---|
| 801 - Physical Resources-Air Quality (1000-1017) | #14023-9 | The Rock Springs District RMP should be driven by a conservation agenda, one that will conserve the best of the unique landscapes, habitats, and native biodiversity it sustains. The RMP should reflect the District's place in the larger Wyoming landscape; its critical role in providing winter habitat for wildlife that summers tens, if not hundreds of miles to the north. It should also protect, and where and whenever possible enhance habitats for resident wildlife and native plants. It should evaluate, consider, and mitigate how energy development impacts air- and watersheds far removed from the district. It should recognize, respect, and protect the history and locations once utilized by our indigenous ancestors. | A full range of alternatives for all resource management has been proposed in the EIS. See Chapter 2 for details of the alternatives and Chapter 4 for the impacts of each alternative. |
| 801 - Physical Resources-Air Quality (1000-1017) | #14032-2 | Air Quality Related Values (AQRVs) The Draft EIS includes a discussion of existing air quality that does not include meaningful metrics to characterize air quality and AQRVs in and near the planning area such as background concentrations or trends for AQRVs. Establishing the existing environment for air quality and AQRVs provides the baseline from which changes in air quality resulting from the alternatives can be judged. Therefore, we recommend characterizing the existing air quality baseline for criteria pollutants and AQRVs, including visibility and resources sensitive to deposition. For criteria pollutants, we recommend coordinating with the Wyoming Department of Environmental Quality (WYDEQ) to establish representative design values (background pollutant concentrations) for criteria pollutants based on the most recent, relevant monitoring data. Alternatively, data are available from the EPA at our design values webpage.1 Monitoring locations and data can also be accessed by the public through EPA's outdoor air monitor webpage,2 as well as through the EPA's Air Quality System (AQS) for AQS users | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #14032-3 | It is unclear from review of the Draft RMP/EIS whether issues identified during the 2017 review have been resolved and why data for emission estimates have not been updated beyond the 2012 timeframe. We recommend providing the detailed emission inventory as an appendix to the Final RMP/EIS since this is the basis for the analysis and estimates cannot be verified in the current summary form. In addition, we recommend updating the emission estimates using the latest emission estimation methods and for years that more closely align to the 20-year planning period for which the RMP would apply (2023-2043). When calculating emissions from oil and gas development and other sources of air pollutants, we recommend considering the impact of regulations that have been promulgated since 2012.7,8 We also recommend using the latest version of the National Emission Inventory (NEI) | The summary of the Analysis of the Management Situation (AMS) was prepared in accordance with 43 CFR 1610 and was completed in August 2013. The AMS is accurate with the analyses of the inventory, and for the basis of formulating reasonable alternatives as described in 43 CFR 1610.4-4. Although some data has been updated in response to changing conditions (ex. air quality emissions and reasonably foreseeable development), most of the baseline data gathered from 2013 has been kept static for comparative analysis purposes. Even if minor conditions have changed for an individual resource in the intervening years since the AMS, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives |
| 801 - Physical Resources-Air Quality (1000-1017) | #14032-4 | The Draft EIS does note that, "the magnitude of estimated emissions of several pollutants for [the fluid mineral development and solid mineral development] category is considerable. Emissions of PM10, VOCs, and NOX from this category have the highest potential to impact air quality under each of the alternatives. These impacts could include increased ambient concentrations of NOX and increased ozone formation in summer and winter." (Draft RMP/EIS p. 4-11). Further the Draft RMP/EIS notes that, "Predicted NOX, PM10, and PM2.5 emissions from oil and gas development under all alternatives could result in degraded visibility and atmospheric deposition." (Draft RMP/EIS p. 4-11). Draft RMP/EIS page 4-6 also identifies the potential for increased ozone in the RSFO and Upper Green River Ozone Nonattainment area as well as decreased visibility and increased atmospheric deposition at Class I areas. However, the magnitude of these potential impacts is not estimated for the alternatives. It is unclear why the BLM's Western United States photochemical grid modeling platform was not used to inform this analysis. We recommend that the Final EIS include a summary of the regional modeling study and model performance. We recommend comparing modeled emissions to those estimated for the alternatives and anticipated impacts under the alternatives as they relate to modeled impacts. This approach would better inform what impacts could be expected due to sources of pollution in the RSFO. We recommend that the Final RMP/EIS include protections such that it would be reasonable to conclude that development allowed under the alternatives would not result in emissions within the Upper Green River Ozone Nonattainment area that would cause or contribute to any new violation of the ozone standard, interfere with the provisions in the applicable State Implementation Plan (SIP), increase the frequency or severity of any existing violation of the ozone standard, or delay timely attainment of the standard. | Air quality impacts are evaluated at the implementation stage, when an actual development is proposed so the analysis is representative of the time and scale of the proposed development and specific mitigations can be applied if unacceptable impacts may result from the proposed activity. The BLM is bound by the Clean Air Act General Conformity regulations for any BLM-authorized activities occurring in the UGRB ozone nonattainment area and can not authorize activities that would cause or contribute to any new violation of the ozone standard, interfere with the provisions in the applicable State Implementation Plan (SIP), increase the frequency or severity of any existing violation of the ozone standard, or delay timely attainment of the standard. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #4026-1 | Chapter 3.2 Geology. The document lacks discussion of Surficial Geology, specifically, the extensive sand dune fields of the Killpecker Sand Dunes complex. This dune field is believed to have existed since at least the Pleistocene, approximately 13,000 years BP (Mayer and Mahan, 2017). These dunes stretch across a good portion of the district and call for specific management efforts to address their unique geologic, hydrologic, biotic, and cultural attributes. There is also no Chapter 4 (Environmental Consequences) discussion of surficial geology (sand dunes). More discussion on the significance of the Killpecker Dunes should also be added and incorporated into appropriate Chapter 4 sections of this document as presented in Comments 11 and 12. | A range of alternatives designed to address these unique geologic, hydrologic, biotic and cultural attributes are found in MA # 1100 - 1116 . MA# 1510, 2218, 5105, 5106, 5122-5127, 5402, 5403, 7446-7515, 7548-7554 . Geology is discussed in Section 3.2. Impacts to these resources are described throughout Chapter 4. Specifically 4.6, 4.7, 4.8, 4.15, 4.17. Additional information is included in the Analysis of Management Situation and the Mineral Potential Report. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #4026-11 | Chapter 4.(new) Surficial Geologic Resources, Assumptions. I recommend a new section be placed in Chapter 4 concerning assumptions made for surficial geologic resources. The wording for the first new assumption might be: "The Killpecker Sand Dunes complex is an erosionally-fragile, surficial geologic feature possessing unique hydrologic, vegetative, biotic, cultural, recreational, and scenic resources." The wording for a second new assumption in this chapter might be: "The percentage of dune field presently stabilized with native vegetation will likely decrease with ongoing climate change and future surface-disturbing activities. | A range of alternatives designed to address these unique geologic, hydrologic, biotic and cultural attributes are found in MA # 1100 - 1116 . MA# 1510, 2218, 5105, 5106, 5122-5127, 5402, 5403, 7446-7515, 7548-7554 . Geology is discussed in Section 3.2. Impacts to these resources are described throughout Chapter 4. Specifically 4.6, 4.7, 4.8, 4.15, 4.17. Additional information is included in the Analysis of Management Situation and the Mineral Potential Report. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #7196-2 | I strongly believe that uncommon paleontological and geologic resources should be given the maximum protection in the final plan. The objective should be to eventually withdraw these parcels from mineral exploration or development. In the meantime they should be strongly protected with NSO stipulations on existing leases and ROW exclusions. Habitat damage can often be mitigated or restored, but special geologic features are non-renewable and damage is completely irrevocable, lost to the public and to science. | Management actions for all four alternatives are identified for geologic resources and can be found in the DEIS from management action 1100-1116.<br>Paleontological resources are protected under the Paleontological Resources Preservation Act of 2009 |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #9853-2 | Soil and Geologic Resources (Pages 2-9 through 2-13) Extraction of paleontological resources generally involves some level of ground-disturbing activities, but following an excavation, it is typical for the site to be restored and for any disturbance to be mitigated. Therefore, SVP prefers management alternatives that allow for some temporary soil disturbance and/or make exceptions for scientific research. Below are SVP's comments and preferences: * Because paleontological resources may occur in different settings, SVP prefers Alternative A for MA#s 1107 and 1108 (Page 2-10) where soil disturbance is avoided but not prohibited, allowing flexibility to conduct carefully managed surface disturbance activities, such as paleontological excavations. For example, important fossil localities may be located in areas with greater than 25% slopes; therefore, Alternative B which prohibits surface disturbances where slopes are greater than 25% is not preferred by SVP. * While SVP supports the requirement for a soil health and restoration plan, discoveries of paleontological resources generally take place where erosion of rocks takes place; therefore, for MA# 1112 (Page 2-11), Alternative C is adequate from a purely paleontological standpoint. * For all other MA#s with different alternatives, SVP is fine with Alternative B preferred by BLM. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | Management actions for all four alternatives are identified for geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-30 | 1106, 1107, 1108 Alterative A from management action 1107 with amended/ additional text Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site- specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site- specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas, as needed. To achieve consistency across jurisdictions, particularly in the checkerboard, the task force suggests the BLM use the text from Management action 1107 in the final RMP with the additional text included in red for Management action 1106, 1107 and 1108: Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site-specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site- specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas, as needed. For mining activities with a mine permit issued by WDEQ-LQD, follow the soil handling and reclamation plan for hard to reclaim soils as outlined in the state mine permit. | Chapter 4.23.5 analyzes erosion control plans under Alternative B.<br>MA#1111 identifies managing soils in partnership with private, local, state, tribal and federal programs. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-31 | 1109 Alternative D with amended/ additional text Apply, on a case-by-case basis, photo-point monitoring of channel crossings, culverts, borrow ditch outlets, and surface disturbance. The task force requests inclusion of additional language to Alternative D, drawn from Alternative B. This inclusion ensures that photo-point monitoring is applied only on disturbances greater than ½ an acre, and only on a case-by-case basis. Alterative D with revised text is preferred because Alternative B requires the broad application of photo-point monitoring regardless of nuanced circumstances. Alterative D, with revised text, created greater flexibility for the BLM as to when to require photo-point monitoring. Revised management action with additional language in red: For surface disturbances greater than ½ acre, apply, on a case-by-case basis, photo-point monitoring of channel crossings, culverts, borrow ditch outlets, and surface disturbance. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-32 | 1114 Alternative D Implement practices, on a case-by-case basis, as needed to protect groundwater, vulnerable aquifers, and prevent soil contamination (Appendix A). Alternative D is preferred because of its case-by-case approach and its link to Appendix A (Project Design Features and Best Management Practices). Alternative B is not preferred because it includes additional requirements/restrictions beyond Appendix A that have not been justified by the BLM. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-33 | 1115 Alternative A No similar action Alterative A is preferred over Alternative D because the language in Alternative D is already a requirement and doesn't need to be restated in the RMP (and isn't included in Alternatives A, B, and C). | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-34 | 1116 Alternative A The natural values of Boars Tusk, Pilot Butte, and Emmons Cone would be protected. Surface occupancy and surface disturbing activities are prohibited in these areas unless such activity would enhance management of these geologic features. Interpretive facilities would be allowed. The BLM owns the surface, but not the mineral estate. Alterative A was selected because it is a continuation of current practice, and the task force did not see a need to adjust the current management regime for these areas. | Management actions for all four alternatives are identified for each individually proposed ACEC and can be found in the DEIS from management action 7400-7570. |

|---|---|---|---|
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13210-117 | 1113 Alternative D Reclaim disturbed areas in compliance with BLM Wyoming and High Desert District Reclamation Plan (Appendix I), and other current guidance. Require that surface-disturbing activities minimize the surface disturbance footprint to the maximum extent possible to limit the areas requiring reclamation. Limit disturbance of desirable vegetative communities established during interim reclamation when implementing final reclamation. This supports agreement in principle #2 by protecting quality wildlife habitat to support healthy and abundant wildlife populations. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13353-3 | MA 1109 We request inclusion of additional language to Alternative D, drawn from Alternative B. This inclusion ensures that photo-point monitoring is applied only on disturbances greater than ½ an acre, and only on a case-by-case basis. Alterative D, with revised text, is preferred because Alternative B requires the broad application of photo-point monitoring regardless of nuanced circumstances. Alterative D, with revised text, created greater flexibility for the BLM as to when to require photo-point monitoring. Revised management action with additional language would read: "For surface disturbances greater than ½ acre, apply, on a case-by-case basis, photo-point monitoring of channel crossings, culverts, borrow ditch outlets, and surface disturbance." | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13353-4 | The BLM preferred Alternative B emphasizes the use of natural processes for forestry management and specifcally prohibits fuel reduction operations on slopes steeper than 25%. Page 4-126 of the Draft RMP/DEIS states, "Limiting logging operations on slopes steeper than 25% (compared to 45%, under Alternative A) would reduce lands where commercial harvests could be conducted, thereby increasing fuel loading that support high-intensity fires." However, the Draft RMP/DEIS does not adequately account for the impacts to soils from the high intensity fires that will result from prohibiting heavy equipment and increasing fuel loading on slopes greater than 25%. Fires that consume large quantities of surface organic matter reduce the moisture- holding capacity and productivity of the soils. Post-fire surface runoff causes increased water and wind erosion as a result of these physical soil changes. Factors controlling post-wildfire erosion differ from site to site. Therefore, a one-size-fits-all management action to prohibit heavy equipment and fuels reduction on slopes steeper than 25% will exacerbate the hazardous fuels growth, increase fire intensity on the slopes, and the result in additional post-wildfire erosion to the soil. | Impacts to soil health and character from wildfires were analyzed in chapter 4.10.<br>MA#4014 identifies instances when logging operations could occur. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13364-3 | 4.4.1. asserts that "For the purposes of this analysis, wind and water erosion are the primary mechanisms for loss of soil productivity," and "removal of vegetation or biological soil crusts increases soil susceptibility to erosion via wind and water by decreasing soil strength, reducing infiltration, increasing runoff, altering soil structure, and reducing protection of the surface from raindrop impact." The RMP does not provide control data for its primary drivers of erosion, that is, the rate and impact of naturally occurring wind and water erosion on surface undisturbed by unnatural activities, which considerably undermines the credibility of this assumption. Additionally, the RMP does not account for the ways in which Mitigation measures counter and in many cases, largely curtail, erosion, which is fundamental to both the short term and long-term analysis. Lack of data notwithstanding, the RMP posits that, "less likelihood for surface disturbing activities in these areas, [results in] greater protection of soil resources." An unsound conclusion given that the RMP failed to establish a correlation through standard scientific methods, much less a causal relationship, between Short-term Surface Disturbances and erosion resulting in loss of soil productivity. | Impacts to soil health and character from wildfires were analyzed in chapter 4.10.<br>Impacts to soil resources are identified in Section 4.4 for each alternative. Page ES-1 addresses baseline data which is detailed in the Analysis of Management Situation. Soil Resources are covered in Section 2.1.3 |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-12 | MA#1104. Alternative B and D. 2-9 How does the BLM propose that facilities minimize salt and sediment loading to water resources due to natural causes? For the trona facilities, the Wyoming Department of Environmental Quality Land Quality Division and Water Quality Divisions already review and regulate salt and sediment loading to water resources. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Jurisdiction of water quality can be found in section 4.5.1, and its analysis of environmental impacts follows.<br>Appendix A identifies Best Management Practices for proposed projects. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-13 | MA#1106. Alternative B, C, and D. 2-9, 2- 10 How long does the BLM anticipate that the coordination with NRCS will take for facilities to complete the proposed Order 2 (Alternative B), Order 3 (Alternative C), or the database (Alternative D) in order to foresee potential business impacts of these required soil surveys, sampling, evaluations, and classifications for each project? Please analyze in detail and disclose to the public your analysis of the timing impacts and potential environmental impacts from the change in agency position. | Impacts on soil resources were analyzed in chapter 4.4. Socioeconomic impacts can be found in Section 4.22. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-14 | MA#1103. Alternative B. 2-9 How does the BLM envision the inventory of public lands be conducted? Who is leading the effort? Who is paying for the effort? What methods will be used to ensure consistent data is being collected? Please analyze in detail and disclose to the public the process it will use to inventory the public lands. | Impacts on soil resources were analyzed in chapter 4.4. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-15 | MA#1107. Alternative B. 2-10 Why is the BLM prohibiting solid mineral leasing in areas where soils have any of the following: wind erodibility index greater than 100, saline, sodic, saline-sodic, 2:1 clays, sand dunes, slopes greater than 25%, slumps and creeps and/or rutting, and areas that are difficult to reclaim? Most of the RMP area exhibits at least one of these characteristics, as the area is a high desert. Specifically closing areas to solid mineral leasing when several leasable minerals, including trona, are mostly subsurface facilities with little to no surface impacts that could affect the soils. Please analyze in detail and disclose to the public the scientific basis that might | Impacts on soil resources were analyzed in chapter 4.4. |

|---|---|---|---|
| | | logically connect underground activities with surface impacts, the agency's justification for the significant change in position, and what basis exists to override the Secretary's obligations to maximize the economic recovery of the federal mineral resources. | |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-16 | MA#1107. Alternative D. 2-10 What does the BLM foresee an approved mitigation plan to look like so facilities can analyze potential foreseeable business impacts from MA# 1107. Currently the Wyoming Department of Environmental Quality Water Quality Division has been delegated the authority to oversee the implementation of the NPDES program in Wyoming. What additional requirements is the BLM suggesting that they have the authority to require facilities do? Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Impacts on soil resources were analyzed in chapter 4.4.<br>Jurisdiction of water quality can be found in section 4.5.1, and its analysis of environmental impacts follows.<br>Appendix A identifies Best Management Practices for proposed projects. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-17 | MA#1109. Alternative B. 2-11 What methodology does the BLM foresee regarding photo point monitoring so the facilities can anticipate potential business impacts stemming from this requirement? | The specific methodology of photo point monitoring are beyond the scope of this EIS and Resource Management Plan. Such details would occur at the implementation level. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-18 | MA#1111. Alternative B. 2-11 Alternative B states that "all methods" will be used to protect soils. "All methods" are never applicable to protect soils. Exceptions should be allowed under Alternative B. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Impacts on soil resources were analyzed in chapter 4.4. BMPs are identified in Appendix A. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-19 | MA#1112. Alternative B. 2-11 How does the BLM propose that water quality would be enhanced by this management action? The majority of the RMP area is a high desert ecosystem which often struggles to maintain ground cover. More detailed information should be released on this management action so facilities can foresee potential impacts to the business. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | Impacts on soil resources were analyzed in chapter 4.4. BMPs are identified in Appendix A. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-20 | MA#1113. Alternative B. 2-11 Mines in the State of Wyoming are subject to regulation under the Wyoming Department of Environmental Quality Land Quality Division and must adhere to the approved reclamation plans within their individual permits to mine. How does the BLM anticipate mines handle complying with both the approved reclamation plans with the state and the BLM Wyoming Reclamation Policy? Will a memorandum of understanding be developed between DEQ LQD and BLM? Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. Wyoming DEQ is identified as a cooperating agency in Section 5.1.1. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-21 | MA#1115. Alternative D. 2-12 Mines in the State of Wyoming are subject to regulation under the Wyoming Department of Environmental Quality Land Quality Division and must adhere to the approved reclamation plans within their individual permits to mine. How does the BLM anticipate mines handle complying with both the approved reclamation plans with the state and the BLM Wyoming Reclamation Policy? Will a memorandum of understanding be developed between DEQ LQD and BLM? Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. Wyoming DEQ is identified as a cooperating agency in Section 5.1.1. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-22 | MA#1114. Alternative B. 2-12 Define "pit" within the RMP. Depending on the definition of "pit" there could be unforeseen business impacts on local industry. Sisecam recommends aligning with Wyoming State Engineer's Office definitions. | MA#1114 defines pits as storing liquids. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13542-58 | 4.4.3 Alternative B 4-22 Reclamation technologies for mined lands have been successfully implemented for many years that have enabled problematic soils to be reclaimed. New technologies are continually developed through research and field trials. We recommend that Alternative B be rejected as being too restrictive, particularly for underground mining. Alternative D should be accepted with revisions to assure appropriate reclamation techniques and monitoring on problem soils. This will be necessary in cases in which surface closures to facilities precludes production of leased and leasable trona. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13624-13 | The Draft RMP/EIS also fails to identify what areas within the RMP will be affected by this Management Action #1107 regarding soil erosion, nor why the management action is necessary. WDEQ requests BLM provide a map of the area affected by Management Action #1107 for public review. BLM should also acknowledge that WDEQ's Land Quality Division has extensive experience in reclamation of areas with poor soil and the regulation and enforcement of successful reclamation efforts through its mine permitting program. WDEQ's Land Quality Division has been regulating mining in Wyoming, including reclamation, since the passage of the Environmental Quality Act in 1973. WDEQ's Abandoned Mine Land Division also has experience in reclaiming legacy abandoned mines situated in areas with very poor soil quality. The Abandoned Mine Land Division state reclamation plan was approved by the Office of Surface Mining and Reclamation Enforcement on February 14, 1983. It is requested that BLM consult with WDEQ to revise Management Action 1107 so it reflects WDEQ's expertise, knowledge and experience in reclaiming environments within the State of Wyoming. Draft EIS, App'x H, p. 88. | Impacts on soil resources were analyzed in chapter 4.4. Wyoming DEQ is identified as a cooperating agency in Section 5.1.1. |

| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13624-60 | Ch. 2#2-5#1101#Across all alternatives: "Apply guidelines and appropriate measures to all management actions (including reclamation) affecting soil health to decrease erosion and sedimentation, to achieve and maintain stability, and to support the hydrologic cycle by providing for water capture, storage, and release."#When guidelines and measures are associated with facilities that require WYPDES stormwater permit coverage, the RMP should recognize that guidelines and appropriate measures developed and utilized should be consistent with the Wyoming Pollutant Discharge Elimination Systems (WYPDES) Program, Stormwater Permitting requirements, including the use of best management practices (BMPs) to prevent erosion and sedimentation. | Impacts of discharged pollutants in water are analyzed in chapter 4.5.<br>Jurisdiction of water quality can be found in section 4.5.1, and its analysis of environmental impacts follows.<br>Appendix A identifies Best Management Practices for proposed projects. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13702-4 | Management Action 1107 in Alternative B would prohibit surface disturbing activity on soils that are erosive or have chemical and physical properties that make them hard to reclaim. Such lands would be closed to mine development and solid mineral leasing. This is unacceptable because reclamation is already required and adhered to in areas such as these. This is also effectively a land withdrawal that has not been legally executed under the Mineral Leasing Act and Mining Law of 1872. Wyoming state agencies including Wyoming Department of Environmental Quality and Wyoming Oil and Gas Conservation Commission have primacy in the case of solid and fluid minerals. | Impacts on soil resources were analyzed in chapter 4.4.<br>Wyoming DEQ is identified as a cooperating agency in Section 5.1.1. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13751-78 | B. Table 2-1 MA #1107 Alternative B would prohibit surface disturbing activity on soils that are erosive or have chemical and physical properties that make them hard to reclaim. Such lands would be closed to mine development and solid mineral leasing. This is technologically unsound because reclamation and revegetation practices are well developed and demonstrated for problematic soils. This is also effectively a land withdrawal that has not been legally executed under the Mineral Leasing Act and Mining Law of 1872. Alternative D is somewhat better than Alternative B but should not be used to restrict surface development where mitigation and reclamation practices can be utilized. Wyoming state agencies including Wyoming Department of Environmental Quality and Wyoming Oil and Gas Conservation Commission have primacy in the case of solid and fluid minerals | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws.<br>Wyoming DEQ is identified as a cooperating agency in Section 5.1.1. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13751-108 | MA #1107 Alternative A Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site-specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas as needed. Industry position: Not acceptable. Reason: These should not be avoidance areas in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Alternative B Prohibit surface disturbing activities in areas where the soils have any of the following: * A wind erodibility index greater than 100 * Saline * Sodic * Saline-sodic * 2:1 clays * Sand dunes * Slopes greater than 25% * Slumps and creeps and/or rutting * Areas that are difficult to reclaim. Manage as: 1) no surface occupancy (NSO) for fluid minerals; 2) closed to mineral material sales/disposals; 3) closed to all solid mineral leasing. Industry position: Not acceptable. Reason: There should be no closures to trona leasing in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Alternative D Avoid surface disturbing activities in areas with limited reclamation potential, subject to adequate mitigation of impacts following BLM mitigation policies. The operator must submit an approved mitigation plan before proposed project will be approved. * Controlled Surface Use (CSU) for fluid minerals. Industry position: Not acceptable. Reason: Hard to reclaim soils should not be an avoidance area in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. | Impacts on soil resources were analyzed in chapter 4.4. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13754-15 | Soil and Geologic Current U.S. Department of Agriculture, Natural Resource Conservation Sciences mapping and ecological site descriptions are behind schedule, so pinning any requirements on this basis at this time is not recommended. Obtaining soil samples for every site, as proposed, is excessive, time- consuming and often unwarranted. Given Wyoming's short growing season, requiring soil samples to be collected and analyzed without specific justification before development could result in substantial delays. It would also be useful for the NRCS to define what characteristics they are looking for before sampling (e.g., soil texture, pH, electroconductivity, etc.). Some tests can be conducted in the field, while many other tests are required to be analyzed in a lab. The decision to conduct soil sampling should be left to the discretion of the project proponent as they are ultimately responsible for successful restoration. The BLM must also ask whether field office staff have sufficient training to make these determinations. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13754-16 | often times areas with "limited reclamation potential" are areas which are already devoid of wildlife and not highly productive. Limited reclamation potential should not be a reason to dissuade or remove productive activities from those lands. As science and practices associated with reclamation and ecological restoration are advancing to become more predictive, understanding limiting factors is likely to go a long way in assisting reclamation in challenging environments. It is important to consider the growing body of knowledge regarding the use of seed | Impacts on soil resources were analyzed in chapter 4.4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | mixes which are tailored to survive in limiting conditions (e.g., native halophytes in saline/sodic soils) and allowing development on lands with low reclamation potential. | |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-1 | MA# 1106, Alt B: "Coordinate with NRCS prior to approval of surface disturbance to analyze surface-disturbing activities... " (p. 2-9) Comment: The requirement to coordinate with NRCS prior to approval will undoubtedly create a bottleneck in all future project development and implementation. It is unlikely NRCS has the budget and staff to fulfill the BLM's expectations for full implementation. Alternative D is much broader and allows utilizing of existing soil data to incorporate and guide future decisions without needing to coordinate with NRCS for the unknown number of surface disturbing activities in the future. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-2 | MA#1107, Alt B: "Prohibit surface disturbing activities in areas where the soils have any of the following..." (p. 2-10) Comment: The DEIS fails to include any information regarding the number of acres the prohibition impacts. For example, "slopes greater than 25%," is completely unknown under this alternative and is not captured under Chapter 4. This further creates uncertainty for project proponents when only project level National Environmental Policy Act (NEPA) analysis is initiated and completed. We insist the BLM identify in the Final EIS and Record of Decision all areas and acres impacted by MA#1107. | Impacts on soil resources were analyzed in chapter 4.4. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-3 | MA#1109, Alt B: "Require photo point monitoring for all channel crossings and all surface disturbances greater than 1/2 acre." (p. 2-11) Comment: The DEIS fails to analyze the impacts on BLM staff or additional costs incurred by project proponents to monitor at the scale found under Alternative B. The expectation of MA#1109 is a significant impact in comparison to Alternative D, which is limited to a case-by-case basis. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. See SR-01 for Socioeconomic Resources. Section 4.22 discloses impacts to Socioeconomic Resources. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-4 | MA#1112, Alt B: "Require site-specific activity and implementation plans to reduce erosion." (p. 2-11) Comment: Again, the increased workload and financial burden to write these required plans is under analyzed under Alternative B, but also assumes you can enhance water quality for the areas beyond the site capability. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. Section 4.22 discloses impacts to Socioeconomic Resources. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-5 | * MA#1114, Alt B: "Prohibit pits that store liquids." (p. 2-12) Comment: This may be assumed to apply only to fluid mineral extraction, but WDA believes the inclusion of "liquids" has the potential for misapplication to any and all liquids, including small stock ponds storing water for livestock grazing, wildlife, or wild horses. We request BLM ensure stock water is excluded from this MA. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13784-44 | "Vegetation treatment actions would have similar impacts to soils as those discussed in Alternative A, but longer resting times for treated areas would likely provide greater protection to soils in these areas as vegetation and soil would have a longer timeframe to establish and stabilize." (p. 4-23) Comment: Alternative B assumes all vegetation treatment actions are alike and all have the same level of impact on soils. Mowing, spraying, prescribed fire, high intensity grazing are all treatment actions, with very different effects. Resting a treatment area for five growing seasons may in fact have a detrimental effect on the purpose and need of the project. BLM must incorporate vegetation objectives into the project and determine how best to reach those objectives. Resting for five growing seasons will not achieve this across all treatment actions. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116.<br>The statement "Requiring management plans to maintain, improve, or restore vegetation in all riparian areas within five years" refers to having a management plan. One of those methods could be resting an area, however, the DEIS does not prescribe that as a method. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13787-37 | MA #1107 PR-05 Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site-specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas as needed. Industry position: Not acceptable Reason: These should not be avoidance areas in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Prohibit surface disturbing activities in areas where the soils have any of the following: * A wind erodibility index greater than 100 * Saline * Sodic * Saline-sodic * 2:1 clays * Sand dunes * Slopes greater than 25% * Slumps and creeps and/or rutting * Areas that are difficult to reclaim. Manage as: 1) no surface occupancy (NSO) for fluid minerals; 2) closed to mineral material sales/disposals; 3) closed to all solid mineral leasing. Industry position: Not acceptable Reason: There should be no closures to trona leasing in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. No similar action. Avoid surface disturbing activities in areas with limited reclamation potential, subject to adequate mitigation of impacts following BLM mitigation policies. The operator must submit an approved mitigation plan before proposed project will be approved. * Controlled Surface Use (CSU) for fluid minerals. Industry position: Not acceptable Reason: Hard to reclaim soils should not be an avoidance area in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Soil handling and | A range of alternatives for MA#1107 exists. Impacts on soil resources were analyzed in chapter 4.4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | reclamation plans for hard to reclaim soils will be reviewed and approved in the mine permit by WDEQ- LQD. Resource: Physical Resources (PR) - Water Resources 1300 - 1325) | |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-2 | PacifiCorp has concerns with the stipulations under Alternative B for MA #1107. The list of soil characteristics included in this alternative fails to account for reclamation practices where such soil types have been successfully reclaimed. For example, BCC has successfully achieved reclamation under some of the conditions listed under Alternative B of MA #1107. The effects of the proposed soil management actions in Alternative B are not fully analyzed by the BLM in the DEIS, are ambiguous, and lack mapping, acreage calculations, and supporting figures that represent what effect this proposed action would have on current or future surface activities. | Impacts on soil resources were analyzed in chapter 4.4. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-3 | Closing areas to all solid mineral leasing or surface disturbance based on a rigid set of indices that are not clearly mapped, instead of evaluating projects on a case-bycase basis is unnecessarily restrictive, and creates difficulty in planning or siting new projects. In addition, there is no exception under Alternative B of MA #1107 for existing facilities (such as power lines or access routes) that require some occasional surface disturbance for operations and maintenance. Surface disturbance has historically been handled through cooperation between BLM specialists and PacifiCorp with the implementation of appropriate Best Management Practices (BMPs) (as Alternatives A, C, and D allow) and Alternative B could prevent PacifiCorp from fulfilling its requirements to maintain and operate its current system because there is no reasonable exception process. In addition to maintaining current infrastructure, the linear characteristics of power lines require that at some point, any new or proposed line or corridor would cross sites with soil disturbance that would fall under the list of soil types in Alternative B of MA #1107. Siting future lines and corridors includes weighing priorities of numerous resources, of which soil quality is one of many considerations. In some areas, powerlines may span soil types; however, there is no possible way to site a future line that could avoid all vulnerable soils, and under Alternative B, there is no reasonable way to determine options and implement BMPs to minimize those impacts. Under Alternative B, it would not be possible to plan future lines or corridors through the RSFO, including transmission infrastructure necessary to meet national energy goals and bring new renewables onto the grid. Alternatives A, C, and D specifically address soil concerns by including avoidance as an option, while requiring a mitigation plan (Alternative D) or erosion control plans (Alternatives A and C) where appropriate, and PacifiCorp recommends that the BLM adopt Alternative A, C, or D for MA #1107. Reclamation and mitigation plans can and are successful in difficult-to-reclaim areas, and should be allowed to continue. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-4 | B. MA #1109 Alternative B of MA #1109 requires photo point monitoring on all disturbances greater than ½ acre and at all channel crossings. This would place an increased burden on agencies and companies with questionable benefits for resources in some areas. If the use of photo point monitoring is to be included under MA #1109, PacifiCorp recommends that the BLM adopt Alternative D, where monitoring is applied on a case-by-case basis, as this would focus monitoring in areas of most benefit to better utilize resources. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-5 | C. MA #1112 The requirement of site-specific activity and implementation plans for all areas under Alternative B of MA#1112 has significant potential to create an increased burden that may not be sustainable for companies or the BLM. Alternative D requires implementation on a case-by-case basis, making the stipulation more sustainable and can be used to focus plan development in areas of greatest benefit while limiting delays in planning projects. PacifiCorp recommends that the BLM adopt Alternative D for MA #1112. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-6 | D. MA #1114 Alternative B of MA #1114 prohibits some practices that have been in place and are currently permitted activities such as waste disposal practices conducted in accordance with the Permit to Mine under the Wyoming Department of Environmental Quality (DEQ) Land Quality Division. Alternative B of MA #1114 would require changes in waste management practices related to the remediation and disposal of petroleum contaminated soils and water from sumps and containment structures, which could conflict with current permits, including the DEQ Land Quality Division Permit to Mine as associated stipulations and regulatory compliance requirements. This may necessitate alterations to various permits to maintain compliance, create the need for costly alternatives to current practices, and it is uncertain if other agencies would allow changes in their permit requirements. PacifiCorp recommends that the BLM adopt Alternative D or A under MA #1114 to maintain consistency with current permits and regulations of other agencies. | Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-50 | As mentioned above, Alternative B also conflicts with regulatory requirements associated with thermal generation and coal mining. PacifiCorp co-owns and operates the Jim Bridger Power Plant located approximately seven miles north of Point of Rocks in Sweetwater County, Wyoming, which is within the boundaries of the area addressed by the RMP and DEIS. The continued operation of the plant may be negatively impacted by the selection of Alternative B. Increased restrictions outlined in proposed Alternative B addressing soil and geologic resources, water resources, and hydrogeologic investigations could pose difficulty for the plant in complying with requirements of the Environmental Protection Agency's coal combustion residual (CCR) requirements. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 802 - Physical Resources-Soil and Geologic | #13865-51 | Prohibitions on motorized travel and topsoil sale areas may inhibit the timely closure and reclamation of CCR impoundments or landfills and increase negative environmental impacts to public lands in the subject area. Raw materials for cover would potentially need to be sourced from areas outside the DEIS and trucked long distances | Environmental impacts to air quality were analyzed in chapter 4.3.4. The impacts of roads and their use are addressed throughout section 4.7. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1100-1116) | | to the site. The increase in truck traffic on established roads will negatively impact wildlife and air quality in the subject area. | |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-55 | Installing new distribution lines underground or converting existing lines from overhead to underground may not be feasible in certain circumstances. In addition, burying power lines can result in greater ground disturbance during construction and repairs, longer outage periods for customers, increased cost, reduced reliability, and may not always be feasible from engineering and operations perspectives. Underground power lines would require continuous excavation through all habitat types. This is in contrast to overhead lines, which result in disturbance only at the structure locations and can span sensitive resources. Underground lines would also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporally over the life of the line, not just during initial construction. Ground disturbance during construction, repairs, and maintenance of underground lines can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. Even in conditions where undergrounding is technologically feasible, there would be financial impacts to PacifiCorp and its customers, as undergrounding distribution lines can cost $600,000 to $1.1 million per mile, and possibly more, compared to $400,000 average for overhead distribution lines. Undergrounding transmission lines is typically not technologically feasible in remote areas, and would include all of the above impacts associated with undergrounding distribution, but at a much greater scale. Likewise, undergrounding transmission lines is cost prohibitive. Because of these considerations, PacifiCorp requests that the BLM remove undergrounding as a design feature that may be required, and instead allow utilities to determine if undergrounding lines is appropriate for their facilities and customers on a case-by-case basis. | See Appendix A.1.4 for BMPs. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13865-58 | o "Place infrastructure in already disturbed locations where the habitat has not been fully restored." As stated previously, power line routes are sited based on many factors, including avoiding sensitive resources and considering costs to utility customers. Consequently, utilities may not always be able to site line routes in areas with existing disturbance. PacifiCorp recommends that the BLM modify this stipulation to include "where feasible, practicable, and cost effective." | See Appendix A.1.4 for BMPs. Management actions for all four alternatives are identified for soil and geologic resources and can be found in the DEIS from management action 1100-1116. |
| 802 - Physical Resources-Soil and Geologic Resources (1100-1116) | #13925-44 | It is assumed BLM conducted an in-depth analysis of the impacts of such management action. Lacking such analysis, and subsequent mapping, Alternative B should be retracted and the narratives of Alternative A or D be adopted as feasible management action. Given all the other management actions regarding restrictions on surface disturbance plus this management action, there is a question of where surface disturbing activities would be allowed? Speculation would be less than 30% of the land mass of the planning unit would be available for surface disturbance (which is also not defined). This management action is an attempt to deny development of mineral resources allowed for in the leasing authority for those mineral activities. This management action would also apply to range improvements for wildlife and livestock. The unintended consequences for such management action are unlimited, and could prevent desired agency actions. The logical management action is to authorize surface disturbance with mitigation to prevent negative impacts. Alternative B if implemented would eliminate the need for professional staff review and design of mitigation and review would just be a check list action to deny or approve proposed occupation with surface disturbance. | Appendix V identifies areas that would have restrictions. Maps identifying those areas are presented in the Map Section for Chapter 2. Chapter 4.4.3: states that all areas would require site specific plans. |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-2 | Chapter 3.4.1 Surface Water. The Draft EIS (Page 3-4) states: "There are no Class 1 waters within the planning area." This statement is not accurate. Appendix A of the State of Wyoming, Department of Environmental Quality, Water Quality Standards (WDEQ, 2018) lists Class 1 (outstanding resource) waters within the state. Element (xi) of that listing is: "The main stem of the Sweetwater River above the mouth of Alkali Creek." Alkali Creek is located in Fremont County slightly upstream of Sweetwater Station. Therefore, all of the main stem of the Sweetwater River in the district is a Class 1 water. The Draft EIS should be corrected to include this information, and provide discussion on the management of the watershed containing this Class 1, outstanding water of the state. | See updated text in 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-3 | The state's water quality standards also contain important requirements relating to tributaries to a Class 1 water. Section 7 of WDEQ/WQD's Chapter 1 states: "Nonpoint source discharges of pollution to Class 1 waters or tributaries of Class 1 waters shall be controlled by application of best management practices." Major tributaries to the Sweetwater River within the Rock Springs District include Lander Creek, East Sweetwater River, Little Sweetwater River, Pine Creek, Mill Creek, Gold Creek, Oregon Slough, and Harris Slough. There are also numerous unnamed perennial, intermittent, and ephemeral tributaries. | See updated text in 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-4 | Chapter 3.4.1 Surface Water. This section of the document does not provide any discussion on the unique surface water features associated with the Killpecker Sand Dunes complex. The snowdrift/shallow groundwater/interdunal pond system is quite unique (Tronstad et. al, 2017) and deserves some additional discussion in this chapter. | See updated text in 3.4.1 |
| 803 - Physical Resources-Water | #4026-5 | Chapter 3.4.2 Groundwater. The Draft EIS is rather deficient on the discussion of springs and groundwater dependent ecosystems (GDEs) in the district. The significance of springs is well presented in the following statement from the Spring Stewardship Institute: Emerging in many forms, springs are said to be windows into the Earth. They are also some of the most sensitive indicators of global climate change. Despite the relatively small | See Chapter 1.4 Planning Criteria for a list of resources evaluated for analysis. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1300-1325) | | area of springs within the landscape, these ecosystems support more than 20 percent of the endangered species in the United States, as well as a high number of rare groundwater-dependent species. In addition, they hold great cultural significance for many indigenous cultures throughout the southwestern United States and the world. Thus, they play a vital role in the health and longevity of our society as well as our planet. BLM Technical Reference 1737-17, A Guide to Managing, Restoring, and Conserving Springs in the Western United States, (Soda et. al, 2001) also recognizes the importance of springs as habitat for a disproportionally high number of wildlife and plant species as well as being vital to a number of unique plant and animal communities in the arid Western United States. These small, unique areas have also experienced significant impact at the hand of man. In this respect, Soda, et. al state: Unfortunately, as springs have been developed to enhance water availability for livestock, game animals …, and humans, the associated riparian and aquatic habitats frequently have been altered due to trampling, diversion, channelization, and impoundment. Springs have also been affected by excessive ground-water use, as well as by the invasion and establishment of nonnative plants and animals. As a result, the current physical and biological characteristics of many springs bear little resemblance to their historical, unaltered conditions. … Evidence showing the biological importance of springs continues to increase. … However, these small wetlands have received limited management priority. Under spring resource management goals, BLM Technical Reference 1737-17 goes on to state: The overall goal of spring management is to maintain the ecological structure and function of the spring habitat by stabilizing discharge and spring brook morphology. Springs should not be subjected to impacts that change functional characteristics of aquatic and riparian biota. The springs located within the high-elevation, cold desert region of the Rock Springs District possess all the attributes and impacts described above. In addition, springs in the Red Desert have also been impacted through trans-aquifer communication resulting from improperly abandoned drill holes. I feel the BLM needs to acknowledge the importance of springs and associated GDEs within this management document. The discussion of the various management alternatives also needs to look at this resource in the analyses | |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-12 | Chapter 4.5.1 Water Resources, Assumptions. Because the analysis area does contain a Class 1, outstanding resource water, I feel the BLM should add an additional assumption in this section. This assumption might be worded as: "Management actions within the Sweetwater River watershed, including tributaries, will involve the full use of Best Management Practices to prevent nonpoint source pollution degradation to this Class 1, outstanding resource water." | The listed assumptions were used in the EIS analysis. See Chapter 1.4 Planning Criteria for a list of resources evaluated for analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-13 | Chapter 4.5.1 Water Resources, Assumptions. I recommend the BLM also include an additional assumption concerning springs in this chapter of the document. This wording could be: "Springs constitute a vital water source in the arid, high desert region of Wyoming. These springs provide important habitat for many species of wildlife and plants. Impacts resulting from spring development, unrestricted grazing, and groundwater use can alter the physical and biological characteristics so that many springs bear little resemblance to their historical, unaltered conditions." | The listed assumptions were used in the EIS analysis. See Chapter 1.4 Planning Criteria for a list of resources evaluated for analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-14 | Chapter 4.5.3 Water Resources, Alternative B. Additional wording should be added on how this alternative protects the Class 1 status of the Sweetwater River. | See appropriate updates to Chapter 4 Alt B analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #4026-15 | Chapter 4.5.3 Water Resources, Alternative B. I recommend additional wording be added on how this alternative best protects springs and their associated groundwater dependent ecosystems (GDEs). As no detailed spring assessment inventory exists for the district, a cursory review of U.S.G.S. topographic maps suggests a large percentage of the mapped springs in the Rock Springs District occur in the Jack Morrow Hills, Pine Mountain, and Little Mountain areas (note: these mapped springs likely represent only a small percentage of the actual total number of springs and seeps in the district). | See Chapter 1.4 Planning Criteria for a list of resources evaluated for analysis. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #9853-3 | Water Resources (Pages 2-13 through 2-22) While SVP supports the requirements to maintain healthy water resources, issues concerning water resources are largely irrelevant from the paleontological standpoint, except for alternatives that would have scenarios completely prohibiting surface disturbance activities. Alternative B of MA#s 1302, 1313, and 1325 (Pages 2-14, 2-16, and 2-22) are such examples SVP does not prefer. Alternative A for MA# 1302, Alternative C or D for MA# 1313, and Alternative D for MA# 1325 (= equivalent to Alternative D of MA# 1320: Page 2-20) would be more sensible from the paleontological standpoint (and thus preferred here) by providing flexibility (on a case-by-case basis or 'avoid' but not necessarily prohibit) to conduct carefully managed surface disturbing activities, such as paleontological surveys, mitigations, and excavations. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | A range of alternatives has been analyzed for management of Water Resources in Chapter 2.2.6 management actions 1300-1325. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-35 | 1301 All alternatives are the same Areas may be considered for acquisition under a willing seller/willing buyer situation to enhance BLM management of watershed resources. The BLM would not use powers of condemnation to acquire lands (Appendix K). The task force expressed support for this statement as it emphasizes willing buyer/willing seller and restricts the use of condemnation. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Appendix K Land Tenure Adjustment Criteria for discussion of process for acquisition, retention and disposal of lands. |

|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-36 | 1302 Alternative D Design land uses and surface disturbing activities to reduce erosion and to maintain or improve water quality. Direct management in wetland and riparian areas toward meeting or making progress toward Wyoming Land Health Standards as a minimum. Alternative D is preferred because it broadly references the Wyoming Land Health Standards. Alternatives A and B do not reference the Wyoming Land Health Standards, and Alternative C includes a narrow refence. Alterative D is preferred because of its broad refence/ inclusion of the Wyoming Land Health Standards. | A range of alternatives has been analyzed for land uses and Surface disturbing activities and Water Resources in Chapter 2.2.6 management actions 1302. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-37 | 1303 Alternative A Management in the planning area would emphasize: * Reduction of sediment, phosphate, and salinity load in drainages where possible. Measures listed in Appendix A would be applied, as necessary. Guidelines described in the Wyoming Water Quality Rules and Regulations would also be applied, as necessary (Wyoming 1989). * Maintaining and improving drainage channel stability. * Restoring damaged wetland areas. * Exclosures would be designed to allow ample water for livestock and allow minimum impediments to big game migration. Alternative A specifically references the Wyoming Water Quality Rules and Regulations ensuring consistency with Wyoming regulations and maintenance of primacy over water quality. Alternative A also requires that exclosures be designed for "ample water flow for livestock and allow minimum impediments to big game" language supported by the task force. | A range of alternatives has been analyzed for management of Water Resources in Chapter 2.2.6 management actions 1303. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-38 | 1305 Alternative D Participate with federal, state, and local government agencies, affected landowners and the Colorado River Salinity Control Forum when developing and implementing salinity control measures, water quality improvement plans, salinity control plans, and TMDLs. Alterative D is preferred because during discussions the BLM indicated this is their current practice across the field office. | A range of alternatives has been analyzed for participation with other agencies on Water Resources in Chapter 2.2.6 management actions 1305. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-39 | 1308 Alternative D No similar action Alternative D ensures consistency across jurisdictions by not adding additional BLM requirements on top of what the DEQ already requires. | A range of alternatives has been analyzed for quantifying sediment, salinity and other nutrients in Water Resources in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-40 | 1309 Alternative D Prepare, on a case-by-case basis, site-specific activity and implementation plans to reduce erosion and sediment yield, promote ground cover, and enhance water quality. Activity and implementation plans could include general or specific watershed management terms and BMPs and incorporate sediment reduction, water retention, and water quality improvement objectives. Consider all existing locally developed watershed plans as new activity and implementation plans are developed. Alternative D is preferred because it provides for evaluations on a case-by-case basis whereas the other alternatives do not. It was noted during discussions that industry is already required to do these things in their mine permits and pollution prevention plans. | A range of alternatives has been analyzed for activity and implementation plans in Water Resources in Chapter 2.2.6 management actions 1309. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-41 | Action Alternative agreed on Management Action Language Justification 1317 Alternative D with amended/ additional text Manage activities in aquifer recharge areas to protect groundwater quality and quantity to ensure continued function. Manage activities in aquifer recharge areas to maintain, at a minimum, recharge volume and groundwater quality by limiting road density, chemical use and storage, and surface occupancy to maintain a healthy recharge area. * CSU for fluid minerals. Apply the above actions to identified and mapped recharge areas. To recognize the primacy of the State of Wyoming on water quality and quantity, the task force requests the following language to Alternative D: "in coordination with the appropriate state agencies." | A range of alternatives has been analyzed for management of aquifer recharge areas in Chapter 2.2.6 management actions 1317. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for Consultation and Coordination activities. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-42 | 1320 Alternative B No similar action The management action of "no similar action" is preferred over the language in Alternative D out of deference to State of Wyoming primacy over water quality and quantity regulation. Further, it is unclear the impact Alternative D would have on existing facilities and on valid existing rights. | See Chapter 1.4 Planning Criteria for discussion of valid and existing rights. A range of alternatives has been analyzed for water resources in Chapter 2.2.6 management action 1320. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-43 | 1322 Alternative A Legal protection of those water uses, both consumptive and nonconsumptive (including instream uses), that are necessary for the accomplishment of BLM programs would be obtained, so that the beneficial uses may be continued or made possible in the future. Alternative A is preferred as it does not discuss federally reserved water rights - while Alternative D does. Concern was expressed that Alternative D directs the BLM to acquire state water rights. | A range of alternatives has been analyzed for water use and water rights in Chapter 2.2.6 management actions 1322. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-44 | 1323 Alternative C No similar action Alterative C preferred as Alternative B and D would require hydrologic investigations across the entire field office (currently only required in the JMH planning area). | A range of alternatives has been analyzed for hydrogeologic investigation in Chapter 2.2.6 management actions 1323. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water | #13210-45 | 1324 Alternative A Herbicide loading sites would be prohibited within 500 feet of water sources, floodplains, riparian areas, and Special Status plant locations and would be used in accordance with the guidelines in | A range of alternatives has been analyzed for pesticide and herbicide loading, maintenance and refueling and water resources in Chapter 2.2.6 management actions 1324. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1300-1325) | | Appendix A. Alternative A is preferred as it adequately allows power and utility companies to effectively conduct their work in remote areas of the field office. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13210-46 | 1325 Alternative A No similar action Alterative A is preferred as Alternative B would make it difficult for power and utility companies to put in a line underground when necessary. | A range of alternatives has been analyzed for shallow unconfined reservoirs in Chapter 2.2.6 management actions 1325. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-23 | MA#1305. Alternative B. 2-15 For the trona facilities, the Wyoming Department of Environmental Quality Land Quality Division and Water Quality Divisions already review and regulate salinity control measures, water quality, and total maximum daily loads to ensure compliance with Colorado River Salinity Forum. Will a memorandum of understanding be developed between the BLM and the state agencies to ensure that facilities are not held to redundant and conflicting requirements regarding salinity? Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for consultation and coordination with other agencies. A range of alternatives has been analyzed for participation with other agencies on Water Resources in Chapter 2.2.6 management actions 1305. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-24 | MA#1308. Alternative B. 2-15 What is the BLM's example of the best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities? More details should be provided for facilities to better understand potential impacts to their businesses from this requirement. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | A range of alternatives has been analyzed for modeling in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-25 | MA#1309. Alternative B. 2-15 How does the BLM propose that water quality would be enhanced by this management action? The majority of the RMP area is a high desert ecosystem which often struggles to maintain ground cover. More detailed information should be released on this management action so facilities can foresee potential impacts to the business. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | A range of alternatives has been analyzed for activity and implementation plans in Water Resources in Chapter 2.2.6 management actions 1309. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-26 | MA#1313. Alternative B. 2-16 Under Alternative B, by closing these areas to mineral material sales and disposals, the BLM would significantly limit potential areas for trona mines to place tailings back underground in previously mined out areas. Wyoming Department of Environmental Quality Land Quality Division Noncoal Chapter 3 Section 2(h)(ii) states that the State of Wyoming prefers mines to place tailings underground. By closing off significant portions of lands that could be used for tailings storage, the BLM's RMP is conflicting with the preference of DEQ LQD. Please consider an amendment to the alternative that allows for compliance with state law. | See Chapter 1.4 Planning Criteria for compliance with applicable laws, and valid and existing rights. See also Glossary for a definition of 'mineral material', which does not apply to leasable minerals. A range of alternatives has been analyzed for mineral material sales/disposal in Chapter 2.2.6 management action 1313. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-27 | MA#1313. Alternative D. 2-16 Define intermittent channels and ephemeral drainages in relation to water quality. Does water have to be naturally occurring to consider a geographical feature an intermittent channel or ephemeral drainage? Please analyze in detail and disclose to the public the scientific basis for the proposed measures. | See Glossary for a definition 'ephemeral channels'. A range of alternatives has been analyzed for surface disturbing activities and Water Resources in Chapter 2.2.6 management actions 1313. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13542-73 | Literature Cited. Wyoming Department of Environmental Quality (DEQ). 2008. LC-16 This report issued by the State of Wyoming is from 15 years ago. The most recent available report available on DEQ WQD's website was published on May 4, 2020. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | See Executive Summary, Chapter 1.4 Planning Criteria, Chapter 4.2.2 Availability of Data and Incomplete Information for compliance with applicable laws, and adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13577-1 | Alternative B in Management Action #1313 would prohibit surface disturbing activities and new permanent facilities within 1,320 feet of 100-year flood plains and other aquatic resources. This prohibition is unacceptable because 1,320 feet is arbitrary and is based on inaccurate use of topography. | A range of alternatives has been analyzed for mineral material sales/disposal in Chapter 2.2.6 management action 1313. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-12 | WDEQ's primacy is further ignored in the proposed Management Actions 1303 through 1309. Those proposals ignore WDEQ primacy and attempts to acquire the authority already vested to WDEQ through primacy agreements with other Federal authorities. Because the actions described in Management Actions 1303 through 1309 fall under the authority of WDEQ, BLM should defer to WDEQ's primacy status and expertise; acknowledging that the BLM's role is to coordinate with WDEQ and provide information for consideration in these areas. Ultimately, the Draft RMP/EIS indicate that BLM intends to assert authority over other federal agencies, such as the EPA, by ignoring the authority EPA has granted to WDEQ. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-14 | Management Actions # 1313 through 1315 similarly do not provide the technical basis for determining that the strict prohibition in Alternative B is justified. WDEQ has the authority to protect all Waters of the State, which extends to floodplains, wetlands, riparian areas, perennial streams, and ephemeral drainages. This authority includes permitting surface disturbing activities and new permanent facilities through WDEQ permitting and 401 Certifications to ensure protections to waters of the state. BLM should recognize WDEQ's existing authority and | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. A range of alternatives has been analyzed for floodplains, wetlands, riparian and perennial streams in Chapter 2.2.6 management actions 1313 - 15. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | regulations are sufficient and consult WDEQ to ensure consistency with Wyoming Water Quality Rules, particularly Chapter 2, Permit Regulations for Discharges to Wyoming Surface Waters. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-22 | Water Quality/Water Resources Table 1-2 in the Draft RMP/EIS primarily addresses Land Use Plans considered during the development process. Draft EIS, Ch. 1, p. 1-6. However, to ensure consistency with Wyoming Water Quality Rules and current water quality management efforts, revisions to the Draft RMP/EIS should include consideration of the plans/reports listed below. The plans/reports that should be reevaluated in Table 1-2 Related Local, State, and Federal Management Plans include: - The 2013 Nonpoint Source Management Plan and any subsequent versions. - The 2020 Integrated 305(b) and 303 (d) Report and any subsequent revisions. - Currently approved Total Maximum Daily Loads (TMDLs): - Bitter Creek TMDL for E.coli. - Killpecker Creek TMDL for E.coli. - Approved new or updated Watershed Based Plans. - Little Sandy River - Bitter Creek - Killpecker Creek | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-50 | General####Throughout the draft RMP, water quality and water quantity are combined in the analysis. In addition, BLM's discussion of water quality and water quantity does not include the critical need to coordinate with the applicable regulatory agencies. To address these issues, the RMP should 1) separate water quality and water quantity; 2) describe the applicable regulations and; 3) describe that the BLM will coordinate with WDEQ/WQD and the Wyoming State Engineer's Office (SEO) regarding water quality and quantity, respectively. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-51 | General####The RMP must identify that the WDEQ has authority to implement sections of the Clean Water Act and Safe Drinking Water Act in the State of Wyoming. The RMP does not currently acknowledge the Clean Water Act and Safe Drinking Water Act programs that the WDEQ has authority to implement in Wyoming. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-52 | General###"Beneficial uses"#The RMP should use the term "designated uses" to be consistent with the Wyoming Water Quality Rules, Chapter 1, Wyoming Surface Water Quality Standards. "Beneficial uses" is used by the Wyoming State Engineer's office and relates to permitting uses of water of the state, which is separate from WDEQ/WQD's authority. | See revised text in Chapter 4.5.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-53 | General###Water Recharge Area and Aquifer Recharge Area.#The RMP should clarify "water recharge area" and/or "aquifer recharge area", as these terms are currently used interchangeably throughout the document. If these terms are describing the same groundwater resource, the BLM should pick one and ensure the language is consistent throughout the document. If these terms are describing different groundwater resources, the terms should be defined and used consistently throughout. | Text has been updated as appropriate. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-54 | Glossary##General#Revise definitions and clarify terms that may have multiple meanings.#The RMP should only use defined terms where the context aligns with the definition. For example, the terms "discharge" and "runoff" are defined in the glossary as they relate to water quantity but are used when discussing both water quality and water quantity. For the glossary to be useful, both contexts should be addressed in the definition. Alternatively, the definitions should be removed to eliminate potential confusion. | The definitions used in the Glossary relate to BLM's analysis and interpretation of the proposed actions in the EIS. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-55 | Glossary###Addition#The RMP Glossary should describe SDWA Underground Injection Control (UIC) well classes, as outlined in Wyoming Water Quality Rules, Chapters 24 (Class VI Injection Wells and Facilities Underground Injection Control Program) and Chapter 27 (Underground Injection Control Program Class I and V Wells). | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-56 | Ch. 1#1-4#1.4#Wyoming Department of Environmental Quality Authority.#The RMP must identify the Wyoming Department of Environmental Quality's primacy and authority to implement sections of the Clean Water Act and Safe Drinking Water Act. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-61 | Ch. 2#2-13#General#Water Resources Table. Spills.#The water resources table should address the protection of surface waters from chemical spills and requirements for spill reporting consistent with Wyoming Water Quality Rules, Chapter 4. Table 2.11 of the 2013 Lander RMP provides an example of how spills can be incorporated. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-62 | Ch. 2#2-16#1311#Formatting.#To improve readability, the RMP should 1) combine section 1312 with Section 1311; and 2) indicate that the management action is consistent across all alternatives. | A range of alternatives has been analyzed for management of the dunal ponds in Chapter 2.2.6 management actions 1311 and 1312. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-63 | Ch. 2#2-16#1311#Addition of 404 certification under the Clean Water Act.#This RMP management action should include compliance with Section 401 of the Clean Water Act. The WDEQ issues Section 401 certifications for USACE404 permits. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-64 | Ch. 2#2-13#PR-06#"Improve water quality and quantity where practical."#The proposed objective should be combined with PR- 08 and a separate water quantity objective developed. | The objectives presented are BLM's objectives for management in the planning area. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-65 | Ch. 2#2-13#PR-07#"Protect and improve surface and groundwater quality and quantity through appropriate measures (e.g., predictive modeling, monitoring, and protection of surface waters and known water recharge areas) during BLM activities and permitted actions over the life of the plan."#This statement does not indicate that the WDEQ/WQD and SEO have regulatory authority for water quality and water quantity, respectively, nor that BLM will coordinate with these agencies. Moreover, combining water quality and water quantity creates confusion regarding which activities are intended to protect water quality versus water quantity. To address these issues, the RMP should 1) address water quality and water quantity separately; 2) describe the regulatory framework for water quantity and water quality; and 3) describe that the BLM will coordinate with WDEQ/WQD and the Wyoming State Engineer's Office (SEO) to protect and improve surface and groundwater quality and quantity, respectively. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-66 | Ch. 2#2-13#PR-08#"Take appropriate actions within State of Wyoming established timeframes to control all causes of impairment and prevent additional listings of impaired waterbodies resulting from BLM actions and permitted activities on watersheds."#This statement is inaccurate, as WDEQ/WQD does not establish "timeframes to control all causes of impairment". To address this issue, WDEQ/WQD recommends replacing "Take appropriate actions within State of Wyoming established timeframes" with "In coordination with WDEQ/WQD, take appropriate actions…" | The objectives presented are BLM's objectives for management in the planning area. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-67 | Ch. 2#2-13#PR-12#"Rehabilitate, maintain, acquire, develop, or reclaim water supply sources to meet other resource goals and objectives."#It is unclear if the proposed statement includes water recharge areas and if coordination with regulatory agencies will be conducted. If managed aquifer recharge for recharge or storage is supposed to be associated with this objective, collaboration with the WDEQ/WQD UIC program and SEO will be required. For further clarification, contact the WDEQ/WQD UIC Program. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-68 | Ch. 2#2-13##Add in the Goal section.#The water resources table should address the protection of Class 1 waters as an objective to meeting the overall goal, since the Sweetwater River, a Class 1 surface water, is within the planning area. As outlined in the Wyoming Water Quality Rules, Chapter 1, Wyoming Surface Water Quality Standards, Class 1 waters are considered "Outstanding Surface Waters of the State" where the water quality at the time of designation must be maintained and no new point sources other than dams may discharge or increase their quantity of pollution discharged. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-69 | Ch.2#2-13#1300#Across all alternatives. "Authorize new activities resulting in the surface discharge of produced water only where compatible with other resource objectives and in consultation with stakeholders."#It is not clear why BLM specifically identified surface discharge of produced water as a means to guide authorization of activities within the RMP, particularly given that BLM must ensure that all activities are compatible with resource objectives. Moreover, although BLM has authority to manage BLM resources and activities on BLM lands, BLM did not coordinate with WDEQ/WQD in identifying this management action, despite the fact that WDEQ/WQD has authority under the Wyoming Environmental Quality Act, Wyoming Water Quality Rules, the Clean Water Act, and its implementing regulations to permit surface discharges. To address this issue, BLM should coordinate with WDEQ/WQD to identify management actions that will ensure protection of surface water quality. If BLM retains this as a management action, BLM should provide justification as to how this action meets management objectives. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-70 | Ch.2#2-14#1302#Across all alternatives.#All Alternatives should recognize that land-disturbing activities near wetlands must comply with Sections 401 and 404 of the Clean Water Act for Waters of the United States (WOTUS) and the WYPDES Wetland Mitigation Permit requirement for the disturbances of more than 1 acre for Non-WOTUS wetlands. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-71 | Ch. 2#2.14#1303#Alternative A: "Reduction of sediment, phosphate, and salinity load in drainages where possible. Measures listed in Appendix A would be applied, as necessary. Guidelines described in the Wyoming Water Quality Rules and Regulations would also be applied, as necessary (Wyoming 1989).#The proposed statement does not adequately represent other water quality criteria within the Wyoming Surface Water Quality Standards, nor provide justification for why sediment, phosphate, and salinity load are the only pollutants of interest. The Wyoming 1989 reference is also inaccurate and not included in the list of citations. It is alarming that BLM referenced the 1989 version of Wyoming Water Quality Rules, Chapter 1, which establishes water quality | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. See updated reference in Literature cited. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | standards for surface waters of the state. Chapter 1 been updated numerous times since 1989, most recently in 2018. It is difficult to understand why such an inaccurate reference was provided if BLM had done its due diligence researching information with the RMP and coordinating with cooperating agencies. The WDEQ/WQD also emphasizes that this Chapter describes rules, not guidelines. To address these issues, the RMP should: 1) Cite the 2018 version of Wyoming Water Quality Rules, Chapter 1, Wyoming Water Quality Standards, as the 2018 version is the most recent version; and 2) Either address management of all pollutants to ensure compliance with Wyoming's Surface Water Quality Standards; or 3) Provide rationale as to why sediment, phosphate, and salinity are the pollutants of interest. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-72 | Ch. 2#2-14#1303#Alternative B, C, and D.#It is inappropriate for BLM to remove the application of Wyoming Water Quality Rules in Alternatives B, C, and D. To address this issue, all alternatives should indicate compliance with Wyoming Water Quality Rules. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-73 | Ch. 2#2-14#1304#Formatting.#Alternative A is the same across all alternatives and should be relocated to the top of the table where management actions across all alternatives are listed. | Location is appropriate for BLM's needs. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-74 | Ch. 2#2-14#1304 1306#"Activity and implementation plans would be designed with measures to reduce phosphate loading to Fontenelle and Flaming Gorge Reservoirs and the Green River." "The BLM would participate with federal and local government agencies to develop and implement phosphate reduction plans in tributaries to Fontenelle Reservoir and Flaming Gorge Reservoir."#The RMP does not provide a justification as to why addressing phosphate loading is a priority, nor specify phosphate sources within the planning area. Section 3.15.6 simply states "there is no potential for developing phosphate in the planning area." To address these issues, the RMP should 1) describe the phosphate sources within the planning area; 2) clarify why phosphate loading is an issue, despite the lack of phosphate development; and 3) specify why phosphate loading is a priority. | Alternative A is the existing management from the 1997 plan. See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-75 | Ch. 2##1304 1306#Fontenelle Reservoir#Fontenelle Reservoir only borders the Rock Springs Planning area and the majority of the reservoir falls within the Kemmerer Field Office and Pinedale Field Office Planning Areas. The RMP should address the importance of including Fontenelle and describe any collaboration between the Kemmerer and/or Pinedale Field Offices to ensure management efforts are consistent. | Alternative A is the existing management from the 1997 plan. See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-76 | Ch. 2#2-15#1309#Across all alternatives.#The RMP should describe that all plans for BLM authorized activities and actions that include reclamation projects that may impact water quality must follow WYPDES Stormwater Permitting requirements to protect surface waters of the state. These requirements can be found in Wyoming Water Quality Rules, Chapter 2, Permit Regulations for Discharges to Wyoming Surface Waters. | A range of alternatives has been proposed for MA 1309. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-77 | Ch. 2#2-16#1311 1312#Across all alternatives. Information to add.#Any alternative that may result in the discharge of point or nonpoint source pollution to wetlands within the state of Wyoming should describe that 1) Wyoming Water Quality Rules Chapter 1, Wyoming Surface Water Quality Standards, establish protections for wetlands and 2) protections from point source discharges of pollution are handled through either the Clean Water Act Section 404 permitting and 401 certification process for Waters of the United States or Water Quality Rules Chapter 2, Section 7 for wetlands not considered Waters of the United States. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-78 | Ch. 2##1317#Alternatives A-D "Aquifer recharge areas would be managed to protect groundwater quality and to ensure continued ability for recharging aquifers."#The RMP should indicate that aquifer recharge area management will ensure groundwater quality is protected consistent with Wyoming Water Quality Rules. Coordination with the SEO should also be noted, as the SEO has regulatory authority over water quantity in Wyoming. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-79 | Ch. 2##1319#Mentioned in Alternatives A-D "Design activities within the water recharge area for the Town of Superior water supply to protect groundwater quality."#The RMP does not provide a rationale as to why the town of Superior recharge area is a high priority, does not commit to coordination with WDEQ/WQD, SEO, or the Wyoming Geological Survey (WGS), and does not recognize the regulatory authority of WDEQ/WQD or the SEO. To address these issues, the RMP should 1) identify the significance of this recharge area within Chapter 3, Affected Environment; 2) describe coordination with WDEQ/WQD, SEO, and the WGS to prioritize recharge areas; and 3) indicate WDEQ/WQD's authority to ensure protection of groundwater quality consistent with Wyoming Water Quality Rules, Chapter 8, Quality Standards for Wyoming Groundwaters. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water | #13624-80 | Ch. 2#2-20#1320#Alternative D ""High" and "Moderately High" sensitivity aquifer systems identified through the use of the Wyoming Groundwater Vulnerability Assessment Handbook or similar document as updated over time."#It is unclear if the BLM is proposing to review and reclassify sensitive aquifers, or if collaboration with | Please read the proposed language in Alt D MA 1320, which does not indicate that BLM will reclassify aquifer designations. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1300-1325) | | cooperating agencies such as the WDEQ/WQD, SEO, or WGS will be done to ensure consistency of groundwater sensitivity analyses. For instance, WDEQ/WQD has developed sensitivity determinations that should be consulted in conjunction with other documentation from other cooperating agencies. The RMP should be consistent with agencies that have authority over groundwater in the state. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-81 | Ch.2#2-20#1321#Cooperation with the state of Wyoming on the development of the state 208 water quality plan.#An MOU for cooperation with BLM on the state 208 plan was signed on March 13, 1981. Since the completion of the state 208 water quality plan, WDEQ/WQD has not proposed and is not planning to make changes to the document. Thus, it is recommended that this section be removed or revised such that it does not imply that WDEQ/WQD is currently developing a new 208 plan. WDEQ/WQD would also like to note that other BLM field offices in the state do not address the 208-plan development within their RMPs. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. A range of alternatives has been analyzed for water quality plans in Chapter 2.2.6 management action 1321. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-82 | Ch. 2#2-20#1325#Alternative B "Prohibit surface occupancy and surface disturbing activities in areas of shallow unconfined aquifers."#It is not clear why BLM identified shallow unconfined aquifers as a means to guide authorization of activities within the RMP, particularly given that BLM must ensure that all activities are compatible with resource objectives. Moreover, although BLM has authority to manage BLM resources and activities on BLM lands, BLM did not coordinate with WDEQ/WQD in identifying this management action, despite the fact that WDEQ/WQD has authority under the Wyoming Environmental Quality Act, Wyoming Water Quality Rules, and the Safe Drinking Water Act to ensure the protection of groundwater and underground drinking water supplies. To address these issues, BLM should coordinate with WDEQ/WQD, SEO, and WGS to identify aquifers and develop a project plan to ensure aquifers are protected and groundwater quality standards are met. If BLM retains this as a management action, BLM should provide justification as to how this action meets management objectives. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. A range of alternatives has been analyzed for shallow unconfined aquifers in Chapter 2.2.6 management action 1325. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-83 | Ch. 2#2-22#1324##This is also addressed in the Invasive Species and Pest section. To avoid redundancy, this information should be removed from the water resources table and retained in the Invasive Species and Pests table. | A range of alternatives has been analyzed for pesticide and herbicide loading, maintenance and refueling and water resources in Chapter 2.2.6 management actions 1324, and for invasive species and pest management in action 4212. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-85 | Ch.3##General##This section should be reformatted and combined with bullet 4 in Section 4.5.1 to ensure WDEQ/WQD's authority is addressed prior to discussing the water classification system. | The document layout and formatting is sufficient for BLM needs. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-86 | Ch. 3#3-4#3.4.1#Paragraph 1. "The portion of the planning area that is drained by the Green/Colorado River (Region 14, Basin 1404401) is subject to the Colorado River Compact."#The Colorado River Salinity Control Act of 1974 should be added to the statement to ensure all applicable rules and regulations are addressed in the RMP. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-87 | Ch. 3#3-4#3.4.1#Paragraph 1. "... the Sweetwater River is located within the Missouri River Basin and is subject to all applicable rules and agreements for that watershed."#To be consistent, the RMP should describe the specific rules and agreements for the Sweetwater River and/or Missouri River Basin, similar to the Green/Colorado River. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-88 | Ch. 3#3-4#3.4.1#Paragraph 2. "Major reservoirs in the area include Eden Valley Reservoir, Big Sandy Reservoir, Fontenelle Reservoir, and Flaming Gorge Reservoir."#As previously noted, the RMP should specify the importance of incorporating Fontenelle Reservoir into the RMP, since the planning area only borders the reservoir. In addition, if the RSFO includes Fontenelle, the reservoir should be added to the water resources map to allow reviewers to see where the water is located. | See Chapter 1.4 for a description of the planning area and the planning criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-89 | Ch. 3#3-4#3.4.1#Paragraph 3. "Waters in Wyoming are classified for water quality regulation according to beneficial uses by the Wyoming Department of Environmental Quality (DEQ)."#The proposed statement is inaccurate as "beneficial uses" are not used to classify surface waters. The RMP should say "The Wyoming Department of Environmental Quality/ Water Quality Division develops surface water quality standards, including designated uses, water quality criteria, and antidegradation provisions, to protect the quality of surface waters of the state." | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-90 | Ch. 3#3-4#3.4.1#Paragraph 3. "Nonpoint sources of pollution in Class 1 waters are controlled by the implementation of appropriate best management practices (BMP)."#Although this statement is correct, the RMP could be interpreted to imply that BMPs are only used to control non-point source pollution for Class 1 waters. To address this issue, the RMP should specify that nonpoint sources of pollution will be identified and best management practices (BMPs) to address nonpoint sources implemented to ensure compliance with surface water quality standards. | Text is sufficient for BLM analysis needs. See Chapter 1.4 for the planning criteria. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-91 | Ch.3#3-4#3.4.1#Paragraph 3. "Class 1, 2, and 3 waters are those with specific water quality standards that must be maintained."#The proposed statement is inaccurate as all Wyoming surface waters of the state have water quality standards and must be managed to ensure those standards are met. | See updated text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-92 | Ch. 3#3-4#3.4.1#Paragraph 3. "There are no Class 1 waters within the planning areas."#The proposed statement is inaccurate as the Sweetwater River, near the northern boundary of the planning area, is a Class 1 Water. | See updated text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-93 | Ch. 3#3-4#3.4.1#Paragraph 3. "There are 42 miles of Class 2 water on the Big Sandy River between the confluence with the Green River and the confluence of the Little Sandy River near Farson."#The proposed information is inaccurate. It appears that the RSFO used the Integrated Report rather than the Wyoming Surface Water Classification List to identify the water resources and applicable surface water quality standards in this area. However, the Integrated Report only identifies waters that have been assessed. There are other waters within the planning area, including Class 2 waters such as the Green River (Class 2AB). As such, the RSFO should include a list of all Class 2 waters located in the planning area. | See updated text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-94 | Ch. 3#3-4#3.4.1#Paragraph 4. Impaired waters.#The list of impaired waters is inaccurate, as WDEQ's 2010 Integrated Report was utilized for identifying impaired waters. The RMP should be updated to include the following waters, as described in WDEQ's Wyoming's 2020 Integrated 305(b) and 3030(d) Report: ? Little Sandy River impaired for sediment. Listed in 2012. ? Lander Creek impaired for E. coli. Listed in 2020. This section could be addressed in a table that lists the impairments within the planning area. For an example, refer to Table 3.8 in the 2013 Lander RMP. Again, BLM's inaccurate references to some of WDEQ/WQD's key sources of information is alarming. | See updated text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-95 | Ch. 3#3-4#3.4.1#Paragraph 4. "Killpecker Creek is also a source of high chlorides in the system but is not listed for chlorides due to naturally high background levels of chlorides originating from the soils."#The proposed statement is inaccurate. Killpecker Creek (Class 3B) is not included in Wyoming's 303(d) listed for chlorides because the numeric chloride criteria is not applicable to Class 3B waters, as outlined in the Wyoming Water Quality Rules, Chapter 1, Wyoming Water Quality Standards. In addition, WDEQ/WQD has not determined whether there are naturally high background levels of chlorides that originate from the soils in Killpecker Creek. As such, WQD recommends removing the statement regarding Killpecker Creek. Alternatively, BLM could simply describe that chloride concentrations are elevated in Killpecker Creek. | See revised text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-96 | Ch. 3#3-5#3.4.2#Entire Section.#Overall, there is not enough information provided on groundwater resources within the planning area to provide substantive comments. The RMP revisions should address groundwater deficiencies including regulatory authorities and potential permits to be obtained, and should provide justification of the classification for each water recharge area. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-97 | Ch. 3##3.4.2#Paragraph 2 "Published information suggests that the following areas can be classified as recharge areas"#The RMP does not elaborate on the "published information" alluded to in the proposed statement; therefore, the WDEQ/WQD cannot determine if the published information is based on science and quality-controlled data. The RMP should provide sufficient justification for water recharge area classifications, including the "published information", geology in the area, information from cooperating agencies, and any literature used when classifying the recharge areas. RSFO should be collaborating with the WDEQ/WQD, SEO, and WGS to ensure recharge areas are classified accurately and consistently. RSFO should also be aware that "managed aquifer recharge" is a term used in the UIC program for the recharge or storage of groundwater. If RSFO's intent is to manage the recharge areas by recharging or storing groundwater, coordination with the WDEQ/WQD UIC program and SEO will be required. For more information the RSFO should coordinate with the WDEQ/WQD. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-98 | Ch.3#3-5#3.5.2#Riparian.#WDEQ/WQD recommends this section identify that all wetlands (WOTUS and non-WOTUS) are considered surface waters of the state in accordance with Wyoming Water Quality Rules Chapter 1, Section 2(b)(I). All wetlands within the planning area should also be listed to better identify the riparian resources within the planning area. An example of this can be found in Chapter 3 of the 2013 Lander RMP. It is concerning that BLM failed to recognize WDEQ's authority relating to all surface waters of the state, including wetlands. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-101 | Ch. 4#4-29#4.5.1#Bullet 4: "The State of Wyoming has primacy with regard to the management of water quality and distribution of water (quantity). The BLM manages the public lands within the planning area."#The proposed statement does not consider that water quality and water quantity are regulated by different state agencies-WDEQ/WQD and SEO, respectively. WDEQ/WQD also has primacy and regulatory authority to implement sections of the Clean Water Act and Safe Drinking Water Act. In addition, the statement should also recognize that BLM is responsible for ensuring BLM-authorized activities and actions do not violate Wyoming Water Quality | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | Rules. The RMP should develop a separate bullet to discuss water quantity, which is regulated by SEO. Finally, to increase readability, this bullet should be moved to section 3.4.1 where WDEQ/WQD's authority is discussed. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-102 | Ch. 4#4-29#4.5.1#Paragraph 4. "Because the state must comply with federal laws, compliance with state laws includes compliance with federal rules and regulations, including the Clean Water Act, Colorado River Salinity Control Act of 1974, Safe Drinking Water Act, and others. Therefore, it is assumed that any discharged water would meet effluent limits and/or water quality standards at the point of discharge."#The WDEQ/WQD expects permittees with discharge permits to comply with all permit conditions, including effluent limits. However, WDEQ/WQD's WYPDES Program conducts compliance and inspection activities to ensure permittees are meeting requirements. The BLM should coordinate with WDEQ/WQD if it has compliance concerns with any permitted facilities. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-103 | Ch. 4#4-29#4.5.1#"An increase of pollutants in surface waters would affect other beneficial uses (e.g., aquatic life, stock watering, irrigation, and/or drinking water supplies)."#"Beneficial uses" should be changed to "designated uses" when discussing surface water quality to be consistent with the terminology used in Wyoming Water Quality Rules, Chapter 1, Wyoming Surface Water Quality Standards. The RSFO should ensure water quality and water quantity elements are separated to better clarify if the uses are established by the WDEQ/WQD or the SEO. | See revised text in Chapter 4.5.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-104 | Ch. 4#4-29#4.5#Entire section.#The entire section should be revised based on the provided comments. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-105 | Map 3-1###Possible addition.#The RMP references Fontenelle Reservoir, but the reservoir is not included in the Water Resources map. Although Fontenelle is primarily in the Kemmerer Planning Area, it would be beneficial to identify where the reservoir is located within the Water Resources map. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-106 | Appendix C.#C-7 C-8 C-12 C-16##"Colorado Salinity Compact." "Colorado River Salinity Compact" "Green River Salinity Compact"#The noted compacts are inaccurate and should be revised. The applicable legislation should be "Colorado River Salinity Control Act of 1974," if referring to water quality. It is concerning that BLM has erred and incorrectly made references to information that is clearly of public record. | See updated text as appropriate |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-107 | Appendix C#C-13#C.5#A natural process or system. "In addition, the stream is listed with the WDEQ as a 303D stream (threatened or impaired, requiring total maximum daily load)."#The proposed statement is inaccurate as there are no waters on the 303(d) list within the proposed Salt Wells ACEC area. Thus, a 303(d) listing also cannot be used to qualify the Salt Well area as an ACEC. | See updated text in Appendix C. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13624-108 | Appendix C#C-29#C.12 C.16 C.17 C.19 C.21 C.26#ACEC Classifications.#As mentioned in previous comments, the RSFO should provide justification for water recharge area designations. Without providing a justification, water recharge areas should not be used to justify an ACEC designation. BLM appears to be making a decision to drive a policy regarding ACECs without data or justification. Within the RMP there should be a description of what qualifies an area as an aquifer recharge area. This includes geological information and any information provided from cooperating agencies that have authority to classify groundwaters, such as the WDEQ/WQD, SEO, and WGS. Proximity to the Continental Divide is not sufficient justification. The evaluation should indicate what recharge area is being considered, as there is not sufficient information to understand the location of water recharge area boundaries. A map of the proposed aquifer recharge areas should be provided in the document to allow cooperating agencies to visualize the locations of the proposed recharge areas. | See updated Glossary. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13691-4 | Alternative A seems to be localized to the "JMH Planning area". However, with the proposed new RSFO preferred Alternative B and Proposed Alternative D, hydrogeologic investigations would be required "where there is a reasonable expectation that surface waters are connected with geologic formations being dewatered." This situation being proposed for the entire EIS managed area is beyond the scope of the average resource user and beyond the capability of most natural resource professionals. | A range of alternatives has been analyzed for hydrogeologic investigation in Chapter 2.2.6 management actions 1323. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13702-5 | Best available modeling is required under Alternative B in MA 1308. Modeling should not be required, especially on smaller disturbances, because best management practices (BMPs) can be implemented to control sediment and pollutants. | A range of alternatives has been analyzed for modeling in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources- | #13702-6 | Alternative B in MA1313 would prohibit surface disturbing activities and new permanent facilities within 1,320 feet of 100-year flood plains and other aquatic resources. This prohibition is unacceptable because 1,320 feet is | A range of alternatives has been analyzed for surface disturbing activities and Water Resources in Chapter 2.2.6 management actions 1313. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Water Resources (1300-1325) | | arbitrary and is based on inaccurate use of topography. Appropriate BMPs have been developed and should be implemented. BLM should work with state agencies, land users, and industry to ensure that effective conservation measures are applied rather than applying prohibitions or blanket restrictions that potentially lock up resources and leave no room for effective mitigation. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13715-11 | Specific BLM Proposed Management Actions with Respect to ROWs Are Arbitrary and Capricious. a. MA #1313 (Floodplains and Drainages). Alternative B prohibits surface disturbing activities and new permanent facilities within ¼ mile of floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the inner gorge of large ephemeral drainages. No linear crossings are permitted in these areas. This requirement will mean that future pipeline crossings of any drainage feature, including non-wetland ephemeral drainages, may be unavailable even if no resource damage will result. Given the prominence of ephemeral drainages in the RFSO area, the DEIS fails to fully analyze the effect of this restriction on future development of necessary ROWs for product transport, pipeline, transportation, and other uses. Alternative D provides a more reasonable alternative by allowing BLM AO to permit linear crossings on a case by case basis. | A range of alternatives has been analyzed for surface disturbing activities and Water Resources in Chapter 2.2.6 management actions 1313. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-4 | Physical Resources (PR) - Water Resources (U.S. Department of the Interior Bureau of Land Management, 2023)(Page 2-22) We respectfully request that BLM edits Alternative B to add language we identify here in italics: "Apply appropriate measures to protect groundwater quality and quantity and prevent commingling of aquifers" | A range of alternatives has been analyzed for ground water quality in Chapter 2.2.6 management action 1323. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-8 | While the state of Wyoming retains primacy over its surface and groundwater, the BLM plays an important role in groundwater protection, because of the drilling and production of groundwater during BLM-permitted oil and gas development. "Land-use decisions that fail to consider the long-term quality, availability, and susceptibility of ground water resources create conditions that contribute to loss of ground water recharge, overuse of water resources, and human health and ecological impacts resulting from ground water contamination. On the other hand, land-use practices that protect and conserve water resources and maintain or even increase aquifer recharge are key to maintaining long-term water availability and economic vitality." (Ground Water Protection Council, 2017) "Produced water" is groundwater that is a by-product of natural gas and oil development; it is extracted with the gas and is then disposed of through "injection." The Upper Green River Alliance has tracked and analyzed groundwater withdrawals and injection in the Pinedale Anticline and Jonah Infill natural gas fields, through their respective Data Management Systems. (Pinedale Anticline Project Office, 2024) (Note: The Jonah Data Management System is no longer updated or publicly available.) We have found tremendous increases in the amount of groundwater that is produced and injected over the past two decades. This is concerning due to the rapid rate of groundwater depletion in the Colorado River Basin as a whole, the extreme drought affecting our aquifers, rivers, streams and ecosystems, and the increasing needs of downstream farmers, ranchers, businesses, and residential water users. While we have tracked Pinedale BLM gas field groundwater withdrawals, similar withdrawals can be expected and reported in the Rock Springs management area. Graph 1 (below) is a graphic display of the increasing amounts of groundwater, in gallons, produced in the Pinedale Anticline natural gas field from 2000-2022. Graph 2 (below) displays the increase of water injected, often to depths of 14,000'. Statistics are reported for every Wyoming gas and oil well at the Wyoming Oil and Gas Conservation Commission. (Wyoming Oil and Gas Conservation Commission, 2024) The Jonah Infill natural gas field shows similar increases in the amount of groundwater produced over the past two decades (Graph 3 below). | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-9 | We respectfully request that the DRMP DEIS in section 4.5.1 "Assumptions" includes the bullet point that: "Groundwater is critical for sustaining flow in the Green River, its tributaries, and ultimately the Colorado River. Groundwater and surface water are a joint resource that must be effectively managed for long-term ability to meet future allocations to the seven Basin states." | The assumptions listed are specific to BLM's analysis. See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-10 | We respectfully request that BLM designs and implements in the RMP FEIS a groundwater monitoring program similar to the Pinedale Anticline Data Management System, that measures groundwater quantity withdrawn during natural gas development for all existing and future natural gas wells and fields, in coordination with other state and federal water management agencies, and in compliance with federal laws. The goal should be to help understand and responsibly manage BLM-permitted surface and subsurface impacts to groundwater and connected streamflow in the Upper Colorado River Basin. | A range of alternatives has been analyzed for management of water resources in Chapter 2.2.6 management actions 1300-1325. Analysis of impacts for actions in each alternative is found in Chapter 4. Best Management Practices for water resources are found in Appendix A.2.8. Identification of modeling programs for specific projects is outside the scope of this document. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-11 | We respectfully request that BLM edits the Alternative B column in the Physical Resources (PR) - Water Resources table on page 2-22 to read: "Apply appropriate measures to protect groundwater quality and quantity and prevent commingling of aquifers." | A range of alternatives has been analyzed for management of shallow unconfined reservoirs in Chapter 2.2.6 management action 1325. Analysis of impacts for action in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-18 | A.2.8 Best Management Practices for Water Resources Best Management Practices are appropriate to mitigate water quantity impacts. We respectfully request that the BLM includes existing aquifer information in this section, available from the Wyoming State Geological Survey. | See Appendix A.2.8 for discussion of Best Management Practices for water resources. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13720-19 | We respectfully request that the BLM adds the following Best Management Practices to the list in this section: * Do not use unlined pits at all, anywhere. * Do not bury liners on site. * A monitoring plan must also include baseline and periodic water quantity data, with publicly- available, annual reports. | See Appendix A.2.8 for discussion of Best Management Practices for water resources. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-79 | Best available modeling is required under Alternative B in Management Action #1308. Modeling should not be required, especially on smaller disturbances, because best management practices (BMPs) can be implemented to control sediment and pollutants. | A range of alternatives has been analyzed for modeling in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-80 | Alternative B in Management Action #1313 would prohibit surface disturbing activities and new permanent facilities within 1,320 feet of 100-year flood plains and other aquatic resources. This prohibition is unacceptable because 1,320 feet is arbitrary and is based on inaccurate use of topography. Appropriate BMPs have been developed and should be implemented. BLM should work with state agencies, land users, and industry to ensure that effective conservation measures are applied rather than applying prohibitions or blanket restrictions that potentially lock up resources and leave no room for effective mitigation. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. A range of alternatives has been analyzed for management of floodplains and other aquatic resources in Chapter 2.2.6 management action 1313. Analysis of impacts for actions in each alternative is found in Chapter 4 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-109 | MA #1303 ALT A Management in the planning area would emphasize: * Reduction of sediment, phosphate, and salinity load in drainages where possible. Measures listed in Appendix A would be applied, as necessary. Guidelines described in the Wyoming Water Quality Rules and Regulations would also be applied, as necessary (Wyoming 1989). * Maintaining and improving drainage channel stability. * Restoring damaged wetland areas. * Exclosures would be designed to allow ample water for livestock and allow minimum impediments to big game migration. Industry Position: Acceptable because it follows WDEQ-WQD Rules and Regulations. ALT B Resource: Physical Resources (PR) - Water Resources 1300 - 1325) Management in the planning area would: * Reduce sediment, phosphate, and salinity loads where possible. Measures listed in Appendix A would be applied. * Improve drainage channel resiliency and stability (improvement could include offsite mitigation). * Restore damaged riparian/wetland areas. * Design riparian exclosures to improve water quality conditions in riparian areas. Industry position: Not acceptable Reason: Arbitrary application of Appendix A should not be applied universally, rather it should be applied as necessary. ALT C Management in the planning area would consider: * Reducing sediment, phosphate, and salinity loads in drainages where possible. Measures listed in Appendix A would be applied, as necessary. * Maintaining or improving drainage channel stability. * Restoring damaged riparian/wetland areas. * Designing exclosures to reduce impediments to wildlife movement and take into account livestock grazing and other uses. Industry Position: Acceptable. Reference to the WY requirements in Alternative A provides added value that is not included here. ALT DEmphasize management in the planning area that would: * Reduce sediment, phosphate, and salinity loads in drainages. Appropriate measures listed in Appendix A would be applied. * Maintain or improve drainage channel and watershed stability and resiliency. * Identify and restore damaged riparian/wetland areas. * Design structures, such as fencing and instream structures, with consideration of other potentially affected resources and uses. Industry position: Not acceptable Reason: Arbitrary application of Appendix A should not be applied universally, rather it should be applied as necessary. | A range of alternatives has been analyzed for management of Water Resources in Chapter 2.2.6 management actions 1303. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-110 | MA #1305 Alternative A In the JMH planning area, the BLM would continue to participate with federal, state, and local government agencies to develop and implement salinity control plans for the Colorado River Basin and maintain existing and future applicable water quality plans. Industry position: Not applicable Reason: Applies only to JMH planning area. Alternative B Participate with federal, state, and local government agencies to develop and implement salinity control measures, water quality improvement plans, and total maximum daily loads (TMDL). Participate with federal, state, and local government agencies and the Colorado River Salinity Control Forum to develop and implement salinity control plans. Industry position: Not acceptable. Reason: Industry is already complying with Colorado Salinity Control Forum discharge standards and limitations based on WDEQ- WQD standards. TMDLs should not be necessary when WDEQ-WQD standards are being met. WDEQ-WQD has primacy for water quality standards and control. Alternative D Participate with federal, state, and local government agencies, affected landowners and the Colorado River Salinity Control Forum when developing and implementing salinity control measures, water quality improvement plans, salinity control plans, and TMDLs. Industry position: Not acceptable. Reason: Industry works under the Salinity Forum through WDEQ-WQD standards. TMDLs should not be necessary when WDEQ-WQD standards are followed. WDEQ-WQD has primacy for water quality standards and control.Proposed Alternative Actions with the potential to create surface disturbance and potential for runoff to the Green River watershed will be designated for minimal erosion, as far as practical, to comply with | See Section 1.5 and Section 4.5.1 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | the Colorado River Salinity Control Act of 1974, as applicable. Permitting and enforcement will be controlled through WDEQ-WQD salinity control standards. Language is taken from Alternatives A and D. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-111 | MA #1308 ALT A Require best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities. Industry position: Not acceptable. Reason: Modeling should not be required for all surface disturbances. All surface disturbances has not been justified and is open-ended because many disturbances for surface facilities will be very small. Water quality protections are adequately covered in the WDEQ-LQD mine permit and the WDEQ-WQD Stormwater Permit Pollution Prevention Plan. ALT BMay use modelling to quantify the amount of sediment, salinity and associated nutrients that would be transported to water bodies. Industry position: Acceptable. Reason: Acceptable as long as water quality requirements are driven WDEQ-LQD regulations and the mine permit and WDEQ- WQD Stormwater Permit Pollution Prevention Plan. REC Sediment, salinity, and other nutrients will be controlled on surface disturbances for facilities necessary for production of trona in the KSLA. Control standards and quantification, if necessary, will be determined in the WDEQ-LQD mine permit, WDEQ-WQD WYPDES permit and Stormwater Pollution Prevention Plan. | A range of alternatives has been analyzed for modeling in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-112 | MA #1309 ALT A Site-specific Activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, enhance water quality) would be prepared for areas where needed. These areas include but are not limited to Cedar Mountain and Sage Creek/Current Creek. The Red Creek watershed plan would continue to be implemented as appropriate. Industry position: Not acceptable. Reason: This alternative is relevant primarily to specified areas. Erosion and sediment control, revegetation, and water quality protection are primarily covered in the WDEQ-LQD mine permit and WDEQ-WQD Stormwater Pollution Prevention Plan. ALT BRequire site-specific activity and implementation plans to reduce erosion and sediment yield, promote ground cover, and enhance water quality for all areas. Activity and implementation plans would be site-specific watershed management stipulations and BMPs and incorporate sediment reduction and water quality improvement objectives. Industry position: Not acceptable. Reason: Plans to reduce erosion and sediment yield, for revegetation, and water quality protection are in the WDEQ- LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan. ALT C Site-specific activity and implementation plans may be prepared but would not be required to reduce erosion and sediment yield, promote ground cover, and enhance water quality. Activity and implementation plans would include only general watershed management stipulations, BMPs, and incorporate sediment reduction and water quality improvement objectives if applicable land health standards are not met. Industry position: Acceptable Reason: Plans that are elective under this alternative are in the WDEQ-LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan and WYPDES permit. ALT D Prepare on a case-by-case basis site-specific activity and implementation plans to reduce erosion and sediment yield, promote ground cover, and enhance water quality. Activity and implementation plans could include general or specific watershed management terms and BMPs and incorporate sediment reduction water retention, and water quality improvement objectives. Consider all existing locally developed watershed plans as new activity and implantation plans are developed. Industry position: Not acceptable. Reason: Plans to reduce erosion and sediment yield, for revegetation, and water quality protection are in the WDEQ-LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan. REC Plans for controlling erosion and sediment yield, protecting water quality, and revegetation will be prepared as required in the WDEQ-LQD mine permit and WDEQ- WQD Stormwater Pollution Prevention Plan. Language on preparing a plan is taken from Alternatives A and C. | A range of alternatives has been analyzed for site-specific Activity and Implementation plans in Chapter 2.2.6 management action 1309. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-113 | MA #1313 ALT A 100-year floodplains, wetlands, and riparian areas are closed to any new permanent facilities (e.g. tanks, pits etc.). Proposals for linear crossings in these areas would be considered on a case-by- case basis. Industry position: Acceptable Reason: Adequate management can be applied on a case-by-case basis for such surface disturbing activities. WDEQ- WQD's stormwater and WYPDES program also required additional permitting, controls and enforcement for these activities. Alternative B Prohibit surface disturbing activities and new permanent facilities (e.g., storage tanks, structure pits, etc.) within 1,320 feet (¼ mile) of 100-year floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the edge of the inner gorge of large ephemeral drainages. Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing. Avoid linear crossings in these areas. Industry position: Not acceptable. Reason: 1,320 feet is arbitrary due to the inaccurate use of topography to generate flood plain maps. Many flood plain maps are out of date. Localized topography and site conditions must be taken into account but are ignored with this language. Alternative C Consider, on a case-by-case basis, surface disturbing activities and new permanent facilities (e.g., storage tanks, structure pits, etc.) proposed for placement within riparian areas or wetlands and 100-year floodplains or adjacent to the inner gorge of large ephemeral drainages. Consider, on a case-by-case basis, linear crossings in these areas. Industry position: Acceptable Reason: Adequate management can be applied on a case-by-case basis for such surface disturbing activities. WY DEQ's stormwater and NPDES program also required additional permitting, controls and enforcement for these activities. Alternative D Avoid placement of permanent facilities within 100-year floodplains, and within 1,320 feet (¼ mile) of wetlands, riparian areas, and perennial streams. Avoid surface disturbing and construction activities within 500 feet of the outer edge of wetland/riparian areas or perennial streams. Avoid surface disturbing and construction activities within 100 feet of the edge of the | A range of alternatives has been analyzed for management of floodplains, wetlands, riparian areas, perennial large ephemeral steams in Chapter 2.2.6 management action 1313 - 1315. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | inner gorge of intermittent channels or ephemeral drainages. Designate these areas as a right-of- way (ROW) avoidance area. Allow linear crossings if a site- specific analysis by a BLM Authorized Officer (AO) determines that no adverse impacts would be likely to occur and a plan to mitigate potential impacts to water quality is approved. Allow structures that would enhance the protection and management of streams, wetlands, and riparian areas. Approval will be on a case-by-case basis and subject to adequate mitigation of impacts following BLM mitigation policies and Wyoming BLM Mitigation Guidelines for Surface-Disturbing and Disruptive Activities. * Controlled Surface Use (CSU) for fluid minerals. Industry position: Not acceptable. Reason: 1,320 feet is arbitrary due to the inaccurate use of topography to generate flood plain maps. Many flood plain maps are out of date. Localized topography and site conditions must be taken into account but are ignored with this language. Proposed Alternative Alternative C is preferred but Alternative A is also acceptable because both alternatives are based on a case-by-case evaluation and conform with WDEQ and Army Corp of Engineers requirements. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-114 | MA #1314 ALT A In the JMH planning area, permanent facilities such as tanks and pits are not allowed in 100-year floodplains, wetlands, or riparian areas. However, structures that would enhance the protection and management of 100-year floodplains, wetlands, and riparian areas could be considered. Proposals for linear crossings in these areas would be considered case by case. Industry position: Not applicable. Reason: Applicable to JMH. | A range of alternatives has been analyzed for management of floodplains, wetlands, riparian areas, perennial large ephemeral steams in Chapter 2.2.6 management action 1313 - 1315. Analysis of impacts for actions in each alternative is found in Chapter 4. S |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-115 | MA #1315 Alternative A Surface disturbing and construction activities (e.g., mineral exploration and development activities, pipelines, power lines, roads, recreation sites, fences, wells, etc.) that could adversely affect water quality and wetland and riparian habitat, would avoid the area within 500 feet of or on 100-year floodplains, wetland/riparian areas, or perennial streams, and within 100 feet of the edge of the inner gorge of intermittent and large ephemeral drainages. Proposals for linear crossings in these areas would be considered on a case-by- case basis. Activities could be allowed if a site- specific analysis determines that no adverse impacts would occur to floodplains, wetland/riparian areas, perennial streams, or water quality, and a plan to mitigate impacts to water quality is approved. Industry position: Acceptable | A range of alternatives has been analyzed for management of floodplains, wetlands, riparian areas, perennial large ephemeral steams in Chapter 2.2.6 management action 1313 - 1315. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13751-116 | MA 1320 ALT D Avoid or mitigate, on a case-by-case basis, BLM-authorized activities and infrastructure such as unlined impoundment ponds/pits, reserve pits, and evaporation ponds that could result in the contamination of sensitive water resources, including Source Water Protection Areas identified in Wellhead or Source Water Protection Plans approved local governing bodies and "High" and "Moderately High" sensitivity aquifer systems identified through the use of the Wyoming Groundwater Vulnerability Assessment Handbook or similar document as updated over time. Industry position: Not acceptable Reason: The management action should include 'avoid, minimize or mitigate only NEW activities on a case-by-case basis'. As written, it applies to valid existing facilities. BLM should refer to WDEQ Rules and Regulations and oversite of such programs. Wyoming has primacy for watershed protection, NPDES, stormwater and underground injection control for the protection of such water source in Wyoming. | A range of alternatives for BLM-authorized activities and infrastructure has been analyzed in Chapter 2.2.6 management action 1320. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13754-14 | The state of Wyoming, with responsibility delegated to the State Engineer's Office, manages the water resources in the state and has jurisdiction to determine their allocation. Any decisions affecting either water quality or quantity should be deferred to the state of Wyoming. Because of this, the BLM should not outright preclude any areas in the RSFO from surface disturbing activities due to their perceived impacts on water quality or quantity. Regulations are such that they can be tailored and their stringency be commensurate to offset the expected amount of water quality degradation. It is rare that projects fail due to an inability to find a reasonable regulatory solution, but those instances do occur. The probability of project success should not be based on a non-jurisdictional decision from the BLM. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13759-1 | Climate change is minimally addressed in the Rock Springs RMP. The majority of where climate change is mentioned in the document is in the Monetized Impacts of Greenhouse gases (GHG's) section. This seems to be where a detailed conversation of climate change begins and ends in the RMP. Addressing GHG's is important, but there are many other issues that should be considered in this management plan in the context of climate change, such as early snowmelt, drought, loss of habitat, wildfires, and water resources (EPA, 2016). I think that this RMP should describe more ways the RSFO can be proactive around these issues and explain how plans will be adaptive in the face of inevitable change. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13784-6 | * MA#1308, Alt B: "Require best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities." (p. 2-15) Comment: The theme of Alternative B is to require additional workloads, of which BLM is likely incapable of doing, especially across ALL surface disturbing activities. Alternative D, states "No similar action," because BLM knows it is unlikely to happen or to have the ability to monitor to the level expected. All project level NEPA will get litigated if the modeling is not completed prior to the analysis and decision. | A range of alternatives has been analyzed for modeling in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water | #13784-48 | "Livestock grazing and range improvements could involve localized surface disturbance from activities such as water source development and construction offences. These activities could result in localized vegetation removal and reduction of soil surface..." (p. 4-33) Comment: BLM is considering livestock grazing as a surface disturbance under Alternative A, which WDA can not support and does not meet the definition of surface disturbing activities | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1300-1325) | | "Management that prohibits or restricts recreation-related surface disturbing activities such as camping, cutting of trees and firewood for camping, and construction of recreation site facilities..." (p. 4-33) Comment: While WDA doesn't oversee recreation, we reiterate our concern of BLM's misapplication and analysis of surface disturbing activities. Camping and cutting of firewood do not disturb soils. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13784-49 | 4.5.3 Water Resources, Alternative B: "Vegetation treatment actions would have similar impacts as those discussed in Alternative A, but longer resting times for treated areas would likely provide greater protections to water resources in these areas as vegetation and soil would have a longer timeframe to establish and stabilize..." (p. 4-35) Comment: The analysis is misleading by assuming the vegetation treatments are near water or on steep slopes where soil runoff is likely to occur. Longer rest times under this analysis are assumed for livestock grazing, but not indicated specifically. Rest from livestock will not guarantee the vegetation objectives are met. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13784-51 | "Impacts to water resources from livestock grazing management would be similar to Alternative A. Under Alternative B some areas would be prohibited or closed to livestock grazing. In these areas, reduced grazing pressure on vegetation would provide greater protections to water resources when compared to Alternative A." (p. 4-36) Comment: The analysis fails to include the necessary information such as acres closed or prohibited from livestock grazing in Alternative B to compare with Alternative A. "Some areas" doesn't give the livestock grazing permittees the information needed to fully understand the impacts to their permits. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-1 | Alternatives lack attention to water quantity and should all be revised to be inclusive of the value of Wyoming's water. Some obvious examples are the impacts beneficial use has on Wyoming socioeconomics, and the impacts unwarranted phreatophyte additions have on return flows, conveyance and transit losses, and that consumptive use and conserved consumptive use is important for compliance to the 1948 Upper Colorado River Compact and the North Platte Decree. The Wyoming State Engineer's Office should be a direct collaborator to evaluate the alternatives for these amendments. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. See Chapter 5.1 and 5.1.1 for consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-2 | Glossary/Acronyms 26/61 Add the following definition to the Glossary: Wyoming State Engineer's Office - the Wyoming State Engineer's Office and Board of Control is to provide for the general supervision and protection of both inter- and intra-state waters of Wyoming. This includes the appropriation, distribution and application to beneficial use of water as provided under the prior appropriation doctrine, and to maintain the flexibility within that framework to meet the changing needs of the citizens of Wyoming. The State Engineer's Office collects, analyzes, maintains and provides water related information for ensuring the appropriate management and regulation of Wyoming's water resources | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. The engineering office is listed in the Coordination and Consistency section. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-3 | Glossary/Acronyms 26/62 Add the following definition to the Glossary: Consumptive Use - The amount of water transpired during plant growth plus what evaporates from the soil surface and foliage. Consumptive use is what is used by the BOR to identify Upper Colorado River state's annual quantity of water that is put to beneficial use compared to each state's apportionment. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-4 | Glossary/Acronyms 26/62 Add the following definition to the Glossary: Wyoming Water development Commission - The Wyoming Water Development Commission is responsible for addressing the water resources needs of our citizens through the construction of new water supply projects and the rehabilitation of existing water supply projects, and by providing and maintaining adequate water supplies and planning for future needs. | The Wyoming Water Development Office plan is listed in Table 1.2 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-5 | Glossary/Acronyms 26/65 Add the following definition to the Glossary: Law of the River - The Law of the River is a collection of binding agreements that administer the water in the Colorado River watershed. | "The Law of the River," is not discussed within the document. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-6 | Glossary/Acronyms 26/63 Add the following definition to the Glossary: Compact - An interstate compact is a contract between two or more states, often to divide shared resources. It carries the force of statutory law and allows states to perform a certain action, observe a certain standard, or cooperate in a critical policy area. | See Section 1.4 for the Planning Criteria. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-7 | Glossary/Acronyms 26/64 Add the following definition to the Glossary: Decree - A decree is an order having the force of law by judicial decree, often to divide resources between state's when an agreement is seen to be breached by one or more state in a compact and litigation is sought by one or more state's in the compact. | See Section 1.4 for the Planning Criteria. |
| 803 - Physical Resources-Water | #13785-8 | Introduction: Planning Criteria 68 1.4 Add following bullet: the RMP will follow all Compacts and Decrees the state Wyoming is a party to. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

| Resources (1300-1325) | | | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-9 | Watershed and Water Quality 288 3.4.1 For clarity, Fontenelle Reservoir should be described as not being within the study area but as a reservoir that is on the mainstem of the Green River as it is identified in the Water Resources map as bordering the study area and not actually being in the study area. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-10 | Watershed and Water Quality 288 3.4.1 "The portion of the planning area that is drained by the Green/Colorado River (Region 14, Basin 1404401) is subject to the Colorado River Compact." "The portion of the planning area that is drained by the Green/Colorado River (Region 14, Basin 1404401) is subject to the Law of the River. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-11 | Watershed and Water Quality 288 3.4.1 "The major portion of the planning area not drained by the Colorado River" "The major portion of the planning area not in the drainage of the Colorado River" | See Chapter 3 for description of Affected Environment. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-12 | Watershed and Water Quality 288 3.4.1 Wyoming has no obligations to any quantity of water to the Missouri River. Wyoming serves as a committee member to the Missouri River Recovery Implementation Committee | See revised text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-13 | Watershed and Water Quality 288 3.4.1 " Sweetwater River is located within the Missouri River Basin and is subject to all applicable rules and agreements for that watershed ....Sweetwater River is located within the North Platte River drainage and will comply with the North Platte Decree and the Platte River Recovery and Implementation Plan" | See revised text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-14 | Watershed and Water Quality 288 3.4.1 Add following as 2nd sentence " The Wyoming Constitution provides that water of all natural streams, springs, lakes, or other collections of still water be the property of the state and therefor Wyoming Title 41 will be complied with. " | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-15 | Watershed and Water Quality 288 3.4.1 "Water bodies in Wyoming are classified for water quality regulation according to beneficial uses by the Wyoming Department of Environmental Quality (WDEQ)." "Water in the State of Wyoming is permitted according to beneficial uses by the Wyoming State Engineer's Office." *As for water body quality, the Wyoming Department of Environmental Quality (WDEQ) standards should be described as recommended by that agency for an accurate description. | See revised text in Chapter 3.4.1 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-16 | Watershed and Water Quality 289 3.4.2 The Groundwater description lacks sufficient detail to convey the complexity of the system. Two possible sources to assist in the development of a proper description are the Scientific Investigations Report 2004-5214, Water Resources of Sweetwater County, Wyoming that the USGS devotes approximately 36 pages to groundwater resources and geology of the Green River Basin, and the Executive Summary to the Green River Basin Water Plan II Groundwater Study Level 1 (2007-2009) that can be found with the Green River Basin Plan on Wyoming Water Development Commissions webpage. Please contact the Groundwater division at the Wyoming State Engineer's Office or the Wyoming Water Development Commission for use or questions. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-20 | Water Resources: Assumptions 345 4.5.1 "The State of Wyoming has primacy with regard to management of water quality and distribution of water (quantity)." " Wyoming's Constitution, Title 41 dictates that all water in Wyoming is the property of Wyoming and therefor Wyoming state agencies the Wyoming Department of Environmental Quality and the Wyoming State Engineer's Office have primacy over the management of water quality and administration of water (quantity) respectively." | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-21 | Water Resources: Assumptions 345 4.5.1 "Because the state must comply with federal laws...., " Because the state must comply with interstate compacts, decrees, and federal water quality standards laws," | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-22 | Water Resources: Assumptions 345 4.5.1 "Therefore, it is assumed that any discharged water would meet effluent limits and/or water quality standards at the point of discharge. " "Therefore, it is anticipated that any discharged water would meet effluent limits and/or water quality standards at the point of discharge. " | Wording is appropriate for "Assumptions" section |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-23 | Water Resources: Assumptions 350 4.5.3 commingling comingling | Wording is appropriately used according to dictionary. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-24 | Consultation and Coordination 594 5.1.2 Coordinates and cooperates on water rights and permitting Administers and regulates Wyoming's water resources | Text is sufficient for BLM analysis needs. See Chapter 1.4 for the planning criteria. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-25 | Chapter 3 MAPS Map legends should differentiate Reservoirs and Lakes | Maps are adequately labeled for this document |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-26 | Chapter 3 MAPS Maps should have all county boundaries within the study area with clear labels, i.e. Water Resource map Sublette County label is appropriate | Maps are adequately labeled for this document |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-27 | Appendices If all the state's governing documents were listed in an Appendix (like Appendix E) it would provide clarity to how complex operations are in both quality and quantity of water, and the exercise of listing and describing the state's governing documents would assist in the inaccurate description of governing documents throughout the entirety of the RMP. | Appropriated governing documents are included in the document |
| 803 - Physical Resources-Water Resources (1300-1325) | #13785-28 | Appendix C The efforts to properly describe groundwater in 3.4.2 should carry over to amend Appendix C inaccuracies | Appendix C provides the criteria and evaluation of ACECs. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-37 | MA #1107 PR-05 Areas where the soils are highly erodible or difficult to reclaim would receive increased attention and are avoidance areas for surface disturbing activities. Surface disturbing activities could be allowed in these areas if site specific analysis determines that soil degradation would not occur, and that water quality would not be adversely affected. When applicable, an erosion control plan would be prepared as part of the site-specific analysis process for activity and implementation planning. Rehabilitation plans would be developed and implemented for disturbed areas as needed. Industry position: Not acceptable Reason: These should not be avoidance areas in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Prohibit surface disturbing activities in areas where the soils have any of the following: * A wind erodibility index greater than 100 * Saline * Sodic * Saline-sodic * 2:1 clays * Sand dunes * Slopes greater than 25% * Slumps and creeps and/or rutting * Areas that are difficult to reclaim. Manage as: 1) no surface occupancy (NSO) for fluid minerals; 2) closed to mineral material sales/disposals; 3) closed to all solid mineral leasing. Industry position: Not acceptable Reason: There should be no closures to trona leasing in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. No similar action. Avoid surface disturbing activities in areas with limited reclamation potential, subject to adequate mitigation of impacts following BLM mitigation policies. The operator must submit an approved mitigation plan before proposed project will be approved. * Controlled Surface Use (CSU) for fluid minerals. Industry position: Not acceptable Reason: Hard to reclaim soils should not be an avoidance area in the KSLA. Soil management and revegetation methodologies for hard to reclaim soils are well developed and recognized in the mining industry. Soil handling and reclamation plans for mining are reviewed and approved by WDEQ-LQD. Soil handling and reclamation plans for hard to reclaim soils will be reviewed and approved in the mine permit by WDEQ- LQD. Resource: Physical Resources (PR) - Water Resources 1300 - 1325) | A range of alternatives for soils has been analyzed in Chapter 2.2.6 management action 1107. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |

|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-38 | MA #1303 PR-10, PR-09 PR-11, BR- 22.1, BR-24, BR-31.1 Management in the planning area would emphasize: * Reduction of sediment, phosphate, and salinity load in drainages where possible. Measures listed in Appendix A would be applied, as necessary. Guidelines described in the Wyoming Water Quality Rules and Regulations would also be applied, as necessary (Wyoming 1989). * Maintaining and improving drainage channel stability. * Restoring damaged wetland areas. * Exclosures would be designed to allow ample water for livestock and allow minimum impediments to big game migration. Industry Position: Acceptable because it follows WDEQ-WQD Rules and Regulations. Management in the planning area would: * Reduce sediment, phosphate, and salinity loads where possible. Measures listed in Appendix A would be applied. * Improve drainage channel resiliency and stability (improvement could include offsite mitigation). * Restore damaged riparian/wetland areas. * Design riparian exclosures to improve water quality conditions in riparian areas. Industry position: Not acceptable Reason: Arbitrary application of Appendix A should not be applied universally, rather it should be applied as necessary. Management in the planning area would consider: * Reducing sediment, phosphate, and salinity loads in drainages where possible. Measures listed in Appendix A would be applied, as necessary. * Maintaining or improving drainage channel stability. * Restoring damaged riparian/wetland areas. * Designing exclosures to reduce impediments to wildlife movement and take into account livestock grazing and other uses. Industry Position: Acceptable. Reference to the WY requirements in Alternative A provides added value that is not included here. Emphasize management in the planning area that would: * Reduce sediment, phosphate, and salinity loads in drainages. Appropriate measures listed in Appendix A would be applied. * Maintain or improve drainage channel and watershed stability and resiliency. * Identify and restore damaged riparian/wetland areas. * Design structures, such as fencing and instream structures, with consideration of other potentially affected resources and uses. Industry position: Not acceptable Reason: Arbitrary application of Appendix A should not be applied universally, rather it should be applied as necessary. Continue to follow Alternative A because it follows WDEQ-WQD rules and regulations. | A range of alternatives has been analyzed for management of Water Resources in Chapter 2.2.6 management actions 1303. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-39 | MA #1305 PR-10, PR-09, PR-11, BR- 22.1, BR-24, BR-31.1 In the JMH planning area, the BLM would continue to participate with federal, state, and local government agencies to develop and implement salinity control plans for the Colorado River Basin and maintain existing and future applicable water quality plans. Industry position: Not applicable Reason: Applies only to JMH planning area. Participate with federal, state, and local government agencies to develop and implement salinity control measures, water quality improvement plans, and total maximum daily loads (TMDL). Participate with federal, state, and local government agencies and the Colorado River Salinity Control Forum to develop and implement salinity control plans. Industry position: Not acceptable Reason: Industry is already complying with Colorado Salinity Control Forum discharge standards and limitations based on WDEQ- WQD standards. TMDLs should not be necessary when WDEQ-WQD standards are being met. WDEQ-WQD has primacy for water quality standards and control. Same as Alternative A. Industry position: Not acceptable Reason: Only applies to the JMH planning area. Participate with federal, state, and local government agencies, affected landowners and the Colorado River Salinity Control Forum when developing and implementing salinity control measures, water quality improvement plans, salinity control plans, and TMDLs. Industry position: Not acceptable Reason: Industry works under the Salinity Forum through WDEQ-WQD standards. TMDLs should not be necessary when WDEQ-WQD standards are followed. WDEQ-WQD has primacy for water quality standards and control. Actions with the potential to create surface disturbance and potential for runoff to the Green River watershed will be designated for minimal erosion, as far as practical, to comply with the Colorado River Salinity Control Act of 1974, as applicable. Permitting and enforcement will be controlled through WDEQ-WQD salinity control standards. Language is taken from Alternatives A and D. | A range of alternatives has been analyzed for management of Salinity control measures in Chapter 2.2.6 management actions 1305. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-40 | MA #1308 PR-07 No similar action. Require best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities. Industry position: Not acceptable Reason: Modeling should not be required for all surface disturbances. "All surface disturbing activities" has not been justified and is open-ended because many disturbances for surface facilities will be very small. In addition, water quality protections are adequately covered in the WDEQ-LQD mine permit and the WDEQ- WQD Stormwater Permit Pollution Prevention Plan. May use modelling to quantify the amount of sediment, salinity and associated nutrients that would be transported to water bodies. Industry position: Acceptable Reason: Acceptable as long as water quality requirements are driven WDEQ-LQD regulations and the mine permit and WDEQ- WQD Stormwater Permit Pollution Prevention Plan. No similar action. Sediment, salinity, and other nutrients will be controlled on surface disturbances for facilities necessary for production of trona in the KSLA. Control standards and quantification, if necessary, will be determined in the WDEQ-LQD mine permit, WDEQ-WQD WYPDES permit and Stormwater Pollution Prevention Plan. | A range of alternatives has been analyzed for quantifying sediment, salinity and other nutrients in Water Resources in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws, and valid and existing rights. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-41 | MA #1309 PR-07, PR-09, PR-11, BR- 22.1, BR-24, BR-31.1 Site-specific Activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, enhance water quality) would be prepared for areas where needed. These areas include but are not limited to Cedar Mountain and Sage Creek/Current Creek. The Red Creek watershed plan would continue to be implemented as appropriate. Industry position: Not acceptable Reason: This alternative is relevant primarily to specified areas. Erosion and sediment control, revegetation, and water quality protection are primarily covered in the WDEQ-LQD mine permit and WDEQ-WQD Stormwater | A range of alternatives has been analyzed for activity and implementation plans in Water Resources in Chapter 2.2.6 management actions 1309. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws, and valid and existing rights. |

|---|---|---|---|
| | | Pollution Prevention Plan. Require site-specific activity and implementation plans to reduce erosion and sediment yield, promote ground cover, and enhance water quality for all areas. Activity and implementation plans would be site-specific watershed management stipulations and BMPs and incorporate sediment reduction and water quality improvement objectives. Industry position: Not acceptable Reason: Plans to reduce erosion and sediment yield, for revegetation, and water quality protection are in the WDEQ- LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan. Site-specific activity and implementation plans may be prepared but would not be required to reduce erosion and sediment yield, promote ground cover, and enhance water quality. Activity and implementation plans would include only general watershed management stipulations, BMPs, and incorporate sediment reduction and water quality improvement objectives if applicable land health standards are not met. Industry position: Acceptable Reason: Plans that are elective under this alternative are in the WDEQ-LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan and WYPDES permit. Prepare on a case-by-case basis site-specific activity and implementation plans to reduce erosion and sediment yield, promote ground cover, and enhance water quality. Activity and implementation plans could include general or specific watershed management terms and BMPs and incorporate sediment reduction water retention, and water quality improvement objectives. Consider all existing locally developed watershed plans as new activity and implantation plans are developed. Industry position: Not acceptable Reason: Plans to reduce erosion and sediment yield, for revegetation, and water quality protection are in the WDEQ-LQD mine permit and the WDEQ-WQD Stormwater Pollution Prevention Plan. Plans for controlling erosion and sediment yield, protecting water quality, and revegetation will be prepared as required in the WDEQ-LQD mine permit and WDEQ- WQD Stormwater Pollution Prevention Plan. Language is taken from Alternatives A and C. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-42 | MA #1313 PR-05, PR-11, PR-09 100-year floodplains, wetlands, and riparian areas are closed to any new permanent facilities (e.g. tanks, pits etc.). Proposals for linear crossings in these areas would be considered on a case-by- case basis. Industry position: Acceptable Reason: Adequate management can be applied on a case-by-case basis for such surface disturbing activities. WDEQ- WQD's stormwater and WYPDES program also required additional permitting, controls and enforcement for these activities. Prohibit surface disturbing activities and new permanent facilities (e.g., storage tanks, structure pits, etc.) within 1,320 feet (¼ mile) of 100-year floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the edge of the inner gorge of large ephemeral drainages. Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing. Avoid linear crossings in these areas. Industry position: Not acceptable Reason: 1,320 feet is arbitrary due to the inaccurate use of topography to generate flood plain maps. Many flood plain maps are out of date. Localized topography and site conditions must be taken into account, but are ignored with this language. Consider, on a case-by-case basis, surface disturbing activities and new permanent facilities (e.g., storage tanks, structure pits, etc.) proposed for placement within riparian areas or wetlands and 100-year floodplains or adjacent to the inner gorge of large ephemeral drainages. Consider, on a case-by-case basis, linear crossings in these areas. Industry position: Acceptable Reason: Adequate management can be applied on a case-by-case basis for such surface disturbing activities. WY DEQ's stormwater and NPDES program also required additional permitting, controls and enforcement for these activities. Avoid placement of permanent facilities within 100-year floodplains, and within 1,320 feet (¼ mile) of wetlands, riparian areas, and perennial streams. Avoid surface disturbing and construction activities within 500 feet of the outer edge of wetland/riparian areas or perennial streams. Avoid surface disturbing and construction activities within 100 feet of the edge of the inner gorge of intermittent channels or ephemeral drainages. Designate these areas as a right-of- way (ROW) avoidance area. Allow linear crossings if a site- specific analysis by a BLM Authorized Officer (AO) determines that no adverse impacts would be likely to occur and a plan to mitigate potential impacts to water quality is approved. Allow structures that would enhance the protection and management of streams, wetlands, and riparian areas. Approval will be on a case-by-case basis and subject to adequate mitigation of impacts following BLM mitigation policies and Wyoming BLM Mitigation Guidelines for Surface-Disturbing and Disruptive Activities. * Controlled Surface Use (CSU) for fluid minerals. Industry position: Not acceptable Reason: 1,320 feet is arbitrary due to the inaccurate use of topography to generate flood plain maps. Many flood plain maps are out of date. Localized topography and site conditions must be taken into account but are ignored with this language. Alternative C is preferred but Alternative A is also acceptable because both alternatives are based on a case-by-case evaluation and conform with WDEQ and Army Corp of Engineers requirements. | A range of alternatives has been analyzed for floodplains, wetlands, riparian areas, perennial and large ephemeral streams in Chapter 2.2.6 management action 1313-1314. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13787-43 | MA #1314 PR-05, PR-11, PR-09 In the JMH planning area, permanent facilities such as tanks and pits are not allowed in 100-year floodplains, wetlands, or riparian areas. However, structures that would enhance the protection and management of 100-year floodplains, wetlands, and riparian areas could be considered. Proposals for linear crossings in these areas would be considered case by case. Industry position: Not applicable Reason: Applicable to JMH. See management action 1313. Industry position: Same as MA #1313 See management action 1313. Industry position: Same as MA #1313 See management action 1313. Industry position: Same as MA #1313 | A range of alternatives has been analyzed for floodplains, wetlands, riparian areas, perennial and large ephemeral streams in Chapter 2.2.6 management action 1313-1314. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water | #13787-44 | MA #1320 PR-07 PR-05 PR-11 No similar action No similar action No similar action Avoid or mitigate, on a case-by-case basis, BLM-authorized activities and infrastructure such as unlined impoundment ponds/pits, reserve pits, and evaporation ponds that could result in the contamination of sensitive water resources, including Source Water | A range of alternatives for BLM-authorized activities and infrastructure has been analyzed in Chapter 2.2.6 management action 1320. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter |

|---|---|---|---|
| Resources (1300-1325) | | Protection Areas identified in Wellhead or Source Water Protection Plans approved local governing bodies and "High" and "Moderately High" sensitivity aquifer systems identified through the use of the Wyoming Groundwater Vulnerability Assessment Handbook or similar document as updated over time. Industry position: Not acceptable Reason: This management action should include 'avoid, minimize or mitigate only NEW activities on a case-by-case basis'. As written, it applies to valid existing facilities. BLM should refer to WDEQ Rules and Regulations and oversite of such programs. Wyoming has primacy for watershed protection, NPDES, stormwater and underground injection control for the protection of such water source in Wyoming. Alternative D must be modified to be acceptable, as provided. | 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-1 | a | |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-7 | 3. Watershed and Water Quality A. MA # 1308 Alternative B of MA #1308 would require "best available modeling" to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies during all surface activities. Proper implementation of sediment and erosion control BMPs, as is the current practice and required under MA #1309, renders this requirement unnecessary. Additionally, Total Dissolved Solids (TDS) and Total Suspended Solid (TSS) modelling for any proposed surface disturbing activity could greatly burden PacifiCorp's O&M activities, potentially delaying responses to emergencies and impacting power reliability to customers. In addition to adding expense and time delays to utility projects, this requirement would also place a burden on the BLM to evaluate the models. The language in Alternative B is also unclear as to the circumstances in which modeling would be required. For example, it could be interpreted to apply to "all surface disturbing activities," which would require modeling in all areas, including where sediment may not reach a water body. Even if the correct intent of Alternative B is only to model in situations where materials would enter water bodies, modeling would likely need to occur for all activities, which is an unnecessary use of utility and agency resources. Because water resource goals can be otherwise and more efficiently achieved through the application of BMPs, PacifiCorp recommends that the BLM adopt Alternatives A or D under MA #1308, requiring no modeling to quantify sediment, salinity or associated nutrients. | A range of alternatives has been analyzed for quantifying sediment, salinity and other nutrients in Water Resources in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-8 | B. MA #1309 Alternative B of MA #1309 requires site-specific activity and implementation plans for all surface disturbing activities. This is likely to cause an unsustainable burden on both the BLM and companies with added costs to projects and time delays. In some areas these plans may not be of significant value. Consequently, PacifiCorp recommends that the BLM adopt Alternatives C or D under MA #1309, allowing for site specific activity and implementation plans as appropriate on a case-by-case basis. | A range of alternatives has been analyzed for activity and implementation plans in Water Resources in Chapter 2.2.6 management actions 1309. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-9 | Alternative B of MA #1313 would require avoidance of linear crossings within ¼ mile of 100-year (1%) floodplains, wetlands, riparian areas and perennial streams. The design of high-voltage transmission lines typically spans these sensitive water/wetland resources. Creating avoidance areas within ¼ mile would greatly add costs when delineating aquatic resources to determine compliance with this buffer, even if the resources are just spanned. Further, siting power lines to avoid these buffers, even if water resources are not directly impacted, could put other resources at risk due to re-routing, longer routes, and other potential resource impacts. Alternative B could also impede the ability of BCC to fulfill already existing permits and mine lease obligations. PacifiCorp recommends that the BLM adopt Alternatives A or C under MA #1313, as these alternatives consider projects on a case-by-case basis, including linear crossings which would allow for consideration of shorter routes to impact fewer resources. | A range of alternatives has been analyzed for floodplains, wetlands, riparian areas, perennial and large ephemeral streams in Chapter 2.2.6 management action 1313-1314. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-10 | D. MA #1324 MA # 1324 would prohibit vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants under Alternatives B and D. This would severely limit PacifiCorp's ability to perform Integrated Vegetation Management (IVM) on its ROWs (see additional comments under Section 4 "Vegetative Communities and Invasive Species"). Herbicides have been safely used by PacifiCorp near wetland and riparian areas with the BLM's approval for many years. Alternatives B and D would place large restrictions on the areas in which herbicide treatments can be utilized as an effective tool, and could jeopardize PacifiCorp's ability to safely operate its system. PacifiCorp recommends that the BLM adopt Alternative C for MA #1324, as this would allow PacifiCorp to continue its current IVM plan to target non-desirable plant species with the application of herbicides according to their label in proximity to wetlands, riparian areas, and aquatic habitats. | A range of alternatives has been analyzed for herbicide and pesticide loading, maintenance and refueling in Chapter 2.2.6 management action 1324. Application of chemicals are addressed in management actions 4212-4213. Analysis of impacts for actions in each alternative if found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-50 | As mentioned above, Alternative B also conflicts with regulatory requirements associated with thermal generation and coal mining. PacifiCorp co-owns and operates the Jim Bridger Power Plant located approximately seven miles north of Point of Rocks in Sweetwater County, Wyoming, which is within the boundaries of the area addressed by the RMP and DEIS. The continued operation of the plant may be negatively impacted by the selection of Alternative B. Increased restrictions outlined in proposed Alternative B addressing soil and geologic resources, water resources, and hydrogeologic investigations could pose difficulty for the plant in complying with requirements of the Environmental Protection Agency's coal combustion residual (CCR) requirements. | A range of alternatives has been analyzed in DEIS in Chapter 2.2.6. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and valid and existing rights. |

|---|---|---|---|
| 803 - Physical Resources-Water Resources (1300-1325) | #13865-57 | o "Control the spread and effects of invasive non-native plant species (Evangelista et al. 2011), including treating weeds prior to surface disturbance and washing vehicles and equipment at designated wash stations when constructing in areas with weed infestations." PacifiCorp routinely washes its vehicles off-site in order to maintain a fleet of clean vehicles and prevent the spread of weed seeds. However, vehicles must travel from commercial wash stations to field sites. Some projects have required on-site vehicle wash stations, and our experience with these facilities has raised concerns. Such wash sites, which are not as efficient as commercial wash stations, can expend water resources that are otherwise limited. During cold temperatures, wash stations can result in icy conditions that pose a safety hazard to those working around them. Consequently, PacifiCorp requests that the BLM allow off-site wash stations to be an acceptable method to prevent the spread of weed seeds. | See Appendix A.1.1 for discussion of when and how Project Design Features and Best Management apply. The referenced section does not imply on-site or off-site. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13904-1 | MA 1302 Alt B Wyoming Land Health Standards are not referenced and should be. It defers consideration of potential grazing adjustments to meet conflicts, if any, with big game parturition, to the permit renewal process. Site specific management with a flexible time frame is correct. Direct management in wetland and riparian areas toward meeting or making progress toward Wyoming Land Health Standards as a minimum. | The language in Management Action 1302 is adequate. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13910-2 | Make NEPA efforts for certain projects easy for wildlife habitat focus, in particular projects such as stabilizing/improving drainages (including intermittent) through projects such as Zeedyke structures. | NEPA for specific projects is outside of the scope of this document, as they are implementation level actions. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13916-1 | MA 1302 Alt B Wyoming Land Health Standards are not referenced and should be. It defers consideration of potential grazing adjustments to meet conflicts, if any, with big game parturition, to the permit renewal process. Site specific management with a flexible time frame is correct. Direct management in wetland and riparian areas toward meeting or making progress toward Wyoming Land Health Standards as a minimum. | The language in Management Action 1302 is adequate. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13923-15 | As described in Management Action #1308, Alternative B will, "Require best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities." Completing this modeling would require significant commitment of resources upfront from the BLM and/or a project proponent. What is the practicality of the BLM monitoring and analysis for soil, for example, when it comes to being able to conduct these surveys, inventory, monitoring, and analysis? | A range of alternatives has been analyzed for quantifying sediment, salinity and other nutrients in Water Resources in Chapter 2.2.6 management actions 1308. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #13925-5 | management actions in Alternative B that purport to regulate air and water quality unlawfully attempt to preempt state programs. BLM lacks any regulatory authority over air or water quality. Congress delegated air and water quality authority to the Environmental Protection Agency, which in turn delegated it to the State of Wyoming or Wyoming Department of Enviornmental Quality (WDEQ). BLM can neither develop new standards or enforce the air or water quality rules. The draft RMP also fails to recognize WDEQ best management practices for nonpoint source water pollution. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies |
| 803 - Physical Resources-Water Resources (1300-1325) | #13925-41 | The alternatives describe 100-year floodplains as closed to permanent facilities. The problem with these management actions is 100 year floodplains are not defined out side of urban areas. And where defined or mapped is subject to challenge as the 100-floodplains are generally inaccurate in description and often illogical when professional surveys are conducted to identify. Alternative B describes an illogical stipulation of no occupancy within 1320 feet as if all floodplains, and does not consider changes in topographic elevation above flood elevations within a zone 1320 feet. The Alternatives need to describe how the 100 year flood plains are identified and how to locate on the ground. Even within urban areas 100- year flood plains are defined by FEMA and are debatable for elevation accuracy. Alternative B would create barriers for linear facilities and eliminate the ability to mitigate with acceptable engineering design Recommend: The 100 year floodplain wetlands and associated wetlands, if defined by FEMA or other authorized agency, are closed to permanent structural facilities and pits. Linear crossings in these areas would be considered on a case by case basis. | A range of alternatives has been analyzed for placement of facilities in 100 year floodplains in Chapter 2.2.6 management action 1313. Analysis of impacts from actions in each alternative is found in Chapter 4 |
| 803 - Physical Resources-Water Resources (1300-1325) | #13925-42 | Alternative B would create ½ mile corridors of riparian types where there can be no treatment to control noxious and invasive species. Numerous noxious weeds and invasive species thrive adjacent to riparian areas, such as Russian olive, tamarisk, white top, Russian knapweed, Canadian thistle, etc. Herbicide technicians are trained to protect water resources during application of herbcides. A combination of the narrative of Alternative A and D is recommended as professional and logical. Currently BLM has not approved Rejuvra (Indaziflam) the latest herbicide to combat cheatgrass, ventenata and medusahead. The combination of Alternative B and no approval of Indaziflam will impact Weed and Pest Districts ability to control noxious weeds and invasive species on public land in Sweetwater County. Recommendation is for the Task Force to seek professional comment from Sweetwater, Unita and Fremont County Weed and Pest Districts. | A range of alternatives has been analyzed for application of chemicals near wetlands, riparian areas, aquatic habitats and special status plants in Chapter 2.2.6 management actions 4212-4213. Analysis of impacts for actions in each alternative if found in Chapter 4. |
| 803 - Physical Resources-Water | #13951-17 | Page 2- 14; Physical Resources #1303 "Management in the planning area would: * Reduce sediment, phosphate, and salinity loads where possible. Measures listed in Appendix A would be applied. * Improve drainage channel resiliency and stability (improvement could include offsite mitigation). * Restore damaged riparian/wetland areas. * | A range of alternatives has been analyzed for water resource management in the planning area in Chapter 2.2.6 management action 1303. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (1300-1325) | | Design riparian exclosures to improve water quality conditions in riparian areas." -Alternative A specifically references the Wyoming Water Quality Rules and Regulations ensuring consistency with Wyoming regulations and maintenance of primacy over water quality. Alternative A also requires that exclosures be designed for "ample water flow for livestock and allow minimum impediments to big game" which I support. | |
| 803 - Physical Resources-Water Resources (1300-1325) | #14023-9 | The Rock Springs District RMP should be driven by a conservation agenda, one that will conserve the best of the unique landscapes, habitats, and native biodiversity it sustains. The RMP should re?ect the District's place in the larger Wyoming landscape; its critical role in providing winter habitat for wildlife that summers tens, if not hundreds of miles to the north. It should also protect, and where and whenever possible enhance habitats for resident wildlife and native plants. It should evaluate, consider, and mitigate how energy development impacts air- and watersheds far removed from the district. It should recognize, respect, and protect the history and locations once utilized by our indigenous ancestors. | A range of alternatives for management of resources in the planning area is found in Chapter 2.2.6. Analysis of impacts for the actions in each of the alternatives is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #14032-5 | The EPA appreciates the presentation of major waterbodies and rivers, and principal aquifers in the BLM planning area found in Appendix A, Map 3-1, as well as the information related to water resources under each alternative presented in Chapter 4.5 of the Draft RMP/EIS. However, the discussions in Chapters 3.4 and 4.5 contain no specific information regarding ephemeral streams. Ephemeral stream systems provide key ecological and hydrological functions by moving water, nutrients, and sediment throughout the watershed. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #14032-6 | EPA further recommends that the Final RMP/EIS provide a more complete description of current water quality conditions for surface water bodies within the planning area and whether BLM management actions under the current RMP have influenced those conditions. The Draft RMP/EIS indicates that the subsurface decision area for fluid minerals under the preferred alternative includes lands containing intermittent, perennial, and ephemeral streams, including approximately 64 miles of impaired streams. We recommend that waterbodies within the planning area including perennial, intermittent and ephemeral water bodies, water body segments classified by the WYDEQ as water quality impaired or threatened under Clean Water Act (CWA) Section 303(d), and water bodies that have not yet been assessed by the WYDEQ for impairment status are clearly identified in the Final EIS/RMP. We recommend that the Final RMP/EIS include a table that identifies the designated uses of water bodies and the specific pollutants of concern, where applicable. Inclusion of this important baseline information about existing water quality conditions is necessary for an accurate evaluation of whether BLM management actions have contributed to the impairments and any other identified water quality issues. This should then inform the development of future management directions. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Executive Summary, chapter 4.2.2 Availability of Data and Incomplete Information, 4.2.3 Analysis Assumptions for adequacy of data and analysis. |
| 803 - Physical Resources-Water Resources (1300-1325) | #14032-7 | The preferred alternative includes MA #1313 stipulation, which prohibits surface disturbing activities and new permanent facilities within ¼ mile of 100-year floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the edge of the inner gorge of large ephemeral drainages (Draft RMP/EIS Appendix B, pp. 12-13). EPA recommends changing the stipulation to apply to all ephemeral drainages, as there is no definition in the RMP for "large ephemeral drainages" and doing so would both ensure protection of ecological and water quality connections and be simpler to apply. Further, cumulative impacts in the vicinity of smaller ephemeral drainages may lead to aggregate impacts that could be equivalent to impacts to a larger drainage. The habitat provided by these types of streams plays a large role in the arid and semi-arid west, making up the majority of water resources and playing essential roles in protecting downstream water quality. | A range of alternatives has been analyzed for placement of facilities in 100 year floodplains in Chapter 2.2.6 management action 1313. Analysis of impacts from actions in each alternative is found in Chapter 4. |
| 803 - Physical Resources-Water Resources (1300-1325) | #14032-8 | We are concerned that Alternative B's stipulations and notices for the protection of water and water- related resources only apply to BLM-administered lands and not to split-estate lands. It is our understanding that BLM operates under many of the same legal requirements on split estate lands as it does on lands wholly owned by the federal government. We recommend applying each lease stipulation and notice to both BLM-administered and split estates and allow for any necessary changes after consultation with surface owners through the standard exception, modification, and waiver procedures. | See Chapter 1.4 Planning Criteria and Chapter 5.1 and 5.1.1 for compliance with applicable laws, and consultation and coordination with other agencies |
| 803 - Physical Resources-Water Resources (1300-1325) | #14032-9 | As identified in the MA #1313 stipulation, surface disturbance is prohibited within ¼ mile of 100- year floodplain. We recommend the Final RMP/EIS utilize one or more of the FFRMS approaches, where applicable, to potentially refine stipulations (e.g., consider whether development should be located outside of the 500-year floodplain), as well as aid in development of the trends analyses of the affected environment sections within the RMP, with consideration of what are the existing and approved developments in 500-year floodplains on the RSFO. As identified in MA #1313, it would be pertinent to evaluate past and future activities within the 500-year floodplain to adequately avoid impacts from extreme weather events. | A range of alternatives has been analyzed for placement of facilities in 100 year floodplains in Chapter 2.2.6 management action 1313. Analysis of impacts from actions in each alternative is found in Chapter 4. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #4026-9 | Chapter 3.22.2 Wilderness Study Areas (WSA). In order for an area to have been designated a WSA, those lands had to have been determined to possess wilderness characteristics. In other words, all WSAs are also LWCs. I have participated in the BLM WSA process since the late 1970s and have been dismayed over the years when politicians sponsored legislation to unilaterally remove WSA status from BLM lands that underwent extensive agency review and public comment. I fully support Alternative B, where if an existing WSA has that status removed, those lands would still be considered LWCs and will subsequently be managed to protect those | A range of alternatives has been analyzed for potential dismissal of Wilderness Study Areas in Chapter 2.2.6, Special Designations - Wilderness Study Area, Management Action 7101. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | wilderness characteristics. This proposed management falls completely within the guidelines of Chapter 1.6 A of BLM Manual 6310. | |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #4026-19 | Chapter 4.14.1 Lands with Wilderness Characteristics, Assumptions. I recommend an additional assumption be added to this section per language contained in BLM Manual 6310 (Section 1.6.A). This assumption could be worded as: "Regardless of past inventory, the BLM must maintain and update as necessary, its inventory of wilderness resources on public lands. In some circumstances, conditions relating to wilderness characteristics may have changed over time, and an area that was once determined to lack wilderness characteristics may now possess them." | The analysis assumptions listed in 4.14.1 are adequate. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #9853-4 | Lands with Wilderness Characteristics (Pages 2-22 through 2-25) While SVP supports the requirements to maintain lands with wilderness characteristics and particularly alternatives that would prohibit mineral explorations (e.g., Alternative B of MA# 1502), SVP finds most of the alternatives in this entire section (Pages 2-23 through 2-25) to be vague in relation to how the paleontological activities can be carried out. Because paleontological resources commonly occur in such wilderness areas, having no management in those areas as suggested in Alternative C of MA#s 1501-1517 would be problematic. SVP prefers an alternative (e.g., Alternative D where 'Manage for multiple use' is noted) that would allow paleontological inventories/surveys, excavations, and mitigations, that may involve some degree of surface disturbances, on a case-by-case basis. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #10494-6 | In the 1970's BLM, under the direction of Congress, identified all areas with wilderness characteristics worthy of protection and designated them as Wilderness Study Areas. Approximately ten of these WSA's lie within the Rock Springs Management Area and are managed as de facto Wilderness pending any future action by Congress. BLM today should not second-guess the work of their predecessors by attempting to broaden wilderness protections through the designation of Lands with Wilderness Characteristics. | Wilderness Study Area designation process is covered in section 3.22.2. Alternatives for management are analyzed in Chapter 2.2.6, section Special Designations, Wilderness Study Area, management actions 7100-7103. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13515-5 | Instead of independent (large and small) ACEC management direction, RMEF recommends that specific management treatments and decisions be made at the project level where potential impacts can be better assessed. Special Designation Wilderness designation (Wilderness Areas - WA, Lands with Wilderness Characteristics - LWC, and Wilderness Study Areas - WSA) and ACECs often restrict various active land management activities that are needed to ensure healthy, sustainable landscapes. This concept is embedded in several proposed land use designations. RMEF supports active management on our public lands to benefit wildlife habitat and manage fire risk. Given the current conditions of many public forests and rangelands, RMEF supports planning components that limit additional wilderness and other special designations that limit management. | See Chapter 3.22 of the DEIS for information about special designations in the planning area and Chapter 4 for analysis results from all four alternatives. Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. Wilderness Study Area designation process is covered in section 3.22.2. Alternatives for management are analyzed in Chapter 2.2.6, section Special Designations, Wilderness Study Area, management actions 7100-7103. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13527-1 | BLM has identified eight areas within the planning area, totaling 63,918 acres, that have been found to have wilderness characteristics, although they are not within wilderness study areas. MOS believes the approach in Alternative B will best protect the wilderness values of these areas. They should be managed so as not to impair their suitability for designation as wilderness. Appropriate guidance appears in BLM's Manual 6330 for Management of Wilderness Study Areas. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each alternative can be found in Chapter 4. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13624-16 | Additionally, the Draft RMP/EIS repeatedly states that BLM will "manage all lands identified as having wilderness characteristics specifically to preserve those characteristics." Draft RMP/EIS, Ch. 2, pp. 2-23 to 2-24. BLM should explain what it means to manage for "wilderness values" as opposed to managing for "wilderness characteristics." Because there is no scientific or regulatory information or explanation differentiating management for wilderness values, wilderness characteristics or lawfully designated wilderness areas - it appears the BLM will manage any portion of the RMP as a wilderness area designated by Congress. Again, BLM does not have the authority to manage areas that are not lawfully designated wilderness in the same manner as lawfully designated wilderness areas. BLM has also failed to identify whether the lands proposed to be managed for "wilderness values or wilderness characteristics" includes acreages that will be impacted by leasing withdrawals. | Text has been updated. See updates to Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for clarification of language. See same section for analysis of a full range of alternatives regarding potential management decisions in these areas. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13624-17 | Management for "wilderness values" also ignores the proper process for designating wilderness areas in accordance with the National Wilderness Preservation System and 16 U.S.C 1131 et al. To designate a wilderness area the Secretary of Interior must make a recommendation to the President that asserts public notice and public hearing or hearings are completed and the Secretary of Interior "advise[d] the Governor of each State and the governing board of each county. . . in which the lands are located, and Federal departments and agencies concerned, and invite such officials and Federal agencies to submit their views on the proposed action at the hearing or by no later than thirty days following the date of the hearing". 16 USC 1132(d)(1). This process was not conducted for the Draft RMP/EIS. BLM should identify the designation process that will be followed to meet these requirements and commit to engaging with the Governor and county commissioners before managing areas within the RMP for "wilderness values". | Wilderness Study Area designation process is covered in section 3.22.2. Alternatives for management are analyzed in Chapter 2.2.6, section Special Designations, Wilderness Study Area, management actions 7100-7103. |

|---|---|---|---|
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13624-18 | Management for "wilderness values" as proposed in Alternative B also significantly differs from the other proposed alternatives. Under Alternatives, A, C and D, the RMP would be managed in accordance with either the approved Green River RMP (Alternative A), for multiple use (Alternative C), or the area would no longer be subject to management as Wilderness Study Areas (Alternative D). Draft EIS, Ch. 2, p. 2-152. BLM has failed to explain why wilderness management significantly differs among the proposed alternatives and, most importantly, why Alternative B is the preferred management plan for wilderness areas. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13624-19 | Enclosed Map 2 depicts WDEQ's understanding of the proposed Wilderness Study Areas. Wilderness Study Areas identified by BLM as having wilderness characteristics is provided in Map 3. If the lands proposed as having "wilderness characteristics" are managed as wilderness, then access to the Wilderness Study Areas appears to be restricted. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. Route specific designations are outside the scope of this DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13748-6 | MA# 1500-1517, Alternative D: We recommend that the BLM manage all Lands with Wilderness Characteristics for multiple use, not preservation. Rationale: We believe these landscapes need active management and are concerned that permittees will not be able to access roads and make necessary improvements if LWCs are managed to preserve their wilderness values. These lands also risk infestation from invasive annual grasses if managed as for wilderness characteristics. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. Route specific designations are outside the scope of this DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13751-117 | MA #1502 ALT B Manage as: 1) closed for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing; 4) an exclusion area for all new ROW; 5) pursue withdrawal from mineral location. Industry position: Not acceptable Reason: Section 201 of Federal Land Policy and Management Act (FLPMA) requires the BLM to maintain an inventory of all public lands and their resources and other values, which includes wilderness characteristics. It states that the preparation and maintenance of the inventory shall not, of itself, change or prevent change of the management or use of public lands. ALT C All lands identified as having wilderness characteristics would not be managed to protect those characteristics. Industry position: Not acceptable Reason: Does not align with PR-13 which would manage lands with wilderness characteristics as appropriate. Should be evaluated on a case-by-case basis. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13784-7 | * MA#1501, Alt B: "Allow motorized travel only for access to state/private parcels." (p.2-23) Comment: MA#1501 will undoubtedly impact livestock grazing permittees from managing their federal grazing permits, prohibit them from using motorized vehicles to load and unload livestock, repair fence, check stock water, or deliver salt and minerals to livestock. Not only will this MA impact livestock grazing permittees, but also recreationist and hunters. BLM will have to close these roads under a travel management plan, because the agency will not have the manpower to ensure compliance of trespass. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. Route specific designations are outside the scope of this DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13784-8 | MA#1506, Alt B: "Pursue acquisition of the state parcel." (p.2-23) Comment: Federal grazing permittees who are also grazing lessees on Office of State Lands and Investment sections will certainly have concern regarding the loss of their state leases due to MA#1506. | See DEIS Chapter 2.2.6 section Land Resources - Lands with Wilderness Characteristics, Management Action 1505 and 1506 for a full range of alternatives analyzed regarding parcel WY040-2011-021. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13784-60 | "Managing lands with wilderness characteristics specifically to preserve those characteristics would prevent surface disturbance..." (p. 4-177) Comment: Preventing surface disturbing activities under Alternative B, and according to the BLM would exclude all range improvement projects. This will have significant impacts to the livestock grazing industry by reducing the ability to manage livestock to meet or make progress towards meeting Wyoming Land Health Standards. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. See impacts of other alternatives on Livestock Grazing in sections 4.16.2, 4.16.4, and 4.16.5. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13787-45 | MA #1502 PR-13 No similar action Manage as: 1) closed for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing; 4) an exclusion area for all new ROW; 5) pursue withdrawal from mineral location. Industry position: Not acceptable Reason: Section 201 of Federal Land Policy and Management Act (FLPMA) requires the BLM to maintain an inventory of all public lands and their resources and other values, which includes wilderness characteristics. It states that the preparation and maintenance of the inventory shall not, of itself, change or prevent change of the management or use of public lands. All lands identified as having wilderness characteristics would not be managed to protect those characteristics. Industry position: Not acceptable Reason: Does not align with PR-13 which would manage lands with wilderness characteristics as appropriate. Should be evaluated on a case-by-case basis. No similar action BLM will manage lands with wilderness characteristics as appropriate and will be evaluated on a case-by-case basis. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Action 1502, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each alternative can be found in Chapter 4. |
| 804 - Physical Resources-Lands with | #13806-2 | (In reference to management actions 1502-1517). As we stated in the original Citizens' Wilderness Proposal, these wilderness areas are "irreplaceable" and this management should be retained in the final plan so as to not lose this unique resource. I would like to note that while in 1994 we expressed concern over "dirt bikes and off-road vehicle | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Wilderness Characteristics (1500-1517) | | use," many of the areas proposed in the preferred alternative as LWCs to be managed for their wilderness characteristics contain two-tracks frequently used by members of the public. I recommend allowing use on existing roads in these areas until travel management planning can occur to allow the public time for comment on which, if any, should remain open, and to prioritize these areas for such planning so as to best preserve their wilderness values (In reference to management action 1501). | alternative. Route specific designations are outside the scope of this DEIS. Impacts from each alternative can be found in Chapter 4. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13845-13 | An accurate, comprehensive inventory of LWCs has not occurred as part of the Rock Springs RMP revision process. The BLM has policy and guidance regarding its obligation to inventory LWCs and consider protection of those values. FLPMA requires the BLM to inventory and consider LWCs during the land use planning process. 43 U.S.C. § 1711(a); see also Ore. Natural Desert Ass'n v. BLM, 625 F.3d 1092, 1122 (9th Cir. 2010). IM 2011-154 and Manuals 6310 and 6320 contain mandatory guidance on implementing this requirement. The guidance directs BLM to "conduct and maintain inventories regarding the presence or absence of wilderness characteristics, and to consider identified lands with wilderness characteristics in land use plans and when analyzing projects under [the National Environmental Policy Act]." This includes the "necessary forms for each area" including photo logs, route analysis forms, and inventory area evaluations (Manual 6310, Appendices A-D). Manual 6310 reiterates that, "[r]egardless of past inventory, the BLM must maintain and update as necessary, its inventory of wilderness resources on public lands." Agency policy also clearly articulates the obligation and protocol for assessing new information regarding LWC inventories when undergoing a land use planning process in addition to when "(t)he BLM has new information concerning resource conditions, including wilderness characteristics information submitted by the public that meets the BLM's minimum standard described in the Wilderness Characteristics Inventory Process section of this policy." (BLM Manual 6310.06(A)). It is the Field Manager's responsibility to "Review and document relevant data, including citizen-submitted information, for conducting and maintaining the wilderness characteristics inventory on a continuing basis." (BLM Manual 6310.04(C).Given this policy guidance, BLM should address and update LWC inventories in the Rock Springs RMP. | A lands with wilderness characteristics inventory was completed for the entire field office as part of this RMP planning effort and can be found on the Project's ePlanning page at https://eplanning.blm.gov/eplanning-ui/project/13853/570. The identified parcels can be seen on Map 3-21 in the DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-4 | B. BLM must complete an updated inventory of lands with wilderness characteristics across the field office to inform the NEPA and planning processes. In compliance with FLPMA, BLM is required to maintain an inventory of LWC on a continuing basis, including during land-use planning, or when the public identifies wilderness characteristics as an issue during a NEPA process or submits new information concerning wilderness resources.25 NEPA also imposes a continuing obligation on agencies to take a hard[...] look at new circumstances or information relevant to environmental impacts of proposed actions.26 Wilderness inventories must be maintained and updated on a continuing basis, and relevant citizen-submitted data is to be evaluated in a timely manner.27 This includes the "necessary forms for each area" including photo log, route analysis forms and inventory area evaluations.28 Manual 6310 reiterates that, "[r]egardless of past inventory, BLM must maintain and update as necessary, its inventory of wilderness resources on public lands."29 It is our understanding that BLM believes it has completed Lands with Wilderness Characteristics inventory that is compliant with Manual 6310. We dispute this understanding, as explained below. | A lands with wilderness characteristics inventory was completed for the entire field office as part of this RMP planning effort and can be found on the Project's ePlanning page at https://eplanning.blm.gov/eplanning-ui/project/13853/570. The identified parcels can be seen on Map 3-21 in the DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-5 | a. RSFO inventory is non-compliant. The Rock Springs draft RMP and EIS are relying on inventories that are non-compliant, outdated, and inaccurate. BLM must reassess and make appropriate changes to its previous inventories, particularly those conducted over a decade ago and before the issuance of Manual 6310. In particular, BLM must assess where on the ground conditions have changed, where previous inventories are not compliant with Manual 6310, and where citizen inventories have pointed out inconsistencies in findings for LWCs or errors with the BLM inventories. Previous comments submitted by our organizations have pointed out the deficiencies in the BLM's inventory, including faulty boundary delineation, improper assessments of naturalness, and arbitrarily narrow interpretations of outstanding opportunities for solitude or primitive and unconfined recreation, for areas including Devil's Playground: Anvil Wash, Twin Buttes Draw, Henry's Fork Hills, WSA Contiguous Unit, and Sage Creek Mountain Badlands; Cedar Mountain North Basin, Dry Creek, North Point, Canyons, and Little Dry Creek; and Southwest Buttes, The Pinnacles, Harris Slough area, and Joe Hay Rim.30Since the BLM's inventory was finalized in 2014, citizens have submitted numerous LWC inventories in the planning area. We dispute BLM's dismissal of these inventories for the same reasons we dispute BLM's own inventory, listed above. | A lands with wilderness characteristics inventory was completed for the entire field office as part of this RMP planning effort and can be found on the Project's ePlanning page at https://eplanning.blm.gov/eplanning-ui/project/13853/570. The identified parcels can be seen on Map 3-21 in the DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-6 | b. Recommended relief for non-compliant BLM inventory. For reassessed previous inventories BLM should clarify how it plans to incorporate new wilderness characteristics information into the Final RMP and EIS. Review and consideration of this inventory should be completed prior to the record of decision (ROD) being published. If the BLM's LWC inventory update cannot be completed and incorporated into this planning process prior to the signing of the ROD, BLM should include language committing to updating the LWC inventory within one year of the completion of the ROD, and committing to deferring any surface disturbing activities, including the issuance of applications for permit to drill (APDs), or mineral leasing, in any identified wilderness inventory unit until the inventory is updated according to BLM Manual 6310. This language would provide the public with necessary assurance that BLM will update required wilderness inventories in a timely manner and ensure that wilderness qualities are not lost prior to the agency completing the inventory process. | A lands with wilderness characteristics inventory was completed for the entire field office as part of this RMP planning effort and can be found on the Project's ePlanning page at https://eplanning.blm.gov/eplanning-ui/project/13853/570. The identified parcels can be seen on Map 3-21 in the DEIS. |

|---|---|---|---|
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-7 | c. Error in draft RMP regarding units WY040-2011-029 and WY040-2011-030 The BLM recognizes nine units of Lands with Wilderness Character in the draft RMP and EIS: WY040-2011-014 (Dry Hollow Creek), WY040-2011-021 (Teepee Mountain), WY040-2011-027 (Potter Mountain), WY040-2011-029 (Laney Rim), WY040-2011-059 (North Pacific Creek), WY040-2011-062 (Hay Ditch), WY040-2011-069 (Mowing Machine Draw), WY040-2011-074 (Bush Creek), and WY040-2011-088 (Bear Creek Trail). Map 3-21 in the draft RMP appears to make an error-including WY040-2011-030 in the legend. This unit is not listed elsewhere in the document as an LWC inventoried unit recognized by the BLM. Map 3-21 neglects to include WY040-2011-029. It's possible that the legend of Map 3-21 mistakenly identifies WY040-2011- 029 Laney Rim as WY040-2011-030. This error should be fixed in the final RMP. | See updates to Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Action 1509 for change of parcel number listed. Changed WY040-2011-029 to correct parcel, WY040-2011-030. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-8 | C. Lands with wilderness characteristics should be managed to preserve those qualities. Alternative B in the draft RMP would manage all nine units of BLM-inventoried Lands with Wilderness Characteristics to preserve wilderness qualities31. These units would be closed to fluid minerals, mineral material sales/disposal, closed to solid mineral leasing, exclude new Rights-of-Way, and would be included in the proposed solid mineral withdrawal.32 We support these decisions to maintain these wilderness qualities for these important areas and request that motorized travel should be restricted to existing roads within LWC units and these areas should be prioritized for future Travel Management Planning. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. Route specific designations are outside the scope of this DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-9 | These LWC units represent just under 2% of the Field Office, a small fraction of the lands therein, and do not represent the total acreage we believe exists with wilderness qualities. Preserving these wilderness qualities will help achieve President Biden's commitment to protect 30% of our nation's lands and waters by 2030. The success of this 30x30 initiative will hinge on using opportunities like resource management plan revisions to ensure that more acres will be managed to maintain a primarily natural state, where ecological processes take precedence, where wildlife connectivity and intact habitats are prioritized, and where clean air and water resources are protected | Note Chapter 4.21.1, Special Designations. Under all 4 alternatives the acreages designated as Wilderness Study Areas remains the same. 227,960 acres. See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in Lands with Wilderness Characteristics. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-10 | While we support Alternative B's management actions to manage nine LWC units to preserve their character, we maintain that for BLM to achieve a true accounting of wilderness resources in the planning area, updates to the LWC inventory are imperative. BLM must correctly inventory all qualifying lands contiguous to existing WSAs (especially those adjacent to Devil's Playground and Twin Buttes WSAs) and reassess existing inventory units that do not meet the guidance in Manual 6310 (including disqualifying areas because of overly narrow interpretations of naturalness and mistaken identification of two-track routes that were not constructed or maintained using mechanical means) | A lands with wilderness characteristics inventory was completed for the entire field office as part of this RMP planning effort and can be found on the Project's ePlanning page at https://eplanning.blm.gov/eplanning-ui/project/13853/570. The identified parcels can be seen on Map 3-21 in the DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-11 | BLM can and should protect wilderness-quality lands that are encumbered by existing oil and gas leases. Existing leases within the field office must not affect BLM's decision to close areas to new leasing throughout this environmental analysis and should not be used as reasoning to disqualify lands with wilderness character from the inventory or from management to maintain that character. Leases are issued for 10-year terms and frequently expire without being developed. It is unreasonable for BLM to make long-range planning decisions in resource management planning based on short-term resource commitments, like leases. Closing areas to leasing does not impact BLM's ability to manage an existing lease were it to go into development. On the other hand, opening an area to leasing impacts BLM's ability to manage other multiple uses in the area, as seen by discretionary choices to determine lands lacking wilderness qualities because of the existence of oil and gas leases.33 The most reasonable approach is to close areas to leasing that have important and rare natural resources, such as wilderness characteristics, thereby minimizing resource conflicts by preventing additional leasing while existing leases run their course. This approach would also increase decision space over time, enabling BLM to better protect wilderness quality lands and other important resources. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each alternative can be found in Chapter 4 |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13899-12 | BLM should consider conditions of approval to protect wilderness characteristics and other important values in the draft EIS and apply those conditions to existing leases in all inventoried LWC units. | COAs are specific to implementation of fluid mineral activities, which is outside the scope of this land use planning document. See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each of the alternatives can be found in Chapter 4. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13925-9 | FLPMA does not include wilderness as one of the statutory multiple uses. 43 U.S.C. §1702(c). Wilderness has its own definition, which is limited to Section 603. ("(l) The term 'wilderness' as used in section 1782 of this title shall have the same meaning as it does in section 1131(c) of Title 16." §1702(l). A word search of FLPMA shows that the term 'wilderness' is found only in the definition section, 43 U.S.C. §§1702(l) and the wilderness review provisions of Section 603, 43 U.S.C. §1782; 43 C.F.R. §1601.0-5(l).2 Section 603 is the only provision in federal law that authorizes the identification, study and recommendation of public lands for wilderness designation by Congress. Thus, BLM is not at liberty to add wilderness to other provisions in FLPMA when Congress so clearly chose not to. | Congressional decisions on wilderness are outside of the scope of this RMP. Wilderness Study Area designation process is covered in section 3.22.2. Alternatives for management are analyzed in Chapter 2.2.6, section Special Designations, Wilderness Study Area, management actions 7100-7103. See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #13942-1 | I do not support Management Action 1501 for Lands with Wilderness Characteristics. The existing two tracks are the only way that the public can access some of the Wilderness Study Areas, which are surrounded by LWCs, especially the one south of Honeycomb Buttes. LWS should be managed like ACECs, not for their wilderness character. This will still protect their character and allow active management yet some level of protection. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. Route specific designations are outside the scope of this DEIS. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #14022-3 | Under MA#1517 the BLM shouldn't pursue acquisition of state parcels unless approached by the Office of State Lands and Investments. Those lands are key to the lease holders for different uses and might not be compatible with BLM's mission but are compatible with the State's mission. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1516 and 1517, for analysis of a full range of alternatives regarding potential management decisions related to parcel WY040-2011-088. |
| 804 - Physical Resources-Lands with Wilderness Characteristics (1500-1517) | #14023-1 | I recommend that Lands with Wilderness Characteristics (LWC) be managed as Wilderness. * I recommend that WSA and LWC be designated and managed as non-mechanized (non-motorized and no bicycle) areas. | See Chapter 2.2.6 of the DEIS, section Physical Resources - Lands with Wilderness Characteristics, Management Actions 1500-1517, for analysis of a full range of alternatives regarding potential management decisions in these areas. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #356-1 | If rare earth minerals, especially those that are essential to sustain renewable energy initiatives, are discovered within this area, will the BLM consider revising the rules on mineral extraction? Should each Alternative include language that grants exceptions for mineral extraction if it promotes and supports the renewable energy movement? | Management actions for all four alternatives for locatable minerals, which includes rare earth minerals, are identified in the DEIS in management actions 2000-2001 |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #358-1 | For Management Action #2507 under Alternative B to “Allow collection of petrified wood with written authorization only to academic, scientific, governmental, or other qualified institution or individual.”, BLM provides no reasonable basis, methodology, or assumptions used to support this alternative. I support the continued application of 43 CFR 4622 allowing collection of petrified wood for hobby purposes and commercial use on public lands. | This is addressed in Chapter 4 Page 4-156 Section 4.13.3. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #392-1 | Remove management action #2507 from the RMP because there is no analysis in the EIS regarding any of the alternatives. | This is addressed in Chapter 4 Page 4-156 Section 4.13.3. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #544-2 | • I own a patented lode mining claim that is a mere 5 miles from being within the proposed RMP. This historic mining property has known gold values and is within a larger mining district. I worry about the “domino effect” should neighboring BLM field offices adopt similar management plans. I consider this to be a very real possibility since we live in a copy-cat world. Limiting access and limiting mining in the surrounding area will severely devalue my property and my ability to enjoy my property. | Please refer to Chapter 1 for a map and description of the planning area. Decisions outside the planning are beyond the scope of this DEIS. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.4.1. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | This is addressed in Chapter 4 Page 4-18 Section 4.4.1 and more specifically Page 4-22 Section 4.4.3. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes | Management actions for all four alternatives for locatable minerals are identified in the DEIS in management actions 5300-5309 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13542-53 | Section 3.15.13. Rare Earth Elements. 3-21 What is the reference and date of the statement, "The RSFO is not aware of mining claims, notice or plan level exploration work that are active or under application rare earth elements." as the document does not appear to address how up to date this statement is? | Section 3.15.13 has been updated. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13787-9 | Similarly, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Further, much of the data in the report is even older. For example, page 5-18 states that "The occurrence of REEs in the RSPA is described in Chapter 3.2.7. There are no known deposits of REE in the RSPA. To date there has been no systematic sampling for or evaluation of REE in the RSPA. However, the WSGS is currently conducting a statewide study, scheduled for completion in mid-2013, to identify, characterize and catalog REE deposits throughout the state." This report and several others related to REEs has been completed and must be incorporated into the RMP for completeness. Finally, as another example, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Page 5-24 states that "Although trona (soda ash) market demand decreased during the global economic slowdown starting in 2008, causing decreased prices and production, the global soda ash industry is showing positive signs of recovery. The 2010 production level at more than 16.5 million tons was up by more than 2 million tons over the 2009 level. In addition, several substantial soda ash price increases have already occurred in 2012. Along with the recovery has come interest by several producers in the possibility of future additional leasing adjacent to existing mines although no firm proposals have been submitted to date. It is expected that during the planning period, current mines or expansions to those mines could accommodate currently projected future demand increases and no new mines will be proposed. However, if the soda ash market undergoes a significant rebound during this time, the situation could change. In addition to new leasing to expand existing mines, new leasing and proposals for in situ recovery could be submitted for BLM consideration." This information is like reading from a history book. The information is outdated on all accounts and must be updated before the RMP can be considered complete or accurate. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13787-14 | Alternative B would have negative impacts on the uranium industry since it would withdrawal thousands of acres of locatable uranium. In accordance with the General Mining Law of 1872, as amended (30 USC 22 et seq.); 43 CFR Parts 3700 and 3800; and the Federal Land Policy and Management Act of 1976 (FLPMA) (43 USC 1701 et seq.) BLM is obligated to allow and encourage claim holders to develop their claims, subject to restrictions to ensure this development will not cause unnecessary or undue degradation of public lands. Domestic uranium is important to balance variable renewable energy, provide an additional source of clean energy, and reduce reliance on foreign supplies. Pages 4-19, 4-140, 4-174, 4-209 "Under this Alternative A, 556,558 acres would be pursued for withdrawal from locatable mineral entry"; Pages 4-34, 4-23, 4-169, 4-190 4-202, "Under Alternative B, 1,993,908 acres would be pursued for withdrawal from locatable mineral entry"; Pages 4-26, 4-171, 4-211 "Under Alternative C, 234,961 acres would be pursued for withdrawal from locatable mineral entry"; Pages 4-172, 4-190, "Under Alternative D, 482,272 acres would be pursued for withdrawal from locatable mineral entry." According to the BLM Solid Mineral Occurrence and Development Potential Report (August 2012, page 4-13) "Currently there are 132 active lode mining claims for uranium staked on federal lands in the RSPA." (Page 5-12) "The occurrence potential for uranium within the boundary of the Great Divide Mining District is classified as moderate." There is at least moderate potential for these minerals in the RMP area and many have not yet been evaluated. However, it is not well understood by the public that locatable minerals include minerals like uranium, lithium, and rare earths. These are critical minerals to our country, and BLM should not restrict their potential by withdrawing and closing areas in this RMP for their development before we even understanding how critical they are. On November 21, 2022, the Biden Administration announced a major investment to preserve Americas clean nuclear energy infrastructure. The announcement included the following: "America's current fleet of nuclear reactors is a vital resource for achieving the President's goal of 100% clean electricity by 2035 and a net-zero emissions economy by 2050." Further, Executive Order 13990 and the January 27, 2021 Executive Order on Tackling the Climate Crisis at Home and Abroad both call for clean energy and good paying jobs. By withdrawing locatable minerals under all Alternatives of this plan, the U.S. domestic ability to produce uranium, lithium, and potentially rare earth mineral will be impacted. Withdrawal/closure of this resource will negatively impact the ability for energy independence and clean power. | Management actions for all four alternatives for locatable minerals are identified in the DEIS in management actions 5300-5309 |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA | See Glossary for a definition of 'surface disturbing activities'. The difference in language among the alternatives in MA 4424 is intentional to apply to different resources and restriction levels. Management actions for all four alternatives for Fish and Wildlife can be found under 4400-4436 in Chapter 2. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13865-28 | M. MA #4616 It is unclear how many additional lands would be impacted by mineral lease withdrawals or non-renewals under Alternative B of MA #4616. Under Alternative B of MA #4616, PacifiCorp is concerned that mineral leases would not be re-offered once they expire, which will have significant impacts to BCC, including impacts to operations and fulfilment of existing lease and permit obligations. PacifiCorp recommends that the BLM adopt Alternative D of MA #4616 as it would allow current operations and would be consistent with current permits, regulations, and policies. | Please refer to the Glossary for a definition of 'withdrawal', which applies to general land laws for locatable minerals. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #13899-78 | E. Support for locatable mineral withdrawals and salable mineral closures FLMPA provides the Interior Secretary with broad authority to withdraw public lands from the operation of other laws, including location and entry under the General Mining Law.199 Through the land use planning process, BLM may identify areas - such as ACECs or other areas with conservation management direction - that warrant withdrawal from hardrock mining to protect surface resources or other non-extractive uses and recommend proposed withdrawals.200 We support the withdrawals proposed in Alternative B for ACECs, the National Historic Trails Corridor and big game winter range. The benefits of the proposed withdrawals from mineral entry in Alternative B for protecting ecosystem resilience values is shown in Appendix 1, Figures 10 and 11. The proposed withdrawals in Alternative B would set aside nearly all of the highest value areas for ecosystem resilience in the field office. This decision is clearly aligned with achieving a balanced land-use plan that allows mining in areas with low conflicts but sets aside areas of high natural resource value for the protection of ecosystem resilience. | Management actions for all four alternatives for locatable minerals are identified in the DEIS in management actions 5300-5309 |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-4 | The Preferred Alternative Ignores the Skyrocketing Demand for Minerals to Meet the Administration's Energy and Electrification Goals | Mineral demand is analyzed in the DEIS under Chapter 4.22.1 (Socioeconomics Ch 4.22). See also Appendix E. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-5 | Unwise Mineral Withdrawals Worsen Mineral Import Reliance Under the preferred alternative, approximately 1,993,908 acres would be pursued for withdrawal from locatable mineral entry. The draft RMP/EIS Maps 2-1 and 2-2, copied below, demonstrate vividly the significance of the 258 percent increase in lands proposed for withdrawal under preferred alternative B. The NMA acknowledges that there are federal lands that are appropriately off limits to mining. This nation has many unique and special areas that deserve protection. But given the importance of secure mineral supply chains to every aspect of society, from manufacturing to infrastructure to defense to technological advancements, such decisions must be informed by appropriate analyses, including an assessment of mineral potential, an evaluation of alternatives and an analysis showing that the use or special features of the area cannot be adequately preserved or protected through other means. | Management actions for all four alternatives for locatable minerals are identified in the DEIS in management actions 5300-5309 |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-6 | When it comes to the proposed withdrawals under the preferred alternative B, the NMA believes BLM is making decisions in a vacuum and relying on dated information as to hardrock mineral potential in the planning area. The draft RMP/EIS itself contains very limited information about the mineral potential beyond noting that a mineral potential report "will be completed and used as part of the RMP revision process."43 As BLM prepares the mineral potential report it must keep in mind that while geologic information is critical to finding previously undiscovered resources of minable quality, mineral deposit, geology alone does not dictate whether a deposit can be economically mined. Changes in price, demand, and technology can also factor into whether a deposit can be mined economically. For example, a mining company may have located a deposit that is too low grade to be mined at today's prices but even a small increase in price could change that dynamic. | The economics of mineral demand are addressed in Chapter 4 under 4.22.1 Assumptions. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. The Mineral Potential Report is available on the project's ePlanning webpage. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-7 | While mentioning the need to prepare a future mineral potential report, the draft RMP/EIS also references a 2012 report, Solid Mineral Occurrence and Development Potential Report for the RSFO [Rock Springs Field Office] as providing historical production data for the planning area, and surface use restrictions for the alternatives analysis.46 Much of the information contained in that report is woefully out of date, in contradiction of the BLM Manual 3031, which indicates that "land use plans will reflect geological, energy and mineral values on public lands through more effective geology and energy and mineral resource data assessment. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-8 | For example, the report notes that uranium is one of the locatable minerals that have received the greatest interest in the planning area. While acknowledging that Wyoming had been the nation's leading producer of uranium since 1995 and the existence of uranium resources in the planning area, the report dismisses future development due to depressed uranium prices beginning in 2008 and the 2011 Fukishima Reactor accident in Japan. Fast-forward to 2024 with record high uranium prices and an increased acceptance of nuclear power to address emissions, the administration's strong support for nuclear power at the COP28 Conference and within the Inflation Reduction Act, rapid growth in reactor construction globally and it becomes clear that a new mineral potential assessment of the planning area is needed. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-9 | Presumably, the agency relied, in part on the 2012 report and data, to conclude that "currently critical minerals identified through EO 13817 [Executive Order on a Federal Strategy to Ensure Secure and Reliable Supplies of Critical Minerals] and SO 3359 [Secretarial Order on Critical Mineral Independence and Security] are not being developed. For many of these minerals, deposits are unknown and current development potential is considered low."48 While it is accurate that no critical minerals are currently being developed in the planning area, the conclusion that current development potential is considered low is not. In fact, using the Wyoming State Geological Survey mapping tools, it is possible to overlay the planning area with USGS identification of critical mineral "focus areas" - areas with at least some potential to host critical minerals. This overlay is depicted below and demonstrates that it is too early for conclusory pronouncements about lack of critical minerals potential. | The economics of mineral demand are addressed in Chapter 4 under 4.22.1 Assumptions. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 805 - Mineral Resources-Locatable Minerals (2000-2001) | #14027-10 | the description of total acreage being placed off limits for mining projects under the preferred alternative B does not take into account acres that may be off limits due to sage grouse management.51 This lack of coordination prevents adequate review of the draft RMP/EIS and completely undermines the Appendix T, the cumulative impacts analysis section. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. Additionally, the 2023 Wild Horse Amendment relating to the four checkerboard HMAs is also now part of the No Action Alternative (Alt A). The RMP will be in compliance with NEPA and FLPMA (Section 1.4). |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #142-1 | This area of Wyoming thrives on recreational activities and mineral extraction. Alternative B (Table 1 and throughout the RMP) closes off much of the unleased lands for trona, which will negatively impact both the state and local economies. By greatly limited new lease and surface disturbing activities, new and existing trona mines (and other mineral extractions) will not be able to continue to efficiently extract this natural resource. This will increase the costs of natural soda ash and increase the synthetic soda ash plants that use harsh chemicals to meet the worldwide demand for soda ash. | The economics of mineral demand are addressed in Chapter 4 under 4.22.1 Assumptions. Management actions for all four alternatives are identified for other leasable minerals under 2400 - 2419 in the DEIS. |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #250-3 | Within the socioeconomic impact statements, it talks about mineral development. Specifically, this would impact soda ash development. Option B there is 1.8 million acres open and 2.1 million in closed. That means that this option is closing 2 million acres to soda ash development. The KSLA of 1954 grandfathered this in and the development is needed in the state. This is not disclosed in the economic impact. Not to mention the KSLA violation and possible lawsuits that could render from this. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. See also Appendix E for a list of laws, regulations, and policies that apply to this RMP. |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. See also Reclamation Plan in Appendix I. |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | See Glossary for a definition of 'surface disturbing activities'. Management actions for all four alternatives are identified for mineral resources under 2000 - 2507 in the DEIS. |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | Management actions for all four alternatives for locatable minerals are identified in the DEIS in management actions 5300-5309 |
| 806 - Mineral Resources– Leasable Minerals– Geothermal (2100-2102) | #13128-1 | If the mines lost their leases (which to my understanding are protected under the FLMPA act passed by legislation in the 1970's) we would lose a great percentage of our incomes and residents, therefore my job at our school district would be effected from the loss of our tax base and lack of enrollment of our student population. | See Section 1.4 for the Planning Criteria. The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 806 - Mineral Resources– Leasable | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, | The difference in language in MA 4424 among the alternatives is intentional and provides a range of alternatives for management. See Glossary for a definition of 'surface disturbance' and 'surface disturbing activities'. Management actions for all four alternatives for Fish and Wildlife can be found under 4400-4436 in Chapter 2. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals–Geothermal (2100-2102) | | and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #47-2 | I further question whether Alternative B is sufficient in terms of preventing or limiting future potential fossil fuel leasing and development. Fossil fuels are clearly harmful, polluting, and the reason why climate change is becoming more deadly. It is imperative that BLM rapidly transition from fossil fuels to clean energy sources. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #65-2 | You also used oil and gas data from over 10yrs ago, so that data is a complete waste. I quick search of active drilling rigs in this area comes to a total of 4 yet you're excluding that number and using the number of lease owners being 85. This is very misleading to the general public. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. Chapter 4.2.2 discloses the unavailability of data. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #317-1 | Accompanying the long-anticipated release of the Rock Springs RMP, the BLM has selected as its preferred alternative one that does not reflect the multiple use mandate in the Federal Land Management and Policy Act (FLPMA). Alternative B, the conservation alternative, would close for fluid leasing 2,186,218 acres of the 3.7 million subsurface acres managed in the field office. It would leave oil and gas development available only where valid existing rights occur, closing every other acre in the field office. Currently, any lands not specifically closed are available for development (as well as every other available use). FLPMA directs that public lands be managed with recognition of the nation's need for domestic sources of minerals2 and has thus identified mineral development as a primary use of public lands. Removing that potential from every acre not already leased is, in effect, a withdrawal of federal lands for a specified purpose, an action which can only be taken by Congress3. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. Impacts to energy and minerals are described in Section 4.11. Withdrawals can be made by the President, the Secretary of the Interior or other authorized Executive branch officers. Specifically 43 USCS § 1714 (a) authorizes the Secretary of the Interior to make modify , extend or revoke withdrawals. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #317-2 | However, expanding development on acreage with valid existing rights is made difficult as Alterative B would also place 2,480,876 acres as exclusion areas for rights-of-way and another 133,903 acres as avoidance. Building the necessary infrastructure to existing leases would be almost impossible across much of the field office. Companies would not be able to get electricity infrastructure built to a site, necessary to run a well; nor would they be able to install distribution pipelines necessary to get product from a site to market. When one continues to add on the additional layers of restrictions and exclusions in Alternative B, developing any new oil and gas resources in this field office will be nearly impossible. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #550-4 | If implemented, Alternative B would have dramatic consequences for businesses in southwestern Wyoming, particularly those supporting oil and gas exploration and production and infrastructure development. Of the 3.7 million acres of mineral estate, currently only about 540,000 acres are closed to oil and gas leasing and 159,000 acres are subject to no surface occupancy stipulation. Alternative B would close almost 2.2 million acres to leasing. Of the remaining 1.5 million acres in the management area, over 800,000 would be subject to no surface occupancy stipulations. In other words, areas open to leasing under standard terms and conditions would decrease from about 3 million acres under current management to about 700,000 acres under Alternative B. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. Socioeconomic analysis is in Section 4.22 |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #550-5 | Decisions to close areas to leasing or add no surface occupancy (NSO) stipulations must be justified with a robust evaluation of the unique resource values that may necessitate those designations; the BLM has failed to provide such a justification for such a massive jump in acreage for both designations. In previous RMP amendments, the BLM has gone to great lengths to properly justify these designations and balance them with areas designated with less restrictive lease stipulations or areas otherwise open to leasing. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #5110-1 | Please consider Not Allowing big Oil & Mining anywhere Near this Vital Ecosystem. I urge you to adopt the provisions for the Northern Red Desert and Big Sandy Foothills, especially the proposed ACECs, as swiftly as possible for the benefit of our shared landscapes and communities! | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. |
| 807 - Mineral Resources- | #7537-1 | I believe a decommissioning fee should also be applied so drillers have to clean and reclaim disturbed sites - each one back to the way it was before the surface is disturbed . | Oil and Gas Operations are regulated by 43 CFR 3000 series. |

|---|---|---|---|
| Leasable Minerals–Oil and Gas (2200-2222) | | | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #9721-1 | In general, throughout the document, analysis is based upon practices and information that is outdated. Lessons have been learned as techniques have evolved and data from habitat restoration has been analyzed. Drilling and completion techniques, processes and equipment have been upgraded since the initiation of this project, | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | Impacts on soil resources were analyzed in chapter 4.4. Such determinations are beyond the scope of a LUP. They would be done at the site-specific level. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BMP's considered to determine effectiveness of surface restoration before complete prohibition is considered. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. BMPs are included in Appendix A. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #9774-7 | Instead, we focus on oil and gas development, particularly regarding examining CO2 emissions and contributions to climate change. According to the US Geological Survey (USGS) and US Department of the Interior (DOI), "the CO2 emissions attributed to Federal lands in Wyoming are 57 percent of the total from the Federal lands in all States and offshore areas combined." The figure below visually depicts the amount of CO2 emissions in Wyoming on public land alone. Furthermore, this pie chart draws attention to the fact that the BLM should be pursuing a conservation approach, given the evidence. It should be noted that the BLM considered alternatives to completely close fluid mineral leasing and coal leasing. However, that alternative was eliminated by the BLM as they stated that "this action is not reasonable in light of the BLM's multiple-use mandate outlined in FLPMA or the Mineral Leasing Act of 1920, and is inconsistent with policy objectives." We challenge this reading of the statute. The term "multiple use" means "the management of public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people...the use of some land for less than all of resources...tak[ing] into account the long-term needs of future generations for renewable and nonrenewable resources." As such, multiple-use does not have the narrow definition as defined by the BLM in this draft plan. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #10225-1 | Sweetwater County and the City of Rock Springs subsidies make up a sizeable portion of our budget. We are dependent on these subsidies to provide many essential services to the aging and mobility challenged population as well as the youth of Sweetwater County. The services that Young at Heart provides are the following: Congregate meals for the community having served approximately 6,891 meals in 2022 This year to date we have recorded 10,836 meals. Home delivered meals totaling around 42,000 in 2022, and social entertainment totaling approximately 17,708 hours (pool, poker, card games, and dominoes). We offer In-Home Services which provides light housekeeping and small chores to more than 92 clients in the Rock Springs and Green River areas. Additionally, we provide In-Home Health services assisting more than 15 patients. And finally we have our Early Learning Center providing children with quality education which serves more than 100 families. Therefore reduction in any of these revenue streams would severely impact, if not totally eliminate some of all of these services. In fact, it could force the closure of the Center altogether. Historically and currently mineral extraction is a | Socioeconomic impacts were analyzed in chapter 4.22. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | mainstay in our local economy. Monies from industrial impacts, mineral severance, sales taxes, etc. flow into the local government budgets to support essential services. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #10225-2 | In addition the oil and gas industry provides income for not only local government but funding for schools. It provides 51% of all property taxes and 80% of all severance taxes. This industry also provides 58,980 jobs in Wyoming alone. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #10468-5 | Specifically, an example of impacts not considered from the limitation of further exploration and use of natural gas will inherently lead to limited availability of the resource for use. Limited supply of natural gas, with steady or, inevitably, increased demand will result in higher rates to end customers. The population that suffers the most from higher costs for basic needs, such as heat, electricity and water, are those populations that were identified for study~ those populations in poverty. Uinta County has one of the largest populations in poverty in the State of Wyoming now and this plan will lead to recession of the economy with greater need for government assistance for all basic human dignities and needs. | Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13134-1 | Majority of our educational funds are in direct correlation with the Energy and Mineral Industries. Reducing the Wyoming State Gross Domestic Product by $1billion/year would be detrimental to our state, our educational system would not survive. Decreasing Oil and Gas development by 73% is astronomical. The surrounding Mines, Coal, Oil and Gas Industries are the backbone of our state and cannot be compromised any more than they have been. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13153-1 | Not only does “Alternative B” constitute the most restrictive of the agency’s possible alternatives– your agency admits in its Environmental Impact Statement that this alternative creates the largest socioeconomic impact due to reduced mineral development on the 3.6 million acres subject to your control. Under the Multiple Use-Sustained Yield Act of 1960, your agency is required to manage federal lands in accordance with the principles of multiple use and sustained yield. This means that all possible uses and benefits of the lands be treated equally by your agency when promulgating land use plans. Clearly, you and your agency have ignored the deeply enshrined principles of multiple use and sustained yield. “Alternative B” removes over 7,000 animal unit months of grazing, removes over 60,000 acres from any and all use to “protect wilderness characteristics,” and “de-emphasizes recreation” in favor of “conservation of resource values with constraints on resource use.” Your preferred plan withdraws millions of acres from mineral extraction, leasing, exploration, and development. Your plan will obliterate the tax revenue derived from mineral, agricultural, recreation and tourism industries in southwest Wyoming | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13210-6 | 6. No new exclusions or avoidance for fluid mineral development and rights of ways in areas operating under existing and approved record of decision. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.1. Management actions for all four alternatives with regards to Lands and Realty are outlined in MA # 6000-6015. Impacts to Lands and Realty were analyzed in chapter 4.19. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13210-47 | 2202 Alternative B Continue to suspend existing oil and gas leases from development within the Mechanically Mineable Trona Area (MMTA). Close the MMTA (MMTA federal 141,409 acres) for new fluid mineral leasing until the oil and gas resource can be recovered without compromising the safety of the underground miners. Represented industries on the task force agreed that Alternative B best addresses the safety that is needed in the Mechanically Mineable Trona Area by closing the area to fluid mineral leasing until the oil and gas can be recovered without compromising the safety of the underground miners. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13218-1 | I am concerned that Alternative B would have a detrimental effect on Wyoming's energy and mineral industries. Alternative B would substantially decrease the opportunity for oil and gas development, coal development, and other mineral development. Alternative B would close 2,122,282 acres to oil and gas development, 3,735,526 acres to coal development, 2,581,741 acres to mineral material sales and disposals, and 49,224 acres to trona leasing and development within the known sodium leasing area. The acres closed for oil and gas development is a 192% increase compared to Alternative A (the current management standard for the Rock Springs planning area); for coal development, a 433% increase compared to Alternative A; for mineral material sales and disposals, a 209% increase compared to Alternative A; and for trona leasing and development, a 101% increase compared to Alternative A. This is an extreme increase in the number of acres closed compared to Alternative A and this would have the greatest negative impact on solid mineral leasing and development, saleable mineral development, and trona development. | Management actions for all four alternatives with regards to Leasable Minerals for Oil and Gas are outlined in Management Actions 2200-2222. Management actions for all four alternatives with regards to Other Leasable Minerals are outlined in Management Actions 2400-2419. Management actions for all four alternatives with regards to Saleable (Mineral Materials) are outlined in Management Actions 2500-2507. |
| 807 - Mineral Resources-Leasable | #13218-2 | Alternative B also imposes extreme restrictions on the limited areas where energy development is or would be allowed. Alternative B would impose & quote no surface occupancy & quote restrictions on 813,354 acres and impose controlled surface use restrictions on 99,674 acres for fluid mineral development. This would | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals–Oil and Gas (2200-2222) | | restrict the area in which development could realistically occur, increase the complexity of mineral operations, slowdown or completely inhibit the production of fluid minerals, and reduce the total number of mineral operations. These restrictions would also reduce the number of federal wells projected over the life of the RMP to 1,292, which is a 73% decrease compared to Alternative A. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13241-1 | Alternative B would have a devasting overall economic impact on Wyoming. Under Alternative B, the estimated economic output is $12.6 billion dollars, the estimated total labor earnings are $2.3 billion dollars, and the estimated total local and state revenues from mineral production is $800 million dollars. This is an extreme decrease from the other alternatives. For example, under Alternative A, the estimated economic output is $29.9 billion dollars, the estimated total labor earnings are $5.4 billion dollars, and the estimated local and state revenues from mineral production is $2.3 billion dollars. The total economic output is 52.3% lower under Alternative B than Alternative A and the total labor earnings are 55.8% lower under Alternative B than Alternative A. In addition, the average annual jobs would also decrease as Alternative B would generate only 2,707 jobs compared to Alternative A generating 6,157 jobs. Most significantly, the total local and state revenues would decrease annually under Alternative B. For example, ad valorem taxes would decrease by 52.4%, severance taxes would decrease by 55.1%, and the state's share of federal mineral royalties would decrease by 52.7%. The total local and state revenues are "52% to 55% lower under Alternative B than Alternative A" and "all quantified economic and public revenue indicators for oil and gas development and production are approximately 74% lower under Alternative B than Alternative A." The reduction in revenues for oil and gas development is due to "the substantially lower number of wells drilled under Alternative B and corresponding reductions in oil and gas production." I am totally concerned that Alternative B would have a detrimental effect on Wyoming's economy. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13330-17 | * Sweetwater County Farm Bureau is opposed to the Alternative B proposed withdrawal of 258% lands from more land from any potential mineral extraction and 305% more lands from oil and gas extraction. Many of our members hold jobs in these sectors to provide supplemental income. Agriculture producers value mineral and oil and gas production in our area. Additionally, such withdrawals would decimate our local economy and the Alternative B proposal directly violates the Domestic Minerals Program Extension Act of 1953, The Mining and Minerals Policy Act of 1970, the Federal Land Policy and Management Act of 1976, and the Energy Policy Act of 2005. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13412-1 | In addition, Alternative B would impose major restrictions along migration corridors. For example, Alternative B would "prohibit surface disturbing activities within ½ mile of big game migration corridors to avoid construction of a current or future identified big game corridors." In contrast, Alternative D would "allow fluid mineral surface occupancy and use within a Wyoming Game and Fish Department designated big game migration corridor if the fluid mineral operator and the BLM arrive at an acceptable conservation plan for avoidance, minimization, rectification and / or restoration within the migration corridor." I am concerned the alternative B is unnecessary and is a compromised approach between mineral development and production and protection of wildlife. | Management actions for all four alternatives with regards to Fish and Wildlife are outlined in Management Actions 4400-4436. Management actions for all four alternatives with regards to the Big Game Migration Corridor ACEC are outlined in Management Actions 7555-7562. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13446-3 | Wyoming is one of the largest energy producers in the nation. The proposed plan effectively undermines the functionality and independence of the nation as a whole by the draconian restrictions set forth in the RPM. Right-of-way controls, regulation of surface disturbance, removal of lease options and controls of existing perimeters cut any sustainable viability for Wyoming's gas and oil production. The reverberations and consequences of such decisions will last for decades and cause more suffering than should be tolerated. (https://www.eia.gov/state/?sid=WY) | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13512-9 | Delete: "This restriction is functionally analogous to the phrase "no surface occupancy" used by the oil and gas program and is applied as an absolute condition to those affected activities." The proposed language is not clear whether temporary surface disturbance would be prohibited within Exclusion Areas. Consistent with longstanding BLM precedent, temporary disturbances must be evaluated separate and apart from permanent disturbances, in particular, when considering visual impacts. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222.<br>This definition refers to the definition of Exclusion Area which is used primarily for ROWs. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13542-28 | MA#2202. Alternative C. 2-28 How will the BLM ensure that the safety of underground miners is not being compromised in the Mechanical Mining Trona Area under Alternative C? | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2202. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13542-52 | Section 3.15.6. Phosphate. 3-19 Reference used for exploration/mining of phosphate is from March 2012. This should be revised to reflect current conditions/status. | The Mineral Potential Report discusses phosphate potential. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13585-26 | Under Alternative B, it is projected that a total of 1,292 federal wells would be drilled during the next 20 years (74% decrease compared to Alternative A). The decrease in the number of wells drilled is due to an increase in areas that are closed to fluid mineral leasing and managed with NSO stipulations. Approximately 2,186,218 acres would be closed to new fluid mineral leasing (305% increase compared with Alternative A) and 813,354 acres would be managed as NSO areas (412% increase compared with Alternative A) (Table 2-4, Map 2-6). Much like buffer zones for trail corridors were established in an arbitrary and capricious manner, NSO boundaries, TLS restrictions (more than 700,000 acres), coal closure (3.54 million acres closed which amounts to a coal policy declaration, not a valid resource management planning provision), and the closing of more than 40,000 acres of trona leasing within the KSLA were established in an arbitrary and capricious manner not based on inventory data or monitoring provisions. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13585-27 | In addition, the NSO area boundaries are such that it would not allow access from offsite drilling. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13604-1 | The “Closed to Fluid Mineral Leasing” of Alternative B would increase closed surface acres by 305%. The potential impacts of a 305% decrease in fluid mineral leases could have unknown impacts not only to the state of Wyoming but to the United States. The studies that were performed in 2011 are now far outdated and new economic and socioeconomic evaluations should be performed. For this reason, Alternative B should be discarded as the preferred alternative. | Impacts to energy and minerals were analyzed in chapter 4.11. Socioeconomic impacts were analyzed in chapter 4.22. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13624-34 | Wyoming's Oil and Gas Production Facilities Chapter 6, Section 2 Permitting Guidance On page Q-4, the BLM references a May 2016 revision for this guidance. The DEQ/AQD has updated the guidance and suggests that BLM reference the December 2018 revision. | References have been updated as necessary. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13651-49 | The following statement (page 4-139) is common to all alternatives. BLM should move it to "assumptions." The whole statement should apply to all alternatives. Limiting the placement of structures that visually intrude on the cultural resources could help to preserve and protect settings. What is the difference between archeological and historic resources and other resources when it comes to a consideration to permit fluid mineral extraction? How many acres will be open for permits and how many permits are expected under this alternative. What is the archeological resource density and type in those areas open to permits under this alternative and other alternatives? Allowing opportunities to explore, locate, and develop fluid minerals in the planning area could increase surface disturbing activities, which could expose previously unknown cultural resources to discovery, thereby enhancing scientific knowledge. Surface disturbing activities also have the potential to cause direct and indirect destruction or damage to cultural resources. Surface disturbing activities could impact soil and rock stability and amplify erosion, which could damage or destroy cultural resources and could cause degradation of the setting in which the cultural resource exists. Limiting the placement of structures that visually intrude on the cultural resources could help to preserve and protect settings. Increased human presence could cause unintentional damage to both known and unknown resources through their surface disturbing activities; as well as intentional destruction through vandalism, and the unauthorized removal of structures or artifacts. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. Impact to cultural resources are analyzed in chapter 4.12. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13651-50 | The information given says nothing about locations and clustering of cultural resources in relation to that for wells and oil and gas facilities, but it should. How do closures in alternatives relate to current oil and gas developed areas? Similarly the draft EIS does not address road and utility developments (pipelines, power lines) and it should. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to cultural resources are analyzed in chapter 4.12. Road and utility development management actions are found in Land Resources (LR) - Lands and Realty (6000-6015). Impacts to Lands and Realty are analyzed in chapter 4.19. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-8 | The RFD for oil and gas that BLM included in the RMP is not reasonable and must be updated. The time periods used for fluid minerals are inappropriately outdated and varied throughout the document. 3.15.1 Leasable Fluid Minerals, page 3-18, refers to the "last 10 years" and then subsequently uses the phase "as of October 2010." WOGCC assumes that BLM is referring to the 10 years prior to the 2013 RFD as no analysis of current conditions appears to have been conducted after that point. This section is deficient as it should include a summary of the current state of leasable fluid minerals including, but not limited to, leased and unleased federal acres, well status, current production, etc. Later in the document, on page 4-255 Table 4-15 is labeled "Historical Annual Wells Drilled, Sublette County, 2000- 2008." The data through 2022 was readily available for inclusion in this Draft RMP and it was inappropriate to not update all the analysis to 2022. | Chapter 4.2.2 discloses the unavailability of data. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-9 | The Reasonably Foreseeable Development Scenario (RFD) used in this EIS is severely outdated. The analysis itself states, 10 years ago, "It is difficult to predict what will occur a few years into the future, but it is even more difficult to predict 20 years ahead. (Pg 92)" Despite this self-admission by the BLM, the appropriateness of the timeframe for the RFD is not addressed. The BLM simply states that the economic impacts were estimated from 2016-2031 (page N-4) a mere 8 years into the 20 year planning period. It appears the decision to not update the RFD was arbitrary in nature as no discussion appears related to the appropriateness of the RFD or the difference between the RFD and what had actually happened in the 12 years since the RFD was completed. According to WOGCC records oil production in 2022 was approximately 815,000 bbls compared to the RFDs prediction of 4.8 million bbls. Similarly, WOGCC records have approximately 66 BCF of gas production in 2022 compared to the predicted 197 BCF. BLM also appears to have redone the analysis in 2016 leading to changes in the Table with no explanation for the changes. There is no discussion of the vast ROW exclusions of Alternative Bin the RFD. In order for BLM to have articulated a legitimate connection between the facts and their ultimate decision, the underlying facts must be reasonably correct. It is not reasonable to use a twelve-year-old analysis that has already been shown to be completely erroneous. | Impacts to energy and minerals were analyzed in chapter 4.11. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-10 | On page 2-3, BLM states that closing the planning area to new leasing of federal minerals, specifically fluid minerals, was considered as a method for resolving conflicts with other resource values and leases. BLM further states that this action is not reasonable in light of the BLM's multiple use mandate outlined in FLPMA and the MLA and is inconsistent with policy objectives. Yet, this is exactly what the agency's preferred alternative is doing. The agency preferred alternative includes significant ROW exclusions, which results in BLM is effectively closing the entire area to new leasing of federal minerals. No operator would lease lands that are physically undevelopable due to the management actions proposed by BLM in Alternative B. With the ROW exclusions, BLM is not only closing federal lands from leasing, but will be significantly impacting state and private lands and also will be effectively eliminating oil and gas development on previously leased but undeveloped federal minerals. The ROW exclusion does so by eliminating the ability of any oil and gas operator to build infrastructure across federal lands where the ROW exclusion is applied. This ROW exclusion in the agency preferred alternative (Alt B) will almost entirely exclude any new ROWs in the north and south areas of the RSFO and will create isolated areas in the checkerboard where infrastructure could be built within an isolated area, but exclusion areas would make it difficult to connect the isolated area to the outside world. These exclusions would eliminate the ability for oil and gas operators to utilize existing rights on currently leased lands and state or private lands because without a road to access the lease or pipelines to move produced oil and gas they cannot drill the well. BLM has created a management scenario that will result in no new leasing of federal minerals and will remove the ability to develop currently leased federal minerals. In their own words this violates BLM's multiple use mandate and is not a reasonable alternative. NEPA requires the analysis of reasonable alternatives and BLM must exclude Alternative Band re-analyze a new alternative in this Draft RMP. Management for preservation purposes is not managing for multiple use when you close all unleased areas to new leasing and ROW. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-21 | On page 4-57 and in various other sections throughout the RMP, BLM discusses no surface occupancy (NSO) stipulations for oil and gas leasing. There is no analysis of the negative effects of blanket NSOs. The BLM routinely makes the argument that an operator could produce the resources underlying a parcel from an adjacent state, fee, or existing federal lease. Where this is the case the NSO is not only useless but potentially detrimental. The NSO would only serve to blindly remove lands from the options land managers and operators have to choose from to make the best decision for wildlife or other disturbance sensitive resources. For example, the adjacent parcel open for surface occupancy may have the best habitat or may contain a sensitive species that the BLM parcel with an NSO does not have. Forcing the development on to the adjacent parcel is a less desirable solution, but would be the only option in this scenario. The BLM needs to analyze this effect in Chapter 4 at least under water resources, soil resources, wildlife resources and special status species. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to Oil and Gas are analyzed in chapter 4.11. Impacts to Water Resources are analyzed in chapter 4.5. Impacts to Soil Resources are analyzed in chapter 4.4. Impacts to Wildlife and Fish are analyzed in chapter 4.7. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-22 | In section 4.11.1, BLM makes the assumption that surface use restrictions cannot be retroactively applied to valid, existing oil and gas leases or to valid, existing use authorizations, but that post lease actions/authorizations could be encumbered by COAs on a case by case basis. This means that the ROW exclusions proposed in Alternative B will impact valid, existing oil and gas leases rendering them undevelopable and potentially bringing up government takings claims. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13658-23 | The analysis in section 4.11.3 is incomplete. Since BLM erred in its use of an outdated and inaccurate RFD for oil and gas, BLM's evaluation of the impacts of each alternative on energy and minerals is inaccurate and incomplete. BLM's assumption of the number of wells drilled, especially in Alternative B, does not match the last decade of oil and gas activity in this area. BLM is vastly overestimating the wells to be drilled in Alternative B because not only will wells be lost to the acreage closed to future leasing, but acreage will be lost as it becomes undevelopable due to the ROW exclusion. BLM did not estimate the number of wells lost to the ROW exclusion. It only calculated the reduction in acreage available for leasing between the alternatives and then reduced the number of wells drilled by | Impacts to energy and minerals were analyzed in chapter 4.11. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | the same ratio. No consideration was given for impacts from any other management action. This deficiency must be addressed by BLM. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-2 | BLM's preferred Alternative B unlawfully interferes with various entities' valid existing rights in the Rock Springs planning area, including valid existing oil-and-gas leases held by operators such as Anschutz. BLM's newly proposed restrictive designations (No Surface Occupancy or ROW exclusion zones) across broad swaths of the planning area where oil-and-gas development is already occurring has the potential to cripple existing exploration and production activities, hamstring transportation of product to market, and interfere with day-to-day operations. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-3 | BLM's Draft RMP improperly does not contain sufficient substitution analysis-the analysis by which agencies provide full and complete information on environmental and socioeconomic impacts that would result from obtaining substitute oil and gas from elsewhere, if the production could not occur under the preferred alternative, to meet the public's existing and future energy demands. Although the agency in the Draft EIS boldly identifies the adverse consequences of oil-and-gas development under the development-friendly Alternative C, BLM fails to apply that critical thinking to its preferred Alternative B: it simply does not candidly analyze the true and complete costs of restricting oil-and-gas development under that alternative. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-5 | The United States Geological Survey ("USGS") has identified Southwestern Wyoming as potentially holding one of the largest unconventional hydrocarbons 5 reserves in the Rockies, with an estimated 104 MMBO of oil and 83,575 BCF of gas.4 BLM, however, does not even acknowledge, let alone internalize, the USGS's findings in its analysis, thereby completely-and perhaps even deliberately- brushing aside the fact that the planning area sits on some of the richest hydrocarbon deposits in the United States. If BLM considered even just a fraction of the future development potential in these unconventional reserves beneath the planning area, that would radically change the economic analysis in the Draft RMP and would undoubtedly tip the scales in favor of more development-friendly solutions. | Impacts to energy and minerals were analyzed in chapter 4.11. Assumptions for oil and gas development are contained within the Reasonably Foreseeable Development. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-8 | BLM's Preferred Alternative Violates Other Mining Laws' Mandates to Encourage Mineral Development. The Mineral Leasing Act ("MLA") "was intended to promote wise development of [ ] natural resources and to obtain for the public a reasonable financial return on assets that 'belong' to the public." California Co. v. Udall, 296 F.2d 384, 388 (D.C. Cir. 1961). Enacted in 1920 in the wake of World War I, the MLA demonstrates incontestably that ensuring energy security and spurring economic growth was among Congress's top priorities in passing the law. See, e.g., Arkla Expl. Co. v. Tex. Oil & Gas Corp., 734 F.2d 347, 358 (8th Cir. 1984) ("broad purpose of the MLA was to provide incentives to explore new, unproven oil and gas areas through noncompetitive leasing, while assuring through competitive bidding adequate compensation to the government for leasing in producing areas"); Geosearch, Inc. v. Andrus, 508 F. Supp. 839, 842 (D. Wyo. 1981) ("purpose of the Act is to promote the orderly development of oil and gas deposits in publicly owned lands of the United States through private enterprise"). The MLA authorizes the Department of the Interior to lease public lands "known or believed to contain oil or gas deposits" and requires BLM to hold quarterly lease sales in each state that contains eligible lands. 30 U.S.C §§ 226(a), (b)(1)(A). Indeed, "[t]he public does not benefit from resources that remain undeveloped and the Secretary must administer the [MLA] so as to provide some incentive for development." Udall, 296 F.2d at 388 (emphases added). | Impacts to energy and minerals were analyzed in chapter 4.11. See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-9 | Similarly, in the Mining and Minerals Policy Act of 1970, 30 U.S.C. § 21a, "Congress declare[d] that it is the continuing policy of the Federal Government in the national interest to foster and encourage private enterprise in … the orderly and economic development of domestic mineral resources … to help assure satisfaction of industrial, security and environmental needs."5 As such, Congress expressly stated that "[i]t shall be the responsibility of the Secretary of the Interior to carry out this policy when exercising his authority under such programs as may be authorized by law other than this Act." Id. (emphasis added). In other words, BLM (through its authority delegated from the Secretary) must follow this express policy of fostering the development of domestic mineral resources when engaging in land-planning exercises and authorizations under FLPMA and the MLA. BLM's initial description of its preference, Alternative B, does not even acknowledge resource development as one of the agency's primary considerations, let alone one of the priorities set out by Congress. It simply states: "Alternative B emphasizes conservation of resource values with constraints on resource uses. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-15 | The recommendation also indicates that fences and other potential impediments should not be constructed. Id. Overall, as this guidance demonstrates, the Wyoming Game and Fish Department recognizes that oil-and gas development can occur within big-game migration corridors with a few limited restrictions. In managing wildlife habitat, the federal government should defer to the state's management prescriptions. As the D.C. Circuit explained, in enacting FLPMA, Congress "carefully and explicitly" "assigned the states the primary responsibility of management of wildlife programs within their boundaries." Defenders of Wildlife v. Andrus, 627 F.2d 1238, 1248 (D.C. Cir. 1980). | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable | #13665-16 | With respect to the Natural Corrals ACEC, under Alternative B, BLM proposes to "retain" the prior 1,110-acre ACEC designation established by the Green River RMP. RMP Draft EIS at 2-191.14 In a change from the prior RMP, however, BLM now proposes to close the Natural Corrals ACEC "to consideration of fluid mineral exploration | Footnote 1 for Table 1. Comparison of Land Use Restrictions and Allocations located in chapter 3 explains the discrepancy in acreages. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals–Oil and Gas (2200-2222) | | and development." Id. But BLM's 14 There is a discrepancy in BLM's characterizations of the total acres included within the Natural Corrals ACEC. Compare RMP Draft EIS at 2-191 (listing 1,110 acres) with id. at 3-28 (listing 1,142 acres). explanation for the change is inadequate. It simply does not express why the protections provided in the Green River RMP are now inadequate to protect the values and resources in the ACEC, requiring BLM to suddenly preclude all oil-and-gas development. See id.; see also id. at C-28-C-29. BLM merely offers the following limp justification: Impacts to wildlife and fisheries from the management of the Natural Corrals ACEC (1,110 acres) would be similar to those described under Alternative A [i.e., the Green River RMP]. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence. Id. at 4-72-4-73. This cursory explanation acknowledges the impacts to "wildlife and fisheries" remain the same and does not even identify the specific species or populations of wildlife that "could" be protected. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-23 | Energy demand in the United States and globally is expected to increase significantly in the coming years. See Energy Information Administration, Annual Energy Outlook (2022).20 If oil and gas cannot be produced efficiently and effectively in the United States, they will have to be imported from abroad, most likely from the OPEC countries that not only lack protective environmental controls but also have been-and continue to be-hostile to American and democratic interests around the world. See DOI-BLM-HQ-3100-2023-0001-EA at 26 (acknowledging that interruptions of domestic oil-and-gas lease sales result in greater dependence on foreign sources that are produced with less-protective environmental measures).21 Importing foreign petroleum also increases global emissions associated with shipping over long distances, risks ocean contamination from spills, increases emissions associated with transporting petroleum from coastal ports to inland destinations, and creates other needless hurdles to providing American consumers with petroleum. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-24 | See 2023-2038 National Outer Continental Shelf Oil and Gas Leasing Program at 212-213.22 By severely reducing the potential for oil-and-gas development in one of the most mineral-rich states in a mineral-rich nation, BLM's favored alternative would constrain domestic oil-and-gas production, hence increasing the United States' and its allies' dependence on foreign sources of oil-and-gas, produced in countries hostile to the United States and with far fewer considerations of environmental or human-rights factors. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-25 | Where such comprehensive and multi-layer processes, including site-specific remedies and mitigation provisions, are clearly available to ensure responsible oil-and-gas development before drilling is authorized, BLM need not-and should not-implement broad-stroke conservation measures and render massive areas of public land off-limits to oil-and-gas development. Doing so reveals that BLM's real motive behind the proposed change is nothing less than to constrict the development of fossil fuel on federal lands. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-26 | BLM states in passing that its preferred alternative could be characterized as "providing the least support to long-standing mining customs and culture in the planning area" and as "fail[ing] to take adequate advantage of the planning area's mineral resources to reduce reliance on foreign energy sources." RMP Draft EIS at 4-262. And that's exactly what Alternative B would do. But to be clear, "long-standing mining customs and culture" is not relegated to "the planning area." Twenty-one of Wyoming's 23 counties produce oil and/or natural gas. See Petroleum Association of Wyoming, Oil and Gas Facts and Figures.25 For over 140 years, mining and oil-and-gas development have sustained Wyoming's economy and the livelihood of its residents. The oil-and-gas industry provides crucial revenue for virtually every public service offered by the state. | Socioeconomic impacts were analyzed in chapter 4.22. Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-27 | In 2022, for example, the oil-and-gas industry was the largest economic driver in Wyoming, generating about $9 billion in economic activity and employing close to 60,000 people. Id. By comparison, the second largest industry in Wyoming that year-travel and tourism-contributed only about $2.5 billion. Id. Wyoming's oil-and-gas industry paid over $5.7 billion in labor income that year. Id. That same year, Wyoming's oil-and-gas industry contributed $2.72 billion to state and local governments in the form of various taxes, royalties, and levies. Id. Around $1.39 billion of that money went to K-12 education, followed by $623 million to the state's general fund and $208 million to public infrastructure. Id. Oil-and-gas production, by itself, accounted for over 40% of the total property taxes levied in Wyoming and nearly 80% of the property taxes levied on all minerals. | Impacts to energy and minerals were analyzed in chapter 4.11. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-28 | Moreover, although Wyoming is also home to many renewable-energy projects, if oil-and-gas production in Wyoming were interrupted, the alternative energy sources that remained would not meet local energy needs. In 2022, renewable-energy sources generated 24% of the electricity in Wyoming, with wind power accounting for more than nine-tenths of this figure | Impacts to energy and minerals were analyzed in chapter 4.11. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil | #13665-31 | Alternative C. On the other, it fails to analyze the true and complete costs of restricting oil-and-gas development under Alternative B. In fact, BLM singles out the oil-and-gas sector and states: "Oil and gas development presents the highest likelihood for impacts within the planning area and in southwest Wyoming as a whole." RMP Draft EIS at T-3. With respect to air-quality impacts, for example, BLM states that "[t]he magnitude of estimated emissions of | Impacts to energy and minerals were analyzed in chapter 4.11. Socioeconomic assumptions were analyzed in chapter 4.22.1 and 4.22.2.. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Gas (2200-2222) | | air pollutants from BLM authorized activities and management actions is predicted to be greatest under Alternative C[,] which includes the highest level of energy development actions." Id. at 4-6. But "Alternative B, with oil and gas development levels about half of Alternative C, would be expected to result in the least impacts to air quality." Id. Even though the Draft EIS notes-correctly-that BLM's analyses of the social cost of greenhouse-gas production "do not constitute a complete cost-benefit analysis, nor do the SC-GHG numbers present a direct comparison with other impacts," id. at 4-7, it nonetheless identifies the development-friendly Alterative C as having the highest social cost and Alternative B as having the lowest social cost. See id. at 4-9. That is intellectually dishonest. In arriving at that conclusion, BLM has ignored the brute-force socioeconomic impacts that Alternative B would cause. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-32 | Realizing that honest disclosure of the negative impacts that can emanate from importing oil and gas in lieu of domestic production is critical to reasoned decision-making, federal agencies often employ "substitution" analyses in their NEPA review. BOEM, for example, recently pointed out that limiting federal offshore oil-and-gas production would mean that "[t]ankering across the Pacific, [Gulf of Mexico], or Atlantic Regions may increase substantially due to an expected increase in foreign oil imports." See 2023-2038 National Outer Continental Shelf Oil and Gas Leasing Program at 212-13.30 Similarly, in discussing the "no action" alternative to lease sales in another NEPA evaluation, BLM applied substitution analysis in a recent EA prepared specifically to evaluate the greenhouse-gas emissions impacts of oil-and-gas development, and observed that "[c]hoosing the No Action alternative [instead of the development-friendly alternative] would not prevent future leasing" or reduce greenhouse emissions associated with oil-and-gas consumption. See DOI-BLM-HQ-3100-2023-0001-EA at 10.31 BLM found just the opposite: reducing domestic supplies of oiland- gas "would likely lead to the import of more oil and natural gas from other countries, including countries with lower environmental and emission control standards than the United States." Id. at 26. | Assumptions for Air Quality analysis are presented in chapter 4.3.2. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-33 | In other words, BLM acknowledges (and assumes) that under its preferred alternative, oil-and-gas-production could simply shift to state lands. But it does not discuss the full extent, or the environmental and financial consequences-including in the form of diminished revenues and federal royalties-of such a shift. See, e.g., id. at T-15 (acknowledging Draft EIS lacks "a thorough cost-benefit analysis incorporating the social benefits of energy production"). Nor does it acknowledge that it would be beyond BLM's prerogative to implement best-management-practices and shape responsible development if the same oil-and-gas production simply shifted to non-federal lands. | Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-34 | Although BLM candidly acknowledges that Alternative B would severely constrain energy development projects-from both traditional and renewable sources-BLM's rationale for favoring that alternative does not support such a radical departure from current policy. For example, even though "[i]mpacts to wildlife and fisheries habitat from … renewable energy …would be the same as those described under Alternative A," id. at 4-67, Alterative B nonetheless restricts over two-million acres from renewable energy development-four to five times as many as are currently off-limits under Alternative A. See id. at ES-5. But if the "[i]mpacts to wildlife and fisheries" would be largely the same under Alterative B "as described under Alternative A"-the less-restrictive, "no action" alterative-then why close-off hundreds of thousands additional acres just to reach the same environmental outcome? Not only is BLM's "preferred alternative" illogical, but the agency's preference for that alternative is "arbitrary, capricious, an abuse of discretion" or "unsupported by substantial evidence" and therefore violates the Administrative Procedure Act. 5 U.S.C. §§ 706(2)(A), (E) | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to Energy and Minerals were analyzed in chapter 4.11. See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-37 | Since 2000, another federal agency, the United States Geological Survey ("USGS"), has been conducting assessments of unconventional resources in the United States. It has identified Southwestern Wyoming as potentially holding one of the largest unconventional hydrocarbons reserves in the Rockies, with an estimated 104 MMBO of oil and 83,575 BFC of gas. BLM, however, does not even acknowledge, let alone internalize, the USGS's findings in its analysis, thereby completely-and perhaps even deliberately-brushing aside the fact that the planning area sits on some of the richest hydrocarbon deposits in the United States. An "agency must examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made." Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983) (emphasis added and citations omitted). "BLM cannot make informed decisions if it does not consider all relevant information at its disposal." W. Watersheds Project v. Rosenkrance, 2011 U.S. Dist. LEXIS 1288, at *23 (D. Idaho Jan. 5, 2011). Rather than discuss the vast potential for energy security and economic growth that these unconventional deposits hold, BLM bases its "foreseeable" scenario and economic analysis only on the limited, historical development associated with "conventional and coalbed natural gas (CBNG) wells. | Assumptions for Energy and Minerals analysis are presented in chapter 4.11.2. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13665-38 | the benefits of technological advancements in horizontal drilling and hydraulic fracturing, would radically change the economic analysis in the Draft RMP and tip the scales in favor of more development-friendly solutions. The vast energy potential, if unleashed, would additionally economically benefit the State and American taxpayers, as well as enhance the nation's energy independence. Moreover, modern horizontal-drilling and hydraulic-fracturing technology allow larger areas to be developed with far-less overall surface impact (i.e., fewer well locations, facilities, roads, pipelines, etc.) than conventional vertical wells, which are no longer commonly used. Thus, | Impacts to energy and minerals were analyzed in chapter 4.11. Assumptions for Energy and Minerals analysis are presented in chapter 4.11.2. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | reliance on data from past vertical-well drilling practices fails to account for the environmental benefits of modern development practices. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-3 | 1. BLM's Use of Outdated Data Overstates Impacts of Oil & Gas Development, and Drove Adoption of Unnecessarily Restrictive Conditions. The proposed revisions to the RSFO Resource Management Plan have been in process for more than 12 years. Much of the underlying data and assumptions utilized in the pending Draft Environmental Impact Statement ("DEIS") were gathered early in this process, rendering it outdated and unreliable with the passage of many years. This is particularly true with respect to fluid minerals development. Section 3.15.1 of the DEIS reflects the dated nature of the data; the last drilling/leasing data is from 2010. The BLM's reasonably foreseeable development scenario ("RFD") forecast is a decade old, dating to 2013,1 and based on data from years before the publication date. Section 4.2.2 of the DEIS states that the best available information pertinent to 1 BLM Rock Springs, Field Office, Reasonably Foreseeable Development Scenario for Oil and Gas (September 25, 2013). | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-4 | In other words, BLM based its actions across the range of alternatives on assumed future proposed mineral development for oil and gas. Those assumptions dated from 2013 for a document issued in 2023. This outdated RFD scenario used by BLM in these decisions had been proven entirely mistaken by actual events well prior to the date of the DEIS. Based off 2013 BLM RFD, all analyses in the DEIS were based upon an average of 336 new wells being drilled every year in the RSFO. In fact, only 18 wells were spudded in FY2022. With this actual data, one would reasonably assume 360 wells would be drilled over the 20-year life of the RMP, not the 6,700 wells projected in the RFD. Assuming the 18 wells spudded in FY2022 representation of an annual average, the BLM's outdated projection overestimates oil and natural gas development in the RSFO by 1,867 percent. BLM of course had this data available to it as of the DEIS, but did not use it. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-6 | BLM Failed to Consider Reduced Land Needs Associated With New Drilling Technologies. By using the outdated 2013 RFD as the basis for its management decisions, BLM also erred by failing to recognize that new drilling technologies in the interval have substantially reduced the 2 Executive Summary at 6 (Environmental Consequences). surface disturbance associated with new oil and gas drilling. The RFD assumed that all new drilling within the RFSO would occur on one-well pads, due to the then-speculative nature of use of multi-well pads.3 As technology has developed, multiple wells can be drilled from single pads, and long horizontal laterals mean that far more oil and gas can be extracted from each well.4 The results of the BLM's failure to consider current oil & gas technology existing as of the date of the DEIS is that BLM greatly overstated the surface effects of future oil and gas production, and understated the socioeconomic loss in worker income, business revenues, and state taxes and royalties, from its proposed elimination of millions of acres of public lands from availability for leasing. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-7 | BLM's Proposed Decision to Rely on Full Mineral Withdrawals Over Vast Areas of the RFSO when Equally Protective But Less Restrictive Measures Are Available Violates the Energy Policy Act of 2005. The Energy Policy Act of 2005, as well as the Energy Policy Conservation Act Amendments of 2000 (collectively "EPACT"), that require federal land management agencies to use the least restrictive means necessary to protect other resource values. Blanket closure to a principal use of public lands is not the least restrictive means.5 Similarly, BLM's own Land Use Planning Handbook provides that areas should only be closed to leasing when "other land or resource values cannot be protected with even the most restrictive lease stipulations."6 As discussed in Comment 2, substantial advances in drilling technologies since the date of the RFD have significantly reduced the footprint of oil and gas development, permitting protection of land and resource values while still permitting development of valuable oil and gas resources. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-9 | Under Alternative B, BLM would expand Areas of Critical Environmental Concern ("ACECs") by some 83%, to over 1.7 million acres. Notably, the Greater Red Creek ACEC, currently traversed by EPP's existing MAPL pipeline, would be more than tripled in size, from 131,600 acres to 468,170 acres. Yet the DEIS failed to analyze how development of these areas has impaired any environmental concerns within the area, how proposed limitations on use would affect existing uses, or why the proposed expansions are necessary to protect identified concerns when lesser restrictions would meet the same goals. | Management actions for all four alternatives are identified for Special Designations (SD)-ACECs and can be found in the DEIS from management action 7400-7570. See Appendix C for ACEC evaluation. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-10 | LM's Excessive ROW Avoidance Measures Will Violate Existing Oil & Gas Lessee's Rights to Fully Develop Their Leases. EPP provides natural gas transportation services to producers operating on BLM lands. To the extent that BLM, through denial of necessary rights-of-way to transport production from existing leases, limits future production from existing leases, it has violated those lessee's leasehold rights. The BLM does not have the authority to unilaterally modify existing leases through a resource plan amendment or otherwise infringe on valid existing rights. All BLM actions, including authorization of RMPs, are "subject to valid existing rights." 43 U.S.C. § 1701, note (h); see also Strata Prod. Co. v. Jewell, No. CV 13-205 JCH-GBW, 2014 WL 12789010, at *7 (D.N.M. Aug. 11, 2014) ("The authority of the BLM to take actions in accordance with a plan, however, is "subject to valid existing rights."' (quoting 43 C.F.R. § 1610.5-3(b))). Nor may BLM apply unduly restrictive conditions or stipulations that would significantly impede or impair new or continued development of existing leases and other rights, like instituting restrictive ROW policies which impede a right-holders ability to access and develop their lease. See | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |

|---|---|---|---|
| | | Colorado Environmental Coal., et al., 165 IBLA 221, 228 (2005) (citing Colorado Environmental Coal., 135 IBLA 356, 360 (1996) aff'd, Colorado Environmental Coal. v. Bureau of Land Management, 932 F. Supp. 1247 (D. Colo. 1996)). The BLM erred in failing to consider the impact of ROW exclusion areas on the valid existing right of oil and gas lessees. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13715-12 | MA #7002-7003 (National Historic and Scenic Trails). Alternative B creates a 10 mile wide trail management corridor (5 miles per side) of right-of-way exclusion areas in the general area where the boundaries of Sublette, Lincoln, and Sweetwater counties converge, on the northwest portion of the RFSO, with an additional ROW avoidance area from mile 5 to 15. This is an area of significant and dense existing natural gas production, is currently fully-leased for oil & gas, and includes EPP's existing Bird Canyon compressor station. This is an area not deemed worthy of ACEC or other special status in any alternative. As noted in MA #7002 for Alternative D, BLM and Wyoming SHPO have agreed that the setting of the NHT in the western part of the RSFO has been compromised by existing development, justifying a ¼ mile buffer on each side of the NHT, not the 10 mile ROW exclusion zone (and combined 30 mile exclusion and avoidance zone) proposed in Alternative B. As discussed in Comment #4 above, the elimination of future right-of-way access for transportation of natural gas is an impairment of the leasehold rights of existing oil & gas lessees. In this case, where BLM has agreed with SHPO that existing development justifies only a¼ mile buffer, it is arbitrary and capricious to impose a giant exclusion zone (and co1Tesponding future leasing withdrawal) where the area is a developed field, and where the protective measures proposed in each of the other three alternatives are fully adequate to protect the NHT resource | Management actions for all four alternatives are identified within management actions 7000-7022 titled "Special Designations-Congressionally Designated Trails." Impacts to energy and minerals were analyzed in chapter 4.11. Impact to Rights-of-Way were analyzed in chapter 4.19. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13720-6 | 3.15.1 Leasable Fluid Minerals (U.S. Department of the Interior Bureau of Land Management, 2023) (Page 3-18) The DRMP DEIS reads "There are currently 85 operators producing oil and gas resources in the planning area. As of October 2010, federal oil and gas leases encompass 1,722,313 acres or 60% of the acres available to lease." The Wyoming Oil and Gas Conservation Commission notes 90 operators in Sweetwater County alone (Wyoming Oil and Gas Conservation Commission, 2024), although the BLM Rock Springs Field Office planning area also covers portions of Lincoln, Uinta, Sublette, and Fremont counties. There have been oil and gas lease sales almost every year since 2010, with annual increases of acreage leased. These DRMP DEIS statistics are likely inaccurate and should be updated to reflect current conditions in the planning area. We respectfully request that BLM updates these 14-year-old statistics to reflect recently-available (2023) numbers of oil and gas operators and federal oil and gas lease acreage compared to acres available to lease. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13720-20 | A.2.9 Reducing Impacts from Fluid Mineral Construction, Operation, and Reclamation We respectfully request that the BLM adds the following Best Management Practices to the list in this section: * Leak detection and mitigation * Reclamation should be initiated during the first growing season after disturbance. * Include traffic speed limits on BLM roads servicing fluid mineral development. | Appendix A is not all inclusive and other BMPs may be considered during site specific implementation and analysis. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13751-118 | MA #2202 ALT A No similar action Industry position: Not acceptable Reason: Oil and gas drilling and development within the KSLA is not consistent with Wyoming Oil and Gas Conservation Commission (WOGCC) Rules and may put miners at safety risk. This needs to be updated with current BLM policy/moratoriums and current WY Oil and Gas Conservation Commission Rules. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. ALT B Continue to suspend existing oil and gas leases from development within the Mechanically Mineable Trona Area (MMTA). Close the MMTA (MMTA federal 141,409 acres) for new fluid mineral leasing until the oil and gas can be recovered without compromising the safety of the underground miners. Industry position: Acceptable but should reference the WOGCC Rules that define the trona resource as the Special Sodium Drilling Area by location and by the required protections. The WOGCC Rules are intended to protect miners and the trona resource. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. ALT C The MMTA would be managed as a CSU. Recovery of the oil and gas resource must be accomplished without compromising the safety of underground miners or the trona mineral resource. Industry position: Acceptable but should reference the WOGCC Rules that define the trona resource as the Special Sodium Drilling Area by location and by the required protections. The WOGCC Rules are intended to protect miners and the trona resource. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA ALT D Existing oil and gas leases are suspended in the MMTA (141,409 surface acres). The MMTA is administratively unavailable for new fluid mineral leasing until the oil and gas resource can be recovered without compromising the safety of the underground miners. Industry position: Acceptable but should reference the WOGCC Rules that define the trona resource as the Special Sodium Drilling Area by location and by the required protections. The WOGCC Rules are intended to protect miners and the trona resource. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil | #13754-1 | , the RFD supported the assumptions of impacts for almost every resource analyzed in the DRMP. The BLM states early in the DRMP, as a way of providing context to all alternatives, that "the biggest difference in impacts from the range of alternatives can be derived from looking at the proposed allocations for minerals cited above in Table ES-1."4 However, upon review of recent, actual data on oil and natural gas production in the RSFO, a very different | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Gas (2200-2222) | | story emerges. The BLM's own data shows that in FY2022 in the RSFO, 33 Applications for Permits to Drill (APD) were received, 21 approved, 13 are pending, a mere 18 wells were actually spud and only 29 were completed.5 Based off the BLM's 2013 RFD, it was projected and all NEPA analyses were based upon an average of 336 new wells being drilled every year in the RSFO. In fact, only 18 wells were spud in FY2022. With this actual data, one would reasonably assume 360 wells would be drilled over the 20-year life of the RMP, not the 6,700 wells projected in the RFD. The BLM has the data for the number of wells actually spud in the RSFO each year since the 2013 RFD was completed. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13754-2 | it has not considered very important data about the reduction in impacts that the oil and natural gas industry has achieved due to technological advancements, especially since 2011. In the year 2000, over 4,000 wells were spud in Wyoming. The following year (2001), combined oil and natural gas production totaled 327 million barrels of oil equivalent (BOE). In 2019, just over 650 wells were spud, and 2020 production totaled 334 million BOE. Just twenty years later, one sixth as many wells were needed to achieve a roughly equivalent production level, which represents a substantial reduction in land disturbance. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13754-3 | it's important to emphasize that vertical wells, more prevalent in the 2000's, were drilled on single-well pads. Directional and horizontal drilling became more prevalent around 2010 and into the present, allowing for multiple wells per pad. This practice has reduced surface disturbance by as much as 70 percent and allows operators to access lease parcels with no surface occupancy, timing limitation, or conditional surface use stipulations.6 Parcels that would be off-limits to leasing under Alternative B could in fact be responsibly developed since industry practice does not result in the impacts that the BLM assumes. Moreover, through the application of prudently attached lease stipulations rather than the blanket closure to leasing that the BLM envisions, impacts to other natural resources can be further minimized or eliminated altogether. Well count is no longer the single surrogate for inferring surface disturbance. The reduction in the number of pads required to recover the same amount of hydrocarbons is greater than the reduction in well count from 2001 to 2019. The BLM has not adequately accounted for the decrease in surface disturbance from well pads, access roads, power lines, pipelines and other infrastructure created by the transition to horizontal drilling and the resulting reduction in fragmentation. The BLM must reanalyze the impacts from oil and natural gas based on actual wells spud and realistic assessments of today's technologies. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13754-4 | Approximately 24 percent of the oil and 11 percent of the natural gas produced in the United States require authorization through the federal onshore and offshore programs, a significant portion of production in our nation. To stunt their development simply elicits greater reliance on other supply chains to meet demand. On average, 40 percent11 of the oil and gas consumed in the United States comes from international sources. Restricting or eliminating the ability for development within the RSFO will result in some portion of that supply coming from international sources. In that instance, the BLM would have no control or knowledge of the environmental controls and mitigation requirements during production, will have no oversight in the refining process, and will result in longer transportation routes and slower delivery. These factors lead to an outcome in which removing oil and natural gas development in the RSFO results in the worst environmental outcome. Real-world scenarios indicate that allowing domestic oil and natural gas development is the environmentally preferable alternative that also has corollary socio-economic benefits. | Impacts to energy and minerals were analyzed in chapter 4.11. Impacts to socioeconomics were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13754-7 | The BLM does not have the authority to unilaterally modify existing leases through a resource plan amendment or otherwise infringe on valid existing rights. All BLM actions, including authorization of RMPs, are "subject to valid existing rights." 43 U.S.C. § 1701, note (h); see also Strata Prod. Co. v. Jewell, No. CV 13-205 JCH-GBW, 2014 WL 12789010, at *7 (D.N.M. Aug. 11, 2014) ("The authority of the BLM to take actions in accordance with a plan, however, is "subject to valid existing rights."' (quoting 43 C.F.R. § 1610.5-3(b))). In particular, oil and gas leases constitute valid existing rights. E.g., Barlow & Haun, Inc. v. United States, 805 F.3d 1049, 1056 (Fed. Cir. 2015). Federal lessees have a legal right to occupy the surface to explore for, produce and develop oil and natural gas resources on their leases, subject only to the stipulations contained in their lease at the time of issuance. See Pennaco Energy v. United States Dep't of the Interior, 377 F.3 d 1147, 1160 (10th Cir. 2004). Thus, the BLM cannot terminate, modify or alter any valid or existing property rights - such as existing oil and gas leasing rights - or apply unduly restrictive conditions or stipulations that would significantly impede or impair new or continued development of existing leases and other rights, like instituting restrictive ROW policies which impede a right-holders ability to access and develop their lease. See Colorado Environmental Coal., et al., 165 IBLA 221, 228 (2005) (citing Colorado Environmental Coal., 135 IBLA 356, 360 (1996) aff'd, Colorado Environmental Coal. v. Bureau of Land Management, 932 F. Supp. 1247 (D. Colo. 1996)); Mitchell Energy Corp., 68 IBLA 219, 224 (1982) | See Section 4.11.1 for analysis assumptions. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13754-19 | both the Jonah and NPL projects are located in two different field offices. Any inconsistency in management from one field office managing for the ROD and another managing from the ROD and superseding RMP requirements would create significant complications. Both the Jonah Infill Development Project and NPL Development Project have more than adequate NEPA analysis and more importantly significant, and effective, resource protection measures in place. | See Section 4.11.1 for analysis assumptions. Both documents cited apply to a site specific level analysis. |

|---|---|---|---|
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13783-2 | If is very likely that Wexpro may seek to expand it oil and gas drilling program in the area, including acquisition of new leases. BLM's proposed No Surface Occupancy areas and right-of-way exclusion zones cover much of the existing Vermillion Field and nearly all of the areas where future development might occur. While there not be concrete plans to develop those resources in those expansion areas at this time, the technology and economics may make those areas viable for drilling and production in the future, and BLM's decision to place them off limits for the next 20 years and likely beyond is short-sighted and fails to acknowledge the multiple use values of these public resources. | See Sections 4.11.1 and 4.19.1 for analysis assumptions. Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13783-3 | As explained further below, BLM's implementation of Alternative B in the Draft RMP, while it claims to protect valid existing rights, threatens to severely restrict or make impracticable Wexpro's continued development and possible expansion of the Vermillion Infill Project. Wexpro requests that BLM implement Alternative A or wholly reconsider the proposed alternatives and release a new Draft EA with a proposed alternative that meets BLM's multiple use obligation. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. Impacts to energy and minerals were analyzed in chapter 4.11 |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13783-19 | Proposed Restrictions in Alternative B Violate Valid Existing Rights. Alternative B ignores BLM's legal obligation to propose a multiple-use management plan. Instead, it elevates EO 13990's environmental goals above all economic uses. Closing off half the planning area to oil and gas leasing and designating nearly a quarter as NSO areas puts a halt to economic growth in the planning area. Beyond BLM's restrictions on new oil and gas leases, under Alternative B, BLM's supposed limits on use of the federal surface for the supposed protection of a variety of resources, including soils on steep slopes, floodplains and riparian areas, big game habitats (winter, parturition), visual resources, and cultural and historic sites threaten to substantially curtail or violate valid existing rights. The below map shows BLM's proposed "no leasing" zone (shaded in blue) and the no surface occupancy leasing zone (shaded in red) in relation to Wexpro's Vermillion Field. Strikingly, the entirety of the Vermillion Field falls within one category or the other. And BLM provides zero justification for designating the area that is proposed for NSO. This map is included in the map appendix to allow BLM to view the map details. Individually, any one of these newly restrictive designations (no surface occupancy or right-of-way exclusion zones) is significant, but taken together, they are crippling. Not only do they restrict new uses, but they also severely limit the ability of existing oil and gas lease holders to develop their resources, and go far beyond the "reasonable" surface restrictions permissible under BLM regulation. See 43 C.F.R. § 3101.1-2. Though BLM disclaims any action affecting valid existing rights (Draft EIS at 1-4, 2-2 (Table 2-1)), the inability of leaseholders to build access roads, lay pipelines, or construct transmission will foreclose the economic development of existing rights, as discussed specifically relating to Wexpro's development in Section III.A.2, above. Moreover, BLM's attempt to impose surface use restrictions on existing leases offered without such limitations violates the terms of those existing property rights. In short, BLM oversteps its bounds under its multiple-use mandate and in violation of existing rights in promoting Alternative B, which forecloses economic uses across most of the planning area. | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. Impacts to energy and minerals were analyzed in chapter 4.11. Impact to socioeconomics were analyzed in chapter 4.22. See Sections 4.11.1 for analysis assumptions |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13787-46 | MA #2202 MR-02, MR-03 No similar action Industry position: Not acceptable Reason: Oil and gas drilling and development within the KSLA is not consistent with Wyoming Oil and Gas Conservation Commission (WOGCC) Rules and may put miners at safety risk. This needs to be updated with current BLM policy/moratoriums and current WY Oil and Gas Conservation Commission Rules. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. Continue to suspend existing oil and gas leases from development within the Mechanically Mineable Trona Area (MMTA). Close the MMTA (MMTA federal 141,409 acres) for new fluid mineral leasing until the oil and gas can be recovered without compromising the safety of the underground miners. Industry position: Acceptable but should reference the WOGCC Rules that define the trona resource as the Special Sodium Drilling Area by location and by the required protections. The WOGCC Rules are intended to protect miners and the trona resource. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. The MMTA would be managed as a CSU. Recovery of the oil and gas resource must be accomplished without compromising the safety of underground miners or the trona mineral resource. Industry position: Acceptable but should reference the WOGCC Rules that define the trona resource as the Special Sodium Drilling Area by location and by the required protections. The WOGCC Rules are intended to protect miners and the trona resource. The WOGCC Rules go beyond the MMTA area and are more aligned with the entire KSLA. Existing oil and gas leases are suspended in the MMTA (141,409 surface acres). The MMTA is administratively unavailable for new fluid mineral leasing until the oil and gas resource can be recovered without compromising the safety of the underground miners. | 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13793-2 | As you are aware, global demand for clean energy supplies is soaring, led by economic growth and fuel switching in China, Japan, South Korea, Taiwan and India and Europe's push to diversify from embargoed Russian natural gas. Natural gas from western basins in the U.S. can play a key role in meeting those energy needs by providing reliable, cleaner baseload power to displace higher carbon fuels and foster renewable energy deployment by balancing intermittency issues and supporting related supply chains. While WSTN shares the mission of reducing global greenhouse gas (GHG) emissions, our original vision is predicated on the fact that GHG emissions know no national or regional boundaries. When that reality is factored into GHG analyses, it is clear that not all emissions are additive to the global tally - some are reductive. Wyoming's in particular would be reductive if exported to Asian markets to displace coal-fired generation. A 2021 study commissioned by WSTN found that the export of Rockies-sourced liquefied natural gas from the North American West Coast to China, India, Japan, South Korea, and Taiwan would reduce net life cycle emissions by 42%-55% if used to replace coal-fired energy generation in those countries. As you consider alternatives that balance all legally designated uses of federal land in the decision area, WSTN encourages consideration of additional research showing that responsible, well-regulated natural gas production and exports can actually reduce global emissions, as evidenced by the study's findings, available here. | See Section 4.3.2 for assumptions for the air quality analysis. See Appendix P for Air Quality Support Document. P.6.1 identifies Emission Development Assumptions. D471 |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13793-3 | Crucially, the State Department supported language in the 2023 Group of Seven Nations Communiqué which defined LNG's usage going forward to support future energy systems such as hydrogen and decarbonized ammonia. This preceded the inclusion of natural gas in the final language from United Nations Conference of the Parties 28 in 2023 as a fuel for the future, which also included Biden Administration priorities relevant to natural gas: methane abatement and the use of carbon capture and storage to limit emissions. Both of these global decisions recognized the reality that four-fifths of the world's energy comes from natural gas and oil, and that a more pragmatic path to the future requires innovation and technology to help manage the evolution to future energy systems without catastrophic economic and social consequences. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13793-4 | Second, there is no realistic expectation that global and domestic natural gas demand is going away for decades, so the best option is to produce it with as low a methane intensity and as many environmentally responsible practices as possible. The regulatory and environmental requirements for natural gas and oil production on federal lands are the most environmentally advantageous sources for these natural resources. Throttling or outright stopping natural gas production on federal leasing areas will limit the best available product from being exported to meet the growing demand, which will in turn lead to a higher emissions cost. What is sold in the global environment matters because pollution knows no geographical boundaries. It is noteworthy that two Wyoming companies are producing some of the least methane-intense natural gas in the world - at roughly one-tenth the prevailing industry intensity - and are commanding a premium for this. These are precisely this type of operational and technological leaps forward that should be encouraged to help the U.S. in terms of economic, energy and national security. | Impacts to air quality were analyzed in chapter 4.3. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13793-5 | Alternative B would limit the domestic ability to support responsible natural resource development, and it does so predicated on a flawed and out-of-date Reasonable Foreseeable Development analysis. This analysis that overestimates emissions levels drastically by relying on historic levels of production that are barely a tenth of current production. | Impacts to energy and minerals were analyzed in chapter 4.11. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13823-2 | My question would be how reclamation and land improvements are factored into this analysis? This relates to both agricultural grazing and mineral exploration. It seems that the RMP views land use as a near zero sum game. As if every acre of land not being grazed or leased for mineral extraction is then, and only then, available for wildlife. It portrays a scenario in which 100% of leasable land for mineral extraction will be disturbed and therefore removed as a resource for wildlife, ignoring the possibility of reclamation and improvement, which could easily be the standard stipulation of a lease. | Impacts to soil are located in Section 4.4. Impacts to vegetation are located in Section 4.6. Impacts to wildlife are identified in Section 4.7. The assumptions used to build these analyses are contained within their respective sections of the DEIS. Refer to Appendix I entitled "Reclamation Plan" to determine reclamation standards. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | A range of alternatives are presented in MA#4424. Impacts to energy and minerals were analyzed in chapter 4.11. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13899-73 | Allowing leasing to occur in the substantial acreage still available in the Preferred Alternative (1,418,592 acres), particularly without adequate bonding will only increase the burden on the public and leave numerous problematic orphaned wells that degrade public lands. | Bonding policy is out of scope for this Resource Management Plan. See Chapter 1.4 for the Planning Criteria. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13899-74 | Speculation on lands with little drilling potential wastes BLM's time and resources (and taxpayer dollars) and locks up public land that should be devoted to uses in the greater public interest. Alternative B would help curb this land speculation | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. Impacts to energy and minerals are analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13899-106 | Any decision not to pursue those fluid mineral closures based on concerns about socio-economic impacts would require BLM to update both the RFD and socio-economic impact analysis. To do so, BLM would need to include actual wells drilled data since 2012 and update the RFD and subsequent socioeconomic impact analysis in the EIS based on updated modeling, such as RFF's. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13899-108 | BLM should not depart from the fluid mineral closures in Alternative B based on the flawed socio-economic analysis in the draft RMP and EIS. | Impacts to energy and minerals were analyzed in chapter 4.11. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13911-12 | The BLM recognized during the Rawlins RMP revision process in 2008 that VRM Class II was inappropriate in the Checkerboard and also agreed to revise its VRM Class II classifications to not affect existing leased areas. See Attach. 3, Rawlins Protest Resolution Report Excerpt at pp. 139-142 (Dec. 24, 2008). The VRM designations were remanded after the protest period to reevaluate the designations and complete an updated inventory of the visual resources within the planning area to comply with its own VRM policy. Id. The BLM last completed a visual resource inventory in the planning area in 2009 and 2011. DEIS at 3-17. In addition, the inventory included in the Analysis of the Management Situation ("AMS") that was used in formulating the alternatives was completed in 2013 and has not been updated in response to changing conditions. Id. at ES-1. So, most of the information relied upon by the BLM in designating VRMs is over a decade old. Even with this older data, when you compare Map 3-8 that shows existing federal oil and gas leases to Map 2-18 (Alt. B) and Map 2-20 (Alt. D), it shows that the BLM has designated VRM Class II management in areas with extensive oil and gas leasing that was approved under the Green River RMP. Under IBLA's holding, the VRM Class II would be largely invalid and unenforceable across the planning area. | Management actions for all four alternatives are identified for Heritage and Visual Resources and can be found in the DEIS from management action 5400-5413. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13911-14 | Id. at 4-258 - 4-259. The BLM notes that impact on overall oil and gas development may not be as high as the large reduction in BLM-managed well counts would indicate because development may shift from the federal surface and mineral estates to non-federal surface and mineral estates. Id. at 4-259. However, this statement fails to recognize that development on private and state lands is unlikely to proceed, especially in the Checkerboard and on intermingled private and state lands, where ROWs across federal lands are necessary for development to occur. In addition, closure of so many areas to development could also adversely impact development of existing leases when the play or unit area is not fully leased and will never be fully leased due to Preferred Alternative B's proposed closures. | Impacts to energy and minerals were analyzed in chapter 4.11. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13923-14 | We recognize the importance of responsible resource development across the RSFO and encourage the BLM to direct oil and gas leasing to areas with moderate to high potential. Removing or avoiding leasing from areas of low potential will direct agency resources to areas 12 with actual development potential and reduce conflict in areas without potential. | Management actions for all four alternatives are identified for Leasable Minerals – Oil and Gas and can be found in the DEIS from management action 2200-2222. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13925-10 | The Mineral Leasing Act is a public land law that provides for the orderly sale of the rights to develop oil and gas on public lands. Any decision of BLM to withhold public lands from sale under the Mineral Leasing Act to protect resources falls squarely within the definition of a withdrawal under FLPMA. The Wyoming district court has twice concluded that Forest Service leasing moratoria, which were enforced by BLM, must comply with Section 204 procedures. Mountain States Legal Foundation v. Andrus, 499 F. Supp. 383 (D. Wyo 1980) ("MSLF I") (deferring action on mineral lease applications pending RARE II violated §204); and Mountain States Legal Foundation v. Hodel, 668 F. Supp. 1466 (D. Wyo. 1987) ("MSLF II") (deferring mineral lease applications pending completion of | See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | EIS and land use plans violated Section 204). The United States never appealed either decision and instead proceeded to process the pending lease applications. BLM contends its discretion to offer a parcel for leasing overrides Section 204, citing Bob Marshall Alliance v. Hodel, 852 F2d 1223, 1229-30 (9th Cir. 1988) and Ash Creek Mining, Co. v. Lujan, 969 F.2d 868, 874-875 (10th Cir. 1992) (company could not show judicial relief would redress injury, because Interior cannot be compelled to offer tract of land for lease sale). Both cases involved an individual tract of land that was not offered for a lease sale, not a programmatic decision to withhold public lands from energy development. It is clear that in Wyoming, BLM must follow Section 204 procedures. | |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13925-43 | Alternative B describes a management prescription where 3,813,000 acres is closed to leasing or if leased subject to no surface occupancy and sever timing limitations. Alternative B requires a social economic analysis of the impact to Sweetwater County and Wyoming before it is adopted. Alternative B describes the elimination of a viable and environmentally responsible industry and major program of the BLM.. The management action includes the criteria of "Exceptions would not be granted ", this illustrates a lack of expertise and knowledge of the authors and BLM leadership. Resource management is imperfect and to tie the hands of future resource managers to resolve unintended consequences is irresponsible, and counter to generations of BLM resource plans. The terminology of Alternative A should be incorporated into the Preferred Alternative, otherwise Alternative B is a demonstration of ignoring the Mineral Leasing Act. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. See DEIS Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13927-2 | When considering the effects of energy development in the GLMA, it is important to recognize that land ownership patterns could exacerbate fish and wildlife impacts from oil and gas development by focusing infrastructure on stream valley locations. Should No Surface Occupancy (NSO) stipulations be implemented on BLM lands, accessing underlying oil and gas resources would require directional drilling from State and private lands, which are predominantly located along streams (Figure 1). These valley bottoms and riparian zones are highly sensitive to surface disturbances, while also being rich habitat for both native trout and wildlife. For instance, the CRCT population in Currant Creek is almost entirely located on state lands where infrastructure would have to be located in order to potentially access nearby federal minerals. | See MA# 0006 and 0007. Impacts to wildlife and fisheries are described in chapter 4.7. Impacts to water resources are described in chapter 4.3. Impacts to energy and minerals were analyzed in chapter 4.11. Se Appendix T.1.1 for analysis methodology and assumptions. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13955-1 | According to the most recent report from the 2022 Bureau of Economic Analysis Report on Outdoor Recreation, "Wyoming outdoor recreation employment increased from 15,285 to 16,202 jobs, accounting for 5.6% of the state's total employment." Wyoming's outdoor recreation economy increased to $2.02 billion according to the U.S. Department of Commerce's Bureau of Economic Analysis. According to the Bureau of Economic Analysis, in 2022 Wyoming's top three industries are oil and gas at $8.99 billion, $2.5 billion for travel and tourism, $1.12 billion for agriculture, and $5.7 Billion in labor income for oil and gas1 The data also shows that $1.712 billion in Wyoming is generated from agriculture and a total of 58,780 jobs for oil and gas. Oil and gas is also the leading industry in Wyoming producing $2.72 billion. The ACEC designations and Alternatives B and D would greatly hinder the economic opportunities throughout the state. Recreation alone is nationally a trillion dollar a year industry and any alternative other than Alternative C would deprive Wyoming from capitalizing on this growing industry. | Management actions for all four alternatives with regards to Recreation are outlined in Management Actions 6500-6557. Recreation impacts were analyzed in chapter 4.17. Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #13955-2 | According to the most recent report from the 2022 Bureau of Economic Analysis Report on Outdoor Recreation, "Wyoming outdoor recreation employment increased from 15,285 to 16,202 jobs, accounting for 5.6% of the state's total employment." Wyoming's outdoor recreation economy increased to $2.02 billion according to the U.S. Department of Commerce's Bureau of Economic Analysis. According to the Bureau of Economic Analysis, in 2022 Wyoming's top three industries are oil and gas at $8.99 billion, $2.5 billion for travel and tourism, $1.12 billion for agriculture, and $5.7 Billion in labor income for oil and gas1 The data also shows that $1.712 billion in Wyoming is generated from agriculture and a total of 58,780 jobs for oil and gas. Oil and gas is also the leading industry in Wyoming producing $2.72 billion. The ACEC designations and Alternatives B and D would greatly hinder the economic opportunities throughout the state. Recreation alone is nationally a trillion dollar a year industry and any alternative other than Alternative C would deprive Wyoming from capitalizing on this growing industry. | Management actions for all four alternatives with regards to Socioeconomic Resources are outlined in Management Actions 8000-8012. Socioeconomic impacts were analyzed in chapter 4.22. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #14022-2 | SCCD is discouraged that the BLM wouldn't utilize the most current and relevant rangeland monitoring data that has been collected in the RSFO for this RMP revision. SCCD has been a part of several cooperative monitoring efforts in the RSFO and has compiled and summarized the data and sent it to the RSFO to be filed in the appropriate allotment files. SCCD has also worked cooperatively with grazing permittees, oil and gas operators, and BLM to conduct inventories associated with the Normally Pressurized Lance gas field as well as portions of the Jonah field. This data appears to have not been utilized and discounts the combined efforts of local BLM staff, SCCD staff, and users of BLM lands that have helped in the above efforts. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. Management actions for all four alternatives with regards to Livestock Grazing Management are outlined in Management Actions 6400-6417. |
| 807 - Mineral Resources-Leasable Minerals–Oil and Gas (2200-2222) | #14100-1 | The new plan should prioritize development away from areas critical to wildlife by closing areas that contain low oil and gas potential to future leasing opportunities, while maintaining public access. | Impacts to wildlife were analyzed in chapter 4.7. |
| 809 - Mineral Resources- | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as | This is addressed in Chapter 4 Page 4-18 Section 4.4.1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Other Leasable Minerals (2400-2419) | | difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | Management actions for all four alternatives are identified for mineral resources under 2400 - 2419 in the DEIS. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419 |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #10225-1 | Sweetwater County and the City of Rock Springs subsidies make up a sizeable portion of our budget. We are dependent on these subsidies to provide many essential services to the aging and mobility challenged population as well as the youth of Sweetwater County. The services that Young at Heart provides are the following: Congregate meals for the community having served approximately 6,891 meals in 2022 This year to date we have recorded 10,836 meals. Home delivered meals totaling around 42,000 in 2022, and social entertainment totaling approximately 17,708 hours (pool, poker, card games, and dominoes). We offer In-Home Services which provides light housekeeping and small chores to more than 92 clients in the Rock Springs and Green River areas. Additionally, we provide In-Home Health services assisting more than 15 patients. And finally we have our Early Learning Center providing children with quality education which serves more than 100 families. Therefore reduction in any of these revenue streams would severely impact, if not totally eliminate some of all of these services. In fact, it could force the closure of the Center altogether. Historically and currently mineral extraction is a mainstay in our local economy. Monies from industrial impacts, mineral severance, sales taxes, etc. flow into the local government budgets to support essential services. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13132-1 | There are many beds or layers of Trona though out Sweetwater County and it is the largest natural deposit of Trona in the world. If there were new restrictions put on trona mines, that would mean the eventual shutdown of the trona mines due to decreased production. This would hurt many families in Uinta County, Lincoln County, and Sweetwater County specifically, but statewide as well. Our livelihood depends on the mining industry, and they cannot afford any more restrictions. This will not only have a lasting impact financially on my family, but the city economy, the state economy, and the country altogether. Trona is a great resource and is used in many things; such as baking soda, glass, and fertilizer. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4 under 4.11.1. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13134-1 | Majority of our educational funds are in direct correlation with the Energy and Mineral Industries. Reducing the Wyoming State Gross Domestic Product by $1billion/year would be detrimental to our state, our educational system would not survive. Decreasing Oil and Gas development by 73% is astronomical. The surrounding Mines, Coal, Oil and Gas Industries are the backbone of our state and cannot be compromised any more than they have been. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13137-1 | If there were new restrictions put on trona leases, that would mean the eventual shutdown of the trona mines due to decreased production. This would hurt many families in Uinta, Lincoln, and Sweetwater Counties specifically, but statewide as well. Our livelihood depends on the mining industry, and they cannot afford any more restrictions. This will not only have a lasting impact financially on my family, but the city economy, the state economy, and the country altogether. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809 - Mineral Resources-Other Leasable | #13153-1 | Not only does “Alternative B” constitute the most restrictive of the agency’s possible alternatives– your agency admits in its Environmental Impact Statement that this alternative creates the largest socioeconomic impact due to reduced mineral development on the 3.6 million acres subject to your control. Under the Multiple Use-Sustained Yield Act of 1960, your agency is required to manage federal lands in accordance with the principles of multiple use and sustained yield. This means that all possible uses and benefits of the lands be treated equally by your agency when promulgating land use plans. Clearly, you and your agency have ignored the deeply enshrined | The Draft EIS, including all four alternatives, are in compliance with FLPMA. Relative to all alternatives, Alternative B emphasizes conservation of resource values with constraints on resource uses (see Executive Summary "Alternatives" [pg. ES-3] and Table 1 for summary of comparison between all alternatives). See Section 1.2.1 Purpose, and Sections 1.4-1.5 Planning Criteria and Relationship to Other Plans (including FLPMA and NEPA). Also, please refer to the Glossary for a definition of withdrawal. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals (2400-2419) | | principles of multiple use and sustained yield. “Alternative B” removes over 7,000 animal unit months of grazing, removes over 60,000 acres from any and all use to “protect wilderness characteristics,” and “de-emphasizes recreation” in favor of “conservation of resource values with constraints on resource use.” Your preferred plan withdraws millions of acres from mineral extraction, leasing, exploration, and development. Your plan will obliterate the tax revenue derived from mineral, agricultural, recreation and tourism industries in southwest Wyoming | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13218-1 | I am concerned that Alternative B would have a detrimental effect on Wyoming's energy and mineral industries. Alternative B would substantially decrease the opportunity for oil and gas development, coal development, and other mineral development. Alternative B would close 2,122,282 acres to oil and gas development, 3,735,526 acres to coal development, 2,581,741 acres to mineral material sales and disposals, and 49,224 acres to trona leasing and development within the known sodium leasing area. The acres closed for oil and gas development is a 192% increase compared to Alternative A (the current management standard for the Rock Springs planning area); for coal development, a 433% increase compared to Alternative A; for mineral material sales and disposals, a 209% increase compared to Alternative A; and for trona leasing and development, a 101% increase compared to Alternative A. This is an extreme increase in the number of acres closed compared to Alternative A and this would have the greatest negative impact on solid mineral leasing and development, saleable mineral development, and trona development. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419 |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13241-1 | Alternative B would have a devasting overall economic impact on Wyoming. Under Alternative B, the estimated economic output is $12.6 billion dollars, the estimated total labor earnings are $2.3 billion dollars, and the estimated total local and state revenues from mineral production is $800 million dollars. This is an extreme decrease from the other alternatives. For example, under Alternative A, the estimated economic output is $29.9 billion dollars, the estimated total labor earnings are $5.4 billion dollars, and the estimated local and state revenues from mineral production is $2.3 billion dollars. The total economic output is 52.3% lower under Alternative B than Alternative A and the total labor earnings are 55.8% lower under Alternative B than Alternative A. In addition, the average annual jobs would also decrease as Alternative B would generate only 2,707 jobs compared to Alternative A generating 6,157 jobs. Most significantly, the total local and state revenues would decrease annually under Alternative B. For example, ad valorem taxes would decrease by 52.4%, severance taxes would decrease by 55.1%, and the state's share of federal mineral royalties would decrease by 52.7%. The total local and state revenues are "52% to 55% lower under Alternative B than Alternative A" and "all quantified economic and public revenue indicators for oil and gas development and production are approximately 74% lower under Alternative B than Alternative A." The reduction in revenues for oil and gas development is due to "the substantially lower number of wells drilled under Alternative B and corresponding reductions in oil and gas production." I am totally concerned that Alternative B would have a detrimental effect on Wyoming's economy. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. The socioeconomic model is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13330-17 | * Sweetwater County Farm Bureau is opposed to the Alternative B proposed withdrawal of 258% lands from more land from any potential mineral extraction and 305% more lands from oil and gas extraction. Many of our members hold jobs in these sectors to provide supplemental income. Agriculture producers value mineral and oil and gas production in our area. Additionally, such withdrawals would decimate our local economy and the Alternative B proposal directly violates the Domestic Minerals Program Extension Act of 1953, The Mining and Minerals Policy Act of 1970, the Federal Land Policy and Management Act of 1976, and the Energy Policy Act of 2005. | Please refer to the Glossary for a definition of 'withdrawal', which does not apply to fluid mineral leasing, solid mineral leasing, or mineral material sales (only General Land Laws such as the 1872 Mining Law). Please refer to the proposed management actions for all four alternatives that are described in Table 2.1. Expected impacts from each of the four alternatives can be found in Chapter 4. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13446-3 | Wyoming is one of the largest energy producers in the nation. The proposed plan effectively undermines the functionality and independence of the nation as a whole by the draconian restrictions set forth in the RPM. Right-of-way controls, regulation of surface disturbance, removal of lease options and controls of existing perimeters cut any sustainable viability for Wyoming’s gas and oil production. The reverberations and consequences of such decisions will last for decades and cause more suffering than should be tolerated. (https://www.eia.gov/state/?sid=WY) | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4 under 4.11.1. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13512-2 | Wyoming's natural soda ash, the largest source in the world, is the essential ingredient for many day-to-day items like glass, detergents, food products, and numerous household goods, along with products prioritized by both domestic and international markets, namely multiple types of EV batteries and photovoltaic solar panels. Soda ash is Wyoming's top export, and in 2022, soda ash production in Wyoming was 18,482,320 tons and employed 2,363 people.3 Even with existing production, it will take the development of several new projects like Project West to meet growing demand. | The economics of mineral demand are addressed in Chapter 4 under 4.22.1 Assumptions. Management actions for all four alternatives are identified for other leasable minerals under 2400 - 2419 in the DEIS. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13665-9 | Similarly, in the Mining and Minerals Policy Act of 1970, 30 U.S.C. § 21a, "Congress declare[d] that it is the continuing policy of the Federal Government in the national interest to foster and encourage private enterprise in … the orderly and economic development of domestic mineral resources … to help assure satisfaction of industrial, security and environmental needs."5 As such, Congress expressly stated that "[i]t shall be the responsibility of the Secretary of the Interior to carry out this policy when exercising his authority under such programs as may be authorized by law other than this Act." Id. (emphasis added). In other words, BLM (through its authority delegated from the Secretary) must follow this express policy of fostering the development of domestic mineral resources when engaging in land-planning exercises and authorizations under FLPMA and the MLA. BLM's initial description of its preference, Alternative B, does not even acknowledge resource development as one | The Draft EIS, including all four alternatives, are in compliance with FLPMA. Sections 1.4- 1.5 of the DEIS cover the planning criteria and requirements of BLM land use plans and amendments, including adherence to FLPMA. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | of the agency's primary considerations, let alone one of the priorities set out by Congress. It simply states: "Alternative B emphasizes conservation of resource values with constraints on resource uses. | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13755-2 | BLM Should Clarify That the Entirety of the Known Sodium Leasing Area Remains Open to Leasing BLM claims that under all alternatives in the Draft RMP, including Alternative B, the KSLA "is open to sodium (trona) exploration and consideration for leasing and development." Table 2-1, at 2-40 (Management Action # 2408). Tata fully supports this management action. However, the statement that the entire KSLA is open to leasing does not present the whole picture and conflicts with language later in the Draft EIS that discusses areas off limits to trona leasing under all alternatives. Under Alternative A, BLM states that 24,458 acres of the 356,960-acre KSLA would be closed to trona leasing and development, referring to Map 2-9. Draft EIS at 4-134. Under Alternative B, BLM says that 49,224 acres would be closed to trona leasing and development, referring to Map 2-10. Draft EIS at 4-135. Under Alternative C, 21,412 acres would be closed to trona leasing and development, referring to Map 2-11. Draft EIS at 4-136. And finally, under Alternative D, BLM states that 24,290 acres would be closed to trona leasing and development, referring to Map 2-11. Draft EIS at 4-13 7. These references to areas closed to trona leasing directly contradict BLM's MA #2408 to ensure the entirety of the KSLA is open to trona leasing. | Appendix V contains a description of the areas determined "No Leasing" for sodium. MA32408 states "The KSLA is open to sodium (trona) exploration and consideration for leasing and development." MA#2411 further defines the conditions under which sodium leasing and exploration would be considered. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13755-3 | Moreover, the reasons for closure of certain areas within the KSLA are not apparent from the maps, which only delineate areas closed to coal, oil shale, and trona leasing, but do not provide any basis for the closures. A review of other resource maps suggests that the acres closed under Alternative A are those areas in the KSLA southwest of Green River that overlap with the Devil's Playground Wilderness Study Area (see overlap in Maps 2-9 and 2-29). But it is impossible to decipher from the maps what might account for the additional 25,000 acres proposed for closure in the KSLA under Alternative B. 1 BLM's failure to adequately describe the acres being proposed for closure under all alternatives or the reasons for the closure, is completely inadequate as a procedural matter because it prevents interested companies and the public from meaningfully commenting on whether such a closure is justified. Moreover, a closure without a reasonable basis is arbitrary and capricious and an abuse of agency discretion that must be reversed. 5 U.S.C. § 706(2)(A). | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. The provided maps are simply a reflection of what each alternative is proposing through the various management actions. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13755-5 | While the greatest amount of actual mining activity occurs in the underground rooms that stretch for miles beneath the surface, trona mining operations also have critical surface operations to process trona ore into soda ash through chemical process and to store associated brines in surface impoundments. Ventilation shafts are necessary to support required air circulation, emergency evacuation, and employee access to the underground mine. Air circulation and emergency evacuation are requirements under 30 C.F.R. Part 57. While minimal,2 these surface uses are necessary for the overall mining operation and require rights-of-way for access and for construction of the surface facilities. BLM's proposal to limit, and in some cases completely prohibit, surface uses within the KSLA and even in the vicinity of existing trona leases, would greatly hinder and even prevent trona mining. The extent of the KSLA is shown in Map 3-10 (the green cross-hatched area) along the southwestern boundary of the RMP area. BLM intends to place major portions of this area off limits to surface use to protect big game crucial winter range. See Map 3-3. BLM also proposes to impose wide swaths of right-of-way exclusion zones throughout much of the KSLA, which areas are also proposed to be managed under restrictive Visual Resource Management Class II designation. See Map 2-22 (ROW exclusions); Map 2-18 (VRM designations). None of these restrictions is justified, especially as they relate to trona mining. | The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4 under 4.11.1. A full range of alternatives, with a variety of management actions for solid mineral leasing and restrictions is proposed in Chapter 2. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13755-6 | BLM proposes to close all "big game crucial winter ranges, parturition areas, migration corridors, and transitional habitats" to surface disturbance or disruptive activities. Draft RMP, Table 2-1 , at 2-68 (MA# 4421). As shown in Map 3-3, almost all of the KSLA is in pronghorn crucial winter or yearlong range.2 In assessing visual impacts of mineral development, BLM makes no attempt to distinguish between underground trona mining and mineral extractive industries that are far more visible and disruptive of surface resources. See Draft EIS at If Alternative B is implemented, trona operators will be unable to access the surface necessary for vital mining support facilities, making this area of the KSLA essentially useless for purposes of trona mining. BLM fails to analyze the impacts to the trona industry of such a drastic restriction across the KSLA. Moreover, such a draconian restriction makes no exception for minimal or seasonal uses, especially in areas that are already frequented by regular traffic from other activities. BLM fails to explain why existing seasonal restrictions are suddenly inadequate to manage pronghorn and other species across the planning area. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13755-9 | Second, much of the federal land in this area is checkerboard. Thus, surface restrictions on federal land have the indirect effect of holding hostage new development of private minerals where access across federal surface is needed. | Table 1-1 describes land and mineral ownership and jurisdictions within the Rock Springs planning area, including addressing in footnote 6 that impacts to areas with private or state ownership will be discussed in the cumulative impacts analysis section (Appendix T). |
| 809 - Mineral Resources-Other Leasable | #13787-1 | The BLM must include the unique mining resources in the Rock Springs RMP Planning area. The area includes significant mineral resources, specifically the Known Sodium Leasing Area (KSLA). The KSLA is a truly exceptional resource and it is not found anywhere else on earth to this magnitude or purity. The KSLA was first defined in March 1954 and later revised in April 1978. The KSLA covers a large portion of the RMP planning area. | Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals (2400-2419) | | The KSLA should be handled appropriately to effectively manage the strategic nature of this resource and its importance to both the Wyoming and U.S. economy. | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13787-9 | Similarly, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Further, much of the data in the report is even older. For example, page 5-18 states that "The occurrence of REEs in the RSPA is described in Chapter 3.2.7. There are no known deposits of REE in the RSPA. To date there has been no systematic sampling for or evaluation of REE in the RSPA. However, the WSGS is currently conducting a statewide study, scheduled for completion in mid-2013, to identify, characterize and catalog REE deposits throughout the state." This report and several others related to REEs has been completed and must be incorporated into the RMP for completeness. Finally, as another example, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Page 5-24 states that "Although trona (soda ash) market demand decreased during the global economic slowdown starting in 2008, causing decreased prices and production, the global soda ash industry is showing positive signs of recovery. The 2010 production level at more than 16.5 million tons was up by more than 2 million tons over the 2009 level. In addition, several substantial soda ash price increases have already occurred in 2012. Along with the recovery has come interest by several producers in the possibility of future additional leasing adjacent to existing mines although no firm proposals have been submitted to date. It is expected that during the planning period, current mines or expansions to those mines could accommodate currently projected future demand increases and no new mines will be proposed. However, if the soda ash market undergoes a significant rebound during this time, the situation could change. In addition to new leasing to expand existing mines, new leasing and proposals for in situ recovery could be submitted for BLM consideration." This information is like reading from a history book. The information is outdated on all accounts and must be updated before the RMP can be considered complete or accurate. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13787-48 | MA #2402 MR-02, MR-04 In the JMH planning area, most of the planning area would be open to coal exploration activities, with avoidance and mitigation requirements needed to protect the resources (Map 2-9, and Table 2-7 Appendix V). Areas currently closed to coal exploration activities (e.g., WSAs and Steamboat Mountain ACEC outside the area of coal occurrence and development potential) would remain closed. In addition, Steamboat Mountain Management Area (outside the area of coal occurrence and development potential) would also be closed. Areas closed to exploration include: WSAs, Oregon Buttes ACEC, Steamboat Mountain ACEC, Steamboat Mountain Management Area, South Pass Historic Landscape ACED, White Mountain Petroglyphs vista, Boars Tusk, Crookston Ranch, Tri-Territory Marker, wetlands, riparian areas, 100-year floodplains +500 foot buffer, Special Status plants, raptor nest sites, and Greater Sage Grouse leks +- mile buffer. Industry position: Not acceptable Reason: Not applicable except in JMH. See MA #2401. See MA #2401. See MA #2401. See MA #2401. | MA #2401 applies to the entirety of the planning area. For a full range of alternatives for coal management, see MA #2401 through #2406, with analysis for each of the alternatives presented in Chapter 4. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13795-3 | The proposed increase in exclusion areas outlined in Maps 2-22 would result in the isolation of existing and potential future trona mines, effectively barring extraction and development of the resources in the KSLA. This risk of the BLM-WY stranding resources by prohibiting ROWs for the transport of operational equipment, personnel, and materials, threatens to derail expansion plans in the KSLA. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13795-7 | As mentioned previously, the global demand for soda ash is spurring increased investment in Green River. There have been several announcements of expansions within the KSLA over the past few years, including Solvay's 2022 announcement of a $200 million expansion. The company, like our competitors, continues to weigh options for producing more soda ash from Wyoming's plentiful natural trona reserves. The ongoing investments in the KSLA promise steady economic growth and job opportunities for Wyomingites. This growth will yield additional tax revenue and royalties for the state, local, and federal governments. However, the growth of the domestic soda ash industry relies on the ability to access the natural resources in a cost effective manner. Should BLM-WY move forward with policy changes that impede continued or future development of the KSLA it will handicap the domestic soda ash industry and encourage Chinese competitors to work towards further market consolidation. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13811-1 | All of these efforts culminated in BLM publishing a "Notice of Intent to prepare an Environmental Impact Statement for the Dry Creek Trona Mine Project" in April 2022.1 Since that time, Pacific has been working closely with the BLM and its third party contractor to prepare the Dry Creek Project EIS. Pacific anticipates the publication of the Dry Creek Project Draft EIS for public comment in the first quarter of 2024. Throughout all of this close coordination, Pacific was never alerted to the potential that the BLM was considering a resource management plan alternative that would be so restrictive that Pacific could be forced to reevaluate the placement of key infrastructure for the Dry Creek Project. | The Draft EIS has been under development since 2011. The BLM is aware of ongoing review of all rights-of-way applications that have been received by the BLM for the RSFO area and has identified any conflicts with the four alternatives proposed, notifying applicants as appropriate. |
| 809 - Mineral Resources-Other Leasable | #13811-4 | In contrast, Alternative A restricts 0.4 million acres, Alternative C restricts 0.25 million acres, and Alternative D restricts 0.4 million acres from trona leasing.12 And in the KSLA specifically, Alternative B removes 49,224 more acres from trona leasing in comparison to the currently available acreage for lease in the Green River RMP, which is a reduction of 101%. The Green River RMP grants BLM discretion to decide whether or not to grant leases and what restrictions to impose upon them. BLM could retain this discretion and achieve significant conservation goals | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Minerals (2400-2419) | | without categorically removing millions of acres from trona leasing. BLM could use its discretion to balance the economic interests in trona development with its long-term conservation interests. Alternative B's categorical restrictions would not achieve that balance. | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13811-6 | The implementation of Alternative B would force the BLM to impose additional restrictions on operations and development in proximity to NHTs, which may or may not be necessary to preserve and protect the NHTs. Under the proposed Alternative B, a five-mile wide buffer on either side of the NHT "would be managed as closed to mineral leasing and mineral material sales, as an exclusion area for ROWs, and a withdrawal would be pursued."17 The areas within the five-mile buffer "would have the most protections to soils from surface disturbing activities, as the stipulations would be more restrictive."18 Additionally, within five to 15 miles on either side of the NHT, the area would be managed as open to mineral leasing and mineral material sales with Controlled Surface Use restrictions and would be a right-of-way avoidance area.19 In short, both of these areas "would receive more protections to soils, compared to Alternative A."20 But as with the other categorical restrictions Alternative B proposes, BLM already has discretion to impose case-by-case restrictions in proximity to NHTs. Trading BLM's discretion for categorical restrictions does no more to achieve its conservation goals while at the same time unduly restricting economic development in the Planning Area. Indeed, the technical and economic viability of the Dry Creek Project is detrimentally affected by these proposed restrictions due to the categorical five-mile development prohibition around the NHTs, limiting required access and mineral processing support features critical to reasonable mineral extraction within the KSLA. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13811-14 | Limitations on Natural Soda Ash Production and the Potential Shift to Synthetic Trona Production Soda ash is a critical component in the production of many essential products in the United States, including glass (for bottles, containers, flat glass, and for solar panels), the production and recycling of lithium carbonate for batteries, chemicals, soaps and detergents, flue-gas desulfurization, pulp and paper, and municipal water treatment, among others. Under the Green River RMP, the trona-mining industry produces approximately 12 million tons of natural soda ash from the Green River Basin. The Green River Basin industry provides approximately 2,300 jobs, nearly $400 million in payroll, and approximately $100 million in federal, state, and local taxes annually. BLM did not adequately analyze or consider the socioeconomic effects of the four alternatives on the Planning Area. If implemented, Alternative B would limit infrastructure development and restrict trona mining and processing in the Green River Basin, where the world's largest trona resources of the quantity and purity necessary to produce natural soda ash exists. But, limiting access to natural trona reserves will not reduce commercial and industrial demands for soda ash. Alternative B could therefore facilitate a shift in production from natural, domestic soda ash to synthetic, foreign soda ash. This shift will have three significant effects. First, the shift will negatively impact local and state economies in and around the Green River Basin. Second, the supply of American natural soda ash available for export will decline, and it will be filled by foreign sources of natural soda ash-specifically Chinese produced natural soda ash. For instance, by the end of 2022, worldwide soda ash production reached a total capacity of 58 million metric tons, 16 million of which was natural. Of those 16 million metric tons of natural soda ash, 11.6 million are American, while the remaining 4.4 million are Turkish. In 2023, Inner Mongolia (China) Berun Yingen ("China Berun") added 5.0 million metric tons of natural soda ash capacity, with an additional 2.8 million tons expected by 2026. If Alternative B is implemented, Pacific's and Sisecam's production of natural soda ash cannot be fully developed, and the difference in the natural soda ash economy will instead be supplied by Chinese Berun. Third, because foreign sources of soda ash cannot fill the gap that the reduction in American natural soda ash resulting from Alternative B, there will be a partial shift toward synthetic soda ash. Synthetic soda ash production is significantly more energy-intensive than natural production,37 it will exacerbate the global climate crisis that BLM management plans are designed, in part, to mitigate against. In short, the implementation of Alternative B would harm Wyoming's 37 U.S.-based natural soda ash production uses less than 50% of the energy and results in 37% fewer greenhouse-gas emissions per ton produced than synthetic production. Pacific Soda, LLC 20 Shoshone Avenue Green River, WY 82935 Page 10 of 10 4884-4214-2618\7 economy and undermine BLM's own conservation goals. BLM could better achieve those important economic and conservation goals by ensuring that natural soda ash production can continue in the KSLA while retaining the Green River RMP's discretion to limit production on a case-by-case basis in consultation with stakeholders. | The socioeconomic report is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if conditions have changed in one sector in the intervening years, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. See Chapter 3 for description of adequacy of baseline data gathered in 2013, which can be used for comparison purposes among the different alternatives. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-3 | Closing areas to all solid mineral leasing or surface disturbance based on a rigid set of indices that are not clearly mapped, instead of evaluating projects on a case-bycase basis is unnecessarily restrictive, and creates difficulty in planning or siting new projects. In addition, there is no exception under Alternative B of MA #1107 for existing facilities (such as power lines or access routes) that require some occasional surface disturbance for operations and maintenance. Surface disturbance has historically been handled through cooperation between BLM specialists and PacifiCorp with the implementation of appropriate Best Management Practices (BMPs) (as Alternatives A, C, and D allow) and Alternative B could prevent PacifiCorp from fulfilling its requirements to maintain and operate its current system because there is no reasonable exception process. In addition to maintaining current infrastructure, the linear characteristics of power lines require that at some point, any new or proposed line or corridor would cross sites with soil disturbance that would fall under the list of soil types in Alternative B of MA #1107. Siting future lines and corridors includes weighing priorities of numerous resources, of which soil quality is one of many | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | considerations. In some areas, powerlines may span soil types; however, there is no possible way to site a future line that could avoid all vulnerable soils, and under Alternative B, there is no reasonable way to determine options and implement BMPs to minimize those impacts. Under Alternative B, it would not be possible to plan future lines or corridors through the RSFO, including transmission infrastructure necessary to meet national energy goals and bring new renewables onto the grid. Alternatives A, C, and D specifically address soil concerns by including avoidance as an option, while requiring a mitigation plan (Alternative D) or erosion control plans (Alternatives A and C) where appropriate, and PacifiCorp recommends that the BLM adopt Alternative A, C, or D for MA #1107. Reclamation and mitigation plans can and are successful in difficult-to-reclaim areas, and should be allowed to continue. | |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-18 | C. MA #4421 Alternative B of MA #4421 prohibits surface disturbing activities on big game crucial ranges, parturition areas, migration corridors, and transitional habitats with no exceptions, even if impacts could be mitigated. Due to the proximity of several big game crucial ranges within BCC's permit area, the prohibitions of Alternative B could limit the ability of BCC to meet existing permit, lease, and reclamation obligations. PacifiCorp recommends that the BLM adopt Alternative A of MA #4412, as it is consistent with current permit and regulatory obligations. Likewise, Alternative D would also be acceptable as this alternative allows for some exceptions to be granted. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | The difference in language among the four alternatives is intentional for MA #4424 to distinguish between fluid minerals and other types of disturbance. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-28 | M. MA #4616 It is unclear how many additional lands would be impacted by mineral lease withdrawals or non-renewals under Alternative B of MA #4616. Under Alternative B of MA #4616, PacifiCorp is concerned that mineral leases would not be re-offered once they expire, which will have significant impacts to BCC, including impacts to operations and fulfilment of existing lease and permit obligations. PacifiCorp recommends that the BLM adopt Alternative D of MA #4616 as it would allow current operations and would be consistent with current permits, regulations, and policies. | Please refer to the Glossary for a definition of 'withdrawal', which applies to general land laws for locatable minerals. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-44 | As stated above, ROW Exclusion areas could impact BCC's ability to comply with permits and regulations as many of its ROW are related to regulatory compliance structures and access to topsoil piles. If a structure needs to be moved, a new well drilled, or a new access road placed in these areas, the BLM would not be able to consider the request due to the ROW exclusion. The ROW avoidance areas in Alternative D would have little or no impact on BCC's operations or regulatory compliance and Alternative D or A is preferred by BCC. In addition, also as discussed above, the ROW Exclusion areas limit existing transmission and distribution O&M and the ability to construct new transmission and distribution and other energy projects. | The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4 under 4.11.1. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13865-45 | Similarly, much of BCC's permit area is considered antelope crucial winter range. Western portions within the permit boundary also have overlapping crucial elk winter range. Any of the big game seasonal restrictions and stipulations in Alternatives B or D that would require surface disturbing activities to stop or severely restrict surface disturbing activities in these areas could have impacts on operations including those that allow BCC to meet regulatory, permit, and lease obligations such as contemporaneous reclamation requirements and monitoring requirements. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809 - Mineral Resources-Other Leasable Minerals (2400-2419) | #13951-18 | Page 2-43; Mineral Resources #2417 "Consider and give priority to the use of land exchanges, where appropriate and feasible, to consolidate land ownership and mineral interests within the oil shale basins." -Interest in commercial leasing for oil shale remains low, so as the Wyoming Governors task force determined, maintenance of the status quo under Alternative A. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809.01 - Solid Leasable Minerals (coal) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 809.01 - Solid Leasable Minerals (coal) | #13702-7 | MA 4421 Alternative B- closes these areas to material sales and closes these areas to all solid mineral (trona and coal) leasing due to No Surface Occupancy. This is not acceptable. Big game migration corridors also need protections, and their locations are a matter of research and on-going monitoring by WGFD. Accurate evaluation of the impact of these migration corridors is very difficult until WGFD releases the latest migration corridors map. | MA 4421 is referencing WGFD designated crucial winter range, migration corridors, and parturition areas. Impacts from WGFD designations are outside the scope of this EIS. The BLM is proposing management actions within these WGFD designated areas on BLM land. For impacts to BLM proposals, see Chapter 4. |
| 809.01 - Solid Leasable Minerals (coal) | #13751-119 | MA #2401 ALT A With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM- administered public lands and federal coal lands in the Green River planning area, except for those lands identified as closed, are open to coal resource inventory and exploration to help identify coal resources and their development potential Table 2-7 in Appendix V, Map 2- 9). Industry position: Not acceptable. Reason: Industry agrees with most of the language in this management action but disagrees with the closure to coal leasing and development within ¼ mile of raptor nest sites under Alternative A in Appendix V Table 2-7 (page V-14). Exceptions should be made where the leasing proponent or coal mine operator has a raptor mitigation plan that has been reviewed and approved by the USFWS that protects raptor nesting success. Appropriate nest protections or mitigation measures will be applied. ALT BWith appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Not acceptable. Reason: Appendix V Table 2-7 pages V-14 - V-15 closes coal leasing and development within one mile of active and historic raptor nest sites and in areas on which soils have the following properties: wind erodibility index>100, saline, sodic, saline- sodic, 2:1 clays, sand dunes, slopes>25%, slumps, difficult to reclaim. Exceptions should be made where leasing proponents and coal mine operators develop a raptor mitigation plan that is reviewed and approved by the USFWS that protects raptor nesting success. Reclamation research and mine reclamation practice has developed techniques to reclaim hard to reclaim soils and steep topography. Reclamation standards for mining on all soils are under the Wyoming Environmental Quality Act (WQA) and enforced under State primacy by WDEQ-LQD through that agency's regulations and mine permits. ALT C With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Acceptable. Reason: Table 2-7 in Appendix V and Map 2- 10 show that the all BLM-administered public land and federal coal lands in the Rock Springs planning area are open for coal leasing and development except the most environmentally sensitive areas. ALT D Same as Alternative A. Industry position: Not acceptable. Reason: Coal leasing and development should not be closed within ¼ mile of 100-year flood plains, wetlands, riparian areas, perennial streams, and within 500 feet of large ephemeral drainages (Appendix V Table 2-7- page V-14). Practices for runoff control, erosion and sediment control are well developed conservation measures and are applied by the coal industry. The WDEQ-LQD under the WQA and through their regulations and mine permits has regulatory authority over mining activities in these areas. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. |
| 809.01 - Solid Leasable Minerals (coal) | #13751-120 | MA #2402 ALT A In the JMH planning area, most of the planning area would be open to coal exploration activities, with avoidance and mitigation requirements needed to protect the resources (Map 2-9, and Table 2-7 Appendix V). Areas currently closed to coal exploration activities (e.g., WSAs and Steamboat Mountain ACEC outside the area of coal occurrence and development potential) would remain closed. In addition, Steamboat Mountain Management Area (outside the area of coal occurrence and development potential) would also be closed. Areas closed to exploration include: WSAs, Oregon Buttes ACEC, Steamboat Mountain ACEC, Steamboat Mountain Management Area, South Pass Historic Landscape ACED, White Mountain Petroglyphs vista, Boars Tusk, Crookston Ranch, Tri-Territory Marker, wetlands, riparian areas, 100-year floodplains +500 foot buffer, Special Status plants, raptor nest sites, and Greater Sage Grouse leks +- mile buffer. Industry position: Not acceptable. Reason: Not applicable except in JMH. | Alternative A is the existing management and only applied to the JMH area. See MA 2401 as referenced in Alt B-D for the proposed actions in response to this existing management action. |
| 809.01 - Solid Leasable Minerals (coal) | #13751-121 | MA #2407 Alternative A BLM-administered public land surface overlaying state-owned coal are open to further consideration for coal development with appropriate and necessary conditions and requirements for protection of the public land surface and surface resource values and uses, including big game crucial winter range, cultural values, geologic features, and rights-of-way (about 28,000 acres). These lands are subject to continued field investigations, studies, and evaluations to determine if certain methods of coal mining can occur without having a significant long-term impact on wildlife, in general, and on threatened and endangered plant and animal species and their essential habitats. Such investigations, studies, and evaluations may be conducted on an as-needed or case-by-case basis in reviewing individual coal leasing and development proposals by the state or, of opportunities or needs arise, area-wide studies may be conducted. These studies include keeping resource databases current (e.g., where raptor nests become abandoned or where new raptor nests become established), analysis of effects to wildlife and threatened and endangered species habitats and populations, and the cumulative effects of mining operations and other activities in the area. Consultation with other agencies (e.g. USFWS, WGFD, etc.) special interest groups, and with industry would occur as needed or required. About 3,000 of these acres are closed to surface mining activities to protect cultural and geologic values. These would be no surface occupancy and very | Alternative A is the existing management. All alternatives similarly keep these lands open to coal exploration. See MA 2407, Alt B-D. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | limited surface occupancy areas. Industry position: Not acceptable. Reason: Closure of the federal surface will in some cases block access to state- owned coal. Coal leasing and development proposals should be evaluated case by case and subject to NEPA rather than blanket closures. Alternative B Open BLM-administered public land surface overlaying state-owned coal to further consideration for coal development with appropriate and necessary conditions and requirements for protection of the public land surface and surface resource values. Industry position: Not acceptable. Reason: Industry agrees with the language of this alternative. However, Map 2-10 Solid Leasable Minerals - Alternative B shows State sections that are closed to coal in areas around active coal mining. The map effectively negates language in this alternative. Development of State coal under federal surface should be managed by NEPA processes, not closures. Alternative C Same as Alternative A. Industry position: Not acceptable. Reason: Closure of the federal surface will in some cases block access to state-owned coal. Coal leasing and development proposals should be evaluated case by case and subject to NEPA rather than blanket closures. Alternative D BLM-administered public land surface overlaying state-owned coal are available for ROWs to develop coal, unless identified as avoidance or exclusion areas in Table 2-10 (Appendix V). Industry position: Not acceptable. Reason: The language of the alternative is acceptable. However, Table 2-10 Appendix V under Alternative D lists avoidance areas of 500 feet from eligible Historic Roads and Trails and ¼ mile from Overland and Cherokee Trails. Industry agrees that protective measures are needed but they should be developed through the NEPA process rather than an avoidance area. | |
| 809.01 - Solid Leasable Minerals (coal) | #13787-5 | Wyoming is the also the top coal producing state in the nation, and coal remains critical to the state's economy. In 2022, the financial contribution from coal to state and local governments in the form of taxes, royalties and fees was over $562.7 million. Wyoming's share of federal mineral royalties - royalties paid on mining the leased federal coal - was over $184 million (with a $229.7 million share paid to the federal government). Revenues generated from the federal coal resource fund federal, state and local governments, highways and roads, schools and community colleges, and the University of Wyoming. Billions of dollars in revenues from Coal Lease Bonus Bids have built new schools and facilities in every county in Wyoming over the last 3 decades. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.01 - Solid Leasable Minerals (coal) | #13787-6 | Coal remains the only abundant, consistently low-cost, and reliable source of electricity generation in the United States at a time when grid reliability is rapidly deteriorating due to the hasty build-out of heavily subsidized, highly unreliable wind and solar. And coal fired base load generation remains critical as the nation moves ever further down the path of over- reliance on unreliable alternative energy sources such as wind and solar, and volatile natural gas subject to price swings. Efforts to restrict the federal coal resource will have a negative effect on Americans not only in terms of reliability, but significantly higher energy prices as well. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.01 - Solid Leasable Minerals (coal) | #13787-12 | Page 4-6 forth bullet of the Draft RMP/DEIS includes the following "The magnitude of and increases in estimated emissions from solid mineral development, including surface mining of coal and trona, at the level of development predicted for all alternatives over the life of the plan have the potential to cause impacts related to fugitive dust and increased ozone formation, visibility degradation, and atmospheric deposition." Likewise on page 4-11 "The quantities of emissions estimated from fluid mineral development and solid mineral development activities are based on reasonably foreseeable estimates of development rates, well counts, production rates, and existing technologies. The estimated emissions should not be considered definitive and may not reflect actual emissions at the time of development, due to the unknown future demand for mineral development over the life of the plan. Although the quantity of emissions calculated for this category may not represent actual emissions from eventual development, the magnitude of estimated emissions of several pollutants for this source category is considerable. Emissions of PM10, VOCs, and NOX from this category have the highest potential to impact air quality under each of the alternatives. These impacts could include increased ambient concentrations of NOX and increased ozone formation in summer and winter." It is well understood that NOx and VOCs emissions contribute to ozone formation; however, these statements should also include a disclaimer that the WDEQ concluded that the trona mines do not contribute to the ozone non-attainment area due to the wind trajectories. This information was concluded by the WDEQ and agreed to by the EPA in 2011 and was the basis for the ozone non-attainment boundary. Likewise, the 1998 visibility study also concluded the trona mines had no impairment on the basin. Further, the WDEQ has recently completed the regional haze glide path review which does not indicate trona (or coal for that matter) as significant contributors to visibility degradation. EPA regulates regional haze at Title 40 (Protection of Environment) of the Code of Federal Regulations (CFR, WY SIP) §51.308. Any effort by the BLM to regulate the same is redundant and an overreach. | Air Quality Management Actions can be found in #1000-1017, with impacts from each of the four proposed alternatives described in Chapter 4. See also Appendices P and Q. |
| 809.01 - Solid Leasable Minerals (coal) | #13787-18 | Alternative B closes coal leasing and development on the vast majority of federal sections both north and south of the checkerboard, which is all lands except State of Wyoming Lands, as shown on Map 2-10 in Appendix V. This closure renders nearly all coal on private or State of Wyoming sections, not already leased and permitted, unminable. Small scale mining that is restricted to private and State sections is uneconomical and infeasible. Access to nonfederal lands over federal sections is also at risk | Proposed management actions related to coal for all four alternatives can be found in MA 2401-2407. Impacts from the four alternatives are presented in Chapter 4. |
| 809.01 - Solid Leasable Minerals (coal) | #13787-19 | Mining and reclamation of flood plains, ephemeral streams, wetlands, riparian areas, or mining areas near them is also proven successful in protecting water quality and meeting water quality standards. The WDEQ-LQD has state primacy and regulates these mining activities through the mine permit. | The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 809.01 - Solid Leasable Minerals (coal) | #13787-20 | Further, Alternative B imposes closures on coal leasing and development in proximity to raptor nesting areas, on hard to reclaim soils, and 100-year flood plains. This is unnecessary for the protection of these resources because protective measures and proven mitigation measures exist to protect these resources while mineral exploration and orderly coal mining operations are on-going. Seasonal restrictions have been followed and worked under Alternative A. These closures are in Appendix V Table 2-7 (page V14) and referenced in MA #2401. As an example, raptor nesting has been successfully protected at coal mines within 1 mile and ¼-mile of raptor nesting areas through raptor mitigation plans that are reviewed and approved by the U.S Fish and Wildlife Service (USFWS). These plans describe how raptor nesting will be protected, mitigation measures that will be authorized, permitting requirements, and monitoring requirements. Mitigation measures are required to be those that have been proven successful. Renewal of plans depends on compliance with the plan and permit stipulations and successful outcomes on mitigation measures. Hard to reclaim soils may be difficult to reclaim but are possible to reclaim. Reclamation research has developed reclamation techniques for these soils. Coal mining operators have successfully implemented reclamation techniques to reclaim these soils for many years. Standards for reclamation and revegetation success are enforced by WDEQ-LQD via the mine permit under oversight of the US Office of Surface Mining Reclamation and Enforcement (OSMRE). | Proposed management actions related to coal for all four alternatives can be found in MA 2401-2407. Impacts from the four alternatives are presented in Chapter 4. |
| 809.01 - Solid Leasable Minerals (coal) | #13787-47 | MA #2401 MR-02, MR-04 With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM- administered public lands and federal coal lands in the Green River planning area, except for those lands identified as closed, are open to coal resource inventory and exploration to help identify coal resources and their development potential Table 2-7 in Appendix V, Map 2- 9). Industry position: Not acceptable Reason: Industry agrees with most of the language in this management action but disagrees with the closure to coal leasing and development within ¼ mile of raptor nest sites under Alternative A in Appendix V Table 2-7 (page V-14). Exceptions should be made where the leasing proponent or coal mine operator has a raptor mitigation plan that has been reviewed and approved by the USFWS that protects raptor nesting success. Appropriate nest protections or mitigation measures will be applied. With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Not acceptable Reason: Appendix V Table 2-7 pages V-14 - V-15 closes coal leasing and development within one mile of active and historic raptor nest sites and in areas on which soils have the following properties: wind erodibility index>100, saline, sodic, saline- sodic, 2:1 clays, sand dunes, slopes>25%, slumps, difficult to reclaim. Exceptions should be made where leasing proponents and coal mine operators develop a raptor mitigation plan that is reviewed and approved by the USFWS that protects raptor nesting success. Reclamation research and mine reclamation practice has developed techniques to reclaim hard to reclaim soils and steep topography. Reclamation standards for mining on all soils are under the Wyoming Environmental Quality Act (WQA) and enforced under State primacy by WDEQ-LQD through that agency's regulations and mine permits. With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Acceptable Reason: Table 2-7 in Appendix V and Map 2- 10 show that the all BLM-administered public land and federal coal lands in the Rock Springs planning area are open for coal leasing and development except the most environmentally sensitive areas. Same as Alternative A. Industry position: Not acceptable Reason: Coal leasing and development should not be closed within ¼ mile of 100-year flood plains, wetlands, riparian areas, perennial streams, and within 500 feet of large ephemeral drainages (Appendix V Table 2-7- page V-14). Practices for runoff control, erosion and sediment control are well developed conservation measures and are applied by the coal industry. The WDEQ-LQD under the WQA and through their regulations and mine permits has regulatory authority over mining activities in these areas. Alternative C is acceptable. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419 |
| 809.01 - Solid Leasable Minerals (coal) | #13865-44 | As stated above, ROW Exclusion areas could impact BCC's ability to comply with permits and regulations as many of its ROW are related to regulatory compliance structures and access to topsoil piles. If a structure needs to be moved, a new well drilled, or a new access road placed in these areas, the BLM would not be able to consider the request due to the ROW exclusion. The ROW avoidance areas in Alternative D would have little or no impact on BCC's operations or regulatory compliance and Alternative D or A is preferred by BCC. In addition, also as discussed above, the ROW Exclusion areas limit existing transmission and distribution O&M and the ability to construct new transmission and distribution and other energy projects. | The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4 under 4.11.1. |
| 809.01 - Solid Leasable Minerals (coal) | #13865-45 | Similarly, much of BCC's permit area is considered antelope crucial winter range. Western portions within the permit boundary also have overlapping crucial elk winter range. Any of the big game seasonal restrictions and stipulations in Alternatives B or D that would require surface disturbing activities to stop or severely restrict surface disturbing activities in these areas could have impacts on operations including those that allow BCC to meet regulatory, permit, and lease obligations such as contemporaneous reclamation requirements and monitoring requirements. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 809.01 - Solid Leasable Minerals (coal) | #13880-16 | Solid Mineral Impacts. The draft RMP assumes no impacts to coal or trona mining within the RSFO because existing leases will not be affected, as additional leasing is not expected even under Alternative A. Evaluating the reasonableness of this assumption, without considering the effect of the other management actions is questionable and would require additional research and coordination with private developers. | The effects of management restrictions on Energy and Minerals are analyzed in Chapter 4, with the analysis assumptions identified in section 4.11.1. |
| 809.01 - Solid Leasable Minerals (coal) | #14027-2 | Despite the recognition in the draft RMP/EIS that coal mining is a significant part of the economy in the planning area, the preferred alternative would close 98 percent of the planning area to future coal mining. Accordingly, the NMA strongly objects to the preferred alternative B. Nowhere in the draft RMP/EIS does BLM fully explain the rationale for such severe restrictions on coal mining activities. Additionally, the agency attempts to downplay the significance of this decision by noting there are no outstanding or pending applications for federal coal leases or exploration licenses on lands within the planning area, that the last leasing was completed in 2013 and recent coal production has been in decline.36 Such statements ignore the continued role of coal in the U.S. energy mix. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.01 - Solid Leasable Minerals (coal) | #14027-3 | As discussed above, not only is the alternative inconsistent with FLPMA and the Mineral Leasing Act, but it fails to achieve the presumably hoped for, but never adequately justified, environmental benefits. Placing this federal coal off limits is unlikely to reduce the overall tonnage of coal that is extracted in Wyoming. Rather, it encourages the development of non-federal coal in a way that is both inefficient and functionally sterilizes federal coal resources. Such an approach would ultimately result in greater impacts on environmental resources while having a negative long-term impact on revenues to federal, state, and local governments. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. The DEIS's adherence to applicable law, regulation, and policy to include FLPMA and the MLA is addressed in Chapter 1 under 1.4 Planning Criteria. Potential prioritization of non-federal resources is analyzed under Appendix T page T-26 |
| 809.01 - Solid Leasable Minerals (coal) | #14027-7 | While mentioning the need to prepare a future mineral potential report, the draft RMP/EIS also references a 2012 report, Solid Mineral Occurrence and Development Potential Report for the RSFO [Rock Springs Field Office] as providing historical production data for the planning area, and surface use restrictions for the alternatives analysis.46 Much of the information contained in that report is woefully out of date, in contradiction of the BLM Manual 3031, which indicates that "land use plans will reflect geological, energy and mineral values on public lands through more effective geology and energy and mineral resource data assessment. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 809.01 - Solid Leasable Minerals (coal) | #14027-10 | the description of total acreage being placed off limits for mining projects under the preferred alternative B does not take into account acres that may be off limits due to sage grouse management.51 This lack of coordination prevents adequate review of the draft RMP/EIS and completely undermines the Appendix T, the cumulative impacts analysis section. | Greater Sage Grouse actions are being evaluated under separate RMP Amendment. See Chapter 1.4 for the Planning Criteria. |
| 809.02 - Public Land Surface Overlying State-Owned Coal | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. |
| 809.02 - Public Land Surface Overlying State-Owned Coal | #13787-49 | MA #2407 MR-02, MR-04 BLM-administered public land surface overlaying state-owned coal are open to further consideration for coal development with appropriate and necessary conditions and requirements for protection of the public land surface and surface resource values and uses, including big game crucial winter range, cultural values, geologic features, and rights-of-way (about 28,000 acres). These lands are subject to continued field investigations, studies, and evaluations to determine if certain methods of coal mining can occur without having a significant long-term impact on wildlife, in general, and on threatened and endangered plant and animal species and their essential habitats. Such investigations, studies, and evaluations may be conducted on an as-needed or case-by-case basis in reviewing individual coal leasing and development proposals by the state or, of opportunities or needs arise, area-wide studies may be conducted. These studies include keeping resource databases current (e.g., where raptor nests become abandoned or where new raptor nests become established), analysis of effects to wildlife and threatened and endangered species habitats and populations, and the cumulative effects of mining operations and other activities in the area. Consultation with other agencies (e.g. USFWS, WGFD, etc.) special interest groups, and with industry would occur as needed or required. About 3,000 of these acres are closed to surface mining activities to protect cultural and geologic values. These would be no surface occupancy and very limited surface occupancy areas. Industry position: Not acceptable Reason: Closure of the federal surface will in some cases block access to state- owned coal. Coal leasing and development proposals should be evaluated case by case and subject to NEPA rather than blanket closures. Open BLM-administered public land surface overlaying state-owned coal to further consideration for coal development with appropriate and necessary conditions and requirements for protection of the public land surface and surface resource values. Industry position: Not acceptable Reason: Industry agrees with the language of this alternative. However, Map 2-10 Solid Leasable Minerals - Alternative B shows State sections that are closed to coal in areas around active coal mining. The map effectively negates language in this alternative. Development of State coal under federal surface should be managed by NEPA processes, not closures. Same as Alternative A. Industry position: Not acceptable Reason: Closure of the federal surface will in some cases block access to state-owned coal. Coal leasing and development proposals should be evaluated case by case and subject to NEPA rather than blanket closures. BLM-administered public land surface overlaying state-owned coal are available for ROWs to develop coal, unless identified as avoidance or exclusion areas in Table 2-10 (Appendix V). Industry position: Not acceptable Reason: The language | Alternative A is the existing management. All alternatives similarly keep these lands open to coal exploration. See MA 2407, Alt B-D. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | of the alternative is acceptable. However, Table 2-10 Appendix V under Alternative D lists avoidance areas of 500 feet from eligible Historic Roads and Trails and ¼ mile from Overland and Cherokee Trails. Industry agrees that protective measures are needed but they should be developed through the NEPA process rather than an avoidance area. BLM-administered public land surface overlaying state-owned coal are available for ROWs to develop coal with appropriate and necessary protective measures to be developed through the NEPA process and in consultation with other state and federal agencies with jurisdiction over surface resources. Language is taken from Alternatives D and B. | |
| 809.03 - Trona (Sodium) | #305-1 | Facts: 1. The trona industry in Southwest Wyoming is producing +90% of the Soda ash in United states. 2. 50% of the Soda Ash is used in the Glass industry 3. 15% of the Soda Ash is use in a detergent manufacturing 4. 18% of the Soda is used in other Chemicals manufacturing (such as lithium salt, used in battery for EV) Opinion: The potential limitation of Soda Ash production and/or mine closer, will have a direct impact to the US economy. Currently there is no substitution of the Natural Soda Ash process in US and mine closures will force the US manufacturers using domestic Soda ash either import Soda Ash or even move their production outside US. This will drive the cost of the manufactured goods (flat, container, other glass, detergents and others) prices up and hurting the end users and US economy as total. The alternative of natural soda ash is synthetic soda ash. The Synthetic Soda ash process has a greater impact to the environment. Raw materials use in this process are Lime stone - typically open pit quarries (surface disturbance), Salt brine - typically solution mining (surface disturbance), Process also uses Ammonia - 2-3% is lost in the process, and last but not least the process it is energy intensive - resulting in bigger CO2 footprint. From a global environmental perspective (considering the planet and not only Southwest WY) the environmental impact from trona mine closer will be bigger. The other significant naturally occurred trona resources are in Turkey and China, owned and operated by Turkish and Chinese companies. | Air Quality Management Actions can be found in #1000-1017, with impacts from each of the four proposed alternatives described in Chapter 4. See also Appendices P and Q. For management actions related to trona, see MA 2408-2411 and Chapter 4. |
| 809.03 - Trona (Sodium) | #551-3 | Proposed Management Actions 2408-2412 -Trona. Section 4.11.3 of the RMP states that "[u]nder Alternative B, 49,224 acres would be closed to trona leasing and development within the KSLA ["Known Sodium Leasing Area"] (Table 2-07, Map 2-10)" The Federal Land Policy Management Act of 1976 ("FLPMA") provides that "In the development and revision of land use plans, the Secretary shall- ( 1) use and observe the principles of multiple use and sustained yield set forth in this and other applicable law" See 43 U.S.C. §l 712(c)(l). Map 2-10 as published is practically impossible to read with respect to which additional BLM parcels will be closed to trona leasing. Taking at face value the statement that the BLM proposes to remove 49,224 acres from the KSLA, this action appears to be arbitrary, capricious and in violation ofFLPMA Section 202(c)(l)'s mandate that the land use plan should "use and observe the principles of multiple use and sustained yield set forth in this and other applicable law". The RMP fails to analyze the potentially severe negative economic impact to Wyoming's trona industry and the over 2,225 workers employed locally in that industry. The trona industry not only benefits the economy directly, but also, through ad valorem and severance taxes, supports state and local government and is a significant funding source for Wyoming's K-12 education system. The RMP fails to analyze these negative externalities arising from proposed management actions 2408, 2409, 2410, 2411 and 2412 in Alternative B. By failing to analyze these negative external economic impacts, the RMP Alternative B violates the FLPMA mandate that it achieve "sustained yield" from multiple use of public lands. I request that zero additional acres be removed from the KSLA. | The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.03 - Trona (Sodium) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. |
| 809.03 - Trona (Sodium) | #13210-8 | 8. No management action should result in the blanket exclusion or avoidance of the responsible leasing and development of sodium minerals (trona/soda ash) within the Known Sodium Leasing Area (KSLA), including management actions that deal with rights-of-way, trails, water, air, wildlife, and raptors. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809.03 - Trona (Sodium) | #13210-9 | 9. The public lands within the Rock Springs Field Office should be managed to promote the responsible development of infrastructure supporting sodium minerals (trona/soda ash) industries within the KSLA. The task force has found consensus that the management actions within the KSLA should: a. Protect wetlands and riparian areas within the KSLA while considering, on a case-by-case basis, linear crossing, surface disturbing activities, and new permanent facilities proposed for placement within riparian areas or wetlands and 100-year floodplains or adjacent to the inner gorge of large ephemeral drainages. See e.g., Management Action 1313. b. Protect big game seasonal areas within the KSLA as identified by the Wyoming Game and Fish Department while allowing for exceptions to be considered on a case-by-case basis if impacts can be mitigated in accordance with exception criteria in Appendix B. See e.g., Management Action 4421. c. Protect active raptor nests within the KSLA as warranted on a case-by-case basis determined by conditions on the ground. Reference to historic nests should be removed. See e.g., Management Actions 4428, 4430, and 4431. d. Maintain current visual resource management (VRM) designations within the KSLA. See e.g., Management Action 5400. e. Except for defined, existing exclusion and avoidance areas, allow for the consideration of granting rights-of-way within the KSLA. Do not designate new exclusion or avoidance areas that conflict with responsible mineral development in the KSLA. See e.g., | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | Management Action 6201. f. For National Historic and Scenic Trails within the KSLA, avoid surface disturbing activities within 1/4 mile of any contributing NHT segment if it would be visible from the trail; subject the area beyond 1/4 mile from the NHTs to standard NHPA and BLM/SHPO Protocol measures to avoid, minimize, or mitigate effects to NHTs; allow NHT crossings by rights-of-way in areas where trail ruts have been modified by modern uses, where previous crossings exist, or where new corridor crossings would not damage trail remains. The BLM and SHPO have agreed that the setting of the NHT in the KSLA has been compromised by existing development. See e.g., Management Actions 7002, 7003, 7004, 7017, and 7021. | |
| 809.03 - Trona (Sodium) | #13542-1 | As a direct requirement for other economic sectors in the United States, soda ash is included by the Federal Reserve Board as an economic indicator for industrial production and economic condition of the country. Therefore, the BLM is obliged to explain to the public its reasons for any change in its position that has for decades favored trona mining within the KSLA over other resources. See Encino Motorcars, LLC v. Navarro, 136 S. Ct. 2117, 2126 (2016) (explaining that after decades of industry reliance on a prior policy, an agency must present a more reasoned explanation for why it deemed it necessary to overrule its previous position). | The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. |
| 809.03 - Trona (Sodium) | #13542-4 | Synthetic soda ash production uses salt, limestone, and ammonia to produce soda ash, rather than naturally deposited trona. This process is much more energy intensive compared to natural soda ash production from trona. United States natural soda ash production from trona uses less than 50% of the energy and results in 37% less greenhouse gas emissions for each ton produced compared to synthetic soda ash production. Any reduction in the ability to produce natural soda ash in the KSLA will not only move that production outside of the United States but will result in higher energy consumption and greenhouse gas emissions. | The scope of air quality analysis is defined in Chapter 4 under 4.3 Air Quality. |
| 809.03 - Trona (Sodium) | #13542-60 | a. LC-15 There are several trona mining leases that have been added since 2011 when this report was run. Please revise and update the information analyzed by the agency and disclosed to the public. | The socioeconomic model is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if market conditions have changed in the intervening years, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. Socioeconomic analysis is covered in Appendix N, including data assumptions and the timeframe of the analyses. See Chapter 3 (page 3-1) regarding adequacy of baseline data for comparative analysis purposes. |
| 809.03 - Trona (Sodium) | #13542-75 | Literature Cited. WMA. 2010. LC-16 This referenced trona report uses production and employment data that are over 13 years old. WMA has a brochure issued in January 2023 (WMA-Trona-Brochure-Update_2022-2023.pdf (wyomingmining.org)) that provides current information on employment and revenue generated by soda ash production in Southwest Wyoming. Wyoming Mining Association: Trona Mining Production and Employment 's website shows 2018 data for trona production and employees. Both sources are more current than the referenced source used in the RMP. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | The socioeconomic model is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if market conditions have changed in the intervening years, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. Socioeconomic analysis is covered in Appendix N, including data assumptions and the timeframe of the analyses. See Chapter 3 (page 3-1) regarding adequacy of baseline data for comparative analysis purposes. |
| 809.03 - Trona (Sodium) | #13624-41 | Wyoming has the world's largest deposit of high quality trona. Trona processed into soda ash has numerous high value uses including, but not limited to, the manufacture of solar glass for photovoltaic panels and batteries for electric vehicles and has applications in, water treatment, pollution control and battery energy storage. The Administration has stated that expanding renewable energy and electric vehicle production is a priority. Because trona is the base mineral product for the manufacture of solar panels and electric vehicle batteries, the BLM should explain how closing approximately 2.2 million acres to trona leasing impacts those priorities. BLM should also provide the scientific basis for exclusion of those acres from exploration and future development of trona products. WDEQ has successfully permitted and regulated the development and commercial operation of trona facilities currently operating in Wyoming. Our experience is that those facilities can, and do, meet environmental standards. Overly restrictive conservation of the resource is not necessary in Wyoming because development of the trona resource has and can continue to be done in a manner that protects human health and environment. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809.03 - Trona (Sodium) | #13624-42 | The Draft RMP/EIS states that 49,224 acres would be closed to trona leasing and development within the Known Sodium Leasing Area (KSLA). Draft EIS, § 4.11.3, p. 4-135. Map 6 is a map of the RMP with overlays of the KSLA and right-of-way exclusions. Because right-of-way exclusions do not allow the development of roads or pipelines, BLM should explain how trona development could occur in the southern portion of the KSLA. BLM should also address the fact that right-of-way exclusions appear to prohibit access to major rail and interstate networks along I-80. See Map 4. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809.03 - Trona (Sodium) | #13624-43 | It is unclear how BLM determined that 49,135 acres should be closed to trona development in the KSLA. It is also unclear if the 49,135 acres also references the cumulative impact of the application of all management actions. For example, based on information available in the Draft RMP/EIS, the total acreage representing right-of-way exclusions, wild and scenic, and visibility management Classes I and II could total approximately 153,000 acres. See Map 1. Based on BLM data in the Draft RMP/EIS, it appears that non-BLM checkerboard sections in the northern portion of the KSLA cannot be developed due to the right-of-way exclusions on the BLM sections; this would result in an addition of approximately 83,000 acres excluded within the KSLA. Additionally, the portion of the KSLA west of the Flaming Gorge Reservoir and south of the right-of-way exclusions could not be effectively developed due to access restrictions. This would exclude an additional acreage of approximately 157,000 from development. Based on these assumptions, a total of approximately 393,000 acres would be closed in the KSLA. | Appendix V contains a description of the areas determined "No Leasing" for sodium. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | BLM should provide how access to develop trona fields would be possible or an analysis of why access for trona development is to be denied in those areas. | |
| 809.03 - Trona (Sodium) | #13702-7 | MA 4421 Alternative B- closes these areas to material sales and closes these areas to all solid mineral (trona and coal) leasing due to No Surface Occupancy. This is not acceptable. Big game migration corridors also need protections, and their locations are a matter of research and on-going monitoring by WGFD. Accurate evaluation of the impact of these migration corridors is very difficult until WGFD releases the latest migration corridors map. | MA 4421 is referencing WGFD designated crucial winter range, migration corridors, and parturition areas. Impacts from WGFD designations are outside the scope of this EIS. The BLM is proposing management actions within these WGFD designated areas on BLM land. For impacts to BLM proposals, see Chapter 4. |
| 809.03 - Trona (Sodium) | #13751-1 | However, the Draft BLM Rock Springs Resource Management Plan and Draft EIS does not achieve this balance and would set precedent for federal agencies to expand their regulatory regimes in a manner that will make access and permitting for alkali products more complex, expensive, and challenging while failing to achieve appreciable environmental or human health benefits. Some of the proposed management actions could even make economical extraction of this unique trona resource essentially impossible. Therefore, Genesis Alkali respectfully requests BLM immediately withdraw the Draft RMP and Draft EIS, complete sage grouse and other important actions, conduct more collaboration, take input from cooperating agencies and interested parties, carefully consider comments and then revise the document, and re-publish it. In the event that BLM does not withdraw the Draft RMP/DEIS as requested, in an abundance of caution we also provide detailed comments on this hurried proposal. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. Public participation and cooperating agency participation is described in Table 5.1. See also Section 1.4 for the planning criteria. |
| 809.03 - Trona (Sodium) | #13751-2 | As a result, any BLM management actions that limit the development of new production or cause the decline of existing natural soda ash production in the Green River basin would, in effect, prevent that soda ash production from happening anywhere in the United States. Because soda ash is critical for the production of other essential products, production that cannot occur in the US will almost certainly move to foreign nations, most likely China, and will likely be produced using synthetic soda ash production technology. Over 40% of the worlds soda ash production already occurs in China and given the rarity of trona resources worldwide, the vast majority of that is synthetic soda ash production. | Trona production is analyzed under Appendix T (Cumulative Impacts) for the CIAA (Cumulative Impacts Analysis Area) on page T-29. |
| 809.03 - Trona (Sodium) | #13751-3 | Synthetic soda ash production uses salt, limestone, and ammonia to produce soda ash, rather than trona. This process is much more complicated and more energy intensive compared to natural soda ash production trona. US natural soda ash production from trona uses less than 50% of the energy and results in 37% less greenhouse gas emissions for each ton produced compared to synthetic soda ash production. Any reduction in ability to produce natural soda ash in the KSLA will not only move that production to foreign nations but will result in higher energy consumption and greenhouse gas emissions. | The scope of air quality analysis is defined in Chapter 4 under 4.3 Air Quality. |
| 809.03 - Trona (Sodium) | #13751-4 | The current Green River RMP (1997), Appendix 1 (page 108) states the following in regard to the KSLA: "Public comment on the RMP Draft EIS recommended consideration of the KSLA for ACEC designation due to an outstanding mineral of regional/national importance. However, the potential for ACEC designation should consider the entire KSLA as a whole and most of the area is within the Kemmerer Resource Area. This area would be deferred for special study and analyzed separately from this document." The definition of an Area of Critical Environmental Concern (ACEC) does not only include areas recommended for conservation but also for unique natural resource value such as the unique trona mineral resource in the KSLA. The KSLA is the only place in the world where such a unique trona resources is found to this extent and purity. In 1997 BLM recognized the KSLA as an area that was deferred for special study and analyzed separately from the RMP; BLM should include the results of that study in this RMP/DEIS. It is unfortunate that ACEC's have become narrowly focused on environmental conservation, and not on overall unique resource protection. We are not recommending the KSLA as an ACEC due to the potential conflict with the current use of the term ACEC. However, we are providing this comment to highlight the fact that the KSLA is worthy of special recognition in the RMP. Within the KSLA, there should be no new management actions beyond the current RMP management actions, until the results of the special study is completed. In other words, as provided in the 1997 comment, the KSLA should be designated as a special study area for the trona resource value, analyzed separately from the RMP document, and in the meantime the existing RMP management actions (Alternative A) should continue to be utilized in the KSLA without change. Further, when the Kemmerer RMP is next reviewed the KSLA in that planning area should also be considered in the same manner. | ACEC nominations and evaluations are included in Appendix C. Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). |
| 809.03 - Trona (Sodium) | #13751-28 | Vol. II, Table U-1 Summary of Impacts, by Resource, more particularly page 7 of 19. The following language summarizes the impact to Trona of Alternative B. "Impacts to trona development would be similar to those described under Alternative A, except more areas would be closed to trona leasing and development. Under Alternative B, 49,224 acres would be closed to trona leasing and development within the KSLA (Map 2-10), which represents a 101% increase compared to Alternative A. This would increase the level of impacts to trona development and could result in further reduction of trona extracted via mining activities." This statement is entirely inaccurate. The notion that B's impact would be similar to the No Action Alternative is absurd. The so-called "Comparative Summary of Impacts" is inaccurate and reflects BLM's failure to properly summarize the impacts on the Trona industry. Concluding the only difference in impacts to the Trona industry within the KSLA is the added acreage withdrawn from leasing completely ignores the impact of the extended right of way exclusion areas, ACEC's, WSA's, VRM's, trail buffer zones, etc. Many of the exclusion areas overlap existing trona leases and trona operations and significant impacts will be felt by existing operations. The analysis is fundamentally flawed and | Impacts from all four alternatives can be found in Chapter 4, including for special designations, rights-of-way exclusion areas, and solid mineral leasing and restrictions. Table U-1, only briefly summarizes the impacts of the actions proposed under each alternative, organized by resource management program. A detailed discussion of the environmental consequences of the actions proposed under each alternative is presented in Chapter 4. Tables 2-3 through 2-12 are in Appendix V. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | misrepresents the impact of Alternative B on the Trona industry and the private mineral holdings within the area. Further, it does not inform the public of the consequences of the proposed action as required by NEPA. | |
| 809.03 - Trona (Sodium) | #13751-38 | The Solid Mineral Occurrence and Development Potential Report is dated August 2012. Further, much of the data in the report is even older. Page 5-18 "The occurrence of REEs in the RSPA is described in Chapter 3.2.7. There are no known deposits of REE in the RSPA. To date there has been no systematic sampling for or evaluation of REE in the RSPA. However, the WSGS is currently conducting a statewide study, scheduled for completion in mid 2013, to identify, characterize and catalog REE deposits throughout the state." This report and several others related to REEs has been completed and must be incorporated into the RMP for completeness. | The socioeconomic model is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if market conditions have changed in the intervening years, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. Socioeconomic analysis is covered in Appendix N, including data assumptions and the timeframe of the analyses. See Chapter 3 (page 3-1) regarding adequacy of baseline data for comparative analysis purposes. |
| 809.03 - Trona (Sodium) | #13751-39 | The Solid Mineral Occurrence and Development Potential Report is dated August 2012. Page 5- 24 "Although trona (soda ash) market demand decreased during the global economic slowdown starting in 2008, causing decreased prices and production, the global soda ash industry is showing positive signs of recovery. The 2010 production level at more than 16.5 million tons was up by more than 2 million tons over the 2009 level. In addition, several substantial soda ash price increases have already occurred in 2012. Along with the recovery has come interest by several producers in the possibility of future additional leasing adjacent to existing mines although no firm proposals have been submitted to date. It is expected that during the planning period, current mines or expansions to those mines could accommodate currently projected future demand increases and no new mines will be proposed. However, if the soda ash market undergoes a significant rebound during this time, the situation could change. In addition to new leasing to expand existing mines, new leasing and proposals for in situ recovery could be submitted for BLM consideration." This information is like reading from a history book. The information is outdated on all accounts and must be updated before the RMP can be considered complete or accurate. As an example, the outdated information discusses potential new leasing which has been completed in the southern part of the Known Sodium Leasing area along with an EIS. To be up-to-date and complete, the RMP must include this updated information. | The socioeconomic model is not a goal or intended outcome, but rather a baseline measurement tool for analysis comparison among the alternatives that have differing management restrictions. Additionally, even if market conditions have changed in the intervening years, the baseline data is adequate to compare conditions and differentiate resource impacts among the alternatives. Socioeconomic analysis is covered in Appendix N, including data assumptions and the timeframe of the analyses. See Chapter 3 (page 3-1) regarding adequacy of baseline data for comparative analysis purposes. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 809.03 - Trona (Sodium) | #13751-95 | BLM failed to analyze the KSLA under a special study as discussed in the 1997 RMP. The unique trona resource in southwest Wyoming deserves such recognition and treatment. It is the only location in the world where such a unique resource is found. | ACEC nominations and evaluations are included in Appendix C. Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). |
| 809.03 - Trona (Sodium) | #13751-122 | MA #2408 ALT A The Known Sodium Leasing Area (KSLA) is open to sodium exploration and consideration for leasing and development but closed to prospecting permits. Industry position: Not acceptable Reason: Industry agrees with most of this language but recommends that prospecting be allowed because it is an existing right held by some operators. ALT B C AND D The KSLA is open to sodium (trona) exploration and consideration for leasing and development. Industry position: Not acceptable. Reason: Industry agrees with the language of this alternative. However, there is a serious conflict between the language of this alternative and language in Chapter 4 page 4-135. The Chapter 4 language states that "Under Alternative B, 49,224 acres would be closed to trona leasing and development within the KSLA (Table 2-7, Map 2-10), which represents a 101% increase compared to Alternative A. This would increase the level of impacts to trona development and could result in further reduction of trona extracted via mining activities." The language in Chapter 4 page 4-135 contradicts the language in MA#2408 Alternative B. These two sections contradict each other. Language in Chapter 4 page 4-135 needs to conform to the language in MA#2408 Alternative B to be acceptable to industry. The industry position is that the KSLA is open to trona leasing and development. | Alt A is current management of the planning area. Trona management for all four alternatives is described in Management Actions 2408-2411 and impacts from each of the four alternatives can be found in Chapter 4. |
| 809.03 - Trona (Sodium) | #13751-123 | MA #2409 ALT A Sodium (trona) leasing would be considered on a case-by-case basis and is subject to the same conditional requirement as oil and gas and coal, and the general management direction applied in this RMP. Industry position: Not acceptable Reason: Recovery and processing are fundamentally for trona rather than for coal or oil and gas. Trona is not a hydrocarbon. Leasing should follow NEPA procedures. | Alt A is current management of the planning area. Trona management for all four alternatives is described in Management Actions 2408-2411 and impacts from each of the four alternatives can be found in Chapter 4. |
| 809.03 - Trona (Sodium) | #13751-124 | MA #2411 Alternative A B C D The known sodium leasing area is open to exploration and consideration for leasing and developments but is closed to prospecting permits. The remainder of the planning area is open to sodium prospecting except for areas that are closed to mineral leasing, surface mining, or mechanical prospecting type activities (areas closed to drilling, off road vehicle use, and explosive charges). Sodium (trona) leasing will be considered on a case-by-case basis, and is subject to the same conditional requirements as oil and gas and coal, and the general management direction applied in this RMP. Industry position: Not acceptable Reason: Same as MA#2408 and 2409. Industry recommends that if sodium leasing is considered outside of the KSLA that other resources be protected by NEPA procedures rather than blanket restrictions or closures. | Trona management for all four alternatives is described in Management Actions 2408-2411 and impacts from each of the four alternatives can be found in Chapter 4. Additionally, Prospecting Permits are allowed as per 43 CFR 3505.10. the KSLA is a defined leasing area and therefore requires an Exploration License as per 43 CFR 3506 |
| 809.03 - Trona (Sodium) | #13751-125 | MA #4209 ALT B Prohibit actions involving the transfer of water from watersheds with aquatic invasive species or fish diseases to other waters. Industry position: Not acceptable Reason: Industry recognizes the ecological harm presented by aquatic invasive species and fish diseases and supports preventing their spread. However, the geographic reach of this prohibition is not clear and needs to be clarified. This prohibition allows no transfer of water for beneficial use for industrial purposes wherein water could be stored or treated and not immediately returned to receiving waters. ALT DProhibit, except to protect life and property, and to prevent the spread of aquatic invasive species, the movement of water from one fourth level (8-digit hydrological unit code) watershed to another fourth level another fourth level (8-digit hydrological unit code) watershed. If movement of water has | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 4200-4213 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | occurred, WGFD will be contacted so that they can begin a monitoring program. Industry position: not acceptable Reason: Industry notes that Map 3-1 Water Resources shows two hydrological unit boundaries within the KSLA. One boundary is in the southern and eastern KSLA and divides the Blacks Fork and the Upper Green-Flaming Gorge hydrological units. The second is in the northern KSLA and divides the Blacks Fork and Upper Green hydrological units. Any transfers of water would be for beneficial use for industrial purposes and may include solution mining. Water for solution mining would be process water and subject to WYPDES discharge requirements or long term storage. | |
| 809.03 - Trona (Sodium) | #13775-1 | While the above referenced portion in Chapter 4 states that 49,224 acres in the KSLA will be closed trona leasing, there is no reference to the closure of these acres in Chapter 2's detailed breakdown of each alternative by Management Action (MA). In MA#2408 and 2409, BLM states that under the Preferred Alternative, "The KSLA is open to sodium (trona) exploration and consideration for leasing and development,5" without any qualification or mention of the closed acres. Nor does any other mention of the closed acres appear anywhere else in the Draft RMP other than the singular mention in Chapter 4. These two facts are inherently at odds with one another; BLM-WY cannot on one hand claim that the entire KSLA is ostensibly open to trona leasing as in Chapter 2 yet also claim it will be closing a substantial portion of that same area to leasing and operations | Appendix V identifies closure to sodium leasing, including closures that may be coming from special management designations or other resources that are beyond those listed specifically for trona in MA 2408 and 2409. |
| 809.03 - Trona (Sodium) | #13787-2 | On August 7, 1981 BLM's District Manager includes a cover letter in the BLM Draft Environmental Assessment of Sodium Mineral Development in the Rocks Springs District (BLM Document WY-049-EA81-8). The cover letter includes the following: "The regional Sodium Mineral Development Draft Environmental Assessment that follows, analyzes the use of a resource that is of international as well a national importance. The trona deposition area within three resource areas of the Bureau's Rock Springs District is presently recognized as the world's largest commercial source of natural soda ash which is used in the production of a wide range of goods -from the glass in your car's windshield to the soap used to clean your clothes. The Bureau of Land Management is obligated to the nation to assure that this unique resource is developed in the best interest of the public…" The Background Section of Sodium Mineral Document WY-049-EA81-8 (page 3) goes on to explain the size and quality of the trona resource as follows: "The trona deposits in Southwest Wyoming represent the largest known commercial source of natural soda ash in the world (Culbertson 1966, Innes 1980). Culbertson (1966) estimated major trona and trona/halite deposits under a 1,400 square-mile area of the Green River Basin at 113 billion tons, including 67 billion tons of halite-free trona in 25 beds, each more than 3 feet thick and ranging in areal extent from 100 to 1,000 square miles. Culbertson and Burnside in a subsequent study (1979) estimated total Southwest Wyoming deposits at 134 billion tons. Trona occurs in only a few places around the world and rarely in commercial quantities…Synthetic soda ash has been made for many years by the complex Solvay process. The natural soda ash proved to be of higher purity, because it contained less sodium chloride contaminant. Also, plants producing soda ash from trona require considerably less energy, labor, and maintenance than plants using the Solvay process (Kostick 1980)." | Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). |
| 809.03 - Trona (Sodium) | #13787-3 | Trona mined and processed in the Known Sodium Leasing Area (KSLA) in the Green River Basin is used to produce approximately 12 million tons of natural soda ash, with the industry providing 2300 direct jobs, nearly $400 million in payroll, and about $100M in local, state, and federal taxes and royalties. Soda ash is a critical input for the manufacture of many other essential products including glass, lithium carbonate for batteries, and baking soda for foodstuff. Trona resources of a substantial quantity and purity to support commercial natural soda ash production are rare worldwide, including the rest of the United States outside of the KSLA. There is no other location in the US that contains trona resources in the quantity and purity necessary for the development of new substantial production of natural soda ash. BLM management actions that limit the development of new production or cause the decline of existing natural soda ash production in the Green River basin would, in effect, prevent that soda ash production from happening anywhere in the United States. | Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.03 - Trona (Sodium) | #13787-4 | Because soda ash is critical for the production of other essential products, production that cannot occur in the US will almost certainly move to foreign nations, most likely China, and will likely be produced using synthetic soda ash production technology. Over 40% of the worlds soda ash production already occurs in China and given the rarity of trona resources worldwide, the vast majority of that is synthetic soda ash production. Synthetic soda ash production uses salt, limestone, and ammonia to produce soda ash, rather than trona. This process is much more complicated and more energy intensive compared to natural soda ash production trona. US natural soda ash production from trona uses less than 50% of the energy and results in 37% less greenhouse gas emissions for each ton produced compared to synthetic soda ash production. Any reduction in ability to produce natural soda ash in the KSLA will not only move that production to foreign nations but will result in higher energy consumption and greenhouse gas emissions, all of which are in direct conflict to goals of the Biden Administration. | Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 809.03 - Trona (Sodium) | #13787-12 | Page 4-6 forth bullet of the Draft RMP/DEIS includes the following "The magnitude of and increases in estimated emissions from solid mineral development, including surface mining of coal and trona, at the level of development predicted for all alternatives over the life of the plan have the potential to cause impacts related to fugitive dust and increased ozone formation, visibility degradation, and atmospheric deposition." Likewise on page 4-11 "The quantities of emissions estimated from fluid mineral development and solid mineral development activities are | Air Quality Management Actions can be found in #1000-1017, with impacts from each of the four proposed alternatives described in Chapter 4. See also Appendices P and Q. Additionally, see Section 1.4 for Planning Criteria and Appendix E for a list of regulations, laws and policies that apply to this EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | based on reasonably foreseeable estimates of development rates, well counts, production rates, and existing technologies. The estimated emissions should not be considered definitive and may not reflect actual emissions at the time of development, due to the unknown future demand for mineral development over the life of the plan. Although the quantity of emissions calculated for this category may not represent actual emissions from eventual development, the magnitude of estimated emissions of several pollutants for this source category is considerable. Emissions of PM10, VOCs, and NOX from this category have the highest potential to impact air quality under each of the alternatives. These impacts could include increased ambient concentrations of NOX and increased ozone formation in summer and winter." It is well understood that NOx and VOCs emissions contribute to ozone formation; however, these statements should also include a disclaimer that the WDEQ concluded that the trona mines do not contribute to the ozone non-attainment area due to the wind trajectories. This information was concluded by the WDEQ and agreed to by the EPA in 2011 and was the basis for the ozone non-attainment boundary. Likewise, the 1998 visibility study also concluded the trona mines had no impairment on the basin. Further, the WDEQ has recently completed the regional haze glide path review which does not indicate trona (or coal for that matter) as significant contributors to visibility degradation. EPA regulates regional haze at Title 40 (Protection of Environment) of the Code of Federal Regulations (CFR, WY SIP) §51.308. Any effort by the BLM to regulate the same is redundant and an overreach. | |
| 809.03 - Trona (Sodium) | #13787-17 | Because of the rare and unique nature of the trona mineral resource, BLM management actions that exclude any of the activities necessary for trona mining and natural soda ash production must be avoided within the KSLA in favor of a reasonable case-by-case evaluation basis being the norm! Continued development of the trona resource in the KSLA is consistent with BLM Manual 1601, Land Use Planning, Section 3(U) BLM's Authority is granted under the Mining and Minerals Policy Act of 1970 that "aims to encourage private enterprise in the development of economically sound and stable domestic mining, minerals, metal and mineral reclamation industries. It also promotes the orderly and economic development of domestic mineral resources, reserves, and reclamation of metals and minerals to help assure satisfaction of industrial, security and environmental needs." Further, the Section 102 (43 U.S.C 1701), the Congressional Declaration of Policy, of the Federal Land Policy and Management Act of 1976 states that "(a)The Congress declares that it is the policy of the United States that--…" and then "(a)(12) the public lands be managed in a manner which recognizes the Nation's need for domestic sources of minerals, food, timber, and fiber from the public lands including implementation of the Mining and Minerals Policy Act of 1970 (84 Stat. 1976, 30 U.S.C 21a) as it pertains to the public lands;". Management actions that exclude leasing and preclude the necessary building and ROWs such that there is not a reasonable opportunity for full development of this unique and essential mineral are contrary to Congressional Policy as stated in FLPMA. | Trona's uniqueness is detailed in Chapter 3 under 3.15.4 Trona (Sodium). The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. |
| 809.03 - Trona (Sodium) | #13787-19 | Mining and reclamation of flood plains, ephemeral streams, wetlands, riparian areas, or mining areas near them is also proven successful in protecting water quality and meeting water quality standards. The WDEQ-LQD has state primacy and regulates these mining activities through the mine permit. | The DEIS's adherence to applicable law, regulation, and policy is addressed in Chapter 1 under 1.4 Planning Criteria. |
| 809.03 - Trona (Sodium) | #13787-50 | MA #2408 MR-02, MR-04 The Known Sodium Leasing Area (KSLA) is open to sodium exploration and consideration for leasing and development but closed to prospecting permits. Industry position: Not acceptable Reason: Industry agrees with most of this language but recommends that prospecting be allowed because it is an existing right held by existing operators. The KSLA is open to sodium (trona) exploration and consideration for leasing and development. Industry position: Not acceptable Reason: Industry agrees with the language of this alternative. However, there is a serious conflict between the language of this alternative and language in Chapter 4 page 4-135. The Chapter 4 language states that "Under Alternative B, 49,224 acres would be closed to trona leasing and development within the KSLA (Table 2-7, Map 2-10), which represents a 101% increase compared to Alternative A. This would increase the level of impacts to trona development and could result in further reduction of trona extracted via mining activities." The language in Chapter 4 page 4-135 contradicts the language in MA #2408 Alternative B. These two sections contradict each other. Language in Chapter 4 page 4-135 needs to conform to the language in M A#2408 Alternative B to be acceptable to industry. The industry position is that the KSLA is open to trona leasing and development. Same as Alternative B. Industry position: Not acceptable Reason: Industry agrees with the language in this alternative. However, as with Alternative B, there is a serious conflict between this language and the language in Chapter 4 page 4-136 which states "Under Alternative C, 21,412 acres would be closed to trona leasing and development within the KSLA (Table 2-7, Map 2-11), which represents a 12% decrease compared to Alternative A. This would reduce related impacts to trona mining activities, as more areas would be available for such mining. The Chapter 4 language contradicts the MA #2408 language. Language in Chapter 4 page 4-136 needs to conform to the language in MA #2408 Alternative C to be acceptable to industry. The industry position is that the KSLA is open to trona leasing and development. Same as Alternative B. Industry position: Not acceptable Reason: Industry agrees with the language of this alternative. However, as with Alternatives B and C, there is a serious conflict between this language and the language in Chapter 4 page 4-137 which states "Impacts to trona development would be the same as those described under Alternative A. Under Alternative D, 24,290 acres would be closed to trona leasing and development within the KSLA, which represents a <1% decrease compared to Alternative A (Table 2-7, Map 2-12). Again, the language in Chapter 4 page 4-137 | Appendix V identifies areas closed to sodium leasing. Prospecting Permits are allowed as per 43 CFR 3505.10. the KSLA is a defined leasing area and therefore requires an Exploration License as per 43 CFR 3506 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | contradicts and effectively negates the language in MA #2408 Alternative D. The language in Chapter 4 needs to conform to the language in MA #2408 Alternative D to be acceptable. The industry position is that the KSLA is open to trona leasing and development. KSLA is open to trona exploration, consideration for leasing, and prospecting. Language is taken from Alternative B with prospecting added. | |
| 809.03 - Trona (Sodium) | #13787-51 | MA #2409 MR-02, MR-04 Sodium (trona) leasing would be considered on a case-by-case basis and is subject to the same conditional requirement as oil and gas and coal, and the general management direction applied in this RMP. Industry position: Not acceptable Reason: Recovery and processing are fundamentally for trona rather than for coal or oil and gas. Trona is not a hydrocarbon. Leasing should follow NEPA procedures. | Management actions for all four alternatives for other leasable minerals are identified in the DEIS in management actions 2400-2419. |
| 809.03 - Trona (Sodium) | #13880-4 | At this point, it is important to note that a blanket one-size-fits-all approach to ROW or other restrictions is not the most effective way to conduct business. Again, drawing from the work put forward by the task force, I will point you to the agreements made regarding the Known Sodium Leasing Area (KSLA). The KSLA comments submitted achieved full consensus thanks to the efforts of both the conservation and mining communities. Those comments take into account responsible development of our natural resources, practical stipulations, and a flexibility that allows for decisions to be made by the people most familiar with the land and its many varied resources. | Management actions for all four alternatives for rights-of-way are identified in the DEIS in management actions 6200-6210. |
| 809.03 - Trona (Sodium) | #13899-76 | We support Alternative B, management action 2408, which establishes that the "[Known Sodium Leasing Area] is open to sodium (trona) exploration and consideration for leasing and development."196 There is no management action listed in Table 2-1 Resource Management Plan Alternatives that mentions closing areas in the Known Sodium Leasing Area (KSLA) to leasing for trona. However, there are areas shown on Map 2-9 Solid Leasable Minerals- Alternative A, Map 2-10: Solid Leasable Minerals-Alternative B and Map 2-12 Solid Leasable Minerals-Alternative D that show areas closed to trona leasing across the field office, including within the KSLA. And BLM notes that under the current Green River RMP and Alternative A in this draft RMP, 24,458 acres within the KSLA are closed to leasing and under Alternative B this would double to 49,224 acres closed to trona leasing in the KSLA.197 These closures are also listed in the draft RMP Volume 2, Table 2-7. BLM must clarify in Table 2-1 and MA 2408 the amount of acreage closed across the alternatives given these closures are mapped.[...] We believe the only necessary restrictions on trona leasing within the KSLA is for the Devil's Playground-Twin Buttes WSA complex (a Congressionally mandated closure) and in line with[...] protections for greater sage-grouse leks, including no surface disturbances within .6 miles of leks. We do not believe areas of big game winter range in the KSLA should be closed to leasing.198 Rather, conditions on development - through the permitting of surface infrastructure - is appropriate. The proposed prohibitions on surface disturbance for the Oregon-California-Mormon National Historic Trails viewshed corridor (up to five miles on each side of the trail in Alternative B) can be modified to be "up to ½ mile" within the KSLA and should not be applied to restrict trona leasing. | Appendix V identifies closure to sodium leasing, including closures that may be coming from special management designations or other resources that are beyond those listed specifically for trona in MA 2408 and 2409. |
| 809.03 - Trona (Sodium) | #13899-77 | While the existing trona mines in the Green River Basin are underground mines (with associated processing plants and infrastructure on the surface) the future of trona mining may well add surface disturbance and bring the mining activities into greater conflict with other resources, such as wildlife habitats. There are currently two proposals for in-situ solution mining for trona - both in the Kemmerer Field Office. These proposals have the potential for significant surface disturbance through the construction of well pads and roads. A plan revision or amendment may be necessary in the future if the industry continues to pursue in-situ mining, given the assumptions underlying leasing areas in this draft RMP are for underground mining. | Management actions for solid mineral leasing (trona) can be found in actions 2408-2411. These actions apply to all trona leasing, regardless of recovery method. |
| 809.04 - Oil Shale | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. |
| 809.04 - Oil Shale | #13210-48 | 2413 Alternative A* Specify that while the preliminary EIS refers to "application for leasing for commercial oil shale development," the BLM could publish in the Federal Register one or more additional requests for expressions of interest in Research Development and Demonstration (RD&D) leasing within one or more of the states of Colorado, Utah, and Wyoming. Any new RD&D lease would have to be consistent with the applicable BLM land use plans. In the management action prioritization exercise, all voting members submitted the same preferred alternative. These recommendations were not discussed during the meetings, but task force members approved their inclusion in the final report. Interest in RD&D leasing for oil shale remains low, thus the task force prefers maintenance of the status quo under Alternative A. | MA 2413 is the existing management for Alternative A. Management actions for all four alternatives for oil shale are identified in the DEIS in management actions 2412-2419. Public Participation associated with the EIS is detailed in Chapter 5 under 5.2. |
| 809.04 - Oil Shale | #13210-49 | 2415 Alternative A* Specify that commercial leasing would occur utilizing a lease by application process. The process would require that additional NEPA analysis be conducted prior to lease issuance. Information collected as part of the lease application process would be incorporated into the NEPA analysis. In the management action prioritization exercise, all voting members submitted the same preferred alternative. These recommendations were not discussed during the meetings, but task force members approved their inclusion in the final report.Interest in commercial leasing for oil shale remains low, thus the task force prefers maintenance of the status quo under Alternative A. | Management actions for all four alternatives for oil shale are identified in the DEIS in management actions 2412-2419. Public Participation associated with the EIS is detailed in Chapter 5 under 5.2. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 809.04 - Oil Shale | #13210-50 | 2416 Alternative A* Specify that approval of the project-specific operating plan would require NEPA review to consider site-specific and project specific factors. The NEPA review for the operating plan may be incorporated into NEPA for the lease application if adequate operational data are provided by the applicant(s). In the management action prioritization exercise, all voting members submitted the same preferred alternative. These recommendations were not discussed during the meetings, but task force members approved their inclusion in the final report. Interest in commercial leasing for oil shale remains low, thus the task force prefers maintenance of the status quo under Alternative A. | Management actions for all four alternatives for oil shale are identified in the DEIS in management actions 2412-2419. Public Participation associated with the EIS is detailed in Chapter 5 under 5.2. |
| 809.04 - Oil Shale | #13210-51 | 2417 Alternative A* Specify that the BLM would consider and give priority to the use of land exchanges, where appropriate and feasible, to consolidate land ownership and mineral interests within the oil shale basins. In the management action prioritization exercise, all voting members submitted the same preferred alternative. These recommendations were not discussed during the meetings, but task force members approved their inclusion in the final report. Interest in commercial leasing for oil shale remains low, thus the task force prefers maintenance of the status quo under Alternative A. | Management actions for all four alternatives for oil shale are identified in the DEIS in management actions 2412-2419. Public Participation associated with the EIS is detailed in Chapter 5 under 5.2. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #142-4 | nder Alternative B, mineral resource # 2507 and heritage and visual resource # 5303, hobby collection of petrified wood would no longer be allowed without written authorization. Impacts from hobby collection of petrified wood are minimal. Most areas with petrified wood have existing roads and trails to them and many hobbyists practice leave no trace principles. | Management actions for all four alternatives for petrified wood are identified in the DEIS in management action 2507. It is further addressed in Chapter 4 Page 4-156 Section 4.13.3. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | This is addressed in Chapter 4 Page 4-18 Section 4.1.1. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | See Glossary for a definition of 'surface disturbing activities'. Management actions for all four alternatives for salable minerals are identified in the DEIS in management actions 2500-2507 |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | Management actions for all four alternatives for salable minerals are identified in the DEIS in management actions 2500-2507 |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #10225-1 | Sweetwater County and the City of Rock Springs subsidies make up a sizeable portion of our budget. We are dependent on these subsidies to provide many essential services to the aging and mobility challenged population as well as the youth of Sweetwater County. The services that Young at Heart provides are the following: Congregate meals for the community having served approximately 6,891 meals in 2022 This year to date we have recorded 10,836 meals. Home delivered meals totaling around 42,000 in 2022, and social entertainment totaling approximately 17,708 hours (pool, poker, card games, and dominoes). We offer In-Home Services which provides light housekeeping and small chores to more than 92 clients in the Rock Springs and Green River areas. Additionally, we provide In-Home Health services assisting more than 15 patients. And finally we have our Early Learning Center providing children with quality education which serves more than 100 families. Therefore reduction in any of these revenue streams would severely impact, if not totally eliminate some of all of these services. In fact, it could force the closure of the Center altogether. Historically and currently mineral extraction is a mainstay in our local economy. Monies from industrial impacts, mineral severance, sales taxes, etc. flow into the local government budgets to support essential services. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13218-1 | I am concerned that Alternative B would have a detrimental effect on Wyoming's energy and mineral industries. Alternative B would substantially decrease the opportunity for oil and gas development, coal development, and other mineral development. Alternative B would close 2,122,282 acres to oil and gas development, 3,735,526 acres to coal development, 2,581,741 acres to mineral material sales and disposals, and 49,224 acres to trona leasing and development within the known sodium leasing area. The acres closed for oil and gas development is a 192% increase compared to Alternative A (the current management standard for the Rock | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | Springs planning area); for coal development, a 433% increase compared to Alternative A; for mineral material sales and disposals, a 209% increase compared to Alternative A; and for trona leasing and development, a 101% increase compared to Alternative A. This is an extreme increase in the number of acres closed compared to Alternative A and this would have the greatest negative impact on solid mineral leasing and development, saleable mineral development, and trona development. | |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13241-1 | Alternative B would have a devasting overall economic impact on Wyoming. Under Alternative B, the estimated economic output is $12.6 billion dollars, the estimated total labor earnings are $2.3 billion dollars, and the estimated total local and state revenues from mineral production is $800 million dollars. This is an extreme decrease from the other alternatives. For example, under Alternative A, the estimated economic output is $29.9 billion dollars, the estimated total labor earnings are $5.4 billion dollars, and the estimated local and state revenues from mineral production is $2.3 billion dollars. The total economic output is 52.3% lower under Alternative B than Alternative A and the total labor earnings are 55.8% lower under Alternative B than Alternative A. In addition, the average annual jobs would also decrease as Alternative B would generate only 2,707 jobs compared to Alternative A generating 6,157 jobs. Most significantly, the total local and state revenues would decrease annually under Alternative B. For example, ad valorem taxes would decrease by 52.4%, severance taxes would decrease by 55.1%, and the state's share of federal mineral royalties would decrease by 52.7%. The total local and state revenues are "52% to 55% lower under Alternative B than Alternative A" and "all quantified economic and public revenue indicators for oil and gas development and production are approximately 74% lower under Alternative B than Alternative A." The reduction in revenues for oil and gas development is due to "the substantially lower number of wells drilled under Alternative B and corresponding reductions in oil and gas production." I am totally concerned that Alternative B would have a detrimental effect on Wyoming's economy. | The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13330-17 | * Sweetwater County Farm Bureau is opposed to the Alternative B proposed withdrawal of 258% lands from more land from any potential mineral extraction and 305% more lands from oil and gas extraction. Many of our members hold jobs in these sectors to provide supplemental income. Agriculture producers value mineral and oil and gas production in our area. Additionally, such withdrawals would decimate our local economy and the Alternative B proposal directly violates the Domestic Minerals Program Extension Act of 1953, The Mining and Minerals Policy Act of 1970, the Federal Land Policy and Management Act of 1976, and the Energy Policy Act of 2005. | See Glossary for a definition of 'withdrawal', which does not apply to leasable minerals. The socioeconomic impacts for Alternative B are detailed in Chapter 4 Section 4.23.5. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13542-29 | MA#2505. Alternatives A, B, C, and D. 2-47 The BLM should consider an alternative that allows for topsoil sale areas because mining activities are required by state law and BLM regulations to reclaim surface disturbances using topsoil; therefore, the agency should study and disclose to the public such environmental impacts across a reasonable range of alternatives. If the BLM is going to continue to analyze not allowing for topsoil sales under all alternatives, then it needs to analyze the environmental impacts from trucking in topsoil to reclaim all BLM authorized surface disturbances to the specifications required by law on lands within the Rock Springs Field Office. | Impacts and analysis from mining activities as they relate to soil resources can me found in Chapter 4 under 4.4.1 for all four alternatives. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13787-9 | Similarly, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Further, much of the data in the report is even older. For example, page 5-18 states that "The occurrence of REEs in the RSPA is described in Chapter 3.2.7. There are no known deposits of REE in the RSPA. To date there has been no systematic sampling for or evaluation of REE in the RSPA. However, the WSGS is currently conducting a statewide study, scheduled for completion in mid-2013, to identify, characterize and catalog REE deposits throughout the state." This report and several others related to REEs has been completed and must be incorporated into the RMP for completeness. Finally, as another example, the Solid Mineral Occurrence and Development Potential Report is dated August 2012. Page 5-24 states that "Although trona (soda ash) market demand decreased during the global economic slowdown starting in 2008, causing decreased prices and production, the global soda ash industry is showing positive signs of recovery. The 2010 production level at more than 16.5 million tons was up by more than 2 million tons over the 2009 level. In addition, several substantial soda ash price increases have already occurred in 2012. Along with the recovery has come interest by several producers in the possibility of future additional leasing adjacent to existing mines although no firm proposals have been submitted to date. It is expected that during the planning period, current mines or expansions to those mines could accommodate currently projected future demand increases and no new mines will be proposed. However, if the soda ash market undergoes a significant rebound during this time, the situation could change. In addition to new leasing to expand existing mines, new leasing and proposals for in situ recovery could be submitted for BLM consideration." This information is like reading from a history book. The information is outdated on all accounts and must be updated before the RMP can be considered complete or accurate. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that | MA# 4424 Alt D specifically addresses fluid mineral restrictions, therefore only fluid minerals would be restricted. The difference in language is intentional as proposed for the range of alternatives in this action. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | |
| 810 - Mineral Resources–Saleable Minerals (2500-2507) | #13899-79 | Similarly, we support Alternative B's proposed salable mineral closures to reduce conflicts and prioritize resource protections. | Management actions for all four alternatives for salable minerals are identified in the DEIS in management actions 2500-2507 |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #257-2 | Another benefit of BLM grazing is that grazing substantially alters the fuel characteristics in rangelands. It reduces fuel continuity, height, and amount of forage. Grazing also increases fuel moisture by decreasing dead plant materials, and particularly prior years' growth of annual and perennial grasses. While there is no way to put a dollar amount on the cost of wildfires prevented on BLM allotments due to livestock grazing permits, there is no question that grazing has prevented a great deal fires and the costs associated with fighting them. | The impacts of grazing activities on vegetation communities are provided in Section 4.6 of the EIS. Section 4.10 of the EIS describes how grazing activities can reduce fuel loads and reduce the occurrence of wildfire. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #9793-5 | Under BLM's preferred alternative, more acres of wildfires would be allowed to burn, the use of prescribed fires would be restricted, and a variety of limits would be imposed on fire suppression activities - again without citing any scientific reason for its preference. | A full range of wildland fire management alternatives can be found in Table 2-1 in management actions 3000-3013. The impacts of grazing activities on vegetation communities are provided in Section 4.6 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #9853-6 | While SVP supports any necessary fire management plans (Pages 2-47 through 2-50), it should be noted that fire has the capacity to damage or destroy paleontological resources and sites. Therefore, if any prescribed fire (controlled burns) of lands need to be conducted, such lands should be expeditiously, but properly and adequately, surveyed for paleontological resources (and mitigated or excavated if necessary) by qualified paleontologists, including BLM paleontologists, prior to the burn. Forest and Woodlands (Pages 2-50 through 2-55) | This comment discusses actions that would be implementation level actions or decisions. Implementation level actions are beyond the scope of this planning level document. See Section 1.4 of the EIS for more information about the scope of this document. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #9853-7 | Paleontological resources are not common in vegetated areas, but they nevertheless do occasionally such as in grasslands. Therefore, although SVP does not have any specific preferences in regard to different proposed alternatives (Pages 2-50 through 2-55), such areas should be properly surveyed for paleontological resources by qualified paleontologists, including BLM paleontologists. If any prescribed fire of such lands is needed (e.g., Alternative A of MA#s 4103-4109), such lands should be expeditiously, but properly and adequately, surveyed for paleontological resources (and mitigated or excavated if necessary) by qualified paleontologists prior to the burn. | This comment discusses actions that would be implementation level actions or decisions. Implementation level actions are beyond the scope of this planning level document. See Section 1.4 of the EIS for more information about the scope of this document. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13210-52 | 3006 Alternative A Fire suppression actions would be based on achieving the most efficient control and allowing historical acres burned to increase. Activity plans would be developed for designated fire management areas defining specific parameters for all fire occurrence. Alternative A is preferred, as this maintains the status quo which the group found to be a good strategy for ongoing fire suppression throughout the field office. | An adequate range of alternatives was considered for Management Action 3006. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13210-53 | 3007 Alternative C Prohibit use of heavy equipment within 100 feet of special management areas, except to protect life or property. Alternative C is preferred because Alternatives B and D were determined to be too restrictive as to when, where, and how a fire can be stopped. | An adequate range of alternatives was considered for Management Action 3007. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and | #13210-54 | 3009 Alternative A Wildfires occurring in forested areas would be appropriately suppressed in accord with resource values threatened, as determined on a case-by-case basis. Alternative A is preferred because there are very few forested areas in the RSFO, and thus little need for a change from the status quo as represented under Alternative A. | An adequate range of alternatives was considered for Management Action 3009. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (3000-3013) | | | |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13210-55 | 3012 Alternative D Take suppression action to protect the basin big sagebrush/lemon scurfpea plant communities. Manage wildfires and prescribed fires in all vegetation types to maintain or improve biological diversity and the overall health of the public lands. Plant species and age class diversity will be a priority; thus, response for all wildfires will be identified and implemented depending on the resources and management objectives for the area. Identify suppression techniques and hazardous fuels reduction activities to reduce wildfire severity and occurrence on portions of the landscape where fire could cause undesirable changes in plant community composition and structure. Prepare a site- specific analysis for sensitive resource areas, such as Special Status plant species sites, cultural resources, historic trails, and ACECs, to determine the type of fire suppression activity that will be acceptable. Limit fire equipment and fire suppression techniques, such as vegetation clearing, to designated roads and trails in Special Status plant species habitat. Update the Fire Management Plan, as appropriate, to reflect the appropriate suppression activity in sensitive resource areas. Alternative D is the preference because it allows for mitigation of damage to power lines in the event of lightning strikes. | An adequate range of alternatives was considered for Management Action 3012. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13330-2 | * MA # 3008: Sweetwater County Farm Bureau prefers Alternative D. The prohibition of chemical fire suppression agents within ¼ mile of surface water (page 2-48-49) puts many agricultural producers who live in rural areas into additional dangers from wildfires. Many ranches are built near identified resources and surface water sources, dropping chemical fire suppression agents onto ranch houses and outbuildings has saved many of them in the past from wildfires. | An adequate range of alternatives was considered for Management Action 3008. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13330-3 | * MA # 4111: Sweetwater County Farm Bureau prefers Alternative A. The least adequate is Alternative B, as a 5 years rest from grazing (page 2-57) of burned areas is excessive and impractical. Unless the burned areas are thoroughly fenced off from big game and wild horses then it seems that the goal is to restrict grazing rather than to give the burned areas rest. | An adequate range of alternatives was considered for Management Action 4111. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13353-4 | The BLM preferred Alternative B emphasizes the use of natural processes for forestry management and specifically prohibits fuel reduction operations on slopes steeper than 25%. Page 4-126 of the Draft RMP/DEIS states, "Limiting logging operations on slopes steeper than 25% (compared to 45%, under Alternative A) would reduce lands where commercial harvests could be conducted, thereby increasing fuel loading that support high-intensity fires." However, the Draft RMP/DEIS does not adequately account for the impacts to soils from the high intensity fires that will result from prohibiting heavy equipment and increasing fuel loading on slopes greater than 25%. Fires that consume large quantities of surface organic matter reduce the moisture- holding capacity and productivity of the soils. Post-fire surface runoff causes increased water and wind erosion as a result of these physical soil changes. Factors controlling post-wildfire erosion differ from site to site. Therefore, a one-size-fits-all management action to prohibit heavy equipment and fuels reduction on slopes steeper than 25% will exacerbate the hazardous fuels growth, increase fire intensity on the slopes, and the result in additional post-wildfire erosion to the soil. | The BLM has reviewed the analysis in Section 4.4.3 of the EIS and determined it is adequate. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13353-5 | Section 4.10.2 Wildfire Ecology and Management, Alternative A (page 4-121) attributes several mineral exploration and development impacts and claims human presence introduces additional ignition sources, increases the probability of wildfire occurrence, and increases the need for fire suppression activities.However, the 2023 Draft RMP/DEIS provides no data to support these claims. By contrast, incident response data and local fire experience in Sublette County indicates the fires related to mineral exploration and development activities occur within established development boundaries, are contained within the rock/soil boundaries of the development, and pose little to no risk to surrounding vegetation.Please provide supporting data from within the planning area to substantiate the existing wildfire ecology problem that resulted from mineral exploration and development described in Section4.10.2 Wildfire Ecology and Management Alternative A (page 4-121). | The BLM has reviewed the analysis in Section 4.10.2 of the EIS and determined it is adequate. Note that Alternative A is the existing management under the 1997 RMP. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13353-9 | The BLM preferred Alternative B fails to adequately consider the impact abandoning Special Recreation Management Areas as it relates to fuel treatments and wildfire suppression near SRMAs. Closing or limiting areas to recreational roads, trails, and routes use would decrease accessibility during emergency response, and prevent these features from being used as fire breaks to inhibit or stop the progress of wildfires in the planning area. Efforts to restrict firefighting equipment will delay emergency response, impede fire suppression efforts, and threaten life safety, property conservation, and resource values. | See Section 3.17.1 for a description of Special Recreation Management Areas. The BLM has reviewed the analysis in Section 4.10.3 of the EIS and determined it is adequate. |
| 811 - Fire and Fuels Management– | #13353-10 | The 2023 Draft RMP/DEIS incorrectly attributes management actions required in Alternative A. The Implementation Guide for Aerial Application of Fire Retardant (USDA Forest Service 2013), uniformly recommends the avoidance of retardants or foams within 300 horizontal feet from the edge of any waterway, waterbody, or | Alternative A is the existing management under the 1997 RMP. The BLM has reviewed the analysis in Section 4.5.3 of the EIS and determined it is adequate. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Wildland Fire Ecology and Management (3000-3013) | | wetland. Furthermore, under Alternative A, firefighter and public safety is always the first priority of incident response. | |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13353-13 | Please remove all references to wildfire being used for resource benefit and as a natural management tool under Alternative B in the Draft RMP/DEIS. The flawed assumptions will lead to improper analysis of the alternatives and lead to a bad decision. | The BLM has reviewed the EIS and the use of language that refers to utilizing wildfire as a resource benefit or natural management tool and determined that this language is appropriate as used. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13515-1 | RMEF is very supportive of active management on our public lands to benefit wildlife habitat and fire risk management. Executing active forest management techniques such as prescribed burns, thinning, and other treatments helps prevent catastrophic wildfires and assists in long-term ecosystem resilience. In addition, managing natural ignitions can help achieve fuel and vegetation goals. RMEF expresses concern about vegetation and timber management restrictions that would be in place following implementation of several Areas of Critical Environmental Concern (ACEC). The draft Plan components lack clarity as to desired conditions for timber production or vegetation management that would support vegetation diversity and heterogeneous vertical structure. As-is, priority would be given to activities that protect, rather than conserve and manage vegetative conditions. | Developing specific desired conditions for timber production or vegetation management are implementation level decisions that are beyond the scope of this planning level document. See Section 1.4 of the EIS for more information about the scope of this document. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13564-3 | Wildfires have begun to spread across the world at an unprecedented rate and it is up to land managers to do their part to manage this. The continued grazing of land by all is one tool available for the prevention of wildfires. While the Red Desert is not known for large fires, it is still important to make sure the landscape is healthy and properly managed to prevent the spread of fire. Each year, the BLM reports "34-50 "unplanned ignitions" in the DRMP area that burns an average of 2,000 acres. It is also important to note that Map 3-6 in the RMP also shows that there were no prescribed burns in the area from 1997 - 2015. Fires can be a useful management tool if used correctly. A 2020 comparison of prescribed fires in Australia found that early dry season prescribed burns could be beneficial to both the vegetation and mammalian life. | Section 4.10 of the EIS contains language that explains the connection between livestock grazing and the removal of hazardous fuels. Management Action 4103 allows for the use of prescribed fire under all Alternatives. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13669-3 | Adopting Alternative B may increase forages available to the point that fire risk would be dramatically increased. In this fire sensitive culture in which we live, responsible livestock grazing to protect the environment is a mutually beneficial way to mitigate fire risk. In addition, if Alternative B is selected, control of any wildfire will be hampered due to restrictions in mobilizing fire suppression equipment to the scene. | Section 4.10 of the EIS describes how livestock grazing can reduce hazardous fuel loads. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13688-1 | The BLM Preferred Alternative B limits emergency response (MA#1501, MA#7225, MA#7229, MA#7320, MA#7426), unnecessarily dictates firefighting strategies/tactics (MA#7437, MA#7475), restricts heavy equipment use (MA#3007), restricts aerial retardant application (MA#3008), seasonally closes areas during wildfire season (MA#4427, MA#7466), increases exclusion distances for fire suppression activities (MA#4431), and prohibits all prescribed fire use (see glossary definition 'surface disturbing activities' page GL-30). These examples of management actions under Alternative B represent unsafe restrictions on wildfire suppression activities that could negatively affect life safety and property conservation. The Draft RMP/DEIS fails to provide scientific analysis to support these recommendations. | Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13688-2 | Management under Alternative A balances the protection of life safety, property conservation, values at risk, and multiple-use objectives. On-scene incident commanders have sufficient decision- making authority to manage fire response activities to achieve resource objectives. Fire ecology management actions under Alternative A include: prescribed fire, fuel management, mechanical treatment, chemical treatment, grazing, fire use, and fire suppression. The remaining alternatives considered within the Draft RMP/DEIS do not improve fire management practices currently employed under Alternative A. | Impacts to Wildfire Management from the Management Actions related to Alternatives B, C and D are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13691-3 | Adopting Alternative B may increase forages available to the point that fire risk would be dramatically increased. In this fire sensitive culture in which we live, responsible livestock grazing to protect the environment is a mutually beneficial way to mitigate fire risk. In addition, if Alternative B is selected, control of any wildfire will be hampered due to restrictions in mobilizing fire suppression equipment to the scene. | Section 4.10 of the EIS contains language that explains the connection between livestock grazing and the removal of hazardous fuels. Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |

|---|---|---|---|
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13751-51 | BLM's plan, especially Alternative B, may actually result in large impacts that were unintended. For example, designating road access will result in limited ability for firefighters to get to remote areas and will result in larger fires and extreme impacts to all resources. Specific examples of how the plan results in unintended consequences are as follows: Eliminating access on these roads will result in more BLM resource and project proponent needs for permitting new roads. Eliminating access for firefighting purposes could be catastrophic for vegetation and soils across the range assuming BLM will be forced to use a policy of "let it burn" due to lack of access for firefighting. The BLM should not change "limited to existing roads and trails" to "limited to designated roads and trails" because it will have an unintended and negative consequence.[...]Appendix H, page 28 clearly shows the intent "restricting heavy firefighting equipment to designated road and trails." By eliminating existing roads and trails, under any alternative, this will eliminate access to large areas. Per BLM (see Management Action 7426), this also eliminates access on some of the existing roads and trails for exploration and even firefighting activities. | Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13759-1 | Climate change is minimally addressed in the Rock Springs RMP. The majority of where climate change is mentioned in the document is in the Monetized Impacts of Greenhouse gases (GHG's) section. This seems to be where a detailed conversation of climate change begins and ends in the RMP. Addressing GHG's is important, but there are many other issues that should be considered in this management plan in the context of climate change, such as early snowmelt, drought, loss of habitat, wildfires, and water resources (EPA, 2016). I think that this RMP should describe more ways the RSFO can be proactive around these issues and explain how plans will be adaptive in the face of inevitable change. | The BLM has reviewed the analysis in Section 4.10 of the EIS and determined it is adequate. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13784-10 | Fire and Fuels Management-Wildland Fire Ecology: MA#3008, Alt B: "Prohibit use of chemical fire suppression agents within 1/4 mile of Special Designations and rock art sites and where it may adversely affect identified resources (e.g. cultural, water, soil, wildlife)." (p. 2.48) Comment: Special Designation areas increase by 460% under Alternative B, leaving a significant portion of the Rock Springs BLM vulnerable to catastrophic wildfires when a tool such as chemical fire suppression is removed under Alternative B. | Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13865-32 | 6. Wildland Fire Ecology and Management PacifiCorp is implementing wildfire system hardening activities throughout its service territory. These actions include, but are not limited to, increased line patrols, conversion from bare conductor to covered conductor on distribution lines, changing out equipment (e.g., non-expulsion arresters and fusing), conversion from overhead to underground distribution lines, pole replacements, fire wrapping of poles, installation of avian and animal guards, installation of pole-mounted weather monitoring stations, and increased scope and frequency of vegetation management with ROWs. In addition to addressing fire risks associated with its facilities and surrounding vegetation, utility ROWs provide a supplemental benefit acting as potential fuel breaks and/or providing access routes for emergency responders during fires. Historically the area within the RSFO has been unimpacted by significant wildfires; however, trends across the West point towards an increase in overall fire risk. Over the past 20 years, the number and scope of fires has increased. The DEIS states that there have only been three significant fires since 1984, yet all three of those occurred after 2000. PacifiCorp is focused on reducing this increasing risk via line and vegetation inspections, system automation (which more quickly de-energizes lines in the event of a fault), installing different pieces of equipment, and other system hardening efforts. These efforts require access to existing infrastructure, as well as system upgrades where appropriate. While the BLM should consider past fires to inform risk, it should also consider the trending increase and ensure PacifiCorp and other utilities can act as partners to reduce wildfire risks. The DEIS acknowledges the importance of human health and safety (see MA #12, which states, "Human health and safety needs supersede all actions in this plan"); however, numerous MAs throughout the draft plan would hinder actions to maintain human health and safety by hindering wildfire prevention. PacifiCorp is concerned that the draft RMP, and specifically preferred Alternative B, does not address the importance of utility system hardening work as critical for human health and safety, and the need for this work to be conducted without administrative delays. System hardening may be considered emergency or O&M work, depending on the circumstances. These activities require utility access to ensure the safe operation of the electric grid. PacifiCorp will require travel through BLM-managed lands to access utility infrastructure for wildfire maintenance activities, and the extensive restrictions included in Alternative B could prohibit of delay this access, potentially putting infrastructure and landscapes at risk. While wildfire is specifically addressed in the DEIS in Chapter 4.10, restrictions elsewhere in the draft plan specifically related to ACECs, seasonal wildlife closures, and ROW restrictions, can impact utility travel and access to ROWs, potentially delaying or prohibiting necessary and time sensitive system hardening work. Specifically, MA #3007 restricts the use of heavy equipment for fire and fuels management that could cause surface disturbance. Electric utilities perform wildfire prevention activities, including vegetation management and infrastructure system hardening, that may use trucks, machinery, or other heavy equipment. Consequently, PacifiCorp recommends that the BLM adopt Alterative C under MA #3007, as this management action protects sensitive areas while still allowing for wildfire prevention activities. Restrictions in the DEIS related to herbicide use may also impact PacifiCorp's ability to implement its wildfire prevention activities. As proposed in Alternative B, prohibiting vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants would severely | None of the management actions under any alternatives would prohibit the treatment of vegetation around structures and equipment as required by law or policy. Section 1.4 of the EIS states "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | limit PacifiCorp's ability to perform integrated vegetation management in its ROWs by placing large restrictions on the areas in which herbicide treatments can be used. Prohibiting herbicide use will result in increased fuel loads on the landscape, a concern for wildfire risk. PacifiCorp's integrated vegetation management plan is consistent with Alternative A's focus on management actions utilizing mechanical and chemical treatments of vegetation in fire ecology management, as described in Chapter 4.10.2 of the DEIS. In summary, PacifiCorp recommends that the BLM adopt the following management actions related to wildfire: ? Allow utility system hardening and related wildfire risk reduction work to proceed without additional restrictions, review, or prior authorization. This is consistent with BLM IM 2023-034 that states: o "To facilitate and expedite O&M activities necessary to reduce the risk of wildfire, the BLM affirms that ROW holders are authorized and responsible to carry out O&M work including inspections to prevent wildfire. The BLM will encourage ROW holders to provide the Authorized Officer prior oral or written notification of O&M activities. The BLM Field Office will request that ROW holders notify the appropriate BLM Field Office within 30 days of completing such work unless this timeframe conflicts with applicable law and regulation. If the ROW holder determines that O&M work is necessary to prevent and suppress wildfire, then Field Offices should not generally require the ROW holder to obtain any additional notice to proceed or other form of prior approval before conducting the O&M work." ? As detailed above, PacifiCorp recommends that the BLM adopt Alterative A in regard to Wildland Fire Ecology and Management (Chapter 4.10.2). ? As detailed above, PacifiCorp recommend that the BLM adopt Alterative C under MA #3007. | |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13865-52 | Sterilization of vegetation is required around certain structures such as fuel tanks, propane tanks, and electrical substations and switches to prevent fires. If BCC is not allowed to used chemicals to help prevent the growth of vegetation in these areas unsafe conditions could arise. | None of the management actions under any alternatives would prohibit the treatment of vegetation around structures and equipment as required by law or policy. Section 1.4 of the EIS states "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #13892-18 | BLM currently calls for wildland and prescribed fires to "be managed in all vegetation types to maintain or improve biological diversity and the overall health of the public lands," but that would switch to "allowing wildfire to function as a natural ecological role." Under BLM's preferred alternative, more acres of wildfires would be allowed to burn, the use of prescribed fires would be restricted, and a variety of limits would be imposed on fire suppression activities- again without citing any scientific reason for its preference. | Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #14026-6 | Adding unnecessary complexity, cost, and mandates on electricity infrastructure may chill investment in grid hardening and expansion, at a time of high wildfire risk and increased electrification of the nation. NRECA urges BLM to refrain from imposing any such requirements on electrical infrastructure in the final RMP/EIS. | Impacts to Wildfire Management from the Management Actions in Alternative B are provided in Section 4.10 of the EIS. |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #14026-7 | NRECA also is deeply concerned about the possible restrictions imposed by the preferred alternative upon access to electricity ROW infrastructure for operations and maintenance activities. As BLM is aware, routine inspections, repairs, and vegetation management of the electrical system is critical for public safety, wildfire mitigation, and continued electric reliability. Utilities already face challenges and prolonged BLM approval processes to conduct these routine activities. Should this RMP/EIS limit access to electricity infrastructure and further complicate vegetation and grid hardening processes, risk of wildfire, outages, and other adverse events could increase. NRECA urges BLM to retract any potential limitations on ROW access and instead use this RMP process as an opportunity to improve utility access to their ROWs and to expedite and ease vegetation management and grid hardening processes on BLM-managed lands. NRECA encourages BLM to work with the electricity sector to understand vegetation management processes and access needs in the region and to incorporate those insights into the Final RMP/EIS. | None of the management actions under any alternatives would prohibit the treatment of vegetation around structures and equipment as required by law or policy. Section 1.4 of the EIS states "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." |
| 811 - Fire and Fuels Management–Wildland Fire Ecology and Management (3000-3013) | #14032-14 | The EPA recommends that the BLM include more detailed discussion in the Final RMP/EIS that considers how projected increases in drought conditions may worsen wildfires in vegetation communities in the planning area. Increased dryness and drought could result in massive plant die-off, creating ample fuel and better spreading conditions for massive wildfires. As part of this discussion, we recommend that BLM identify potential impacts from increased severity of wildfire under climate change conditions to water quality by increasing sedimentation or presence of pollutants in water resources located in the planning area. We further encourage the BLM to evaluate ways to mitigate or reduce the likelihood of climate-related wildfires and other drought-related impacts. Designing land use activities to maintain or increase the ability of the land to capture, retain and release water will increase the resiliency of the RSFO against drought and wildfires into the future. For instance, we recommend the Final RMP/EIS evaluate actions such as, but not limited to, the following: * Reevaluation of livestock grazing practices | The BLM has reviewed the analysis in Section 4.10 of the EIS and determined it is adequate. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | could result in less-impacted soils which may absorb and retain more water. Reducing livestock disturbance through grazing land rotation strategies can reduce land overuse and reduce introduction of noxious plant species that can promote wildfires. * Instream water management activities, such as beaver reintroduction or beaver dam analog construction can restore natural flows and increase water retention. * Filing for water rights, including instream flow under applicable state or federal permitting, to ensure water availability for multiple use management and healthy functioning riparian and upland ecosystems. | |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #9793-6 | Commercial timber harvest would be prohibited. What is the science that has led BLM to develop these components as its preference? | A range of alternatives for designation of Wild and Scenic Rivers and commercial timber harvest are analyzed in actions 7226, 7230 and 7234. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #9794-2 | RNAs Page 4-179, Alternative B refers to "designation of new … research natural areas" (RNAs). But there are no RNAs included in the document. Explain this inconsistency. | See updated text in 4.16.3 |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13210-56 | 4003 Alternative A with amended/ additional text Noncommercial forest lands (woodlands) would be managed to optimize cover and enhance habitat for wildlife, protect soil and watershed values, and complement recreation uses. The task force's preference is to combine language from Alternatives A and D to reflect that forested lands in the field office be managed to provide cover, enhance habitat for wildlife, etc... and provide forest and woodland products to the public. Requested additional language included in red: Noncommercial forest lands (woodlands) would be managed to optimize cover and enhance habitat for wildlife, protect soil and watershed values, and complement recreation uses, while providing forest and woodland products to the public. | Management Action #4003 for alternative A is the No action/existing management action under the Green River RMP. See page ES-3 for a description of Alternative A. A range of alternatives for managing forest woodlands are analyzed in Chapter 2.2.6. management action 4003. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13210-57 | 4013 Alternative A* Noncommercial forest lands (woodlands) would be managed to optimize cover and enhance habitat for wildlife, protect soil and watershed values, and complement recreation uses. In the management action prioritization exercise, all voting members submitted the same preferred alternative. These recommendations were not discussed during the meetings, but task force members approved their inclusion in the final report. | A range of alternatives are analyzed for restriction of timber harvest in Chapter 2.2.6 management action 4013. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13784-11 | MA#4003, Alt B: "Manage forests and woodlands to improve vegetative health and for the benefit of other resources. Use natural processes to the greatest extent possible." (p. 2-51) Comment: Alternative B excludes what natural processes are approved and eludes to relying primarily on natural fire regimes and perhaps insects to manage the forest and woodlands, which WDA believes does not improve vegetative health or benefit other resources such as wildlife. | A range of alternatives are analyzed for management of woodland forests in Chapter 2.2.6 management action 4020. Analysis of impacts for actions in the alternative is found in chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13784-12 | * MA#4016, Alt B: "Leave harvested areas and areas denuded by natural causes to revegetate naturally." (p. 2- Comment: Areas burned by wildfire are prone to heavy cheatgrass infestations. By choosing Alternative B, BLM lands will no longer meet the habitat needs of many wildlife species and likely conflict with designated wildlife habitats such as crucial winter range, parturition areas, nesting for sage-grouse, etc. | A range of alternatives for harvested areas are analyzed in Chapter 2.2.6 management action 4016. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13784-13 | MA#4020, Alt B: "Prohibit pre-commercial thinning except for fuels treatment." (p. 2-54) Comment: Alternative B is a direct conflict by prohibiting pre-commercial thinning as a tool scientifically proven and utilized across the West to improve the resource for not only commercial purposes, but also for other beneficiaries such as wildlife. | A range of alternatives are analyzed for management of woodland forests in Chapter 2.2.6 management action 4020. Analysis of impacts for actions in the alternative is found in chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #13892-19 | The proposal does "allow the sale of small vegetative permits to meet public demand for posts and poles, firewood, sawlogs, Christmas trees, burlwood, and other vegetative products and to meet forest health objectives and wildlife habitat requirements," but prohibits clear-cuts and harvest methods that create clear-cuts, as well as prohibits pre-commercial thinning except for fuels treatment. Commercial timber harvest would be prohibited. What is the science that has led BLM to develop these components as its preference? | A range of alternatives are analyzed for the sale of permits in Chapter 2.2.6 management action 4010. Analysis of impacts for actions in each alternative are found in Chapter 4. See Chapter 4.18.1 for assumptions used for analysis. |
| 812 - Biological Resources- | #14022-4 | In the Biological Resources section MA#4011 under Alternative B prohibits clear-cuts and harvest methods that create them. SCCD discourages this as sometimes the species requires a clear cut to revegetate after a harvest. Lodgepole Pine is the perfect example within the RMP planning area. Also, when there is a disease or insect | A range of alternatives are analyzed for clear-cuts in Chapter 2.2.6 management action 4011. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Forest and Woodlands (4000-4024) | | outbreak the best way to deal with the outbreak maybe clear cutting and removing that tool from the toolbox ties the hands of the people trying to manage the landscape. | |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #14022-5 | MA#4016 under Alternative B is very restrictive and could lead to large landscapes crossing a threshold that might be irreversible. Land managers and conservationists throughout history have had to intervene with restoration efforts when mother nature has a hard time doing it on her own. SCCD believes that the BLM may be setting themselves up for failure with this prescription, when the better approach is to monitor the revegetation and determine intervention on a case-by-case basis. | A range of alternatives for harvested areas are analyzed in Chapter 2.2.6 management action 4016. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #14022-6 | MA#4017 Alternative B states that natural processes will be used to manage forest health. SCCD would like to point out that human interaction with the natural fire regime and further lack of management has led to decadent, disease prone forest stands within the RSFO. Alternative B appears to all forested stands like they are in a National Park and not managed under FLPMA. SCCD strongly encourages the BLM to manage for a healthy ecosystem and utilize all tools in resource management that help you achieve this goal, as suggested in Alternative D. | A range of alternatives for revitalizing decadent stands are analyzed in Chapter 2.2.6 management action 4017. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 812 - Biological Resources-Forest and Woodlands (4000-4024) | #14022-7 | MA#4020, SCCD would like the prohibition of pre-commercial thinning to be removed as it is a tool that is needed at times depending on the project location. | A range of alternatives for managing woodland forests are analyzed in Chapter 2.2.6 management action 40120. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #4026-6 | Chapter 3.5 Vegetative Communities. As relating to the Killpecker Sand Dunes complex, I believe a "Sand Dunes" vegetation deserves discussion as a separate vegetation community found in the district. These dunes could potentially harbor a number of rare plants, such as the blowout penstemon (Penstemon haydenii). Information for additional discussion on a "Sand Dunes" vegetation can be gotten from Jones (2002). | Chapter 3.5 contains an adequate description of the vegetation communities within the planning area. For impacts from each of the proposed alternatives, see Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #9721-2 | Numerous articles specific to Wyoming have been written detailing habitat restoration studies conducted by the University of Wyoming, yet have not been utilized by this project. Some researchers from UW that have completed work within or near the area include P. Stahl, M. Curran, J. Norton and C. Strong. Their research and peer reviewed publications are unbiased and specific to the landscapes analyzed in the BLM proposed RMP. The BLM claims to use the best available science yet does not include the latest site specific research and data related to the habitat under consideration. | See Executive Summary and Chapter 4.2.2 Availability of Data and Incomplete Information for adequacy of data and analysis. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #9721-6 | What is the threshold for determining whether an area is difficult to reclaim? Does that include areas that have a high likelihood of reclamation success, but contain a component that may result in specific lands to be classified as difficult? The BLM needs to state specifically what attributes, combination of attributes or lands may contain habitats that are difficult to reclaim, as well as the overall likelihood of success in reclaiming those lands. Furthermore, those areas should not be delineated with a broad pen but ground truthed with site specific data. | See Glossary for a definition of 'reclamation' and 'limited reclamation potential'. A range of alternatives has been analyzed for soil resources in Chapter 2.2.6 management actions 100-1116. See appendix I for the Reclamation Plan. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #9721-7 | The statement requiring photo point monitoring for all channel crossings and all surface disturbances greater than½ acre limits the use of best available technology or most appropriate monitoring methods to track and monitor rangelands. Monitoring programs are to be developed to accurately capture and record trends in relation to desired goals and objectives. Photo point monitoring is a good and appropriate method for monitoring some attributes of rangelands but, should not be considered the only method due to development of future monitoring protocols or management objectives. You should restate this requirement to state the BLM encourages the utilization of photo point monitoring, but other methods may be considered. | A range of alternatives has been analyzed for photo-point monitoring in Chapter 2.2.6 management action 1109. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and | #9721-10 | Native plant species are preferential, however non-native species are important for competing against invasive and undesirable species. In addition to competition with invasive species non-native species attract pollinators, capture moisture helping to establish native species, minimize erosion, act as nurse crops and often fill a niche that is left devoid due to lack of commercial availability of native species. Options utilizing non-native species in revegetation must be kept open. | Please refer to Chapter 3.6. A range of alternatives has been analyzed for desired plant community objectives in Chapter 2.2.6 management action 4102. Analysis of the impacts from the actions in each alternative is found in Chapter 4 |

|---|---|---|---|
| Shrubland Communities (4100-4112) | | | |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #9853-7 | Paleontological resources are not common in vegetated areas, but they nevertheless do occasionally such as in grasslands. Therefore, although SVP does not have any specific preferences in regard to different proposed alternatives (Pages 2-50 through 2-55), such areas should be properly surveyed for paleontological resources by qualified paleontologists, including BLM paleontologists. If any prescribed fire of such lands is needed (e.g., Alternative A of MA#s 4103-4109), such lands should be expeditiously, but properly and adequately, surveyed for paleontological resources (and mitigated or excavated if necessary) by qualified paleontologists prior to the burn. | A range of alternatives has been analyzed for vegetation-grassland and shrubland communities in Chapter 2.2.6 management action 4100-4112. A range of alternatives has been analyzed for protection of paleontological resources in actions 5300-5309. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13210-58 | 4102 Alternative A Native plant communities are the preferred species identified when establishing desired plant community objectives (see Riparian Vegetation Guidelines for additional guidance). The task force preferred a maintenance of the status quo under Alternative A. Alterative C was not preferred because it allows for the acceptance of native and approved non-native plants species - which the BLM indicated they typically don't allow. | A range of alternatives has been analyzed for desired plant community objectives in Chapter 2.2.6 management action 4102. Analysis of the impacts from the actions in each alternative is found in Chapter 4 |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13210-59 | 4103 Alternative D Alternative D: Same as Alternative C. Alternative C: Use naturally occurring wildfires, prescribed fire, chemical treatments, biological treatments, mechanical methods, and livestock grazing to meet vegetation management objectives. Alternative D supports agreements in principle # 4 and # 5, by allowing for flexible means to achieve vegetation management objectives. Specifically, Alternative D recognizes livestock grazing as well as prescribed fire, chemical, biological and mechanical treatments to meet vegetative management objectives. | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4 |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13210-60 | 4110 Alternative A Vegetation manipulation projects would be conducted to reach multiple use objectives and would involve site-specific environmental analysis and coordination. Funds for vegetation manipulation in I category allotments would be provided by the BLM, other state or federal agencies, and private sources. Alternative A is preferred as it identifies the use of vegetation manipulations projects to achieve multiple- use objectives whereas Alternative C suggest vegetation management projects would only be used to achieve ecosystem health objectives. | A range of alternatives has been analyzed for vegetation treatments in Chapter 2.2.6 management action 4110. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13210-61 | 4111 Alternative D Adapt management of treated areas, using a site-specific analysis of contributing factors, if not meeting or making significant progress toward vegetation objectives. This management action supports agreements in principle # 4 and # 5 by providing for critical site- specific determination regarding rest of treated areas. Alternative D is preferred because it allows for flexible management. Alternative B requires the resting of a treated area for five growing seasons which the task force felt lacked scientific support and would be detrimental to livestock operators. Alternative A did not provide clear language as to who would be responsible for the fencing out of livestock and big game animals if necessary. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13210-62 | 4112 Alternative D Design vegetation treatment projects to maintain or improve water quality and reduce erosion by dissipating erosive energies. Alterative D is preferred because it allows for water maintenance and improvement. | A range of alternatives has been analyzed for vegetation treatments and water quality in Chapter 2.2.6 management action 4112. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland | #13247-2 | a. Credible Data: Scattered throughout the EIS is the policy that the BLM will be establishing plans and management policies based on monitoring data and site data as it becomes available. BLM did not appropriately cooperate with Fremont County in acknowledging the Fremont County NRMP. See BLM # 4101 While monitoring and site data can be important tools, this data needs to qualify as credible data in order to be consistent with the Fremont County NRMP: | See Chapter 1.5 Relationship to Other Plans |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Communities (4100-4112) | | | |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13704-1 | I urge the BLM to consider the rarity of Limber Pine stands, especially those on the windward slopes of interior meadows. (i.e. location: 41.051341N, 108.976374W) 5. I urge the BLM to consider the occurrence of Draba Juniperina as a listed species of concern on the Wyoming Natural Diversity Database. Years ago, a researcher happened by our cabin and informed me that this very rare species was present on Pine Mountain. | A range of alternatives for Special Status plant species was analyzed in Chapter 2.2.6 management actions 4600-4624 and 6400-6417. See Chapter 3.8.2 for a list of Sensitive species. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13748-9 | MA# 4103, Alternative C: Use naturally occurring wildfires, prescribed fire, chemical treatments, biological treatments, mechanical methods, and livestock grazing to meet vegetation management objectives. Rationale: Alternative C recognizes livestock grazing as well as prescribed fire, chemical, biological, and mechanical treatments to meet vegetative management objectives while Alternative B does not recognize chemical, livestock grazing, and mechanical methods to meet vegetation requirements. Different vegetation types and ecosystems respond differently to various management methods. Employing a range of techniques allows land managers to address the specific needs of diverse plant communities, promoting a more balanced and resilient ecosystem. We would like land managers to be able to use a variety of tools to meet vegetation standards | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13754-20 | One requirement the BLM proposes is that the average frequency of shrubs within a project area must accomplish 50 percent coverage as gauged against a reference site. It can take well over 20 years for shrubs to dominate a site at that level. The BLM's focus on shrub coverage ignores the science associated with ecological succession. Therefore, it may be dismissive of a more reasonable and productive outcome which would be to target healthy, vigorous and diverse plant communities which provide benefits to invertebrates and support trophic food webs. Allowing discretion at the planning stages will increase the probability of achieving the best outcome. | See Appendix I: Reclamation Plan for general reclamation requirements. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13754-21 | Another standard the BLM is proposing is that the average percentage composition and total diversity of forbs must be equal to or greater than pre-disturbance composition. Yet multiple agencies with expertise, including the NRCS, Sublette County Conservation District, the Wyoming Department of Agriculture WGFD and the Bureau itself have determined that the requirement for forbs be equal or greater than pre-disturbance composition is a poor measurement or criteria. This is an arbitrary goal set by the BLM that again will not result in the best outcome for reclaiming a disturbed site. | See Appendix I: Reclamation Plan for general reclamation requirements. See Chapter 1.4 Planning Criteria for coordination with other agencies. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13769-4 | 3. We urge the BLM to consider the synergistic effects of increasing feral horse populations and decreasing forage production in the area due to climate change. We have observed considerable impacts of wild horse forage consumption. The impacts are significant because unlike migrating wildlife or cattle, feral horses graze the same areas year around. Also, horse digestive physiology forces horses to intake more forage and use it more inefficiently than native ungulates. Horses are clearly noteffectively managed and their populations increase each year. Horses also concentrate in certain areas like watering holes and the few riparian areas. We have observed a decrease in both the quantity and diversity of forage in these habitats. For example, the increase in non-palatable species like Prickly Pear Cactus and Rubber Rabbit Brush in areas of heavy grazing is concerning. While the former can be partially attributed to drought and a changing climate, we are concerned that uncontrolled feral horse populations will result in irreversible change in species richness and net primary productivity. We report numerous 'stud pile' areas that are devoid of any vegetation because of repeated occupancy and trampling by numerous stud horses. A decrease in plant cover results in increased soil erosion and a decrease in forage production. While not documented scientifically, we observe in these areas that the trampling is so severe that it appears as if sub-soil salts are leached to the surface and form alkaline deposits that further reduce plant production and lead to the spread of noxious weeks (e.g. Halogeten (Halogeton glomeratus)). | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 actions 4600-4624. See Chapter 3.9 for information about wild horses within the planning area. Analysis of impacts for actions in each alternative is found in chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13784-14 | MA#4103, Alternative B: "Use naturally occurring wildfires, prescribed fire, and biological treatments to meet vegetation management objectives or to protect and enhance crucial and sensitive wildlife habitats." (p. 2-56) Comment: Unlike Alternatives C and D, Alternative B prohibits the use of chemical treatments. BLM has recent approval for the chemical Rejuvra, which is the most effective chemical on the market for the long-term treatment of cheatgrass and other annual grass species. By prohibiting chemicals such as Rejuvra, or other chemicals developed and approved in the future and during the implementation of this RMP, the Rock Springs Field Office will likely experience significant infestations of weeds and annual grasses. Ultimately, livestock grazing permittees will experience negative impacts on their permits as a result of not meeting standards for upland and wildlife. | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13784-15 | MA#4111, Alternative B: "Rest all treated areas a minimum of five growing seasons from livestock grazing." Comment: MA#4100 states "Manage vegetation using the best available science-based assessment and modeling information..." However, Alternative B directly conflicts with MA#4100 by requiring a blanket timeframe of 5 years rest for all treatments. Not every treatment would benefit from rest and may in fact benefit from grazing to reduce monocultures of a particular vegetation species. Additionally, BLM interchanges this MA throughout the document and analysis with five growing season, five years, and five seasons. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13784-17 | MA#4111, Alternative D: "Adapt management of treated areas using a site-specific analysis of contributing factors, if not meeting or making significant progress toward vegetation objectives." (p. 2-57) Comment: WDA also does not support Alternative D for a number of reasons. The MA is incorporating and misapplying Wyoming Land Health Standards language for making a determination. Establishing and meeting vegetative objectives following a vegetation treatment does not follow the same analysis, or determination of causal factors. WDA recommends rewording Alternative D as follows: "Develop reasonable vegetation objectives based on treatment methodology and defer livestock grazing as needed to reach objectives. | The language of Alt D in Management Action 4111 is not referring to land health standards, but vegetation objectives. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13784-47 | "Livestock grazing management actions would be similar to Alternative A, except where areas open to grazing under Alternative A would be prohibited or closed to livestock grazing (exclosures and recreation areas). In these areas, reduced grazing pressure on vegetation would provide greater protection to soils compared to Alternative A." (p. 4-24) Comment: BLM needs to include the number of acres prohibited or closed to grazing to inform the public and most importantly the livestock grazing permittees of the actual impact from current management under Alternative A. | Section 4.16 of the EIS describes the number of acres closed to livestock grazing under all management actions for each alternative. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13784-52 | 4.6.2 Vegetative Communities, Alternative B: "The increased restrictions placed on livestock grazing activities under this alternative would likely support vegetation resources to a greater degree when compared to Alternative A. Closing all exclosures within the planning areas to livestock grazing and suspend AUMs currently authorized in these exclosures would allow the forage in the exclosures area a chance to regrow." Comment: BLM needs to identify what restrictions are placed on livestock grazing. If the exclosures are already in place under Alternative A, this excludes grazing, and vegetation isn't being utilized. There is no "regrowth" occurring under Alternative B. The analysis lacks enough information to compare the impacts between alternatives. | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. Livestock grazing management action can be found in actions 6400-6417, with impacts found from each alternative in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13799-1 | We recommend this plan support the national sagebrush initiative and not constrain important conservation opportunities that could be considered in future greater sage grouse specific amendments. The Draft RMP lands comprise some of the largest intact native sagebrush communities in the West, a conservation priority for the Department of Interior. These sagebrush communities are of national significance as an intact ecosystem, as a seed bank, and as an essential core sustaining rangewide ecological integrity in Wyoming and throughout the high deserts of the western United States (USGS Open File Report, 2022). These central habitat strongholds of greater sage grouse safeguard a robust intact genetic and demographic core population that is essential to sustain small, isolated outlying sage grouse populations, such as the population resident to Grand Teton National Park. | See Chapter 1.3 for description of the separate sage-grouse planning effort. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13849-2 | Biological Resource #4111. Page 2-57. Alternative D provides for critical site-specific determination regarding rest of treated areas and is preferred because it allows for flexible management. What is the scientific rationale for 5 years? Who would be responsible for fencing out the wild horses, wildlife, and or big game animals if an area is to be rested for 5 years? To say nothing of the problematic and devastating effects such a lengthy rest would have for me as a livestock operator. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13851-2 | Biological Resource #4111. Page 2-57. Alternative D provides for critical site-specific determination regarding rest of treated areas and is preferred because it allows for flexible management. What is the scientific rationale for 5 years? Who would be responsible for fencing out the wild horses, wildlife, and or big game animals if an area is to be rested for 5 years? To say nothing of the problematic and devastating effects such a lengthy rest would have for me as a livestock operator. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological | #13851-3 | Biological Resource #4103. Page 2-56. Alternatives C and D recognize livestock grazing as a beneficial tool, in addition to fire and weed & pest measures, to meet vegetation management objectives. Other states have | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | | been imploring the use of livestock grazing as a tool to reduce the amount of fuel to slow the speed of wildfires after the recent onslot of recent wild and forest fires. | |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13865-12 | A. MA #4102 Alternative B of MA #4102 requires there are only native plant species used for reclamation, while Alternatives A and C "prefer" there are native species. This requirement could pose practical problems when implementing reclamation on-the-ground at mine sites, generation facilities, or power line ROWs. For example, native plant species are not always available for seed mixes and in some years, depending on growing conditions for seed companies, they may be impossible to procure. Appropriate substitutions should be allowed to establish desired plant community objectives and this language should be added to Alternatives A and D of MA #4102. The strict limitation in Alternative B could make meeting reclamation obligations difficult or impossible by significantly limiting the number of species that could be included in a seed mix. There is also uncertainty if non-native seed would be allowed as a temporary cover crop under Alternative B. The use of temporary cover crops is required by some other regulatory permits to protect topsoil and control dust. If non-native seed were not allowed for temporary cover crops under this management action, it could put facilities at risk of violations with other permits and regulations. PacifiCorp recommends that the BLM adopt Alternative C under MA #4102, or use A or D with the above substitution language added. | A range of alternatives has been analyzed for desired plant community objectives in Chapter 2.2.6 management action 4102. Analysis of the impacts from the actions in each alternative is found in Chapter 4 |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13865-13 | Alternative B of MA # 4108 refers to MA #4103, which permits the use of only "naturally occurring wildfires, prescribed fire, and biological treatments to meet vegetation management objectives or to protect and enhance crucial and sensitive wildlife habitats." Limiting vegetation management to only these methods will adversely affect PacifiCorp's ability to perform IVM on its ROWs. PacifiCorp recommends that the BLM adopt Alternative A under MA #4108 because it allows for the use of mechanical, chemical, and biological methods of IVM, which is consistent with industry standards and best management practices. | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13865-58 | o "Place infrastructure in already disturbed locations where the habitat has not been fully restored." As stated previously, power line routes are sited based on many factors, including avoiding sensitive resources and considering costs to utility customers. Consequently, utilities may not always be able to site line routes in areas with existing disturbance. PacifiCorp recommends that the BLM modify this stipulation to include "where feasible, practicable, and cost effective." | See first paragraph in Appendix A.1.2 for explanation of Project Design Feature applicability. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13870-2 | The Draft RMP, in Chapter 2, management action 4018 Alternative D proposes such management. "Identify special management areas and incorporate appropriate management*into activity plans. Examples of such special tree populations include: The Douglas Fir on Pine Butte, the northern most extent of Colorado Pinon Pine located in Wild Horse Basin, old growth Juniper stands, and the isolated alpine woodland community on top of Black Mountain at Pine Springs."3 To protect identified special populations of trees, my recommendation is that the BLM should include the above management action (MA) into the Final Rock Springs | A range of alternatives has been analyzed for special forest management areas in Chapter 2.2.6 management action 4018. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13889-1 | 4111 A &D both state two growing seasons should be a consideration to allow for management decisions regarding livestock, but it should be on a site-specific basis to ensure that it is meeting the vegetation and habitat objectives. Riparian and Wetland Resources (4300-4303) 4300 – A Under this Green River RMP, 75% of the riparian areas should, within 10 years, have plans in various states of implementation that would allow riparian areas to achieve or maintain PFC. This provides manageable goals, restoration takes time and if riparian areas are in an upward or declining trend they should be monitored and reasonable accommodations to improve riparian habitat should be discussed by livestock producers, BLM officials and other entities on the ground that can make the BMP's work. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. A range of alternatives has been analyzed for riparian and wetland resources in Chapter 2.2.6 management actions 4300-4303. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13892-24 | Page 4-179, Alternative B refers to "designation of new … research natural areas" (RNAs). But there are no RNAs included in the document. Explain this inconsistency. | See updated text on page 4-179. |

|---|---|---|---|
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13904-2 | MA 4111 Alt B requires 5 years of rest after fire. There is not scientific evidence to support that amount of rest. The area must be evaluated as site specific. Management must be more flexible and adaptive. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13916-2 | MA 4103 Alt B Excludes livestock grazing as a management tool. It should be included like Alternative D | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13916-3 | MA 4111 Alt B requires 5 years of rest after fire. There is not scientific evidence to support that amount of rest. The area must be evaluated as site specific. Management must be more flexible and adaptive. As a wildland firefighter for the BLM, I have seen firsthand the ecological impacts that fire can have. I have also seen the incredibly fast recovery which BLM land in particular is capable of after a fire. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13945-1 | 1. Management Action (MA) #4111 requiring a minimum 5 year deferment of livestock grazing following a wild fire without a replacement source of forage would require the permittee to sell off livestock in the absence of a replacement source of summer and fall grazing. The Draft EIS does not fully account for the social and economic impacts of large scale fires in the RSFO area in one or more permittees is force off their allotments for 5 or more years. | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. See socioeconomics impacts for each alternative in Chapter 4.22. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13951-19 | Page 2-56; Biological Resources #4103 "Use naturally occurring wildfires, prescribed fire, and biological treatments to meet vegetation management objectives or to protect and enhance crucial and sensitive wildlife habitats" -Alternatives C and D recognize livestock grazing is a beneficial tool, in addition to fire and weed & pest measures, to meet vegetation management objectives. Other states have been imploring the use of livestock grazing as a tool to reduce the amount of fuel to slow the speed of wildfires after the recent on slot of wild and forest fires. We are fortunate to have the tools in place to do this. | A range of alternatives has been analyzed for vegetation management objectives in Chapter 2.2.6 management action 4103. Analysis of the impacts from the actions in each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #13951-20 | Page 2-57; Biological Resources #4111 "rest all treated areas a minimum of five growing seasons from livestock grazing." -Alternative D provides for critical site-specific determination regarding rest of treated areas and is preferred because it allows for flexible management. What is the scientific rationale for 5 years? Who would fence out the wild horses, wildlife, and or big game animals if an area is to be rested for five years? To say nothing of the problematic and devastating effects such a lengthy rest would have for livestock operators. As the Governors Task Force also noted, "Alternative A did not provide clear language as to who would be responsible for the fencing out of livestock and big game animals if necessary". | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #14022-8 | MA#4102 SCCD encourages utilizing native species is key when doing reclamation from any activity. However, SCCD also understands that, in certain situations, native species can't outcompete the already existing invasive species so the ability to utilize non-native species in those unique situations is ideal to successful revegetation in parts of the RSFO. | A range of alternatives has been analyzed for desired plant community objectives in Chapter 2.2.6 management action 4102. Analysis of the impacts from the actions in each alternative is found in Chapter 4 |
| 813 - Biological | #14022-9 | MA#4111, SCCD disagrees with the Alternative B action of resting 5 growing seasons. SCCD has seen in the RSFO that resting up to 2 growing seasons has been ample time to see revegetation be successful. The BLM | A range of alternatives has been analyzed for resting treated areas in Chapter 2.2.6 management action 4111. Analysis of impacts of the actions for each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | | could state that rest needs to occur until local cooperatively set objectives have been met, as suggested in Alternative D. | |
| 813 - Biological Resources-Vegetation-Grassland and Shrubland Communities (4100-4112) | #14023-9 | The Rock Springs District RMP should be driven by a conservation agenda, one that will conserve the best of the unique landscapes, habitats, and native biodiversity it sustains. The RMP should re?ect the District's place in the larger Wyoming landscape; its critical role in providing winter habitat for wildlife that summers tens, if not hundreds of miles to the north. It should also protect, and where and whenever possible enhance habitats for resident wildlife and native plants. It should evaluate, consider, and mitigate how energy development impacts air- and watersheds far removed from the district. It should recognize, respect, and protect the history and locations once utilized by our indigenous ancestors. | See The Purpose and Need section of the document page ES-2 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #21-1 | I see unsustainable impacts to rangelands from too much cattle grazing. This is having a lasting impact on native plants and encouraging introduction of exotic species which are capturing ground and preventing recovery. This is causing declines in many wildlife species, particularly grassland birds. Furthermore increased traffic, new roads and pipeline maintenance are further spreading exotic species. BLM efforts to control these impacts are not keeping pace with the problem. One clear solution is to lower cattle stocking and to lessen the duration and frequency of grazing leases. Another solution is to demand greater care be taken by mineral leases and ranchers to reduce the spread of exotic species by cleaning equipment and treating exitic species. Reducing roads would also help with these problems. | Vegetative Communities Livestock Grazing Management are addressed in section 4.6 and 4.16, respectively. Additionally, management actions for all four alternatives are identified in 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9307-1 | Many invasive species have a proportionally larger impact to riparian ecology and removing herbicide use greatly limits tools available for management and does not align with the EPA approval on pesticide labeling. Fremont County Weed and Pest District suggests allowing for the labeled use of herbicides to manage invasive and noxious weeds. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9684-1 | Under 4.6, Vegetation Communities, Alternative A suggests prohibiting herbicide applications within 500 feet of water sources, riparian areas, wetlands, and sensitive resources. From our understanding, this would carry into the subsequent alternatives as well. What is the justification for this prohibition when many herbicide labels allow for use to the water's edge and even within water sources, riparian areas, and wetlands? Many invasive species have a proportionally larger impact to riparian ecology and removing herbicide use greatly limits tools available for management and does not align with the EPA approval on pesticide labeling. Sweetwater County Weed and Pest District suggests allowing for the labeled use of herbicides to manage invasive and noxious weeds. | Analysis can be found in section 4.6. Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9684-2 | * Under 2.2.6 Detailed Alternative Descriptions by Resource, Table 2.1, Biological Resources - Invasive Species and Pest Management (4200-4213), MA# 4207, Alternative B suggests limiting control of noxious and other invasive plant species to mechanical and biological methods. This action will cripple the tools and methods available for managing invasive weeds and appears to be in direct conflict with the RMP's invasive species concerns, management goals, and resource protection emphasis described within the preferred alternative. Sweetwater County Weed and Pest District does not support limiting the tools available for the best management practices of invasive weeds. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9684-3 | * Under 2.2.6 Detailed Alternative Descriptions by Resource, Table 2.1, Biological Resources - Invasive Species and Pest Management (4200-4213), MA# 4212, Alternative B suggests prohibiting aerial applications to ½ mile for riparian and special status plants. This action will severely limit the tools and methods available for managing weeds, such as cheatgrass, which impact upland rangelands adjacent to riparian and special status plants. Sweetwater County Weed and Pest District suggests allowing for the labeled use of aerial application equipment and herbicides for the control of invasive weeds. We support reasonable buffers exceeding pesticide labeling for special status plant protections. | Analysis can be found in section 4.6. Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and | #9684-4 | ? Herbicides are a tool used to keep invasive species managed. They can help improve ecosystem health. Statements that are blatantly incorrect like "chemicals could sicken and kill special wildlife" is irresponsible (section 4-87). As an applicator, we use pesticides in accordance with EPA labels which when applied correctly will not sicken or kill wildlife. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Pest Management (4200-4213) | | | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9684-5 | The use of the word chemical is uneducated. The proper terminology is pesticide and when referring to managing plants which is how they are commonly used on BLM are called herbicides. Herbicide applications are made by request from BLM staff and are used to improve habitat and natural resources. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9684-6 | We need the ability to manage invasive species in Wilderness Study and Wilderness areas as decided by local BLM field managers. Invasive species know no boundaries. These areas are still subject to invasive species encroachment. Under the direction of the local RSFO, Sweetwater County Weed and Pest needs to be able to access, map, and treat invasive species. Invasive weed management will help to preserve the wilderness characteristics of these designated areas. | Comments addressed in section 4.21. Additionally, management actions for all four alternatives are identified in 4200-4213.§ 6304.22. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9721-8 | Following vegetation treatment, in Alternative B, a blanket statement of 5 years rest is required. This statement of 5 years rest is ignorant of the resilience of the landscape nor does it consider site specific conditions, yearly climatic or environmental changes. In many instances the time of rest should be much less than five years where in others the five-year time line may be insufficient. This statement should be adjusted to state that when management objectives or specific thresholds have been achieved than grazing may continue. | See section 4.4.3. Additionally, management actions for all four alternatives are identified in 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9721-11 | all options need to remain available for consideration including chemical, mechanical, and various grazing systems to achieve vegetation objectives. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9721-12 | Blanket prohibition of chemical application unless supported by label direction will allow vectors of invasive species to remain and reestablish or spread into previously treated areas or become established in areas that previously were not infested. You must follow label directions regarding herbicide utilization rather than further impeding the ability to successfully treat noxious and invasive species by placing further restrictions on herbicide use that are not supported by label direction. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-22 | The plan calls for restricting animal damage control throughout the district, and to allow such efforts "on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns." The DEIS is deficient by neglecting to provide any scientific basis for the need for such restrictions. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest | #9792-29 | The DEIS and the preferred alternative do not rely on current science in treatment of animal damage control. Please revise the document to reflect the findings of the following documents: Taylor, David T., et al. "An economic analysis of predator management in Wyoming." Wyoming Animal Damage Management Board Wyoming Department of Agriculture (2009). {Attachment C, indicating the benefits of predator control for both livestock and wildlife). USDA Wildlife Services, 2020. Final Environmental Assessment Predator Damage and Conflict Management in Wyoming. {Attachment D, on reasons for and impact of predator damage and conflict management.} USDA Wildlife Services, 2019, Wolf Damage and Conflict Management in Wyoming. {Attachment E, outlining the Wildlife Services role in wolf conflict management.} Knowlton, F. F., Gese, E. M., & Jaeger, M. | See section 4.16.3. Additionally, see management actions for all four alternatives under 4200-4213 and 4400-4436. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (4200-4213) | | M. (1999). Coyote depredation control: An interface between biology and management. Journal of Range Management, 52(5), 398-412. {Attachment F, suggesting that predator control is a tool to assist both livestock and wildlife and: "Predation management requires a partnership among producers and wildlife managers to tailor programs to specific damage situations so the most appropriate techniques can be selected."} | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-30 | Page 2-65 Alternative B, states "Allow animal damage control on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns." This is a ridiculous restriction and does not account for the need for wildlife damage control on domestic livestock or wildlife. This restriction is not scientifically justified and would cause harm to livestock producers and private land owners within the RSFO, as well as wildlife. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4400-4436. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-31 | On the same page, Alternative C refers to "county pest control." County "pest" control is an incorrect term. Wyoming has "county animal damage management districts" and it is this terminology that should be used in the EIS, and their activities are "wildlife damage management," not "animal damage control" as used in the current document. We suggest that no matter what management alternative is selected, the selected alternative be revised to include: "The BLM would continue to coordinate and to annually review with APHISWS their annual wildlife damage management plan for activities on public lands. Areas where proposed wildlife damage management activities (all or specific methods) are not compatible with BLM planning and management prescriptions or objectives for other resource activities and users, would be identified on a case-by- case basis, and APHIS-WS would be requested to amend or adjust proposed wildlife damage management activities accordingly." | Language and terms have been updated as necessary. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-32 | Page 2-60 Alternative B, includes the statement: "Designate, in coordination with APHIS-WS, the entire planning area as a "restricted control area" for animal control. Animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives. Emphasize non-lethal methods." The DEIS does not define "restricted control area," nor is this area reflected on a map in the DEIS. This statement indicates these restrictions would encompass "the entire planning area," which presumably means the entire RSFO. As written, the DEIS indicates "animal control" would be prohibited. This statement should be deleted from the plan. It is not scientifically supported and the broad and undefined statement of "animal control" could prohibit the control of wild horses, feral dogs, rabid skunks, and capture of ungulates for research purposes. | See Glossary for updated terms as necessary. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-33 | In addition to the attached documents, we request the BLM consider the following scientific papers and incorporate integrated animal damage management into a new preferred alternative, which would be a revised Alternative D: Raven and coyote removal on sage grouse: https://www.sciencedirect.com/science/article/abs/pii/S0006320716303147 Grouse survival with coyote control: https://wildlife.onlinelibrary.wiley.com/doi/abs/10.1002/jwmg.21296 Video monitoring of sage grouse nests (ravens and badger depredations): https://gaiavisions.org/deiSHerb/FOIAcomments/Public%20Comment%20809%20Attachment/Sage%20Grouse/Coates%20et%20al.%202008%20Predators%20of%20Greater%20Sage-Grouse%20nests%20id.pdf "Known predators of adult and yearling sage-grouse include coyotes (Canis latrans), golden eagles (Aquila chrysaetos), northern harriers (Circus hudsonius; Fletcher et al. 2003), prairie falcons (Falco mexicanus; Hartzler 1974, Conover and Roberts 2017), and large hawks in the genus Buteo (Schroeder et al. 1999, Fletcher et al. 2003, Hagen 2011, Conover and Roberts 2017)." https://digitalcommons.usu.edu/cgi/viewcontent.cgi?article=1764&context=hwi Wyoming study: "Coyotes were the greatest contributor to nest failure in this study. Other causes of nest failure included abandonment, female mortality, and nest depredation by raven, badger, red fox, striped skunk, gopher snake, and pronghorn." https://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=2953&=&context=icwdm_usdanwrc&=&seiredir=1&referer=https%253A%252F%252Fscholar.google.com%252Fscholar%253Fhl%253Den%2526as_sdt%253D0%25252C10%2526q%253Deagle%252Bdepredation%252Bof%252Bsage%252Bgrouse%2526btnG%253D#search=%22eagle%20depredation%20sage%20grouse%22 | An analysis for animal damage control methodologies is outside the scope of this RMP. See Planning Criteria in Section 1.4. See management actions for all four alternatives under 4200-4213 and 4400-4436. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9792-34 | The new preferred alternative should include provisions to allow wildlife damage management as indicated: "The BLM would continue to coordinate and to annually review with APHIS-WS their annual wildlife damage management plan for activities on public lands. Areas where proposed wildlife damage management activities (all or specific methods) are not compatible with BLM planning and management prescriptions or objectives for other resource activities and users, would be identified on a case-by- case basis, and APHIS-WS would be requested to amend or adjust proposed wildlife damage management activities accordingly." | See management actions for all four alternatives under 4200-4213 and 4400-4436. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #9846-4 | TP, page 2-65, states that BLM will "allow animal damage control on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns." However, Page 2-60, the same alternative states "Designate, in coordination with APHIS-WS, the entire planning area as a "restricted control area" for animal control" without specifically define "restricted control area." It also states BLM will "Emphasise non-lethal methods." | See management actions for all four alternatives under 4200-4213 and 4400-4436. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #10324-6 | Within the RMP there was mention of pesticides in regards to water and water quality, however there was no mention of how pesticides affect wildlife and how they will be applied responsibly in the area. I think it is important to include information on how pesticides will be used as some of them harm insect and therefore predator populations, so including a note about appropriately managing pesticide use for wildlife would be important. It is known that pesticide use has increased over the past 50 years, with this number only suggested to continue increasing, and this does not only pose a threat to wildlife, but also humans, and livestock.19 One of the main victims of being affected by pesticides are our bird populations, both raptors and non raptors. As mentioned before raptors are critical to the ecosystem in the area, and specifically rodenticide is a major threat to our scavenging raptors, including owls, hawks, eagles, and vultures. In a study with 149 dead birds, 42% of them had been killed by injecting animals that had been poisoned.20 | See Appendix A for Project Design Features and Best Management Practices. See section 4.23.4. Additionally, see management actions for all four alternatives under 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #10324-8 | Birds are not just the only animals being affected by pesticides, some of our state's most iconic wildlife is as well. A study conducted in Montana found that white-tailed deer who consumed pesticides were more likely to have developmental effects and a higher rate of disease later on in life.22 Unfortunately, that is just the start, the paper also found that birds and deer were susceptible to eye diseases, impaired immune systems, skin disorders, lymphatic disorders, and liver disease.22 As mentioned in the chronic wasting disease portion of my comment letter, Wyoming has a culture built upon our deer populations, and the effects of pesticides are now affecting these important species. | An in-depth analysis of how all wildlife respond to pesticides in outside the scope of this RMP. See Section 1.4 for the Planning Criteria. See section 4.23.4. Additionally, see management actions for all four alternatives under 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13064-3 | The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | See management actions for all four alternatives under 4200-4213 and 4400-4436. Impacts to livestock are discussed in section 4.16. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13210-5 | 5. Place no restrictions on current authorities to authorize new range improvements, maintain existing improvements, and conduct predator control activities to protect livestock | See management actions for all four alternatives under 6400-6417. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13210-63 | 4209 Alternative A No similar action Alterative A is preferred because Alternatives B and D would impact water management in the KSLA, and are worded too broadly regarding Wyoming's water rights, and lack geographic scoping. | See management actions for all four alternatives under 2400-2419. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13210-64 | 4211 Alternative C with amended/ additional text This management action supports agreements in principle # 4 and # 5. The task force supports Alternative C with the following edits: delete the first sentence and amend the language to read as follows (new text in red): Discuss and consider control techniques and methods at the annual management meeting between the BLM and APHIS-WS and include the Wyoming Department of Agriculture in these meetings. | See a range of alternatives for Invasive Species and Pest Management in MA 4200-4213. Impacts from each alternative can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13219-1 | Alternative B also limits "control of noxious weeds and other invasive species to mechanical and biological methods." The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13300-1 | Alternative B would negatively impact Wyoming's agriculture industry especially livestock grazing. Alternative B designates that, "in coordination with [Animal and Plant Health Inspection Service-Wildlife Services], the entire planning area as a 'restricted control area' for animal control." Alternative B further provides that "animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives" and there would be an emphasis on "non-lethal methods." This would significantly expand the area of restricted animal control to the entire Rock Springs planning area. Under Alternative A, restricted animal control is imposed solely in the Jack Morrow Hills area. Alternative B also limits "control of noxious weeds and other invasive species to mechanical and biological methods." The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13377-1 | Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing" This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing" There is no evidence in the draft Rock Springs RMPthat supports an increase of three growing seasons for resting treated areas from livestock grazing. If there was ample evidence to support this extended resting period, it could potentially be discussed with the permittees and practices found to make this applicable. | Impacts to livestock are discussed in section 4.16. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13542-30 | MA#4207. Alternative B. 2-59 What does the BLM foresee as the monitoring methods and protocols for MA#4207 so the facility can determine potential business impacts of this requirement? This stipulation should not apply to all activities, as some activities are not needed. Please analyze, disclose to the public, and select reasonable waivers and/or exceptions. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. See Appendix A.2 for BMPs. Monitoring methods are implementation level activities and out of scope for the EIS. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13542-31 | MA#4211. Alternative B. 2-60 Several industrial facilities in the RMP planning area struggle with roosting ravens. Common ravens (Corvus corax) are considered migratory birds and receive federal protection from the Migratory Bird Treaty Act, but few ravens in southwest Wyoming migrate. Currently the facilities work with the US Department of Agriculture (USDA) Animal and Plant Health Inspection Service (APHIS) to use lethal and non-lethal methods to combat the birds. Allowing the non-migratory birds to feed and roost creates health and safety concerns for employees and contractors due to the amount of debris and fecal matter left on platforms and access ways that workers must encounter on a daily basis. The USDA APHIS uses avicide, effigies, and other methods to deter the ravens. With Alternative B, the USDA APHIS will not be able to effectively manage the ravens in the area and protect local workers from unsanitary working conditions. Commentary: Some successful methods to mitigate conflicts caused by common ravens in an industrial environment (usu.edu). Please analyze and disclose to the public the BLM's reasons for not following the regulations and recommendations of the expert federal agency on this matter. | An analysis on ravens, including methods to control unsanitary working conditions, is outside the scope of this RMP. See Section 1.4 for the Planning Criteria. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13542-32 | MA#4212. Alternatives B, C, and D. 2-60 Prohibiting aerial applications of chemicals near wetlands, riparian areas, aquatic habitats, and Special Status plants does not follow an integrated pest management approach. This would prohibit Sweetwater County Weed and Pest from applying aerial applications for treatment of adult mosquitoes that protect the health and well-being of residents and workers in the area from West Nile virus and other encephalitis's that are transmitted by infected mosquitoes. They have proper authorization from the USDA to apply these pesticides and would be restricted from using them in areas where mosquitoes breed the most. Aerial applications of chemicals near these areas should be considered on a case-by-case basis for a more realistic approach. Please analyze and disclose to the public the BLM's reasons for not following the regulations and recommendations of the expert federal and state agencies on this matter. | A range of alternatives has been proposed for MA 4212, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources- | #13542-33 | MA#4213. Alternatives B, C, and D. 2-60 Prohibiting vehicle and hand application of chemicals near wetlands, riparian areas, aquatic habitats, and Special Status plants does not follow an integrated pest management approach. Invasive weeds, such as perennial pepperweed often grow in these areas and would not be able to be | A range of alternatives has been proposed for MA 4213, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |

|---|---|---|---|
| Invasive Species and Pest Management (4200-4213) | | properly managed. This also would prevent local trona mines from applying larvicide in puddles around the facility to protect the health and well-being of residents and workers in the area from West Nile virus and other encephalitis's that are transmitted by infected mosquitoes. Vehicle and hand application of these chemicals should be considered on a case-by-case basis for a more realistic approach. Please analyze and disclose to the public the BLM's reasons for not following the regulations and recommendations of the expert federal and state agencies on this matter. | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13542-50 | Section 3.6. Invasive Species and Pest Management. 3-6 Raven pest control is not discussed in this section. It is known that the USDA APHIS-WS assists industrial facilities and landfills to control raven populations in the RSFO management area. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | An analysis on ravens, including local methodologies used by local industries, is outside the scope of this RMP. See section 3.6. Additionally, see management actions for all four alternatives under 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13720-16 | A.1.6 Reclamation With the rapid expansion of cheatgrass across the West, including in the Rock Springs management area, there must be a more rapid and robust response to cheatgrass infestation than is represented in the Reclamation section. Cheatgrass treatment should be especially emphasized in this section, yet invasive vegetation is not even mentioned here as it should be. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. App A describes project design features and BMPs common to all projects. Species specific control would be based on site specific parameters which are beyond the scope of a land use planning document. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13720-17 | Although the BLM requires oil and gas operators to complete well pad, road, and surface disturbance reclamation, it appears that operators' efforts are failing to control this powerfully invasive and destructive species that is inundating Sublette and Sweetwater counties, and much of the West. We respectfully request that the BLM recognizes the severity of cheatgrass infestation that is spreading from the vectors in Sublette and Sweetwater natural gas fields to other public lands, and we ask that BLM and oil and gas operators address with more urgency and effectiveness this public land habitat threat. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. Impacts to vegetative communities from oil and gas activity is analyzed in Section 4.6. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13751-126 | MA #4212 Alternative B Prohibit aerial application of chemicals within 2,640 feet (½ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Not Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Future control of west nile virus could be impacted by this restriction. Alternative C Prohibit aerial application of chemicals within 100 feet of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. Often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Alternative D Prohibit aerial application of chemicals within 1,320 feet (¼ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Consider exceptions on a case-by-case basis to manage riparian weed species. Apply chemicals in accordance with label requirements. Industry Position: Not Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Future control of west nile virus could be impacted by this restriction. | Impacts from invasive species are discussed throughout Chapter 4. See also Appendix A for Best Management Practices. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13751-127 | MA #4213 ALT B Prohibit vehicle and hand application of chemicals within 1,320 feet (¼ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Not Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Application within 1,320 feet can be accomplished without harm to these resources when applied and handled appropriately. ALT C Prohibit vehicle and hand application of chemicals within 25 feet (by vehicle) or 10 feet (by hand) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. ALT D Prohibit vehicle and hand application of chemicals within 25 feet (by vehicle) or 10 feet (by hand) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Consider exceptions on a case-by- case | Impacts from invasive species are discussed throughout Chapter 4. See also Appendix A for Best Management Practices. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | basis to manage riparian weed species. Apply chemicals in accordance with label requirements. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-1 | MA#4207 Alternative B limits the control of noxious weeds and other invasive plant species to mechanical and biological methods. This BRI l, 12 and 05 goal would limit the ability to treat early, small infestations of noxious weeds and or pests allowing for the proliferation and exponential spread. The limitation of all essential tools to stop an infestation would be devastating to the early detection and control of an unwanted species. Best management practices according to the BLM guidelines are a suite of techniques that guide or may be applied to aid in desired outcomes. Eliminating chemical use does not seem to be a suitable alternative in a BMP. | Impacts from invasive species are discussed throughout Chapter 4. See also Appendix A for Best Management Practices. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-2 | MA#4212 All alternatives are beyond the EPA regulations and labeling requirements for several herbicides under FIFRA. Pesticide labels specially specify distance from riparian areas for both ground and aerial treatments. Pesticide applicators are in violation of the law if they do not follow label requirements. Not allowing the use of approved pesticides adjacent to or labeled for aquatic use would cripple the ability to protect habitat down stream and decrease the value of the riparian system for wildlife, livestock and recreation. Invasive species have a considerable impact on the habitat and ecosystem of the riparian areas. Salt cedar and cheatgrass are excellent examples of the effect it has on watershed health. | A range of alternatives has been proposed for MA 4212, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-3 | Livestock grazing, as referred to on page 4-64, Chapter 4.7, does not always cause invasive species. Grazing can be a used as a tool to manage weeds in an Integrated Pest Management system and help keep the ecosystem healthy. Invasive species are introduced to systems in a variety of ways including but not limited to: OHV's, recreation, energy, people, and native wildlife. Thus, inclusion of education of the public in 4207 is a critical component of Invasive Pest Management across all alternatives. All alternative discussed the importance of cleaning vehicles, boats, equipment and OHV's which is critical to limit the spread of invasive species. | See section 4.7.2. Additionally, management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-4 | Blanket statements in 4.7 page 4-60, "Chemical control could damage habitat and could sicken or kill wildlife if treated vegetation were consumed or wildlife were in contact with herbicides," should be clarified. Herbicides are a tool used to keep invasive species managed and can help improve ecosystem health. Pesticides used in accordance with EPA labels which when applied correctly will not sicken or kill wildlife. | See section 4.7.2. Additionally, management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-5 | Weeds have no boundaries and if not established in Wilderness areas they could be and Weed and Pest Districts need the ability to manage invasive species in Wilderness Study and Wilderness areas as decided by local BLM field managers. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13758-6 | There should not be a restriction on the annual acres treated within the RMP. Infestation of invasive species should be controlled as funding and methods allow in accordance with the RMP invasive species section and the Wyoming Weed and Pest Act of 1973 | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213 |
| 814 - Biological Resources-Invasive Species and Pest | #13769-4 | 3. We urge the BLM to consider the synergistic effects of increasing feral horse populations and decreasing forage production in the area due to climate change. We have observed considerable impacts of wild horse forage consumption. The impacts are significant because unlike migrating wildlife or cattle, feral horses graze the same areas year around. Also, horse digestive physiology forces horses to intake more forage and use it more inefficiently than native ungulates. Horses are clearly noteffectively managed and their populations increase each year. Horses also concentrate in certain areas like watering holes and the few riparian areas. We have observed a decrease in both the quantity and diversity of forage in these habitats. For example, the increase in non-palatable species like Prickly Pear Cactus and Rubber Rabbit Brush in areas of heavy grazing is concerning. While the | Management actions for all four alternatives with regards to management of Wild horses are outlined in Management Actions 4900-4910. Impacts due to wild horses are described in Section 4.9. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (4200-4213) | | former can be partially attributed to drought and a changing climate, we are concerned that uncontrolled feral horse populations will result in irreversible change in species richness and net primary productivity. We report numerous 'stud pile' areas that are devoid of any vegetation because of repeated occupancy and trampling by numerous stud horses. A decrease in plant cover results in increased soil erosion and a decrease in forage production. While not documented scientifically, we observe in these areas that the trampling is so severe that it appears as if sub-soil salts are leached to the surface and form alkaline deposits that further reduce plant production and lead to the spread of noxious weeks (e.g. Halogeten (Halogeton glomeratus)). | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13784-16 | MA#4207, Alt. B: "Limit control of noxious weeds and other invasive plant species to mechanical and biological methods." Comment: The limited approach to address annual grasses, including cheatgrass through chemical applications will dramatically prohibit livestock grazing permittees from achieving Wyoming Land Health Standards for upland or sensitive species. The recent efforts to approve Rejuvra for long-term control of cheatgrass on BLM Rock Springs Field Office lands will not apply to the Rock Springs Field Office under Alternative B. This lack of weed suppression will have a cumulative impact to private, state, and other federal lands. | A range of alternatives has been proposed for MA 4207, with the impacts for each alternative described in Chapter 4. Additionally, impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13784-18 | MA#4211, Alt. B: "Designate, in coordination with APHIS-WS, the entire planning area as a "restricted control area" for animal control. Animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives. Emphasize non-lethal methods." (p.2-50). Comment: The WDA Animal Damage Management Board (ADMB) was founded by state statute 11-6-301 through 11-6-313, to promote best management practices for predator related issues across the state to benefit livestock producers, wildlife populations, and human health and safety. The Wyoming predator program operates under the Wyoming Statutes WS 11-6-101 through 11-6-108, WS 11-6- 201 through 11-6-210 and Chapter 14 Aerial hunting regulations. In conjunction with USDA-Wildlife Services and the County Predator boards all trappers work with an integrated approach to animal damage. The methods include nonlethal control (herders, fencing, fladry and guard animal), ground work (ex. hunting trapping snaring), and aerial control. A reduction in animal damage control due to budget cuts has had a definite impact on the producer's losses as reflected in the 2021 Wyoming Ag Statistics report: https://www._nass^jsda.£ov/Statistics by State/Wyoming/Publications/Annual Statistical Bulletin/ The predation by coyotes has risen 57% from 9,400 head of sheep and lambs in 2015 to 24,800 head in 2021. The value of these losses of sheep and lambs has risen from $1,671,000 to $2,643,000. These losses have had a significant impact on the sheep producers in the State. Several Wyoming Sheep producers utilize the area in question to winter their sheep herds. Reducing or eliminating the ability to use lethal control under Alternative B, will further increase the economic impact to producers. The Wyoming predator program operating under the Wyoming Statutes WS 11-6-205 states county boards are also responsible for the protection of wildlife and the Wyoming Game and Fish Department has provided more money to the ADMB for removal of coyotes during fawning season, the county boards also work with USDA/Wildlife Services for raven removal. Wyoming operates under the ADMB Chapter 2 regulations for wolf management funding. Wolf work continues to be a major concern as the wolf population continues to spread across the state. The Rock Springs Field Office is a main corridor for wolves. If these lands are restricted to non-lethal methods, wolves will expand their territory and create issues for the control objectives set by the Wyoming Game and Fish Department: With most wolves in the predator zone not being collared, removing the wolves when depredation occurs can be very expensive. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. Impacts from predatory species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13784-19 | MA#4212, Alt. B: "Prohibit aerial application of chemicals within 2,640 feet (1/2 mile) of wetlands, riparian areas, aquatic habitats and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species." (p. 2-50) Comment: The science behind the need for application of specific herbicides is found on the label, which each alternative includes. To go beyond the label and increase buffers of each individual chemical is not only unnecessary, but based on opinion rather than science. | A range of alternatives has been proposed for MA 4212, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13784-20 | MA#4213, Alt. B: "Prohibit vehicles and hand application of chemicals within 1320 feet (1/4 mile) of wetlands..." (p.2-60) Comment: The science behind the need for application of specific herbicides is found on the label, which each alternative includes. To go beyond the label and increase buffers beyond the label of each individual chemical is not only unnecessary, but based on opinion rather than science. | A range of alternatives has been proposed for MA 4213, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources- | #13784-77 | "Alternative B would restrict certain management practices, which could increase costs. Chemical treatments for vegetation management are specifically allowed under Alternative A, but not included as an option under Alternative B."(p.4-259) Comment: Areas infested with cheatgrass, or other noxious and invasive weed species, | See section 4.23.5. Additionally, management actions for all four alternatives with regards to treatment of invasive species and pest management are found in Management Actions 4200-4213. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Invasive Species and Pest Management (4200-4213) | | can be one of the reasons a Wyoming Land Health Standards determination is not met, especially pertaining to Greater Sage-grouse. Reductions in livestock grazing could result in a 60% reduction by the third year due to not meeting the Standard for Special Status Species. However, BLM's Alternative B prohibits the use of chemical treatments to address these noxious and invasive species. Unless weeds are addressed, there is no possibility to work towards meeting the Standards. This is just one more example of cumulative effects and direct economic impacts to the livestock grazing industry where the analysis of Alternative B fails to address or identify the full impact of the Preferred Alternative. | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13787-52 | MA #4209 BR-14, BR-12, BR-13 No similar action Prohibit actions involving the transfer of water from watersheds with aquatic invasive species or fish diseases to other waters. Industry position: Not acceptable Reason: Industry recognizes the ecological harm presented by aquatic invasive species and fish diseases and supports preventing their spread. However, the geographic reach of this prohibition is not clear and needs to be clarified. This prohibition allows no transfer of water for beneficial use for industrial purposes wherein water could be stored or treated and not immediately returned to receiving waters. No similar action Prohibit, except to protect life and property, and to prevent the spread of aquatic invasive species, the movement of water from one fourth level (8-digit hydrological unit code) watershed to another fourth level another fourth level (8-digit hydrological unit code) watershed. If movement of water has occurred, WGFD will be contacted so that they can begin a monitoring program. Industry position: Not acceptable Reason: Industry notes that Map 3-1 Water Resources shows two hydrological unit boundaries within the KSLA. One boundary is in the southern and eastern KSLA and divides the Blacks Fork and the Upper Green-Flaming Gorge hydrological units. The second is in the northern KSLA and divides the Blacks Fork and Upper Green hydrological units. Any transfers of water would be for beneficial use for industrial purposes and may include solution mining. Water for solution mining would be process water and subject to WYPDES discharge requirements or long term storage. Water transfers will be allowed to supply water needs for trona production. Spent water will be subject to WYPDES discharge standard or will be stored long term. Management of transferred and spent water will support the objectives in the Wyoming Aquatic Invasive Species Management Plan as updated/revised (WGFD 2010). Language is taken from Alternative B of MA #4208. | Assumptions for Water Resources are found in Section 4.5.1. Additionally, see Section 1.4 Planning Criteria for a description of the planning area covered by this document. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13787-53 | MA #4212 BR-11 BR-28 BR-30 No similar action Prohibit aerial application of chemicals within 2,640 feet (½ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Not Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Future control of west nile virus could be impacted by this restriction. Prohibit aerial application of chemicals within 100 feet of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. Often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Prohibit aerial application of chemicals within 1,320 feet (¼ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Consider exceptions on a case-by-case basis to manage riparian weed species. Apply chemicals in accordance with label requirements. Industry Position: Not Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Mosquito control and other pests may also require aerial applications. Future control of west nile virus could be impacted by this restriction. Alternative C is acceptable | A range of alternatives has been proposed for MA 4212, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13787-54 | MA #4213 BR-11, BR-28, BR-30 No similar action Prohibit vehicle and hand application of chemicals within 1,320 feet (¼ mile) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Not acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Application within 1,320 feet can be accomplished without harm to these resources when applied and handled appropriately. Prohibit vehicle and hand application of chemicals within 25 feet (by vehicle) or 10 feet (by hand) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Apply chemicals in accordance with label requirements. Exceptions could be applied to manage riparian weed species. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Prohibit vehicle and hand application of chemicals within 25 feet (by vehicle) or 10 feet (by hand) of wetlands, riparian areas, aquatic habitats, and Special Status plants. Consider exceptions on a case-by- case basis to manage riparian weed species. Apply chemicals in accordance with label requirements. Industry Position: Acceptable Reason: The concern is understood regarding the use of chemicals near water bodies. However, often invasive species propagate from riparian, wetland and aquatic habitats. Alternatives C and D are acceptable | A range of alternatives has been proposed for MA 4213, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |
| 814 - Biological | #13865-11 | 4. Vegetative Communities and Invasive Species As detailed in Chapter 3-6 of the DEIS, invasive plants and noxious weeds can impact ecosystems. PacifiCorp agrees that invasive plants and noxious weeds can impact | See section 4.6 for all four alternatives. Additionally, management actions for all four alternatives with regards to treatment of invasive species and pest management are found in Management Actions 4200-4213. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources-Invasive Species and Pest Management (4200-4213) | | ecosystems and also recognizes the role some invasive plant species can play in wildfire risk and severity. As part of its vegetation management and reclamation activities, PacifiCorp implements BMPs as applicable to prevent the spread of noxious weeds. For example, PacifiCorp's vegetation management for power line ROWs utilizes IVM best practices wherever possible to conduct cover type conversion and to cultivate stable, low-growing plant communities comprised of plants that will not interfere with power lines. IVM can create natural, diverse, and sustaining ecosystems that encourage the growth of native plant species and can increase plant diversity. Several of the management actions under Alternative B identified in Table 2-1 would hinder our ability to implement IVM or other best practices, and to control or prevent the spread of noxious/invasive plants. | |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13865-14 | C. MA #4207 Alternative B of MA #4207 would restrict the control of noxious weeds and other invasive plant species to only mechanical or biological methods, thereby reducing the effectiveness of PacifiCorp's current IVM plan for controlling vegetation along power line ROWs. The use of only mechanical or biological treatments as prescribed by Alternative B may contribute to resource impacts resulting from repeated and prolonged treatments by vegetation management crews. Herbicide use can be more effective than mechanical or biological controls in reducing noxious weeds and non-desirable tree species, resulting in the need for less frequent treatments. Herbicide application requires a shorter duration of work and less noise compared to mechanical treatments and could thereby reduce disturbance impacts to wildlife in certain situations. PacifiCorp encourages the BLM to adopt Alternative C under MA #4207, which will allow it to continue its current IVM plan to target invasive plant species with the application of herbicides according to their label. In addition to impacting PacifiCorp's ability to perform vegetation management along its ROWs, Alternative B of MA #4207 would impact the ability of BCC to conduct weed control. The restrictions against chemical controls of noxious weeds in Alternative B conflict with permits, lease obligations, and regulations of different state and federal agencies, including the Permit to Mine issued by the DEQ Land Quality Division, and requirements of the Mine Safety and Health Administration (MSHA) to conduct weed/vegetation control in specific locations. Certain species, such as salt cedar, are only temporarily suppressed by mechanical removal and tend to resprout vigorously, and chemical treatments, which would be prohibited under Alternative B of MA #4207, are highly effective at inhibiting the spread of this species. The BLM currently requires Pesticide Use Plans at the BCC mine, and chemical weed control is an important part of this Integrated Pest Management. Under MA #4207, PacifiCorp recommends that BLM adopt Alternatives C or D. Similarly, Alternative B of MA #4207 dictates the use of BMPs (per Appendix A) for noxious/invasive weeds. However, in Appendix A (A.1.4), general BMPs for all alternatives include "Control the spread and effects of invasive non-native plant species (Evangelista et al. 2011), including treating weeds prior to surface disturbance." This general BMP is inconsistent with Alternative B, which prohibits the use of chemicals for controlling noxious/invasive weeds. Furthermore, under MA #4212 and #4213, limits on chemical use within certain distances of streams, rivers, and wetlands are included for Alternative B. It is unclear why these limits are included for Alternative B when chemical control is not allowed under that alternative. | A range of alternatives has been proposed for MA 4207, with the impacts for each alternative described in Chapter 4. Additionally, impacts from invasive species are discussed throughout Chapter 4. See also Appendix A for Best Management Practices. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13865-15 | D. MA #4213 Despite the contradiction in the forgoing paragraph, MA #4213, which prohibits vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants, would severely limit PacifiCorp's ability to perform IVM on its ROWs. IVM utilizing mechanical, biological, and chemical treatments is a critical component of vegetation maintenance that selectively targets invasive species of plants, as well as other non-desirable vegetation. Alternative B would place large restrictions on the areas in which herbicide treatments can be used as an effective tool. Alternatives A (preferred), C, or D of MA #4213 will allow PacifiCorp to continue its current IVM plan to target invasive plant species with the application of herbicides according to their label. Herbicides have been safely used by PacifiCorp near wetland and riparian areas with the BLM's approval for many years. Because PacifiCorp has numerous linear utility corridors, power lines inevitably cross streams and riparian areas, and existing ROW and special use permits issued by BLM may require weed control. Consequently, restrictions on the use of chemicals under Alternative B of MA #4207 and #4213, and the wide buffers under Alternative B of MA #4213 reduce PacifiCorp's options for effective treatments of noxious or invasive plant species. Likewise, the prohibition of chemical weed control within a ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status species, as identified in Alternative B of MA #4213, could jeopardize BCC's compliance with existing permit, lease, or regulatory requirements, as described previously. Alternatives A (preferred), C, or D of MA #4213 provide more flexibility for PacifiCorp to use the appropriate and most effective method of control (biological, mechanical, or chemical), while also including reasonable buffers around aquatic features. Reclamation of decommissioned mine areas, roads, or utility corridors includes relatively large areas that have had significant soil disturbance, and typically have numerous invasive plant species. For effective reclamation, it is best to have every tool to prevent those species from becoming established, particularly in the early stages of reclamation. Removing chemical treatment from the options would reduce the effectiveness of reclamation and have a lasting negative effect on the soils, vegetation, and subsequent hydrology of reclaimed sites. 5. Wildlife and Fisheries Habitat Several of the management actions in this section of the DEIS conflict with permits or guidance issued by the U.S. Fish and Wildlife Service (USFWS) under the Migratory Bird Treaty Act (MBTA; 1918) and the Bald and Golden Eagle Protection Act (BGEPA; 1940) and overstep BLM's authority to manage habitat versus species. In addition, the management actions in this section should be consistent with the BLM's Biological Resources Goal # BR-21 which discusses accordance with these acts. | A range of alternatives has been proposed for MA 4213, with the impacts for each of the alternatives presented in Chapter 4. Impacts from invasive species are discussed throughout Chapter 4. |

|---|---|---|---|
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13865-32 | 6. Wildland Fire Ecology and Management PacifiCorp is implementing wildfire system hardening activities throughout its service territory. These actions include, but are not limited to, increased line patrols, conversion from bare conductor to covered conductor on distribution lines, changing out equipment (e.g., non-expulsion arresters and fusing), conversion from overhead to underground distribution lines, pole replacements, fire wrapping of poles, installation of avian and animal guards, installation of pole-mounted weather monitoring stations, and increased scope and frequency of vegetation management with ROWs. In addition to addressing fire risks associated with its facilities and surrounding vegetation, utility ROWs provide a supplemental benefit acting as potential fuel breaks and/or providing access routes for emergency responders during fires. Historically the area within the RSFO has been unimpacted by significant wildfires; however, trends across the West point towards an increase in overall fire risk. Over the past 20 years, the number and scope of fires has increased. The DEIS states that there have only been three significant fires since 1984, yet all three of those occurred after 2000. PacifiCorp is focused on reducing this increasing risk via line and vegetation inspections, system automation (which more quickly de-energizes lines in the event of a fault), installing different pieces of equipment, and other system hardening efforts. These efforts require access to existing infrastructure, as well as system upgrades where appropriate. While the BLM should consider past fires to inform risk, it should also consider the trending increase and ensure PacifiCorp and other utilities can act as partners to reduce wildfire risks. The DEIS acknowledges the importance of human health and safety (see MA #12, which states, "Human health and safety needs supersede all actions in this plan"); however, numerous MAs throughout the draft plan would hinder actions to maintain human health and safety by hindering wildfire prevention. PacifiCorp is concerned that the draft RMP, and specifically preferred Alternative B, does not address the importance of utility system hardening work as critical for human health and safety, and the need for this work to be conducted without administrative delays. System hardening may be considered emergency or O&M work, depending on the circumstances. These activities require utility access to ensure the safe operation of the electric grid. PacifiCorp will require travel through BLM-managed lands to access utility infrastructure for wildfire maintenance activities, and the extensive restrictions included in Alternative B could prohibit of delay this access, potentially putting infrastructure and landscapes at risk. While wildfire is specifically addressed in the DEIS in Chapter 4.10, restrictions elsewhere in the draft plan specifically related to ACECs, seasonal wildlife closures, and ROW restrictions, can impact utility travel and access to ROWs, potentially delaying or prohibiting necessary and time sensitive system hardening work. Specifically, MA #3007 restricts the use of heavy equipment for fire and fuels management that could cause surface disturbance. Electric utilities perform wildfire prevention activities, including vegetation management and infrastructure system hardening, that may use trucks, machinery, or other heavy equipment. Consequently, PacifiCorp recommends that the BLM adopt Alterative C under MA #3007, as this management action protects sensitive areas while still allowing for wildfire prevention activities. Restrictions in the DEIS related to herbicide use may also impact PacifiCorp's ability to implement its wildfire prevention activities. As proposed in Alternative B, prohibiting vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants would severely limit PacifiCorp's ability to perform integrated vegetation management in its ROWs by placing large restrictions on the areas in which herbicide treatments can be used. Prohibiting herbicide use will result in increased fuel loads on the landscape, a concern for wildfire risk. PacifiCorp's integrated vegetation management plan is consistent with Alternative A's focus on management actions utilizing mechanical and chemical treatments of vegetation in fire ecology management, as described in Chapter 4.10.2 of the DEIS. In summary, PacifiCorp recommends that the BLM adopt the following management actions related to wildfire: ? Allow utility system hardening and related wildfire risk reduction work to proceed without additional restrictions, review, or prior authorization. This is consistent with BLM IM 2023-034 that states: o "To facilitate and expedite O&M activities necessary to reduce the risk of wildfire, the BLM affirms that ROW holders are authorized and responsible to carry out O&M work including inspections to prevent wildfire. The BLM will encourage ROW holders to provide the Authorized Officer prior oral or written notification of O&M activities. The BLM Field Office will request that ROW holders notify the appropriate BLM Field Office within 30 days of completing such work unless this timeframe conflicts with applicable law and regulation. If the ROW holder determines that O&M work is necessary to prevent and suppress wildfire, then Field Offices should not generally require the ROW holder to obtain any additional notice to proceed or other form of prior approval before conducting the O&M work." ? As detailed above, PacifiCorp recommends that the BLM adopt Alterative A in regard to Wildland Fire Ecology and Management (Chapter 4.10.2). ? As detailed above, PacifiCorp recommend that the BLM adopt Alterative C under MA #3007. | A range of alternatives for Wildland Fire Management has been proposed in MA 3000-3013. Impacts from each alternative can be found in Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13865-52 | Sterilization of vegetation is required around certain structures such as fuel tanks, propane tanks, and electrical substations and switches to prevent fires. If BCC is not allowed to used chemicals to help prevent the growth of vegetation in these areas unsafe conditions could arise. | See section 4.6 for all four alternatives. Additionally, management actions for all four alternatives with regards to treatment of invasive species and pest management are found in Management Actions 4200-4213. |

|---|---|---|---|
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13865-57 | o "Control the spread and effects of invasive non-native plant species (Evangelista et al. 2011), including treating weeds prior to surface disturbance and washing vehicles and equipment at designated wash stations when constructing in areas with weed infestations." PacifiCorp routinely washes its vehicles off-site in order to maintain a fleet of clean vehicles and prevent the spread of weed seeds. However, vehicles must travel from commercial wash stations to field sites. Some projects have required on-site vehicle wash stations, and our experience with these facilities has raised concerns. Such wash sites, which are not as efficient as commercial wash stations, can expend water resources that are otherwise limited. During cold temperatures, wash stations can result in icy conditions that pose a safety hazard to those working around them. Consequently, PacifiCorp requests that the BLM allow off-site wash stations to be an acceptable method to prevent the spread of weed seeds. | Refer to Appendix A (Project Design Features) for a list of Best Management Practices (BMPs) regarding designated wash stations. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13899-103 | The most effective treatment for cheatgrass is chemical control and we oppose Alternative B's moratorium on herbicides (MA-4207), supporting instead the management actions proposed in Alternative D as providing a full suite of tools to address these species. There is general agreement that prevention and containment of weed infestations is more cost-effective and productive than rehabilitation and field office staff, contractors, and permittees should be afforded access to the best tools available to keep invasive species like cheatgrass in check. 265 | Management actions for all four alternatives with regards to treatment of invasive species and pest management are found in Management Actions 4200-4213. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13951-21 | Page 2-59; Biological Resources #4209 "Prohibit actions involving the transfer of water from watersheds with aquatic invasive species or fish diseases to other waters." - Alterative A is preferred because Alternatives B and D would impact water management in the KSLA, and are worded too broadly regarding Wyoming's water rights. They also lack geographic scoping. | Assumptions for Water Resources are found in Section 4.5.1. A full range of alternatives has been proposed for MA 4209, with impacts for each alternative presented in Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #13951-22 | Page 2-60; Biological Resources #4211 "Designate, in coordination with APHIS-WS, the entire planning area as a "restricted control area" for animal control. Animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives. Emphasize non-lethal methods. Discuss control techniques and methods at the annual management meeting between the BLM and APHIS-WS." Our ranch is in the heart of a declared predator area and to emphasize non-lethal methods and restricting predator control efforts would be detrimental to our livelihood. Last year we purchased 50 head of bred cows and heifers and calved them out at our ranch headquarters; we lost more than 20 babies to the predators. The area supervisor for the Wyoming Game and Fish came and determined it was coyotes. I've included a couple of pictures that cant even begin to express the heartbreak! Lethal methods still need to be allowed. I'm in agreement with both the Wyoming Stock Growers Association and the Governor's Task Force in choosing Alternative C and let the annual management meeting between the BLM, APHIS-WS, and the Wyoming Department of Agriculture discuss and consider control techniques and methods. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. Impacts from predatory species are discussed throughout Chapter 4. |
| 814 - Biological Resources-Invasive Species and Pest Management (4200-4213) | #14019-2 | WACD recognizes the importance of weed and pest mitigation to support meaningful conservation work. The constraints that Alternative B places on control measures severely undermines the capability to control undesirable species. This alternative places unreasonable restrictions based on arbitrary metrics, such as a half mile buffers. This creates safe harbors for weeds, undermining successful reduction in the seed bank and in many cases may bar eradication. Among other effects, reductions in the efficacy of treatments due to restrictions on methods, plant species and locations of treatments burdensomely increases treatment costs. | Management actions for all four alternatives with regards to treatment of invasive species and pest management are outlined in Management Actions 4200-4213. Impacts from predatory species are discussed throughout Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #539-10 | In LSGA's situation, the BLM has made the determination that our Little Sandy allotment is not meeting the BLM's riparian habitat standards, citing livestock use as the central cause.32 The punishment for not meeting the BLM's rangeland health protocols are a 20% reduction in AUMs for up to 3 years.33 This is an extremely frustrating item to see in the RMP because LSGA is on the phone and meeting with our range conservationist either weekly or bi-weekly and this has never come up in our conversations in terms of what a riparian habitat is and its regulatory consequences. There are no maps available showing where the riparian areas are. The lack of transparency as to what ranchers are being charged with is shocking. We can only assume that the BLM considers the Little Sandy as a riparian area and much of that is private. | A range of alternatives has been analyzed for authorized livestock use and Land Health Standards in Chapter 2.2.6 management action 6404. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland | #539-11 | Further, in conversations with our range conservationists, we have come to believe that the elk and deer degrade that water stream far harder than livestock, especially in the winter months. We request that the BLM show us proof of this declaration. If it cannot do so, we request that this be removed from the plan. Further, even if for some reason this were true, the punishment for failing to meet rangeland health standards under this provision is arbitrary and capricious because this punishment does not match the congressional intent of PRIA and the TGA. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for authorized livestock use and Land Health Standards in Chapter 2.2.6 management action 6404. Analysis of impacts for actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| Resources (4300-4303) | | | |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #9721-7 | The statement requiring photo point monitoring for all channel crossings and all surface disturbances greater than½ acre limits the use of best available technology or most appropriate monitoring methods to track and monitor rangelands. Monitoring programs are to be developed to accurately capture and record trends in relation to desired goals and objectives. Photo point monitoring is a good and appropriate method for monitoring some attributes of rangelands but, should not be considered the only method due to development of future monitoring protocols or management objectives. You should restate this requirement to state the BLM encourages the utilization of photo point monitoring, but other methods may be considered. | A range of alternatives has been analyzed for photo point monitoring in Chapter 2.2.6 management action 1109. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13064-5 | Alternative B would also prohibit livestock grazing in wetland and riparian areas that are not meeting proper functioning condition.29 Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing."30 This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing."31 There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. This could significantly impact the allotment areas ranchers may graze their livestock within the Rock Springs planning area. | A range of alternatives has been analyzed for livestock grazing and riparian areas in Chapter 2.2.6 management action 6414. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13219-2 | Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing." This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing." There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. This could significantly impact the allotment areas ranchers may graze their livestock within the Rock Springs planning area. | A range of alternatives has been analyzed for resting treated areas from livestock grazing in Chapter 2.2.6 management action 4111. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13287-25 | While we appreciate the RMP direction in Alternative B that riparian areas should be managed to achieve Properly Functioning Condition, should achieve this within 5 years, and be managed for late-successional vegetation (DEIS at 2-61), these are aspirational statements and may not provide the concrete, measurable direction that is required to meet the objectives expressed. The Green River RMP required management for PFC, and achievement of this standard within 10 years across 75% of riparian areas, but 25 years later this not only has never happened, but riparian areas are in uniformly bad shape. If BLM range managers were unable to achieve a 75% benchmark in 10 years (see Alternative A, id.), it seems unlikely that the same range managers would be able to achieve 100% compliance within 5 years, absent some more concrete, measurable benchmarking standards incorporated in the plan | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13287-26 | The direction for riparian areas under Alternative D is a violation of BLM regulations, because it requires lands to meet or move toward meeting Land Health standards within 10 years; if lands are not currently meeting or moving toward these standards, then corrective action must be taken prior to "the start of the next grazing year" (not within 10 years), under federal regulations. 43 CFR § 4180. | See Chapter 1.4 Planning Criteria for compliance with applicable laws and regulations. A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13300-2 | Alternative B would also prohibit livestock grazing in wetland and riparian areas that are not meeting proper functioning condition. Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing." This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing." There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300, and for resting of treated areas in management action 4111. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13549-1 | One such concern is 6414 page 2-123 that states "prohibit livestock grazing in riparian areas that are not meeting PFC" According to the Riparian Area Management book issued by the NRCS, U.S. Department of Interior, and U.S. Department of Agriculture in the Introduction on page 1 states: 1) "PFC is also an appropriate starting point for determining and prioritizing the type and location of quantitative inventory or monitoring necessary. 2) Also in Appendix E on page 105 states "PFC isn't the sole methodology for assessing the riparian-wetland area". 3) "PFC isn't desired condition. It is a pre-requisite to achieving desired condition. Therefore: to obtain a complete picture of the riparian-wetland area health, including the biological side, one must have information on both physical status, provided through the PFC assessment and biological habitat quality. Neither will provide a complete picture when analyzed in isolation. In most cases, proper functioning condition will be a pre-requisite to achieve and maintaining habitat quality". "PFC isn't designed to be a long-term monitoring tool, but it maybe an appropriate part of a well-designed monitoring program". | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13549-2 | According to this book PFC has an important role but not a solitary role in range monitoring nor determination. In the RMP on 4300 page 2-61 according to proposed alternative B while everyone wants the range to meet PFC and have a desired condition having PFC be the only monitoring data and placing a time-line of 5 or 10 years is not site-specific. Each area has its own issues and needs to be monitored not only with PFC but other site-specific methods of collecting data. The reduction of AUMs based solely on PFC 4300 page 2-61 is not following the monitoring book explained earlier. | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13549-5 | The second issue with this same section is putting a percentage rate on reduction of AUMs. Again some sites need more time to rest and others need less. To set a specific reduction and time reduction does not work for all areas. This needs to be determined by a management team on a site-by-site basis. | A range of alternatives for livestock use has been analyzed in Chapter 2.2.6 management action 6404. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13624-99 | Ch. 3#3-5#3.5.2#Riparian. Addition of WOTUS and Non-WOTUS permitting requirements.#The RMP is lacking necessary permitting information for WOTUS and Non-WOTUS wetlands. This information should include: 1) The U.S. Army Corps of Engineers determines whether any of the listed wetlands are waters of the United States (WOTUS). 2) For wetlands that are determined to be WOTUS, any discharges of dredged or fill material to those wetlands would need to be covered under a 401 water quality certification issued by the WDEQ and a 404 dredge and fill permit from the U.S. Army Corps of Engineers. Information on the 401 certification process can be found at https://deq.wyoming.gov/water- quality/watershed-protection/cwa-section- 401-turbidity-wetland/401-water-quality-certification/. 3) For wetlands that are determined to be non- WOTUS, discharges of dredged or fill material to those wetlands would fall under state regulation. Discharges of dredged or fill material that results in the permanent loss of less than or equal to one cumulative acre of non-WOTUS wetlands, are permitted by rule in accordance with Wyoming Water Quality Rules, Chapter 2, Section 7(f). Discharges of dredged or fill material that results in the permanent loss of more than one cumulative acre of non- WOTUS wetlands require mitigation pursuant[...]to Wyoming Water Quality Rules, Chapter 2, Section 7(a). Chapter 4. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.1 Cooperating Agencies for discussion of Cooperating Agencies, and Chapter 5.1.2 Coordination and Consistency for discussion of other agency involvement. Determination of WOTUS and Non-WOTUS waters is beyond the scope of this document. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13691-5 | DCFB believes that if an entity such as the RSFO or any other publicly owned entity is in active pursuit of any type of acreage, then that process is counter to growth in the surrounding areas. If acreage were to be made available and no other interested private individuals or entities are available for such a purpose, then a public entity may make offer(s) for such purposes. | See Appendix K - Land Tenure Adjustment Criteria for discussion of criteria for retention, acquisition, or disposal of BLM managed lands. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13748-7 | MA# 4300-4303, Alternative D: "Manage all riparian/wetland areas and streams to meet or make significant progress toward meeting Wyoming's Land Health Standards. Give priority to those areas that are functioning at risk with a downward trend or in non-functioning condition. All riparian areas not meeting or making significant progress toward meeting the Wyoming Land Health Standards should, within 10 years, have activity or other management plans in various states of implementation that would allow riparian objectives to achieve, or make significant progress toward achieving, the Wyoming Land Health Standards." Rationale: Alternative D sets forth reasonable actions for riparian areas to meet Land Health Standards. Alternative B requires the BLM to have, within five years, management plans for all riparian areas in various states of implementation that would allow riparian areas to achieve these objectives. This is not a reasonable management action for the BLM. | A range of alternatives has been analyzed for riparian and wetland resources in Chapter 2.2.6 management action 4300-4303. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13784-21 | MA#4300, Alt B: "Achieve PFC and/or maintained as a minimum standard on all riparian and wetland areas. All riparian areas should, within five years, have activity or other management plans in various states of implementation..." (p.2-61) Comment: Achieving Proper Functioning Condition (PFC) is not a standard under the Wyoming Land Health Standards. The DEIS has interchanged or intermixed PFC and Standards. PFC is a methodology used to assess riparian areas, but is not based entirely on quantitative data. PFC should inform the Standard for riparian areas as part of a Standards Determination. | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13784-39 | MA#7414, Alt B: "Consider livestock water developments only if wildlife habitat and resource conditions would be improved or maintained." Comment: Narrowing all range improvement projects to only focus on wildlife habitat does not meet the intent of numerous other reasons for the projects. For example, if the concern is to address a stream segment in Functioning At Risk category under PFC, Alternative B will prohibit the water development and directly conflict with MA#4300. | A range of alternatives has been analyzed for livestock water developments in Chapter 2.2.6 management action 7414, and for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13785-17 | Riparian 289 3.5.2 "economic values which stem from use in livestock production, forest management, and mineral extraction." "...economic values which stem from use in agricultural commodity production, forest management, and mineral extraction." | Description of economic values is adequate for the description of affected environment. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13785-18 | Riparian 289 3.5.2 "...located on the lands adjacent to surface waters" "...located on the lands adjacent to and supplied water by the surface waters of the state of Wyoming..." | Description is adequate for the description of affected environment. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13821-7 | Our primary concern with MA 6414 lies in the prohibition of livestock grazing within riparian areas if they do not meet Proper Functioning Condition (PFC) criteria. It is crucial to emphasize that riparian areas are dynamic ecosystems that can recover and thrive under proper grazing management practices. The outright prohibition in the preferred alternative (B) may not take into account the positive contributions of well-managed livestock grazing to riparian health. Our concern is that; in allotments that contain long watersheds or large riparian areas significant costly structural range improvements would need to be constructed to limit livestock access. These large structural improvements have the potential to fragment large and small game habitat, in addition to providing a nesting perch for raptors in core sage grouse areas. Initially, these improvements might not be warranted if other management changes (i.e. changes in timing of use, duration of use, grazing management system ) are deemed appropriate to facilitate recovery of PFC. In addition, Swanson et. al. (2015) suggests that proper grazing management has the benefit of facilitating recovery within the riparian zone.3 In contrast, we would like to highlight that the Management Action (MA) in Alternative D of the Draft RMP, does not include a similar action to prohibit grazing in riparian areas solely based on PFC criteria. Alternative D provides a more balanced approach that acknowledges the dynamic nature of riparian ecosystems and the potential benefits of well-managed grazing to their health. | A range of alternatives has been analyzed for livestock grazing and riparian areas in Chapter 2.2.6 management action 6414. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13865-15 | D. MA #4213 Despite the contradiction in the forgoing paragraph, MA #4213, which prohibits vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants, would severely limit PacifiCorp's ability to perform IVM on its ROWs. IVM utilizing mechanical, biological, and chemical treatments is a critical component of vegetation maintenance that selectively targets invasive species of plants, as well as other non-desirable vegetation. Alternative B would place large restrictions on the areas in which herbicide treatments can be used as an effective tool. Alternatives A (preferred), C, or D of MA #4213 will allow PacifiCorp to continue its current IVM plan to target invasive plant species with the application of herbicides according to their label. Herbicides have been safely used by PacifiCorp near wetland and riparian areas with the BLM's approval for many years. Because PacifiCorp has numerous linear utility corridors, power lines inevitably cross streams and riparian areas, and existing ROW and special use permits issued by BLM may require weed control. Consequently, restrictions on the use of chemicals under Alternative B of MA #4207 and #4213, and the wide buffers under Alternative B of MA #4213 reduce PacifiCorp's options for effective treatments of noxious or invasive plant species. Likewise, the prohibition of chemical weed control within a ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status species, as identified in Alternative B of MA #4213, could jeopardize BCC's compliance with existing permit, lease, or regulatory requirements, as described previously. Alternatives A (preferred), C, or D of MA #4213 provide more flexibility for PacifiCorp to use the appropriate and most effective method of control (biological, mechanical, or chemical), while also including reasonable buffers around aquatic features. Reclamation of decommissioned mine areas, roads, or utility corridors includes relatively large areas that have had significant soil disturbance, and typically have numerous invasive plant species. For effective reclamation, it is best to have every tool to prevent those species from becoming established, particularly in the early stages of reclamation. Removing chemical treatment from the options would reduce the effectiveness of reclamation and have a lasting negative effect on the soils, vegetation, and subsequent hydrology of reclaimed sites. 5. Wildlife and Fisheries Habitat Several of the management actions in this section of the DEIS conflict with permits or guidance issued by the U.S. Fish and Wildlife Service (USFWS) under the Migratory Bird Treaty Act (MBTA; 1918) and the Bald and Golden Eagle Protection Act (BGEPA; 1940) and overstep BLM's authority to manage habitat versus species. In addition, the management actions in this section should be consistent with the BLM's Biological Resources Goal # BR-21 which discusses accordance with these acts. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for application of chemicals in Chapter 2.2.6 management actions 4212 and 4213 and for BMPs and limits on control in action 4207. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland | #13904-3 | MA 4300 Alt B indicates that PFC is the single only measurement to meet Wyoming Land Health Standards #2. This is incorrect. Wording in Alt D is acceptable. Manage all riparian/wetland areas and streams to meet or make significant progress toward meeting the Wyoming s Land Health Standards. Give priority to those areas that are functioning at risk with a downward trend or in non functioning condition. All riparian areas not meeting or making significant progress toward meeting the Wyoming Land Health Standards should, within 10 years, have activity or | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. | Resources (4300-4303) | | other management plans in various states of implementation that would allow riparian objective to achieve, or make significant progress toward achieving, the Wyoming Land Health Standards. | |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #13916-4 | MA 4300 Alt B indicates that PFC is the single only measurement to meet Wyoming Land Health Standards #2. This is incorrect. Wording in Alt D is acceptable. Manage all riparian/wetland areas and streams to meet or make significant progress toward meeting the Wyoming s Land Health Standards. Give priority to those areas that are functioning at risk with a downward trend or in nonfunctioning condition. All riparian areas not meeting or making significant progress toward meeting the Wyoming Land Health Standards should, within 10 years, have activity or other management plans in various states of implementation that would allow riparian objective to achieve, or make significant progress toward achieving, the Wyoming Land Health Standards. | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 815 - Biological Resources–Riparian and Wetland Resources (4300-4303) | #14022-10 | MA#4300, PFC is a qualitative assessment and, in many cases, due to natural or manmade event the reach fluctuate in and out of "PFC" status. Due to the variability along stream reaches, SCCD does not recommend having PFC the minimum standard. SCCD suggests following the Wyoming Land Health Standards and working towards maintaining or improving riparian function utilizing trend monitoring methods as the best approach, as suggested in Alternative D. | A range of alternatives has been analyzed for riparian areas and PFC in Chapter 2.2.6 management action 4300. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #142-2 | Alternative B also closes off many existing roads and trails used for recreational activities that southwest Wyoming has grown to know and love. Several seasonal restrictions called out in MA #4427 are outdated and many of the areas have not been ground-truthed to ensure that these are actual habitats that provide crucial habitats to the various species rather than things like existing roads, pipelines, mines, etc. | Alternative B does not close designated roads and trails to recreational activities. A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436. Analysis of seasonal restrictions for each alternative is in Chapter 4.7. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #301-1 | Wildlife populations fluctuate, sometimes widely, in response to natural factors such as cycles in the abundance of prey bases or extremes in seasonal weather (e.g., severe winters). | A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436. Management of wildlife populations is the responsibility of the State, and is outside of the scope of this document. See Chapter 1.4 Planning Criteria. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #8686-2 | All the west, federal governments, state governments and private landowners have dedicated much of the past many years to preserving and stabilizing the sage grouse habitat, its' range and population. Your Plan B restricting or eliminating predator control will reverse any gains made for the sage grouse. Your Plan B also will help destroy the antelope and deer populations. They struggle enough with Wyoming's winters and if you eliminate predator control on lands under plan B, you are placing another nail in their coffin. | Analysis of all four alternatives for fish and wildlife species is found in section 4.7. Management for fish and wildlife are addressed for all alternatives in management actions 4400 - 4436. Management for predators is covered for all alternatives in the Invasive species and Pest Management Section, specifically management action 4211. Sage-grouse management is being analyzed separately and is outside the scope of this document, and is addressed in Section 2.2.5 Overview of Alternatives. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #9448-2 | All the west, federal governments, state governments and private landowners have dedicated much of the past many years to preserving and stabilizing the sage grouse habitat, its' range and population. Your Plan B restricting or eliminating predator control will reverse any gains made for the sage grouse. Your Plan B also will help destroy the antelope and deer populations. They struggle enough with Wyoming's winters and if you eliminate predator control on lands under plan B, you are placing another nail in their coffin. | Analysis of all four alternatives for fish and wildlife species is found in section 4.7. Sage-grouse management is being analyzed separately and is outside the scope of this document, and is addressed in Section 2.2.5 Overview of Alternatives. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #9794-4 | Bighorn Sheep Page 3-8 states, "There currently are no bighorn sheep herd management areas in the planning area due to conflicts with domestic sheep grazing allotments (primarily disease transmission from domestic to wild sheep)." This statement is factually incorrect and prejudicial. Change it to: "The RSFO is outside of Wyoming Bighorn Sheep Management Areas as designated by Wyoming Statute § 11-19-604." | See updated text in Section 3.7.1. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #9794-5 | Appendix H Appendix H, page 6, refers to "mother" grizzly bears repeatedly. Replace with "grizzly sow." This section should also mention that grizzly bears are not known to inhabit the RSFO. | See updated text in Appendix H. page 6. Grizzly bear range extends into the RSFO planning area. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-1 | In the draft EIS, Chronic Wasting Disease (CWD) is not mentioned, despite being one of the biggest threats to many of the large charismatic wildlife that inhabit the area. CWD is a prion disease, an untreatable, easy to spread, brain disease, that is found in ungulates such as white-tailed deer, mule deer, elk, and moose.1 As mentioned this disease is untreatable and affects many of the large game species that are iconic symbols of the West, and with the disease spreading, especially in states like Wyoming, it is important to consider how the impounding disease spread and management for CWD will be handled in the Rock Springs RMP. In 2017, DeVivo | Analysis related to disease transmission is outside the scope of this document, and outside of BLM jurisdiction. A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436. Analysis of seasonal restrictions for each alternative is in Chapter 4.7. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | and Kauffman et. Al explained that CWD is present in over 20% of Wyoming's mule deer population, and this is causing a significant population decline regionally throughout the state.2 This study also found that in addition to mortality from the prion disease itself, animals infected with the disease are more likely to be predated upon by mountain lions.2 Though CWD can only be transmitted to other ungulates that are susceptible to the disease currently, it should be noted that there has been research conducted that has found that the disease can survive and pass through the digestive system of carnivores, like mountain lions and coyotes, which could not only put these animals at risk at some point, but also can spread the disease even further than local ungulate herds | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-2 | With the threat of CWD becoming more present in the area, there is a threat to the wildlife in the area, and this should be addressed not only for the wildlife in the area but also for the community. Hunting is a large part of the economy, and as noted in the draft EIS, the total high value for hunting in the area was $7,306,388, which is notably higher than any other recreation consumer surplus value in 2016.5 When looking up things about Sweetwater County and Rock Springs, I found that many of the guides for the area brought up hunting as an activity that is popular in the area, and this is important as it is an activity that helps bring the community together, brings new people to the area, and brings in revenue both for the state but also for wildlife conservation through laws like the Pittman-Robertson Act. As CWD is a fatal disease that is easily transmissible, this puts entire herds of big game species at risk of dying out, which would severely impact the culture of the area and the economy. | Analysis related to disease transition is outside the scope of this document, and outside of BLM jurisdiction. A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436. Analysis of seasonal restrictions for each alternative is in Chapter 4.7. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-4 | A recent study estimated that there are about ten bat mortalities per wind turbine per year, which may sound like a very small number, but when you consider the amount of wind turbines in Wyoming, that is not an insignificant number.12 It was a fantastic start to discuss what precautions would be made to prevent raptor and wind turbine collisions, but it is important to protect our less charismatic species like bats in this area as well. Bats are incredibly unique species and are often misunderstood by the public, which can be a reason why people have not been concerned about the bats in the area thus far. However, bats are critical for the habitats they live in and provide incredible benefits to humans, and with bats facing risks in addition to wind turbines like White Nose Syndrome, the urgency to protect these species is increasing. One of the incredible services that bats provide to the humans in the area is the consumption of insects, including pest insects | A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436, and for special status wildlife species in actions 4600-4624. Analysis of seasonal restrictions for each alternative is in Chapter 4.7. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-5 | Bats can use man-made structures to hibernate like bridges, so I think it is important to consider how building new infrastructure, like bridges, could impact the transmission of WNS. Because there are a lot of passionate people about bats in Wyoming and a lot of research being done, there is A Strategic Plan for White-nose Syndrome in Wyoming, which would be a great resource when considering adding a plan for WNS into the RMP.18 White-nose Syndrome is an imposing threat to the entirety of the migratory bat species that live in or migrate through the Rock Springs area, so it is important that the area is prepared and takes preventative measures where they can. I suggest that any new infrastructure projects that could have the potential to have bats roost in them should be evaluated in relation to WNS, and discussion with scientists should be had to determine if there are risks associated/precautions that can be taken in order to minimize the risk of a WNS outbreak in the area. | Analysis related to disease transition is outside the scope of this document, and outside of BLM jurisdiction. A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436, and for special status species in 4600-4624. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-6 | Within the RMP there was mention of pesticides in regards to water and water quality, however there was no mention of how pesticides affect wildlife and how they will be applied responsibly in the area. I think it is important to include information on how pesticides will be used as some of them harm insect and therefore predator populations, so including a note about appropriately managing pesticide use for wildlife would be important. It is known that pesticide use has increased over the past 50 years, with this number only suggested to continue increasing, and this does not only pose a threat to wildlife, but also humans, and livestock.19 One of the main victims of being affected by pesticides are our bird populations, both raptors and non raptors. As mentioned before raptors are critical to the ecosystem in the area, and specifically rodenticide is a major threat to our scavenging raptors, including owls, hawks, eagles, and vultures. In a study with 149 dead birds, 42% of them had been killed by injecting animals that had been poisoned.20 | Pesticide use is analyzed for a range of alternatives in management actions 4200-4213, Invasive Species and Pest Management. Best Management Practices for Pesticide use are identified in Appendix A. Analysis for each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #10324-8 | Birds are not just the only animals being affected by pesticides, some of our state's most iconic wildlife is as well. A study conducted in Montana found that white-tailed deer who consumed pesticides were more likely to have developmental effects and a higher rate of disease later on in life.22 Unfortunately, that is just the start, the paper also found that birds and deer were susceptible to eye diseases, impaired immune systems, skin disorders, lymphatic disorders, and liver disease.22 As mentioned in the chronic wasting disease portion of my comment letter, Wyoming has a culture built upon our deer populations, and the effects of pesticides are now affecting these important species. | Pesticide use is analyzed for a range of alternatives in management actions 4200-4213, Invasive Species and Pest Management. Best Management Practices for Pesticide use are identified in Appendix A. Analysis for each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13210-2 | 2. The task force recognizes the economic, cultural, and biological value of healthy and abundant wildlife populations. Accordingly, the Rock Springs Field Office should implement management actions that support thriving and diverse wildlife populations and, where necessary, support the restoration of native habitat | A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436, and for special status wildlife species in actions 4600-4624. analysis of impacts for each of these alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13287-1 | For example, wilderness inventories have identified lands with wilderness characteristics that do not qualify for protection solely because they are consolidated into 640-acre units, and which would fully qualify for wilderness (and Wilderness Study Area) protections if they were in consolidated federal ownership. A National Conservation Area proposed for the Red Desert (Attachment 1) includes checkerboard lands, whose management would be complicated by intermixed private lands and minerals. Sage grouse Priority Habitat Management Areas exist in checkerboard lands, and it is difficult to apply the full level of prescribed protections to these checkerboard portions due to fragmented land ownership patterns. Wildlife migration corridors cross the checkerboard, and their conservation is impeded by the presence of private inholdings. Alternative B considers providing public access to public lands across private property at the landowner's request (DEIS at 2-109); if access is to be granted only on a request basis, it should be at the public's request rather than the landowner's. | Management for Lands with Wilderness Characteristics has been analyzed in all alternatives in management actions 1500-1517. Analysis for each of the alternatives is found in Section 4.14. Management for wildlife migration corridors has been analyzed for all alternatives in Section 2.2.6 actions 4421, 4424, and 7555 - 7562. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13287-13 | A new analysis of potential wildlife overpass locations shows hotspots in the Point of Rocks area corresponding to the location where this migration would cross the Interstate; another hotspot is on State Highway 28 near South Pass. The BLM should include direction in its plan to cooperate with WYDOT to install wildlife overpasses of the type currently in place at the Trappers Point bottleneck on the Path of the Pronghorn in these areas, and protect the landings on either side such that the use of these overpasses is not impeded by development. The Tolar viewshed protections included elsewhere in Alternative B (DEIS at 2-92) should be helpful in providing this protection. | Analysis of specific projects is outside of the scope of this document. See Section 1.4 Planning Criteria for a list of the criteria identified. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13287-27 | For animal damage management activities, while we recognize the expansion of "restricted control area" status from the Jack Morrow Hills CAP area to the entire Field Office (DEIS at 2-60), an additional restriction that should be added is to specify that animal damage management is limited to non-native species. The provision that such activities would be allowed under the Preferred Alternative "only if it would benefit Special Status Species or is needed for valid safety concerns" (DEIS at 2-65) approaches this level of specificity but may yet be prone to abuse through discretionary stretching of justification rationales. We have seen this too often to be complacent that it would not occur despite plan direction. Thus, the prohibition on "control" of native species must be watertight and explicit, with the possible exception for cases where human life is immediately at risk. This latter caveat is unlikely ever to be triggered in the Rock Springs Field Office, which lacks animals that pose a significant threat to human life. | A range of alternatives has been analyzed for invasive species and pest management specific to control areas for animal control, in management action 4211. Predator Management required design features are described in Appendix F. Analysis of impacts of each of these alternatives is found in chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13287-28 | We appreciate that the Preferred Alternative provides that livestock grazing will be excluded from large mammal parturition habitats, usually May 1 through June 30. DEIS at 2-68. This exclusion should be extended to begin on March 15th such that the new growth of grass on these habitats will not be substantially depleted prior to the arrival of fawning/calving wildlife. | A range of alternatives has been analyzed for management of big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts of each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13287-29 | Exclosures should be implemented (See DEIS at 2-65), not only in riparian areas but also in uplands, and a primary purpose of these exclosures should be to (1) provide a baseline for comparison that allows forage utilization by livestock to be accurately assessed, and (2) to provide reference conditions for vegetation composition that would occur in the absence of livestock and/or with rest from livestock. These exclosures need not be constructed to exclude native herbivores, and should use wildlife-friendly fencing methods. It is common sense that all livestock exclosures be closed to livestock grazing (DEIS at 2-120, Alt. B); it is nonsensical to establish an exclosure and then not exclude livestock. | A range of alternatives has been analyzed for management of special management and riparian management exclosures in Chapter 2.2.6 management actions 4411 and 6407. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13310-1 | I would like to urge protection for the Big Sandy Foothills as an intact ecosystem to continue to support the highest concentrations of sage grouse in the world, a significant portion of the longest mule deer migration corridor in the world and critical big game winter range and calving grounds. | Analysis for management of Greater Sage-grouse is outside the scope of this document, see Chapter 1.3 for explanation. Analysis for big game and other wildlife for all alternatives can be found in Chapter 2.2.6, actions 4400-4436. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13330-4 | * MA # 4406: Sweetwater County Farm Bureau prefers Alternative C. The other alternatives acquisition of additional lands along perennial waters and wetlands may specifically target existing home ranches and lands currently in agriculture production with an end result of reducing local ag and likely putting family ranches out of business with reduced access and loss of historical agriculture and multiple use lands. | A range of alternatives has been analyzed for aquatic, wetland and riparian disposal and acquisition in Chapter 2.2.6 management action 4406. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13330-5 | Sweetwater County Farm Bureau prefers Alternative C. Allowing "animal damage control on BLM lands only if it would benefit Special Status Species" is an irresponsible plan that directly discriminates against agriculture and multiple use. Depredation makes a significant impact on both wildlife population and livestock production and even one season of focusing only on "special status species" could decimate local wildlife and wipe out a producer's annual crop or entire herd. | A range of alternatives has been analyzed for animal damage control activities in Chapter 2.2.6 management action 4412. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13330-7 | * MA # 4420: Sweetwater County Farm Bureau does not prefer any of the Alternatives, but Alternative D seems most favorable to keeping historical AUM grazing rights. Sweetwater County Farm Bureau is opposed to the prohibition of livestock grazing in the big game parturition habitat from May 1 to June 30. (page 2-68). The delayed turnout of cattle from May 1st to July 1st would force producers to keep their cows on hay fields and their private property during peak hay growing season. This places an enormous financial burden on livestock operations due to the extra two months of required feeding. Hay producers would also lose their first cutting of hay. This would change the historical dynamic of the agricultural industry in the area. This blatantly violates the grazing rights by not honoring the agreement with each individual permittee. | A range of alternatives has been analyzed for management of big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts of each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13330-8 | * MA # 4430: Sweetwater County Farm Bureau prefers alternative A. The least adequate is alternative B to "prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds." This is excessive restriction of multiple use. Including "historical" raptor nests is especially ambiguous and sets a dangerous precedent to restrict access of a changed habitat with no current proof of viability. Alternative B is grasping at straws to restrict access on inaccurate (old) data incongruent with the science of present-day raptor sites. | A range of alternatives has been analyzed for raptor nesting protections in Chapter 2.2.6 management action 4430. Analysis of impacts of each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13412-2 | The Red Desert to Hoback migration corridor spans 150 miles and crosses private land, state trust land, United States National Forest land, and public land managed by the BLM. This migration corridor is the longest known mule deer migration corridor in the United States and is traveled by approximately 5,000 deer biannually. Alternative B would designate a new ACEC called the Big Game Migration Corridor ACEC. This ACEC would contain significant portions of the Red Desert to Hoback migration corridor. As I am following the the Select Committee on Federal Natural Resource Management (Committee) of the Wyoming Legislature, the Committee heard testimony from Wyoming's Game and Fish Department at our meeting on October 6, 2023 that Alternative B's inclusion of the Red Desert to Hoback migration corridor within the ACEC would be detrimental to the Wyoming Game and Fish Department's management of wildlife populations within the migration corridor. I support the hard work the Wyoming Game and Fish Department has put into migration corridors. I am committed to conserving these vital migration corridors to help maintain wildlife populations. I believe that designating migration corridors within ACEC is not in the best interest of the state or the wildlife. | A range of alternatives has been analyzed for the Big Game Migration Corridor ACEC in chapter 2.2.6 management actions 7555 - 7562. Analysis of the actions in each alternative is found in Chapter 4.21. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13480-1 | Furthermore, I would like to emphasize the importance of including updated language in the plan to address the mule deer migration corridor. It is crucial that strong management prescriptions are adopted to ensure the preservation of the corridor's permeability. I strongly urge the BLM to review the latest scientific data collected, cataloged, reviewed, and evaluated by the University of Wyoming's team. In particular, the 2020 peer-reviewed study conducted by Sawyer et al. provides valuable insights, highlighting a 3% threshold level for migratory disturbance. Given that this study was conducted within the deer herd that utilizes lands administered by the Rock Springs Field Office of the BLM, I believe it serves as a credible scientific basis for developing case-by-case management prescriptions in the most critical habitats. | A range of alternatives has been analyzed for the Big Game Migration Corridor ACEC in chapter 2.2.6 management actions 7555 - 7562. Analysis of the actions in each alternative is found in Chapter 4.21. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13515-7 | As a long-term partner in BLM lands/realty work, RMEF supports continued use of land acquisitions and conservation easements to conserve critical habitat for big game and other wildlife. BLM-managed lands across the planning area include several landlocked parcels and/or a checkerboard arrangement. RMEF supports Plan components recognizing that acquisition or land tenure adjustments should focus on consolidating land ownership, improving public access, and conserving/enhancing resources. | A range of alternatives have been analyzed for land tenure adjustments, acquisitions and disposals in management actions 60000-6015. Assumptions and analysis of impacts of these actions is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13549-6 | In section 4408 page 2-64 states in proposed Plan B that water developments only if wildlife habitat and resource conditions would be improved. Now wildlife certainly is important the BLM is a multi-use organization and needs to consider all animals. When ranchers put in a new water development this helps out the wildlife in many aspects not only providing them with water but also distributing the animals across the landscape so not to overgraze one area to give more feed for all animals throughout. To say it is good for wildlife is to only look at one part of the whole picture. | A range of alternatives have been analyzed for water developments in Chapter 2, management action 4408. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13574-2 | MA #4428 Alternatives B, C, and D contain references to Appendix J which prescribes distances. These alternatives contain acceptable language but the references to Appendix J makes them unacceptable. In some cases, the distances listed in the alternative exceeds US Fish & Wildlife Service (USFWS) recommended distances. Since USFWS has primary jurisdiction over raptor nests, eggs, and young, USFWS recommended distances should be used. An acceptable alternative should reference USFWS recommended distances and allow case-by-case determination of distances based on species, topography, line of sight distances and additional protective measures to be worked out in consultation with USFWS, WGFD, and BLM. | A range of alternatives have been analyzed for raptor nest protections in Chapter 2, management action 4428. Analysis of the impacts of these actions for each alternative is found in Chapter 4. Appendix J contains Seasonal Raptor restrictions. |
| 816 - Biological Resources–Fish and | #13624-109 | Appendix H#H-22#H.4#Physical Resources.#This section should be updated to be consistent with the comments provided above. BLM should add the agencies that have authority to ensure the language does not indicate BLM as the regulatory agency. | See Appendix H for updated text. See Chapter 1.4 Planning Criteria for compliance with laws and authorities. |

| Wildlife (4400-4436) | | | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13668-3 | Management # 7421 Page 2-178 …Prohibit surface disturbing activities, except for activities intended to protect or enhance ACEC values. I would prefer a different alternative than B that will not prohibit surface disturbing activities, such as drilling a well and limiting the kind of fence that one would be allowed to use. Areas of our allotment that would be VRM 2 on the top of Mellor Mtn. and the Sage Creek pasture may, in the future need solar panels or some other means to supply water to a well for not only our livestock, but for all species who currently drink, and limiting that due to "visibility" does not seem logical nor humane; to say nothing of achieving and maintaining rangeland health. Wells can address livestock distribution in addition to the distribution of other species. Lastly, if only electric fences are allowed, then what do we do about the sage grouse running into it? A well-thought out alternative that takes into consideration the whole picture and all apparent factors would be a sensible approach. | A range of alternatives has been analyzed for ACECs in management actions 7400-7570. A range of alternatives specific to surface-disturbing activities has been analyzed in action 7421. Analysis of impacts for the actions in these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13720-5 | Biological Resources (BR) - Fish and Wildlife Goals and Objectives (U.S. Department of the Interior Bureau of Land Management, 2023)(Page 2-62) We respectfully request that BLM adds goals and objectives between BR-18 and BR-19 that read: "Identify connectivity habitat based on the known movements of individuals." "Delineate potentially important connectivity areas, termed 'ecological corridors' that are necessary to enhance the integrity, viability and stability of protected areas." | BLM coordinates and cooperates with WGFD to track movements and identifies connectivity. See Chapter 1.4 Planning Criteria regarding BLM/WGFD coordination. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13720-12 | 4.7 WILDLIFE AND FISHERIES (U.S. Department of the Interior Bureau of Land Management, 2023) (Page 4-53) 4.7.1 Assumptions In this section, BLM states assumptions that will be applied to all wildlife and fisheries management in the Rock Springs resource area. We believe that additional assumptions should be added, based on the most recent science and best management practices: We respectfully request that BLM adds this assumption: "Conservation of species, ecosystems and habitats can only be achieved if protected areas are functionally connected." We respectfully request that BLM edits the first bullet point in this section to add the language we identify here in italics that read: "The quality and quantity of winter ranges, which are core habitats that are functionally connected by ecological corridors are generally considered to be the limiting factors on big game populations in the planning area. The ability of big game to access core habitats that support wintering populations is a major factor in determining yearlong population levels." We respectfully request that BLM edits the third bullet point to add the language we identify here in italics that read: "wildlife migration corridors, stopover areas, migration bottlenecks, crucial winter ranges, transitional ranges, and parturition areas are critically important wildlife habitats. Together, they form an ecological network which is established, restored, and maintained to conserve biological diversity." | The assumptions in 4.7.1 were used for the completed analysis. For BLM's goals for fish and wildlife management, see Chapter 2 Goals and Objectives BR-16 through BR-26. Also, see Executive Summary and Chapter 4.7 adequacy of data, assumptions and analysis. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13720-13 | 4.7.3 Alternative B The discussion of impacts to wildlife and fisheries in Alternative B is similar to those for Alternative A, which we discuss here. The DRMP DEIS at page 4-56 states that, "The WGFD estimates that 170 acres surrounding each well pad is the minimum area in which impacts on pronghorn (Antilocarpa americana) would occur (WGFD 2004b). The greater mobility and adaptability of this species to human activity and disturbed areas likely would prevent long-term population impacts…" There is no citation in the Literature Cited for this "WGFD 2004b" report, which makes its accuracy and reliability questionable. Further, the most current and best available science disputes the DRMP DEIS statement that, "adaptability of this species to human activity and disturbed areas likely would prevent long-term population impacts…" On the contrary, Sawyer et al documented behavioral response to human activity and energy development site disturbance. In a 15-year study using 171 collared pronghorns, "distance from natural gas well pads increased through time and was concurrent with declines in winter residency." (Sawyer, 2019) Pronghorns increased individual well pad avoidance to a quarter-mile, and overall well pad avoidance by half a mile. Pronghorns spent one month less time in natural gas fields. More than half of the pronghorn population simply left what had been their traditional winter ranges. Considering that the Sublette pronghorn population has declined by 30% since 2007, (see Table 1 below) and the winter of 2022-2023 resulted in the loss of 75% of the Sublette pronghorn herd, (Tan, 2023) we can no longer depend on their "adaptability" to activities that are managed by BLM on public land. This outdated, anachronistic misconception is no longer valid in 2024, and in fact exacerbates negative "long-term population impacts." Along with habitat fragmentation and degradation from natural gas development, BLM land managers must also consider the impacts of a 24-year drought and the increasing shocks to essential habitats resulting from climate change. We respectfully request that the BLM provides the source for the cited "WGFD 2004b" report. We respectfully request that the statement at page 4-56 be deleted that states, "The greater mobility and adaptability of this species to human activity and disturbed areas likely would prevent long-term population impacts…" We respectfully request that the DEIS at page 4-56, third paragraph be edited to include the sentence we identify here in italics, "Documented behavioral response to energy development includes avoidance of natural gas well pads and declines in winter residency of traditional winter ranges." | See Literature Cited for updated Citation. See Executive Summary and Chapter 4.7.1 for adequacy of assumptions, data and analysis. |
| 816 - Biological | #13748-8 | MA# 4411, Alternative D: "Allow development and/or maintenance of special management and riparian management exclosures, subject to adequate mitigation of impacts following BLM mitigation policies. Review | A range of alternatives has been analyzed for management of special management and riparian management exclosures in Chapter 2.2.6 management actions 4411 . |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources–Fish and Wildlife (4400-4436) | | existing exclosures, and if they are providing intended function, create and implement exclosure plans. If they are not providing intended function, determine if changes can be made, or if they should be removed." Rationale: Alternative D provides for critical site-specific determination for existing exclosures while also providing flexibility to build new structures as needed. Alternative B is too vague and lacks clear management direction. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13752-7 | The vehicle travel restrictions that would be imposed by Proposed Management Action 4427 are overly restrictive and at a minimum should provide exceptions for electric infrastructure access. Year-round access is needed to electric power lines and wind energy projects for routine operations and maintenance work and any emergency repairs. The preferred alternative fails to provide an exception for access needed to repair and maintain existing infrastructure. | A range of alternatives has been analyzed for management of seasonal vehicular travel restrictions in wildlife habitats in action 4427. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13755-6 | BLM proposes to close all "big game crucial winter ranges, parturition areas, migration corridors, and transitional habitats" to surface disturbance or disruptive activities. Draft RMP, Table 2-1 , at 2-68 (MA# 4421). As shown in Map 3-3, almost all of the KSLA is in pronghorn crucial winter or yearlong range.2 In assessing visual impacts of mineral development, BLM makes no attempt to distinguish between underground trona mining and mineral extractive industries that are far more visible and disruptive of surface resources. See Draft EIS at If Alternative B is implemented, trona operators will be unable to access the surface necessary for vital mining support facilities, making this area of the KSLA essentially useless for purposes of trona mining. BLM fails to analyze the impacts to the trona industry of such a drastic restriction across the KSLA. Moreover, such a draconian restriction makes no exception for minimal or seasonal uses, especially in areas that are already frequented by regular traffic from other activities. BLM fails to explain why existing seasonal restrictions are suddenly inadequate to manage pronghorn and other species across the planning area. | See Glossary for a definition of 'surface disturbing activities'. A range of alternatives has been analyzed for management of surface disturbing and disruptive activities in wildlife habitats in Chapter 2.2.6 management action 4421. Analysis of the impacts of the actions in these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13755-7 | Further, blanket prohibitions on surface use in wildlife habitat is at odds with Wyoming Game and Fish Department management planning. In matters of wildlife management, the federal government must yield to the jurisdiction of the state.3 Here, Wyoming has applied conservative approaches to managing big game throughout the State and within the Rock Springs planning area, including seasonal restrictions. For instance, the Wyoming Game and Fish's Recommendations for Development of Oil and Gas Resources Within Important Wildlife Habitat, Version 6.0, Table 1 (Apr. 2010), recommends seasonal closures, rather than wholesale exclusion areas, in crucial big game habitat. BLM's proposal to override the State's balanced wildlife management scheme is contrary to multiple use management and the federal government's FLPMA obligation to follow the State's lead on wildlife protection. | A range of alternatives has been analyzed for management of surface disturbing and disruptive activities in wildlife habitats in Chapter 2.2.6 management action 4421. Analysis of the impacts of the actions in these alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria that identifies BLM's cooperation and coordination with WGFD. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13755-10 | The court in Defenders of Wildlife v. Andrus, 627 F.2d 1238, 1248 (D.C. Cir. 1980), explained that in enacting FLPMA, Congress "carefully and explicitly" "assigned the states the primary responsibility of management of wildlife programs within their boundaries." Id. ("It is unquestioned that 'the States have broad trustee and police powers over wild animals within their jurisdictions.'" (quoting Kleppe v. New Mexico, 426 U.S. 529,545 (1976)). While Congress may preempt state prerogatives on federal lands via the Property Clause, it elected not to do so when it drafted FLPMA. Id.; see U.S. Const., Art. IV, § 3, cl. 2. | See Chapter 1.4 Planning Criteria for compliance with Applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13783-18 | Wyoming possesses "unquestioned … 'broad trustee and police powers over wild animals[.]'" Andrus, 627 F.2d at 1248 (quoting Kleppe, 426 U.S. at 545). BLM's decision to abandon Wyoming's multiple-use plan to forbid all surface disturbing activity contravenes the State's authority and violates principles of multiple use. | See Chapter 1.4 Planning Criteria for compliance with Applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-22 | MA#4408, Alt B: "Consider water developments only if wildlife habitat and resource conditions would be improved or maintained." Comment: Narrowing all range improvement projects to only focus on wildlife habitat does not meet the intent of numerous other reasons for the projects. For example, if the concern is to address a stream segment in Functioning At Risk category under PFC, Alternative B will prohibit the water development and directly conflict with MA#4300. | A range of alternatives has been analyzed for water developments in Chapter 2 management action 4408. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-23 | * MA#4412, Alt B: "Allow animal damage control on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns." Comment: Alternative B does not actually consider the correlation between the species being controlled and special status species. Pg 3-12 lists the special status species for mammals, avian fish, amphibians and reptiles in the project area. At best, the correlation between predatory species being controlled for animal damage may only be with pygmy rabbit and Greater sage-grouse. The Alternative B doesn't address the true need for animal damage control. | A range of alternatives has been analyzed for animal control in Chapter 2 management action 4412. Analysis of impacts for management in each of the alternatives is found in chapter 4. |
| 816 - Biological Resources–Fish and | #13784-24 | MA34418, Alt B: "Prohibit renewable energy projects in big game crucial winter range..." Comment: The Programmatic Solar EIS recently came out and WDA believes Alternative B and the current administration's priorities for increased renewable energy are in direct conflict. | A range of alternatives has been analyzed for renewable energy projects in big game crucial winter range in Chapter 2 management action 4418. Analysis of impacts from the actions in each alternative is found in chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Wildlife (4400-4436) | | | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-25 | * MA#4420, Alt B: "Prohibit livestock grazing in big game parturition habitat during the birthing season (usualy from May 1 through June 30)." Comment: Most BLM livestock grazing permits overlap with big game habitat and the dates indicated. For those livestock grazing permittees in the prohibited areas, this would likely cause significant economic impacts to their operations. Additionally, BLM must incorporate the Wyoming Land Health Standards to ensure livestock grazing is a significant causal factor for not providing adequate forage and habitat in the parturition areas. | A range of alternatives has been analyzed for livestock grazing in big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-26 | A#4427, Alt. B: "Seasonally close vehicular travel in important periods (big game crucial winter, parturition, calving, nesting areas" Comment: This alternative closes the mentioned areas for over 9 of the 12 months of the year. Of which, overlaps with most livestock grazing seasonal use periods and would prohibit livestock grazing permittees from maintaining range improvement projects, supplying salt and minerals, or other livestock grazing management tasks requiring motorized vehicles. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2.2.6 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-27 | * MA#4430, Alt. B: "Prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds. This includes project components such as permanent and/or high profile structures..." Comment: The interpretation of Alternative B will undoubtedly prohibit livestock grazing permittees from installing windmills and solar panels for water developments. By not allowing livestock grazing permittees to install water developments due to raptor nests locations, permittees may not fully utilize the forage equitably across their allotments or potentially meet Wyoming Land Health Standards. | A range of alternatives has been analyzed for raptor protections in Chapter 2.2.6 management action 4430. Analysis of impacts from the actions in each of the alternatives is found in chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-53 | 4.7.3 Wildlife and Fisheries, Alternative B: "Resting lands from livestock grazing a minimum of five seasons after treatments would allow treated areas to revegetate, soils to stabilize and vegetation to mature to the point of withstanding livestock grazing pressure. Rested areas could provide wildlife with new vegetation for cover and forage without competition with livestock during the rest period." (p. 4-69) Comment: The statement and analysis are biased. If removal of livestock grazing for a period of five growing seasons is beneficial, why does wildlife grazing on the same treated areas not compromise the treatment's ability to mature? | A range of alternatives has been analyzed for resting treatment areas in Chapter 2 management action 4111. Analysis of the impacts from actions in each of the alternatives is found in Chapter 4 |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13784-54 | "Removal of fences reduces threats of injury or death from collisions or entanglement with fences, enhances migration corridors, and could allow access to additional forage and cover." Comment: There wasn't a specific management action pertaining to the removal of fences under Alternative B, Chapter 2.Fences are not a limiting factor with wildlife and forage. Remove the statement. | Text in Chapter 4 has been updated. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13787-55 | MA #4407 BR-20, BR-19 No similar action Maintain and improve habitat quantity and quality for migratory bird species of conservation concern to prevent, avoid, reduce, and/or mitigate adverse impacts to the extent feasible, and in a manner consistent with regional or statewide bird conservation priorities. Industry Position: Not acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. Maintain habitat quantity and quality for migratory bird species of conservation concern to avoid, reduce, or mitigate adverse impacts to the extent feasible, and in a manner consistent with regional or statewide bird conservation priorities. Industry Position: Not acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. Maintain or improve habitat quantity, functionality, and quality, on a case- by case basis, for migratory bird species of conservation concern consistent with regional or statewide bird conservation priorities. Require, on a case-by-case basis, pre- construction surveys by a qualified biologist for any project proposed to be implemented during the migratory bird nesting season, generally February 1 through August 31. If active/occupied nests are identified, construction activities in the immediate area will be halted, until it is determined that the nest is no longer active/occupied, due to events such as fledging, nest predation, or nest abandonment. Industry Position: Not acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. Improving habitat quantity and functionality and quality must not be required. BLM will ensure that actions follow MBTA, USFWS, and WGFD requirements. Protection of the habitat should be consistent with regional and statewide bird conservation priorities on a case-by-case basis. | A range of alternatives has been analyzed for migratory birds in Chapter 2, management action 4407. Analysis of impacts of actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for applicable laws and policies |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13787-56 | MA #4419 BR-41, BR-09, BR-26 To the extent possible, suitable wildlife habitat and forage would be provided to support the WGFD 1989 Strategic Plan objectives. Changes within WGFD planning objective levels would be considered based on habitat capability and availability and site- specific analysis. Industry Position: Acceptable Reason: Industry supports WGFD herd unit objectives and population plans. Manage wildlife habitat to provide forage to support the WGFD 2009 (or subsequent approved) Strategic Habitat Plan in the attainment of big game herd unit objectives, strategic population plans, and aquatic basin management plan objectives. Consider habitat capability and availability during coordination with WGFD for changes to plan objectives. Industry Position: Not acceptable Reason: Industry supports WGFD herd unit objectives and population plans but habitat capability and availability are subjective enough to lead to NSOs where appropriate mitigation would provide adequate habitat | A range of alternatives has been analyzed for wildlife habitat to support WGFD strategic plans in Chapter 2 management action 4419. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | protection. Manage wildlife habitat, to the extent possible, to provide forage for all resources. Consider habitat capability and availability during coordination with WGFD for changes to plan objectives. Industry Position: Not acceptable Reason: Industry supports WGFD herd unit objectives and population plans but habitat capability and availability are subjective enough to lead to NSOs whereas appropriate mitigation would provide adequate habitat protection. Manage, to the extent possible, wildlife habitat to provide forage to support the WGFD Strategic Habitat Plan in the attainment of big game herd unit objectives, strategic population plans, and aquatic basin management plan objectives. Industry Position: Acceptable Reason: Alternative D uses the current WGFD Strategic Plan and captures the desired wildlife habitat result. Alternatives A and D are acceptable. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13787-57 | MA #4426 BR-24, BR-18, BR-41 Big game crucial winter ranges and birthing areas are open to further consideration for federal coal leasing and development with a provision for maintaining a balance between coal leasing and development, and adequate crucial winter range and birthing area habitats to prevent significant adverse impacts to important big game species. This would be accomplished through controlled timing and sequencing of federal coal leasing and development in these areas. For example, satisfactory abandonment and adequate reclamation of mined lands in big game crucial winter ranges and birthing areas would be required before additional federal coal leasing and development is initiated in the same crucial winter ranges and birthing areas. Industry position: Not acceptable Reason: A mining and reclamation schedule that allows for the orderly and environmentally sound development of the coal reserve is developed by the operator and reviewed and approved by WDEQ-LQD in the operator's mine permit. WDEQ-LQD has primacy, WGFD and BLM have consultation, and USOSMRE has oversight. Close big game crucial winger ranges and parturition areas to further consideration for federal coal leasing and development. Industry position: Not acceptable Reason: The need to protect big game crucial winter range and parturition areas is respected. To close these areas completely is overly restrictive. Allowance should be made for the orderly development of the coal resource through a mining and reclamation schedule reviewed and approved by WDEQ-LQD. Reclamation should be timely as the coal is mined and return the functionality of these habitats. Open big game crucial winter ranges and parturition areas for further consideration for coal leasing and development. Maintain a balance between coal leasing and development and maintaining adequate levels of these habitats. Prevent significant adverse impacts to these habitats. Open big game crucial winter ranges and parturition areas to further consideration for federal coal leasing and development with a provision for maintaining a balance between coal leasing and development, and adequate crucial winter range and birthing area habitats. Prevent significant adverse impacts to important big game species through controlled timing and sequencing of federal coal leasing and development in these areas. Industry position: Not acceptable Reason: Most of this language is acceptable but "adverse" impacts is open to interpretation and open-ended. Same as Alternative A. Industry position: Not acceptable Reason: A mining and reclamation schedule that allows for the orderly and environmentally sound development of the coal reserve is developed by the operator and reviewed and approved by WDEQ-LQD in the operator's mine permit. WDEQ-LQD has primacy, WGFD and BLM have consultation, and USOSMRE has oversight. Open big game crucial winter ranges and parturition areas for further consideration for coal leasing and development. Maintain a balance between coal leasing and development and adequate crucial winter range and parturition area habitats by developing a reclamation schedule that will be reviewed and approved by WDEQ- LQD in consultation with WGFD and BLM. | A range of alternatives has been analyzed for big game crucial winter range in Chapter 2 management action 4426. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. See also Appendix E for applicable laws, including the Mineral Leasing Act. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13787-58 | MA #4427 BR-24, BR-41 Vehicular travel in crucial and important wildlife habitats and during crucial and important periods (strutting grounds, spawning beds, big game ranges, calving/fawning periods, etc.) would be restricted seasonally, as necessary. Industry position: Not acceptable Reason: The need for protective measures is accepted. Allowance should be made for determination of protective measures case by case that protect the wildlife resource and allow for access to surface facilities needed for trona production in the KSLA. Seasonally close vehicular travel in crucial and important wildlife habitats and during crucial and important periods (big game crucial winter ranges 11/15-4/30, deer parturition areas 5/1-6/30, elk calving areas 5/1-6/30, moose calving areas 5/1- 6/30, raptor nesting areas 2/1-7/31). See Appendix J. Industry position: Not acceptable Reason: This alternative applies the season and distance restrictions in Appendix J. Appendix J Alternative B has a 2-mile restriction on raptors. Two miles exceeds USFWS guidance. Limit vehicular travel to designated roads and trails in crucial and important wildlife habitats and during crucial and important periods (big game crucial winter ranges 11/15-4/30, deer parturition areas 5/1- 6/30, elk calving areas 5/1-6/30, moose calving areas 5/1-6/30, raptor nesting areas 2/1-7/31). Industry position: Not acceptable Reason: Limitation to "designated roads" potentially restricts access to surface facilities that are needed for trona production in the KSLA. Allowance is needed to develop protective measures case by case in consultation with USFWS and BLM. Seasonally close, on a case-by-case basis, vehicular travel in designated crucial winter ranges and parturition areas during key periods (big game crucial winter ranges 11/15-4/30, big game parturition areas 5/1- 6/30). Exceptions will be granted for administrative use. See Appendix J. Industry position: Not acceptable Reason: Appendix J Alternative D contains some distance restrictions that exceed USFWS guidance. Vehicular travel in crucial and important wildlife habitats and during crucial and important periods (strutting grounds, spawning beds, big game ranges, calving/fawning periods would be allowed to gain access to surface facilities needed for trona production in the KSLA, including rights of way for pipelines, powerlines, and roads. Protective measures needed for protection of said habitats and wildlife will be developed case by case in consultation with the USFWS, WGFD, and BLM. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13811-10 | Seasonal restrictions on construction may also significantly influence when and how the Dry Creek Project construction and maintenance are scheduled and performed and may influence operations if sensitive maintenance activities cannot be completed in a timely manner due to seasonal restrictions. In Pacific's view of the RMP/DEIS, it appears there is some internal inconsistency with respect to whether BLM would entertain waivers, exceptions, or modifications to the otherwise date-certain and area-certain seasonal restrictions. In Volume 2, Appendix B, Table B-1, BLM provides "criteria for considering request for exceptions, modifications, and waivers according to stipulations applied for the alternatives."25 In Table B-1, under Management # 4430 (Raptor Nest) BLM identifies in the Action Text that "[b]uffer recommendations could be modified on a site-specific or project-specific basis based on field observations and local conditions,"26 but BLM later states in the Stipulation Description that no exceptions, modifications, or waivers will be considered for raptor nests. Again, under Management # 4431 (Raptor Nest) the Stipulation Description states both, "No surface occupancy or disturbing activities within a two-mile radius during raptor seasonal restrictions (generally February 1 to August 15) unless the operator submits a plan that adequately addresses mitigation of impacts following BLM mitigation policy to raptor nests"27 and BLM suggests no exceptions, modifications, or waivers will be considered relative to raptor nest restrictions. Lastly, under Management # 4435 (Game Fish and Special Status Fish Populations during Spawning Season) the Action Text states, "Evaluate, on a case-by-case basis, requests for exceptions to timing limitations and consider reducing or increasing these standard dates."28 BLM then suggests in the Stipulation Description that no exceptions, modifications, or waivers will be considered for fisheries resources. BLM's conflicting statements makes it unclear how exactly they intend to manage these resources and whether the Dry Creek Project can be developed in alignment. | A range of alternatives has been analyzed for raptor protections in Chapter 2, 4428-4434. Analysis for actions in each of the alternatives is found in chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-14 | C. MA #4207 Alternative B of MA #4207 would restrict the control of noxious weeds and other invasive plant species to only mechanical or biological methods, thereby reducing the effectiveness of PacifiCorp's current IVM plan for controlling vegetation along power line ROWs. The use of only mechanical or biological treatments as prescribed by Alternative B may contribute to resource impacts resulting from repeated and prolonged treatments by vegetation management crews. Herbicide use can be more effective than mechanical or biological controls in reducing noxious weeds and non-desirable tree species, resulting in the need for less frequent treatments. Herbicide application requires a shorter duration of work and less noise compared to mechanical treatments and could thereby reduce disturbance impacts to wildlife in certain situations. PacifiCorp encourages the BLM to adopt Alternative C under MA #4207, which will allow it to continue its current IVM plan to target invasive plant species with the application of herbicides according to their label. In addition to impacting PacifiCorp's ability to perform vegetation management along its ROWs, Alternative B of MA #4207 would impact the ability of BCC to conduct weed control. The restrictions against chemical controls of noxious weeds in Alternative B conflict with permits, lease obligations, and regulations of different state and federal agencies, including the Permit to Mine issued by the DEQ Land Quality Division, and requirements of the Mine Safety and Health Administration (MSHA) to conduct weed/vegetation control in specific locations. Certain species, such as salt cedar, are only temporarily suppressed by mechanical removal and tend to resprout vigorously, and chemical treatments, which would be prohibited under Alternative B of MA #4207, are highly effective at inhibiting the spread of this species. The BLM currently requires Pesticide Use Plans at the BCC mine, and chemical weed control is an important part of this Integrated Pest Management. Under MA #4207, PacifiCorp recommends that BLM adopt Alternatives C or D. Similarly, Alternative B of MA #4207 dictates the use of BMPs (per Appendix A) for noxious/invasive weeds. However, in Appendix A (A.1.4), general BMPs for all alternatives include "Control the spread and effects of invasive non-native plant species (Evangelista et al. 2011), including treating weeds prior to surface disturbance." This general BMP is inconsistent with Alternative B, which prohibits the use of chemicals for controlling noxious/invasive weeds. Furthermore, under MA #4212 and #4213, limits on chemical use within certain distances of streams, rivers, and wetlands are included for Alternative B. It is unclear why these limits are included for Alternative B when chemical control is not allowed under that alternative. | A range of alternatives has been analyzed for control of noxious weeds in Chapter 2, management action 4207. Analysis of impacts from the actions in each alternative are found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-15 | D. MA #4213 Despite the contradiction in the forgoing paragraph, MA #4213, which prohibits vehicle and hand application of chemicals within ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status plants, would severely limit PacifiCorp's ability to perform IVM on its ROWs. IVM utilizing mechanical, biological, and chemical treatments is a critical component of vegetation maintenance that selectively targets invasive species of plants, as well as other non-desirable vegetation. Alternative B would place large restrictions on the areas in which herbicide treatments can be used as an effective tool. Alternatives A (preferred), C, or D of MA #4213 will allow PacifiCorp to continue its current IVM plan to target invasive plant species with the application of herbicides according to their label. Herbicides have been safely used by PacifiCorp near wetland and riparian areas with the BLM's approval for many years. Because PacifiCorp has numerous linear utility corridors, power lines inevitably cross streams and riparian areas, and existing ROW and special use permits issued by BLM may require weed control. Consequently, restrictions on the use of chemicals under Alternative B of MA #4207 and #4213, and the wide buffers under Alternative B of MA #4213 reduce PacifiCorp's options for effective treatments of noxious or invasive plant species. Likewise, the prohibition of chemical weed control within a ¼ mile of wetlands, riparian areas, aquatic habitats, and Special Status species, as identified in Alternative B of MA #4213, could jeopardize BCC's compliance with existing permit, lease, or regulatory requirements, as described previously. Alternatives A | A range of alternatives has been analyzed for application of chemicals in Chapter 2 management action 4213. Analysis for the impacts of the actions in each alternative are found in chapter 4. See Chapter 1.4 Planning Criteria for applicable laws and policies. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | (preferred), C, or D of MA #4213 provide more flexibility for PacifiCorp to use the appropriate and most effective method of control (biological, mechanical, or chemical), while also including reasonable buffers around aquatic features. Reclamation of decommissioned mine areas, roads, or utility corridors includes relatively large areas that have had significant soil disturbance, and typically have numerous invasive plant species. For effective reclamation, it is best to have every tool to prevent those species from becoming established, particularly in the early stages of reclamation. Removing chemical treatment from the options would reduce the effectiveness of reclamation and have a lasting negative effect on the soils, vegetation, and subsequent hydrology of reclaimed sites. 5. Wildlife and Fisheries Habitat Several of the management actions in this section of the DEIS conflict with permits or guidance issued by the U.S. Fish and Wildlife Service (USFWS) under the Migratory Bird Treaty Act (MBTA; 1918) and the Bald and Golden Eagle Protection Act (BGEPA; 1940) and overstep BLM's authority to manage habitat versus species. In addition, the management actions in this section should be consistent with the BLM's Biological Resources Goal # BR-21 which discusses accordance with these acts. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-16 | A. MA #4407 PacifiCorp acknowledges the desire to conserve migratory bird habitat under MA #4407, and concurs that migratory bird habitat conservation should be implemented in accordance with regional or state bird conservation priorities and in accordance with EO 13816 (Responsibilities of Federal Agencies to Protect Migratory Birds, 2001). In regard to migratory bird habitat conservation, PacifiCorp concurs with Alternatives B, C, and D. However, the pre-construction survey requirements contained in Alternative D would severely impact PacifiCorp's ability to operate and maintain its facilities. Pre-construction surveys should not be required for routine O&M work or emergency repairs. In many cases, raptors and other migratory birds may nest on electric utility facilities; halting or prohibiting work in such instances could jeopardize operations, human health and safety, avian safety, and wildfire risks. PacifiCorp maintains Special Purpose - Utility (SPUT) permits with the USFWS, Chapter 33 permits with the Wyoming Game and Fish Department (WGFD), and has robust Avian Protection Plans (APPs) for its Transmission and Distribution (T&D) Operations, Generation, and Mining facilities, all of which detail and provide agency authorization for management of migratory bird nests and work around active nests when necessary. BLM is overstepping its authority by requiring nest surveys and halting work surrounding active nests, as this is under the jurisdiction of the USFWS under MBTA and BGEPA. Consequently, PacifiCorp recommends that the BLM adopt Alternatives B or C, which afford for migratory bird habitat conservation while recognizing USFWS authority over migratory birds and their nests. | A range of alternatives has been analyzed for migratory birds in Chapter 2, management action 4407. Analysis of impacts of actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for applicable laws and policies |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-17 | B. MA #4418 Prohibiting renewable energy development in big game crucial winter range and high-use/high-density raptor areas is unnecessary and removes vast areas of lands for potential renewable energy development(Milligan et al. 2021). Renewable energy facilities can implement BMPs on project sites to minimize wildlife impacts and would also be required to follow agency stipulations for projects cited on public lands. Likewise, USFWS manages the take of eagles and migratory birds, thereby negating the need for BLM to prohibit renewable energy projects in raptor habitat. PacifiCorp recommends that the BLM adopt Alternative A, C, or D under MA #4418. | A range of alternatives has been analyzed for renewable energy projects in big game crucial winter range, parturition and high density raptor nesting/roosting/perching sites in Chapter 2 management action 4418. Analysis of impacts from the actions in each alternative is found in chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-18 | C. MA #4421 Alternative B of MA #4421 prohibits surface disturbing activities on big game crucial ranges, parturition areas, migration corridors, and transitional habitats with no exceptions, even if impacts could be mitigated. Due to the proximity of several big game crucial ranges within BCC's permit area, the prohibitions of Alternative B could limit the ability of BCC to meet existing permit, lease, and reclamation obligations. PacifiCorp recommends that the BLM adopt Alternative A of MA #4412, as it is consistent with current permit and regulatory obligations. Likewise, Alternative D would also be acceptable as this alternative allows for some exceptions to be granted. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-19 | D. MA #4424 It is unclear if MA #4424 applies only to fluid minerals or to all surface disturbances, as the language differs between Alternatives B, C, and D. If the intent is to apply a ½ mile buffer around big game migratory corridors for all surface disturbances, this could impact PacifiCorp's ability to operate its system, serve customers, and meet project reclamation requirements. Big game routinely cross underneath power lines and utilize power line ROWs, renewable energy sites, and mine reclamation areas as habitat. BLM has failed to provide supporting evidence that prohibiting surface disturbance will benefit migrating big game. Likewise, "Identify and preserve wildlife species migration and travel corridors" is too vague and could pertain to any number of wildlife species that migrate and travel in corridors, further limiting where surface disturbing activities can occur. If the intent of this MA is towards big game, it should be clarified, and seasonal construction buffers should reflect those identified by the lead agency (WGFD); however, blanket restrictions on surface occupancy for all activities is unreasonable and rather should be evaluated on a case-by-case basis. For these reasons, PacifiCorp recommends that the BLM adopt Alternative A or C for MA #4424. | The language difference among the four alternatives is intentional. Please see Glossary for definitions of 'surface disturbance' and 'surface disrupting activities'. A range of alternatives has been analyzed for designated big game corridors in chapter 2, management action 4424. Analysis of impacts for actions in each alternative is found in chapter 4. |
| 816 - Biological Resources–Fish and | #13865-20 | E. MA #4426 Alternative B of MA #4426 closes areas that are near winter ranges and parturition areas to further development considerations including coal leasing. The effects of development on big game populations can be mitigated and a balance maintained through currently employed practices. The BLM should have the flexibility to consider further development and whether impacts of future projects could be mitigated. An outright closure of the winter ranges and parturition areas without consideration of other impacts or if the impacts from development | A range of alternatives has been analyzed for coal leasing and development in Chapter 2, management action 4426. Analysis of impacts for actions in each of the alternatives is found in chapter 4 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Wildlife (4400-4436) | | could be mitigated appears to be at odds with the BLM mission to "...sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations." Coal leasing and development are significant sources of revenue to the local economy and to local and state governments and closing areas to future development and coal leasing would likely impact this revenue source. PacifiCorp recommends that the BLM adopt Alternative A or D (both are the same), as this would provide flexibility to consider each project on a case-by-case basis, rather than a blanket closure. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-21 | F. MA # 4427 The overlap of seasonal closures for vehicle travel in all alternatives of MA #4427 would block necessary travel and access for PacifiCorp. This includes areas that BCC is mandated to monitor as a permit requirement. Denying access to conduct monitoring by the seasonal closure of roads could put BCC in violation of its DEQ Land Quality Division Permit to Mine. These road closures would also limit reclamation activities of BBC and other PacifiCorp projects. Vehicle travel must be allowed when needed to access PacifiCorp's projects, power lines, and other assets year-round for O&M activities and during emergencies. The extended duration of seasonal closures is problematic because it narrows the window in which certain areas can be accessed and work performed. The cumulative closure period for all wildlife resources combined in MA #4427 is from November 15 to June 30 (for Alternative D) or July 31 (for Alternatives B and C), which leaves utilities with August 1 to November 14 to perform work. This is not sufficient time to complete necessary O&M or construction. In addition, closing vehicle traffic in raptor nest areas is contradictory for locations where raptors nest on utility infrastructure and can require nest management or other O&M work during the nesting season. Restricting access would prevent PacifiCorp from complying with its APP, company avian policies, and commitments to the USFWS that require timely retrofitting of poles with eagle or migratory bird mortalities. Likewise, PacifiCorp has agency mandated timeframes to respond to facility conditions. Failure to meet these timeframes puts the company at risk of substantial fines, regulatory noncompliance, and safety concerns. PacifiCorp recommends that the BLM adopt Alternative A under MA#4427, and allow vehicular travel when necessary. PacifiCorp also recommends that all seasonal buffers be waived for emergency work and time sensitive O&M or repairs. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-22 | G. MA # 4428 Alternatives A and B of MA #4428 are overly broad, overstep BLM's authority by attempting to regulate migratory birds, and conflict with guidance issued by the USFWS. USFWS is the agency with authority to regulate raptor conservation and take under the MBTA and BGEPA. While BLM has the authority to regulate habitat on BLM-managed lands, the agency does not have the authority to regulate raptor species. By setting nest criteria that contradicts that of the USFWS, the BLM is overstepping its authority. In addition, the BLM fails to analyze how these contradictory measures reflect current best science or offer tangible benefits to raptors. Under Alternatives A and B, "protections" would be afforded to nests that are not currently active or occupied; this is illogical as it does not afford protection to these species if nests are vacant and contradicts with USFWS guidance. Protections for raptor nest sites should apply only to verified occupied nests in the current year an activity is being performed, not historic nest sites. In addition, changing from species-specific buffer distances to blanket buffer distances is arbitrary and does not account for the unique biology of each species. The following are specific concerns with language in MA #4428: ? Consistent with USFWS guidance, protections for raptor nest sites should apply only to verified occupied nests in the current year an activity is being performed, not historic nest sites. The USFWS memorandum "MBPM-2" (Migratory Bird Permit Memorandum, April 15, 2003), states: "The MBTA does not contain any prohibition that applies to the destruction of a migratory bird nest alone (without birds or eggs), provided that no possession occurs during the destruction." Since the publication and implementation of national APP Guidelines in 2005 between the USFWS and the Avian Power Line Interaction Committee (APLIC), the USFWS directive to electric utilities has been that "active" nests are "those with eggs or young present" (APLIC and USFWS 2005; APLIC 2006). USFWS allows for destruction of migratory bird nests, yet BLM is proposing significant buffers for such nests under Alternatives A and B of MA #4428. While utilities do not remove or destroy inactive nests unless necessary due to a safety or fire risk, the application of buffers around such nests is an unnecessary restriction against the safe operations and maintenance of electrical infrastructure. ? Under Alternative A of MA #4428, BLM identifies an active nest as "one that has been occupied within the past three years." This contradicts the USFWS directive, which has been implemented effectively for two decades under MBPM-2, and defines active nests as those with eggs or chicks. PacifiCorp recommends that the BLM adopt the USFWS definition of an active nest as those which contain eggs or chicks. ? Under Alternative A of MA #4428, BLM defines a historic nesting site as "an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors." The basis of this definition is questionable, as topographic relief is unrelated to historic nesting activity. Active nests, as defined by USFWS, would be protected from disturbance by nest buffers. BLM's concern to maintain historic nests sites would be addressed by active nest buffers and by USFWS authority over nest destruction. ? The term raptor "feeding areas" used in Alternative B of MA #4428 is far too vague and expansive to be useable or practical, and should be removed as an alternative. Indeed, nearly all of the RSFO could potentially fall under the category of a "raptor feeding area." Different raptor species have varied and complex life cycles and feeding areas may be focused in different locations based upon season and a variety of conditions. Feeding areas could include locations around nests, concentrations near winter roost areas, large landscapes used for migration, and wintering areas. Likewise, some raptors may perch hunt from power poles or other infrastructure, resulting in nonsensical feeding buffers around anthropogenic features. Raptors are not | A range of alternatives has been analyzed for raptor nesting protections in Chapter 2.2.6 management action 4428 - 4434. Analysis of impacts of each of these alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria and Appendix E for compliance with applicable laws. Note also that Alternative A is the existing management in place since 1997. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | particularly sensitive to human activities near feeding areas, nor would activity in these areas be detrimental to their life cycle in most situations. This is particularly true of utility O&M activities that are typically limited in footprint and short in duration. Feeding areas are much less sensitive to disturbance impacts than nest areas; consequently, active nest buffers would provide more appropriate protection to raptors. PacifiCorp recommends that the BLM remove restrictions or buffers around "raptor feeding areas." ? PacifiCorp concurs that topographic barriers may influence buffers. For example, if there are significant topographic features between an activity and a nest, a nest buffer distance may be reduced since the activity may not be seen or heard by the nesting birds. ? Activity types around raptor nests should also be considered when identifying nest buffers. Buffers should be applied for new construction activities; however, routine maintenance and emergency activities should be exempted from buffers as these activities are typically short in duration, pose minimal disturbance risk, and are necessary for safety and reliability reasons. Raptor protections should include allowing a biologist to monitor occupied raptor nests while work is being done inside raptor nest buffers if it is appropriate for the species and type of work. In many locations within the RSFO, harsh winter conditions and associated restricted access limit construction windows and necessitate construction during the summer months. Utility APPs identify activity types and nest protection measures, which may range from seasonal/spatial buffers for new construction, use of biological monitors for projects that may extend more than several hours, or no buffers for necessary work within shorter durations. PacifiCorp recommends that the BLM allow utilities to continue these practices, which have been established with and undergo ongoing review by USFWS. ? MA #4428 fails to recognize that utility infrastructure can create nesting substrates for raptors, including several species listed as BLM Wyoming Sensitive Wildlife Species (bald eagle [BAEA], peregrine falcon [PEFA], and ferruginous hawk [FEHA]). Implementing buffers around utility infrastructure could impact safe operations and maintenance of the electric grid. Necessary O&M work on utility infrastructure within nest buffers should be exempted from buffer restrictions as detailed above, and instead managed under APPs and USFWS permits/agreements. ? PacifiCorp concurs that different raptor species require different disturbance buffers, and encourages the BLM to use buffer distances that are consistent with USFWS guidance for eagles and other raptors (see Romin and Muck 2002; USFWS 2007; USFWS 2022). These documents are applicable within the USFWS Region 6 area, and have been effectively used by the USFWS and industry for two decades. Appendix J of the DEIS includes seasonal wildlife restrictions, with dates and buffers for various raptor species. Alternatives A, B, C, and D all differ from USFWS guidance for various species, and PacifiCorp recommends that the BLM modify its alternatives to align with USFWS guidance. Specifically, PacifiCorp recommends the following: o Appendix J.1. Alternative A is consistent with USFWS for golden eagles (GOEA) with a ½ mile buffer; however, other distances contradict USFWS guidance (other raptors have a blanket buffer of ½ mile under BLM vs. species-specific buffer distances under USFWS). o Appendix, J.2. Alternative B uses blanket buffer distances "within 2 miles of active and historic nests." This is overly restrictive, contradictory with USFWS guidance, and appears only to restrict and hinder development and operations of permittees. Likewise, BLM fails to justify the need for buffers beyond USFWS recommendations, and fails to document the biological benefits of the blanket buffer distances to the various species. o Appendix J.3. Alternative C implements a blanket buffer distance of ½ mile of active nests. Under this alternative, buffers only apply to active nests, which is consistent with USFWS. However, the buffer distance is inconsistent with USFWS guidance, which uses species specific buffers that are 1/8, ¼, ½, or 1 mile depending on the species. PacifiCorp recommends that the BLM modify this alternative to use buffer distances consistent with USFWS. o Appendix J.4. Alternative D applies differing buffer distances around "occupied and historic nest sites." Buffers around historic nests are overly restrictive, contradictory with USFWS guidance, and appear only to restrict and hinder development and operations of permittees. Likewise, BLM fails to justify the need for buffer distances beyond USFWS recommendations, and fails to document biological benefits to species for buffers around historic or unoccupied nests. On some projects in other BLM Field Offices, PacifiCorp has been required to monitor historic nests; this has resulted in increased project costs and none of the historic nests have been subsequently used in future years. Rather, the nests continue to deteriorate over time. PacifiCorp does not want the BLM to perpetuate such a requirement, as there is no biological reason or benefit to justifying protections or surveys of unoccupied and dilapidated nests. As stated previously, USFWS nest protections apply only to active nests because there is not a biological reason or regulatory requirement to implement a buffer around an inactive nest. Under this alternative, BLM buffer distances for GOEA, FEHA, and burrowing owl (BUOW) are the same as USFWS guidance; however, BLM buffer distances conflict with USFWS for BAEA and "general raptor." BLM fails to explain why a 2.5-mile buffer is used for BAEA (occupied and historic nests), when USFWS guidance is 330ft or 660ft, depending on the visibility of the activity (USFWS 2007). As noted previously, a blanket buffer of ½ mile for other raptors is inconsistent with USFWS guidance, which uses species-specific buffers that are either 1/8, ¼, ½, or 1 mile. o All alternatives under Appendix J provide broad nesting dates. There should be flexibility to adapt nest buffer dates based on the actual nest activity dates. For example, buffers for Swainson's hawks (SWHA) should not begin on February 1, as this species does not return from migration until well after this date (USFWS buffer dates start on April 1 for SWHA). Likewise, if an active raptor nest has fledged by June 25, the buffer should not be held until August 15. This is consistent with USFWS guidance regarding protection of active nests and reflects the spirit of MBTA to protect nests while they are active. o None of the alternatives under Appendix J are consistent with the lead agency (USFWS) for these species. Therefore, PacifiCorp questions the adequacy of BLM's analysis for nest | |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | buffers, including consistency with other agency recommendations. PacifiCorp recommends that the BLM modify Alternative C to use species-specific buffer distances consistent with USFWS established buffers (see USFWS 2022), and maintain these buffers around active nests only, not historic nests. Likewise, buffer dates should be adaptable to actual dates of nesting activity as described above. In addition to the above concerns with MA #4428, PacifiCorp notes that the BLM has failed to consider current USFWS regulatory changes to MBTA and BGEPA. USFWS is currently revising the regulations pertaining to bald and golden eagle permits (50 CFR Part 22) and contemplating making available permits to take other migratory birds protected under the MBTA. Should a company obtain either of these permits, raptor nest restrictions in the permits should supersede raptor nest restrictions in the BLM's Management Plan. Likewise, current utility SPUT or Eagle Take Permits (ETP) issued by USFWS, as well as Chapter 33 permits issued by WGFD, should supersede BLM RMP management actions regarding nests of eagles and migratory birds. PacifiCorp recommends that the BLM adopt Alternative C of MA #4428, with the modification to Appendix J as detailed above. PacifiCorp recommends that this modification to MA #4428 also be used instead of Alternative A of MA #4429. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-23 | H. MA #4430 MA # 4430 establishes No Surface Occupancy (NSO) restrictions for facilities within raptor nest buffers under all alternatives and is an excessive and unnecessary burden on industry for which BLM has failed to analyze associated impacts. Many of the concerns identified under our prior comments for MA #4428 also apply to MA #4430, including protections around historic or inactive nests, and feeding areas, and buffer distances that are inconsistent with USFWS guidance. Likewise, MA #4430 fails to recognize that numerous raptor species use infrastructure, such as power poles, for nest substrates. This MA also contradicts USFWS guidance by creating NSOs rather than buffers, and fails to apply industry best practices that prevent or mitigate potential negative impacts. Best practices for the electric utility industry, developed by APLIC and USFWS (see APLIC and USFWS 2005, APLIC 2006, APLIC 2012) apply avian-safe construction methods to prevent bird mortalities associated with power lines. Likewise, wind energy developments implement various raptor protection measures in coordination with USFWS. PacifiCorp recommends that the BLM remove all NSO requirements around raptor nests under MA #4430 and rather allow new infrastructure that follows current industry best practices for avian protection, such as APLIC guidance. PacifiCorp proposes that the language for Alternative C under MA #4430 be modified and accepted as: "Project components, such as permanent and high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.. ) are allowed within occupied raptor nest buffers if the projects utilize current industry best practices for avian protection and are constructed outside of the appropriate seasonal and spatial buffers for the species." | A range of alternatives has been analyzed for raptor nesting protections in Chapter 2.2.6 management action 4428 - 4434. Analysis of impacts of each of these alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-24 | I. MA #4431, #4432, and #4433 MA #4431 is duplicative of MA #4428. Consequently, PacifiCorp reiterates its comments regarding buffer distances, feeding grounds, and occupied vs. historic nests detailed under MA #4428 here. PacifiCorp recommends that the BLM adopt the above comments under MA #4428 and refer to MA #4428 under MA #4431. PacifiCorp also recommends that MA #4432 and #4433 reference the proposed changes to MA #4428. | A range of alternatives has been analyzed for raptor nesting protections in Chapter 2.2.6 management action 4428 - 4434. Analysis of impacts of each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-25 | J. MA #4434 MA #4434 requires raptor nest surveys within buffer distances that are in excess of what would be required to identify and protect nests, particularly under Alternative B, which requires surveys within a 4- mile radius of projects. The BLM fails to analyze or justify this 4-mile radius, or explain why it differs from established guidance from USFWS or through existing permits. ? BCC current mine permits and USFWS requirements require raptor surveys within two miles of the mine permit boundary, which is inconsistent with the BLM's 4-mile radius; ? In the absence of existing USFWS guidance or other permit requirements, survey efforts should align with the buffer distance for a species, rather than basing the distance on a blanket 1- or 4-mile radius. For example, per USFWS (2022), FEHA buffers are 1 mile; consequently, a nest survey radius for FEHA should be 1 mile. For GOEA, prairie and peregrine falcons, and American goshawk, the buffers recommended by USFWS are 0.5 mile; therefore, the nest survey radius for these species should be 0.5 mile. By using survey radius based on the species, efforts can be focused on the suitable habitats for particular species within the project area. This is more targeted and cost effective than a blanket approach and will still identify and satisfy raptor nests and buffer needs; and ? Alternative A stipulates that nest surveys would need to be completed only if construction is to occur during the nesting season. Importantly, this limitation on the need for surveys is missing from Alternatives B and D, and is necessary because nest surveys should not be required if construction is to occur outside of the nesting season. PacifiCorp recommends that the BLM adopt Alternative D of MA #4434 with a change in language from "within one mile" to "within appropriate buffer distances for the species." | A range of alternatives has been analyzed for raptor nesting protections in Chapter 2.2.6 management action 4428 - 4434. Analysis of impacts of each of these alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-28 | M. MA #4616 It is unclear how many additional lands would be impacted by mineral lease withdrawals or non-renewals under Alternative B of MA #4616. Under Alternative B of MA #4616, PacifiCorp is concerned that mineral leases would not be re-offered once they expire, which will have significant impacts to BCC, including impacts to operations and fulfilment of existing lease and permit obligations. PacifiCorp recommends that the BLM adopt Alternative D of MA #4616 as it would allow current operations and would be consistent with current permits, regulations, and policies. | See Glossary for a definition of 'withdrawal', which does not apply to fluid or solid mineral leasing. A range of alternatives has been analyzed for protection of special status species habitat in Chapter 2.2.6 management action 4616. Analysis of the impacts of actions in each alternative are found in chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-30 | In addition, map 3-4 (Raptor Nest Sites) has an error. Canada goose and common raven are listed and included under 'Occupied Raptor Nests' in the Raptor Nest Sites Map 3-4. Neither one of these species should be listed as a raptor. | See Map 3-4 for updates. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-31 | O. Bridger Coal Company BCC has a USFWS-approved Migratory Bird Protection Plan and Raptor Mitigation Plan that is incorporated in the Company's Permit to Mine and updated and approved every five years. The last update and approval occurred in 2022. BCC should be allowed to operate under the USFWS approved plan and is concerned that the BLM restrictions would conflict with permits and plans already in place. There is concern that BLM-proposed buffers around inactive nests would interfere with BCC's ability to conduct nest monitoring and management. BCC possesses USFWS and WGFD permits that authorize it to relocate raptor nests from mine pit walls to nest platforms, which are typically located near mine operations otherwise birds may abandon the nests if they are moved too far. These relocated nests may fall within buffer distances or NSO distances (see MA #4430) under the draft RMP, presenting a conflict between BLM proposed stipulations and existing USFWS and state permit requirements, agreements, and long established protocols. BCC has monitored raptors for 45 years inside the permit boundary and for a two mile radius outside of the permit boundary, and have documented over 500 active and historic nests. BLM-proposed buffer restrictions around historic nests would prevent BCC from operating from February 1- August 15 of each year. This would result in significant economic impacts, threaten the ability to provide electricity to customers, and impact BCC's environmental and mining regulatory compliance, including reclamation. Reclamation activities are conducted year-round to prepare reclamation areas to meet the short seeding window in the fall. Inactive nest buffers, coupled with seasonal road closure restrictions, would also impact the required raptor and other wildlife monitoring that BCC is required to conduct per its Permit to Mine. The questionable benefit of buffering historic nests is again a concern, as BCC has data from the last 45 years of raptor monitoring that shows an increase in raptors in an area without historic nest buffers. BCC is able to provide this data to BLM upon request. | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-37 | 11. Renewable Energy Alternative B will significantly impair the ability to operate existing renewable energy and the development of new renewable energy projects. The land use, time and distance, and travel prohibitions and restrictions under Alternative B will potentially limit access to renewable energy development sites, vehicular routes to renewable energy sites, the placement of renewable energy facilities, structures, and transmission lines and pipelines. The restrictions in Alternative B will also potentially limit site preparation and construction activities associated with renewable energy development and have operational restrictions on renewable energy projects. Future renewable energy projects could require additional impact minimization measures as impacts become known and better understood. Prohibiting renewable energy projects in big game crucial winter range and parturition habitat, raptor concentration areas, currently mapped unique habitats, or new areas identified as part of site-specific investigations would preclude renewable energy development in those areas. | A range of alternatives has been analyzed related to renewable energy project in Chapter 2.2.6. Analysis of impacts for actions in each of these alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-45 | Similarly, much of BCC's permit area is considered antelope crucial winter range. Western portions within the permit boundary also have overlapping crucial elk winter range. Any of the big game seasonal restrictions and stipulations in Alternatives B or D that would require surface disturbing activities to stop or severely restrict surface disturbing activities in these areas could have impacts on operations including those that allow BCC to meet regulatory, permit, and lease obligations such as contemporaneous reclamation requirements and monitoring requirements. | A range of alternatives has been analyzed for big game seasonal restrictions in Chapter 2.2.6. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-46 | Finally, the effects of buffering around historic raptor nests in both Alternative B and Alternative D have the same effect on BCC's and PacifiCorp's operations. BCC is required to monitor raptor territories and nests within its permit area. BCC created maps illustrating buffers around all active and historic nests as defined in the RMP and found that both Alternatives B and D as written would have a significant negative impact on operations, including reclamation. | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13865-47 | [comment:13865-47; 824, 827]. In addition to the inconsistencies already discussed, Alternative B will create regulatory inconsistencies across BLM field offices and is beyond the scope of BLM regulation. There must be consistency across BLM field offices. For linear utilities or any project that straddles field office boundaries, changing how any resource is managed within multi-agency process driven protocol is going to result in confusion, inconsistencies, and the immediate need for variances and exceptions. Disregarding the VRM process or Section 106 process that ultimately finds its way to SHPO so that affects are seen differently than all other BLM Field offices will create inconsistent evaluation of the same resource. Alternative B exceeds BLM regulatory authority by, for example, changing avian seasonal stipulations and buffers that have been established by other agencies is beyond the scope of a land management agency.[comment end] | See Chapter 1.4 Planning Criteria for compliance with laws, policy and valid and existing rights. |
| 816 - Biological | #13889-2 | 4408 and 4409. Alt. A,C and D all allow for water development. Water is a critical component to every living creature. The agency should not be limited to water development for big game or wildlife. Water development for | A range of alternatives has been analyzed for water developments in Chapter 2 management action 4408. Analysis of impacts of the actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources–Fish and Wildlife (4400-4436) | | livestock, wildlife, and wild horses takes pressure off riparian areas and disperses animals throughout the range. It would be beneficial for all wildlife not just big game and sage grouse with the development of water off the riparian areas and existing developments. Water developments reduce trampling, increase vegetation, and other beneficial outcomes by providing other avenues for water to all animals out in the management area. Livestock are not the only animals that influence riparian health. Water development improves not only riparian areas but provides a valuable resource to wildlife. | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13904-4 | MA 4420 Alt B Prohibit livestock grazing in big game parturition habitat during the birthing season (usually from May 1 through June 30). That is not reasonable. There is no basis for a blanket regulation. The time to determine if there are adjustments to grazing to meet conflicts, if any, with big game parturition, is to the permit renewal process. | A range of alternatives has been analyzed for big game parturition habitat in Chapter 2 management action 4420. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13905-1 | The Green River RMP (reflected in Alternative A) specifies ESA consultation on listed species only in the Jack Morrow Hills CAP area (DEIS at 2-81), while the Preferred Alternative would consult with USFWS throughout the planning area. This is a nondiscretionary legal requirement under the ESA, so it is not optional. It is beneficial to include this in the plan, as an extra reminder for land and resource managers not to forget this important procedural step. Conducting field surveys for Special Status wildlife species (as in Alternatives B and D) is wise to avoid unforeseen impacts to listed species. | See Chapter 1.4 Planning Criteria for compliance with laws and policy. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13908-14 | 4408 B Consider water developments only if wildlife habitat and resource conditions would be improved or maintained. Match language in Alternative D and include consultation with WGFD. Allow water developments in big game crucial winter range and parturition areas on a case-by-case basis in consultation with WGFD and subject to adequate mitigation of impacts following BLM mitigation policies. | A range of alternatives has been analyzed for water developments in Chapter 2 management action 4408. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13908-16 | 4418 B Prohibit renewable energy projects in big game crucial winter range and parturition habitat, raptor concentration (high-use/high- density raptor nesting/roosting/perching areas) areas, and currently mapped unique habitats (e.g. aspen and mountain shrub) or new areas identified as part of site-specific investigations. Research regarding the impacts of renewable energy projects to big game is lacking and should be considered prior to a complete prohibition. Raptor concentration areas are not defined or delineated in any provided figures. Allow for consideration on a case-by-case basis. Avoid renewable energy projects in big game crucial winter range and parturition habitat, defined raptor concentration (high-use/high- density raptor nesting/roosting/perching areas) areas, and currently mapped unique habitats (e.g. aspen and mountain shrub) or new areas identified as part of site-specific investigations. Development may be considered on a case-by-case basis. | A range of alternatives has been analyzed for renewable projects in big game crucial winter range and parturition habitats, raptor concentration areas and currently mapped unique habitats in Chapter 2, management action 4418. Analysis of impacts for actions in each alternative are found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13908-18 | 4421 B Prohibit surface disturbing or disruptive activities on big game crucial winter ranges, parturition areas, migration corridors and transitional habitats, as idenfied by WGFD. Remove migration corridors and transitional habitats since migration corridors are refernced in MA 4424. Add language that allows for exceptions on a case-by-case basis, as is the norm for other RMPs in Wyoming, and allow for habitat treatments. WGFD should be consulted given our management responsibilities. Prohibit surface disturbing or disruptive activities on WGFD-identified big game crucial winter ranges from November 15-April 30 and parturition areas from May 1-June 30. Consider exceptions on a case-by- case basis if impacts will not adversely impact the population being protected or they will benefit the resource values. Exception requests will be reviewed in consultation with WGFD. | A range of alternatives has been analyzed for surface disturbing or disruptive activities in big game crucial winter ranges, parturition areas, migration corridors and transitional habitats in chapter 2.2.6 management actions 4421. Analysis of impacts for actions in each of the alternatives is found in chapter 4. See Appendix B: Exceptions, Modifications and Waivers, Table B-1. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13908-19 | 4421 B Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing Recent scientific publications provide disturbance thresholds that allow for limited development resulting in minimal to no impact to big game, dependent on location of development. Prohibiting surface disturbing/disruptive activities with an exception process and closely reviewing all proposed developments will allow for some level of development while adequately protecting big game herds. Protection will be further enhanced with mitigation as provided in Alternative D language. Remove from alternative. | A range of alternatives has been analyzed for surface disturbing or disruptive activities in big game crucial winter ranges, parturition areas, migration corridors and transitional habitats in chapter 2.2.6 management actions 4421. Analysis of impacts for actions in each of the alternatives is found in chapter 4. See Appendix B: Exceptions, Modifications and Waivers, Table B-1. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13908-20 | 4421 B Steamboat Mountain ACEC is closed to motor vehicle use from May 1 though June 30 for crucial birthing habitat for deer and elk. Closure includes much greater area than necessary. We recommend closure is restricted to the parturition area, which is captured in the Alternative D language. The Elk Parturition area within the Steamboat Mountain ACEC is closed to motor vehicle use from May 1 to June 30 for crucial birthing habitat for deer and elk. | A range of alternatives has been analyzed for surface disturbing or disruptive activities in big game crucial winter ranges, parturition areas, migration corridors and transitional habitats in chapter 2.2.6 management actions 4421. Analysis of impacts for actions in each of the alternatives is found in chapter 4. See Appendix B: Exceptions, Modifications and Waivers, Table B-1. |
| 816 - Biological Resources–Fish and | #13908-22 | 4424 B Prohibit surface-disturbing activities within 1/2 mile of a big game migration corridors to avoid constriction of current or future identified big game corridors. A 1/2 mile protective buffer applied to migration corridors is not supported by the science. This should not be included in any alternative. | A range of alternatives has been analyzed for designated big game corridors in chapter 2.2.6 management action 4424. Analysis of impacts for actions in each alternative is found in chapter 4. |

|---|---|---|---|
| Wildlife (4400-4436) | | | |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-1 | In order to align with state species management goals, and be consistent with future BLM planning efforts, we request that the Final RMP incorporate the management criteria set forth within the Wyoming Executive Order 2019-3, Greater Sage-Grouse Core Area Protection. Additionally, the Wyoming Greater Sage-grouse core area map that was recently updated and provided to the BLM via the Wyoming Sage-grouse Implementation Team (SGIT) and the Wyoming Governor's office should be incorporated into the Final Rock Springs RMP. | Analysis of management for Greater Sage-grouse is being conducted in a separate document and is outside the scope of this document. See Chapter 1.3 for discussion. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-13 | The language in Management Action #4424 states that the BLM will work with project proponents to create a conservation plan. Sportsmen request that the BLM also work in partnership with WGFD to develop a conservation plan from the outset. The MA #4424 should recognize WGFD's authority to manage wildlife and the important role the agency plays to inform land management decisions for the health of wildlife on state and federal lands in Wyoming. The BLM should consult with WGFD early and often to appropriately site development projects outside of designated migration corridors. | A range of alternatives has been analyzed for designated big game corridors in chapter 2.2.6 management action 4424. Analysis of impacts for actions in each alternative is found in chapter 4. See Chapter 1.4 Planning Criteria authorities and compliance with applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-18 | To emphasize WGFD involvement, sportsmen support Alternative D for MA #4424 and request the following language pertaining to migration corridors be included in the Rock Springs Final RMP. ? Wherever possible, development, infrastructure and use should occur outside of designated corridors. Inside corridors, regulatory agencies should support the continued functionality of designated migration corridors by conditioning permits to avoid and minimize impacts from development or use allowed within the corridor. | A range of alternatives has been analyzed for designated big game corridors in chapter 2.2.6 management action 4424. Analysis of impacts for actions in each alternative is found in chapter 4. See Chapter 1.4 Planning Criteria authorities and compliance with applicable laws. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-21 | We request the management prescriptions as outlined in Alternative D MA #4421 be adopted in the final plan with the following language changes. 11 ? We request that surface disturbing activities be prohibited in these areas as the default, not allowed as noted in this management action. | A range of alternatives has been analyzed for surface disturbing or disruptive activities in big game crucial winter ranges, parturition areas, migration corridors and transitional habitats in chapter 2.2.6 management actions 4421. Analysis of impacts for actions in each of the alternatives is found in chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-22 | For Management Action #4418, we support Alternative B that will prohibit renewable energy development projects in crucial habitat. Additionally, because these resource values are not compatible with wind energy development, ROW authorizations should not be issued within these areas. This is congruent with the 2005 Final Wind Programmatic Environmental Impact Statement and should be consistent in the planning area. | A range of alternatives has been analyzed for renewable projects in big game crucial winter range and parturition habitats, raptor concentration areas and currently mapped unique habitats in Chapter 2.2.6, management action 4418. Analysis of impacts for actions in each alternative are found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13923-24 | Additionally, we recognize that the BLM is currently conducting a programmatic Environmental Impact Assessment to revise the Western Solar Plan. If Wyoming is included in this plan, we support amendments to the RSFO RMP to manage future solar development that minimizes impacts to wildlife resources. | The Solar PEIS will amend the RSFO RMP. Also, see Section 1.4 for the Planning Criteria. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13927-1 | Overall, we support the recommendations for the GLMA made by the GLMC and the Wyoming Governor's Task Force. However, in the Currant Creek Portion of the Red Creek ACEC, Sage Creek Portion of the Red Creek ACEC, and Pine Mountain Management Areas - because of the unique and sensitive nature of the CRCT habitat found in these areas as well as TU's long track record of investment in habitat restoration in collaboration with the BLM, state agencies, industry, and private landowners - we ask that you consider making lands in these areas unavailable for leasing to provide greater protection than No Surface Occupancy stipulations. | A range of alternatives has been analyzed for the Greater Red Cr. ACEC in Chapter 2.2.6 management actions 7418-7445. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #13927-2 | When considering the effects of energy development in the GLMA, it is important to recognize that land ownership patterns could exacerbate fish and wildlife impacts from oil and gas development by focusing infrastructure on stream valley locations. Should No Surface Occupancy (NSO) stipulations be implemented on BLM lands, accessing underlying oil and gas resources would require directional drilling from State and private lands, which are predominantly located along streams (Figure 1). These valley bottoms and riparian zones are highly sensitive to surface disturbances, while also being rich habitat for both native trout and wildlife. For instance, the CRCT population in Currant Creek is almost entirely located on state lands where infrastructure would have to be located in order to potentially access nearby federal minerals. | A range of alternatives has been analyzed for the Greater Red Cr. ACEC in Chapter 2.2.6 management actions 7418-7445. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #14023-8 | I recommend that any new fencing be made wildlife friendly as de?ned by the Wyoming Game and Fish department. | See Chapter 1.4 Planning Criteria for consultation with other agencies. BLM's fencing Manual provides requirements for wildlife friendly fencing |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #14023-9 | The Rock Springs District RMP should be driven by a conservation agenda, one that will conserve the best of the unique landscapes, habitats, and native biodiversity it sustains. The RMP should re?ect the District's place in the larger Wyoming landscape; its critical role in providing winter habitat for wildlife that summers tens, if not hundreds of miles to the north. It should also protect, and where and whenever possible enhance habitats for resident wildlife and native plants. It should evaluate, consider, and mitigate how energy development impacts air- and watersheds far removed from the district. It should recognize, respect, and protect the history and locations once utilized by our indigenous ancestors. | See Chapter 1.2 Purpose and Need for the Resource Management Plan Amendments and refer to Section 1.4 for the Planning Criteria. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #14026-8 | Further, NRECA is concerned about the preferred alternative's wildlife management proposals. Restrictions on major and principle uses, including electricity infrastructure, based on big game and raptor habitat are under the jurisdiction of the U.S. Fish and Wildlife Service ("USFWS"), not BLM.12 Rather than including such prescriptive requirements such as buffer zones and no mitigation options in the RMP process, BLM should entrust management of protected species in the region to the expertise of USFWS and their established wildlife management processes. | See Chapter 1.4 Planning Criteria for compliance with applicable laws and authorities, and consultation with other agencies. |
| 816 - Biological Resources–Fish and Wildlife (4400-4436) | #14027-10 | the description of total acreage being placed off limits for mining projects under the preferred alternative B does not take into account acres that may be off limits due to sage grouse management.51 This lack of coordination prevents adequate review of the draft RMP/EIS and completely undermines the Appendix T, the cumulative impacts analysis section. | Analysis of management for Greater Sage-grouse is being conducted in a separate document and is outside the scope of this document. See Chapter 1.3 for discussion. |
| 816.01 - General Wildlife | #250-2 | On numerous pages through out the RMP it discusses the “natural community” and the regulations that are required to insure “natural community.” What analysis do you have that can ensure that nature and natural animals don’t modify or change the “natural community”? None is provided for the assurance of this in the RMP. Example: pine beetles, beavers, massive elk herds. They change the whole of a landscape within a single cycle. | See Executive Summary and Chapter 4.2.2 adequacy of data, and analysis. See also Section 1.4 for the Planning Criteria, including issues identified for analysis. Assumptions for each resource analysis can be found in Chapter 4. |
| 816.01 - General Wildlife | #436-1 | How does the "relocating" predators or no kill affect the indigenous animals. FYI - "High plain desert," "incredibly bad winter," decreased wildlife & predator's = decreased & predator's = increased risk of predator's leaving areas & endangering humans | Relocation of predators is outside of the scope of this document, and outside BLM jurisdiction. See Chapter 1.4 Planning Criteria. |
| 816.01 - General Wildlife | #8686-2 | All the west, federal governments, state governments and private landowners have dedicated much of the past many years to preserving and stabilizing the sage grouse habitat, its’ range and population. Your Plan B restricting or eliminating predator control will reverse any gains made for the sage grouse. Your Plan B also will help destroy the antelope and deer populations. They struggle enough with Wyoming’s winters and if you eliminate predator control on lands under plan B, you are placing another nail in their coffin. | Analysis of all four alternatives for fish and wildlife species is found in section 4.7. Management for fish and wildlife are addressed for all alternatives in management actions 4400 - 4436. Management for predators is covered for all alternatives in the Invasive species and Pest Management Section, specifically management action 4211. Sage-grouse management is being analyzed separately and is outside the scope of this document, and is addressed in Section 2.2.5 Overview of Alternatives. |
| 816.01 - General Wildlife | #9793-7 | Explain how offsite mitigation will be used and where. Pages 2-209 South Wind River ACEC, 2210 East Sand Dunes ACEC, p 2-211 Big Game Migration Corridor, all mention "Manage a separate offsite mitigation area for biological impacts from energy development." Yet the Preferred Alternative will make these areas unavailable for leasing or energy development. Explain. Where will this offsite mitigation area be located? Is it within the RSFO? Page 4-73 states: "Managing lands as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Wildlife such as elk, prairie dogs, and northern harrier could benefit from the low, early seral areas of vegetation," from both the South Wind River ACEC as well as the Big Game Migration Corridors ACEC under Alternative B. Yet referring to the South Wind River ACES on p4-103 through p4-104 states "Managing land as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Special status wildlife such as mountain plover, white-tailed prairie dogs, and swift fox could benefit from the low, early seral areas of vegetation." These are different species than identified in the earlier pages. Why the inconsistency, and what is the specific plan for offsite mitigation? The claim that this off-site mitigation could result in benefits to swift fox is a bit concerning, since the swift fox is a species not known to occur in the RSFO. Please explain how offsite mitigation will work, and why this provision is specifically added to these three ACECs. | See Chapter 3 for a list of species found within the planning area. See Glossary for a definition of 'offsite mitigation'. A range of alternatives has been analyzed for the East Sand Dunes ACEC and the Big Game Migration Corridor ACEC in Chapter 2.2.6 management actions 7548 - 7562. Analysis of impacts for actions in each of the alternatives is found in chapter 4. |
| 816.01 - General Wildlife | #9846-4 | TP, page 2-65, states that BLM will “allow animal damage control on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns.” However, Page 2-60, the same alternative states “Designate, in coordination with APHIS-WS, the entire planning area as a “restricted control area” for animal control” without specifically define “restricted control area.” It also states BLM will “Emphasise non-lethal methods.” | See glossary for updated text |
| 816.01 - General Wildlife | #9850-1 | I'm commenting in regard to the lack of timing restrictions related to sagebrush-obligate songbirds, such as sage thrasher, sage sparrow and Brewers sparrow. These species, all protected by the MBTA and all BLM SSS, would be afforded no protection from the direct destruction of nests/young when projects impact sagebrush habitat. The lack of timing restrictions seems arbitrary and capricious as the BLM offers timing restrictions for breeding raptors, sage-grouse, and many mammal species. | A range of alternatives has been analyzed for migratory birds in Chapter 2.2.6, management action 4407. Analysis of impacts of actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13078-1 | First, Appendix F states that the “BLM will require application of all appropriate conservation measures” with regards to predator management. What the hell does that mean? I have to use non-lethal means in a declared predator area when a coyote or a wolf is attacking our livestock or even a family member? More importantly, the Game and Fish already has science-based approaches to predator management and works with other government | See Appendix F for list of required design features. See Chapter 1.4 Planning Criteria for compliance with applicable laws and authorities |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | agencies, including the BLM, to achieve a common goal with appropriate habitat balance with regards to wildlife and predators alike. Predator management is not the job of the Bureau of Land Management. | |
| 816.01 - General Wildlife | #13287-17 | We also support proposed prohibitions on wind development in raptor concentration areas and other sensitive habitats. These protections also should be extended to solar developments, as these have been shown to block or impede antelope migrations (Sawyer et al. 2022, Attachment 6). We offer the report Wind Power in Wyoming: Doing it Smart from the Start (Attachment 7) as a comprehensive blueprint for lands where wind power development should be excluded. Importantly, this report included as a Best Management Practice to keep big game seasonal habitats as "caution areas" rather than "exclusion areas" for wind development, pending scientific research to determine whether they should become exclusion areas. That scientific research has been completed, and these lands should also be treated as exclusion areas as a result of the finding that wind farm development results in large mammal avoidance. | A range of alternatives has been analyzed for renewable energy projects in Chapter 2 management actions 6100-6108. A range of alternatives for big game and renewable energy has been analyzed in Chapter 2 management action 4418. Analysis of impacts for actions in each alternative are found in chapter 4. |
| 816.01 - General Wildlife | #13287-30 | Herbivory by cattle and sheep on public lands removes forage otherwise available to native herbivores, and therefore leasing public land for livestock grazing necessarily reduces the population of native herbivores (from large hunted species down to small mammals and even insects) substantially. This means that the interests of the recreating public (both hunters and wildlife-watchers) are materially harmed when the federal government chooses to lease public lands for livestock production. A cow that grazes on public land eats as much forage as 2 elk, 6 mule deer, or 10 pronghorn (Ogle and Brazee 2009, Attachment 10). Given that desert elk (the Steamboat Mountain and Petition Herds) and mule deer (the Red Desert to Hoback migration and others) have high public profile and value, the significant loss of population numbers due to density-dependent competition with livestock is a factor that requires detailed analysis in the EIS, but has yet to receive adequate treatment. | A range of alternatives has been analyzed for fish and wildlife in Chapter 2 management actions 4400 - 4436, and for livestock grazing in Chapter 2 management actions 6400-6417. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13356-2 | The proposed alternatives for the Rock Springs Resource Management Plan is missing any mention of planning for bison restoration. Bison are not only a missing keystone species in the land management area, but are a low cost tool for soil health, native plant and wildlife diversity, carbon sequestration and riparian health. | Wild Bison restoration is outside of the scope of this document. See Chapter 1.4 Planning Criteria. |
| 816.01 - General Wildlife | #13542-35 | MA#4407. Alternative B. 2-64 How does the BLM intend to deal with pre-existing tailings and process water ponds regarding improving habitat quantity and quality for migratory bird species? More information is needed for facilities to assess foreseeable current and future impacts on the business of this requirement. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | See Chapter 1.4 Planning Criteria for valid and existing rights. See Executive Summary and 4.2.2 for adequacy of data and analysis. |
| 816.01 - General Wildlife | #13542-38 | MA#4427. Alternative B. 2-71 By seasonally closing vehicular traffic in crucial and important wildlife habitats and important periods, trona mines would not be allowed to operate vehicles at the facility a good portion of the year, nor would employees be able to travel to and from their work. The crucial winter range habitat data should be ground-truthed to clear up this confusion and exceptions should be allowed. Sisecam recommends working with WGFD and considering seasonal vehicular closures on a case-by- case basis for a more realistic approach. Please analyze in detail and disclose to the public the additional analysis and mitigation measures the agency intends to implement or require. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13542-98 | Appendix T. T.1.3. Wildlife and Fisheries. T-20 The RMP states, "Mineral development activities would likely cause displacement of animals..." which is not necessarily true. Many underground mines, such as sodium leased areas, have very few or isolated surface disturbance activities, and allow animals to live and migrate through the leased areas. The impacts that mineral development activities could have on wildlife, regardless of whether from underground mining or surface-based solution mining, can be mitigated through best management practices. Please analyze and disclose to the public the scientific justification for any restrictions contemplated and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | See Executive Summary and 4.2.2 for adequacy of data and analysis. Impacts from solid mineral leasing, such as coal or trona, can be found in Chapter 4. |
| 816.01 - General Wildlife | #13668-1 | Management #7418 & 7419 Page 2-177 #7418 Expand the Greater Red Creek ACEC to include Sugarloaf Management Area and Salt Wells Management Area (468,170 acres, Table 2-12, Appendix V and Map 2-30). I am against any expansion of ACEC's in the Greater Red Creek area or expansion of any VRM 2. Expansion of ACECs and increasing restrictions (VRM 2 areas, no surface occupancy) would further limit the tools grazing could use to meet rangeland health objectives (fence, types of fence, placement of range improvements like wells, reservoirs, troughs, etc.). Rangeland health objectives are already in place to see if management is meeting ecology goals, so why do we need more restrictions when elk have increased to the point they are overgrazing the aspen clones to the point where they die off? If big game is thriving to the extent they are damaging their habitat, do they really need more protections than are there currently? | A range of alternatives has been analyzed for the Greater Red Cr. ACEC in Chapter 2.2.6 management actions 7418-7445. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13672-7 | Appropriate protections of big game crucial winter ranges and parturition areas are important. MA #4421 Alternative B for these areas imposes No Surface Occupancy (NSO) on fluid minerals, closes these areas to material sales, and closes these areas to all solid mineral (trona and coal) leasing. This is not necessary when field visits are made by BLM personnel with land users including project proponents or when project proponents present credible data that enable decisions to be made as to what seasonal protections are needed. MA #4421 Alternatives C and D have language that meets big game habitat needs while providing specific dates which allow | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternatives is found in chapter 4 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | land users to plan their activities, and on a case-by-case basis apply appropriate mitigation practices and obtain exceptions where no undue impacts to big game will occur. | |
| 816.01 - General Wildlife | #13751-128 | MA #4407 ALT B Maintain and improve habitat quantity and quality for migratory bird species of conservation concern to prevent, avoid, reduce, and/or mitigate adverse impacts to the extent feasible, and in a manner consistent with regional or statewide bird conservation priorities. Industry Position: Not Acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. ALT C Maintain habitat quantity and quality for migratory bird species of conservation concern to avoid, reduce, or mitigate adverse impacts to the extent feasible, and in a manner consistent with regional or statewide bird conservation priorities. Industry Position: Not Acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. ALT D Maintain or improve habitat quantity, functionality, and quality, on a case- by case basis, for migratory bird species of conservation concern consistent with regional or statewide bird conservation priorities. Require, on a case-by-case basis, pre- construction surveys by a qualified biologist for any project proposed to be implemented during the migratory bird nesting season, generally February 1 through August 31. If active/occupied nests are identified, construction activities in the immediate area will be halted, until it is determined that the nest is no longer active/occupied, due to events such as fledging, nest predation, or nest abandonment. Industry Position: Not Acceptable Reason: Because habitat quantity and quality are undefined there is no way to measure or attain this goal. Improving habitat quantity and functionality and quality must not be required. | A range of alternatives has been analyzed for migratory birds in Chapter 2.2.6, management action 4407. Analysis of impacts of actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13759-1 | Climate change is minimally addressed in the Rock Springs RMP. The majority of where climate change is mentioned in the document is in the Monetized Impacts of Greenhouse gases (GHG's) section. This seems to be where a detailed conversation of climate change begins and ends in the RMP. Addressing GHG's is important, but there are many other issues that should be considered in this management plan in the context of climate change, such as early snowmelt, drought, loss of habitat, wildfires, and water resources (EPA, 2016). I think that this RMP should describe more ways the RSFO can be proactive around these issues and explain how plans will be adaptive in the face of inevitable change. | See Executive Summary and 4.2.2 for adequacy of data and analysis. Air Quality impacts can be found in Chapter 4. |
| 816.01 - General Wildlife | #13779-10 | BLM states that "studies have documented deaths of avian and bat species from wind turbines, although the levels of collision and death vary in the scientific research (Cohn 2008; Madders and Whitfield 2006). Collision levels fluctuate based on habitat, terrain, elevation and even weather conditions (Madders and Whitfield 2006)." However, BLM then states "prediction of accurate bird or bat losses from wind development is currently not available."23 Again, BLM's science is severely outdated and its conclusions regarding wildlife collision impacts from wind energy facilities are as a result uninformed and deficient. | See Executive Summary and 4.2.2 for adequacy of data and analysis. A range of alternatives has been analyzed for renewable energy projects in Chapter 2 management actions 6100-6108. Analysis of impacts for actions in each of these alternatives is found in chapter 4. |
| 816.01 - General Wildlife | #13779-11 | Among the key scientific findings missing from BLM's analysis or management considerations: impacts to birds from wind energy are orders of magnitude lower than for buildings (250,000% lower), communications towers, and other anthropogenic causes of mortality24,25,26,27; eagle populations have remained stable or increased over the past decade28, 29 concurrent with increasing wind energy development (specifically, the USFWS reported in 2020 the bald eagle population has quadrupled since 2009 to 71,400 nesting pairs and 316,700 individuals30, and a 2022 study examining the cause of death for golden eagles in the western US attributed only 1% of fatalities to wind energy31, indicating wind energy is not having a significant impact on the population32); and targeted turbine curtailment is a powerful tool for reducing bat mortality at wind turbines33, although wind energy impacts on listed bat species are generally low (as evidenced by summaries of over 10034 and over 60035 post-construction monitoring studies) and not the reason bat species are listed36 or proposed for listing37,38. | See Appendix A for Best Management Practices and Design Features. A range of alternatives has been analyzed for renewable energy projects in Chapter 2 management actions 6100-6108. Analysis of impacts for actions in each of these alternatives is found in chapter 4. |
| 816.01 - General Wildlife | #13779-12 | wildlife conservation measures will be thwarted if we are unable to mitigate the worst impacts of climate change. BLM does not discuss the existential threat to many bird (and other) species posed by climate change. As the U.S. Fish and Wildlife Service itself has noted, "Because of climate change, some populations may decline, many will shift their ranges substantially, and still others will face increased risk of extinction."39 Audubon's Survival by Degrees analysis finds a warming scenario of 3.0 degrees Celsius above pre-industrial levels would put 389 North American avian species at risk of extinction.40 Audubon further notes by stabilizing carbon emissions and holding warming to 1.5 degrees Celsius, 76 percent of vulnerable species will be better off and nearly 150 species would no longer be vulnerable to extinction due to climate change. Wind energy is an essential solution to help reduce these risks from climate change. | A global climate analysis regarding impacts to bird species is outside the scope of this RMP document. See Section 1.4 for the Planning Criteria. |
| 816.01 - General Wildlife | #13841-1 | MA4427 Seasonal Vehicle closures should determined by the Wyoming Game and Fish on a as needed basis. | See FLPMA for information about BLM's authority to manage public lands. Additionally, a range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13851-1 | Management Action #4420. Page 2-68. We vaccinate our heifers and have not experienced a single Brucellosis outbreak in the 60+ years of ranching. So Alternative D is preferred because it appropriately defers consideration of potential grazing adjustments to meet conflicts, if any, with big game parturition, to the permit renewal process. It also allows for site-specific management with a flexible timeframe, while other alternatives require a specific timeframe. | A range of alternatives has been analyzed for big game parturition habitat in Chapter 2 management action 4420. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816.01 - General Wildlife | #13865-21 | F. MA # 4427 The overlap of seasonal closures for vehicle travel in all alternatives of MA #4427 would block necessary travel and access for PacifiCorp. This includes areas that BCC is mandated to monitor as a permit requirement. Denying access to conduct monitoring by the seasonal closure of roads could put BCC in violation of its DEQ Land Quality Division Permit to Mine. These road closures would also limit reclamation activities of BBC and other PacifiCorp projects. Vehicle travel must be allowed when needed to access PacifiCorp's projects, power lines, and other assets year-round for O&M activities and during emergencies. The extended duration of seasonal closures is problematic because it narrows the window in which certain areas can be accessed and work performed. The cumulative closure period for all wildlife resources combined in MA #4427 is from November 15 to June 30 (for Alternative D) or July 31 (for Alternatives B and C), which leaves utilities with August 1 to November 14 to perform work. This is not sufficient time to complete necessary O&M or construction. In addition, closing vehicle traffic in raptor nest areas is contradictory for locations where raptors nest on utility infrastructure and can require nest management or other O&M work during the nesting season. Restricting access would prevent PacifiCorp from complying with its APP, company avian policies, and commitments to the USFWS that require timely retrofitting of poles with eagle or migratory bird mortalities. Likewise, PacifiCorp has agency mandated timeframes to respond to facility conditions. Failure to meet these timeframes puts the company at risk of substantial fines, regulatory noncompliance, and safety concerns. PacifiCorp recommends that the BLM adopt Alternative A under MA#4427, and allow vehicular travel when necessary. PacifiCorp also recommends that all seasonal buffers be waived for emergency work and time sensitive O&M or repairs. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13865-51 | Prohibitions on motorized travel and topsoil sale areas may inhibit the timely closure and reclamation of CCR impoundments or landfills and increase negative environmental impacts to public lands in the subject area. Raw materials for cover would potentially need to be sourced from areas outside the DEIS and trucked long distances to the site. The increase in truck traffic on established roads will negatively impact wildlife and air quality in the subject area. | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2 management action 4427. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13865-69 | o "Inventory and monitor predator populations by project proponents." This stipulation is vague, fails to define 'predators', offers no explanation or justification for the stipulation, and does not provide a benefit to resources. Unless the purpose of a project is directly related to predators, such as an animal control project, there is no reason or a regulatory requirement to conduct predator monitoring. For these reasons, PacifiCorp recommends that this stipulation be removed as a RDF or BMP. | See management action #4 "Apply best management practices (BMP) to authorized BLM activities on a case-by-case basis," and Appendix A. |
| 816.01 - General Wildlife | #13870-1 | This study identified several pockets of small mammal populations that were considered rare within the planning areas but not considered threatened or endangered on a statewide basis. These populations included the Canyon Mouse (Cedar Canyon), Northern Flying Squirrel (Little Mountain) and the Merriam's Shrew (White Mountain) The report recommended special management for these populations. Please see the quote below:2 Because of this report, I recommend that the BLM, within the Rock Springs Final RMP, identify management strategies that could protect these isolated pockets of mammals. These strategies could range from establishing ACECs to stipulating development management actions that would protect essential habitats.If the BLM does not protect these species, one poorly planned management action could wipe out the entire population for one species. For example, the BLM could exterminate the entire Little Mountain Northern Flying Squirrel population by one unfortunate fire or timber management action. To avoid this, please consider protections for these isolated pockets of rare small mammals within the BLM Rock Springs Field Office Final RMP. | See Chapter 3.8 for a description of Special Status species for the Rock Springs Field Office. None of the listed species here are species of concern identified in Section 3.8, nor were they identified in the planning criteria for analysis (See Section 1.3). Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |
| 816.01 - General Wildlife | #13892-15 | when the BLM proposes (Page 2-69) to "Prohibit surface disturbing or disruptive activities on big game crucial winter ranges, parturition areas, migration corridors and transitional habitats, as identified by WGFD" it means any human use for more than one hour in a 24-hour period within these areas would be prohibited. That's what the DEIS says, meaning: People would be prohibited from camping within these habitats during that time. Sheepherder camps would be prohibited. Anything that involved people being present for more than one hour would be prohibited. But this time the BLM noted the restriction would apply in these habitats as identified by the Wyoming Game & Fish Department. But the BLM did not include maps of these areas in the DEIS | See Glossary for a definition of 'casual use' and for 'surface disturbing activities' and 'surface disturbance'. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.01 - General Wildlife | #13892-17 | "For actions other than those taken for human health and safety, regulatory compliance or emergency, an activity is 'disruptive' if the activity would require people and/or the structure or activity to be present in these habitats for a duration of more than one hour during any one 24-hour period during the applicable season in the site- specific area." That is a stunning expansion of the meaning of a disruption, again without citing a scientific basis. | See Glossary for a definition of 'casual use' and for 'surface disturbing activities' and 'surface disturbance'. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.01 - General Wildlife | #13908-2 | RMPs typically prohibit activity in big game crucial ranges and parturition areas during the seasonal stipulation period first, and then allow for it on a case-by-case basis through the exception/waiver/modification process. The approaches to protect these vital areas vary among alternatives in the current draft Rock Springs RMP and have the potential for significant negative impacts to big game. The Department recommends the final preferred alternative match surrounding Field Office RMPs and require avoidance during the seasonal stipulation period, with a review process to consider exceptions on a case-by-case basis. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 816.01 - General Wildlife | #13908-13 | 4407 B Add language currently provided in Alternative D. Require, on a case-by-case basis, pre-construction surveys by a qualified biologist for any project proposed to be implemented during the migratory bird nesting season, generally February 1 through August 31. If active/occupied nests are identified, construction activities in the immediate area will be halted, until it is determined that the nest is no longer active/occupied, due to events such as fledging, nest predation, or nest abandonment. | A range of alternatives has been analyzed for migratory birds in Chapter 2.2.6, management action 4407. Analysis of impacts of actions in each of the alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13908-15 | 4408 D Allow water developments in big game crucial winter range and parturition areas on a case-by-case basis subject to adequate mitigation of impacts following BLM mitigation policies. Include consultation with WGFD. Allow water developments in big game crucial winter range and parturition areas on a case-by-case basis in consultation with WGFD and subject to adequate mitigation of impacts following BLM mitigation policies. | A range of alternatives have been analyzed for water developments in Chapter 2, management action 4408. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.01 - General Wildlife | #13908-17 | 4419 D Manage, to the extent possible, wildlife habitat to provide forage to support the WGFD Strategic Habitat Plan in the attainment of big game herd unit objectives, strategic population plans, and aquatic basin management plan objectives. Strategic Habitat Plan is now the Statewide Habitat Plan. Manage, to the extent possible, wildlife habitat to provide forage to support the WGFD Statewide Habitat Plan in the attainment of big game herd unit objectives, strategic population plans, and aquatic basin management plan objectives. | See updated text |
| 816.01 - General Wildlife | #13908-21 | 4421 D Allow surface disturbing activities on big game crucial winter ranges and parturition areas subject to adequate mitigation of impacts following BLM mitigation policies. This is the core of our concern expressed in the Wildlife Environmental Review letter. The language needs to make clear that surface disturbing/disruptive activities are prohibited but may be approved via an excpetion process and in consultation with WGFD. Prohibit surface disturbing or disruptive activities on WGFD-identified big game crucial winter ranges from November 15-April 30 and parturition areas from May 1-June 30. Consider exceptions on a case-by- case basis if impacts will not adversely impact the population being protected or they will benefit the resource values. Exception requests will be reviewed in consultation with WGFD. | See Appendix B Exceptions, Modifications and Waivers Table B-1 |
| 816.01 - General Wildlife | #13908-23 | 4425 B Manage big game crucial winter range and parturition habitat for the plant condition and composition that would be most ecologically beneficial for the identified species while also considering the habitat of other species. Avoid, where possible, single wildlife species management. More closely match Alternative D language so habitat condition is quantifiable. Manage big game crucial winter range and parturition habitat in a manner that meets the Wyoming Land Health Standards, and the plant condition and composition that would maintain a functional habitat for the benefit of all herbivores. | A range of alternatives has been analyzed for big game crucial winter range and parturition habitat in Chapter 2 management action 4425. Analysis of impacts for actions in each alternative can be found in Chapter 4. |
| 816.01 - General Wildlife | #13910-4 | I believe BLM should have the ability to reimburse the permittees for what is needed in plans for habitat projects. Adding more "riders" for protecting projects after they are done should be a big factor for consieration. | Analysis of components of specific projects is outside the scope of this document. See Chapter 1.3 Planning Issues and 1.4 Planning Criteria. |
| 816.01 - General Wildlife | #13910-5 | Perhaps "habitat committees" should be set up to aid in gaining more information and pursuing collaborative efforts. More outside opinions should be considered, rather than just those who have permits. | See Chapter 1 Purpose and Need for description of the is planning effort. See Chapter 1.3 and 1.4 for Planning issues and Criteria |
| 816.01 - General Wildlife | #13940-7 | Management Action #4408 under Alternative B allows "water development only if wildlife habitat and resource conditions would be improved or maintained." Id. at 2-64. The BLM needs to look at water developments for other uses, such as livestock grazing, rather than from just a wildlife habitat and resource conditions perspective. If the BLM only considers what is good for wildlife, then they are ignoring their management mandates for other resources. | A range of alternatives has been analyzed for water developments in Chapter 2 management action 4408. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.01 - General Wildlife | #13940-8 | Management Action #4420 under Alternative B would prohibit livestock grazing in big game parturition habitat from May 1 through June 30. Id. at 2-68. Livestock grazing has always been allowed in pastures containing wildlife and existing Allotment Management Plans do not provide for this limitation. The BLM must first determine that, pursuant to the Wyoming Land Health Standards, grazing is a causal factor in reducing forage within parturition habitat before reducing and/or limiting livestock grazing. Handbook 4180-1, pp. III-12 - III-14 (Jan. 19, 2001). | A range of alternatives has been analyzed for management of big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts of each of these alternatives is found in Chapter 4. |
| 816.01 - General Wildlife | #13940-9 | Management Action #4421 under Alternative B would "[p]rohibit surface disturbing or disruptive activities on big game crucial winter ranges, parturition areas, migration corridors and transitional habitats, as identified by WGFD." DEIS at 2-69. Again, the prohibition of "surface disturbing or disruptive activities" would also apply to any development of specific range improvements that may also support wildlife, such as water improvements. It is also unclear whether this restriction only applies seasonally versus year long. JRB opposes this management action as it could impact livestock grazing operations as well as prevent any other type of development. For the same reason, JRB objects to Management Action #4424. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.01 - General Wildlife | #13943-5 | The language in alternative D Management Action #4424 gives strong protections to WGFD designated migration corridors and allows the department flexibility on where development is sited. The BLM should consult with WGFD early and often to appropriately site development projects outside of designated migration corridors. To emphasize WGFD involvement, we request the following modifications be made for MA #4424 in alternative D. o The language in this Management Action states that the BLM will work with project proponents to create a conservation plan. We request that the BLM also work in partnership with WGFD to develop a conservation plan from the | A range of alternatives has been analyzed for designated big game corridors in chapter 2, management action 4424. Analysis of impacts for actions in each alternative is found in chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | outset. The management action should recognize WGFD's authority to manage wildlife and the important role the agency plays to inform land management decisions for the health of that wildlife on state and federal lands in Wyoming. | |
| 816.01 - General Wildlife | #13960-1 | Under plan B, predator control must be done by non-lethal methods only. This might work in a small, fenced in area, but not in a 3.6 million acre, mostly unfenced area. The result of this policy will increase the number of predators in the area and will cause more damage to the livestock industry as well as the wildlife numbers and recreational hunting. | A range of alternatives has been analyzed for animal damage control activities in Chapter 2.2.6 management action 4211. |
| 816.01 - General Wildlife | #14022-11 | MA#4411, SCCD has seen across not only the RSFO but most of BLM managed lands that exclosures are put in to address an issue then go unmaintained, eventually causing a resource issue themselves. BLM does not have the man power to maintain the range improvements that they currently have. SCCD feels that adding workload is not wise on the BLM's behalf. SCCD feels that in most situations a cooperative solution with grazing permittees can help solve the issue without adding exclosures to the landscape. | A range of alternatives has been analyzed for management of special management and riparian management exclosures in Chapter 2.2.6 management actions 4411 and 6407. |
| 816.02 - Big Game | #12-1 | I have no problem with the 15% excluded for deer and antelope protection from mineral extraction production. | Analysis of impacts to pronghorn and mule deer for actions In each alternative is found in Chapter 4 |
| 816.02 - Big Game | #42-1 | Returning the bison and limiting grazing on public lands to the extent that bison can coexist & reestablish ancestral migratory access is necessary. | Wild Bison restoration is outside of the scope of this document. See Chapter 1.4 Planning Criteria. |
| 816.02 - Big Game | #65-1 | you've opted to include animal data from 2005.... We're coming off of one of the worst winter kill years on record. So the numbers you have for deer and antelope are completely inaccurate. | See Executive Summary and 4.2.2 for adequacy of data and analysis. |
| 816.02 - Big Game | #189-1 | If BLM is so concerned about "crucial winter range" for ungulates, BLM should stop the Chokecherry/Sierra Madre wind farms which are smack dab on the Wyoming mule deer winter range | The referenced wind farms are outside of the planning area and are outside of the scope of the document. See Chapter 1..2 for Purpose and Need for this document |
| 816.02 - Big Game | #4026-7 | Chapter 3.7.1 Wildlife and Fisheries Habitat, Wildlife. I feel this chapter should also include some language on big game migration routes and their importance in maintaining wildlife populations. The Wyoming Migration Initiative at the University of Wyoming has identified a number of significant wildlife migration routes within the district. That initiative has reported (Sawyer et. al, 2013) both impermeable (housing developments, Interstate highways, intense industrial development) and semi-permeable (roads, fences, dispersed industrial development) barriers can constrain the possible routes and ranges used by migrating animals. Semi-permeable barriers can impact the functionality of migration routes through increased detouring, increased rates of movement, and reduced stopover ability. The negative impacts from semi-permeable barriers, however, can be reduced through specific management actions. | See updated text in Chapter 3 regarding big game migration |
| 816.02 - Big Game | #4026-16 | Chapter 4.7.1 Wildlife and Fisheries, Assumptions. I recommend an additional assumption be made in this chapter as related to wildlife migration routes. This assumption could be worded: "Impermeable and semi-permeable barriers to wildlife migration can constrain the routes and ranges of migrating animals. The impacts of semi-permeable barriers to migrating wildlife can be reduced through specific management actions." | The assumptions listed in Chapter 4 apply to the analysis presented in the document. See Executive Summary and Chapter 4.2.2 for adequacy of assumptions, data an analysis |
| 816.02 - Big Game | #13210-65 | 4420 Alternative D Evaluate and adjust grazing schedules, at the time of permit renewal, if any conflicts with parturition areas exist. This management action supports agreements in principle # 4 and # 5. Alterative D is preferred because it appropriately defers consideration of potential grazing adjustments to meet conflicts, if any, with big game parturition, to the permit renewal process. Alternative D allows for site specific management with a flexible timeframe, while other alternatives require a specific timeframe. | A range of alternatives has been analyzed for livestock grazing in big game parturition in Chapter 2 management action 4420. Analysis of impacts from the actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13287-12 | The Rock Springs RMP should identify and protect wildlife migration corridors. Important migration corridors in the Field Office include the Red Desert - to - Hoback mule deer migration corridor, and the Path of the Pronghorn migration corridor, which extends from Jackson Hole to the environs of Interstate 80. The Red Desert - to - Hoback migration route likely would have extended southward beyond Interstate 80, but is interdicted by the highway and woven-wire fences designed to keep animals off the roadway. The proposed corridor (DEIS at Map 2-30) should be expanded slightly at its southern terminus to encompass mule deer wintering habitats along the Interstate. The BLM should also designated the Path of the Pronghorn migration route as an ACEC, like Red Desert-to-Hoback, but at present it is not designated for special protections. DEIS at Map 2-30. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555-7562. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13412-2 | The Red Desert to Hoback migration corridor spans 150 miles and crosses private land, state trust land, United States National Forest land, and public land managed by the BLM. This migration corridor is the longest known mule deer migration corridor in the United States and is traveled by approximately 5,000 deer biannually. Alternative B would designate a new ACEC called the Big Game Migration Corridor ACEC. This ACEC would contain significant portions of the Red Desert to Hoback migration corridor. As I am following the the Select Committee on Federal Natural Resource Management (Committee) of the Wyoming Legislature, the Committee heard testimony from Wyoming's Game and Fish Department at our meeting on October 6, 2023 that Alternative B's inclusion of the Red Desert to Hoback migration corridor within the ACEC would be detrimental to the Wyoming Game and Fish Department's management of wildlife populations within the migration corridor. I support the hard work the Wyoming Game and Fish Department has put into migration corridors. I am committed to conserving | A range of alternatives has been analyzed for the big game migration ACEC in Chapter 2 management actions 7555-7562. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | these vital migration corridors to help maintain wildlife populations. I believe that designating migration corridors within ACEC is not in the best interest of the state or the wildlife. | |
| 816.02 - Big Game | #13542-34 | MA#4404. Alternatives B and C. 2-63 The data used to develop the seasonal restrictions, surface use, and rehabilitation standards has not been ground truthed. The crucial winter range for antelope shows that a large section of a tailings pond and the surface facilities, buildings, parking lots, roadways, etc. at Sisecam Wyoming LLC are crucial winter range, when they provide no habitat for antelope. When an on-lease activity is authorized by the BLM for an underground mineral lease, seasonal restrictions apply to it regardless of location (i.e., disturbance within the footprint of the existing manufacturing facility). Data used to develop these restrictions should be updated and exceptions should be allowed to be granted for cases where the actual surface conditions do not warrant such restrictions. Without exceptions, these seasonal restrictions largely impact construction projects and upgrades at new and existing facilities, only allowing a few months of construction each year. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management actionand develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | See Glossary for a definition of 'crucial winter range'. A range of alternatives has been analyzed for surface use and seasonal restrictions in Chapter 2.2.6 management action 4404. Analysis of impacts for actions in each alternative is found in Chapter 4. Crucial Winter Range and other important big game habitats are designated by WGFD, see Chapter 1.4 Planning Criteria for applicable criteria |
| 816.02 - Big Game | #13542-36 | MA#4421. Alternative B. 2-69 The data used to develop the big game crucial winter ranges, parturition areas, migration corridors and transitional habitats has not been ground-truthed. The crucial winter range for antelope shows that a large section of a tailings pond and the surface facilities, buildings, parking lots, roadways, etc. at Sisecam Wyoming LLC are crucial winter range, when they provides no habitat for antelope. When an on-lease activity is authorized by the BLM for an underground mineral lease, seasonal restrictions apply to it regardless of location (i.e., disturbance within the footprint of the existing manufacturing facility). Data used to develop these restrictions should be updated and exceptions should be allowed to be granted for cases where the actual surface conditions do not warrant such restrictions. Without exceptions, these seasonal restrictions largely impact construction projects and upgrades at new and existing facilities, only allowing a few months of construction each year. In addition, closing all of these areas to solid mineral leasing and mineral material disposal, including trona, makes little difference in conservation efforts because these areas are mostly subsurface facilities with little to no surface impacts that could affect big game. Under Alternative B, by closing these areas to mineral material sales and disposals, the BLM would significantly limit potential areas for trona mines to place tailings back underground in previously mined out areas. Wyoming Department of Environmental Quality Land Quality Division Noncoal Chapter 3 Section 2(h)(ii) states that the State of Wyoming prefers that mines place tailings underground. By closing off significant portions of lands that could be used for tailings storage, the BLM's RMP is conflicting with the preference of DEQ LQD. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. Additionally, please analyze and disclose to the public the BLM's reasons for not following the regulations and recommendations of the expert state agency on this matter. | See Glossary for a definition of 'crucial winter range' and 'parturition area'. A range of alternatives has been analyzed for big game crucial winter range in Chapter 2 management action 4421. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. Crucial Winter Range, Parturition areas and big game Migration corridors are designated by WGFD.. |
| 816.02 - Big Game | #13542-37 | MA#4424. Alternatives A and D. 2-70 Define who will be identifying the big game corridors for the implementation of the RMP in the Rock Springs Field Office administered areas, as several sources have conflicting migration corridors, specifically for mule deer (Wyoming Game and Fish Department, WesternMigrations.net, etc.). Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424. Alt D identifies that the corridors are designated by WGFD. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for updated text. |
| 816.02 - Big Game | #13542-51 | Section 3.7.1. Wildlife and Fisheries Habitat. Mule Deer. 3-7 The reference used for mule deer populations was from 2005, 18 years ago. Why did the BLM choose to reference such aged data when there have been recent mule deer studies from the Wyoming Game and Fish Department? | See Executive Summary and Chapter 4.2.2 for adequacy of assumptions, data an analysis |
| 816.02 - Big Game | #13542-68 | Literature Cited. Sawyer, H. 2014a and 2014b. LC-16 These studies from 2014 are 9 years old. The Wyoming Game and Fish Department has several studies specifically focused on mule deer and other big game that are more recent and could have been used instead of the older data. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | See Executive Summary and Chapter 4.2.2 for adequacy of assumptions, data an analysis |
| 816.02 - Big Game | #13542-69 | Literature Cited. Sawyer, H. and M.J. Kauffman. LC-16 This study is from 2011 and is 12 years old. The Wyoming Game and Fish Department has several studies specifically focused on mule deer and other big game that are more recent and could have been used instead of the older data. Please revise and update the agency's analysis to include the latest data and disclose the same to the public. | See Executive Summary and Chapter 4.2.2 for adequacy of assumptions, data an analysis |
| 816.02 - Big Game | #13542-76 | Appendix B. M#7466. Alternative B. 106 The crucial big game winter ranges need to be ground truthed. The current antelope crucial winter range includes areas of active tailings ponds and soda ash manufacturing facilities, buildings, paved parking lots, roads, etc., that are not habitat for antelope, let alone crucial habitat. If the current dataset is used and Alternative B is selected, the RMP states that no exceptions, waivers, or modifications will be granted. This does not make sense when the data being used does not accurately reflect current habitat available for big game. Please analyze and disclose to the public the scientific justification for any restrictions contemplated | WGFD designates Big Game Crucial Winter Ranges. See Chapter 1.4 Planning Criteria for consultation with other agencies, including WGFD. |

|---|---|---|---|
| | | under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | |
| 816.02 - Big Game | #13556-1 | Big game migration corridors also need protections and their locations are a matter of research and on-going monitoring by WGF. Accurate evaluation of the impact of these migration corridors in very difficult until WGF releases the latest migration corridors map. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for updated text. |
| 816.02 - Big Game | #13574-1 | MA #4421 Alternatives C and D have language that meets big game habitat needs while providing specific dates which allow land users to plan their activities, and on a case-by-case basis apply appropriate mitigation practices and obtain exceptions where no undue impacts to big game will occur. Big game migration corridors also need protections and their locations are a matter of research and on-going monitoring by WGFD. Accurate evaluation of the impact of these migration corridors is very difficult until WGFD releases the latest migration corridors map. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13665-13 | As discussed above, an area may meet the criteria for a "relevant" "fish or wildlife resource" if it includes "habitat for endangered, sensitive or threatened species, or habitat essential for maintaining species diversity." 43 C.F.R. § 1610.7-2(a); Manual at § 1613.11(A)(2). Mule deer and other large game species (which are identified in the EIS at 3-7-3-8) are not endangered, sensitive, or threatened.9 In fact, BLM's EIS identifies federally listed wildlife in the planning area and "Wyoming BLM Sensitive Wildlife Species" that BLM has determined "require special management consideration to avoid potential future listing under the ESA." See id. at 3-10-3-12. Notably absent from either list are mule deer and other large game species. Nonetheless, BLM contends that it has evaluated the creation of the Big Game Migration Corridor ACEC "based on a citizen propos[al]"10 and that the ACEC meets the criteria for a "relevant" fish-and-wildlife resource simply because the area is a "significant migration corridor for large game species." Id. at C-62.11 That is patently insufficient for ACEC designation: big game are not a special status species and do not require special management consideration. | See Appendix C for evaluation of nominated ACECs and the relevance and importance criteria. A range of alternatives has been analyzed for big game migration corridor ACEC in Chapter 2 management actions 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13665-14 | Indeed, BLM fails entirely to explain why new special management for the big-game migration corridor is necessary. See id. at 2-210-2-211; C-62-C-63. BLM does not address why existing seasonal restrictions and surface-occupancy stipulations (in existing leases and following the Wyoming Game and Fish Department's guidance) are insufficient to protect the big-game migration areas. | See Appendix C for evaluation of nominated ACECs and the relevance and importance criteria. A range of alternatives has been analyzed for big game migration corridor ACEC in Chapter 2 management actions 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13665-15 | The recommendation also indicates that fences and other potential impediments should not be constructed. Id. Overall, as this guidance demonstrates, the Wyoming Game and Fish Department recognizes that oil-and gas development can occur within big-game migration corridors with a few limited restrictions. In managing wildlife habitat, the federal government should defer to the state's management prescriptions. As the D.C. Circuit explained, in enacting FLPMA, Congress "carefully and explicitly" "assigned the states the primary responsibility of management of wildlife programs within their boundaries." Defenders of Wildlife v. Andrus, 627 F.2d 1238, 1248 (D.C. Cir. 1980). | See Section 1.4 for the Planning Criteria, including compliance with FLPMA. See Appendix E for a list of laws and regulations that are applicable to this RMP. |
| 816.02 - Big Game | #13672-7 | Appropriate protections of big game crucial winter ranges and parturition areas are important. MA #4421 Alternative B for these areas imposes No Surface Occupancy (NSO) on fluid minerals, closes these areas to material sales, and closes these areas to all solid mineral (trona and coal) leasing. This is not necessary when field visits are made by BLM personnel with land users including project proponents or when project proponents present credible data that enable decisions to be made as to what seasonal protections are needed. MA #4421 Alternatives C and D have language that meets big game habitat needs while providing specific dates which allow land users to plan their activities, and on a case-by-case basis apply appropriate mitigation practices and obtain exceptions where no undue impacts to big game will occur. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13702-7 | MA 4421 Alternative B- closes these areas to material sales and closes these areas to all solid mineral (trona and coal) leasing due to No Surface Occupancy. This is not acceptable. Big game migration corridors also need protections, and their locations are a matter of research and on-going monitoring by WGFD. Accurate evaluation of the impact of these migration corridors is very difficult until WGFD releases the latest migration corridors map. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13702-15 | The BLM should defer to the Wyoming Game & Fish Department (WGFD) guidelines for surface disturbing activities in big game crucial winter habitat and parturition areas. | See Chapter 1.4 Planning Criteria for preliminary planning criteria |
| 816.02 - Big Game | #13720-14 | Existing leases with valid lease rights can be drilled with submittal of an Application for Permit to Drill (APD) right now. Map A shows currently-active, BLM oil and gas leases that intersect the Red Desert to Hoback mule deer migration corridor. If developed, these leases have the potential to sever the mule deer migration, perhaps forever. Given the abundance of oil and gas leases active and available for development today, but not utilized by operators, it makes sense to allow withdrawals from mineral location to help protect and preserve valuable wildlife habitats and other important natural resources managed by the BLM. | See Chapter 1.4 Planning Criteria for valid and existing rights. A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13751-81 | MA #4421 Alternative B for these areas imposes No Surface Occupancy (NSO) on fluid minerals, closes these areas to material sales, and closes these areas to all solid mineral (trona and coal) leasing. This is not acceptable. MA #4421 Alternatives C and D have language that meets big game habitat needs while providing specific dates which allow land users to plan their activities, and on a case-by-case basis apply appropriate mitigation practices and obtain exceptions where no undue impacts to big game will occur. Big game migration corridors also need | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | protections and their locations are a matter of research and on-going monitoring by WGFD. Accurate evaluation of the impact of these migration corridors is very difficult until WGFD releases the latest migration corridors map. | |
| 816.02 - Big Game | #13751-82 | #4424 Alternative B imposes no surface occupancy (NSO) to fluid minerals, closes areas to mineral material sales, and closes areas to all solid mineral leasing. This alternative is unacceptable because it has high potential to shut down a large amount of mineral leasing which will have a broad negative economic impact. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. Socioeconomic impacts for all four alternatives can be found in Chapter 4 and Appendix N. |
| 816.02 - Big Game | #13751-83 | MA #4424 Alternatives C and D, though not acceptable on their own, have acceptable language that would allow for surface occupancy with protective measures and mitigation practices that will protect corridors and migrating big game. These would be worked out on a case-by-case basis in consultation with WGFD and BLM. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424. |
| 816.02 - Big Game | #13751-129 | MA #4419 ALT B Manage wildlife habitat to provide forage to support the WGFD 2009 (or subsequent approved) Strategic Habitat Plan in the attainment of big game herd unit objectives, strategic population plans, and aquatic basin management plan objectives. Consider habitat capability and availability during coordination with WGFD for changes to plan objectives. Industry Position: Not acceptable Reason: Industry supports WGFD herd unit objectives and population plans but habitat capability and availability are subjective enough to lead to NSOs where appropriate mitigation would provide adequate habitat protection. ALT C Manage wildlife habitat, to the extent possible, to provide forage for all resources. Consider habitat capability and availability during coordination with WGFD for changes to plan objectives. Industry Position: Not acceptable Reason: Industry supports WGFD herd unit objectives and population plans but habitat capability and availability are subjective enough to lead to NSOs whereas appropriate mitigation would provide adequate habitat protection. | A range of alternatives has been analyzed for wildlife habitat to support WGFD strategic plans in Chapter 2 management action 4419. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13751-130 | MA #4421 ALT A In the JMH planning area, disruptive activities would be prohibited in big game crucial winter range between November 15 and April 30. Seasonal limitations may be excepted, provided criteria in Appendix B can be met and appropriate mitigation can be implemented (as determined by the BLM). Mitigation of adverse effects (e.g., noise and traffic) on all habitats would be determined and applied on a case- by-case basis. Steamboat Mountain ACEC is closed to motor vehicle use from May 10 to July 1 for crucial birthing habitat for deer and elk. Industry position: Acceptable but applicable to JMH so another alternative is needed. Alternative B Prohibit surface disturbing or disruptive activities on big game crucial winter ranges, parturition areas, migration corridors and transitional habitats, as identified by WGFD. Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing. Steamboat Mountain ACEC is closed to motor vehicle use from May 1 to June 30 for crucial birthing habitat for deer and elk. Industry position: Not acceptable Reason: Areas within the KSLA should not be closed to trona leasing. Alternative C Restrict surface disturbing and/or disruptive activities in big game crucial winter range between November 15 and April 30. Restrict surface disturbing and/or disruptive activities in big game birthing areas between May 1 and June 30. Grant exceptions if impacts could be mitigated in accordance with exception criteria (see specific exception/waiver/modification criteria, Appendix B). Determine and apply mitigation of adverse effects (e.g., noise and traffic) on all habitats. Steamboat Mountain ACEC is closed to motor vehicle use from May 1 to June 30 for crucial birthing habitat for deer and elk. Industry position: Acceptable Reason: Specific dates enable planning and management. This should also enable exceptions to be considered case by case, site-specific, and project-specific. Alternative D Allow surface disturbing activities on big game crucial winter ranges and parturition areas subject to adequate mitigation of impacts following BLM mitigation policies. Avoid disruptive activities in big game crucial winter range between November 15 and April 30. Avoid disruptive activities in big game parturition areas between May 1 and June 30. Grant exceptions if impacts could be mitigated in accordance with exception criteria (see specific exception/waiver/modification criteria, Appendix B). Determine and apply mitigation of impacts (e.g., noise and traffic) on all habitats and habitat functionality. The Elk Parturition area within the Steamboat Mountain ACEC is closed to motor vehicle use from May 1 to June 30 for crucial birthing habitat for deer and elk. Industry position: Not acceptable Reason: Language is mostly acceptable, but modifications are recommended. MA #4422 NOT ACCEPTABLE SEE 4421 | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13751-131 | MA #4424 ALT B Identify and preserve wildlife species migration and travel corridors. Prohibit surface- disturbing activities within ½ mile of big game migration corridors to avoid constriction of current or future identified big game corridors. Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing. Industry position: Not acceptable. Reason: Trona leasing and development should not be closed in the KSLA. This alternative would shut down a large amount of trona leasing and development in the KSLA. Migration corridors are hard to evaluate until WGFD releases latest migration corridors map. ALT C Restrict, on a case by case basis, surface disturbing activities within identified wildlife migration corridors. Industry position: Not acceptable. Reason: Industry recognizes the necessity for protections for wildlife migration corridors. Development of surface facilities needed for trona production in the KSLA should be allowed with appropriate protective measures to be determined case by case. | A range of alternatives has been analyzed for wildlife habitat to support WGFD strategic plans in Chapter 2 management action 4419. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13751-132 | MA #4426 ALT A Big game crucial winter ranges and birthing areas are open to further consideration for federal coal leasing and development with a provision for maintaining a balance between coal leasing and development, and adequate crucial winter range and birthing area habitats to prevent significant adverse impacts to important big game species. This would be accomplished through controlled timing and sequencing of federal coal leasing | A range of alternatives has been analyzed for big game crucial winter range in Chapter 2 management action 4426. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | and development in these areas. For example, satisfactory abandonment and adequate reclamation of mined lands in big game crucial winter ranges and birthing areas would be required before additional federal coal leasing and development is initiated in the same crucial winter ranges and birthing areas. Industry position: Not acceptable. Reason: A mining and reclamation schedule that allows for the orderly and environmentally sound development of the coal reserve is developed by the operator and reviewed and approved by WDEQ-LQD in the operator's mine permit. WDEQ-LQD has primacy, WGFD and BLM have consultation, and USOSMRE has oversight. Alternative B Close big game crucial winger ranges and parturition areas to further consideration for federal coal leasing and development. Industry position: Not acceptable. Reason: The need to protect big game crucial winter range and parturition areas is respected. To close these areas completely is overly restrictive. Allowance should be made for the orderly development of the coal resource through a mining and reclamation schedule reviewed and approved by WDEQ-LQD. Reclamation should be timely as the coal is mined and return the functionality of these habitats. Alternative C Open big game crucial winter ranges and parturition areas for further consideration for coal leasing and development. Maintain a balance between coal leasing and development and maintaining adequate levels of these habitats. Prevent significant adverse impacts to these habitats. Open big game crucial winter ranges and parturition areas to further consideration for federal coal leasing and development with a provision for maintaining a balance between coal leasing and development, and adequate crucial winter range and birthing area habitats. Prevent significant adverse impacts to important big game species through controlled timing and sequencing of federal coal leasing and development in these areas. Industry position: Not acceptable. Reason: Most of this language is acceptable but "adverse" impacts is open to interpretation and open-ended. | |
| 816.02 - Big Game | #13751-133 | MA #4427 ALT A Vehicular travel in crucial and important wildlife habitats and during crucial and important periods (strutting grounds, spawning beds, big game ranges, calving/fawning periods, etc.) would be restricted seasonally, as necessary. Industry position: Not acceptable. Reason: The need for protective measures is accepted. Allowance should be made for determination of protective measures case by case that protect the wildlife resource and allow for access to surface facilities needed for trona production in the KSLA. ALT B Seasonally close vehicular travel in crucial and important wildlife habitats and during crucial and important periods (big game crucial winter ranges 11/15-4/30, deer parturition areas 5/1-6/30, elk calving areas 5/1-6/30, moose calving areas 5/1- 6/30, raptor nesting areas 2/1-7/31). See Appendix J. Industry position: Not acceptable. Reason: This alternative applies the season and distance restrictions in Appendix J. Appendix J Alternative B has a 2-mile restriction on raptors. Two miles exceeds USFWS guidance. ALT C Limit vehicular travel to designated roads and trails in crucial and important wildlife habitats and during crucial and important periods (big game crucial winter ranges 11/15-4/30, deer parturition areas 5/1- 6/30, elk calving areas 5/1-6/30, moose calving areas 5/1-6/30, raptor nesting areas 2/1-7/31). Industry position: Not acceptable. Reason: Limitation to "designated roads" potentially restricts access to surface facilities that are needed for trona production in the KSLA. Allowance is needed to develop protective measures case by case in consultation with USFWS and BLM. ALT DSeasonally close, on a case-by-case basis, vehicular travel in designated crucial winter ranges and parturition areas during key periods (big game crucial winter ranges 11/15-4/30, big game parturition areas 5/1- 6/30). Exceptions will be granted for administrative use. See Appendix J. Industry position: Not acceptable. Reason: Appendix J Alternative D contains some distance restrictions that exceed USFWS guidance. | It should be noted that Alternative A is the existing management plan that has been in place since 1997. A range of alternatives has been analyzed for big game crucial winter range in Chapter 2.2.6 management action 4427. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13775-3 | Categorical prohibition on surface disturbance should be replaced with limitations within specific timelines which give predictability and certainty to operators. Further, there should be exceptions, waivers, or modifications that can be utilized for applicable cases. BLM-WY's current management practices under Alternative A already utilizes these concepts via predictable seasonal limits in MA#4421 in combination with exceptions, waivers, and modifications. BLM- WY should take the approached used in MA#4421 - which is confined to the Jack Morrow Hills Planning Area - and apply it to the entire planning area as appropriate. | A range of alternatives has been analyzed for big game crucial winter range in Chapter 2.2.6 management action 4421. Exceptions, modifications and waivers are analyzed in multiple alternatives for the planning area. Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13783-16 | BLM proposes in Alternative B to put all areas newly closed to oil and gas leasing off limits to surface occupancy or disturbance to protect "important habitats." Draft EIS at 2-68 (MA # 4417). BLM also proposes to replace big game seasonal restrictions with a year-round prohibition on surface disturbance in big game crucial winter range, parturition areas, migration corridors and transitional habitats, as identified by the Wyoming Game and Fish Department. EIS at 2-69 (MA # 4421). In essence, all important big game habitats would be off limits to surface uses as part of oil and gas development. BLM does not explain why current seasonal restrictions are inadequate to protect wintering, calving, or migrating game animals. Moreover, BLM's proposal to foreclose other surface uses outright in these habitats is contrary to Wyoming Game and Fish Department management recommendations. | A range of alternatives has been analyzed for big game crucial winter range in Chapter 2.2.6 management actions 4417 and 4421 . Analysis of impacts of each of the actions in these alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13783-17 | Here, Wyoming has applied conservative approaches to managing big game throughout the State and within the Rock Springs planning area, including seasonal drilling restrictions. For instance, the Wyoming Game and Fish's Recommendations for Development of Oil and Gas Resources Within Important Wildlife Habitat, Version 6.0, Table 1 (Apr. 2010), recommends seasonal closures, rather than wholesale exclusion areas, in crucial big game habitat. BLM's proposal to override the State's balanced wildlife management scheme with blanket restrictions on all new surface uses in designated habitats flies in the face of multiple use management and the federal government's FLPMA obligation to follow the State's lead on wildlife protection | A range of alternatives has been analyzed for management of fish and wildlife and their habitats in Chapter 2.2.6 management actions 4400-4436. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816.02 - Big Game | #13811-9 | BLM further proposes to "[p]rohibit surface-disturbing activities within ½ mile of big game migration corridors to avoid constriction of current or future identified big game corridors."24 Big game migration corridors are designated by the WGFD. Currently, no WGFD-defined migration corridors exist in proximity to the Dry Creek Project; however, WGFD is currently reviewing data relative to pronghorn and mule deer movement patterns, and new migration corridors could be designated in the future. Without grandfathering protections, designation of a future migration corridor near the Dry Creek Project infrastructure after construction of the Project may limit the use or maintenance of certain Dry Creek Project infrastructure. | See Chapter 1.4 Planning Criteria for valid and existing rights. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13845-1 | Alternative B offers the strongest level of conservation for identified big game migration corridors (MA-4421 and MA-4424) though in order to better conform with current state policy and best-known science, Pew recommends a tiered management approach that applies different levels of management prescriptions to various levels of use of the corridor by animals, as defined by scientific analyses. This tiered management approach should include the following: * Bottleneck, Stopover, and High-Use habitats should prohibit surface disturbance altogether and enact seasonal closures for permitted human activities. * Medium and low-use habitats should allow development with a 3% disturbance cap for mule deer and a 1% disturbance cap for pronghorn, stemming from best available science. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13845-2 | Pew strongly recommends that the BLM apply conservation management prescriptions as outlined in MA-4421 to migration corridors identified through a rigorous scientific analysis, rather than only to those corridors identified by the Wyoming Game and Fish Department. In doing so, the BLM would recognize that scientific study and migration identification can occur through a variety of reputable sources, including the University of Wyoming and other federal agencies such as the United States Geological Survey's Corridor Mapping Team. We support the management prescriptions that MA-4421 applies to winter range and parturition areas due to their essential role in supporting healthy herds of big game species and their unique sensitivity to development impacts. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13865-20 | E. MA #4426 Alternative B of MA #4426 closes areas that are near winter ranges and parturition areas to further development considerations including coal leasing. The effects of development on big game populations can be mitigated and a balance maintained through currently employed practices. The BLM should have the flexibility to consider further development and whether impacts of future projects could be mitigated. An outright closure of the winter ranges and parturition areas without consideration of other impacts or if the impacts from development could be mitigated appears to be at odds with the BLM mission to "...sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations." Coal leasing and development are significant sources of revenue to the local economy and to local and state governments and closing areas to future development and coal leasing would likely impact this revenue source. PacifiCorp recommends that the BLM adopt Alternative A or D (both are the same), as this would provide flexibility to consider each project on a case-by-case basis, rather than a blanket closure. | A range of alternatives has been analyzed for big game crucial winter range and parturition areas in management action 4426. Analysis of impacts of the actions for each alternative can be found in Chapter 4. |
| 816.02 - Big Game | #13865-45 | Similarly, much of BCC's permit area is considered antelope crucial winter range. Western portions within the permit boundary also have overlapping crucial elk winter range. Any of the big game seasonal restrictions and stipulations in Alternatives B or D that would require surface disturbing activities to stop or severely restrict surface disturbing activities in these areas could have impacts on operations including those that allow BCC to meet regulatory, permit, and lease obligations such as contemporaneous reclamation requirements and monitoring requirements. | See Chapter 1.4 Planning Criteria for valid and existing rights. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13899-25 | BLM must adopt a science-driven, tiered management approach for known and not-yet identified big game migration corridors. The science on ungulate migrations continues to evolve and has revealed how animals use different areas, or habitats, within a corridor at different intensities. For instance, mule deer have been shown to spend 95% of the migratory period foraging and resting at stopover sites. Sawyer and Kauffman (2011), identified that habitat quality is higher in stopovers than in the area between stopover sites and deer used the same stopover areas between years during all migratory periods | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13899-26 | Because of the emerging research about habitat components (stopover, bottlenecks, high-, medium-, and low-use areas) of migration corridors, we encourage the BLM to implement a tiered approach to big game migration corridors in the draft RMP. The failure to incorporate specific management guidance in the RMP will almost certainly result in projects that harm the corridor. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13899-27 | To avoid the situation we described above in the Pinedale Field Office, and to provide both clarity and durability of management through this RMP, we recommend BLM design targeted management for each component of a big game migration corridor. The tiered management approach should generally consist of: ? Bottleneck, Stopover, and High-Use habitats should prohibit surface disturbance and enact seasonal closures for permitted human activities. ? Medium and low-use habitats should limit development: we recommend a 3% density disturbance cap for mule deer medium and low use; a 3% density disturbance cap for pronghorn low-use; and a 1% density disturbance cap for pronghorn medium-use | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13899-36 | Researchers have identified several big game migration corridors in the Rock Springs Field Office, and more could be found in the future. For example, the Path of the Pronghorn (or Sublette Pronghorn migration corridor) has been recognized and mapped for years; early in 2024 the State of Wyoming will consider designating it. Yet, | A range of alternatives has been analyzed for big game migration corridors in Chapter 2 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | the draft RMP is silent regarding this important migration corridor. We support BLM's intent, in Alternative B, to determine management in the RMP for corridors that are identified in the future. As the case study from the Pinedale Field Office, discussed above, shows, the combination of a newly identified and designated corridor and a RMP that does not acknowledge or have management guidance for it can result in projects sited within corridors, impacting the functionality and risking habitat loss and fragmentation. We recommend BLM adopt the tiered management approach described above for corridors that will be identified in the coming decades, after this RMP is finalized, and to consider incorporating the Sublette Pronghorn into the RMP before the signing of the ROD. | |
| 816.02 - Big Game | #13899-37 | MA-4424: Identify and preserve wildlife species migration and travel corridors. Prohibit surface- disturbing activities within 1/2 mile of big game migration corridors to avoid constriction of current or future identified big game corridors. Manage as: 1) NSO for fluid minerals; 2) closed to mineral material sales/disposal; 3) closed to all solid mineral leasing. ? Revise to: Identify big-game migration corridors using the best available science. Ensure continued functionality of migrations with the tiered management approach described above, including prohibiting surface disturbance in Bottleneck, Stopover, and High-Use habitats (by closing to fluid and solid mineral leasing, pursuing a locatable mineral withdrawal, and excluding rights-of-way) and enacting seasonal closures for permitted human activities. Medium and low-use habitats could allow development with a 3% disturbance cap for mule deer and pronghorn low-use, and a 1% disturbance cap for pronghorn medium-use. Evaluate and update migration habitats every three years to account for best available science. ? Justification: The BLM should manage for all corridors that are identified by peer- reviewed research (e.g. USGS Ungulate Migrations of the Western United States Volumes 1-399100101). Corridors should be modeled using the best available science for all herds and species that have sufficient data available. Identifying migratory routes and the landscape attributes associated with them are keys to protecting, enhancing, and mitigating habitat needed to sustain migrations and ungulate populations102. A buffer around corridors is not necessary. | A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13899-38 | The BLM should ensure adequate protections for Big Game Crucial Winter Range Big game crucial winter ranges are essential habitats for ungulates at a time of year when these animals are often at their most nutritionally stressed103 and disturbances on winter range can have a negative impact on herd health and population numbers. For instance, mule deer populations studied on the Pinedale Anticline natural gas field declined by 36% in response to direct habitat loss of winter range from well pads and roads covering only 3.5% of the study area104. We applaud the BLM for analyzing no-surface occupancy stipulations for oil and gas leases, closures for solid mineral leasing, and closures to wind and solar energy development for these habitats in Alternative B. Management options in Alternative C and D are far too permissive, focusing only on seasonal activity restrictions with abundant exceptions outlined. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13899-39 | The impacts of development on winter range are not just from human activity itself but the loss of habitat and the long-term avoidance of infrastructure and have been reported for pronghorn105, mule deer106, and elk107 in the region. We believe big game winter ranges could be managed through low caps on disturbance densities in deference to BLM's multiple use mandate if based on disturbance thresholds reported in peer-reviewed literature. However, because this concept is not within the range of alternatives, we support Alternative B's no- surface occupancy stipulations for oil and gas, closures to renewable energy projects, and restrictions on solid mineral leasing. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13899-40 | Additionally, the BLM needs to account for spatial adjustments to habitat boundaries based on updated science, including studies funded by the BLM. These include: ? Sawyer, H. 2014. Seasonal distribution patterns and migration routes of mule deer in the Red Desert and Jack Morrow Hills Planning Area. Western Ecosystems Technology, Inc., Laramie, WY. ? Sawyer, H. 2015. Seasonal distribution patterns of the Steamboat Elk Herd west of US Highway 191. Western Ecosystems Technology, Inc., Laramie, WY. ? Sawyer, H. 2015. Seasonal distribution and movement patterns of pronghorn northeast of Rock Springs. Western Ecosystems Technology, Inc., Laramie, WY. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. |
| 816.02 - Big Game | #13899-41 | The BLM should ensure adequate protections for Big Game Parturition Areas Parturition areas represent important seasonal habitat for ungulates, where forage quality108, vegetative cover109, and freedom from human disturbance110 can influence neonate survival and eventual recruitment of new animals into the population. Given this, and because young animals are especially vulnerable during their first weeks of life, we support the use of identified big game parturition areas to guide management prescriptions that maintain habitat quality and limit disturbance to parturient, newborn, and lactating ungulates in the planning area. However, we do not believe these important habitats need to have the lengthy restrictions on grazing that are proposed in Alternative B. Instead, we advocate that grazing schedules and any need for exclosures (generally and within parturition areas) are evaluated and adjusted at the time of permit renewal-in consultation with the Wyoming Game and Fish Department. | A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. A range of alternatives was analyzed for Livestock Grazing Management in actions 6400-6417. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13899-42 | These important calving and fawning grounds do require restrictions on surface disturbances from fluid and solid mineral leasing and development. We support the closures outlined in Alternative B for mule deer parturition and believe that for elk parturition, a low disturbance cap of 2% could be appropriate-unless, of course, these areas are closed for other resources (like, ACEC designations). | A range of alternatives has been analyzed for big game parturition in Chapter 2.2.6 management actions 4419-4426. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816.02 - Big Game | #13905-5 | We support proposed prohibitions on wind development in raptor concentration areas and other sensitive habitats. These protections should be extended to solar developments, as these have been shown to block or impede antelope migrations. Wind Power in Wyoming: Doing it Smart from the Start (Attachment I) as a comprehensive blueprint for lands where wind power development should be excluded. Importantly, this report included as a Best Management Practice to keep big game seasonal habitats as "caution areas" rather than "exclusion areas" for wind development, pending scientific research to determine whether they should become exclusion areas. That scientific research has been completed, and these lands should also be treated as exclusion areas as a result of the finding that wind farm development results in large mammal avoidance. | A range of alternatives has been analyzed for protections to wildlife sensitive habitats in Chapter 2.2.6 management actions 4400-4436, and for renewable energy in management actions 6100-6108. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13908-4 | Based on the available literature, which we have provided below, we recommend integrating the following points into the Environmental Consequences assessment: * Avoidance behavior of migrating mule deer begins when development exceeds 3%. o Mule deer prefer intact habitat for stopover sites and may alter those sites to avoid disturbance while maintaining overall use of the migration path. * A disturbance threshold for migrating antelope is harder to define but varies between 1% and 9.25%. * Both mule deer and antelope avoid natural gas infrastructure during the crucial winter period, emphasizing the need to restrict development in critical areas to big game and reviewing proposed developments elsewhere on a case-by-case basis. We recommend considering the following scientific publications and adding additional supporting information into the DEIS as necessary. Aikens, E. O., Wyckoff, T. B., Sawyer, H., & Kauffman, M. J. (2022). Industrial energy development decouples ungulate migration from the green wave. Nature Ecology & Evolution, 6(11), 1733-1741. * Natural gas development within a migration corridor altered mule deer movements, reducing their ability to move with spring green-up. Sandoval Lambert, M., Sawyer, H., & Merkle, J. A. (2022). Responses to natural gas development differ by season for two migratory ungulates. Ecological Applications, 32(7), e2652. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. |
| 816.02 - Big Game | #13908-5 | Mule deer avoidance behavior began around 3% disturbance. o Antelope avoidance behavior was less consistent among spatial scales tested and varied between 1% and 9.25% disturbance during migration. * Mule deer and antelope on winter range avoided disturbance with no reliable disturbance thresholds identified. Sawyer, H., Lambert, M. S., & Merkle, J. A. (2020). Migratory disturbance thresholds with mule deer and energy development. The Journal of Wildlife Management, 84(5), 930-937. * Use by migratory mule deer decreased when disturbance percentage exceeded 3%. Seidler, R. G., Long, R. A., Berger, J., Bergen, S., & Beckmann, J. P. (2015). Identifying impediments to long-distance mammal migrations. Conservation Biology, 29(1), 99-109 | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13908-6 | Migrating antelope avoided heavily developed areas of a natural gas field during migration. * Wildlife-friendly fencing is effective at increasing or maintaining big game movement on the landscape. Sawyer, H., Korfanta, N. M., Nielson, R. M., Monteith, K. L., & Strickland, D. (2017). Mule deer and energy development-Long-term trends of habituation and abundance. Global Change Biology, 23(11), 4521-4529. * Mule deer continued to avoid disturbance and development in a natural gas field in western Wyoming over a 15-year period. o Disturbance percentage was 3.5% of the study area. o Mule deer used areas approximately 0.62 miles further from well pads compared with deer prior to development. * The intensity of avoidance lessened as winter severity increased, potentially as a result of access to forage and nutritional condition of mule deer. * Mule deer abundance decreased 36% during the study period. Sawyer, H., Beckmann, J. P., Seidler, R. G., & Berger, J. (2019). Long-term effects of energy development on winter distribution and residency of pronghorn in the Greater Yellowstone Ecosystem. Conservation Science and Practice, 1(9), e83. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13908-7 | Antelope avoidance of natural gas well pads increased by approximately 1,350 feet over the 13-year development period. * Antelope spent 22% less time (approximately 1 month) in the natural gas field after development. * The number of antelope that left the study area during the winter increased by 57% during the study period, suggesting loss of functional winter range. Wyckoff, T. B., Sawyer, H., Albeke, S. E., Garman, S. L., & Kauffman, M. J. (2018). Evaluating the influence of energy and residential development on the migratory behavior of mule deer. Ecosphere, 9(2), e02113. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2.2.6 management action 4421 and 4424. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13908-8 | The science evaluating impacts of wind and solar energy to big game are lacking, which should be reflected in the decision-making process. * Impacts of wind energy to antelope are variable although most studies have identified some level of avoidance behavior near turbines. * Poorly sited solar facilities can have significant negative impacts on antelope movement. We recommend considering the following scientific publications and adding additional supporting information to the EIS as necessary. Wind Energy Development Milligan, M. C., Johnston, A. N., Beck, J. L., Smith, K. T., Taylor, K. L., Hall, E., ... & Kauffman, M. J. (2021). Variable effects of wind-energy development on seasonal habitat selection of pronghorn. Ecosphere, 12(12), e03850. | A range of alternatives has been analyzed for protections to wildlife sensitive habitats in Chapter 2.2.6 management actions 4400-4436, and for renewable energy in management actions 6100-6108. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13908-11 | Winter survival was not significantly influenced by exposure to wind energy development during their study period (3 winters). o Survival increased as distance from major roads increased and time spent in sagebrush. Solar Energy Development Sawyer, H., Korfanta, N. M., Kauffman, M. J., Robb, B. S., Telander, A. C., & Mattson, T. (2022). Trade-offs between utility-scale solar development and ungulates on western rangelands. Frontiers in Ecology and the Environment, 20(6), 345-351. * Research was focused on antelope movement at the Sweetwater Solar facility, which is located on BLM-lands within the RSFO. * Sweetwater Solar facility is located within Antelope Crucial Winter-Yearlong Range. * Solar facility is a barrier to antelope, blocking access and reducing connectivity | A range of alternatives has been analyzed for protections to wildlife sensitive habitats in Chapter 2.2.6 management actions 4400-4436, and for renewable energy in management actions 6100-6108. Analysis of impacts for the actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | to formerly available habitats. o The single ~570-acre facility impacted 69% of resident antelope, 86% of local migrants, and 57% of Opal herd migrants. | |
| 816.02 - Big Game | #13912-16 | Big Game Crucial Habitats. BLM proposes to close all "big game crucial winter ranges, parturition areas, migration corridors, and transitional habitats" to surface disturbance or disruptive activities (MA# 4421). As shown in Map 3-3, these important big game ranges encompass vast areas throughout the RMP, including much of the checkerboard lands north of Interstate 80 and along the western edge of the RMP area, which also happens to overlap with the Known Sodium Leasing Area ("KSLA"). If implemented, these severe restrictions would hamstring project development throughout the checkerboard, in violation of BLM's obligation to allow for multiple uses. | See Section 1.4 for the Planning Criteria, including references to all alternatives compliance with FLPMA. A range of alternatives has been analyzed for surface disturbing and disruptive activities in big game crucial winter ranges, migration corridors and transitional habitats in chapter 2 management action 4421. Analysis of impacts of the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13912-17 | Importantly, BLM fails to explain why blanket, year-round restrictions are necessary throughout these massive habitats. BLM does not explain whether population trends under current management warrant such restrictions, or why less drastic measures would not be sufficient to address big game concerns. Moreover, blanket prohibitions that make no exception for seasonal use are inconsistent with Wyoming Game and Fish Department recommendations, which takes primacy in matters of wildlife management.3 Here, Wyoming has applied conservative approaches to managing big game throughout the State and within the Rock Springs planning area, including seasonal restrictions. BLM's proposal to override the State's balanced wildlife management approach is contrary to multiple use management and the federal government's FLPMA obligation to follow the State's lead on wildlife protection. | A range of alternatives has been analyzed for protections to wildlife sensitive habitats in Chapter 2.2.6 management actions 4400-4436. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13923-11 | The Sublette Mule Deer Migration Corridor should be recognized as a migration corridor Maintaining the functionality and permeability of this corridor is paramount for the health and longevity of the Sublette mule deer herd. Migration corridor functionality as defined in Executive Order 2020-1, Wyoming Mule Deer and Antelope Migration Corridor Protection (EO 2020-1) states, "Maintaining connectivity between summer and winter ranges to allow mule deer and antelope movements conducive to necessary foraging and rest during migration, based on best-available scientific data." Sportsmen support the management prescriptions outlined in EO 2020-1 and realize that this is meant to be an adaptive document. The Rock Springs Final RMP should include management prescriptions outlined in EO 2020-1 and be adaptive to accommodate any changes reflected in EO 2020-1 and/or any changes in the best available science. For example, if any new science dictates no surface occupancy (NSO) in high use or stopover habitat, then the sportsmen would support amending the management to reflect the contemporary science. | See updated text in Chapter 3 regarding existing big game corridors. A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13923-12 | In a study conducted just north of the RSFO, in the Pinedale Anticline, Sawyer et. al (2020) found that mule deer migration is disrupted when surface disturbance within a migration corridor, in sagebrush dominant landscapes, exceeds three percent. While this is a relatively low threshold, it does allow for some development within a corridor. The BLM NEPA Handbook directs the BLM to, "...use the best available science to support NEPA analyses…(BLM Handbook H-1790-1, p.55)" Similarly, a study conducted by Lambert et. al. (2022) conducted in the Green River Basin also found that mule deer begin avoiding areas during migration once a surface disturbance threshold of three percent is reached. The BLM should consider all relevant and contemporary science, including the studies described above and use their findings to inform management decisions in the final RMP and ROD. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13923-20 | Pursuant to NEPA, there is no requirement for federal agencies to adhere to Instruction Memoranda or Secretarial Orders when revising Resource Management Plans. These specific directives, SO 3362 and IM 2023-005, are extremely important, however, when contemplating management actions within the RSFO, which hosts a myriad of connected habitats that need to remain intact to ensure long term viability of big game species. Sportsmen request that the BLM follow the instructions outlined in IM 2023-005 and SO 3362 and work closely with the state of Wyoming, specifically the WGFD, to assess and prioritize the management of these important habitats. | See Chapter 1.4 Planning Criteria for compliance with applicable laws and policy, as well as coordination with the State of Wyoming and WGFD. |
| 816.02 - Big Game | #13943-2 | We request that BLM include language in the final RMP that is responsive to the most recent science through updated allocations and management actions, especially regarding the need for permeability within big game migration corridors and important seasonal habitats. o In a study conducted just north of the RSFO, in the Pinedale Anticline, Sawyer et. al (2020) found that mule deer migration is disrupted when surface disturbance within a migration corridor, in sagebrush dominant landscapes, exceeds three percent. While this is a relatively low threshold, it does allow for some development within a corridor. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13943-3 | * Recognize Secretarial Order 3362 and Instructional Memorandum 2023-005 in the final RMP: o Secretarial Order 3362 (SO 3362), Improving Habitat Quality in Western Big Game Winter Range and Migration Corridors, directs the appropriate bureaus within Department of the Interior to, "...work in close partnership with…Wyoming to enhance and improve the quality of big-game winter range and migration corridor habitat on Federal lands under the management jurisdiction of this Department in a way that recognizes state authority to conserve and manage big-game species…" | See Chapter 1.4 Planning Criteria for compliance with applicable laws and policy, as well as coordination with the State of Wyoming and WGFD. |
| 816.02 - Big Game | #13943-4 | studies suggest that current EO 2020-1 guidance for controlled surface use along with timing limitation stipulations in high use stopovers, and high, medium, and low use areas may need to be updated in the final plan to adequately ensure corridor connectivity. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816.02 - Big Game | #13943-6 | At a minimum, we ask the BLM to work with the WGFD and the state of Wyoming to apply management prescriptions as identified in EO-2021 for the corridor as the state moves forward with a state designation process. We request that BLM also include in its analysis the expectation/potential that the Sublette Antelope Herd will be designated by the state, and create additional standards, guidelines, and management actions that would apply once designation is complete. | See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. A range of alternatives has been analyzed for big game migration corridors in Chapter 2.2.6 management actions 4424 and 7555 - 7562. Analysis of impact for actions in each of the alternatives is found in Chapter 4. |
| 816.02 - Big Game | #13943-10 | All mapped big game crucial winter areas, parturition areas, stopover areas, and migration corridors should be fully considered in the RMP, and BLM should include management actions that avoid or significantly limit surface disturbing activities in those areas. * At a minimum, all formally designated migration corridors and non-designated corridors that have been recognized through a scientific, peer reviewed process should be managed in a manner that is consistent with the Wyoming Executive order 2020-1 and include the following oil and gas stipulations: no surface disturbance in bottlenecks, controlled surface use along with timing limitation stipulations in high use stopovers, and high, medium, and low use areas. | A range of alternatives has been analyzed for big game in Chapter 2.2.6 management actions 4419-4426. Analysis of impact for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and policy, as well as coordination with the State of Wyoming and WGFD. |
| 816.02 - Big Game | #13945-2 | 2. MA #4420 requiring no livestock grazing in big game parturition areas, which is most of the allotment used by this commentor, from May 1 to June 30. This would cause a one month reduction in the season of use, which is a crucial time period to have livestock on the allotment and off private land in order to grow winter feed. This MA would further interrupt pasture rotations on the allotment that have been carefully developed between the permittee and BLM staff. Again, the Draft EIS does not fully account for the social and economic impacts of delaying turnout for one month nor does it account for the environmental impacts caused by the disruption of established rotational grazing schemes. This MA also applies a sledge hammer approach to areas in which there is no documented conflict between big game parturition and livestock grazing. | A range of alternatives has been analyzed for livestock grazing and big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.02 - Big Game | #13951-4 | Page 2-68; Biological Resources #4420 "Prohibit livestock grazing in big game parturition habitat during the birthing season (usually from May 1 through June 30)." -The governor already has a task force to address wildlife corridors. The only reason to involve parturition is brucellosis. Alterative D is preferred because it appropriately defers consideration of potential grazing adjustments to meet conflicts, if any, with big game parturition, to the permit renewal process. Alternative D allows for site-specific management with a flexible timeframe, while other alternatives require a specific timeframe. | A range of alternatives has been analyzed for livestock grazing and big game parturition in Chapter 2.2.6 management action 4420. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #9793-4 | Currently, BLM restricts both "surface disturbing" and "disruptive activities" seasonally within 1/2- to 1-mile radius of occupied raptor nesting sites. Under the BLM's preferred alternative, these activities would be restricted "within a two-mile radius of occupied nests" as well as "historic raptor nesting sites" and "associated feeding grounds." The DEIS fails to provide a scientific reason for such expansion, and it is far beyond the recommendations set forth by the U.S. Fish & Wildlife Service (the agency with responsibility for these species) or in scientific literature on the subject. | A range of alternatives has been analyzed for raptors in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for the actions in each alternatives is found in Chapter 4. See Appendix J for summary of seasonal restrictions. |
| 816.03 - Raptors | #9794-1 | Map 3-4, is a map of raptor nests but includes nesting locations for ravens and Canada goose. Neither of these species are raptors and should not be included. | Changes have been incorporated to remove non-raptor species. |
| 816.03 - Raptors | #9846-3 | TP proposes to increase restrictions to protect raptors on public lands….with TP defining “raptor” to include “hawks, owls, vultures, ravens, and eagles.” Ravens aren’t raptors; raven nests on industrial equipment causes and creates health hazards for works. Suggesting that these nests should be protected is irresponsible and ignorant | See Chapter 1.4 Planning Criteria for compliance with applicable laws. Ravens are protected under the Migratory Bird Treaty Act. |
| 816.03 - Raptors | #10324-3 | 2.) Power lines and Raptors While power lines were mentioned in the EIS concerning preventing perches being developed on power lines to protect raptor prey species, however, I think it is important to consider how power lines impact raptors via electrocution. Within the RMP, there are six raptors that the BLM listed as a high priority for conservation, and there is a lot of content in the RMP about raptor habitat and nesting sites, however, there is very minimal consideration besides a small section in Alternative A about power lines near nesting sites. While this is very important, birds can fly, so only looking at the effect of power lines in nesting ranges is turning a blind eye to the problem. In 2021, the National Wildlife Federation published an article on this topic and shared the staggering data that as many as 11.6 million birds may be killed each year by electrocution via power lines, and due to the generally large size of raptors, like the charismatic bald and golden eagles, this puts species like this at severe risk.8 Throughout a 15 year study by the US Fish and Wildlife Service's National Forensics Laboratory examined over 400 birds within 13 species of raptors and concluded that almost 80% of the birds electrocuted were bald or golden eagles, which are two of the species mentioned on the RMP as species of conservation concern.8 Raptors, specifically eagles, are an iconic species not only in the US, but also in Wyoming, which draws people interested in bird and wildlife watching to the area, so it is important for the community to be interested and involved in raptor conservation. In the RMP, the 2016 Consumer Surplus Value for wildlife viewing was high valued at $1,722,409, which is not a number to push aside.5 In addition to wildlife viewing bringing money to the area, raptor and power line conclusions can become costly for utility companies, through events like power outages.9 There are relatively cheap solutions out there, to prevent these instances, so it is irresponsible for the RMP to not address this. This cost to the power company likely will trickle down to customers and can impact individuals in the surrounding area with power outages. Some of the ideas mentioned in the RMP including minimizing perches, like power lines, | See Chapter 1.4 Planning Criteria for compliance with applicable laws and policy. See the Executive Summary, Section 4.2.2 for Availability of Data and Incomplete information, and 4.2.3 for Analysis Assumptions for Adequacy of Data and Analysis. See Also Appendix A for Best Management Practices. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | where there is good habitat for hunting or nesting, are a great start. But it should be considered to look at power line development in areas of raptor migration and other protective technologies on the power lines itself. | |
| 816.03 - Raptors | #13210-118 | 4431 Alternative D Avoid surface disturbing and disruptive activities seasonally within the identified buffer of occupied nests and historic raptor nest sites (see Appendix J). Appendix J (Seasonal Wildlife Restrictions), referenced in Alternative D, includes the current USFWS guidance for appropriate buffer distances around raptor nest sites. One group expressed concern that there is discrepancy between Appendix J and current USFWS guidance and therefore desired to alter the management action language to direct the BLM to match this guidance rather than specific buffers outlined in Appendix J. | Appendix J is consistent with USFWS Wyoming Guidelines |
| 816.03 - Raptors | #13287-11 | We support the employment of raptor perch deterrents (DEIS at 2-82), but it is important to recognize that these are only partially effective. Such perch deterrents reduce, but do not eliminate, raptor perching (Slater and Smith 2010). Notably, it was golden eagles and ravens, two of the most important sage grouse predators and nest predators, respectively, that most effectively circumvented powerline perch inhibitors in this study. Within the range of the Gunnison sage grouse, Prather (2010) empirically found perch inhibitors to be ineffective at preventing raptor perching on smaller powerlines. The RMP amendment must include sufficient protections to keep such transmission lines at least 0.25 miles away from all Occupied and Unoccupied Habitats. | A range of alternatives for raptor perches is analyzed in Chapter 2.2.6 management action 4620. A range of alternatives for raptor nesting protections is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13353-11 | The 2023 Draft RMP/DEIS Glossary of Terms (page GL-24) has de?ned Raptors as: "Bird of prey with sharp talons and strongly curved beaks such as hawks, owls, vultures, ravens, and eagles." Map 3-4: Raptor Nest Sites, further expands this de?nition to include the following species: Northern Harrier, American Kestrel, Osprey, Bald Eagle, Prairie Falcon, Burrowing Owl, Red-Tailed Hawk, Canada Goose, Sharp-Shinned Hawk, Common Raven, Short-Eared Owl, Cooper's Hawk, Swainson's Hawk, Ferruginous Hawk, Turkey Vulture, Golden Eagle, Great Horned Owl, Merlin, and Unidenti?ed Raptors. However, Map 3-4 Raptor Nest Sites, does not include the required two-mile exclusion zone around each of these identi?ed raptor nests and associated feed grounds for the listed species. It appears the seasonal closures would impact the vast majority of the planning area. Please provide an accurate map indicating total areas that will be seasonally closed for wildlife habitat. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Maps of seasonal restrictions and closures can be found by alternative in maps 2.5 through 2-8. |
| 816.03 - Raptors | #13353-12 | The 2023 Draft RMP/DEIS seems to erroneously include several species as raptors in the glossary of terms and associated map, e.g., Canada Goose and Common Raven. These species are clearly not threatened or endangered species requiring special management action as de?ned in the Endangered Species Act (1973), nor are these species considered raptors. | Ravens and Canada geese are both protected by the Migratory Bird Treaty Act. |
| 816.03 - Raptors | #13542-3 | Historic Raptor Nests--Alternative B proposes to prohibit surface occupancy within one mile of historic raptor nest locations, not just active raptor nest locations; this has the potential to suddenly close many current operations that have valid existing rights to operate where a historic nest may have existed and will certainly limit the ability to continue with development of the trona resource to supply those existing soda ash production operations as the current active mining areas are depleted and we need to pursue mining in planned areas The term "Historic" raptor nest has been taken out of context of the original Green River RMP which was intended to reference historic raptor areas like Kinney Rim. Applying historic raptor nests to the entire RMP is unprecedented and not based on sound science. The timeline of Historic raptor nests is not defined. | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. |
| 816.03 - Raptors | #13542-39 | MA#4430. Alternative B. 2-73 By closing sodium prospecting in the MMTA within 1 mile of occupied and historic raptor nests and associated feeding grounds, the BLM would be limiting future extraction of naturally occurring trona and undermining the BLM's directive of multiple use of the managed lands in large areas. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | A range of alternatives is analyzed for raptor nest protections and buffers in Chapter 2.2.6 management action 4430. Assumptions for analysis can be found in 4.7.1. |
| 816.03 - Raptors | #13542-41 | MA#4430. Alternatives B and D. 2-73 How did the BLM define buffer distances for each species? BLM should consider allowing the term "appropriate distance" and "determined on a case-by-case basis" into each of the alternatives to allow for flexibility and real-world conditions. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | A range of alternatives is analyzed for raptor nest protections and buffers in Chapter 2.2.6 management action 4430. Assumptions for analysis can be found in 4.7.1. |
| 816.03 - Raptors | #13542-42 | MA#4431. Alternatives B, C, and D. 2-74 How did the BLM define buffer distances for each species? BLM should consider allowing the term "appropriate distance" and "determined on a case-by-case basis" into each of the alternatives to allow for flexibility and real-world conditions. Many existing industrial facilities are closer to occupied and historic raptor nesting sites than these alternatives allow. Please define raptor "associated feeding grounds" within the RMP, as this could apply to broad swaths of land depending on the definition used by BLM. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. A range of alternatives is analyzed for raptor nest protections and buffers in Chapter 2.2.6 management action 4430. Assumptions for analysis can be found in 4.7.1. |
| 816.03 - Raptors | #13542-43 | MA#4434. Alternatives B and D. 2-74 There is little value and high costs in time and personnel to conduct raptor surveys for all projects within a four-mile (or one mile for Alternative D) radius of surface disturbing or disruptive activities if the proposed activities are not scheduled to occur during raptor nesting seasons or are small projects | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | with little potential impact on raptors. An exception should be allowed for these required surveys and the distances should be reduced for these surveys | |
| 816.03 - Raptors | #13542-46 | MA#4620. Alternative B. 2-82 How will the BLM determine what new permitted vertical structures are suitable for raptor perching? Please analyze in detail and disclose to the public the scientific sources used to develop potential criteria to determine suitability, and potential mitigation measures that could be used to avoid impacts. | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. |
| 816.03 - Raptors | #13556-2 | MA#4428 Alternatives B, C, and D contain references to Appendix J which prescribes distances. These alternatives contain acceptable language but the references to Appendix J makes them unacceptable. In some cases, the distances listed in the alternative exceeds US Fish & Wildlife recommended distances. Since USFW has primary jurisdiction over raptor nests, eggs, and young, USFW recommended distances should be used. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13585-61 | Management Actions #4428 and #4430 under Preferred Alternative B, and other alternatives, could close areas where historic raptor nests are located instead of limiting it to only occupied nests. DEIS at 2-72 - 27-3. The County questions the protection of historic nests when the DEIS provides no explanation or scientific evidence establishing the need to protect historic nests. See BLM Handbook, Section 6.8.1.1 (requiring the identification of known and predicted effects that are related to the issues within an EIS). | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13585-62 | In addition to the issue of historic raptor nests, MA#4431places a buffer requirement of 2-miles from surface disturbing facilities which is more restrictive than United States Fish and Wildlife standards. The BLM has not provided information to support a 2-mile buffer zone. The BLM arbitrarily applied a 2-mile buffer zone. (See Attach. 13, Wyoming Ecological Field Office Protections for Raptors) | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13672-8 | The need to protect nesting raptors and species-specific requirements is understood and accepted. MA #4428 Alternatives B, C, and D contain references to Appendix J which prescribe distances. These alternatives contain acceptable language but the references to Appendix J makes them unacceptable. In some cases, the distances listed in the alternative exceed US Fish & Wildlife Service (USFWS) recommended distances. Since USFWS has primary jurisdiction over raptor nests, eggs, and young, USFWS recommended distances should be used. An acceptable alternative should reference USFWS recommended distances and allow case-by-case determination of distances based on species, topography, line of sight distances and additional protective measures to be worked out in consultation with USFWS, WGFD, and BLM. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13702-8 | MA 4428 Alternatives B, C, and D contain references to Appendix J which prescribes distances. These alternatives contain acceptable language but the references to Appendix J makes them unacceptable. In some cases, the distances listed in the alternative exceeds US Fish & Wildlife Service (USFWS) recommended distances. Since USFWS has primary jurisdiction over raptor nests, eggs, and young, USFWS recommended distances should be used. An acceptable alternative should reference USFWS recommended distances and allow case-by-case determination of distances based on species, topography, line of sight distances and additional protective measures to be worked out in consultation with USFWS, WGFD, and BLM. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13730-2 | On page 2-71 it states that a seasonal closure in raptor nesting areas and in Appendix J-2 the restrictions will be from feb 1-july 31 within two miles. There are no definitions for "active" or "historic" or "associated feeding areas" where are they? | See Map 3-4. |
| 816.03 - Raptors | #13730-3 | The plan lists raptors as hawks owls vultures ravens and eagles. RAVENS? they are not raptors! | Ravens are protected by the Migratory Bird Treaty Act |
| 816.03 - Raptors | #13751-46 | Per the current Green River RMP and Page 2-72 [Alternative A] of the Draft RMP/DEIS, a historic nesting site is an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors, such as Cedar Canyon, Four-J Basin, Kinney Rim." The term Historic Raptor Nests has been taken out of context in Alternative B. Although the glossary properly indicates temporal and spatial restrictions will not apply, Appendix J includes spatial and temporal restriction for historic raptor nests. In conformance with current science, 'historic' raptor nesting areas may be worthy of reference, but any seasonal buffers and no-surface-occupancy limitations must be based on sound science.[...]The Rock Springs Draft RMP/DEIS does not provide any scientific basis for raptor nest closures, rather the brief discussion on Page 4-56 is speculative and not based on specific biological statistics. Raptors are not on the Draft RMP/DEIS list of special status species.[...]The Rock Springs RMP must not just declare Historic Raptor Nest buffer areas as no-surface-occupancy because it has no basis on science. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13751-53 | Alternative B proposes to prohibit surface occupancy within one mile of historic raptor nest locations, not just active raptor nest locations; this has the potential to suddenly close many current operations that have valid existing rights to operate where a historic nest may have existed. The term "Historic" raptor nest has been taken out of context of the original Green River RMP which was intended to reference historic raptor areas like Kinney Rim. Applying historic raptor nests to the entire RMP is unprecedented and not based on sound science. The timeline of a Historic raptor nests is not being defined. Occupied includes the last 3 years, which is more appropriate and based on current information. The approved Kemmerer RMP does not use the same definition for "historic" raptor nests and is a better model to follow (see Kemmerer RMP Decision or management action #4044). | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 816.03 - Raptors | #13751-84 | The need to protect nesting raptors and species-specific requirements are accepted. MA #4428 Alternatives B, C, and D contain references to Appendix J which prescribes distances. These alternatives contain acceptable language but the references to Appendix J makes them unacceptable. In some cases, the distances listed in the alternative exceeds US Fish & Wildlife Service (USFWS) recommended distances. Since USFWS has primary jurisdiction over raptor nests, eggs, and young, USFWS recommended distances should be used. An acceptable alternative should reference USFWS recommended distances and allow case-by-case determination of distances based on species, topography, line of sight distances and additional protective measures to be worked out in consultation with USFWS, WGFD, and BLM. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13751-134 | MA #4428Alternative A Active and historic raptor nesting sites would be protected and managed for continued nesting activities. An active raptor nest is one that has been occupied within the past three years; a historic nesting site is an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors, such as Cedar Canyon, Four-J Basin, Kinney Rim, etc. The appropriate level of protection would be determined on a case-by- case basis depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors may require different types of protective measures (Appendix J). Industry position: not acceptable Reason: Industry supports distance restrictions in Appendix J for Alternative A and the importance of protecting occupied nests and future nesting opportunities. Industry favors distance restrictions for "occupied nests" as opposed to "active" nests that are not occupied. Industry disagrees with the definition BLM assigns to "active nest" as one that has been occupied within the past three years. This definition contradicts the memorandum dated June 14, 2018, issued by the USFWS Assistant Director, Migratory Birds to Regional Directors on the Subject "Destruction and Relocation of Migratory Bird Nest Contents. Footnote 2 on page 1 of that memorandum states "An active nest is one that contains viable eggs and/or chicks. A nest becomes active when the first egg is laid and remains active until fledged young are no longer dependent on the nest. Nests that are empty, contain non-viable eggs, are being built but do not have an egg in them are considered inactive." USFWS guidance should be followed since that agency has the primary jurisdiction over raptors, their nests, eggs, and young. The term historic raptor nest is properly defined here per the current RMP as follows: historic nesting site is an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors, such as Cedar Canyon, Four-J Basin, Kinney Rim, etc. The term "etc." must be removed here because it is too open ended and specific historic raptor nesting areas as presented in the current RMP must be defined. Alternative B Protect occupied nests and historic raptor nesting sites and associated feeding areas and manage for continued nesting activities. Determine, on a case-by-case basis, the appropriate level of protection depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors could require different types of protective measures (Appendix J). Industry position: not acceptable Reason: Appendix J for Alternative B sets a restricted area of two miles from active and historic nests for all raptor species. This distance exceeds the guidance for all raptor species in USFWS Wyoming Ecological Services Field Office March 9, 2022, guidance document Table 1 which sets distances for each applicable raptor species except bald eagles. Distances in that guidance range from 0.25 miles to 1.00 mile depending on species. Specific buffer distance recommendations for bald eagles in the USFWS California and Nevada dated May 2021 is 1 mile except for all activities except for blasting and other loud non-regular noises which is 2 miles. USFWS guidance should be followed since that agency has primary jurisdiction over raptors, nests, eggs, and young. Industry also notes a disagreement between the definition of Historic Raptor Nest on Glossary page GL-14 and Appendix J seasonal closure restrictions and restricted areas. The definition of Historic Raptor Nests in the Glossary states that "Temporal and special stipulations will not apply." Appendix J applies seasonal restrictions and restricted areas to historic nests in Alternatives B and D. Alternative C Protect occupied raptor nesting sites and managed for continued nesting activities. Determine, on a case-by-case basis, the appropriate level of protection depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors could require different types of protective measures (Appendix J). Industry position: not acceptable Reason: Industry supports the language in Alternative C but notes a contradiction between Alternative C language which uses "occupied nests" and Appendix J (J.3) Alternative C which uses "active nests." Alternative D No similar action (see other actions in this section) Industry position: Not acceptable. Reason: Industry notes that Appendix J (J.4) Alternative D contains a 2-1/2 mile restricted area distance from occupied and historic bald eagle nests. This distance exceeds USFWS recommendations referenced under Alternative A. Industry also notes a disagreement between the definition of Historic Raptor Nest on Glossary page GL-14 and Appendix J seasonal closure restrictions and restricted areas. The definition of Historic Raptor Nests in the Glossary states that "Temporal and special stipulations will not apply." Appendix J applies seasonal restrictions and restricted areas to historic nests in Alternatives B and D. MA #4429 SAME AS MA 4428 | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13751-135 | MA #4430 ALT A Project components, such as permanent and high-profile structures, e.g., buildings, storage tanks, power lines, roads, well pads, etc. are prohibited within an appropriate distance of active raptor nests. The appropriate distance (usually less than ½ mile) would be determined on a case-by- case basis and may vary depending upon the species involved, natural topographic barriers, and line-of-sight distances, etc. Placement of facilities, "on" (very low profile) or below ground, and temporary disruptive activities, such as occur with pipeline construction, seismic activity, etc., could be granted exceptions within ½ mile of active raptor nests, in certain | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | circumstances (Appendix J). Industry position: Not acceptable Reason: Alternative A is working as can be demonstrated by good raptor numbers in the area. However, surface facilities can often be located outside of an appropriate distance of ½ mile. In instances where ½ mile is not feasible in the KSLA allowance should be made for mitigation that does not disrupt the future nesting success of the raptor pair. Industry also notes that this MA and Appendix J (J.1) Alternative A applies to "active nests" presumably the BLM definition of active nest. USFWS definition of active nest should be used. ALT B Prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds. This includes project components such as permanent and/or high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.). Manage as: 1) NSO for fluid minerals; 2) closed for coal and sodium prospecting; 3) closed to material sales; 4) avoidance area for new rights-of-way. Buffer recommendations could be modified on a site-specific or project-specific basis based on field observations and local conditions. Infrastructure (or facilities) that have potential to cause direct avian mortality (e.g., wind turbines, guyed towers, airports, wastewater disposal facilities, transmission lines), would follow USFWS recommendations to locate structures away from high avian- use areas such as those used for nesting, foraging, roosting or migrating, and the travel between high-use areas. Industry position: not acceptable Reason: Industry supports locating surface facilities so that impacts to raptors are prevented whenever feasible. A 1-mile prohibition is excessive. When surface facilities must be located to support leasable mineral extraction in the KSLA effective mitigation measures should be employed with the cooperation with the cooperation of BLM and USFWS and WGFD as necessary. The concept of historic raptor nests is being taken out of context under Alternative B. The current RMP uses the concept of historic raptor nest only for very specific locations. ALT CProject components, such as permanent and high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.) are restricted within an appropriate distance of occupied raptor nests. The appropriate distance (usually less than ½ mile) would be determined on a case-by- case basis and may vary depending upon the species involved, natural topographic barriers, and line-of-sight distances, etc. * CSU for fluid minerals. Industry position: not acceptable Reason: Industry largely agrees with this language except that language should be added that exceptions to the restriction are considered with implementation of effective mitigations within the KSLA. Mitigation measures will protect future nesting. ALT D Industry position: not acceptable Reason: The language of this MA is largely acceptable. Industry recognizes the need to protect raptor nesting success in areas of needed surface facilities. However, this MA should clearly state that buffer distances can be modified on a site-specific basis in the KSLA with the development of an appropriate mitigation and monitoring plan to protect nesting success and future nesting success in the nesting territory. The concept of historic raptor nests is being taken out of context under Alternative B. The current RMP uses the concept of historic raptor nest only for very specific locations. | |
| 816.03 - Raptors | #13751-136 | MA #4431 ALT A Industry position: Not acceptable: Reason: Industry respects the need to protect occupied raptor nests with appropriate distances. Distance determinations should be made case by case and be project specific with appropriate specific mitigation and monitoring plans. ALT B Industry position: Not acceptable Reason: A two-mile protective radius is excessive for occupied nests and not necessary for historic nests. Site-specific and project-specific mitigations can be applied to reduce the protective radius. ALT C Industry position: Not acceptable Reason: Industry supports a 1/2-mile buffer around occupied raptor nests, but allowance should be made for site-specific and project-specific mitigation and protective measures. ALT D Industry position: Not acceptable Reason: Appendix J sets a protective distance of 2-1/2 miles for occupied and historic bald eagle nests and 1 mile for occupied and historic ferruginous hawk nests. Industry recognizes the need for a larger protective distance for these two species relative to other raptor species and for the need to protect nesting success of occupied nests and future nesting. However, in the KSLA allowance should be made appropriate site- specific and project-specific mitigation and monitoring where surface facilities are needed to support leasable trona. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management action 4431. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13751-137 | MA #4434 ALT A Industry position: Not acceptable Reason: Raptor nest surveys should not be required if the surface disturbing activity is not in an area of raptor nesting habitat. A requirement for raptor nest surveys should be case by case. ALT B Industry position: Not acceptable Reason: Industry agrees with raptor survey in the area around proposed surface disturbance that is proposed to occur during the nesting season in areas of raptor nesting or in the area of permanent or long duration surface facilities. The requirement should be case by case. A four-mile radius is excessive; ½ to 1 mile is acceptable based on species expected to occur in the area. Once occupied nest(s) are located raptors can be expected to forage within 4 miles of the nest because most of their hunting will be within their nesting territory. ALT C Industry position: Not acceptable Reason: Industry agrees in large part with this MA in order to protect active raptor nests and future nesting when and where surface facilities are needed. Industry desires to add that nest surveys should be done case by case where suitable raptor nesting is identified. ALT D Industry position: Not acceptable Reason: Industry agrees with this language but would add if surface disturbing activities are proposed to occur during raptor nesting season. | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. |
| 816.03 - Raptors | #13751-138 | MA #4435 ALT A Industry position: Not acceptable Reason: Industry agrees with protective measures for fish spawning areas and application as necessary. Industry recommends allowance for mitigation and monitoring that will protect water quality and prevent erosion and sedimentation and disruption of spawning activity. ALT B Industry position: Not acceptable Reason: Area should not be closed to trona leasing within the KSLA. The TLS opens only 6 weeks during the late summer for construction of surface facilities. Allowance should be made case | A range of alternatives has been analyzed for fish bearing streams in Chapter 2.2.6 management action 4435. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | by case for construction of surface facilities in support of leasable trona where adequate mitigation can be applied. ALT D Industry position: Not acceptable Reason: Industry agrees that fish reproduction habitat should be protected. TLS stipulation leaves only 6 weeks open for construction of surface facilities. Allowance should be made for case-by-case review of surface facilities with adequate mitigation | |
| 816.03 - Raptors | #13752-8 | changing from species-specific buffer distances to a blanket one-mile buffer does not account for the unique biology of each species. EWAC encourages the BLM to be consistent with the USFWS and reference the Service's published raptor nest buffer distances rather than create arbitrary buffers for this Field Office (USFWS 2002, 2020). Raptor species vary in their sensitivity to human activity while nesting. Raptor protections should include allowing a biologist to monitor an occupied raptor nest while work is being done inside raptor nest buffers if it is appropriate for the species and type of work. Restrictions should not apply to raptor feeding areas, as this term is far too expansive. Raptors forage over large to very large areas, depending on the species. Indeed, nearly all of the Rock Springs Field Office could potentially fall under the category of a "raptor feeding area." | See Appendix J. A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13754-18 | Appendix J Table J.2 Seasonal Wildlife Restrictions applies a 2-mile restricted area around active and historic raptor nests from February 1 through July 31. These blanket restrictions are not supported by scientific studies and do not consider variable conditions such as nest condition, recent nest use/dis-use, topographic sight-line and sound barriers, or species- specific tolerance to human activity. With regard to buffers surrounding raptors nests, it has long been the practice of the BLM to defer to the U.S. Fish & Wildlife Service for those determinations. This coordination should continue allowing BLM biologists and USFWS to use their scientific and regional knowledge to analyze disturbance thresholds, topography and other sight-line and sound barriers around active raptor nests on a case-by-case basis | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13775-4 | The Preferred Alternative contains several provisions relating to surface occupancy and disturbance restrictions near raptor nests. Specifically, under MA#4428, BLM-WY would "Protect occupied nests and historic raptor nesting sites and associated feeding areas for continued nesting activities." The Preferred Alternative would also "Determine case by case the appropriate level of protection depending on species, topography, line of sight distances (Appendix J).19" This is problematic because, as previously mentioned, the distances described in Appendix J include a two-mile buffer from historic and active nests for all raptors. This exceeds USFWS' science-based guidance of 0.25 to one-mile buffers - which are meant to vary by species as opposed to Alternative B's categorical two-mile buffer for all raptor species - and is therefore arbitrary and unsupported. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13775-5 | the ubiquitous two-mile buffer does not give any consideration to specific locations, geography/topography, line of sight distances to nests from human activities, specific human activities in question, and individual raptor species' toleration of those activities. BLM-WY should provide itself with the ability to tailor protection measures based on circumstances such as - but not limited to - those described above. This can enable raptors to receive necessary protections at the proper time and in the proper manner while still allowing activities that do not actually harm or deter raptors from using nests to continue. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13779-7 | Management Action 4430 in the proposed alternative would prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds. Under current management practice, the distance between the nest and allowed surface occupancy is determined on a case-by-case basis (but is usually less than ½ mile). BLM does not explain why an increase from ½ to 1 mile is necessary. Nor does BLM explain how associated feeding grounds would be identified. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13787-47 | MA #2401 MR-02, MR-04 With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM- administered public lands and federal coal lands in the Green River planning area, except for those lands identified as closed, are open to coal resource inventory and exploration to help identify coal resources and their development potential Table 2-7 in Appendix V, Map 2- 9). Industry position: Not acceptable Reason: Industry agrees with most of the language in this management action but disagrees with the closure to coal leasing and development within ¼ mile of raptor nest sites under Alternative A in Appendix V Table 2-7 (page V-14). Exceptions should be made where the leasing proponent or coal mine operator has a raptor mitigation plan that has been reviewed and approved by the USFWS that protects raptor nesting success. Appropriate nest protections or mitigation measures will be applied. With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Not acceptable Reason: Appendix V Table 2-7 pages V-14 - V-15 closes coal leasing and development within one mile of active and historic raptor nest sites and in areas on which soils have the following properties: wind erodibility index>100, saline, sodic, saline- sodic, 2:1 clays, sand dunes, slopes>25%, slumps, difficult to reclaim. Exceptions should be made where leasing proponents and coal mine operators develop a raptor mitigation plan that is reviewed and approved by the USFWS that protects raptor nesting success. Reclamation research and mine reclamation practice has developed techniques to reclaim hard to reclaim soils and steep topography. Reclamation standards for mining on all soils are under the Wyoming Environmental Quality Act (WQA) and enforced under State primacy by WDEQ-LQD through that agency's | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. A range of alternatives is analyzed for raptor nest protections and buffers in Chapter 2.2.6 management action 4430. A range of alternatives are analyzed for other leasable minerals in Chapter 2.2.6 management actions 2400-2419. Assumptions for analysis can be found in 4.7.1. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | regulations and mine permits. With appropriate limitations and mitigation requirements for the protection of other resources values, all BLM-administered public lands and federal coal lands in the Rock Springs planning area, except for those lands identified as closed, would be open to coal resource inventory and exploration to help identify coal resources and their development potential (Table 2-7 in Appendix V, Map 2-10). Industry position: Acceptable Reason: Table 2-7 in Appendix V and Map 2- 10 show that the all BLM-administered public land and federal coal lands in the Rock Springs planning area are open for coal leasing and development except the most environmentally sensitive areas. Same as Alternative A. Industry position: Not acceptable Reason: Coal leasing and development should not be closed within ¼ mile of 100-year flood plains, wetlands, riparian areas, perennial streams, and within 500 feet of large ephemeral drainages (Appendix V Table 2-7- page V-14). Practices for runoff control, erosion and sediment control are well developed conservation measures and are applied by the coal industry. The WDEQ-LQD under the WQA and through their regulations and mine permits has regulatory authority over mining activities in these areas. Alternative C is acceptable. | |
| 816.03 - Raptors | #13787-59 | MA #4428 BR-21, BR-24, BR-35 Active and historic raptor nesting sites would be protected and managed for continued nesting activities. An active raptor nest is one that has been occupied within the past three years; a historic nesting site is an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors, such as Cedar Canyon, Four-J Basin, Kinney Rim, etc. The appropriate level of protection would be determined on a case-by- case basis depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors may require different types of protective measures (Appendix J). Industry position: Not acceptable Reason: Industry supports distance restrictions in Appendix J for Alternative A and the importance of protecting occupied nests and future nesting opportunities. Industry favors distance restrictions for "occupied nests" as opposed to "active" nests that are not occupied. Industry disagrees with the definition BLM assigns to "active nest" as one that has been occupied within the past three years. This definition contradicts the memorandum dated June 14, 2018, issued by the USFWS Assistant Director, Migratory Birds to Regional Directors on the Subject "Destruction and Relocation of Migratory Bird Nest Contents. Footnote 2 on page 1 of that memorandum states "An active nest is one that contains viable eggs and/or chicks. A nest becomes active when the first egg is laid and remains active until fledged young are no longer dependent on the nest. Nests that are empty, contain non-viable eggs, are being built but do not have an egg in them are considered inactive." USFWS guidance should be followed since that agency has the primary jurisdiction over raptors, their nests, eggs, and young. The term historic raptor nest is properly defined here per the current RMP as follows: historic nesting site is an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors, such as Cedar Canyon, Four-J Basin, Kinney Rim, etc. The term "etc." must be removed here because it is too open ended and specific historic raptor nesting areas as presented in the current RMP must be defined. Protect occupied nests and historic raptor nesting sites and associated feeding areas and manage for continued nesting activities. Determine, on a case-by-case basis, the appropriate level of protection depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors could require different types of protective measures (Appendix J). Industry position: Not acceptable Reason: Appendix J for Alternative B sets a restricted area of two miles from active and historic nests for all raptor species. This distance exceeds the guidance for all raptor species in USFWS Wyoming Ecological Services Field Office March 9, 2022, guidance document Table 1 which sets distances for each applicable raptor species except bald eagles. Distances in that guidance range from 0.25 miles to 1.00 mile depending on species. Specific buffer distance recommendations for bald eagles in the USFWS California and Nevada dated May 2021 is 1 mile except for all activities except for blasting and other loud non-regular noises which is 2 miles. USFWS guidance should be followed since that agency has primary jurisdiction over raptors, nests, eggs, and young. Industry also notes a disagreement between the definition of Historic Raptor Nest on Glossary page GL-14 and Appendix J seasonal closure restrictions and restricted areas. The definition of Historic Raptor Nests in the Glossary states that "Temporal and special stipulations will not apply." Appendix J applies seasonal restrictions and restricted areas to historic nests in Alternatives B and D. Protect occupied raptor nesting sites and managed for continued nesting activities. Determine, on a case-by-case basis, the appropriate level of protection depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. Different species of raptors could require different types of protective measures (Appendix J). Industry position: Not acceptable Reason: Industry supports the language in Alternative C but notes a contradiction between Alternative C language which uses "occupied nests" and Appendix J (J.3) Alternative C which uses "active nests." No similar action (see other actions in this section) Industry position: Not acceptable. Reason: Industry notes that Appendix J (J.4) Alternative D contains a 2-1/2 mile restricted area distance from occupied and historic bald eagle nests. This distance exceeds USFWS recommendations referenced under Alternative A. Industry also notes a disagreement between the definition of Historic Raptor Nest on Glossary page GL-14 and Appendix J seasonal closure restrictions and restricted areas. The definition of Historic Raptor Nests in the Glossary states that "Temporal and special stipulations will not apply." Appendix J applies seasonal restrictions and restricted areas to historic nests in Alternatives B and D. Protect occupied raptor nesting sites for continued nesting activities. Determine case by case the appropriate level of protection depending on species, topography, line of sight distances. Additional protective measures to ensure future nesting will be determined case by case. USFWS | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | distance guidance and definitions of active nests will be followed. BLM must continue to refer to historic raptor nests as currently approved in the RMP per Alternative A or remove those references entirely. Language is taken from Alternative C, but excludes the reference to Appendix J active nests. | |
| 816.03 - Raptors | #13787-60 | MA #4430 BR-21, BR-24, BR-35 Project components, such as permanent and high-profile structures, e.g., buildings, storage tanks, power lines, roads, well pads, etc. are prohibited within an appropriate distance of active raptor nests. The appropriate distance (usually less than ½ mile) would be determined on a case-by- case basis and may vary depending upon the species involved, natural topographic barriers, and line-of-sight distances, etc. Placement of facilities, "on" (very low profile) or below ground, and temporary disruptive activities, such as occur with pipeline construction, seismic activity, etc., could be granted exceptions within ½ mile of active raptor nests, in certain circumstances (Appendix J). Industry position: Not acceptable Reason: Alternative A is working as can be demonstrated by good raptor numbers in the area. However, surface facilities can often be located outside of an appropriate distance of ½ mile. In instances where ½ mile is not feasible in the KSLA allowance should be made for mitigation that does not disrupt the future nesting success of the raptor pair. Industry also notes that this MA and Appendix J (J.1) Alternative A applies to "active nests" presumably the BLM definition of active nest. USFWS definition of active nest should be used. Prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds. This includes project components such as permanent and/or high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.). Manage as: 1) NSO for fluid minerals; 2) closed for coal and sodium prospecting; 3) closed to material sales; 4) avoidance area for new rights-of-way. Buffer recommendations could be modified on a site-specific or project-specific basis based on field observations and local conditions. Infrastructure (or facilities) that have potential to cause direct avian mortality (e.g., wind turbines, guyed towers, airports, wastewater disposal facilities, transmission lines), would follow USFWS recommendations to locate structures away from high avian- use areas such as those used for nesting, foraging, roosting or migrating, and the travel between high-use areas. Industry position: Not acceptable Reason: Industry supports locating surface facilities so that impacts to raptors are prevented whenever feasible. A 1-mile prohibition is excessive. When surface facilities must be located to support leasable mineral extraction in the KSLA effective mitigation measures should be employed with the cooperation with the cooperation of BLM and USFWS and WGFD as necessary. The concept of historic raptor nests is being taken out of context under Alternative B. The current RMP uses the concept of historic raptor nest only for very specific locations. Project components, such as permanent and high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.) are restricted within an appropriate distance of occupied raptor nests. The appropriate distance (usually less than ½ mile) would be determined on a case-by- case basis and may vary depending upon the species involved, natural topographic barriers, and line-of-sight distances, etc. * CSU for fluid minerals. Industry position: Not acceptable Reason: Industry largely agrees with this language except that language should be added that exceptions to the restriction are considered with implementation of effective mitigations within the KSLA. Mitigation measures will protect future nesting. Allow surface occupancy within the identified buffer of occupied and historic raptor nests, subject to adequate mitigation of impacts following BLM mitigation policies. This includes project components such as permanent and/or high- profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.). Ferruginous hawk - ½ mile Bald eagle - one mile Golden eagle - ¼ mile Burrowing owl - ¼ mile General raptor - ¼ mile * CSU for fluid minerals. Modify buffer recommendations, on a site- specific or project-specific basis, based on field observations and local conditions. Require implementation of USFWS recommendations to locate structures away from high avian-use areas such as those used for nesting, foraging, roosting or migrating, and the travel between high-use areas on infrastructure (or facilities) that have potential to cause direct avian mortality (e.g., wind turbines, guyed towers, airports, wastewater disposal facilities, transmission lines). Industry position: Not acceptable Reason: The language of this MA is largely acceptable. Industry recognizes the need to protect raptor nesting success in areas of needed surface facilities. However, this MA should clearly state that buffer distances can be modified on a site-specific basis in the KSLA with the development of an appropriate mitigation and monitoring plan to protect nesting success and future nesting success in the nesting territory. The concept of historic raptor nests is being taken out of context under Alternative B. The current RMP uses the concept of historic raptor nest only for very specific locations. Allow surface occupancy within the identified buffer of occupied raptor nests subject to adequate mitigation of impacts following BLM mitigation policies. This includes permanent and high-profile structures (e.g. buildings, tanks, powerlines, roads, well pads, etc.). Identified buffers are: Ferruginous hawk - ½ mile Bald eagle - 1 mile Golden eagle - ¼ mile Burrowing owl - ¼ mile General raptor - ¼ mile Modify buffer recommendations on a site- specific or project-specific basis based on field observations and conditions. Require implementation of USFWS recommendations to locate structures away from high avian-use areas such as nesting, foraging, roosting, migrating, travel between high-use areas. Infrastructure with potential to cause direct avian mortality includes wind turbines, guyed towers, airports, wastewater disposal facilities, transmission lines. Allowance will be made in the KSLA for site-specific and project-specific mitigation and monitoring plans in consultation with USFWS, BLM, WGFD, and WDEQ-LQD to protect present and future raptor nesting success in areas where surface facilities are needed for leasable trona. Language is taken from Alternative D with additions. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 816.03 - Raptors | #13787-61 | MA #4431 BR-21, BR-24, BR-35 Nesting raptors would be protected by restricting disruptive activities seasonally within a ½-mile to one-mile radius of occupied raptor nesting sites. Industry position: Not acceptable Reason: Industry respects the need to protect occupied raptor nests with appropriate distances. Distance determinations should be made case by case and be project specific with appropriate specific mitigation and monitoring plans. Restrict surface disturbing and disruptive activities seasonally within a two-mile radius of occupied nests and historic raptor nesting sites and associated feeding grounds to protect nesting raptors. Industry position: Not acceptable Reason: A two-mile protective radius is excessive for occupied nests and not necessary for historic nests. Site-specific and project-specific mitigations can be applied to reduce the protective radius. Restrict surface disturbing or disruptive activities seasonally within a ½-mile radius of occupied raptor nesting sites to protect nesting raptors. Industry position: Not acceptable Reason: Industry supports a 1/2-mile buffer around occupied raptor nests, but allowance should be made for site-specific and project-specific mitigation and protective measures. Avoid surface disturbing and disruptive activities seasonally within the identified buffer of occupied nests and historic raptor nest sites (Appendix J). Industry position: Not acceptable Reason: Appendix J sets a protective distance of 2-1/2 miles for occupied and historic bald eagle nests and 1 mile for occupied and historic ferruginous hawk nests. Industry recognizes the need for a larger protective distance for these two species relative to other raptor species and for the need to protect nesting success of occupied nests and future nesting. However, in the KSLA allowance should be made appropriate site- specific and project-specific mitigation and monitoring where surface facilities are needed to support leasable trona. Avoid surface disturbing and disruptive activities within ½ mile of occupied raptor nests whenever possible. Variances will be developed on a site-specific, project-specific, and species-specific basis in cooperation with USFWS, WGFD, and BLM. When surface facilities are needed to support leasable trona production in the KSLA mitigation and monitoring measures will be developed that protect occupied nests and future nesting in the nesting territory. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13787-62 | MA #4432 BR-21, BR-24, BR-35 In the JMH planning area, temporary disturbances associated with placement of facilities such as pipelines and other actions such as seismic activities can be allowed within ½ to one mile of active raptor nests. Industry position: Not applicable Reason: Specific to JMH See MA #4431 | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13787-63 | Industry position: same as MA #4431 Same as MA #4431 MA #4433 BR-21, BR-24, BR-35 In the JMH planning area, disruptive activities would be seasonally restricted within a ½- to one-mile radius of occupied raptor nesting sites. Raptor nest surveys would be conducted within a one- mile radius or linear distance of proposed surface uses or activities during raptor nesting season. Seasonal limitations may be excepted, provided criteria in Appendix B can be met and appropriate mitigation can be implemented (as determined by the BLM). Mitigation of adverse effects (e.g., noise and traffic) on all habitats would be determined and applied on a case-by-case basis. Industry position: Not applicable Reason: Specific to JMH | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13787-64 | MA #4434 BR-21, BR-24, BR-35 Raptor nest surveys would be conducted within a one-mile radius, or linear distance of proposed surface uses or activities, if such activities are proposed to be conducted during raptor nesting seasons, usually between February 1 and July 31. Industry position: Not acceptable Reason: Raptor nest surveys should not be required if the surface disturbing activity is not in an area of raptor nesting habitat. A requirement for raptor nest surveys should be case by case. Conduct raptor surveys (for nesting, roosting, and foraging) within up to a four- mile radius of surface disturbing or disruptive activities based on the extent and nature of the proposed action. Industry position: Not acceptable Reason: Industry agrees with raptor survey in the area around proposed surface disturbance that is proposed to occur during the nesting season in areas of raptor nesting or in the area of permanent or long duration surface facilities. The requirement should be case by case. A four-mile radius is excessive; ½ to 1 mile is acceptable based on species expected to occur in the area. Once occupied nest(s) are located raptors can be expected to forage within 4 miles of the nest because most of their hunting will be within their nesting territory. Same as Alternative A. Industry position: Not acceptable Reason: Industry agrees in large part with this MA in order to protect active raptor nests and future nesting when and where surface facilities are needed. Industry desires to add that nest surveys should be done case by case where suitable raptor nesting is identified. Conduct raptor nest surveys within one mile of proposed surface uses or activities, on a case-by case basis, if suitable raptor nesting habitat is identified. Industry position: Not acceptable Reason: Industry agrees with this language but would add if surface disturbing activities are proposed to occur during raptor nesting season. Conduct raptor nest surveys within 1 mile of proposed surface uses or activities on a case-by-case basis if suitable raptor nesting habit is identified and if such activities are proposed to occur during the raptor nesting season. This is Alternative D but only applicable if surface disturbing activities are proposed to occur during the raptor nesting season. | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13811-7 | In addition, defining and delineating "feeding grounds" without specific guidance does not provide certainty for project proponents. Furthermore, some species, ferruginous hawks for example, may use multiple feeding areas with each area encompassing tens to hundreds of acres. Requiring a one-mile buffer around a nest site and multiple feeding areas places an unreasonable burden on project proponents. BLM could retain its discretion to determine "appropriate distance" on a case-by-case basis and thereby achieve the same conservation interests instead of imposing the rigid and significantly more burdensome categorical prohibition in Alternative B. | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4431. Analysis of impacts for actions in each alternative is found in Chapter 4. |

|---|---|---|---|
| 816.03 - Raptors | #13811-8 | Alternative B would also expand the restrictions from active nesting sites to active and historic nesting sites. "Historical raptor nests" means "[a]ny raptor nest or site that has been destroyed but was historically recorded and documented."22 Such a restriction could conceivably apply to any tree or cliffside now, or in perpetuity, as additional sites are discovered. This restriction imposes a vague and overly restrictive regulatory regime on Pacific and puts into jeopardy any project going forward. For existing operations, any expansion opportunity would be similarly restricted, not only with respect to current active raptor nests, but any historical nest ever documented. Such a broad expansion of regulatory restrictions creates uncertainty for existing and future operators who have been making critical project decisions based on the need to avoid active nests only. In addition to regulatory uncertainty, expanding the buffer zone from ½ mile to one mile of both current and historic raptor nest sites would impose significant additional monitoring burdens on any and all of Pacific's projects in the Planning Area without achieving any clear conservation goals that are not already managed through the ½-mile buffer. BLM provides no scientific basis for this proposed expansion or for including historic raptor nests in the regulatory regime. Furthermore, both of these proposed changes depart from the coordination between the State of Wyoming and the U.S. Fish & Wildlife Service that typically precedes such changes. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for coordination with other agencies. |
| 816.03 - Raptors | #13831-11 | Appendix B - Management #4430 - Raptor Nests: States that there shall be no surface occupancy within a 1-mile radius of raptor nests. It further specifically identifies airports as infrastructure that have the potential to cause direct avian mortality. o Map 3-4 shows a raptor nest right on the edge of the airport property (western side on the approach to Runway 9). This would eliminate the ability for surface occupancy on BLM managed lands within 1 mile which would once again have an adverse impact on any development around the airport. Surface occupancy is defined as, "Placement or construction on the land surface of semi-permanent or permanent facilities requiring continual service or maintenance". The Airport Board sees this once again impacting infrastructure leading to the airport including the roadway, water, sewer, gas, and electric. | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4430. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13865-21 | F. MA # 4427 The overlap of seasonal closures for vehicle travel in all alternatives of MA #4427 would block necessary travel and access for PacifiCorp. This includes areas that BCC is mandated to monitor as a permit requirement. Denying access to conduct monitoring by the seasonal closure of roads could put BCC in violation of its DEQ Land Quality Division Permit to Mine. These road closures would also limit reclamation activities of BBC and other PacifiCorp projects. Vehicle travel must be allowed when needed to access PacifiCorp's projects, power lines, and other assets year-round for O&M activities and during emergencies. The extended duration of seasonal closures is problematic because it narrows the window in which certain areas can be accessed and work performed. The cumulative closure period for all wildlife resources combined in MA #4427 is from November 15 to June 30 (for Alternative D) or July 31 (for Alternatives B and C), which leaves utilities with August 1 to November 14 to perform work. This is not sufficient time to complete necessary O&M or construction. In addition, closing vehicle traffic in raptor nest areas is contradictory for locations where raptors nest on utility infrastructure and can require nest management or other O&M work during the nesting season. Restricting access would prevent PacifiCorp from complying with its APP, company avian policies, and commitments to the USFWS that require timely retrofitting of poles with eagle or migratory bird mortalities. Likewise, PacifiCorp has agency mandated timeframes to respond to facility conditions. Failure to meet these timeframes puts the company at risk of substantial fines, regulatory noncompliance, and safety concerns. PacifiCorp recommends that the BLM adopt Alternative A under MA#4427, and allow vehicular travel when necessary. PacifiCorp also recommends that all seasonal buffers be waived for emergency work and time sensitive O&M or repairs. | See Chapter 1.4 Planning Criteria for valid and existing rights. A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2.2.6 management action 4427. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13865-22 | G. MA # 4428 Alternatives A and B of MA #4428 are overly broad, overstep BLM's authority by attempting to regulate migratory birds, and conflict with guidance issued by the USFWS. USFWS is the agency with authority to regulate raptor conservation and take under the MBTA and BGEPA. While BLM has the authority to regulate habitat on BLM-managed lands, the agency does not have the authority to regulate raptor species. By setting nest criteria that contradicts that of the USFWS, the BLM is overstepping its authority. In addition, the BLM fails to analyze how these contradictory measures reflect current best science or offer tangible benefits to raptors. Under Alternatives A and B, "protections" would be afforded to nests that are not currently active or occupied; this is illogical as it does not afford protection to these species if nests are vacant and contradicts with USFWS guidance. Protections for raptor nest sites should apply only to verified occupied nests in the current year an activity is being performed, not historic nest sites. In addition, changing from species-specific buffer distances to blanket buffer distances is arbitrary and does not account for the unique biology of each species. The following are specific concerns with language in MA #4428: ? Consistent with USFWS guidance, protections for raptor nest sites should apply only to verified occupied nests in the current year an activity is being performed, not historic nest sites. The USFWS memorandum "MBPM-2" (Migratory Bird Permit Memorandum, April 15, 2003), states: "The MBTA does not contain any prohibition that applies to the destruction of a migratory bird nest alone (without birds or eggs), provided that no possession occurs during the destruction." Since the publication and implementation of national APP Guidelines in 2005 between the USFWS and the Avian Power Line Interaction Committee (APLIC), the USFWS directive to electric utilities has been that "active" nests are "those with eggs or young present" (APLIC and USFWS 2005; APLIC 2006). USFWS allows for destruction of migratory bird nests, yet BLM is proposing significant buffers for such nests under Alternatives A and B of MA #4428. While utilities do not remove or destroy | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and coordination with other agencies. |

|---|---|---|---|
| | | inactive nests unless necessary due to a safety or fire risk, the application of buffers around such nests is an unnecessary restriction against the safe operations and maintenance of electrical infrastructure. ? Under Alternative A of MA #4428, BLM identifies an active nest as "one that has been occupied within the past three years." This contradicts the USFWS directive, which has been implemented effectively for two decades under MBPM-2, and defines active nests as those with eggs or chicks. PacifiCorp recommends that the BLM adopt the USFWS definition of an active nest as those which contain eggs or chicks. ? Under Alternative A of MA #4428, BLM defines a historic nesting site as "an area of high topographic relief, particularly cliff areas, known to have supported concentrations of nesting raptors." The basis of this definition is questionable, as topographic relief is unrelated to historic nesting activity. Active nests, as defined by USFWS, would be protected from disturbance by nest buffers. BLM's concern to maintain historic nests sites would be addressed by active nest buffers and by USFWS authority over nest destruction. ? The term raptor "feeding areas" used in Alternative B of MA #4428 is far too vague and expansive to be useable or practical, and should be removed as an alternative. Indeed, nearly all of the RSFO could potentially fall under the category of a "raptor feeding area." Different raptor species have varied and complex life cycles and feeding areas may be focused in different locations based upon season and a variety of conditions. Feeding areas could include locations around nests, concentrations near winter roost areas, large landscapes used for migration, and wintering areas. Likewise, some raptors may perch hunt from power poles or other infrastructure, resulting in nonsensical feeding buffers around anthropogenic features. Raptors are not particularly sensitive to human activities near feeding areas, nor would activity in these areas be detrimental to their life cycle in most situations. This is particularly true of utility O&M activities that are typically limited in footprint and short in duration. Feeding areas are much less sensitive to disturbance impacts than nest areas; consequently, active nest buffers would provide more appropriate protection to raptors. PacifiCorp recommends that the BLM remove restrictions or buffers around "raptor feeding areas." ? PacifiCorp concurs that topographic barriers may influence buffers. For example, if there are significant topographic features between an activity and a nest, a nest buffer distance may be reduced since the activity may not be seen or heard by the nesting birds. ? Activity types around raptor nests should also be considered when identifying nest buffers. Buffers should be applied for new construction activities; however, routine maintenance and emergency activities should be exempted from buffers as these activities are typically short in duration, pose minimal disturbance risk, and are necessary for safety and reliability reasons. Raptor protections should include allowing a biologist to monitor occupied raptor nests while work is being done inside raptor nest buffers if it is appropriate for the species and type of work. In many locations within the RSFO, harsh winter conditions and associated restricted access limit construction windows and necessitate construction during the summer months. Utility APPs identify activity types and nest protection measures, which may range from seasonal/spatial buffers for new construction, use of biological monitors for projects that may extend more than several hours, or no buffers for necessary work within shorter durations. PacifiCorp recommends that the BLM allow utilities to continue these practices, which have been established with and undergo ongoing review by USFWS. ? MA #4428 fails to recognize that utility infrastructure can create nesting substrates for raptors, including several species listed as BLM Wyoming Sensitive Wildlife Species (bald eagle [BAEA], peregrine falcon [PEFA], and ferruginous hawk [FEHA]). Implementing buffers around utility infrastructure could impact safe operations and maintenance of the electric grid. Necessary O&M work on utility infrastructure within nest buffers should be exempted from buffer restrictions as detailed above, and instead managed under APPs and USFWS permits/agreements. ? PacifiCorp concurs that different raptor species require different disturbance buffers, and encourages the BLM to use buffer distances that are consistent with USFWS guidance for eagles and other raptors (see Romin and Muck 2002; USFWS 2007; USFWS 2022). These documents are applicable within the USFWS Region 6 area, and have been effectively used by the USFWS and industry for two decades. Appendix J of the DEIS includes seasonal wildlife restrictions, with dates and buffers for various raptor species. Alternatives A, B, C, and D all differ from USFWS guidance for various species, and PacifiCorp recommends that the BLM modify its alternatives to align with USFWS guidance. Specifically, PacifiCorp recommends the following: o Appendix J.1. Alternative A is consistent with USFWS for golden eagles (GOEA) with a ½ mile buffer; however, other distances contradict USFWS guidance (other raptors have a blanket buffer of ½ mile under BLM vs. species-specific buffer distances under USFWS). o Appendix, J.2. Alternative B uses blanket buffer distances "within 2 miles of active and historic nests." This is overly restrictive, contradictory with USFWS guidance, and appears only to restrict and hinder development and operations of permittees. Likewise, BLM fails to justify the need for buffers beyond USFWS recommendations, and fails to document the biological benefits of the blanket buffer distances to the various species. o Appendix J.3. Alternative C implements a blanket buffer distance of ½ mile of active nests. Under this alternative, buffers only apply to active nests, which is consistent with USFWS. However, the buffer distance is inconsistent with USFWS guidance, which uses species specific buffers that are 1/8, ¼, ½, or 1 mile depending on the species. PacifiCorp recommends that the BLM modify this alternative to use buffer distances consistent with USFWS. o Appendix J.4. Alternative D applies differing buffer distances around "occupied and historic nest sites." Buffers around historic nests are overly restrictive, contradictory with USFWS guidance, and appear only to restrict and hinder development and operations of permittees. Likewise, BLM fails to justify the need for buffer distances beyond USFWS recommendations, and fails to document biological benefits to species for buffers around historic or unoccupied nests. On some projects in other BLM Field Offices, PacifiCorp has been required to monitor historic nests; this | |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | has resulted in increased project costs and none of the historic nests have been subsequently used in future years. Rather, the nests continue to deteriorate over time. PacifiCorp does not want the BLM to perpetuate such a requirement, as there is no biological reason or benefit to justifying protections or surveys of unoccupied and dilapidated nests. As stated previously, USFWS nest protections apply only to active nests because there is not a biological reason or regulatory requirement to implement a buffer around an inactive nest. Under this alternative, BLM buffer distances for GOEA, FEHA, and burrowing owl (BUOW) are the same as USFWS guidance; however, BLM buffer distances conflict with USFWS for BAEA and "general raptor." BLM fails to explain why a 2.5-mile buffer is used for BAEA (occupied and historic nests), when USFWS guidance is 330ft or 660ft, depending on the visibility of the activity (USFWS 2007). As noted previously, a blanket buffer of ½ mile for other raptors is inconsistent with USFWS guidance, which uses species-specific buffers that are either 1/8, ¼, ½, or 1 mile. o All alternatives under Appendix J provide broad nesting dates. There should be flexibility to adapt nest buffer dates based on the actual nest activity dates. For example, buffers for Swainson's hawks (SWHA) should not begin on February 1, as this species does not return from migration until well after this date (USFWS buffer dates start on April 1 for SWHA). Likewise, if an active raptor nest has fledged by June 25, the buffer should not be held until August 15. This is consistent with USFWS guidance regarding protection of active nests and reflects the spirit of MBTA to protect nests while they are active. o None of the alternatives under Appendix J are consistent with the lead agency (USFWS) for these species. Therefore, PacifiCorp questions the adequacy of BLM's analysis for nest buffers, including consistency with other agency recommendations. PacifiCorp recommends that the BLM modify Alternative C to use species-specific buffer distances consistent with USFWS established buffers (see USFWS 2022), and maintain these buffers around active nests only, not historic nests. Likewise, buffer dates should be adaptable to actual dates of nesting activity as described above. In addition to the above concerns with MA #4428, PacifiCorp notes that the BLM has failed to consider current USFWS regulatory changes to MBTA and BGEPA. USFWS is currently revising the regulations pertaining to bald and golden eagle permits (50 CFR Part 22) and contemplating making available permits to take other migratory birds protected under the MBTA. Should a company obtain either of these permits, raptor nest restrictions in the permits should supersede raptor nest restrictions in the BLM's Management Plan. Likewise, current utility SPUT or Eagle Take Permits (ETP) issued by USFWS, as well as Chapter 33 permits issued by WGFD, should supersede BLM RMP management actions regarding nests of eagles and migratory birds. PacifiCorp recommends that the BLM adopt Alternative C of MA #4428, with the modification to Appendix J as detailed above. PacifiCorp recommends that this modification to MA #4428 also be used instead of Alternative A of MA #4429. | |
| 816.03 - Raptors | #13865-23 | H. MA #4430 MA # 4430 establishes No Surface Occupancy (NSO) restrictions for facilities within raptor nest buffers under all alternatives and is an excessive and unnecessary burden on industry for which BLM has failed to analyze associated impacts. Many of the concerns identified under our prior comments for MA #4428 also apply to MA #4430, including protections around historic or inactive nests, and feeding areas, and buffer distances that are inconsistent with USFWS guidance. Likewise, MA #4430 fails to recognize that numerous raptor species use infrastructure, such as power poles, for nest substrates. This MA also contradicts USFWS guidance by creating NSOs rather than buffers, and fails to apply industry best practices that prevent or mitigate potential negative impacts. Best practices for the electric utility industry, developed by APLIC and USFWS (see APLIC and USFWS 2005, APLIC 2006, APLIC 2012) apply avian-safe construction methods to prevent bird mortalities associated with power lines. Likewise, wind energy developments implement various raptor protection measures in coordination with USFWS. PacifiCorp recommends that the BLM remove all NSO requirements around raptor nests under MA #4430 and rather allow new infrastructure that follows current industry best practices for avian protection, such as APLIC guidance. PacifiCorp proposes that the language for Alternative C under MA #4430 be modified and accepted as: "Project components, such as permanent and high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.. ) are allowed within occupied raptor nest buffers if the projects utilize current industry best practices for avian protection and are constructed outside of the appropriate seasonal and spatial buffers for the species." | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4430. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13865-24 | I. MA #4431, #4432, and #4433 MA #4431 is duplicative of MA #4428. Consequently, PacifiCorp reiterates its comments regarding buffer distances, feeding grounds, and occupied vs. historic nests detailed under MA #4428 here. PacifiCorp recommends that the BLM adopt the above comments under MA #4428 and refer to MA #4428 under MA #4431. PacifiCorp also recommends that MA #4432 and #4433 reference the proposed changes to MA #4428. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13865-25 | J. MA #4434 MA #4434 requires raptor nest surveys within buffer distances that are in excess of what would be required to identify and protect nests, particularly under Alternative B, which requires surveys within a 4- mile radius of projects. The BLM fails to analyze or justify this 4-mile radius, or explain why it differs from established guidance from USFWS or through existing permits. ? BCC current mine permits and USFWS requirements require raptor surveys within two miles of the mine permit boundary, which is inconsistent with the BLM's 4-mile radius; ? In the absence of existing USFWS guidance or other permit requirements, survey efforts should align with the buffer distance for a species, rather than basing the distance on a blanket 1- or 4-mile radius. For example, per USFWS (2022), FEHA buffers are 1 mile; consequently, a nest survey radius for FEHA should be 1 mile. For | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | GOEA, prairie and peregrine falcons, and American goshawk, the buffers recommended by USFWS are 0.5 mile; therefore, the nest survey radius for these species should be 0.5 mile. By using survey radius based on the species, efforts can be focused on the suitable habitats for particular species within the project area. This is more targeted and cost effective than a blanket approach and will still identify and satisfy raptor nests and buffer needs; and ? Alternative A stipulates that nest surveys would need to be completed only if construction is to occur during the nesting season. Importantly, this limitation on the need for surveys is missing from Alternatives B and D, and is necessary because nest surveys should not be required if construction is to occur outside of the nesting season. PacifiCorp recommends that the BLM adopt Alternative D of MA #4434 with a change in language from "within one mile" to "within appropriate buffer distances for the species." | |
| 816.03 - Raptors | #13865-30 | In addition, map 3-4 (Raptor Nest Sites) has an error. Canada goose and common raven are listed and included under 'Occupied Raptor Nests' in the Raptor Nest Sites Map 3-4. Neither one of these species should be listed as a raptor. | See updated map 3-4. |
| 816.03 - Raptors | #13865-31 | O. Bridger Coal Company BCC has a USFWS-approved Migratory Bird Protection Plan and Raptor Mitigation Plan that is incorporated in the Company's Permit to Mine and updated and approved every five years. The last update and approval occurred in 2022. BCC should be allowed to operate under the USFWS approved plan and is concerned that the BLM restrictions would conflict with permits and plans already in place. There is concern that BLM-proposed buffers around inactive nests would interfere with BCC's ability to conduct nest monitoring and management. BCC possesses USFWS and WGFD permits that authorize it to relocate raptor nests from mine pit walls to nest platforms, which are typically located near mine operations otherwise birds may abandon the nests if they are moved too far. These relocated nests may fall within buffer distances or NSO distances (see MA #4430) under the draft RMP, presenting a conflict between BLM proposed stipulations and existing USFWS and state permit requirements, agreements, and long established protocols. BCC has monitored raptors for 45 years inside the permit boundary and for a two mile radius outside of the permit boundary, and have documented over 500 active and historic nests. BLM-proposed buffer restrictions around historic nests would prevent BCC from operating from February 1- August 15 of each year. This would result in significant economic impacts, threaten the ability to provide electricity to customers, and impact BCC's environmental and mining regulatory compliance, including reclamation. Reclamation activities are conducted year-round to prepare reclamation areas to meet the short seeding window in the fall. Inactive nest buffers, coupled with seasonal road closure restrictions, would also impact the required raptor and other wildlife monitoring that BCC is required to conduct per its Permit to Mine. The questionable benefit of buffering historic nests is again a concern, as BCC has data from the last 45 years of raptor monitoring that shows an increase in raptors in an area without historic nest buffers. BCC is able to provide this data to BLM upon request. | See Chapter 1.4 Planning Criteria for compliance with valid and existing rights. A range of alternatives is analyzed for raptor nest protections and buffers in Chapter 2.2.6 management action 4430. Assumptions for analysis can be found in 4.7.1. |
| 816.03 - Raptors | #13865-46 | Finally, the effects of buffering around historic raptor nests in both Alternative B and Alternative D have the same effect on BCC's and PacifiCorp's operations. BCC is required to monitor raptor territories and nests within its permit area. BCC created maps illustrating buffers around all active and historic nests as defined in the RMP and found that both Alternatives B and D as written would have a significant negative impact on operations, including reclamation. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with valid and existing rights |
| 816.03 - Raptors | #13865-47 | [comment:13865-47; 824, 827]. In addition to the inconsistencies already discussed, Alternative B will create regulatory inconsistencies across BLM field offices and is beyond the scope of BLM regulation. There must be consistency across BLM field offices. For linear utilities or any project that straddles field office boundaries, changing how any resource is managed within multi-agency process driven protocol is going to result in confusion, inconsistencies, and the immediate need for variances and exceptions. Disregarding the VRM process or Section 106 process that ultimately finds its way to SHPO so that affects are seen differently than all other BLM Field offices will create inconsistent evaluation of the same resource. Alternative B exceeds BLM regulatory authority by, for example, changing avian seasonal stipulations and buffers that have been established by other agencies is beyond the scope of a land management agency.[comment end] | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and coordination with other agencies. |
| 816.03 - Raptors | #13865-53 | .1.2. Perch discouragers are not the current best practices and can cause unintended negative consequences including increased electrocution risk for eagles or other raptors, increased likelihood of raptor and raven nesting on discouragers, and safety and operational concerns (APLIC 2006, 2015). Perch discouragers were widely used from the 1970s to 1990s to address avian electrocution risk; however, data over the past two decades has documented poor effectiveness of perch discouragers and greater effectiveness of other techniques to prevent avian mortality. Likewise, research has demonstrated limited effectiveness of discouragers in preventing perching or nesting (see APLIC 2015 for a summary of research studies). PacifiCorp's field surveys conducted from 2001 to present have documented that poles with perch discouragers have electrocution mortality rates over three times greater and raptor/raven nest rates over four times greater than poles without perch discouragers. Consequently, as part of its APP and agreements with USFWS, PacifiCorp has removed perch discouragers from its avian protection standards. Requiring perch discouragers as a project design feature would conflict with our APP and USFWS directives, and potentially result in mortality of eagles or other migratory birds. Perch discouragers can also interfere with the ability of line crews to safely climb or work around the deterrents, posing safety risks to | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | employees. In harsh conditions, such as high wind and UV exposure experienced by equipment in the RSFO, discouragers can break down quickly, risking the discouragers falling into energized lines and leading to outage or fire hazards. In addition, depending on structure configurations, clearances, and discourager size/placement, discouragers may not be feasible due to NESC or engineering considerations. Because of the reasons detailed above, PacifiCorp requests that the BLM remove perch discouragers or deterrents as a project design feature. Rather, industry best practices should be referenced (e.g., APLIC guidance documents). | |
| 816.03 - Raptors | #13865-56 | "Equip tanks and other above-ground facilities with structures or devices that discourage nesting and perching of raptors and corvids." As discussed previously under the perch discourager section above, such devices are ineffective and have unintended negative consequences. Consequently, PacifiCorp recommends that this stipulation be removed from the Appendix or clarified that it does not apply to electrical infrastructure. | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |
| 816.03 - Raptors | #13865-66 | "Construct or modify vertical structures in a manner that prevents nesting or perching by scavengers or raptors." As detailed previously, perch discouragers are ineffective and have unintended negative consequences. It is contradictory that the DEIS proposes significant buffers around raptor nests, including inactive nests, yet contains a RDF directing the prevention of raptor nesting and perching. Wildlife habitat conservation and improvement can be much more effective in aiding sensitive prey species productivity and survivorship than attempts at perch and nest management. It is also important to note that raptors and corvids are protected by MBTA and devices intended to restrict their perching or nesting can potentially result in takes of these species. Due to the unrealistic nature of this stipulation and the potential regulatory conflict with MBTA, PacifiCorp requests that the BLM remove it as a RDF. | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |
| 816.03 - Raptors | #13865-67 | Require raptor perch deterrents on power poles as a component of permit issuance or renewal according to Avian Power Line Interaction Committee (APLIC) 2012 standards (APLIC 2012. Suggested Practices for Raptor Protection on Power Lines and Mitigating Bird Collisions with Power Lines. http://aplic.org)." This stipulation incorrectly references APLIC documents and misrepresents APLIC guidance. APLIC (2012) is a document related to avian collisions with power lines, and does not discuss or recommend perch deterrents. APLIC documents that address perch discouragers include the 2006 Suggested Practices ('electrocution manual') and the 2015 sage-grouse BMP document; however, none of the APLIC documents recommend perch discouragers. Rather, APLIC documents discuss the unintended consequences of these products, associated risks, and offer other BMPs as alternatives. PacifiCorp has been an active member of APLIC since its formation in the late 1980s, has contributed to all of the APLIC guidance documents, and would be happy to provide an overview of APLIC materials to BLM staff upon request. In addition to the above corrections, APLIC is not a governing body that has standards or requirements; rather, APLIC is a working group of utility and agency biologists and engineers that provide guidance. PacifiCorp recommends that the BLM modify the above RDF to read: "Power lines should be constructed in accordance with current avian protection guidance issued by the Avian Power Line Interaction Committee (APLIC)." | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |
| 816.03 - Raptors | #13892-14 | Alternative B says the BLM will "Seasonally close vehicular travel in crucial and important wildlife habitats and during crucial and important periods (big game crucial winter ranges 11/15-4/30, deer parturition areas 5/1-6/30, elk calving areas 5/1-6/30, moose calving areas 5/1-6/30, raptor nesting areas 2/1-7/31)." Again, did the BLM mean vehicle closures would only apply in certain designated birthing areas, or wherever in the district these areas occur? Right now, the document states that it's wherever in the district these areas are located. When all these restrictions are overlaid, it would close a large portion of the RSFO to vehicular traffic for a large part of the year. There are hundreds of raptor nests scattered throughout the sagebrush ecosystem when all raptor species are considered, so vehicles would be unable to use these areas from February 1 to August 1, under the plain reading of BLM's plan. That information is not readily disclosed to the public in the DEIS. | See Glossary for a definition of 'parturition area' for big game. A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2.2.6 management action 4427. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13892-16 | Page 2-74 says the BLM will "Restrict surface disturbing and disruptive activities seasonally within a two-mile radius of occupied nests and historic raptor nesting sites and associated feeding grounds to protect nesting raptors." That would encompass a huge amount of ground throughout the RSFO for about six months of the year for raptor nesting. Is this really the BLM's intention? To restrict any human use of more than an hour throughout much of the district, for six months of the year? On paper, the BLM proposes to disallow most human use for six months of the year across a large swath of public land. | Restrictions apply to permitted activities, not casual use. See Glossary for definitions. |
| 816.03 - Raptors | #13892-22 | Map 3-4, is a map of raptor nests but includes nesting locations for ravens and Canada goose. Neither of these species are raptors and should not be included. | See updated Map 3-4. |
| 816.03 - Raptors | #13899-43 | The draft EIS has as a biological goal [BR-21], to "[m]aintain current and historic raptor habitat within the planning area to ensure long-term species sustainability and widely distributed functioning habitats in accordance with the Migratory Bird Treaty Act and Bald and Golden Eagle Protection Act (1940)." The draft EIS also makes note of Raptor Concentration Areas (RCAs), with management actions related to these. However, BLM fails to identify where these areas are - a serious flaw in this draft EIS. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and coordination with other agencies. |

|---|---|---|---|
| 816.03 - Raptors | #13899-44 | Of note, the draft EIS fails to adequately account for the impact on golden eagles, beyond the breeding season and the larger regional populations. Wyoming is home to the largest breeding population of golden eagles in the lower 48 states and provides critical habitat for wintering and migrating individuals; the state contains some of the most valuable areas for long-term conservation in the western United States | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and coordination with other agencies. |
| 816.03 - Raptors | #13899-45 | ? We strongly encourage management actions be aligned with the USFWS raptor guidelines, in regard to buffer sizes and seasonal windows, which varies by species and are based on the best available science118. As currently presented in the draft EIS, these are not consistent with USFWS. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws and coordination with other agencies. |
| 816.03 - Raptors | #13899-46 | ? MA 4418: Given the known conflicts with wind turbines, we are supportive of Alternative B, which prohibits renewable energy in Raptor Concentration Areas (RCA). | A range of alternatives for renewable energy projects in wildlife areas is analyzed in Chapter 2.2.6 management action 4418. |
| 816.03 - Raptors | #13899-47 | ? MA 4427: With the variable reaction of raptors (by species and individuals) to different road types and varying traffic volumes, we are supportive of a combination of[...] Alternative B and D. We believe the "case-by-case basis" for closure should apply for RCAs as well - not just big game habitats (as is currently stated for Alternative D). | A range of alternatives has been analyzed for seasonal vehicle closures in Chapter 2.2.6 management action 4427. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13899-48 | ? MA 4428: We are concerned with the weakening of protections for raptor nests. Active and historic raptor nesting sites had been protected and managed for continued nesting activities (Alternative A), but Alternatives C and D deviate from this. We are supportive of Alternative B, which also provides local influence by referencing "case-by-case basis". | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13899-49 | ? MA 4430: Support a modification of Alternative B and D, with changes to buffers to be the same as those referenced in the USFWS raptor guidelines. We appreciate that both alternatives take into account new science, which recommends locating structures away from high avian-use areas (including travel between areas) as these can cause direct mortality | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4430. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13899-50 | ? MA 4431: Buffers should be the same as those referenced in the USFWS raptor guidelines | A range of alternatives has been analyzed for raptor buffers in Chapter 2.2.6 management action 4431. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13899-51 | ? MA 4434: Raptor surveys should be at least 1-mile radius for all raptor species, except larger for golden eagles and proposed wind development | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13899-52 | ? MA 4620: Alternative D is preferred, to give field staff flexibility in requiring raptor perch deterrent devices on a case-by-case basis. | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |
| 816.03 - Raptors | #13899-55 | ? For Special Designations (SD), where there are RCAs: ? MA 7310 (as an example) - support both Alternative B and D - specifies "Manage important wildlife habitats for no-net-loss of habitat and to retain habitat function by applying surface use restrictions …" [emphasis added] ? MA 7328 (as an example) - support Alternative B which specifies "Develop and implement an HMP focused on … and raptor concentration areas, nesting, and feeding grounds that addresses PFC and managing plant communities through proper grazing management, OHV use, and strategically placed energy development." [emphasis added] | A range of alternatives has been analyzed for important wildlife habitats in the Red Desert Management Area in Chapter 2.2.6 management action 7310. |
| 816.03 - Raptors | #13905-6 | The Proposed RMP would defer nest buffer delineation for birds of prey to some future, undetermined process, on a case-by-case basis (DEIS at 2-72). The Preferred Alternative goes on to specify a one-mile nest buffer preventing most facility siting for occupied and historic raptor nests and feeding grounds (DEIS at 2-73). This is supplemented by an additional one-mile buffer where "restrictions" would apply. (DEIS at 2-74). We find this grossly inadequate. Watson et. al. (The Journal of Wild. Mgmt. 1-10; 2020) found that "current and historical evidence for depressed golden eagle nesting in Washington (State) is consistent with documented effects from habitat conversion, prey declines, lead contamination, and wind power development" (emphasis added). | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428-4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13905-7 | When considering perch inhibitors (DEIS at 2-82) it is important to recognize that these are only partially effective. Such perch deterrents reduce, but do not eliminate, raptor perching (Slater and Smith 2010). Notably, it was golden eagles and ravens, two of the most important sage grouse predators and nest predators, respectively, that most effectively circumvented powerline perch inhibitors in this study. Within the range of the Gunnison sage grouse, Prather (2010) empirically found perch inhibitors to be ineffective at preventing raptor perching on power lines. | A range of alternatives has been analyzed for raptor perches in Chapter 2.2.6 management action 4620. See Appendix A.1.1 for discussion of Project Design Features. |
| 816.03 - Raptors | #13908-24 | 4428 B Protect occupied nests and historic raptor nesting sites and associated feeding areas and manage for continued nesting activities. For consistency within the document and with surrounding field office RMPs, and for clarity, use raptor concentration areas instead of historic raptor nesting sites. Remove feeding areas as they are difficult to define objectively. Protect occupied nests and raptor concentration areas and manage for continued nesting activities. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13908-25 | 4428 B Determine, on a case-by-case basis, the appropriate level of protection depending upon the species involved, natural topographic barriers, and line-of- sight distances, etc. We recommend using seasonal and spatial buffers in Appendix J, Table J-4, the proposed buffers for Alternative D. Determine, on a case-by-case basis, the appropriate level of protection considering raptor-specific seasonal and spatial buffers (Appendix J) and natural topographic barriers, and line-of- sight distances, etc. | A range of alternatives for raptor nesting protections and buffer distances is analyzed in Chapter 2.2.6 management actions 4428. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 816.03 - Raptors | #13908-26 | 4430 B Prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds. This includes project components such as permanent and/or high-profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.). Allow for species-specific buffer protections that are consistent with spatial buffers currently proposed in Appendix J, Table J-4, the currently proposed buffers for Alternative D. Use language from first paragraph in Alternate D but include individual project review when appropriate. Allow, on a case-by-case basis, surface occupancy within the identified buffer of occupied and historic raptor nests (Appendix J), subject to adequate mitigation of impacts following BLM mitigation policies. This includes project components such as permanent and/or high- profile structures (e.g., buildings, storage tanks, power lines, roads, well pads, etc.). | A range of alternatives has been analyzed for raptor nest protections in Chapter 2.2.6 management action 4430. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13908-27 | 4431 B Restrict surface disturbing and disruptive activities seasonally within a two-mile radius of occupied nests and historic raptor nesting sites and associated feeding grounds to protect nesting raptors. We recommend using buffers currerntly proposed in Appendix J, Table J-4. We also recommend prohibiting with an exception process and removing feeding grounds given the difficulties in defining those areas. Prohibit surface disturbing and disruptive activities seasonally within raptor-specific seaonal and spatial buffers (Appendix J) of occupied nests and historic raptor nesting sites to protect nesting raptors. Consider exceptions on a case-by-case basis if impacts will not adversely impact the population being protected. | A range of alternatives has been analyzed for raptor nests seasonal protections in Chapter 2.2.6 management action 4431. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13908-28 | 4431 D Avoid surface disturbing and disruptive activities seasonally within the identified buffer of occupied nests and historic raptor nest sites (see Appendix J). Similar recommendations as those in Alterntive B. Prohibit surface disturbing and disruptive activities seasonally within raptor-specific seaonal and spatial buffers (Appendix J) of occupied nests and historic raptor nesting sites to protect nesting raptors. Consider exceptions on a case-by-case basis if impacts will not adversely impact the population being protected. | A range of alternatives has been analyzed for raptor nests seasonal protections in Chapter 2.2.6 management action 4431. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.03 - Raptors | #13908-29 | 4434 B Conduct raptor surveys (for nesting, roosting, and foraging) within up to a four-mile radius of surface disturbing or disruptive activities based on the extent and nature of the proposed action. 4 miles is unneccessary given the proposed buffer sizes. We recommend matching language in Alternative D. Conduct raptor nest surveys within one mile of proposed surface uses or activities, on a case-by case basis, if suitable raptor nesting habitat is identified. | A range of alternatives has been analyzed for raptor survey requirements in Chapter 2.2.6 management action 4434. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 816.04 - Fish | #13668-2 | #7419 Manage the Sage Creek, Currant Creek, and Red Creek watersheds in support of watershed stability and Colorado River cutthroat trout habitat management objectives. Management for watersheds only is shortsighted. Overbrowsing could affect the woody species along streams and actually decrease habitat quality for trout. Hasn't it been one of the goals for the area to improve stream and trout habitat? Limiting the tools livestock operators have (which an ACEC would do in conjunction with sage grouse fence avoidance) would work against improving stream or trout habitat; that's counter productive and works against the ACEC's current goals. In other words, not only is it double speak, but seems to be working against one of the goals of the ACEC while limiting the tools livestock operators have to achieve proper functioning condition (PFC) and rangeland health. | A range of alternatives has been analyzed for the Greater Red Cr. ACEC in Chapter 2.2.6 management actions 7418-7445, which includes management for Sage Creek, Currant Creek and Red Creek. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 816.04 - Fish | #13908-12 | 4406 D Restrict land exchanges of aquatic, wetland, and riparian habitat only for land of equal or better ecological/functional resource value as determined by the BLM. Include consultation with WGFD. Restrict land exchanges of aquatic, wetland, and riparian habitat only for land of equal or better ecological/functional resource value as determined by the BLM and in consultation with the WGFD. | See Chapter 1.4 Planning Criteria for acknowledgement of consulting with agencies including WGFD |
| 816.04 - Fish | #13923-25 | We request that Alternative B be adopted for MA#4435 with the following NSO addition. To conserve native/cold water fisheries and native aquatic species habitat we request a half mile (.5mi) NSO buffer zone for industrial development surface disturbance to include the Big Sandy River, Little Sandy River, Sweetwater River, Green River, Upper Bitter Creek, Bitter Creek, Trout Creek, Currant Creek, Sage Creek, Red Creek, Little Red Creek, Gooseberry Creek, Henry's Fork. The NSO should only apply to industrial development. Agricultural and waterway enhancement and/or restoration projects should be evaluated on a case-by-case basis pursuant to the exemption/waiver/modification process. The BLM should consult with the WGFD to evaluate these requests. This buffer zone will result in less potential for effects from surface disturbing activities and potential spills associated with fluid mineral development. Additionally, this will minimize sediment loading, erosion, and contamination. This buffer zone should also be applied to waterways that have high potential for native fish restoration. | A range of alternatives has been analyzed for fish bearing streams in Chapter 2.2.6 management action 4435. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for acknowledgement of consulting with agencies including WGFD. |
| 816.04 - Fish | #13943-13 | To conserve native/cold water fisheries and native aquatic species habitat we request a half mile (.5mi) NSO buffer zone for industrial development surface disturbance to include the Big Sandy River, Little Sandy River, Sweetwater River, Green River, Upper Bitter Creek, Bitter Creek, Trout Creek, Currant Creek, Sage Creek, Red Creek, Little Red Creek, Gooseberry Creek, Henry's Fork. The NSO should only apply to industrial development. Agricultural and waterway enhancement and/or restoration projects should be evaluated on a case-by-case basis pursuant to the exemption/waiver/modification process. The BLM should consult with the WGFD to evaluate these requests. This buffer zone will result in less potential for effects from surface disturbing activities and potential spills associated with fluid mineral development. Additionally, this will minimize sediment loading, erosion, and contamination. This buffer zone should also be applied to waterways that have high potential for native fish restoration. | A range of alternatives has been analyzed for fish bearing streams in Chapter 2.2.6 management action 4435. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. See Chapter 1.4 Planning Criteria for acknowledgement of consulting with agencies including WGFD. |

| 817 - Biological Resources–Special Status Species (4600-4624) | #42-1 | Returning the bison and limiting grazing on public lands to the extent that bison can coexist & reestablish ancestral migratory access is necessary. | Bison reintroduction is outside the scope of this EIS and proposed RMP, as it was not identified as a planning issue during scoping. See Section 1.3 of the DEIS. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #9793-7 | Explain how offsite mitigation will be used and where. Pages 2-209 South Wind River ACEC, 2210 East Sand Dunes ACEC, p 2-211 Big Game Migration Corridor, all mention "Manage a separate offsite mitigation area for biological impacts from energy development." Yet the Preferred Alternative will make these areas unavailable for leasing or energy development. Explain. Where will this offsite mitigation area be located? Is it within the RSFO? Page 4-73 states: "Managing lands as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Wildlife such as elk, prairie dogs, and northern harrier could benefit from the low, early seral areas of vegetation," from both the South Wind River ACEC as well as the Big Game Migration Corridors ACEC under Alternative B. Yet referring to the South Wind River ACES on p4-103 through p4-104 states "Managing land as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Special status wildlife such as mountain plover, white-tailed prairie dogs, and swift fox could benefit from the low, early seral areas of vegetation." These are different species than identified in the earlier pages. Why the inconsistency, and what is the specific plan for offsite mitigation? The claim that this off-site mitigation could result in benefits to swift fox is a bit concerning, since the swift fox is a species not known to occur in the RSFO. Please explain how offsite mitigation will work, and why this provision is specifically added to these three ACECs. | See Glossary definition of 'offsite mitigation'. Implementation of offsite mitigation occurs at a project level and is outside the scope of this RMP planning document. See also section 4.21 of Chapter 4 of the DEIS for analysis of proposed management actions for all four alternatives. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #9794-3 | Whitebark Pine Whitebark Pine is in Appendix H, but not listed in 3.8.3 special status plant species. | See change to Table 3.2 in Section 3.8.3 |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13210-66 | 4602 Alternative A Known locations of Special Status plant species communities would be protected and closed to: 1) surface disturbing activities or any disruptive activity that could adversely affect the plants or their habitat; 2) the location of new mining claims (withdrawal from mineral location and entry under the land laws would be pursued); 3) mineral material sales; 4) all offroad vehicular use, including those vehicles used for geophysical exploration activities, surveying, etc.; and 5) the use of explosives and blasting. (See the discussion Lands and Realty management and Minerals management.) Alternative A is preferred because it provides that Special Status plant communities will remain protected, while still allowing for compatible activity in the area, which is not the case under Alternatives B and D. | Management actions for Special Status Species can be found in actions 4600-4624. Management actions related to the Special Status Plant ACEC can be found in actions 7508-7515. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13210-67 | 4617 Alternative D Manage Special Status Species habitat for the plant condition and composition that maintains a healthy functional habitat. Alterative D is preferred because it represents a continuation of the status quo in the field office regarding the management of Special Status Species habitat, which the task force found no need to diverge from. | Management actions for Special Status Species can be found in actions 4600-4624. Impacts from all four alternatives can be found in Chapter 4. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13287-9 | It is ironic that the Green River RMP (reflected in Alternative A) specifies ESA consultation on listed species only in the Jack Morrow Hills CAP area (DEIS at 2-81), while the Preferred Alternative would consult with USFWS throughout the planning area. This is a nondiscretionary legal requirement under the ESA, so it is not optional. It is beneficial to include this in the plan, as an extra reminder for future land and resource managers not to forget this important procedural step. Conducting field surveys for Special Status wildlife species (as in Alternatives B and D) is a wise and necessary step to avoid unforeseen impacts to listed species. | See Appendix H for the ESA Biological Assessment. See also Management Action 4618 for a comparison of all four alternatives that address consultation for ESA. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13287-24 | For invasive species, Alternative B precludes chemical methods, which might potentially be useful against cheatgrass for small applications, and might also be expanded to include rest from livestock grazing as a viable method to reduce cheatgrass over long time horizons | Management for Invasive Species and Pest Management can be found for all four alternatives in actions 4200 - 4213. Management for Livestock grazing is included in actions 6400-6417. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13542-44 | MA#4602. Alternatives A, B, C, and D. 2-77 Define who is managing the "Special Status" list for the implementation of the RMP in the Rock Springs Field Office administered areas, as several sources have conflicting lists (WNDDD, USFQS, WGFD, etc.). | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 817 - Biological Resources–Special Status Species (4600-4624) | #13542-45 | MA#4616. Alternative B. 2-80 The stipulation for not reoffering mineral leases once they expire should not apply to mineral leases that would have no impact on the surface or would have impacts that can be avoided, reduced, or mitigated. This alternative should include language to allow for exceptions, waivers, and modifications. | See Appendix B for Exception, Modification, and Waiver Criteria. Management of Special Status Species is included for all alternatives in actions 4600 - 4624. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13751-139 | MA #4600 ALT A B C D Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas. ALT B Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13751-140 | MA #4602 ALT B C Industry Position: Not Acceptable Reasoning: No geographic distance is proposed and as written the restriction is arbitrary. ALT D Industry Position: Acceptable Reasoning: Geographic distance is provided that reasonably allows for activities that do not disturb plants. | Impacts from all four alternatives can be found in Section 4.8. See also Section 3.8.3 for a description of special status plants within the field office. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13784-28 | MA#4602, Alt. B: "Prohibit surface disturbing activities or any disruptive activity on known locations of Special Status plant species." Comment: BLM must identify all known locations of Special Status plant species in order for the project proponents to know what impact Alternative B would have on their respective industry. | Impacts from all four alternatives can be found in Section 4.8. See also Section 3.8.3 for a description of special status plants within the field office. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13784-29 | MA#4610, Alt. B: "Prohibit surface disturbing activities in potential habitat areas of Special Status plant species." Comment: MA#4610 goes even further than known locations and will have devastating impacts to industries utilizing the project area for development given the unknown "potential habitats." | Impacts from all four alternatives can be found in Section 4.8. See also Section 3.8.3 for a description of special status plants within the field office. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13784-46 | "Prohibiting use of fire chemicals, salt or mineral supplements, and range improvements within % mile of special status plant species could indirectly further protect soil quality in these areas." (p. 4-24) Comment: The prohibition of range improvements includes fencing. Fencing is often used to protect vegetation, including special status plant species. Yet, Alternative B, will not allow fencing to protect the plants within % mile of the plants. Also, how is soil "quality" protected? | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. Section 4.4 provides analysis of all alternatives for soil resources. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13787-65 | MA #4600 BR-27, BR-28, BR-30 Any management actions on potential habitat of Special Status plant species communities on federal land or on split estate lands (i.e., non-federal land surface ownership with BLM-administered federal minerals ownership) would require searches for the plant species prior to project or activity implementation to determine the locations of Special Status plant species and essential and/or important habitats. Special status plant populations are closed to activities that could adversely affect these species and their habitat. Management requirements in habitat areas may include prohibiting or limiting motorized vehicle use, surface uses, and explosive charges or any other surface disturbing or disruptive activity that may cause adverse effects to the plants. Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas. Require Special Status plant species surveys on potential habitats on federal land surface before any project or activity is approved. If species are found, species- specific protective measures would be developed and implemented. For Interrelated or Interdependent Actions and when necessary to comply with the Endangered Species Act (ESA), require inventories for listed or proposed species potential habitats on federally leased lands before any project or activity is approved (see BLM Manual 6840). If species are found, species-specific protective measures would be developed and implemented in consultation with the USFWS. If Special Status plant species are found during construction, halt all disturbing activities in the inhabited area until species-specific protective measures are developed and implemented. Develop and implement protective measures for listed and proposed species in consultation with the USFWS. Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas. Require Special Status plant species surveys on potential habitats on federal land surface before any project or activity is approved. If species are found, species-specific protective measures would be developed and implemented. For Interrelated or Interdependent Actions and when necessary to comply with the ESA, require inventories for listed or proposed species on potential habitats on split-estate lands before any project or activity is approved (see BLM Manual 6840). If species are found, species-specific protective measures | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | would be developed and implemented in consultation with the USFWS. If species are found during construction, avoidance measures would be taken if possible. Develop and implement protective measures for listed species in consultation with the USFWS. Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas. Require Special Status plant species surveys on potential habitats on federal land surface before any surface disturbing project or activity is approved. If species are found, species-specific protective measures would be developed and implemented. For Interrelated or Interdependent Actions, require inventories for listed or proposed species potential habitats on federally leased lands before any surface disturbing project or activity is approved (see BLM Manual 6840). If species are found, species-specific protective measures would be developed and implemented in consultation with the USFWS. If Special Status plant species are found during construction, halt all disturbing activities in the inhabited area until species- specific protective measures are developed and implemented. Develop and implement protective measures for listed and proposed species in consultation with the USFWS. Industry Position: Not acceptable. Reasoning: "potential habitats" could be everywhere. The action must be defined to known special status species areas. Require Special Status plant species review on identified or known vegetation communities on federal land surface before any project or activity is approved. If species are determined in the project area, species-specific protective measures would be developed and implemented. For Interrelated or Interdependent Actions and when necessary to comply with the ESA, require inventories for listed or proposed species on identified vegetation communities on split-estate lands before any project or activity is approved (see BLM Manual 6840). If species are found, species-specific protective measures would be developed and implemented in consultation with the USFWS. If Special Status plant species are found during construction, halt all disturbing activities in the inhabited area until species-specific protective measures are developed and implemented. Develop and implement protective measures for listed and proposed species in consultation with the USFWS. Identified vegetation communities may be based on Special Status Plant Species NRCS mapping, ESDs and existing vegetation information (such as NRCS) or site-specific vegetation information. Language is taken from Alternative B and C and D, with modifications. | |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13787-66 | MA #4602 BR-27, BR-28, BR-29 Known locations of Special Status plant species communities would be protected and closed to: 1) surface disturbing activities or any disruptive activity that could adversely affect the plants or their habitat; 2) the location of new mining claims (withdrawal from mineral location and entry under the land laws would be pursued); 3) mineral material sales; 4) all off- road vehicular use, including those vehicles used for geophysical exploration activities, surveying, etc.; and 5) the use of explosives and blasting. (See the discussion Lands and Realty management and Minerals management.) Industry Position: Not Acceptable Reason: Should be evaluated on a case-by- case basis or a buffer should be defined. Prohibit surface disturbing activities or any disruptive activity on known locations of Special Status plant species. Manage as: 1) NSO for fluid minerals; 2) withdrawal from mineral location and entry under the land laws would be pursued; 3) closed to mineral material sales; 4) closed to all off-highway vehicle (OHV) vehicular travel, including those vehicles used for geophysical exploration activities, surveying, etc.; 5) the use of explosives and blasting; 6) avoidance area for new ROWs. Industry Position: Not Acceptable Reasoning: No geographic distance is proposed and as written the restriction is arbitrary. Avoid known locations of Special Status plant species for surface disturbing activities. Permit authorizations where applicants could demonstrate that proposed activities would not impact sensitive plant species. Manage as: 1) avoidance area for new ROWs; 2) limit vehicle use to existing roads and trails. Industry Position: Not Acceptable Reasoning: No geographic distance is proposed and as written the restriction is arbitrary. Prohibit surface disturbing activities or any disruptive activity within 100 feet of the boundary of known locations of Special Status plant species. * NSO for fluid minerals. * Close to mineral material sales. * Allow subsurface mining only and prohibit surface facilities. * Designate as a ROW avoidance area. * Close to all OHV vehicular travel, including those vehicles used for geophysical exploration activities, surveying, etc. * Prohibit the use of explosives and blasting. Industry Position: Acceptable Reasoning: Geographic distance is provided that reasonably allows for activities that do not disturb plants. Alternative D is acceptable. | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13834-1 | None of the species collected are considered of high state interest (Wyoming Game & Fish Memorandum, December 6, 1979). However, the Dwarf Shrew, Merriam's Shrew, Cliff Chipmunk , Canyon Mouse, and Sagebrush Vole are listed as "Special Mammals" by the Nature Conservancy (1979). * Three of these species probably only occur in isolated "pockets"' in the Planning Unit, which should be recognized as unique areas and worthy of careful consideration when evaluating the impacts of development. The Canyon Mouse was only found in the Limber Pine habitat in Cedar Canyon. Although Long ( 1965) also reported it from the Lower Green River Drainage, it was not collected there during this study. In addition, the Northern Flying Squirrel was only found on Little Mountain and the Merriam's Shrew only on White Mountain. Also, within the attached report, there are scientific references to the characteristics of each species, their habitat, and the locations of the transects that the biologists trapped these mammals in. Because of this report, I recommend that the BLM, within the Rock Springs Final RMP, identify management strategies that could protect these isolated pockets of mammals. These strategies could range from establishing ACECs to stipulating development management actions that would protect essential habitats. If the BLM does not protect these species, one poorly planned management action could wipe out the entire population for one species. | See Chapter 3.8 for a description of Special Status species for the Rock Springs Field Office. None of the listed species here are species of concern identified in Section 3.8, nor were they identified in the planning criteria for analysis (See Section 1.3). Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 817 - Biological Resources–Special Status Species (4600-4624) | #13865-26 | K. MA #4602 The buffers associated with rare plant species differ under the alternatives of MA #4602 from buffers around plant "communities", "locations", or boundaries of locations. Consequently, these potential buffer distances could vary greatly. If these areas are included as ROW exclusion areas, there could be impacts on the ability for electric utilities to serve customers if areas much larger than needed to protect sensitive plants are included in extensive buffers (e.g., around plant communities). To protect rare plants while not overreaching on the need for ROW exclusion areas, PacifiCorp recommends that the BLM adopt Alternative C under MA #4602. | See Chapter 3.8 for a description of Special Status species for the RMP. Management of Special Status Species is included for all alternatives in actions 4600 - 4624 and the analysis can be found in Chapter 4. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13865-27 | L. MA #4609 Alternatives A, B, and D of MA #4609 fail to follow NEPA as they would allow BLM to designate new ACECs without public input. The protections of rare plants are already addressed in MA #4602. For these reasons, PacifiCorp recommends that the BLM adopt Alternative C of MA #4609. | See language in MA 4609 for Alt A, B and D that references RMP amendments, which require NEPA. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13865-29 | N. MA #4619 Alternative B of MA #4619 should not be adopted because it: (1) does not include consultation with USFWS and/or WGFD; (2) offers no ability to grant exceptions; and (3) requires survey methods to be determined by a RSFO BLM biologist. Federal or state species listings are the jurisdiction of USFWS or WGFD, and these agencies should be consulted. There should be an ability to adapt or implement exceptions depending on specific circumstances, particularly in the case of emergencies or wildfire prevention activities. Surveys can be conducted by qualified biologists without BLM pre-approval; requiring BLM biologists to determine survey methods creates an unnecessary time delay and burden for both BLM and project proponents. For these reasons, PacifiCorp recommends that the BLM adopt Alternative D of MA #4619. | MA 4619 provides a range of alternatives and is consistent with BLM policy and procedures. Analysis from the impacts of all Special Status proposed management actions can be found in Chapter 4. |
| 817 - Biological Resources–Special Status Species (4600-4624) | #13865-58 | o "Place infrastructure in already disturbed locations where the habitat has not been fully restored." As stated previously, power line routes are sited based on many factors, including avoiding sensitive resources and considering costs to utility customers. Consequently, utilities may not always be able to site line routes in areas with existing disturbance. PacifiCorp recommends that the BLM modify this stipulation to include "where feasible, practicable, and cost effective." | Appendix A: Project Design Features and Best Management Practices apply to implementation of projects, please see Section A.1.1 for when these may apply. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #9850-1 | I'm commenting in regard to the lack of timing restrictions related to sagebrush-obligate songbirds, such as sage thrasher, sage sparrow and Brewers sparrow. These species, all protected by the MBTA and all BLM SSS, would be afforded no protection from the direct destruction of nests/young when projects impact sagebrush habitat. The lack of timing restrictions seems arbitrary and capricious as the BLM offers timing restrictions for breeding raptors, sage-grouse, and many mammal species. | See Management Action 4407 for restrictions proposed for migratory bird species. Additional management for sagebrush protections can be found in the Greater Sage Grouse Amendments that is ongoing as a separate RMP planning effort. Management actions for special status species can be found in actions 4600-4624. Management actions for general wildlife species can be found in actions 4400-4436. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13542-63 | Literature Cited. Patterson, R.L. 1952. LC-15 The sage grouse source was from 1952, or 71 years old. In more recent history, there has been a lot of research and information documented on sage grouse by the Wyoming Game and Fish Department that would be a more relevant and recent source of data. | Greater Sage-Grouse management is being analyzed in a separate RMP amendment process, and is outside the scope of this document. See Section 1.3 for the Planning Criteria for this DEIS. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13665-19 | The Draft EIS's opening chapter provides that "[a]ll [sage-grouse] management actions … are outside the scope of this planning effort and are not analyzed," and BLM disclaims that any of its management decisions are based on sage-grouse. RMP Draft EIS at 1-3. Nonetheless, in the Draft RMP, BLM cites sage-grouse core areas (designated by the State of Wyoming) as relevant wildlife resources that support its proposed designation of several ACECs. See, e.g., id. at App. C-9-C-11, C-13-C-14, C-17, C-28. For example, in laying out its rationale for one of the proposed ACECs, the Salt Wells ACEC, BLM cites the sage-grouse priority-habitat management area ("PHMA") (a federal designation that is different from-though overlapping with-the 15 There is also a discrepancy in BLM's characterizations of the total acres included within the Cedar Canyon ACEC. Compare id. at 3-28 (listing 2,550 acres) with id. at 4-72 (listing 2,540 acres). state's "core area") as "more than locally significant"; having "qualities or circumstances that make it fragile … endangered, threatened, or vulnerable"; and a "national priority." Id. at C-13- C-14. But BLM cannot have it both ways-either the sage-grouse habitat is relevant to its ACEC decisions, or it is not. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. ACEC Relevance and importance criteria can be found in Appendix C - Areas of Critical Environmental Concern Evaluation, and management actions for specific ACECs can be found 7400-7570. |
| 818 - Biological Resources–Special Status | #13665-20 | In any event, although BLM is currently considering amendments to its Wyoming Greater Sage- Grouse RMP that guide the conservation of sage-grouse in several Western states,16 it has not yet released its proposed sage-grouse RMP amendments, so there are no proposed maps, restrictions, or analyses for the public to consider during this comment period. They are not made a part of this Rock Springs proposed RMP in any event. It is | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Species-Greater Sage-Grouse (4700-4800) | | therefore impossible for the public to understand, much less accurately comment on, a sage-grouse-based ACEC. And "[a] decision made without adequate notice and comment is arbitrary or an abuse of discretion." NRDC v. EPA, 279 F.3d 1180, 1186 (9th Cir. 2002) (citing 5 U.S.C. § 706(2)(A)). | ACEC Relevance and importance criteria can be found in Appendix C - Areas of Critical Environmental Concern Evaluation, and management actions for specific ACECs can be found 7400-7570. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13665-21 | BLM's currently designated PHMAs for sage-grouse, outlined in the Wyoming Greater Sage- Grouse RMP,17 overlap with Wyoming's core sage-grouse area designations. They cover much of Wyoming and the Rock Springs area, and they both implement a multiple-use strategy. The PHMA's "management priority is: to open to oil and gas leasing, but with restrictions; to exclude or avoid disturbance to sage-grouse and their habitat; and to minimize impacts to PHMA where they cannot be avoided." Wyoming Greater Sage-Grouse RMP, at 6 (Mar. 2019). BLM's Draft RMP fails to provide any justification for why management under the current PHMA framework does not sufficiently protect sage-grouse in the areas covered by BLM's newly proposed ACECs, or why the areas must be entirely closed to further oil-and-gas leasing, rights-of-way, or new roads solely to protect sage-grouse. BLM's designation of ACECs based on the presence of sage-grouse is arbitrary and contrary to BLM's assertion that its new RMP decisions are not based on sage-grouse conservation. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. ACEC Relevance and importance criteria can be found in Appendix C - Areas of Critical Environmental Concern Evaluation, and management actions for specific ACECs can be found 7400-7570. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-31 | The RMP is flawed at the outset, both substantively and procedurally. The RMP and DEIS completely ignores sage grouse even though the agency is aggressively working to expand sage grouse areas and protections. Many of which will directly impact the RMP area. The RMP explicitly disregards the wild horse management issue. Wild horses impact significant portions of the RMP. BLM's decision to ignore these matters seems inconsistent with NEPA and FLPMA and the BLM planning regulations. This is unacceptable because NEPA requires a comprehensive analysis with all cumulative issues and impacts. By pulling these important items out of the RMP there is no way to evaluate the cumulative impacts, restrictions, closures, withdrawals, and actions properly. BLM needs to finish its work on sage grouse and wild horses and then incorporate those actions into the RMP, not the other way around because the RMP is the umbrella planning document that must consider all other resources, impacts and actions. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. Additionally, the 2023 Record of Decision for the Wild Horse Management in the Checkerboard amended the 1997 RMP and are part of Alternative A. Both Greater Sage-grouse and wild horse resources are disclosed in Chapter 3 as part of the resource area. Wild Horse management actions in this RMP can be found in actions 4900-4910. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-32 | BLM was going one direction on sage grouse and then with this draft RMP/DEIS they completely switched directions. This was a complete surprise to the public and is unacceptable. All news releases from the BLM regarding this RMP indicated it was going to incorporate sage grouse planning into the RMP, but with this recent August 2023 release have now indicated no sage grouse planning will be incorporated into the RMP. This is unacceptable and BLM must incorporate sage grouse planning and restrictions into this RMP. The plan cannot be adequately reviewed without having sage grouse planning included. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-33 | BLM's intent was to incorporate sage grouse planning into the Rock Springs RMP and the notice of intent did not say it was not going to incorporate sage grouse planning into the Rock Springs RMP. At a minimum per this Notice of Intent and Court Order, BLM should at least do a supplemental EIS to incorporate important sage grouse planning decisions into the Rock Springs RMP. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-34 | Page ES-3 of the Draft RMP/DEIS, August 2023 (in a footnote only):"Greater Sage-grouse management, including all actions related to management of Priority Habitat Management Areas and General Habitat Management Areas, are being addressed under separate ongoing Amendment(s) and are not included as planning issues for this document. All management actions, including restrictions for mineral development, that are currently being implemented through prior Amendment (Ex. 2015) are outside the scope of this planning effort and are not analyzed." With this footnote, BLM's intent completely changed on sage grouse planning (or complete lack thereof) in this RMP. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-35 | BLM has made it impractical to evaluate sage grouse and RMP planning because they are not two distinct issues, but rather one must be dependent on the other and the 2014 and 2015 Notices of Intent fully indicated the RMP would incorporate sage grouse planning from other actions. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-36 | The distribution and abundance of wildlife in the planning area are primarily functions of habitat conditions." The RMP must include sage grouse habitat planning management decisions and cannot simply punt on this important issue. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-74 | Sage Grouse. The Executive Summary pages ES-2 and ES-3 and Planning Issues Page 1-3, Section 1.3 indicate that Greater Sage Grouse Resource management and Wild Horse management have not been incorporated into the Draft Resource Management Plan (RMP). Also, the Purpose and Need section (Sections 1.2, 1.2.1, and 1.2.2) address "Numerous RODs for Programmatic EISs that have been completed or are ongoing," but omit greater sage grouse and wild horses. Both of these resources represent potential significant risks and impacts to various groups of land users that cannot be evaluated accurately for this RMP when they have not been incorporated. Land users should have the right to evaluate these risks and impacts in aggregate as well as evaluate whether or not the multiple use principles of the Federal Land Policy and Management Act (FLPMA) are being upheld given that these planning efforts have been in development for over 10 years. As a case in point, a BLM News Release on February 3, 2014 indicated that work on the draft RMP would be put on temporary hold until the Wyoming Greater Sage-Grouse Land Use Plan Amendment and EIS could be completed and incorporated into the Rock Springs RMP. By not incorporating these two resources the BLM has changed course to the detriment of informed public participation. This is unacceptable. These omissions are serious enough to warrant withdrawal of the draft RMP until the sage grouse management plan is incorporated. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. Additionally, the 2023 Record of Decision for the Wild Horse Management in the Checkerboard amended the 1997 RMP and are part of Alternative A. Both Greater Sage-grouse and wild horse resources are disclosed in Chapter 3 as part of the resource area. Wild Horse management actions in this RMP can be found in actions 4900-4910. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13751-100 | The document is inherently flawed based on the decisions to: (1) completely ignore pending sage grouse plans, even though BLM had previously announced it was delaying development of the RMP pending development of the sage grouse RMP amendments and (2) entirely ignore the impact of wild horses within the area as well as pending administrative actions related to the wild horse population. These two items are determinative of the treatment of wide expanses of the area covered by this EIS/Draft Management plan. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. Additionally, the 2023 Record of Decision for the Wild Horse Management in the Checkerboard amended the 1997 RMP and are part of Alternative A. Both Greater Sage-grouse and wild horse resources are disclosed in Chapter 3 as part of the resource area. Wild Horse management actions in this RMP can be found in actions 4900-4910. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13787-10 | BLM was going one direction on Greater sage-grouse and then with this draft RMP/DEIS they completely switched directions. This was a complete surprise to the public and is unacceptable. All news releases from the BLM regarding this RMP indicated it was going to incorporate Greater sage-grouse planning into the RMP, but with this recent August 2023 release have now indicated no Greater sage-grouse planning will be incorporated into the RMP. This is unacceptable and BLM must incorporate Greater sage-grouse planning and restrictions into this RMP. In particular, Appendix T, the cumulative impacts analysis section is flawed by not including Greater sage-grouse. The plan cannot be adequately reviewed without having Greater sage-grouse planning included. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 818 - Biological Resources–Special Status Species-Greater Sage-Grouse (4700-4800) | #13787-11 | Section 4.1 like Section 1.3 also informs the reader that the BLM Greater sage-grouse land use plans are not included in the Rock Springs Planning Area Draft RMP. The Draft RMP, especially preferred Alternative B, represents significant impacts to land users and socioeconomically to the community in the planning area. A later release of the Greater sage- grouse land use plans greatly adds to the uncertainty of this Draft RMP and to potentially even greater socioeconomic impacts that cannot be evaluated in the review of this Draft RMP. We suggest withdrawal of Preferred Alternative B until the Draft Greater sage-grouse Plan is released so that the full impact can be evaluated. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. See Planning Criteria in Section 1.3. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #65-3 | You mention wild horses burros yet you again use extremely old data and fail to mention that the population has exploded to unmanageable levels that are causing extreme damage to the land and the roundups/sales are not putting a dent in the population controls. | Wild horse gather and removal operations are an implementation level action that is beyond the scope of this planning level document. All management actions from the 2023 RMP Amendment for Wild Horses have been incorporated into this RMP Revision. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #540-1 | It must also be noted that, to the extent BLM relies on the Consent Decree of 2013 as justification for planning wild horse management and livestock grazing as part and parcel of one another, the 2013 Consent Decree has expired and is no longer in effect. The 2013 Consent Decree should not be considered by BLM when selecting locations to be designated as ACECs. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. The language referencing the 2013 Consent Decree has been updated to reflect the current status of the Wild Horse RMP Amendment. |
| 819 - Biological | #540-2 | BLM should consider the harmful effects of livestock grazing and the benefits to the range of wild, free roaming horses, ensuring that wild horses are given priority over livestock grazing when ACECs overlap with wild horse | Impacts from livestock grazing and wild horse use on vegetation resources are provided in Section 4.6 of the EIS. Impacts to wildlife habitat from livestock grazing and wild horse use are provided in Section 4.7 of the EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources–Wild Horses (4900-4910) | | HMAs and other lands on which wild horses roam. Often, where there is ecological degradation to the range, BLM will place fault on wild horses and prioritize their removal, to the benefit of livestock grazing and contrary to the WHBA and the goal of the RMP/EIS. However, a report by Public Employees for Environmental Responsibility (PEER) noted that BLM's own records show that cows outnumber horses on BLM lands by a ratio of 30 to 1.14 "Of the lands that failed to meet [Land Health Standards], BLM reported that in 72% of cases, 'a significant cause' was livestock grazing."15 This equates to approximately 40 million acres of BLM land [nationwide] that is failing due to overgrazing of livestock.16 Limiting livestock grazing also helps protect the natural habitats of elk, deer, moose, pronghorn, and other rangeland wildlife. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #540-3 | BLM should also consider the benefits to the range by limiting livestock grazing in the ACECs and the planning area, allowing for thriving wild horse populations that are highly beneficial to the rangeland.17 Studies demonstrate that equids support healthy ecosystems on public land if given sufficient habitat and left alone (Lundgren et al., 2021; Lundgren et al., 2017; Downer 2014). Wild horses spread plant seeds over large areas where they roam and do not decompose the vegetation they ingest as thoroughly as ruminant grazers, such as cattle or sheep, allowing the seeds pass through their digestive tract intact into the soil fertilized by wild horse droppings. Wild horses also help to prevent catastrophic fires and help to build more moisture-retaining soils. Soil moisture dampens out incipient fires and makes the air coating the earth moister. | Management Actions 7433, 7438 and 7443 consider eliminating livestock grazing from certain portions of ACECs. Impacts to various resource values associated with these management actions are provided in Chapter 4 of the EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13213-1 | According to the 'RMP Amendments for Wild Horse Management, Record of Decision', from 1979 to 2010 RSGA consented to the presence of up to a total of five hundred (500) wild horses on the checkerboard portion of these HMAs, which include RSGA's private lands. No other private landowners within these HMAs have consented to allow wild horses to use their land. 1. I conducted an on-line search which resulted in no other private landowners within the checkerboard area, other than the RSGA, having filed suit against the Department of Interior and/or Bureau of Land Management for wild horses using their private lands without consent. 2. If no other private landowners consented to allow wild horses to use their land, then why were they free to roam the checkerboard area from 1979 to 2010, 31 years, and 3. Why is the RSGA the ONLY private landowner named in the 2013 Consent Decree? | The legal basis of the 2013 Consent Decree is beyond the scope of this RMP Revision. See Section 1.4 of the EIS for the scope of this planning effort. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13260-1 | In addition, there are pictures taken from highway 191 north on the east and west side of the highway. There is an obvious difference in the range conditions between these two areas which are only separated by the highway ROW. Both areas have cattle grazing allotments. The difference is the west side has an overabundance of wild horses which damage the range. Therefore, a comprehensive evaluation and management plan cannot be established without considering the damage caused by feral horses. | The analysis in Section 4.6 of the EIS has been updated to clarify the impacts wild horses have on vegetation communities. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13273-2 | I am concerned that wild equines are being left out of the management plan. The BLM is required to manage our public lands in a manner that supports our wild equines, maintaining genetically viable herd strength. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment and become part of Alternative A, No Action. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13287-5 | Under the Wild and Free-Roaming Horses and Burros Act, wild horses "are to be considered in the area where presently found, as an integral part of the natural system of the public lands." In 1971, wild horses were found throughout the length and breadth of the Red Desert, both north and south of Interstate 80. However, current Herd Management Areas (HMAs) arbitrarily and capriciously exclude lands suitable for wild horse habitation where wild horses were found in 1971, that are contiguous to occupied HMAs with no rational boundary on the ground that would prevent the free movement of wild horses, thereby arbitrarily denying wild horses to lands and habitats that they inhabited in 1971 and to which they have a legally cognizable right under the WFRHBA to inhabit today. This is an illegal situation which must be rectified through the Rock Springs RMP revision to comply with federal law. | Section 1.4 explains that "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." All management actions comply with all laws, regulations, and policies. This would include The Wild Free-Roaming Horses and Burros Act of 1971. See updated Section 2.2.4. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13287-6 | In particular, western portions of the Continental Peak Herd Area and central portions of the Rock Springs Herd area east of U.S. Highway 191 were historically are currently occupied by free-roaming horses of the Great Divide HMA, and accordingly this HMA must be expanded westward to include a HA lands as far west as Highway 191. For example, Figure 1, taken in September 2023, shows wild horses grazing in a draw tributary to Pacific Creek in the Jack Morrow Hills, and area far west of the Great Divide HMA. Southwestern portions of the Rock Springs HA and western portions of the Salt Wells HA that fall outside the Salt Wells HMA boundary need to be added back to the Salt Wells HMA. These land additions will better afford wild horses more habitat to roam, and more opportunities for the public to view them. The Continental Peak Herd Area should be allowed to be repopulated. Wild horses are also considered a Supplemental Values contributing to wilderness characteristics, and the Sand Dunes and Buffalo Hump Wilderness Study Areas will benefit from according wild horses the full measure of protection required by law within their boundaries. | See updated Section 2.2.4. |
| 819 - Biological Resources– | #13287-7 | The reason that these horses are inhabiting these areas is not because they are ecologically inappropriate (the exact same ecosystems exist in the neighboring HMAs) or that there are sensitive resources that are being measurably impacted (the same sensitive resources occur in HAs and HMAs, and the agency cannot point to measurable differences in impacts to these sensitive resources, primarily because the impacts of cattle and sheep authorized by the agency so swamp the comparatively small impacts of wild horse grazing that differences in | See updated Section 2.2.4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Wild Horses (4900-4910) | | impact cannot be discerned). And there are no fences, ridgelines, or other geographic barriers that would impede or even slow wild horse dispersal from HMA to HA lands. In effect, the boundaries are entirely arbitrary, a bureaucratic effort to find an excuse to round up and remove horses from lands where they are not authorized, but which under the law the agency must consider them "an integral part of the natural system of the public lands." This is a legally problematic situation that the BLM has created for itself, which now must be corrected by expanding HMA boundaries. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13287-8 | The 2020 Rawlins - Rock Springs Wild Horse RMP Amendment ("Wild Horse Amendment") provides a useful baseline of information for the number of wild horses that these HMAs can sustain while still maintaining a thriving natural ecological balance. For the Adobe Town HMA, "these allotments were [already] able to meet these standards at current stocking densities, it is expected that a slightly reduced stocking density will continue to support rangeland health standards in this area, and ensure a TNEB." Wild Horse Amendment DEIS at 1. For the Salt Wells HMA, "The BLM conducted a review of AML (as per H-4700-1) and found that there would be adequate forage, water cover and space to sustain a wild horse herd, and maintain a TNEB within the solid-block portion of the HMA (see Appendix A)." Id. For all alternatives, "By managing wild horses at AML in combination with other permitted uses, the BLM would ensure a TNEB in Alternatives A, B, and D. … Under Alternative C, all wild horses would be permanently removed from the planning area." Wild Horse Amendment DEIS at 94. Under Alternatives A and B, BLM generated AMLs for each HMA that were virtually identical, and more importantly, non-zero. Wild Horse Amendment DEIS Appendix A at unnumbered 2. (This AML analysis failed to consider the number of wild horses that could be accommodated under the "thriving natural ecological balance" threshold if domestic livestock were completely removed). Thus, all alternatives, including the No Action alternative, from the Wild Horse Amendment met the "thriving natural ecological balance" requirement of the WFRHBA. The agency should therefore, at minimum, increase AMLs to 2020 pre-roundup horse population levels: Adobe Town 1,114 Divide Basin 1,282 Little Colorado 493 Salt Wells 894 White Mtn. 469 | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. All comments related to the content of the FEIS for the 2023 RMP Amendment are beyond the scope of this document. See Section 1.4 of the EIS for the scope of this planning effort. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13287-22 | 43 CFR § 4180 requires that corrective action be taken before the next grazing season where Land Health Standards are not met and livestock are a causal factor; it is unclear that Alternatives A, C, and D contain direction consistent with 43 CFR § 4180. In addition, livestock grazing should be zeroed out with wild horse Herd Management Areas, pursuant to 43 CFR § 4710.5. | Section 1.4 explains that "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." All management actions comply with all laws, regulations, and policies. This would include 43 CFR 4180. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13288-1 | I am commenting on the Rock Springs Resource Management Plan (RMP) Revision and Draft EIS, addressing concerns regarding the management of 3.6 million acres of BLM-administered public land in southwestern Wyoming. I oppose the agency's decision to separate wild horse considerations from the RMP revision, specifically the elimination and reduction of Herd Management Areas (HMAs) via a separate RMP amendment process that is currently being litigated. The BLM is mandated to manage public lands for multiple uses in a manner that preserves thriving natural ecological balance (TNEB), necessitating the evaluation of wild horse use in conjunction with other uses. As a result, the RMP revision must consider wild horse use and: Increase Appropriate Management Levels (AMLs) in the five HMAs within the planning area to reflect the "thriving natural ecological balance" required by the Wild Free-Roaming Horses and Burros Act. This adjustment, based on 2020 population levels recognized by the BLM as achieving TNEB, would permit a population of more than 4,700, supporting genetically viable wild horse herds and enhancing the public's ability to view these iconic animals in their natural habitat. Revert Herd Areas to active HMA status to restore the habitat that has been arbitrarily taken away from wild horses since the 1971 Wild Free Roaming Horses and Burros Act was passed. This is in accordance with the Act's mandate to protect wild horses “where PRESENTLY FOUND as an integral part of the natural system of the public lands.” The BLM can and should reduce or eliminate commercial livestock grazing within wild horse HMAs. The BLM is legally mandated to protect wild horses, while livestock grazing is a discretionary use of the public lands. Include provisions for consolidating checkerboard lands through land swaps with private landowners to create contiguous public land habitat for wild horses and other wildlife. This will reduce conflicts, enhance public access to public lands, and alleviate land management challenges. The Draft EIS fails to integrate wild horse use with other public land activities, contradicting the agency's mandate. | See section 2.2 Development of Alternatives, 2.2.4 Alternatives Considered but Eliminated from Detailed Analysis, 2.2.5 Overview of the Alternatives, 2.26 Detailed Alternative Descriptions by Resource Land Resources (LR)-Lands and Realty (6000-6015), 3.9 Wild Horses. A "Closure to Livestock Grazing" alternative was considered but eliminated from detailed analysis (see Section 2.2.4). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13381-1 | 1. Reasonable Alternatives The EIS unreasonably narrows the range of alternatives and fails to consider reasonable alternatives that would consolidate private and public lands in checkerboard areas to address the private property and permittee complaints calling for the removal of wild horses. The BLM can use “land exchanges with other landowners to improve land management, consolidate ownership, and protect environmentally sensitive areas…the BLM can acquire other lands with important recreation, conservation, scenic, cultural and other resource uses. Land exchanges also allow the BLM to reposition or consolidate lands into more manageable units…” (BLM Lands and Realty – Sales, R&PP and Exchanges; The BLM Lands Exchange Handbook 2-294) The EIS fails to take a hard look at reasonable alternatives and fails to mitigate harm to wild horses with balanced actions to provide for wild horses in the area. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |
| 819 - Biological | #13381-2 | 2. Restore Zeroed-Out Herd Areas The BLM previously zeroed out the majority of wild horse habitat in southern Wyoming. The EIS fails to consider repatriating wild horses to these areas and/or expanding HMAs to the | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this |

|---|---|---|---|
| Resources–Wild Horses (4900-4910) | | boundaries existing when the 1971 Wild Horse & Burros Act was passed -- including the Cumberland, Slate Creek, La Barge, Desert, Carter Lease, Granger Lease, Continental Peak, Gold Creek, Triangle, Rock Springs, Checkerboard South, Doty Mountain Cherokee, Sand East Creek (portions), and Bolten Herd Areas. | RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. See updated Section 2.2.4. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13381-3 | . Cumulative Impacts The EIS fails to consider the cumulative impact of eliminating additional wild horse HMAs in the state. Fifty percent (50%) of the original Congressionally designated wild horse habitat in Wyoming has been zeroed out or eliminated for wild horse use. Yet, the BLM continues to permit livestock grazing in these same areas. The EIS proposes to reduce by another 43% the public lands available to wild horses in the state. The cumulative impact of the proposal results in the BLM eliminating 71% of all public lands originally designated by Congress for wild horse use in the state of Wyoming. The proposed removal of wild horses from 1,554,282 acres of public lands represents removing wild horses from 6% of all public lands where BLM currently manages wild horses and burros. Currently, BLM only manages wild horses and burros on 64% of the original public lands identified by Congress for wild horse and burro habitat. That means since 1971 the BLM has cumulatively reduced wild horse and burro habitat by 37%. BLM has wiped out wild horses and burros from more than 1 of every 3 acres of public lands which Congress designated “principally” for wild horse and burro usage. The EIS fails to consider these cumulative negative impacts on wild horses and fails to take actions to mitigate these negative impacts. | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13402-1 | We strongly urge the BLM to abandon the proposals to eliminate all wild horses in the Salt Wells and Great Divide Basin Herd Management Areas (HMAs) and to sterilize wild horses in the White Mountain HMA. The EIS fails to (1) take a hard look at the cumulative negative impacts of the proposed actions on wild horses in Wyoming, (2) consider and incorporate prevailing public opinion which opposes these actions and (3) consider reasonable alternatives to address claimed concerns regarding the current wild horse populations.” From a petition from The Cloud Foundation | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13449-3 | The BLM fails to provide justification in the Draft RMP Amendment and EIS to remove wild horses from public lands in the planning area that indicates an “overpopulation” or “excess” of wild horses exist, or that removal is necessary to restore a TNEB, and multiple-use relationship. 1. “Prior to removing WH&B from public lands, the authorized officer must make a determination, based on current information, that excess animals are present, and their removal is necessary to restore a TNEB and multiple-use relationship.” (H-4700-1; 7.1.2; Pg. 47) 2. “In making the determination the authorized officer will analyze current information including . . . current population inventory.” (H-4700-1; 7.1.2; Pg. 47) 3. 16 U.S.C. 1333(b)(2) of the WFRHBA (as amended) gives the BLM authority to immediately remove animals upon determination that excess WH&B exist, to achieve AMLs, restore a TNEB, and protect the range from the deterioration associated with the overpopulation. a. The BLM fails to provide current information proving there is an “overpopulation” and “excess” of wild horses on the checkerboard, and b. Fails to provide a current population inventory, and c. Provides no proof that removal of the wild horses from the checkerboard is needed to restore a TNEB, and d. Provides no proof that the range needs to be protected from deterioration associated with overpopulation of wild horses. e. “Justifying a removal based on nothing more than the established AML is not acceptable.” (H-4700-1; 7.1.2; Pg. 47) f. Definition of current: “belonging to the present time; happening or being used or done now”. (Oxford Languages). The BLM publishes public data of horse population estimates, most recent population inventory (Month \| Year), by HMAs within states: Wyoming Wild Horse and Burro Areas Administrated by the Bureau of Land Management, as of March 1, 2022, and as of March 1, 2023 reports. As of March 1, 2022, and March 1, 2023: 1. Adobe Town HMA – a. 2022 Horse Population Estimate - 610 b. Most recent population inventory - March 2019 c. 2023 Horse Population Estimate - 1,693 d. Most recent population inventory – November 2022 2. Great Divide HMA – a. 2022 Horse Population Estimate - 467 b. Most recent population inventory - March 2019 c. 2023 Horse Population Estimate - 875 d. Most recent population inventory – November 2022 3. Salt Wells Creek HMA – a. 2022 Horse Population Estimate - 251 b. Most recent population inventory - March 2019 c. 2023 Horse Population Estimate – 1,003 d. Most recent population inventory – November 2022 4. White Mountain HMA – a. 2022 Horse Population Estimate - 205 b. Most recent population inventory - March 2019 c. 2023 Horse Population Estimate – 549 d. Most recent population inventory – December 2022 Using the data published by the BLM yields the calculated Per Cent of Increase Over Time. Note: the day(s) of the ‘Most Recent Population Inventory’ is not provided. Therefore, I used March 1, 2019 and the last day of the month for November and December 2022. This provides reasoning and transparency. Three of the four HMAs wild horse population estimates are biologically impossible (Adobe Town, Salt Wells Creek, and White Mountain). 1. Adobe Town HMA – • March 1, 2019, to November 30, 2022 = 3 years 9 months = 3.75 years. • (1,693/610)-1 x 100/3.75 years = 47.3% • The percentage of increase over time is biologically impossible. 2. Great Divide HMA – • March 1, 2019, to November 30, 2022 = 3 years 9 months = 3.75 years. • (875/467)-1 x 100/3.75 years = 23.3% • The percentage of increase over time aligns with the BLMs notion that wild horse herds can multiply by 20 to 25% over four years. The problem with this notion is that not all wild horse herds and their habitats are created equal. • Wild horses’ habitats are federally designated across 10 western states where topography, climate, forage, water, cover, and space components differ as well. • “Each HMA is unique in its terrain features, local climate and natural resources, just as each herd is unique in its history, genetic heritage, coloring and size distribution.” (HMAs\|(blm.gov) 3. Salt Wells Creek HMA – • March 1, 2019, to November 30, 2022 = 3 years 9 months = 3.75 years. • (1,003/251)-1 x 100/3.75 years = 80% (79.9%) • The percentage of | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. Wild horse gather and removal operations are an implementation level action that is beyond the scope of this planning level document. All management actions from the 2023 RMP Amendment for Wild Horses have been incorporated into this RMP Revision. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | increase over time is biologically impossible. 4. White Mountain HMA – • March 1, 2019, to December 31, 2022 = 3 years 10 months = 3.83 years. • (549 / 205)-1 x 100/3.83 years = 43.8% • The percentage of increase over time is biologically impossible. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13471-1 | The EIS fails to (1) take a hard look at the cumulative negative impacts of the proposed actions on wild horses in Wyoming, (2) consider and incorporate prevailing public opinion which opposes these actions and (3) consider reasonable alternatives to address claimed concerns regarding the current wild horse populations. | Impacts to wild horses from the management actions proposed in this EIS are provided in Section 4.9 of this EIS. Information on public involvement is provided in the RMP development process is provided in Chapter 5 of the EIS. The range of alternatives analyzed in this EIS represents a reasonable range of alternatives (see Section 1.4 of the EIS). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13490-1 | I am writing to express my opposition to the BLM's decision to separate wild horse considerations from the RMP revision. The BLM is mandated to manage public lands for multiple uses in a manner that preserves a thriving natural ecological balance (TNEB), and that necessitates the evaluation of wild horse use in conjunction with other uses. As a result, the RMP revision must consider wild horse use | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13490-2 | *Increase Appropriate Management Levels (AMLs) in the five HMAs within the planning area to reflect the "thriving natural ecological balance" required by the Wild Free-Roaming Horses and Burros Act. This adjustment, based on 2020 population levels recognized by the BLM as achieving TNEB, would permit a population of more than 4,700, supporting genetically viable wild horse herds and enhancing the public's ability to view these iconic animals in their natural habitat. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. Appendix R provides an evaluation of the AML for the Little Colorado HMA. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13490-3 | *Revert Herd Areas to active HMA status to restore the habitat that has been arbitrarily taken away from wild horses since the 1971 Wild Free Roaming Horses and Burros Act was passed. This is in accordance with the Act's mandate to protect wild horses “where presently found as an integral part of the natural system of the public lands.” | See updated Section 2.2.4. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13490-4 | *Reduce or eliminate commercial livestock grazing within wild horse HMAs. The BLM is legally mandated to protect wild horses, while livestock grazing is a discretionary use of the public lands. It is widely known that the Taylor Grazing Act (43 U.S.C. §§ 315-315r) grants the BLM the discretion to issue permits for livestock grazing on public lands, but it also clear: “the issuance of a permit . . . shall not create any right, title, interest, or estate in or to the lands.” More important, the federal Wild and Free-Roaming Horses and Burros Act (43 C.F.R. § 4710.5) compels the BLM to “close appropriate areas of the public lands to grazing” in order “to provide habitat for wild horses” or “to protect wild horses.” | A "Closure to Livestock Grazing" alternative was considered but eliminated from detailed analysis (see Section 2.2.4). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13493-1 | Concerns The EIS fails to consider the actual cumulative impact of this action in the State. Fifty percent (50%) of the original Congressionally designated wild horse habitat in Wyoming has been zeroed out for wild horse use. However, it seems that the BLM continues to permit livestock grazing in these same areas. The EIS proposes to reduce by another 43% the public lands available to wild horses in the state. The cumulative impact of the proposal results in the BLM eliminating 71% of all public lands originally designated by Congress for wild horse use in the state of Wyoming. The proposed removal of wild horses from 1,554,282 acres of public lands represents removing wild horses from 6% of all public lands where BLM currently manages wild horses and burros. Currently, BLM only manages wild horses and burros on 64% of the original public lands identified by Congress for wild horse and burro habitat. Therefore, since 1971, the BLM has cumulatively reduced wild horse and burro habitat by 37%. BLM has wiped out wild horses and burros from more than 1 of every 3 acres of public lands which Congress designated “principally” for wild horse and burro usage. The EIS fails to consider these cumulative negative impacts on wild horses and fails to take actions to mitigate aforementioned negative impacts. | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13493-3 | FLPMA requirements state that “balance wild horse and burro use with other resources” should be done, which equates to at least a 50-50 allocation of available forage between horses and livestock on WHTs. The EIS fails to address this. The EIS fails to address that FLPMA highlights the importance of the non-market value within its definition of the term “multiple-use.” FLPMA requires that: “(c) . . . consideration being given to the relative values of the resources, and not necessarily to the combination of uses that will give the greatest economic return, or the greatest unit output.” The intrinsic value of wild horses and burros falls under the non-market definition specified by both laws (Sec. 302 of FLPMA). | Section 1.4 explains that "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." All management actions comply with all laws, regulations, and policies. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13493-4 | The BLM previously zeroed out the majority of wild horse habitat in southern Wyoming. Despite this, the EIS fails to consider repatriating wild horses to these areas and/or expanding HMAs to the boundaries existing when the 1971 Wild Horse & Burros Act was passed. This habitat includes, the Cumberland, Slate Creek, La Barge, Desert, Carter Lease, Granger Lease, Continental Peak, Gold Creek, Triangle, Rock Springs, Checkerboard South, Doty Mountain Cherokee, Sand East Creek (portions), and Bolten Herd Areas. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. See also updated Section 2.2.4 of the EIS. |
| 819 - Biological Resources– | #13494-1 | We oppose the agency's decision to separate wild horse considerations from the RMP revision, specifically the elimination and reduction of Herd Management Areas (HMAs) via a separate RMP amendment process that is currently being litigated. The BLM is mandated to manage public lands for multiple uses in a manner that | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |

|---|---|---|---|
| Wild Horses (4900-4910) | | preserves thriving natural ecological balance (TNEB), necessitating the evaluation of wild horse use in conjunction with other uses. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13494-2 | Increase Appropriate Management Levels (AMLs) in the five HMAs within the planning area to reflect the "thriving natural ecological balance" required by the Wild Free-Roaming Horses and Burros Act. This adjustment, based on 2020 population levels recognized by the BLM as achieving TNEB, would permit a population of more than 4,700, supporting genetically viable wild horse herds and enhancing the public's ability to view these iconic animals in their natural habitat. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. Appendix R provides an evaluation of the AML for the Little Colorado HMA. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13494-3 | The EIS fails to consider the cumulative impact of eliminating additional wild horse HMAs in the state. Fifty percent (50%) of the original Congressionally designated wild horse habitat in Wyoming has been zeroed out or eliminated for wild horse use. Yet, the BLM continues to permit livestock grazing in these same areas. The EIS proposes to reduce by another 43% the public lands available to wild horses in the state. The cumulative impact of the proposal results in the BLM eliminating 71% of all public lands originally designated by Congress for wild horse use in the state of Wyoming. The proposed removal of wild horses from 1,554,282 acres of public lands represents removing wild horses from 6% of all public lands where BLM currently manages wild horses and burros. Currently, BLM only manages wild horses and burros on 64% of the original public lands identified by Congress for wild horse and burro habitat. That means since 1971 the BLM has cumulatively reduced wild horse and burro habitat by 37%. BLM has wiped out wild horses and burros from more than 1 of every 3 acres of public lands which Congress designated "principally" for wild horse and burro usage. The EIS fails to consider these cumulative negative impacts on wild horses and fails to take actions to mitigate these negative impacts. | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13507-1 | According to language in the Draft RMP Amendment and EIS for Wild Horse Management (Pg. 9) the BLM has met the requirements of the Consent Decree. Since the BLM has met the requirements of the Consent Decree and the Consent Decree is deemed terminated (valid for 10 years) it is no longer a valid driver for the planning area. • The Consent Decree requires that BLM consider **these actions but does not require that the BLM implement any specific action. The BLM has met the requirements of the Consent Decree by considering each of these actions as elements of various alternatives in this EIS, though no single alternative considers all of them together. (Draft RMP Amendment & EIS; Pg. 9) o ** these actions reference changing the Salt Wells Creek and Great Divide Basin HMAs to Herd Areas, which the BLM would manage for zero wild horses. o ** Change the Adobe Town HMA AML to 225-450 wild horses or lower, and gathered wild horses will not be returned to public lands. o **Manage the White Mountain HMA as a non-reproducing herd by utilizing fertility control and sterilization methods to maintain a population of 205 wild horses and to initiate gathers if the population exceeds 205 wild horses. The BLM is not portraying wild horse management plans in the Draft RMP Amendment and EIS, they are portraying a draft plan to unlawfully eradicate the wild horses from their federal designated homes whether HMAs are on or off the checkerboard area. The BLM admits that removing the wild horses from the solid-block portions of their federally designated homes is purely for administrative convenience because it would be “difficult for BLM to prevent this herd from continually returning to private lands in the checkerboard”. (Draft RMP Amendment Pg. 18). • This is unlawful and unacceptable. The 1971 WFRHBA (Pub. L. 92-195; Sec. 1334) does NOT give the BLM authority to remove wild horses from federal public lands to prevent wild horses from straying onto private lands. The BLM admits in conducting reviews of three HMAs (Adobe Town, Great Divide Basin, Salt Wells Creek), the findings resulted that adequate forage, water, cover, and space exists to sustain a wild horse herd and maintain a TNEB. • The BLM needs to exercise their authority in the planning area by enforcing federal regulation 43 CFR 4710.5(a) – “If necessary to provide habitat for wild horses or burros, to implement herd management actions, or to protect wild horses or burros, to implement herd management actions, or to protect wild horses or burros from disease, harassment or injury, the authorized officer may close appropriate areas of the public lands to grazing use by all or a particular kind of livestock.” • 43 CFR 4710.5(a) authorizes the BLM to provide habitat for wild horses and protect them by closing areas of public lands to grazing by private livestock. o In the Adobe Town HMA both cattle and sheep utilize the area in summer and winter months. (Draft RMP Amendment; Pg. 42). o In the Great Divide Basin, Salt Wells Creek, and White Mountain HMAs domestic cattle and sheep utilize area lightly in summer and moderately in winter. (Draft RMP Amendment; Pg’s. 42 and 43). o The BLM should take this opportunity to exercise their authority and execute 43 CFR 4710.5(c) to either temporarily or permanently close the public lands of the planning area to private livestock grazing. o The BLMs “multiple-use” mandate does not authorize private livestock grazing in HAs and/or HMAs. o Under Sec. 103(c) [43 U.S.C. 1702] of the 1976 FLPMA (Federal Land Policy Act); Pub. L. 94–579; “The term “multiple use” means the management of the public lands and their various resource values . . . with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output.” o Pub. L. 94-579 refers to the management of “various resource values” and requires that consideration be given to the “relative values of the resources”. o Under 43 CFR 4700.0-6(b), “WH&B shall be considered comparably with other resource values in the formulation of LUPs. WH&B are a resource value as opposed to a land use (e.g., livestock grazing or timber harvest).” o Alternatives B, C, and D in the Draft RMP Amendment and EIS are unlawful, and the BLM needs to abandon them as they violate: ? 43 CFR 4710.5(a), ? Pub. L. 94-579 - Sec. 103(c) [43 U.S.C. 1702] ? Pub. L. 92-195 - Sec. 1334, and ? 43 CFR 4700.0-6(b). Please implement Alternative A and | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |

|---|---|---|---|
| | | revisit the conflicts with the RSGA by proposing land exchanges and/or exercising your authority under 43 CFR 4710.5(c). Under Sec. 2; Pub. L. 100-409 Congress declares that land exchanges are IMPORTANT TOOLS FOR EFFICIENT MANAGEMENT AND TO SECURE WILDLIFE HABITATS. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13515-8 | The draft Plan indicates that: 'Wild horse management for the four herd management areas that contain portions of the mixed private/public checkerboard land pattern and are subject to the 2013 Consent Decree and Joint Stipulation for Dismissal in Rock Springs Grazing Association v. Salazar, No. 11-cv-002630F are being addressed under a separate ongoing RMP Amendment and Environmental Impact Statement.' The Record of Decision and Approved RMP Amendment for Wild Horse Management for the BLM Rock Springs and Rawlins Field Offices was signed on May 8, 2023. RMEF supports the change to revert status and manage for 0 horses in the Rock Springs Field Office portion of the Adobe Town, the Great Divide Basin, and the Salt Wells Creek Horse Management Areas (HMA). RMEF requests incorporation of these recent amendments in the final EIS. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. The language referencing the 2013 Consent Decree has been updated to reflect the current status of the Wild Horse RMP Amendment. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13515-9 | The Little Colorado HMA was not included in the May 2023 Plan Amendment for Wild Horse Management and the current draft Plan lacks components related to wild horse forage for that HMA. The draft Plan indicates that: 'Forage for wild horses is not included in the forage utilization estimates discussed below. The BLM allocates forage for wildlife and wild horses separately.' Yet in the May 2023 Plan Amendment for Wild Horse Management, Animal Unit Months (AUM) are included in management actions/goals for all but the Little Colorado HMA (not included in that amendment). There appears to be no other area where AUMs are addressed or any discussion on where information on wild horse forage for the Little Colorado HMA is available. Please direct us to the document where this assessment is made, and forage allocation decided. If no such assessment exists, RMEF recommends inclusion and assignment of AUMs for the Little Colorado HMA in the final EIS. | See updated Section 4.9 |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13515-10 | In addition, the RMP does not lay out a plan to reduce the wild horse population to within the proposed Appropriate Management Level (AML). The last estimate was in 2015 when the population was estimated at 259 animals. Nine years have passed since that estimate and RMEF would like to see further Plan details regarding wild horse removals on a population that is now much larger than the last estimate. RMEF recommends population growth suppression and gather management actions/goals be included, in the final EIS, similar to those included in the May 2023 Plan Amendment for Wild Horse Management. | Wild horse gather and removal operations are an implementation level action that is beyond the scope of this planning level document. All management actions from the 2023 RMP Amendment for Wild Horses have been incorporated into this RMP Revision. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13681-1 | I oppose the agency's decision to separate wild horse considerations from the RMP revision, specifically the elimination and reduction of Herd Management Areas (HMAs) via a separate RMP amendment process that is currently being litigated. The BLM is mandated to manage public lands for multiple uses in a manner that preserves thriving natural ecological balance (TNEB), necessitating the evaluation of wild horse use in conjunction with other uses. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13681-2 | Increase Appropriate Management Levels (AMLs) in the five HMAs within the planning area to reflect the "thriving natural ecological balance" required by the Wild Free-Roaming Horses and Burros Act. This adjustment, based on 2020 population levels recognized by the BLM as achieving TNEB, would permit a population of more than 4,700, supporting genetically viable wild horse herds and enhancing the public's ability to view these iconic animals in their natural habitat. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13681-3 | Include provisions for consolidating checkerboard lands through land swaps with private landowners to create contiguous public land habitat for wild horses and other wildlife. This will reduce conflicts, enhance public access to public lands, and alleviate land management challenges. This is something the BLM should have been doing years ago and private land and livestock owners continue to hold the belief that public land near their private land is "their own" to use as they wish and they continue to make demands to remove predators and any wildlife they deem as a menace. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13681-4 | Reasonable Alternatives The EIS unreasonably narrows the range of alternatives and fails to consider reasonable alternatives that would consolidate private and public lands in checkerboard areas to address the private property and permittee complaints calling for the removal of wild horses. The BLM can use "land exchanges with other landowners to improve land management, consolidate ownership, and protect environmentally sensitive areas. Additionally, the BLM can acquire other lands with important recreation, conservation, scenic, cultural and other resource uses. Land exchanges also allow the BLM to reposition or consolidate lands into more manageable units…" (BLM Lands and Realty - Sales, R&PP and Exchanges; The BLM Lands Exchange Handbook 2-294) The EIS fails to take a hard look at reasonable alternatives and fails to mitigate harm to wild horses with balanced actions to provide for wild horses in the area. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13681-5 | The EIS fails to consider the cumulative impact of eliminating additional wild horse HMAs in the state. Fifty percent (50%) of the original Congressionally designated wild horse habitat in Wyoming has been zeroed out or eliminated for wild horse use. Yet, the BLM continues to permit livestock grazing in these same areas. The EIS proposes to reduce by another 43% the public lands available to wild horses in the state. The cumulative impact of the proposal results in the BLM eliminating 71% of all public lands originally designated by Congress for wild horse use in the state of Wyoming. The proposed removal of wild horses from 1,554,282 acres of public lands represents removing wild horses from 6% of all public lands where BLM currently manages wild horses and burros. Currently, | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | BLM only manages wild horses and burros on 64% of the original public lands identified by Congress for wild horse and burro habitat. That means since 1971 the BLM has cumulatively reduced wild horse and burro habitat by 37%. BLM has wiped out wild horses and burros from more than 1 of every 3 acres of public lands which Congress designated "principally" for wild horse and burro usage. The EIS fails to consider these cumulative negative impacts on wild horses and fails to take actions to mitigate these negative impacts. | |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13751-31 | The RMP is flawed at the outset, both substantively and procedurally. The RMP and DEIS completely ignores sage grouse even though the agency is aggressively working to expand sage grouse areas and protections. Many of which will directly impact the RMP area. The RMP explicitly disregards the wild horse management issue. Wild horses impact significant portions of the RMP. BLM's decision to ignore these matters seems inconsistent with NEPA and FLPMA and the BLM planning regulations. This is unacceptable because NEPA requires a comprehensive analysis with all cumulative issues and impacts. By pulling these important items out of the RMP there is no way to evaluate the cumulative impacts, restrictions, closures, withdrawals, and actions properly. BLM needs to finish its work on sage grouse and wild horses and then incorporate those actions into the RMP, not the other way around because the RMP is the umbrella planning document that must consider all other resources, impacts and actions. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. Greater sage grouse amendments from 2015 and 2019 also have been incorporated into this EIS as Alternative A. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13751-74 | Sage Grouse. The Executive Summary pages ES-2 and ES-3 and Planning Issues Page 1-3, Section 1.3 indicate that Greater Sage Grouse Resource management and Wild Horse management have not been incorporated into the Draft Resource Management Plan (RMP). Also, the Purpose and Need section (Sections 1.2, 1.2.1, and 1.2.2) address "Numerous RODs for Programmatic EISs that have been completed or are ongoing," but omit greater sage grouse and wild horses. Both of these resources represent potential significant risks and impacts to various groups of land users that cannot be evaluated accurately for this RMP when they have not been incorporated. Land users should have the right to evaluate these risks and impacts in aggregate as well as evaluate whether or not the multiple use principles of the Federal Land Policy and Management Act (FLPMA) are being upheld given that these planning efforts have been in development for over 10 years. As a case in point, a BLM News Release on February 3, 2014 indicated that work on the draft RMP would be put on temporary hold until the Wyoming Greater Sage-Grouse Land Use Plan Amendment and EIS could be completed and incorporated into the Rock Springs RMP. By not incorporating these two resources the BLM has changed course to the detriment of informed public participation. This is unacceptable. These omissions are serious enough to warrant withdrawal of the draft RMP until the sage grouse management plan is incorporated. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. Additionally, the 2023 Wild Horse Amendment relating to the four checkerboard HMAs is also now part of the No Action Alternative (Alt A). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13751-100 | The document is inherently flawed based on the decisions to: (1) completely ignore pending sage grouse plans, even though BLM had previously announced it was delaying development of the RMP pending development of the sage grouse RMP amendments and (2) entirely ignore the impact of wild horses within the area as well as pending administrative actions related to the wild horse population. These two items are determinative of the treatment of wide expanses of the area covered by this EIS/Draft Management plan. | The ongoing Greater Sage-Grouse Amendment will amend the RMP for the Rock Springs Field Office. The previous Greater Sage-Grouse Amendments in 2015 and 2019 amended the 1997 Green River RMP and are in effect today as part of the No Action alternative (Alt A) of this document. Additionally, the 2023 Wild Horse Amendment relating to the four checkerboard HMAs is also now part of the No Action Alternative (Alt A). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13769-4 | 3. We urge the BLM to consider the synergistic effects of increasing feral horse populations and decreasing forage production in the area due to climate change. We have observed considerable impacts of wild horse forage consumption. The impacts are significant because unlike migrating wildlife or cattle, feral horses graze the same areas year around. Also, horse digestive physiology forces horses to intake more forage and use it more inefficiently than native ungulates. Horses are clearly not effectively managed and their populations increase each year. Horses also concentrate in certain areas like watering holes and the few riparian areas. We have observed a decrease in both the quantity and diversity of forage in these habitats. For example, the increase in non-palatable species like Prickly Pear Cactus and Rubber Rabbit Brush in areas of heavy grazing is concerning. While the former can be partially attributed to drought and a changing climate, we are concerned that uncontrolled feral horse populations will result in irreversible change in species richness and net primary productivity. We report numerous 'stud pile' areas that are devoid of any vegetation because of repeated occupancy and trampling by numerous stud horses. A decrease in plant cover results in increased soil erosion and a decrease in forage production. While not documented scientifically, we observe in these areas that the trampling is so severe that it appears as if sub-soil salts are leached to the surface and form alkaline deposits that further reduce plant production and lead to the spread of noxious weeks (e.g. Halogeten (Halogeton glomeratus)). | See updates to Section 4.6. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13807-1 | The EIS unreasonably narrows the range of alternatives and fails to consider reasonable alternatives that would consolidate private and public lands in checkerboard areas to address the private property and permittee complaints regarding wild horses. The BLM can use "land exchanges with other landowners to improve land management, consolidate ownership, and protect environmentally sensitive areas…the BLM can acquire other lands with important recreation, conservation, scenic, cultural and other resource uses. Land exchanges also allow the BLM to reposition or consolidate lands into more manageable units…" (BLM Lands and Realty - Sales, R&PP and Exchanges; The BLM Lands Exchange Handbook 2-294) The EIS fails to take a hard look at reasonable alternatives and fails to mitigate harm to wild horses with balanced actions to provide for wild horses in the area. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 819 - Biological Resources–Wild Horses (4900-4910) | #13807-2 | The BLM previously zeroed out the majority of wild horse habitat in southern Wyoming. The current EIS fails to consider repatriating wild horses to these (former/zeroed out) areas and/or expanding HMAs to the boundaries existing when the 1971 Wild Horse & Burros Act was passed - including the Cumberland, Slate Creek, La Barge, Desert, Carter Lease, Granger Lease, Continental Peak, Gold Creek, Triangle, Rock Springs, Checkerboard South, Doty Mountain Cherokee, Sand East Creek (portions), and Bolten Herd Areas. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. See updates to Section 2.2.4. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13807-3 | The EIS fails to consider any of the multitude of alternatives that would *equitably* eliminate the conflict between livestock and wild horse grazing. For example, the EIS fails to consider reducing wild horses on certain public lands (e.g. in the Divide Basin, Salt Wells or Adobe Town HMAs) and simultaneously increasing wild horse AML (AUMs) on previously zeroed-out Herd Areas. The BLM could also conduct an equitable exchange of AUMs on certain checkboard lands - which would not increase livestock AUMs - but rather eliminate the livestock vs wild horse competition for grazing on specific public lands. Such an AUM exchange must include fair and equitable resource allocation for wild horses and should increase horse AUMs to be in conformance with the Act that requires wild horses be the principal user of the range. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13807-4 | The EIS fails to consider BLM's own regulation 43 C.F.R. 4710.5(a). Based on BLM's EIS assessment, it is necessary to remove livestock to provide habitat for wild horses. Given that RSGA grazing on public lands is the basis for the EIS proposed action, the EIS must consider and implement the elimination of RSGA livestock grazing on public lands to accommodate wild horses. The EIS fails to consider utilizing the agency's Adaptive Management mandate and its discretion under 43 C.F.R. 4710.3-2 and 43 C.F.R. 4710.5(a), which allows for the reduction or elimination of grazing for privately-held animals to improve conditions and forage availability for wild horses or burros. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. A "Closure to Livestock Grazing" alternative was considered but eliminated from detailed analysis (see Section 2.2.4). |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13807-5 | The EIS fails to consider the cumulative impact of the Proposed Action in relation to BLM management of wild horses nationwide and BLM Wyoming management of wild horses. To date, BLM has zeroed out 53% of the original Congressionally-designated wild horse habitat in the state of Wyoming. Yet, the BLM continues to permit livestock grazing in these same areas. This has a tremendous cumulative impact on wild horses both in Wyoming and nationwide. The EIS fails to consider the cumulative impact of the Proposed Action in relation to BLM Wyoming's elimination of wild horses from public lands in the state. The Preferred Alternative proposes to reduce the public lands available to wild horses in the state by another 43%. The cumulative impact of the Preferred Alternative results in the BLM eliminating 71% of all public lands originally designated by Congress for wild horse use in the state of Wyoming (see below).The proposed removal of wild horses from 1,554,282 acres of public lands represents removing wild horses from 6% of all nationwide public lands where BLM currently manages wild horses and burros. | The management actions referenced in this comment are related to a previously approved RMP Amendment for wild horse management that was approved in May 2023. The EIS associated with that RMP Amendment analyzed cumulative impacts to wild horses associated with those management actions. Impacts to wild horses from management actions associated with this RMP Revision are provided in Section 4.9 of this EIS. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13813-1 | Work with land owners by utilizing labd exchanges to benefit wild horses. - restore zeroed-ou areas - you are to follow the 1971 ACT to return wild horses to this area or expanding HMAs. - stop permitting livestock & extractive industries to use the land that you stole from the wild horses. | Wild horse management within the checkerboard land pattern, including alternatives considered, was addressed in the 2023 Wild Horse Amendment and has been incorporated into this EIS within Alternative A. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13923-3 | The Jack Morrow Hills area has high populations of feral horses. These feral horses need to be managed with population objective control. They are extremely territorial and part of that behavior includes competing for food among ungulates and grazers. Sportsmen recommend that the BLM reduce the number of feral horses to the standard population objectives. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #13926-1 | should not consider livestock grazing and wild horses as parts of a unified whole, but rather as two separate elements, as doing so creates the risk of benefitting livestock grazing at the expense of the federally protected populations of wild horses. This concern is validated by BLM stating in the RPM/EIS that one of the primary issues is "[w]ild horse management Livestock grazing/rangeland management," noting that wild horse management is subject to a 2013 Consent Decree.12 BLM should endeavor to uphold its duties and obligations to protect wild horses under the WHBA, as opposed to the interests in livestock grazing. It must also be noted that, to the extent BLM relies on the Consent Decree of 2013, the 2013 Consent Decree has expired and is no longer in effect. | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. The language referencing the 2013 Consent Decree has been updated to reflect the current status of the Wild Horse RMP Amendment. |
| 819 - Biological Resources–Wild Horses (4900-4910) | #14020-2 | The Wild and Free-Roaming Horses and Burros Act of 1971 (WHA) unambiguously states that wild horses "are to be considered in the area where presently found, as integral part of the natural system of public lands." (emphasis added) 16 U.S.C. 1331. Despite this clear directive, current Herd Management Areas (HMAs) exclude suitable land where wild horses were found in 1971 and should be corrected by the current revision to comply with the WHA. Unfenced and adjacent Herd Areas (HAs) are still used by wild horses, as they were in 1971, and reincorporating these HAs into the current HMAs would allow for additional habitat and a reduced need for costly, ineffective, and burdensome removal operations currently planned by the agency. Furthermore, incorporating these HAs would increase the agency's compliance with the aforementioned directives of the WHA. | See updated Section 2.2.4 |
| 819 - Biological | #14020-3 | Appropriate Management Levels (AMLs) should be adjusted to reflect a current wild horse population based on a "thriving natural ecological balance," as ordered by the WHA. AML for the five HMAs within the RSFO were | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this |

| Resources–Wild Horses (4900-4910) | | established in over 25 years ago and therefore cannot represent current information. Vol. 1 Ch. 3 at 3.13-3.14. Information provided by the agency in the Rock Springs Horse RMP Amendment demonstrates that the subject HMAs can sustain the current number of wild horses, if not more, while maintaining a thriving natural ecological balance. As a result, the agency must inform itself of the number of wild horses that the land can support to comply with the definition of AML. In addition, if any land or resources are added to the current HMAs, AML must be raised to consider these changes. See BLM Wild Horses and Burros Management Handbook (H-4700-1) at page 30 stating "Monitoring data is needed to support AML establishment and decisions to remove excess WH&B. Various rulings from Interior Board of Land Appeals (IBLA) underscore the need to base WH&B management decisions on the results of monitoring" and Id. at page 47 stating that "[j]ustyifing removal based on nothing more than the established AML is not acceptable." In addition, the agency should consider and analyze ecosystem services provided by wild horses in order to comply with these directives. | RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. Appendix R provides an evaluation of the AML for the Little Colorado HMA. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #11-1 | I encourage you to involve tribal members closely in all stages of research, protection, policy development, and management | See Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #4026-8 | Chapter 3.11 Cultural Resources. I feel this document needs to include additional language on both Paleoindian (11,200-8,500 years BP) and Archaic (8,500-2,500 years BP) peoples within the cultural resources section of this document, especially as to their use of sand dune areas. Paleoindian bison hunters were known to utilize steep-sided sand dunes to trap bison (Frison, 1998; Mayer, 2003). With a subsequent drying climate and decrease in megafauna populations, native inhabitants during Archaic times diversified their food resources and utilized sand dune areas to collect Indian rice grass (Achnatherum hymenoides) and goosefoot (Chenopodium spp.) seeds for food (Schroedl, A.R., 1985). | See the Executive Summary and Chapter 3 for explanation of the planning process and determination of the affected environment. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #4026-17 | Chapter 4.12.1 Cultural Resources, Assumptions. I recommend an additional assumption be added to this section concerning the cultural resources in the proposed West Sand Dunes Archeological District MA. The wording could be: "The Killpecker Sand Dunes complex contains important Paleoindian, Archaic, and Late Prehistoric peoples' cultural resources." | See Executive Summary and Chapter 4.2.2 Availability of Data and Incomplete Information, and 4.2.3 Analysis Assumptions for discussion of assumptions used. A range of alternatives was analyzed for the West Sand Dunes Archaeological District in Chapter 2.2.6 management actions 5122-5124. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #4026-18 | Chapters 4.12.2 and 4.12.3, Alternatives A and B. These two alternatives include a West Sand Dunes Archeological District MA. I feel both alternatives need to briefly describe why this special management area would be established. I feel a generic explanation of the area's cultural significance will help the public understand the need for special management considerations without compromising the integrity or confidentiality of known cultural sites. | See Chapter 3 for a description of the existing condition in the field office, including cultural resources. A range of alternatives was analyzed for the West Sand Dunes Archaeological District in Chapter 2.2.6 management actions 5122-5124. Goal SD-04 describes importance of the site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #9774-8 | However, the RMP/DEIS currently lacks any mention of consultation with relevant THPOs, raising concerns about the thoroughness of the agency's compliance with regulatory requirements. | See Chapter 5.1.3 Native American Interests regarding consultation with Native American Tribes. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #9853-8 | ains, trace, or imprint of a plant or animal that has been preserved in the Earth's crust since some past geologic or prehistoric time (AGI Glossary of Geology)" (Page GL-12). However, while it is somewhat contradictory for the definition of "Historic Properties" that reads "Any prehistoric or historic district, site, building, structure, or object…" (Page GL-14), if the word 'prehistoric' is used in the RMP, it should be explicit if it is used in the archaeological context, paleontological context, or both, in order to increase clarity. For example, all | See Glossary for definitions used in this document. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #10324-9 | Native Americans, and there is some mention of preserving wildlife and other elements of the land for Native Americans. I think it may be powerful and important to place that in more of the RMP sections, such as more of the wildlife sections and some of the other resource sections. The Environmental Justice Impact section does a really great job at flagging groups of people that may be at higher risk from being negatively impacted, and I think that it could be mentioned a little more in all the alternatives that any actions will be looked at from an Environmental Justice lens as well. I am very pleased at the thought put into the list of individual groups and that there is an emphasis on the fact that no matter the alternative there will be consideration to these groups. | See Chapter 5.1.3 regarding consultation with Native American Tribes. |
| 820 - Heritage and Visual Resources– | #12999-1 | I am basically in support of Alternative B, but I am concerned about the adequacy of the five-mile protection zone (or less if terrain shadowing permits). The problem is wind turbines. Each year sees taller turbines that are visible at greater distances. Their motion inevitably results in quick detection by the human eye. Clearly, the turbines | See Chapter 2.2.1, 2.2.2 and 2.2.3 for discussion of alternatives development. A range of alternatives has been analyzed for Congressionally Designated trails in Chapter 2.2.6 management actions 7000-7022. Analysis of |

|---|---|---|---|
| Cultural Resources (5000-5013) | | distract (destroy) the evocative experience. Solar farms present similar issues if poorly sited. How will this issue be addressed? A second concern is locations where utility corridors cross and potentially impact NHTs. Best practices should include: * Reducing the amount of surface disturbance as much as possible. Corridors should cross NHTs at right angles if possible. * Co-locating project ROWs unless the proponent can clearly demonstrate that it cannot be safely done. * Confining new disturbance within existing disturbance areas. * Locating the new project within or immediately adjacent to existing disturbance zones. * Boring under high-quality ruts. * Restoring NHT routes within disturbed areas in accordance with BLM Trail Class 6. Except at ROW crossings, emigrant trails have historically received good protection. I hope that will continue but protection would be improved by the above. My final concern is degradation of the setting. A preserved setting is essential to the ability of a visitor to feel the experience of the emigrant's journey. Not unlike Native Americans, we emigrant descendants feel an emotional impact when visiting the same location that emigrants visited 175 years ago. On many occasions I have stood at the South Pass monuments and admired the mostly pristine vista. It is unsurpassed in the West for its scenic value and history. | impacts for actions in each alternative if found in Chapter 4. Best Management Practices for important cultural resource and trail setting are found in Appendix A.2.1 |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13180-1 | We urge you to please put in place the same Trails' protections for the Rock Springs Field Office that you put in place for the Lander Field Office in 2014. | Efforts were made to match surrounding Field Office trail corridor management but this may not be feasible in all situations, particularly where special management is present such as the South Pass Historic Landscape ACEC. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13247-4 | Buffer zones for National Historic Trails and other National Historic Places: In Alternative "B", The Rock Springs RMP proposes extreme buffers for National Historic Trails. See for example BLM # 7002 "Designate lands within five miles on each side of the National Historic Trails as the trail management corridor. Subject all actions within five miles on each side of the NHTs, except for highly visible projects and/or projects out of scale with the surrounding environment (e.g. wind farms, gas plants, large transmission lines, and power plants), to the following restrictions: 1) closed to mineral leasing; 2) closed to mineral material sales; 3) a withdrawal would be pursued; 4) exclusion area for ROWs." BLM # 6411 (restricting placement of salt and mineral supplements within 3 miles on each side of a National Historic Trail). These broad buffers that are done in a carte blanche fashion rather than on a case-by-case basis with an eye toward preserving current uses and property rights are in conflict with the following Fremont County objectives and priorities (from Fremont County NRMP, 2021): | A full range of alternatives has been analyzed in Chapter 2.2.6 MA#7002 and #6411. Analysis of impacts for each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13257-1 | Clearly Alternative B provides the greatest protection to the cultural resources, and I would support the provisions as outlined in Alternative B. Some of the best traces and remnants of the Oregon National Historical Trail and its variants are in Southwestern Wyoming and deserve protection, for once they're gone, they're gone forever. In some places, pristine stretches of the Historic Emigrant Trails are so well preserved and so undisturbed by modern development that they offer an opportunity to immerse one's self in the history of the United States by seeing the land as the pioneers would have 175 years ago and by literally walking in the pathways the pioneers traveled. It is at these segments and sites that the utmost protection be enforced. Such as, limits to direct effects i.e., Right-Of-Way Crossing, Powerlines, Transmission Lines, Access Roads, Solar, Wind etc. While the 5-mile setback on each side is a reasonable standard, exceptions could be acceptable. Where there are less than good trail remnants, a shorter set back may be in order, conversely, the indirect effects of wind turbines adversely affect the visual setting even at 5 miles. | A range of alternatives has been analyzed for Congressionally Designated trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative if found in Chapter 4. Best Management Practices for important cultural resource and trail setting are found in Appendix A.2.1 |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13287-18 | Alternative B's quarter-mile setback for vibroseis from NRHP-eligible sites FEIS at 2-151) is insufficient; a setback of at least one mile is necessary, particularly in the case of rock art panels (which might shear off and shatter) and structures (which might collapse) vulnerable to vandalism. | A full range of alternatives has been analyzed in Chapter 2.2.6 MA#5100 in regards to geophysical activities. Analysis of impacts for each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-1 | We want to make sure the new RMP protects the land in such a way that we, and our future generations, can continue to exercise our treaty rights through food gathering. This includes lands within the RSFO we have yet to reclaim but that have long standing significance to Tribal Members and serve as desired sites for future gathering of foods, medicines, and for other traditional uses. | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-2 | Our ability to reclaim this important heritage depends upon the health and integrity of the entire landscape, not just cultural sites. For us, food gathering sites, cultural resources, and sacred or culturally sensitive sites cannot be separated from each other, nor can they be considered separately from the health and integrity of the surrounding lands and all the plant and animal communities therein. Within this vast area of the Greater Red Desert and Rock Springs Field Office-which includes petroglyphs, buffalo jumps, shelter rings, and vision quest sites of our ancestors-we find cultural kinship with the land which also provides our essential foods, medicines and materials | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | for living. Long missing from Western land management is a holistic approach to living with the land and an acknowledgement of Indigenous Traditional ways of knowing. | |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-3 | The preferred alternative of the proposed draft management plan includes encouraging language that moves the agency toward recognizing important cultural sites, traditional knowledge and building better relationships with Tribal Nations. Additionally, it includes large, landscape-level protections, such as the proposed ACECs, that impose stringent restrictions on industrial development that could harm the integrity of important ecosystems around our gathering sites. As written, the preferred alternative begins to lay the foundation for fulfilling the BLM's Trust responsibility to protect these important lands and Tribal traditional uses into perpetuity. We would like to make sure this language and these area protections are carried forward in the final plan, as well as some new clarifications we would like to propose below: | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-4 | * In alignment with recent national-level direction from the Executive Office and the BLM, we ask that language in the RMP goes beyond considering Tribal perspectives and includes direction on collaborating with our Tribal Governments on co-managing these important landscapes. (In reference to Management Goals HR-03, 14, 15, & 16 and any associated Management Actions including but not limited to MA's 5000, 5001, 5010, and 5200 as per BLM Permanent Instruction Memorandum 2022-0112}. | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. Chapter 2.2.6 management actions 5000 and 5001 are common to all alternatives. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-5 | * Knowledge of our food gathering sites and other important cultural sites is not to be shared or incorporated into BLM databases unless done so in collaboration with Tribal Nations, with their approval, and in a manner such that it is "utilized to advance Indigenous aspirations for collective and individual wellbeing" | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-6 | Chief Washakie famously said "I fought to keep our land, our water, and our hunting grounds today, education is the weapon my people will need to protect them." In this vein, "the RSAFG works hard to preserve and protect traditional knowledge. It is important to reclaim that knowledge, and protect it, so that the knowledge cannot be co-opted, commodified and sold for the benefit of others outside the community." In other words, we have inherent data sovereignty, which "includes the data itself, how the data is collected and accessed, where and how it is safely stored, and intellectual property."1 It cannot simply be given to the BLM to be incorporated, and co-opted, for BLM planning use. | Chapter 5.1.3 for how Native American Interests accounted for. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13319-7 | * Maintain landscape-level protections in the final RMP that seek to preserve the integrity of the entire ecosystem including all proposed ACECs, LWCs, overlapping protection for WSAs, management prescriptions that prioritize habitat intactness and integrity, etc. o Activities that severely fragment habitat--including aquatic habitats and water sources--that disrupt natural cycles and environmental processes, and that otherwise degrade the quality of life for all plant, rock, soil, water, animal, and other beings negatively impacts our food gathering sites. These can be anything from transmission lines, oil and gas development, hard rock mining, and road building to excessive impacts from recreation. It is imperative the land as a whole is intact and healthy, not just the plants or animals we seek to gather. | Chapter 5.1.3 for how Native American Interests are addressed. See Chapter 1.4 Planning Criteria for Tribes involvement in the planning process. A range of alternatives was analyzed regarding consultation with Tribes in Chapter 2.2.6 management actions 5200-5202. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13542-99 | Appendix T. T.1.3. Cultural Resources. T-24 The RMP states, "Activities permitted through the BLM (such as leasing of federal minerals, and mining on federal minerals) would likely disturb cultural resources." This is not a factual statement for underground mineral leases using conventional mining methods. It is also not a foregone conclusion for surface mining activities, which can study and avoid, minimize, and mitigate impacts to cultural resources. Apart from the surface refining facilities, most of the leased area has little to no surface impacts. | See Appendix T.1.1 Cumulative Analysis Methodology and T.1.2 for discussion of Cumulative Impact analysis. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13600-1 | Thanks to its culture, climate, history and sparse population, Wyoming has some of the best and best-preserved historic trails in the nation. The trails on BLM land in our state arte long, often continuous, often pristine and always open to the public. They have high historic values because their topographies and viewsheds are so similar to what they were 170 years ago. The trails are alive with past events. The trails also, of course, thread their way among numerous BLM Field Offices as they cross the West, so it's important that their management be not just top notch but consistent. Now is an opportunity to make that happen relative to your BLM neighbors to the east. | A range of alternatives for Congressionally Designated trails was analyzed in Chapter 2.2.6 management actions 7000-7022. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13600-2 | A few general comments: We are particularly glad to see Alternative B protects trails for five miles on each side. A less strict protection, according to what's clearly visible from the trails might be possible, but detailed viewshed analyses would need to be done in every case. It would be possible to reduce the five-mile restrictions if the trails are in poor condition. Protecting trails from the visual pollution of big power lines and other industrial elements is crucial to preserving their historic character. We recommend that large rights-of-way cross the main Oregon-California-Mormon-Pony Express route only on disturbed areas around Highway 191 and on the agricultural lands in the area. Near the Sublette Cutoff, similarly—crossings only on lands around Highway 191 and the developed Big Sandy/Eden reservoir lands—or along the Lincoln/Sweetwater county-line road. | A range of alternatives for Congressionally Designated trails was analyzed in Chapter 2.2.6 management actions 7000-7022. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13600-3 | We would oppose any major ROW crossings of the Lander Cutoff, the Kinney and Slate Creek variants or (my favorite part of all the trails) the Seminoe Cutoff closer to South Pass. With as many highways as there are, major ROWs should not have a hard time finding routes. | A range of alternatives for ROW crossings on Congressionally Designated Trails are analyzed in Chapter 2.2.6 management action 7007. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13600-4 | For large wind or solar projects near trails in good or better condition, please use protections similar to the ones in the Lander RMP. | A range of alternatives for Congressionally Designated trails was analyzed in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for the actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13600-5 | MA# 5011, p. 2-90, the alternative B option on stewardship programs, and Goal HR-12, p. 2-91 on recreation programs. Please include Wyoming OCTA in any trails-related planning for these programs. The Lander and Kemmerer field offices often do this already; we hope you will too. | A range of alternatives was analyzed for site stewardship in Chapter 2.2.6 management action 5011. See Appendix E, referencing the Trails for America in the 21st Century (EO 13195). |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-3 | There is no citation or mention of the promised cultural resources overview in the documents given for public comment. Similarly there are no citations to any of the major cultural resource inventory, data recovery (excavations), historic context, and syntheses reports extant for cultural sites within the Rock Springs District. The BLM should make its overview and other cultural resource studies available to the public, with consideration for removal of sensitive locational information. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-4 | The present cultural resource sections (3-11 & 4-12) are far too abbreviated and require elaboration. There is no discussion of how much of the RMP Update area has been inventoried or surveyed. How reliable is the existing cultural resources data? What is the average site density? What proportion of sites are eligible to the National Register of Historic Places (NRHP)? Given average densities and proportion of historic properties, how many eligible sites/places might remain undiscovered? The importance and significance of the highlighted cultural resource sites and landscapes needs further development. What is the rationale behind the selection and boundaries of specific Areas of Critical Environmental Concern (ACEC)? Why are certain rock art sites so important? | See Appendix C Areas of Critical Environmental Concern Evaluation for procedures used to evaluate the relevance and importance of each ACEC. See Chapter 1.4 Planning Criteria for compliance with applicable laws. S See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-5 | The cultural resources map (3-7) is incomplete. Many sites discussed in the text are not shown on this map. | Disclosure of site locations is prohibited under 43 CFR 7.18. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-6 | We hope to see a discussion in detail about how boundary determinations were made for historic trail corridors. The final EIS should reference, discuss and provide copies or links to agreements with the State Historic Preservation Office and the Advisory Council on Historic Preservation as they pertain to district resources. | A range of alternatives for Congressionally Designated trails was analyzed in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for the actions in each alternative is found in Chapter 4. See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 4.12.1 Assumptions for assumptions regarding coordination with SHPO, and Chapter 5.1 Consultation and Coordination for coordination with SHPO throughout the planning process. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-8 | Much was said and promised about cultural resources in the existing (1997) RMP. What has been accomplished in conformance with the existing RMP? What have we learned about archaeology, history, and cultural resources since then? Can the BLM substantiate a proven record of follow-through on RMP commitments? These questions need an answer in your planning documents. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-9 | How much monitoring of known cultural resources and development sites (such as oil pads) has been done? What damage to cultural resources has occurred from development projects and outright looting? Is avoidance of important cultural resources effective? Do sites remain undamaged? | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-10 | In some parts of the District deep alluvial and aeolian sands exist making it impossible to locate many of the most potentially significant cultural resources through traditional surface walk-over inventories. In the past how many new archeological sites were found in areas with previously completed archeological inventory? Are there predictive models for significant cultural resource locations? Has the BLM tested models about where significant sites eligible for the NRHP might exist? Are backhoe and geophysical sampling protocols in place to help locate deeply buried sites and have they proven effective? | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-14 | HR-01 page 2-86: The requirement of the RMP to compile a list of numbers and types of cultural resources and assign use allocations is a necessary part of the draft EIS. The lack of these items is a fatal flaw in the Draft RMP. We cannot assess the RMP if there is no definition of current condition of resources and if no use allocations are proposed. | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-15 | HR-01: Compile a record of known cultural resources in the Rock Springs Field Office (RSFO) and assign those resources to appropriate uses. | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-16 | All the remaining actions in this section (HR-2 through HR-9) need to define context and specify implementation actions. Some examples for context are numbers of sites and expected numbers of consultations. Implementation actions might include number of treatment plans anticipated, methods to promote stewardship, number of public programs and products for interpretation, the organization and frequency estimates for site steward programs to monitor site conditions and methods you plan to put in place to surveil and implement stabilization and protection measures. Implementation actions need to include milestones, timelines and costs for completion. Descriptive examples of costs include work months and expenses for overhead, contracts, supplies, equipment and transportation. HR-02: Manage each type of cultural resource according to their proper use allocation and monitor those resources' condition and use. HR-2.1: Develop activity plans or project/site-specific treatment plans or other protective measures for significant cultural resources at risk from deterioration or adverse effects from other uses. HR-03: Consult with Native American tribal governments regarding proposed land uses having the potential to affect cultural resources identified as having tribal interests or concerns. Determine the types of resources of concern to various tribes and take tribal views into consideration when making land use allocations or decisions. HR-04: Promote stewardship, conservation, and appreciation of cultural resources. HR-05: Maintain and enhance programs that provide opportunities for scientific research of cultural resources. HR-06: Provide opportunities for public education and interpretation of cultural resources. HR-6.1: Conduct presentations for schools, community organizations, and the public. HR-07: Provide for appropriate interpretation of sites of high public interest. HR-08: Pursue establishment of site stewardship programs at vulnerable cultural sites, including, but not limited to, the Tolar, White Mountain, Cedar Canyon, Sugarloaf, and La Barge petroglyph sites. HR-09: Preserve and stabilize significant cultural resources, especially resources that face immediate threat and/or historic structures in high public use areas. | A range of alternatives has been analyzed for management of cultural resources in Chapter 2.2.6 management actions 5000-5013, 5100-5127 and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. Specific implementation activities are outside the scope of this document. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-17 | We recommend that you include in the RMP a process with milestones to meet Historic Preservation Act section 110 responsibilities to inventory public lands for cultural resource sites, districts, buildings, structures and objects. | Chapter 2.2.6 management actions 5000-5003 discuss responsibilities and requirements to inventory public lands for cultural resource sites, districts, buildings, structures and objects. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-18 | MA# 5011 page 2-90: Alternative B states: Develop and enhance the site stewardship program and public education opportunities in coordination with recreation and other programs for NHTs and other sites. Alternatives B, C, D should all read the same as alternative B because BLM is required by statute to establish federal trail protection components. See especially National Trails System Act sections that: 1. Require protection of National Trails on federally managed lands and work with non-federal landowners to promote protection of trail resources on non-federal lands to administer the trail continuously (16USC1242 (a)(3),16USC1246 (a)(1)(A)) and, 2. Cooperation with volunteers and volunteer trail organizations (16USC1241(c), 16USC1246 (h)and 16USC1250). | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for site stewardship in Chapter 2.2.6 management action 5011. Analysis of impacts for actions each alternative is found in chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-27 | BLM should specify the VRM Class of each National Register and National Register property. Apply this specifically to the South Pass Historic Landscape, Rock Art Sites, Playa Sites, Archeological and Historic Districts and all ACECs designated for archeological and historic values. Our comment here reemphasizes that the relationship of these types of properties listed or eligible for inclusion in the NRHP must have integrity of setting. It follows that specific identification of the quality and character of setting is a necessary component of any consideration of eligibility. The Management Action 5402 that designates "Greater Sand Dunes ACEC, South Pass Historic Landscape ACEC, and White Mountain Petroglyphs ACEC would be managed as VRM Class II areas" | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes'. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | should extend to the setting of all existing and identified National Register and National Register eligible sites and districts in the RMP Planning Area. | |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-28 | The MA# 5410 in Alternative B should be applied more broadly to all alternatives where settings of National Register and National Register eligible sites might experience damage through the direct and indirect impacts of land use: "Prohibit, on a case-by-case basis, surface-disturbing activities that create a moderate to strong contrast (via the visual contrast rating system) in areas managed consistent with VRM Class III and IV objectives that can be observed from areas managed consistent with VRM Class I and II (e.g., wind development)." | A range of alternatives has been analyzed for surface disturbing actions and VRM classes in Chapter 2.2.6 management action 5407. Analysis for impacts of actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-29 | Archeological Resources Protection Act We recommend that the BLM should create a new section on goals and management actions to carry out the provisions of the Archeological Resources Protection Act. This might parallel management actions for those ground disturbing activities listed in Paleontological Resources section (5300-5309; pages 2-103 to 2-106). Several goals in the "Cultural Resources" section need to specify management actions under the public education provisions and stewardship provisions of the Archeological Resources Protection Act. Management Actions for example should establish a site stewardship program with volunteers. Establish these stewardship relationships under individual and group volunteer services agreements. Make specific mention of a goal to promote and support local schools, colleges and universities and assist them to participate in BLM Project Archaeology education programs as training supported through volunteer agreements. | A range of alternatives has been analyzed for management activities regarding Cultural Resources in Chapter 2.2.6 management actions 5000-5013, 5100-5127 and 5200-5202. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-39 | 3.11 Cultural Resources (pages 3-14-3-15) We recommend that the RMP should subdivide this section into parts for: 1) National Historic Trails (NTSA), 2) Archaeological Resources (ARPA), 3) National Register eligible and listed sites, districts, buildings, structures and places including tribal and non-tribal traditional cultural properties (NHPA) and, 4) Graves and items of cultural patrimony under the Native American Graves Protection and Repatriation Act(NAGPRA). List the number of known locations and identification of types in each set in a table. Quantification of resource information is a critical part of the NEPA process. The statement that, "The area also contains more linear miles of intact NHTs, NHT candidates, and historical wagon roads than any other BLM Field Office in Wyoming" needs support. That point is not irrelevant to management actions that are driven by statute. BLM has the responsibility for the NHT resource throughout the district without reference to land ownership. The way it protects the trail resource of course must depend upon who has control of surface and subsurface rights. However, the NTSA is very clear in its definition of the federal responsibility for protection of all the congressionally designated trail corridor regardless of land ownership. At the very minimum provide a discussion of how the RMP will have impact on the NHT on lands within and adjacent to the RMP planning area (including adjoining BLM and Forest Service planning area and cumulative impacts on the corridors of the entire NHT. | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-40 | BLM should specify the number and distribution of categories of known archeological resources with a table and with a source for the data in the statement: Prehistoric resources include lithic scatters, temporary camp sites, occupation sites, hunting/kill/butchering sites, processing areas, rock shelters, rock art, cairns, trails, and corrals. Historic resources include historic trails, stage stations, homesteads/farmsteads, roads, irrigation ditches, reservoirs, mining sites, corrals, cairns, campsites, rock art/inscriptions, and trash scatters. The Wyoming SHPO maintains a database of archeological resources by site type. It records information by township with percentage of the township surveyed. We recommend presentation of database information on a map of the planning area in order to characterize affected environment. A similar approach would use a raster-level or even point-distribution map created from the Wyoming Cultural Records Office database. An example of the distribution of Archaic bison sites is found in George C. Frison and others(2017) Middle Plains Archaic Bison Hunting in Southcentral Wyoming: Revisiting the Scoggin Site (48CR304), Plains Anthropologist, 62:244, i-414, DOI: 10.1080/00320447.2017.1374079. | See Chapter 3.11 for description of cultural resources affected environment. See the Analysis of Management Situation document on the RMP Revision eplanning site. See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-46 | Move the quoted statement (page 4-139) to the "assumptions" section in 4.12.1 because it applies to all permitted land uses: Allowing opportunities to explore, locate, and develop fluid minerals in the planning area could increase surface disturbing activities, which could expose previously unknown cultural resources to discovery, thereby enhancing scientific knowledge. | See Chapter 4.2.3 Analysis Assumptions for discussion of adequacy of assumptions. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-49 | The following statement (page 4-139) is common to all alternatives. BLM should move it to "assumptions." The whole statement should apply to all alternatives. Limiting the placement of structures that visually intrude on the cultural resources could help to preserve and protect settings. What is the difference between archeological and historic resources and other resources when it comes to a consideration to permit fluid mineral extraction? How many acres will be open for permits and how many permits are expected under this alternative. What is the archeological resource density and type in those areas open to permits under this alternative and other alternatives? Allowing opportunities to explore, locate, and develop fluid minerals in the planning area could increase surface disturbing activities, which could expose previously unknown cultural resources to discovery, thereby enhancing scientific knowledge. Surface disturbing activities also have the potential to cause direct and indirect destruction or damage to cultural resources. Surface disturbing activities could impact soil and rock | See chapter 4.2 Analysis Methods, 4.2.1 Types of impacts, 4.2.2 Availability of Data and Incomplete Information and 4.2.3 Analysis Assumptions for discussion of adequacy of data, assumptions and analysis. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | stability and amplify erosion, which could damage or destroy cultural resources and could cause degradation of the setting in which the cultural resource exists. Limiting the placement of structures that visually intrude on the cultural resources could help to preserve and protect settings. Increased human presence could cause unintentional damage to both known and unknown resources through their surface disturbing activities; as well as intentional destruction through vandalism, and the unauthorized removal of structures or artifacts. | |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-50 | The information given says nothing about locations and clustering of cultural resources in relation to that for wells and oil and gas facilities, but it should. How do closures in alternatives relate to current oil and gas developed areas? Similarly the draft EIS does not address road and utility developments (pipelines, power lines) and it should. | See chapter 4.2 Analysis Methods, 4.2.1 Types of impacts, 4.2.2 Availability of Data and Incomplete Information and 4.2.3 Analysis Assumptions for discussion of adequacy of data, assumptions and analysis. A range of alternatives was analyzed for Right of Way Corridors in Chapter 2.2.6 management actions 6200-6210. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-51 | The draft EIS specifies Cultural Resource Activity Plans in the no action alternative (4-141): The preparation of site/project specific activity or development plans for five significant rock art sites in the planning area: Tolar, White Mountain, Cedar Canyon, Sugarloaf, and La Barge petroglyph sites (as well as for significant rock art sites identified in the future) as well as protective management for other cultural and historic sites could reduce or prevent damage or degradation of those sites. Surface disturbing activities could impact soil/rock stability and amplify erosion, which could damage or destroy cultural resources. Limiting the placement of structures that visually intrude on the cultural resources would help to preserve and protect settings. The management could increase protection of cultural resources from human-caused surface disturbances and the potential for loss of resources through unauthorized removals of artifacts or vandalism. What is the status of these plans? Why are there no activity plans or specific actions in Alternatives B, C & D? Examples of the kind of information that should be presented for each activity plan are in the ACEC Evaluations in Volume II, Appendix C of the RMP. | A range of alternatives has been analyzed for management activities regarding Cultural Resources in Chapter 2.2.6 management actions 5000-5013, 5100-5127 and 5200-5202. The implementation and preparation of site/project specific activity or development plans is beyond the scope of this document. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13651-58 | Indian Gap Trail is only discussed under Alternative A. Why is this? It is an equally important site under all the alternatives. Even though it may not qualify as a traditional cultural property this historic trail requires evaluation for the National Register of Historic Places and development of a management plan in compliance with NHPA and ARPA. BLM should commit to consideration of this trail as its own ACEC. | A range of alternatives was analyzed for respected places, including Indian Gap Trail in Chapter 2.2.6 management action 5201. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13665-36 | Surely there must be better approaches to conserve cultural resources than to lock off vast swaths of lands from responsible-and necessary-resource development in the hopes that there could be an "unknown" resource somewhere in the restricted area | A range of alternatives has been analyzed for management of cultural resources in Chapter 2.2.6 management actions 5000-5013, 5100-5127 and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13672-3 | The planning area includes a large amount of land in the checkerboard land ownership. The large broad-brush ROW exclusion and avoidance areas prescribed in MA#7002 and MA#7003 could make it impossible in some cases for private landowners to exercise their rights for access and development. These broad-brush exclusions and avoidance areas should be removed and replaced with case-by-case assessment in the checkerboard ownership areas. Case by case assessment of development projects has worked well under the 1997 RMP in that it has protected wildlife populations and other resources and allowed development and land uses to continue. It remains a good model to follow. | A range of alternatives was analyzed for National Historic Trails in Chapter 2.2.6 management actions 7000-7022. A range of alternatives for Rights-of-ways was analyzed in management actions 6100 - 6210. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13672-4 | The Draft RMP incorrectly applies management actions to trails that are not congressionally designated National Historic Trails (NHT). Management actions #7017-7022 in the Draft RMP incorrectly apply "NHT-like" restrictions to eligible but NOT congressionally designated trails ("non-NHT trails"). Management Actions #7017, #7018, #7019, #7020, #7021, #7022 should be removed altogether because they do not follow current rules, regulations, policy and guidance. Non-NHT trails are adequately covered by Management Actions #5000-5004. | A range of alternatives was analyzed for Trails that are eligible not designated in Chapter 2.2.6 management actions 7017-7022 . A range of alternatives for the management of cultural resources was analyzed in Chapter 2.2.6 management actions 5000-5013. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13755-8 | BLM proposes a vast increase in areas subject to right-of-way exclusion throughout the management area. Within the KSLA, most of the newly excluded areas appear to coincide with the historic Overland Trail that cross I-80 within the KLSA, and the 1850 Cherokee Trail in the southern portion of the KSLA. Current restrictions related to these trails are limited to case-bycase mitigation and avoidance of surface uses within 0.25-mile. Now, BLM would exclude uses up to 5 miles from designated or eligible historic trails. These restrictions would render exclusion zones within the KSLA completely useless for trona mining. BLM provides little justification for expanded right-of-way exclusion zones. First, for purposes of the Overland Trail in the area of the KSLA, much of trail and the associated exclusion zone is within the viewshed ofI-80 and other service roads. It makes little sense to close the area to new rights-of-way when the visual setting is already highly impacted by thousands and thousands of passing vehicles | A range of alternatives was analyzed for National Historic Trails in Chapter 2.2.6 management actions 7000-7022. A range of alternatives for Rights-of-ways was analyzed in management actions 6100 - 6210. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13776-9 | The well-preserved condition and number of intact historic trail and wagon road miles in this Field Office warrant serious protection. Ideally and for continuity, the Rock Springs RMP would match the National Historic Trails protections outlined in the Lander Field Office RMP, with similar viewshed protections and NSO conditions. For Management Actions 7001-7006, Alternative D provides the most balanced approach, acknowledging that viewshed in certain parts of the National Historic Trails has been compromised. | A range of alternatives was analyzed for National Historic Trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13811-5 | The current approach to management under the Green River RMP applies restrictions to surface disturbing activities, requires effective mitigation measures, designates management corridors to protect trail or site boundaries, and restricts the placement of structures that visibly intrude on the NHT.16 These management strategies already place protections on the trails, which have survived significant development in this region for many years. Pacific does not see the need to further restrict development for purposes of trail preservation when the system in place already gives BLM discretion to make management decisions to "preserve and protect" the NHTs. | A range of alternatives was analyzed for National Historic Trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13824-1 | MA 7203-7217 Range improvements that would be helpful may need to be less than 5 miles from NHT, a 1/4 mile is more than enough distance. | A range of alternatives was analyzed for National Historic Trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13826-6 | BLM Goal: LR-08: Promote the increased awareness of the historical and cultural values and facilitate a sense of stewardship within the backcountry byways. My Concern: These sites that will be located in the ACECs and will not be easily accessed by people, especially older or handicapped adults, or young children. Therefore establishing many of the ancient history sites, Native American history sites and early American History sites will prevent this visitation and not promote a sense of stewardship with the residents and visitors to Wyoming. I believe this needs to also help promote respectful education of the different cultures. Of course if these site have graves or significant spiritual significance then that should be taken into consideration. But also, places such as pioneer graves, Mormon trail and South Pass for example also hold strong religious and spiritual purposes for the members of the L.D.S. church and their culture and this also needs to be taken into consideration and respected. Special Designations (SD) - Congressionally Designated Trails (7000-7022) Coordinate with recreation and other programs to provide opportunities for public visitation, interpretation, education, and appreciation of NHTs. | A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. A range of alternatives for management of Congressionally designated Trails was analyzed in management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13826-10 | BLM Goals and Objectives: * HR-03: Consult with Native American tribal governments regarding proposed land uses having the potential to affect cultural resources identified as having tribal interests or concerns. Determine the types of resources of concern to various tribes and take tribal views into consideration when making land use allocations or decisions. * SD-04: Manage for protection cultural resources for scientific study, education, and interpretation. * HR-14: Maintain existing and establish new working relationships with Native American tribes for purposes of advancing the protection of cultural resources. * HR-15: Consult, as appropriate, with Native American tribes to identify tribally sensitive resources or places that may be present within the RSFO. Safeguard all information considered by tribes to be confidential and utilize the information to prevent conflicts with incompatible uses. * HR-16: Preserve and protect the cultural remains and natural settings of Sacred, Spiritual, and/or Traditional Cultural Properties. My Comment: It seems that the BLM is actively doing this, which I fully support. Again I believe that placing these sites in ACES or restricting access by closing roads or ROW access will make it more difficult of the Native Americans to access sites as well, especially if there are members that have disabilities or are older or children. | A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13826-11 | * HR-04: Promote stewardship, conservation, and appreciation of cultural resources. My Comment: If BLM choses the Alternative B how is the public going to be able to be involved in this stewardship and learn and experience the cultural sites and resources that will be within the ACECs and not accessed by maintained roads. People with physical and mental disabilities, older adults, children and individuals will not have equal access to these locations. | A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13826-12 | * HR-05: Maintain and enhance programs that provide opportunities for scientific research of cultural resources. * HR-06: Provide opportunities for public education and interpretation of cultural resources. * HR-6.1: Conduct presentations for schools, community organizations, and the public. * HR-07: Provide for appropriate interpretation of sites of high public interest. My Comment: Sites that are related to Ancient cultural and geographical history should be open to the public to give them the opportunity for scientific research and for the public to observe the research in progress. For example, when there is an active dinosaur dig or local historical dig. My husband was involved in historical site digs with Dudley Gardner. I was able to occasionally go and visit and respectfully observe. Doing this taught me respect for the site, the history and the scientific process. It was a stewardship of learning for the public. This would promote further stewardship and responsibility of the public and visitors. I love going to Fort Bridger and see the site area they left open for the public to see. It gives you a sense of the science | A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | and authenticity of history involved at that historic, cultural or natural site. I recommend working in cooperation with the local and state agencies to build this stewardship. In general if the public is a part of this and views the process it will hopeful instill more respect, knowledge and concern for these sites. Again, I don't believe the proposed Alternative B supports this process with sites no longer managed. | |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13826-13 | * HR-08: Pursue establishment of site stewardship programs at vulnerable cultural sites, including, but not limited to, the Tolar, White Mountain, Cedar Canyon, Sugarloaf, and La Barge petroglyph sites. * HR-09: Preserve and stabilize significant cultural resources, especially resources that face immediate public use areas. * 5001 HR-15, HR-03 Identify culturally sensitive sites on BLM-administered lands within the planning area. * HR-09, HR-08, HR-2.1, HR-6.1 Protect and preserve representative samples of the full array of significant cultural resources for the benefit of present and future generations. * 5003 HR-02, HR-03Coordinate with other BLM programs preplanning measures to prevent potential conflicts before they occur. * HR-10: Preserve and protect the historical remains and historical setting of the South Pass Historic Landscape ACEC. See the ACEC section for management alternatives for these resources. * HR-11: Establish appropriate management prescriptions for the South Pass Historic Landscape ACEC. * HR-12: Coordinate with recreation and other programs to provide opportunities for public visitation, interpretation, education, and appreciation of the South Pass Historic Landscape ACEC. * HR-13: Preserve and protect the cultural remains and natural settings of significant rock art sites, including but not limited to Tolar, White Mountain, Cedar Canyon, Sugarloaf, and La Barge petroglyph sites. See the Areas of Critical Environmental Concern section for management alternatives for these resources. If they are not designated ACECs, then management actions for them would be analyzed in this section. * HR-21: Provide opportunities for the public to enjoy limited recreational collection of common invertebrate and plant fossils in portions of the planning area. * HR-22: Develop interpretive sites relative to paleontological resources. * HR-23: Promote and implement stewardship, conservation, and protection of paleontological resources. * HR-24: Ensure areas containing, or likely to contain, vertebrate or noteworthy occurrences of invertebrate or plant fossils are identified and evaluated prior to authorizing surface-disturbing activities. My Comments: Having been born and raised in Sweetwater County again I think this is an essential BLM goal and objective but it can not be achieved if these sites are designated as ACECs where they will not be accessible by the general public. Many of these sites, I didn't even realize, where available to visit or view. I would like to see programs that would promote this stewardship, respect and educate the residents. | A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-1 | Many of these THPO offices are not included in the BLM's current consultation list as presented in the draft RMP and would fall within the parameters of management goal HR-14's proposed mandate to "establish new working relationships with Native American Tribes." In this vein, we recommend updating the list, and subsequently extending an offer for, consultation with additional Tribes prior to issuing a record of decision, including but not limited to: ? Eastern Shoshone THPO ? Northern Arapaho THPO ? Shoshone-Bannock HeTO (Heritage Tribal Office) ? Crow THPO ? Ute Indian Tribe of the Uintah and Ouray Reservation ? Southern Ute Indian Tribe ? Ute Mountain Ute Tribe ? Rocky Mountain Tribal Leaders Council These Tribal Nations also have ties to this landscape and BLM consider soliciting their input: ? Fort Belknap Indian Community ? Rosebud Sioux Tribe of Indians ? Cheyenne & Arapaho Tribes ? Comanche Nation ? Northern Cheyenne Tribe ? Lower Brule Sioux Tribe ? Kiowa Tribe ? Osage Nation 1 1851 Fort Laramie Treaty, Fort Bridger Treaty of 1863 and 1868, and the websites of above mentioned Tribal Nations, which provide descriptions of ancestral homelands and territories. https://native-land.ca/ is a helpful reference site for Tribal homelands and Treaties. ? Fort Peck Assiniboine & Sioux Tribes ? Navajo Nation ? Te-Moak Tribe of Western Shoshone | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-3 | The lands within the Rock Springs Field Office encompass the traditional homelands and migratory territories of over many Tribal Nations, several of which continue to practice traditional uses and enact reserved treaty rights on these landscapes-including gathering food and medicines-that are dependent upon intact, functioning ecosystems as a whole, not just impacts to individual cultural sites. When determining when and how to conduct meaningful consultation, it is important to note the entire landscape is often of significance to Tribal Nations and thus they should be included in a collaborative manner when determining how all resources are managed and when consultation is warranted. The Department of Interior issued a Joint Secretarial Order on Co-Stewardship3 and the BLM offered additional guidance through PIM2022,4 stating that the BLM will meet and consult regarding co-stewardship opportunities and evaluate proposals submitted by Tribes, including proposals to build both Tribal and Federal capacity to carry out the SO. | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-4 | While the draft RMP references taking Tribal concerns into consideration, it does not reflect current guidance directing the BLM to collaborate with Tribal Nations on co-stewarding resources of interest to Tribal Nations within the Rock Springs Field Office. PIM 2022-011 further notes "the BLM can also use land use plans to formalize its commitment to engage in co-stewardship arrangements for subsequent implementation decisions. For example, the BLM can incorporate Tribal priorities into the designation and management of resource management areas, etc."6 We urge BLM to update Management Goals HR-03, 14, 15, & 16 and any associated Management Actions (including but not limited to MA's 5000, 5001, 5008, 5010, 5109, 5123 and 5200) to include better direction on collaborating with Tribes, not just considering their concerns. | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. |

|---|---|---|---|
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-5 | Management Goal HR-03 states:"Consult with Native American tribal governments regarding proposed land uses having the potential to affect cultural resources identified as having tribal interests or concerns. Determine the types of resources of concern to various tribes and take tribal views into consideration when making land use allocations or decisions." The BLM should alter this language to state "consult with Native American Tribal Governments regarding proposed land uses having the potential to affect resources identified as having Tribal interests or concerns. Determine the types of resources of concern to various Tribes and collaborate with Tribal Nations on co-stewarding Tribal Cultural Sites (defined below) and related resources, especially when making land use allocations or decisions." | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-6 | It is a misconception that Tribal Nations are only concerned with archaeological sites or sacred sites, or conversely that cultural resources in the eyes of Tribal Nations only refer to archaeological resources or sacred sites. In the absence of a clarifying definition from individual Tribal Nations, we propose the following definition for Tribal Cultural Sites. Tribal Cultural Site: "Tribal cultural site" refers to: a sacred site; a historic property (as defined in section 800.16 of title 36, Code of Federal Regulations); or a landform, landscape or location that-(a) is or may be important to the customs, practices, objects, places, religions, or ceremonies of an Indian Tribe; (b) is or may be important to an Indian Tribe for the undertaking of religious, cultural, spiritual, traditional subsistence, or other traditional practices; (c) contains unique or important traditional Tribal food, medicinal, or material gathering areas; or (d) is connected through features, ceremonies, objects, histories, or cultural practices to other sites or to a larger sacred landscape, as determined by an Indian Tribe8." | See Glossary for the definition of 'cultural resources' that BLM used in the preparation of this document. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-8 | MA 5000 should include direction on identifying and managing Tribal Cultural sites for the benefit of present and future generations in collaboration with and, if so-desired, in co-stewardship with said Tribal Nations. | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. A range of alternatives regarding relationships with Tribes was analyzed in Chapter 2.2.6 management actions 5200 - 5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13827-9 | we recommend the BLM modify MA 5010 to specify Tribal traditional use. Additionally, as per the BLM's Federal Trust Responsibility, it should be made clear that if there is a conflict between Tribal traditional use and scientific or experimental use, Tribal interests will take priority. This should apply to the management of steatite quarries as indicated in Alternative D for management action 5008 but with the solid and fluid mineral closures as listed in Alternative B. Similarly, Tribal consultation, collaboration, and priorities should take precedence over scientific inquiry when considering management actions regarding known archaeological sites such as those included in the West Sand Dunes Archaeological District and listed in Management Action 5109. | A range of alternatives for the management of cultural resources was analyzed in Chapter 2.2.6 management actions 5000-5013. A range of alternatives regarding relationships with Tribes was analyzed in Chapter 2.2.6 management actions 5200 - 5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13865-33 | 7. Cultural Resources Cultural resources follow the Section 106 process that is consistent between Federal and State agencies. This process is broader than the BLM and includes Tribes and Tribal consultation, State Historic Preservation Offices (SHPO), Oregon California Trail Association (OCTA), and National Historic Trails (NHT). Any changes to the evaluation of adverse direct or indirect effects would create a situation in which the RSFO would be inconsistent with adjacent BLM Field Offices and would create anomalous criteria within established processes for National Historical Register (NHR) evaluations. All historical properties should be managed under the established Section 106 evaluation process including for indirect visual protocols. To maintain consistency with other agencies and Tribal processes and to avoid BLM overreach of its authority, PacifiCorp recommends that the BLM adopt Alternative A for MAs #5100 through #5127. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.2 Coordination and Consistency for discussion of coordination actions with SHPO and other agencies. A range of alternatives was analyzed for Specific Cultural Resources in Chapter 2.2.6 management actions 5100-5127. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13865-60 | A.2.1. For resources that require multi-agency agreement such as cultural, no action should take place that is inconsistent with established BLM protocol in adjacent Field Offices with agencies such as SHPO, tribal consultation or NHT. Buffers on the trail should remain the same and consistent. VRM classifications should go through the evaluation process and be defined geographically in a manner that captures the intended protection clearly if there are proposed changes. The Green River formation is shared by four Field Offices and there would be no benefit in changing the stipulations for Paleontology and the management of fossil rich strata. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.2 Coordination and Consistency for discussion of coordination actions with SHPO and other agencies. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13911-10 | The other resource values requiring protection in the ACEC analysis include areas of cultural significance, such as rock art panels, petroglyphs, and other geological features, as well as historic trails. While the Coalition does not object to the relevance and importance of some of these sites, it does not agree with the expansive additional acreage proposed under Preferred Alternative B. In its analysis, the BLM fails to recognize the statutes that protect these types of sites. For example, Cedar Canyon, La Barge, Sugarloaf, Tolar, and White Mountain, which are areas that contain rock art and petroglyphs, are already protected by the Archaeological Resources Protection Act ("ARPA"), 16 U.S.C. §§ 470aa-470mm, and the National Historic Preservation Act ("NHPA"), 54 U.S.C. §§ 300101-300315; 36 C.F.R. Part 800. In addition, under all alternatives, the BLM proposes to manage rock art sites and their surrounding viewshed "to protect their cultural and historical values" by prohibiting surface occupancy, placing a no surface occupancy for fluid minerals, designated it as a right-of-way exclusion area, etc. DEIS at 2-91 - 2-92 (Mgmt. Action #5100). The BLM must show additional special management is required to protect these resources or that the current laws are inadequate to protect them before designating them as ACECs. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.2 Coordination and Consistency for discussion of coordination actions with SHPO and other agencies. A range of alternatives was analyzed for the management of cultural resources, specific cultural resources, and Sacred, Spiritual or other traditional Cultural Properties in Chapter 2.2.6 management actions 5000-5013, 5100-5127 , and 5200-5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13911-11 | Finally, national historic trails and wagon roads are also protected by the NHPA and do not necessitate a large swath of land to be designated as an ACEC to protect the trails themselves. Pursuant to the National Register Bulletin #15, a trail must also retain its integrity to be considered in the National Register of Historic Places. A trail must still be well-established or still visible, and not obscured by modern use. For those that are visible, a ¼ mile buffer on each side of the trail is only warranted pursuant to the National Trails Act. See e.g. 16 U.S.C. § 1244(a)(3) ("The authority of the Federal Government to acquire fee title under this paragraph shall be limited to an average of not more than ¼ mile on either side of the trail."). In addition, the BLM fails to explain why the National Historic Trails within the Proposed South Pass Historic Landscape ACEC would require an additional 50,000+ acres under the Preferred Alternative B to protect trails that any many places are no longer visible. See DEIS at 2-195 (Mgmt. Action #7498 - expanding South Pass ACEC from 53,940 acres to 171,300 acres under Preferred Alternative B). | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.2 Coordination and Consistency for discussion of coordination actions with SHPO and other agencies. A range of alternatives was analyzed for Congressionally designated trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13912-9 | As an initial matter, BLM has no authority to manage the non-federal lands within the checkerboard to "preserve the existing character of the landscape" for the benefit of trails without national historic designations. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives was analyzed for eligible but not designated trails in Chapter 2.2.6 management actions 7017 - 7022 |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13912-11 | BLM provides little or no justification for this significant change in management for historic trails. BLM does not explain why current protections, which are applied on a case-by-case basis, are now inadequate to protect historical resources. Indeed, all federal actions in the planning area, regardless of their distance from historic trails, must undergo National Historic Preservation Act Section 106 consultation, including consultation with the State Historic Preservation Office ("SHPO"). That means that under current management, undertakings within the viewshed of these trails are already carefully examined, cautiously permitted, and subject to minimization and mitigation requirements in consultation with the SHPO. Blanket restrictions that place large swaths of public lands off limits to preserve the landscape for a handful of potential historic trail users illegally violate BLM's multiple-use obligation, and in checkerboard areas, these restrictions, make no sense where existing private surface uses affect the visual landscape and BLM cannot effectively manage to avoid interference with the historical setting. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Chapter 5.1.2 Coordination and Consistency for discussion of coordination actions with SHPO and other agencies. A range of alternatives was analyzed for Congressionally designated trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13913-4 | BLM should conduct further consultation to explore opportunities for incorporating the directions and intentions of incorporate the directions and intentions of both Secretarial Order 3403 "Joint Secretarial Order on Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters" and BLM's commitments to adhere to the principles in that Order, outlined in Permanent Instruction Memorandum 2022-011. That instruction memorandum notes "the BLM can also use land use plans to formalize its commitment to engage in co-stewardship arrangements for subsequent implementation decisions."4 We urge BLM, through consultation prior to the signing of the ROD, to incorporate in this guidance and identify places Tribal Nations can not only be involved in designing, but be involved in the implementation of, management actions. | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. A range of alternatives regarding relationships with Tribes was analyzed in Chapter 2.2.6 management actions 5200 - 5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #13913-5 | C. Update definition of Tribal Cultural Site BLM has the opportunity in this RMP to acknowledge that Tribal Nations have interests in the planning area that extend beyond archaeological or spiritual sites. Secretarial Order 3403 notes that "lands and waters contain cultural and natural resources of significance and value to Indian Tribes and their citizens, including sacred religious sites, burial sites, wildlife, and sources of indigenous foods and medicines." Cultural resources need not only refer to archaeological resources or sacred sites but include lands where Tribal members food-gather, hunt, seek connections, recreate, practice customs, or are important for other uses. In the absence of a clarifying definition from individual Tribal Nations, which BLM could solicit during future consultation, we propose BLM consider the following definition for Tribal Cultural Sites. This definition is aligned with the definition in the proposed "Tribal Cultural Areas Protection Act," legislation authored by numerous Tribal Historic Preservation Offices as well the National Association of Tribal Historic Preservation Officers. "Tribal cultural site" refers to: a sacred site; a historic property (as defined in section800.16 of title 36, Code of Federal Regulations); or a landform, landscape or location that-(a) is or may be important to the customs, practices, objects, places, religions, or ceremonies of an Indian Tribe; (b) is or may be important to an Indian Tribe for the undertaking of religious, cultural, spiritual, traditional subsistence, or other traditional practices; (c) contains unique or important traditional Tribal food, medicinal, or material gathering areas; or (d) is connected through features, ceremonies, objects, histories, or cultural practices to other sites or to a larger sacred landscape, as determined by an Indian Tribe." | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See Glossary for definitions that BLM used in the preparation of this document. |
| 820 - Heritage and Visual Resources–Cultural Resources (5000-5013) | #14032-10 | on December 1, 2022, when the Departments of Agriculture and the Interior announced implementation of new policy recommendations designed to increase Tribal engagement in mining 11 https://www.fema.gov/floodplain-management/intergovernmental/federal-flood-risk-management-standard 12 https://www.ecfr.gov/current/title-44/chapter-I/subchapter-A/part-9 proposals and protect Tribal interests and resources from the impacts of mining; a key land use activity provided for in the RSFO RMP/EIS. Under this policy, DOI agencies are directed to: * Begin informing all potentially impacted Tribal governments of exploration "notices" when those notices are received by the agency, and create an easy-to-use website that will allow Tribal Governments and the general public to see | See Chapter 5.1.3 for discussion of Native American Interests. See Chapter 5.3 of Tribal Governments that were included in this planning process. A range of alternatives regarding relationships with Tribes was analyzed in Chapter 2.2.6 management actions 5200 - 5202. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | what exploration notices have been submitted on BLM-managed public lands (specific to the DOI); * Begin the development of a system that will allow Tribal Governments to confidentially specify geographic areas of interest and receive notifications when mineral exploration or mining proposals occur within those areas; * Invite Tribal Governments to participate in pre-exploration or mining plan submission meetings with mine developers; * Explore the formation of intergovernmental teams composed of federal, Tribal, state and local government officials to facilitate information-sharing and identification of issues of concern related to mining proposals; * Consult with Tribal Governments on reclamation plans and appropriate financial assurance levels for mineral exploration and mining proposals, and engage Tribes in discussions about desired post-mining land uses; and * Make additional efforts to include Tribal Governments who have a current or historical presence in a potentially impacted area, or who would be impacted by mineral development, to participate in the NEPA process as cooperating agencies. The EPA encourages BLM to use these directives in informing its on-going and future consultation efforts with American Indian Tribes around project-specific mining (and all other) proposals in the planning timeframe covered by the RMP/EIS, as well as to develop potential related goals, objectives, and management directions to include in Table 2-1 in the Final RMP/EIS specific to Tribal interests. | |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #9774-9 | Raising additional questions, we inquire whether the BLM has maintained contact with the relevant THPOs in Wyoming since the commencement of this plan in 2011. With representatives for the Northern Arapaho Tribe and the Shoshone Tribe of the Wind River Reservation, we underscore the importance of consulting with tribal representatives despite the geographic distance from Rock Springs. The omission of information regarding tribal cultural resources in the RMP/DEIS further underscores the need for comprehensive engagement. | See Chapter 5.1.3 Native American Interests for discussion of BLM consultation efforts with Native American Tribes. See Chapter 1.4 Planning Criteria for involvement of Tribes in the planning process. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13287-14 | In addition, BLM should use eminent domain to acquire a legal public access along the Barrel Springs county road, so the public can have access along the Overland Trail route without trespass. We agree with the direction to consult with tribes on Traditional Cultural Properties; we would encourage BLM to apply the same stringent site-and-viewshed protections to tribally-identified sites as it does to specific cultural resources under Alt. B at p. 2-91. | See Appendix K - Land Tenure Adjustment Criteria for discussion of acquisition, retention and disposal criteria for public lands. A range of alternatives has been analyzed for Specific Cultural Resources in Chapter 2.2.6 management actions 5100-5127. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13651-19 | MA# 5012 page 2-90: Alternative B states: Avoid ground disturbance activities through use of a minimum 500 foot buffer around sites eligible for inclusion in the National Register of Historic Places under Criterion D (because of their scientific information content). Ground disturbance activities include geophysical activities. This avoidance distance might be appropriate for sites eligible for the NRHP under other criteria as determined on a case-by-case basis. Develop appropriate mitigation measures if a site cannot be avoided. Alternatives C and D vary only by the avoidance difference (100 feet instead of 500): Avoid ground disturbing activities, including geophysical activities, on sites eligible for inclusion in the NRHP under Criterion D (because of their scientific information content) by at least 100 feet. This avoidance distance could be appropriate for sites eligible for the NRHP under other criteria and would be determined on a case-by-case basis. Develop appropriate mitigation measures if a site cannot be avoided.Avoidance and treatment measures should take account of "integrity of setting." If a site is avoided then that avoidance should include the integrity of the visual and sound characteristics of the setting. The plan should require the establishment of the significant parameters of setting as part of a determination of eligibility. Treatment measures must include documentation of the setting when a decision is made that avoidance of an eligible site is not possible. The distance of the impacts from the visual and audible setting of the site become a "mitigation measure" in themselves and will vary based on the context and nature of the site under consideration. We would expect different treatment and avoidance measures in the setting of a tool-stone source versus a habitation site. The BLM should develop these alternate measures on a site-by-site or where appropriate on a class of site basis. All alternatives should state that avoidance is the normal treatment. Other forms of mitigation require external coordination before their use. | A range of alternatives has been analyzed for sites eligible for inclusion in the NRHP in Chapter 2.2.6 management action 5012. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13651-21 | MA 5100 HR-13, HR-16, HR 6.1 pages 2-91 How does the viewshed differ within the settings of these five rock art sites? The setting of a National Register eligible or listed rock art site will include the viewshed and sound-shed as integral information defining the site. Therefore having a variable protection area for the setting by alternative (3 miles for Alternative B, ¼ mile for Alternative C and ½ mile for Alternative D) is inconsistent with the conservation of integrity of setting that made the site eligible for the National Register. If the BLM permits activities which alter setting then it needs to construct appropriate treatment measures on a case-by-case basis. Permit actions within the sound-shed and viewshed (setting) of National Register properties will require consideration of treatment measures. National Register site descriptions should define important aspects of setting. To have buffer zones at an arbitrary distance makes no more sense for Rock Art Sites than it does for the historic landscape of the South Pass Historic Landscape National Register property. This measure should commit to a National Register nomination update which defines the variable distance boundaries of the rock art sites to include viewshed and sound-shed characteristics. The alternative is to continue an unworkable solution that places an arbitrary buffer zone distance and clouds the assessment of direct and indirect effects on National Register properties. Reworking | A range of alternatives has been analyzed for Rock Art Sites in Chapter 2.2.6 management actions 5100-5106. Analysis of impacts for actions in each alternative is found in Chapter 4 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | the relationship between sound-shed and viewshed as components of the setting of National Register and National Register eligible sites requires a rewrite of the rock art Management Actions 5100 through 5106 (from page 2-91 through 2-96). | |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13651-22 | Playa Lake Areas MA # 5109 (page 2-96) The RMP should define Playa Lake areas as locations where National Historic Preservation Act Section 110 inventories must occur. The inventory would have a goal to define National Register historic districts. BLM should commit to prepare a thematic Multiple Properties Documentation Form which establishes the qualities of integrity of these areas (including the setting-landscape) within Playa Lake areas. The plan should identify all playas as potential areas where special treatment measures are likely. Activities such as fencing, interpretive signs, or barriers to ensure protection of the area are appropriate under all alternatives and serve in lieu of extensive data recovery within Playa Districts. The BLM should advise proponents of undertakings that additional treatment measures and associated costs are possible for activities in playa lake settings. | Specifying specific areas for 110 inventory are project implementation level decisions and are outside the scope of this document. A range of alternatives has been analyzed for management of Specific Cultural Resources in Chapter 2.2.6 management actions 5100 - 5127. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13651-23 | West Sand Dunes Archaeological District MA# 5122 (page 2-99) Clarify what is meant by the statement in Alternative C that "The West Sand Dunes Archeological District would not be retained." Why? Does BLM intend to excess this land? If the West Sand Dunes Archeological District is a National Register or National Register eligible property then all alternatives would require measures to protect the archeological district or mitigate its loss: this is a matter of use allocation. The language here should tie into the mandatory designation of use allocation of archeological and historical sites. Use allocation needs to be part of the RMP designations by site type. | A range of alternatives has been analyzed for the West Sand Dunes Archaeological District in Chapter 2.2.6 management actions 5122 - 5127. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13702-9 | American Graves Protection and Repatriation Act of 1990 (NAGPRA)is disregarded in MA 5112. Under NAGPRA all known human burial sites would be protected regardless of their ethnic affiliation. 43 CFR 10.4 provides a process for Federal agencies to address new inadvertent discoveries of Native American human remains, funerary objects, sacred objects and objects of cultural property intentionally excavated or inadvertently discovered on Federal or Tribal lands. 43 CFR 10.4(d)(2) states that "The activity that resulted in the inadvertent discovery may resume thirty (30) days after certification by the notified Federal agency of receipt of the written confirmation of notification of inadvertent discovery if the resumption of the activity is otherwise lawful." | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for known burial sites in Chapter 2.2.6 management action 5112. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13751-85 | Cultural Resources: MA #5112 does not take into consideration the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA). Under NAGPRA all known human burial sites would be protected regardless of their ethnic affiliation. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for known burial sites in Chapter 2.2.6 management action 5112. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13751-141 | MA #5112 ALT A Industry Position: Not Acceptable Reasoning: This is a very rare potential risk and as managed under Alternative A has worked appropriately. However, it provides no option for mitigation. |---|---|---|---|
| | | all new ROWs. Consult with appropriate tribes regarding management of Native American burial sites and surrounding areas. Excavation/data recovery would not be the preferred method for mitigation of adverse effects to any burial location. Any burial located in the future will be managed with the same prescriptions as known burial sites. Industry Position: Not acceptable Reasoning: No option for mitigation. All known human burial sites would be protected regardless of their ethnic affiliation. Management of Native American burial sites would adhere to the Native American Graves Protection and Repatriation Act of 1990 (NAGPRA), which provides a process in 43 CFR 10.4 for Federal agencies to address new discoveries of Native American human remains, funerary objects, sacred objects and objects of cultural property intentionally excavated or inadvertently discovered on Federal or Tribal lands. Resource: Heritage and Visual Resources (HR) - Paleontological Resources (5300-5309) | |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13827-12 | Management Action 5112 under Alternative B and D attempts to acknowledge Tribal Nations "right of possession" and NAGPRA's mandate to protect all known burial sites located on Federal lands. However, we believe it does not adequately address potential impacts to said burial sites and is a strong candidate for incorporating a provision requiring Tribal concurrence for all actions relating to burial site management. These sites would best be protected by combining language in Alternative B with that in D. We agree that all known burial sites should be closed to mineral material sales/disposal, closed to solid mineral leasing, an exclusion area for right-of-ways, and recommend closure to fluid minerals in place of leasing with no surface occupancy stipulations so as to prevent any below-ground disturbance to unknown but possibly closely located human burials. To that end, we recommend incorporating Alternative D's provisions to manage any burial located in the future with the same prescriptions as known burial sites. We also support language in Alternative B that stipulates excavation and data recovery would not be the preferred method for mitigation. However, we believe that language in Alternative D requiring consultation with appropriate Tribes regarding burial sites and the surrounding area moves the field office toward meeting the intent of NAGPRA. To fully meet the intent of NAGPRA, however, and PIM 2022-011, we recommend including additional language that requires Tribal concurrence for any project or decision that may affect known or unknown burial sites within the field office. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. A range of alternatives has been analyzed for known burial sites in Chapter 2.2.6 management action 5112. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13848-5 | BLM provides no factual basis for its decision to impose 4 to 10 mile buffers around undesignated trails or any basis for deciding that any resources associated with the trails could be protected with less restrictive means. | MA#7000-7022 (Special Designations – Congressionally Designated Trails) discuss the full range of alternatives considered in the EIS. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13848-9 | With the exception of the 1850 Cherokee Trail, which is currently being studied by the National Park Service for eligibility as a national historic trail, eligible but not designated trails within the checkerboard should have no rights of way exclusion and retain a one quarter mile protective set back on either side of contributing sections of trails. Those eligible but not designated trails include but are not limited to 1849 Cherokee Trail, Overland Trail, Point of Rocks to South Pass Road, and other expansion era roads and trails. | A range of alternatives has been analyzed for management of Congressionally Designated Trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 821 - Heritage and Visual Resources–Specific Cultural Resources (5100-5127) | #13899-21 | The most common damage to rock art in the Rock Springs Field Office happens in the form of vandalism. Because of the sensitive nature of archaeological rock art sites, we support Alternative B's management actions to manage significant rock art sites (including both prehistoric and historic inscriptions) and their surrounding viewshed (the actual area that can be seen from the rock art sites, within three miles) to protect their cultural and historical values. Visibility [viewshed] is of major importance to how humans relate to and interpret the landscape. People often describe a place based on the visibility.73 Viewshed analysis is, therefore, an important element in the interpretation of the landscape for understanding past societies and should be implemented into land management strategies. We agree with the analysis of protected acres and viewshed protected acres listed under Alternative B for the rockWe support the prohibition of surface disturbing activities, visual intrusions, and audible intrusions, within these areas. Our organizations contend that the management of visitor use at rock art sites could include interpretive signing, fencing, barriers, and other activities with particular emphasis on addressing vandalism at the sites. As noted in the Tribal Consultation and Co-stewardship section of this document, the BLM can also use land use plans to formalize its commitment to engage in co-stewardship arrangements for subsequent implementation decisions. We recommend that the BLM incorporate Tribal priorities into the management of visitor use at Indigenous rock art sites. And for all culturally significant areas, we recommend that the BLM prioritize and fund Tribal-led stewardship of these sites.[...] art sites at Cedar Canyon (311 acres + 4,008 viewshed acres), LaBarge Bluffs (20 acres + 5,008 viewshed acres), Sugarloaf (20 acres + 371 viewshed acres), Tolar (20 acres + 1,512 viewshed acres), and White Mountain (20 acres + 4,780 viewshed acres). | A range of alternatives has been analyzed for management of Rock Art Sites in Chapter 2.2.6 management actions 5100-5105. Analysis of impacts for actions in each alternative is found in Chapter 4. See Chapter 5.1.3 Native American Interests, for discussion of consultation with Tribes. |
| 821 - Heritage and Visual Resources– | #13913-2 | Other Historic Trails The Rock Springs Field Office hosts several other nationally and regionally important trails the BLM considers "Eligible but not Designated" for the National Register of Historic Places. Of note is the Cherokee Trail, which is still under assessment by the National Parks Service, and the Overland Trail. There are | A range of alternatives has been analyzed for management of Congressionally Designated Trails in Chapter 2.2.6 management actions 7000-7022. Analysis of impacts for actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Specific Cultural Resources (5100-5127) | | also many local routes and roads, like the Point of Rocks to South Pass trail. Many of these trails have significant acreage in the public-private land checkerboard, making access and preservation difficult. We find the Management Actions proposed in Alternative D would suffice to maintain these trails amidst the array of multiple uses, including rights-of-way corridors, that should be permitted in the checkerboard (as opposed to in other intact, high-value landscapes in the Field Office). Of note, we believe where these trails intersect with established Section 368 Energy Corridors, the rights-of-way should be allowed to cross the trails and not be in full avoidance. We do support avoidance of rights-of-way for wind and solar energy developments on and within the buffer of these trails. Because these trails have seen, and will see, future development that impacts their setting we encourage the BLM to establish a management action regarding mitigation-one that would include supporting local and state-based educational efforts regarding these trails. | |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13651-24 | What is a "Native American tribe?" The US government has special responsibilities to "federally recognized Indian Tribes" in a government to government relationship. We recommend that the BLM should define how this relationship transpires in a different section independent of "Heritage and Visual Resources." | Chapter 5.1.3 discusses Native American Interests in regards to the DEIS. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13651-25 | If there are special interests in "American Indian" heritage resources, include here language to identify Indian tribes with such interests. That identification would include specific Tribal Historic Preservation Offices, where they exist, and federally recognized American Indian Tribes that do not currently have Tribal Historic Preservation Offices under 54 CFR § 302701 - § 302706. Especially relevant is the language in 54 CFR § 302701 (b)(2): | Chapter 5.1.3 discusses Native American Interests in regards to the DEIS. MA#5200-5202 and H.R.#14-16 address consultation and relationship with Native American tribes. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13651-26 | Instead of a vague description of relationships, this is an ideal section to identify which Tribes have geographic affinity to the Rock Springs RMP. BLM should commit to coordination with relevant tribal interests. Coordination should occur through relationships that exist with established tribal historic preservation offices and, where a defined relationship with tribal historic preservation offices does not exist, the BLM should coordinate with tribal governments to determine the range and complexity of their interests. Those interests may go beyond how they wish to get National Historic Preservation Act and the Native American Grave Protection and Repatriation Act information for future consultation. This section should attempt to set a baseline standard for these relationships. | Chapter 5.1.3 discusses Native American Interests in regards to the DEIS. MA#5200-5202 and H.R.#14-16 address consultation and relationship with Native American tribes. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13806-4 | To improve upon the language proposed in the draft, and in support of my Tribal member friends and colleagues, I recommend the BLM include improved direction on collaborating with Tribal Governments in co-managing important landscapes, as opposed to simply considering Tribal perspectives. This is in alignment with recent national-level direction from both the Executive Office and the BLM. (In reference to Management Goals HR-03, 14, 15, & 16 and any associated Management Actions including but not limited to MA's 5000, 5001, 5010, and 5200 as per BLM Permanent Instruction Memorandum 2022-011). This collaboration should extend to knowledge sharing. Traditional knowledge is not to be shared or incorporated into BLM databases unless done so in collaboration with Tribal Nations, with their approval, and in a manner such that it is "utilized to advance Indigenous aspirations for collective and individual wellbeing". (In reference to RMP Management Goals HR-14 & 15 and ssociated MA 5200 under Alternative B as per 2022 OSTP-CEQ Memorandum on Indigenous Knowledge). | Chapter 2.2.6 management actions 5200-5202 and H.R.#3, 4, & 14-16 address consultation and relationship with Native American tribes. See Chapter 1.4 Planning Criteria for coordination/consultation with Native American Tribes. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13827-7 | Management Action 5201 under Alternative D states: "Consult with Tribal leaders, SHPO, and the activity proponent when an activity is proposed in the vicinity of TCPs, sacred sites, or places of cultural or religious importance. Design management based on the characteristics of the site and the proposed activity. Mitigate activities, on a case-by-case basis, to protect the site and surrounding setting." We recommend modifying the management action to replace "sacred sites or places of cultural or religious importance" with "Tribal Cultural Sites". We also recommend Alternative D's variation on the language provided that subsequent consultation with Tribal Nations determines an acceptable and agreed upon understanding of "in the vicinity" so as to ensure Tribal priorities and concerns are addressed. The management action should further be modified to direct the BLM to collaborate with Tribal Nations on appropriate management and mitigation. | Chapter 2.2.6 management actions 5200-5202 (Sacred, Spiritual or other Traditional Cultural Properties) discusses the full range of alternatives considered in the EIS. |
| 822 - Heritage and Visual | #13827-10 | Indigenous Traditional Knowledge and knowledge of Tribal cultural sites is not to be shared or incorporated into BLM databases unless done so in collaboration with Tribal Nations, with their approval, and in a manner such that | See Chapter 5.1.3 Native American Interests. |

|---|---|---|---|
| Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | | it is "utilized to advance Indigenous aspirations for collective and individual wellbeing"11. While we commend the BLM on seeking to update management in the Rock Springs Field Office to incorporate Indigenous Knowledge and to protect the confidentiality of said knowledge- as is referenced in Management Goals HR-14, HR-15 and associated Management Action 5200 under Alternative B-it still falls short of recognizing and protecting Indigenous data sovereignty. | |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13827-11 | While we support the intent of Management Action 5200 as written under Alternative B and ask that it be retained in the final plan, we ask that in recognition of our Tribal partners' knowledge sovereignty, clarifying language be added to the management action to include "In collaboration with Tribal Nations, and subject to Tribal Government approval, document important sites, areas, and resources and keep confidential as appropriate. Subject to Tribal Government approval, the information would be incorporated into the planning system to identify conflicts in the early stages, to avoid conflicts whenever possible, and to support Native communities' interests in the Field Office. In collaboration with Tribal Nations, manage Tribal Cultural Sites to minimize disturbance to them and to ensure continued access." | Chapter 2.2.6 management actions 5200-5202(Sacred, Spiritual or other Traditional Cultural Properties) discusses the full range of alternatives considered in the EIS. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13865-60 | A.2.1. For resources that require multi-agency agreement such as cultural, no action should take place that is inconsistent with established BLM protocol in adjacent Field Offices with agencies such as SHPO, tribal consultation or NHT. Buffers on the trail should remain the same and consistent. VRM classifications should go through the evaluation process and be defined geographically in a manner that captures the intended protection clearly if there are proposed changes. The Green River formation is shared by four Field Offices and there would be no benefit in changing the stipulations for Paleontology and the management of fossil rich strata. | BLM is not proposing changes to the measures listed in A.2.1., only re-integrating established best management practices for important cultural resource and trail settings that are currently in use. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13878-1 | I do not believe the BLM has fulfilled the commitments made regarding these Tribal requests in the current RMP (Alternative A) and request that they be carried forward into the new RMP. On page 3-15 the draft RMP states: The Green River RMP and the JMH both identify Indian Gap and the Indian Gap Trail as a respected place for tribes. Both plans also state that Indian Gap and the associated Indian Gap Trail will be further researched. Subsequent research, including Tribal consultation and field visits from 1998 and 2003, revealed that two tribes identified the Gap as a historic resource. Oral history indicates that an historical Indian trail passed through the saddle between Steamboat Rim and Essex Mountain (Indian Gap). One tribal elder stated that the trail was used to bring coal from Rock Springs to the Wind River reservation perhaps as early as 1880s-1920s. A Tribal elder from a different tribe stated that the trail was used by their people while travelling between Fort Duchesne, Utah and Fort Washakie, Wyoming. The Elders mother said they would travel to either Rock Springs or Farson to buy supplies before continuing their journey. There are no existing physical remnants of the trail. | See Chapter 3.11 on page 3.14 discusses the Indian Gap Trail. A range of alternatives has been analyzed for the Indian Gap Trail in Chapter 2.2.6 management action 5201. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13878-2 | I want to point out that the BLM cannot claim, as it does in the RMP, that they have done this research based on consultations from 1996-2003 - before the JMH ROD was signed. That agency document, and the commitments it made, date from its formal passage in 2006. Thus, the agency has failed to subsequently conduct the research promised in the JMH ROD, for the Indian Gap Trail. There has been no report issued. I request that real and current day research occur. Specifically, I request that MA 5013 under Alternative A be included in the final RMP, and instead of requiring "an interpreted plan" be developed, that the agency report back to the two Tribes that requested this study in 2003. | See Chapter 3.11 on page 3.14 discusses the Indian Gap Trail. A range of alternatives has been analyzed for the Indian Gap Trail in Chapter 2.2.6 management action 5201. Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13878-3 | Better Indigenous Site Protection The current RMP and the RMP draft commit to protection of important Indigenous sites (and this was also requested by the Tribes in 2003). I want, in this comment letter, to urge the agency to do a better job and be serious in their attention to this. For example, under the White Mt. Petroglyphs ACEC section in the draft RMP under MA 7531, in Alt. A it states: The ACEC is open to consideration of such activities as fencing, interpretive signs, or construction or placement of barriers to ensure protection of the site. Public awareness and use of the area as an educational site are encouraged. This is stated as the same for Alternatives B and D. Yet I believe this language fails to really implement its stated goal for this section: SD-38: Protect cultural resource values from degradation. Instead, I suggest that the agency include language that states: The BLM will use fencing, interpretive signs, or construction or placement of barriers to ensure protection of the site, in consultation with Tribal authorities. | A range of alternatives has been analyzed for the White Mountain Petroglyphs in Chapter 2.2.6 management actions 7530 - 7537. A range of alternatives for Sacred, Spiritual and/or Traditional Cultural Properties was analyzed in Chapter 2.2.6 management actions 5100 - 5127. Analysis of impacts for actions in each alternative is found in Chapter 4. Implementation and preparation of site/project specific activity or development plans is beyond the scope of this document. |
| 822 - Heritage and Visual Resources–Sacred, | #13899-22 | The designation of archaeological and historic districts is a critical step toward preserving cultural heritage, especially when combined with Tribal consultation and co-stewardship. Therefore, we support Alternative B's management actions to manage areas with high cultural resource density, such as Blue Point, Blue Forest, Adobe Town Rim, Cedar Canyon, and the Bozovich site complex, as historic districts. We also support the designation of | Chapter 2.2.6 management actions #5200-5202 (Sacred, Spiritual or other Traditional Cultural Properties) discuss the full range of alternatives considered in the EIS. Analysis of impacts of actions in each alternative is found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Spiritual and/or Traditional Cultural Properties (5200-5202) | | the West Sand Dunes Archaeological District as a portion of the Steamboat Mountain ACEC. We believe it is necessary to close these areas to surface-disturbing[...] activities that could harm cultural resources. In contrast, Alternative C would provide the least protection for cultural resources and would be detrimental to preserving Wyoming's history and prehistory. | |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #13913-3 | Update list of Tribal Nations for consultation We appreciate the steps BLM took in the past decade to engage and consult with Tribal Nations during the development of this draft RMP. We urge continued effort to engage with the Nations listed in the RMP and to expand that list and reach out to Nations who have yet to be engaged. The current list does not include all the Tribal Nations who have ancestral and migratory territories in the planning area and must be updated to be fully inclusive. Lastly, we urge the BLM to prioritize contacting the Tribal Historic Preservation Offices (THPOs) for these Tribal Nations, or the relevant cultural or heritage office, in acknowledgment of the authority vested in those offices by their respective governments and the unique role they play. We believe BLM should be consulting with: Eastern Shoshone THPO ? Northern Arapaho THPO ? Shoshone-Bannock HeTO (Heritage Tribal Office) ? Crow THPO ? Ute Indian Tribe of the Uintah and Ouray Reservation ? Southern Ute Indian Tribe ? Ute Mountain Ute Tribe ? Rocky Mountain Tribal Leaders Council These Tribal Nations also have ties to this landscape and the RSFO should solicit their input: ? Fort Belknap Indian Community ? Rosebud Sioux Tribe of Indians ? Cheyenne & Arapaho Tribes Comanche Nation ? Northern Cheyenne Tribe ? Lower Brule Sioux Tribe ? Kiowa Tribe | See Chapter 5.1.3 Native American Interests for a description of consultation activities, and Chapter 5.3 for a distribution list that includes interested Native American Tribes from when the process began. Updates have been incorporated as necessary. |
| 822 - Heritage and Visual Resources–Sacred, Spiritual and/or Traditional Cultural Properties (5200-5202) | #14023-9 | The Rock Springs District RMP should be driven by a conservation agenda, one that will conserve the best of the unique landscapes, habitats, and native biodiversity it sustains. The RMP should re?ect the District's place in the larger Wyoming landscape; its critical role in providing winter habitat for wildlife that summers tens, if not hundreds of miles to the north. It should also protect, and where and whenever possible enhance habitats for resident wildlife and native plants. It should evaluate, consider, and mitigate how energy development impacts air- and watersheds far removed from the district. It should recognize, respect, and protect the history and locations once utilized by our indigenous ancestors. | See the Executive Summary, and the Purpose and Need for a description o the reason for this document. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-1 | While SVP supports the requirements to maintain healthy air resources, issues concerning air resources are largely irrelevant from the paleontological standpoint, except where surface disturbances, that may impact paleontological resources at or near ground surfaces (if any) are involved. Therefore, SVP prefers Alterative A for MA# 1010 (Page 2-7) in light of the fact that how ground disturbances will be handled is not clear in Alternative B. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | A range of alternatives has been analyzed for mitigation for air quality impacts in Chapter 2.2.6 management action 1010. A range of alternatives has been analyzed for paleontological resources in Chapter 2.2.6 management actions 5300 - 5309. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-2 | Soil and Geologic Resources (Pages 2-9 through 2-13) Extraction of paleontological resources generally involves some level of ground-disturbing activities, but following an excavation, it is typical for the site to be restored and for any disturbance to be mitigated. Therefore, SVP prefers management alternatives that allow for some temporary soil disturbance and/or make exceptions for scientific research. Below are SVP's comments and preferences: * Because paleontological resources may occur in different settings, SVP prefers Alternative A for MA#s 1107 and 1108 (Page 2-10) where soil disturbance is avoided but not prohibited, allowing flexibility to conduct carefully managed surface disturbance activities, such as paleontological excavations. For example, important fossil localities may be located in areas with greater than 25% slopes; therefore, Alternative B which prohibits surface disturbances where slopes are greater than 25% is not preferred by SVP. * While SVP supports the requirement for a soil health and restoration plan, discoveries of paleontological resources generally take place where erosion of rocks takes place; therefore, for MA# 1112 (Page 2-11), Alternative C is adequate from a purely paleontological standpoint. * For all other MA#s with different alternatives, SVP is fine with Alternative B preferred by BLM. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | A range of alternatives for soil resources was analyzed in Chapter 2.2.6 in actions 1100-1116. A range of alternatives Paleontological resources was analyzed in actions 5300 - 5309. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-3 | Water Resources (Pages 2-13 through 2-22) While SVP supports the requirements to maintain healthy water resources, issues concerning water resources are largely irrelevant from the paleontological standpoint, except for alternatives that would have scenarios completely prohibiting surface disturbance activities. Alternative B of MA#s 1302, 1313, and 1325 (Pages 2-14, 2-16, and 2-22) are such examples SVP does not prefer. Alternative A for MA# 1302, Alternative C or D for MA# 1313, and Alternative D for MA# 1325 (= equivalent to Alternative D of MA# 1320: Page 2-20) would be more sensible from the paleontological standpoint (and thus preferred here) by providing flexibility (on a case-by-case basis or 'avoid' but not necessarily prohibit) to conduct carefully managed surface disturbing activities, such as paleontological surveys, mitigations, and excavations. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | Surface disturbances that may impact paleontological resources are addressed under management actions 5300 - 5309. Management for water resources is covered in all alternatives in actions 1300-1325. |
| 823 - Heritage and Visual Resources–Paleontological | #9853-4 | Lands with Wilderness Characteristics (Pages 2-22 through 2-25) While SVP supports the requirements to maintain lands with wilderness characteristics and particularly alternatives that would prohibit mineral explorations (e.g., Alternative B of MA# 1502), SVP finds most of the alternatives in this entire section (Pages 2-23 through 2-25) to be vague in relation to how the paleontological activities can be carried out. Because paleontological | A range of alternatives has been analyzed for Lands With Wilderness Characteristics in Chapter 2.2.6 management actions 1550-1517 and for Paleontological Resources in actions 5300-5309. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (5300-5309) | | resources commonly occur in such wilderness areas, having no management in those areas as suggested in Alternative C of MA#s 1501-1517 would be problematic. SVP prefers an alternative (e.g., Alternative D where 'Manage for multiple use' is noted) that would allow paleontological inventories/surveys, excavations, and mitigations, that may involve some degree of surface disturbances, on a case-by-case basis. SVP asks that any decision-making should be made in consultation with the bureau's own paleontologists in the region. | |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-5 | SVP prefers an alternative that would prohibit, or minimally strongly discourage or limit, any forms of mineral resource activities where very high potential for paleontological resources exists, particularly if areas of interest have the Potential Fossil Yield Classification (PFYC) rating of "4" or "5". For any lands of interest, no mineral activity permits should be issued prior to each mineral activity without proper paleontological surveys and any necessary excavations/mitigations by qualified paleontologists, including BLM paleontologists. While 'no mineral activities' is the most preferred option for SVP, we must note that an elaborate plan for best practices for mineral (including oil, gas, and coal) explorations at paleontologically sensitive sites must be in place if alternatives that allow such explorations are selected. We have attached below (Appendix 2) our generic paleontological resources management plan that pertains to energy and mineral activities, including oil and gas explorations. SVP hopes BLM will adopt the suggested best practices in Appendix 2 for the areas of concern in this present case (DOI-BLM-WY-D040-2011-0001-RMP-EIS) in consultation with the bureau's own paleontologists in the region. | See Chapters 3.15 and 4.11 for a description and analysis of mineral development within the planning area. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-6 | While SVP supports any necessary fire management plans (Pages 2-47 through 2-50), it should be noted that fire has the capacity to damage or destroy paleontological resources and sites. Therefore, if any prescribed fire (controlled burns) of lands need to be conducted, such lands should be expeditiously, but properly and adequately, surveyed for paleontological resources (and mitigated or excavated if necessary) by qualified paleontologists, including BLM paleontologists, prior to the burn. Forest and Woodlands (Pages 2-50 through 2-55) | A range of alternatives for paleontological resources has been analyzed in Chapter 2.2.6 management actions 5300 - 5309. A range of alternatives for Fire and Fuels Management has been analyzed in Chapter 2.2.6 management actions 3000-3013. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-8 | ains, trace, or imprint of a plant or animal that has been preserved in the Earth's crust since some past geologic or prehistoric time (AGI Glossary of Geology)" (Page GL-12). However, while it is somewhat contradictory for the definition of "Historic Properties" that reads "Any prehistoric or historic district, site, building, structure, or object…" (Page GL-14), if the word 'prehistoric' is used in the RMP, it should be explicit if it is used in the archaeological context, paleontological context, or both, in order to increase clarity. For example, all | See Glossary for a definition of 'prehistoric'. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-9 | For example, Alternative D of MA# 5302 states "No similar action (action required under existing law, regulation and policy)", which can be interpreted that paleontological sites would not be managed for their paleontological resources. Alternative D of MA# 5308 states: "Allow surface disturbing activities, on a case-by-case basis, in the Farson Fossil Fish Beds, subject to adequate mitigation of impacts following BLM mitigation policies." SVP points out that, not only this alternative would allow the scientifically significant fossil fish bed to be disturbed, but it also appears contradictory to the statement for the alternative in the sixth paragraph on Page 4-162 which reads: "Under Alternative D, management of paleontological resources would have impacts similar to Alternative A; however, additional management for the Farson Fossil Fish Beds could protect the paleontological site." SVP is uncertain how it (i.e., Alternative D of MA# 5308) could protect the fossil site by allowing surface disturbing activities. | MA 5302 Alt D specifically identifies that 'no similar action' is due to existing laws, regulations, policies. A range of alternatives has been analyzed for paleontological resources in Chapter 2.2.6 management actions 5300-5309. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-10 | * Alternative B of MA# 6504 states "other resource values" where SVP expects that these include paleontological resources. | Resource values includes paleontological resources. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-11 | * Alternative B of MA# 6505 states "Close areas to camping if resource damage occurs", but because paleontological resources are nonrenewable, detailed management plans must be in place to eliminate the possibility of damage to paleontological resources in such areas in the first place. | A range of alternatives has been analyzed for dispersed camping in Chapter 2.2.6 management action 6505 . See Chapter 1.4 Planning Criteria for compliance with applicable laws. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #9853-12 | Alternative B of MA# 6516 states "Prohibit surface disturbing activities within three miles or the visual horizon, whichever is closer, of developed recreation sites unless such activities are determined to be compatible with or are done for meeting recreation objectives for the area." SVP hopes that paleontological surveys, mitigations, and excavations that will likely cause some degree of surface disturbance to be allowed. | A range of alternatives regarding surface disturbing activities and recreation has been analyzed in chapter 2.2.6 management action 6516. Analysis for impacts of actions in each alternative is found in chapter 4. |
| 823 - Heritage and Visual | #13751-142 | MA #5302 ALT A B C Industry Position: Not Acceptable Reasoning: 43 CFR 3600 is regarding mineral material sales and does not reference paleontological resources. 43 CFR 3622.3(a) states "All public lands administered by | See Chapter 1.4 Planning Criteria for compliance with applicable laws. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources–Paleontological Resources (5300-5309) | | the Bureau of Land Management and the Bureau of Reclamation are open to or available for free use removal of petrified wood unless otherwise provided for by notice..." and 43 CFR 8365.1-5(b)(6) "Common invertebrate and plant paleontological resources as provided under part 49 of this title." 43 CFR 49.805(a) states "Casual collecting of common invertebrate or plant paleontological resources is allowed on lands administered by BLM, except on BLM- administered land that is closed to casual collecting in accordance with this part, other statutes, executive orders, regulations, proclamations, or land use plans." There are no scientific or educational values outlined in these referenced citations and BLM must not induce land use plan restrictions without authority to do so. | |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13751-143 | MA #5304 ALT A D Industry Position: Not Acceptable Reasoning: Management is not limited to vertebrate fossils. Management of fossilized wood should be managed according to 43 CFR 3622. | Please refer to all proposed alternatives under #5304, which reference petrified wood. A range of alternatives has been analyzed for surface disturbing activities and paleontological resources in Chapter 2.2.6 management action 5304. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13784-31 | * MA#5305, Alt. B: "Prohibit surface disturbing activities in Adobe Town and Desolation Flat/Desolation Point Areas." Comment: It remains unclear of all activities considered and prohibited as a surface disturbing activity. The total number of prohibited acres from surface disturbing activities when compiled is incredibly high and will undoubtedly cause harm to the industries using the project area and those employed in the local communities. | See Glossary for a definition of 'surface disturbance' and 'surface disturbing activities'. A range of alternatives has been analyzed for paleontological resources in Adobe Town and Desolation Flat/Point areas in Chapter 2.2.6 action 5305 Analysis of impacts for actions in each alternative is found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13787-68 | MA #5302 HR-17, HR-23 Significant paleontological resources would be managed for their scientific and educational values and in accordance with 43 CFR 3600, 43 CFR 3622, and 43 CFR 8365. Industry Position: Not acceptable Reasoning: 43 CFR 3600 is regarding mineral material sales and does not reference paleontological resources. 43 CFR 3622.3(a) states "All public lands administered by the Bureau of Land Management and the Bureau of Reclamation are open to or available for free use removal of petrified wood unless otherwise provided for by notice..." and 43 CFR 8365.1-5(b)(6) "Common invertebrate and plant paleontological resources as provided under part 49 of this title." 43 CFR 49.805(a) states "Casual collecting of common invertebrate or plant paleontological resources is allowed on lands administered by BLM, except on BLM- administered land that is closed to casual collecting in accordance with this part, other statutes, executive orders, regulations, proclamations, or land use plans." There are no scientific or educational values outlined in these referenced citations and BLM must not induce land use plan restrictions without authority to do so. Manage significant paleontological resources for their scientific and educational values and in accordance with 43 CFR 3600, 43 CFR 3622, and 43 CFR 8365, and other applicable laws and regulations. Industry Position: Not acceptable Reasoning: 43 CFR 3600 is regarding mineral material sales and does not reference paleontological resources. 43 CFR 3622.3(a) states "All public lands administered by the Bureau of Land Management and the Bureau of Reclamation are open to or available for free use removal of petrified wood unless otherwise provided for by notice..." and 43 CFR 8365.1-5(b)(6) "Common invertebrate and plant paleontological resources as provided under part 49 of this title." 43 CFR 49.805(a) states "Casual collecting of common invertebrate or plant paleontological resources is allowed on lands administered by BLM, except on BLM- administered land that is closed to casual collecting in accordance with this part, other statutes, executive orders, regulations, proclamations, or land use plans." There are no scientific or educational values outlined in these referenced citations and BLM must not induce land use plan restrictions without authority to do so. Same as Alternative A Industry Position: Not acceptable Reasoning: 443 CFR 3600 is regarding mineral material sales and does not reference paleontological resources. 43 CFR 3622.3(a) states "All public lands administered by the Bureau of Land Management and the Bureau of Reclamation are open to or available for free use removal of petrified wood unless otherwise provided for by notice..." and 43 CFR 8365.1-5(b)(6) "Common invertebrate and plant paleontological resources as provided under part 49 of this title." 43 CFR 49.805(a) states "Casual collecting of common invertebrate or plant paleontological resources is allowed on lands administered by BLM, except on BLM- administered land that is closed to casual collecting in accordance with this part, other statutes, executive orders, regulations, proclamations, or land use plans." There are no scientific or educational values outlined in these referenced citations and BLM must not induce land use plan restrictions without authority to do so. No similar action (action required under existing law, regulation and policy) Industry Position: Acceptable Reasoning: Management must follow existing laws, regulations and policy. Alternative D is acceptable. | See Chapter 1.4 Planning Criteria for compliance with applicable laws. See also Appendix E. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13787-69 | MA #5304 HR-17, HR-23 Surface disturbing activities that affect known vertebrate fossil localities would be considered in site-specific analyses and potential adverse effects would be mitigated. At the area manager's discretion, mitigating measures may be required for surface disturbing activities occurring in areas having a reasonable chance for the occurrence of scientifically significant fossils. Operators are required to report any paleontological resources discovered during the course of operations. Industry Position: Acceptable Reasoning: Management properly limited to vertebrate and significant fossils. It would also be prudent to define "significant." Consider surface disturbing activities that affect known significant paleontological resource localities after site-specific analyses and potential adverse effects are mitigated. The AO may require mitigating measures for surface | A range of alternatives has been analyzed for surface disturbing activities and paleontological resources in Chapter 2.2.6 management action 5304. Analysis of impacts for actions in each alternative is found in Chapter 4. See Planning criteria for compliance with applicable laws. |

|---|---|---|---|
| | | disturbing activities occurring in areas having a reasonable chance for the occurrence of scientifically significant fossils. Require operators to report any paleontological resources discovered during the course of operations. Industry Position: Not acceptable Reasoning: Management is not limited to vertebrate fossils. Management of fossilized wood should be managed according to 43 CFR 3622. Same as Alternative A Industry Position: Acceptable Reasoning: Management properly limited to vertebrate and significant fossils. It would also be prudent to define "significant." Allow surface disturbing activities that affect known significant paleontological resource localities after site-specific analyses and potential adverse effects are mitigated. The AO may require mitigating measures for surface disturbing activities affecting known localities of scientifically significant fossils. Require operators to report any paleontological resources discovered during the course of operations. Industry Position: Not acceptable Reasoning: Management is not limited to vertebrate fossils. Management of fossilized wood should be managed according to 43 CFR 3622. Alternative A and C are acceptable. | |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13826-9 | BLM Goals and objectives: * HR-2.1: Develop activity plans or project/site-specific treatment plans or other protective measures for significant cultural resources at risk from deterioration or adverse effects from other uses. * HR-17: Manage, preserve, and protect paleontological resources and areas on BLM- administered land in the planning area. * HR-18: Reduce threats to paleontological resources from natural or human-caused deterioration. * HR-19: Promote and enhance scientific and educational knowledge of paleontological resources in the planning area. * HR-20: Provide paleontological research opportunities for qualified scientists/academia on public lands within the planning area in conjunction with the Wyoming State Office Paleontologist, implementing the paleontology-permitting program. My Comment: If there is a concern that these sites are in danger than involve the public in stewardship programs and install a permit program that would encourage public responsibility or accountability for the respect of sites when visiting them and if needed open them on schedules so they can be monitored by BLM Staff. | The BLM already has a permitting program for the collection of paleontological resources. The goals and objectives identified in the EIS are for the planning area resources. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13865-34 | 8. Paleontological Resources Paleontological resources have established protocols to identify and protect significant surface exposures. Known areas that have been traditionally exploited for petrified wood should be managed in a way to better protect buried resources without restricting travel or closing areas to ROWS or other development. The paleontology in the RSFO is part of the Green River Formation that is also shared by the Casper, Rawlins, Kemmerer and Little Snake BLM Field Offices, in both Wyoming and Colorado. Any deviation of established protocols in this Formation would be problematic for state paleontologists as well as for linear projects that span across multiple field offices. Consequently, PacifiCorp recommends that the BLM maintain current practices and adopt Alternative A for Paleontological Resources (MA #5300- 5309). | A range of alternatives has been analyzed for paleontological resources in Chapter 2.2.6 management actions 5300-5309. Analysis of impacts for actions in each of the alternatives is found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13865-60 | A.2.1. For resources that require multi-agency agreement such as cultural, no action should take place that is inconsistent with established BLM protocol in adjacent Field Offices with agencies such as SHPO, tribal consultation or NHT. Buffers on the trail should remain the same and consistent. VRM classifications should go through the evaluation process and be defined geographically in a manner that captures the intended protection clearly if there are proposed changes. The Green River formation is shared by four Field Offices and there would be no benefit in changing the stipulations for Paleontology and the management of fossil rich strata. | A full range of alternatives has been proposed for both paleontology and cultural management actions. Impacts from each alternative can be found in Chapter 4. |
| 823 - Heritage and Visual Resources–Paleontological Resources (5300-5309) | #13912-14 | Draft RMP, Map 2-18, Map 3-16, Appx C-64. BLM offers no explanation for this misalignment. And without an explanation, no interested party can adequately assess or comment on the difference. And if the rationale for VRM class II designation is simply that the area is an ACEC, BLM has failed to meet FLPMA's requirements. Draft RMP, 4-147. Under FLPMA, BLM must properly determine the range for both the size and prescription type of each ACEC. If some portion of or the entirety of an ACEC is not founded on a visual resource, BLM cannot implement visual restrictions in those ACEC areas on the basis of special management of the ACEC. Because BLM both fails to explain why it deviated from the VRI class III designations and has, perhaps, simply used a blanket VRM class II designation for the entire ACEC, the proposed RMP fails FLPMA and its required processes. | A full range of alternatives is proposed for each of the ACECs, including management actions related to visual resource management for each. The impacts from each of the four alternatives can be found in Chapter 4. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #537-1 | In ACEC's with a VRM of a Class 2 - standard wire fences cannot be built. Only electric fences can be installed. Electric fences are very hazardous for sage grouse since they cannot seem to see them. With this type of hazard for sage grouse, electric fences will also not be built in a VRM Class 2. This is poor planning on the part of the BLM as it doesn't allow for the management of livestock and is therefore all ACES's in a Class 2 are unfeasible because they are too restrictive. | See Glossary definition for 'Visual Resource Management Classes' - 'Class II' in the DEIS. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #7196-4 | I saw no mention in the draft of any Dark Sky guidelines. There are many areas of the Rock Springs District that still maintain an abundance of this rapidly dwindling resource. Given that there will inevitably be growth and industrial development across the planning area, guidance should be included in any project for how to minimize light pollution. | See Updates to DEIS Volume II, Appendix A.2 Best Management Practices, section A.2.7 for recommendations regarding facility lighting. |
| 824 - Heritage and Visual Resources– | #9354-7 | 6528 VMR class within 15 miles of each side of continental divide. If we have 15 miles of either side of the trails and historical markers that is a lot of area, and we need wells, and fences and other VRM's. | See DEIS Chapter 2.2.6 Section Land Resources - Recreation, Management Actions 6527 and 6528 for a full range of alternatives regarding the designation of Visual Resource Management Classes surrounding the |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Visual Resources (5400-5413) | | | Continental Divide National Scenic Trail. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13210-14 | 14. Understanding that Visual Resource Management mapping is a direct result of the special designation and management areas within each alternative, it is difficult to take a position on VRMs without taking a position on the underlying special designations, and particularly the areas of critical environmental concern. The task force recognizes that identifying a given management action within the VRM alternatives would remain unresolved without being able to specifically reference and agree upon each corresponding designation as referenced. a. Within the checkerboard, the Task Force supports removing VRM class II designation where it is driven solely by the visual resource inventory (Draft RMP Map 3-16). | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13287-16 | "the petitioner has proven that Area A deserves the very rare or uncommon designation due to its historical, geological, wildlife and scenic values. The area includes The Haystacks region and is beyond rare or uncommon." Very Rare or Uncommon Designation at 18. Black Rock is a volcanic butte that falls entirely within the checkerboard, and is an important scenic landmark that deserves visual resource conservation. Delaney Rim is characterized by banded red sediments and badlands all along its northern front, and is a scenic wonder and deserves maximum protection. The Kinney Rim extends northward into the checkerboard, is part of a citizens' proposed wilderness, and deserves Class I protection. The areas around Aspen Mountain is popular for recreation and deserves at least Class II scenic conservation. The Point of Rocks - South Pass Road and the Overland Trail each cross substantial portions of the checkerboard, and the viewsheds of each should receive Class I designation in order to fulfill the NHPA directive to protect not just the historic feature, but also its setting. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13542-6 | Section 1.1. 1-1 Table 1-1 VRM acreages do not match Table 4.8. | See updates to DEIS Volume I Table 4-8 for correction. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13579-1 | In regard to MA #5400 Alternatives B and D. Where is the justification for the change of class for a majority of the area to a class II? BLM Manual 8410 Section 6(A)(1) states that "The Bureau shall prepare and maintain on a continuing basis an inventory of visual values on all public lands." There is a reference to the 2011 inventory in Section 4.15.2 (page 4-167). however, the reference is not included in the Literature Cited section or on ePlanning. Per Instruction Memorandum No. 2012-055 states that "Efforts to inventory and record visual values for the Bureau's lands must utilize the VRI data standard found in the attachments of this IM. All offices must use these standards when inventorying, recording, amending, or maintaining electronic VRI data sets." | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. The Visual Resource Inventory is a part of the Administrative Record and is available at the Rock Springs Field Office. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13585-39 | Finally, the BLM's conclusion that impact to livestock grazing would not change between Alternative A and Alternative Bis false. See DEIS at 4-178, 4-259. Many of the ACEC's have a no surface occupancy "NSO" designation and this will impact permitted livestock owners' ability to drill for water wells within their grazing allotments. See DEIS at Append. V-4 - V-7. In addition, VRM Class II designations, ROW exclusions, and prohibition of surface disturbing activities within an ACEC would impact the ability of permittees to develop range improvements, such as fences, wells, or other water developments. See id. At 2-210 (Mgmt. Action #7556), 4-179. Some of the proposed ACECs also call for closure of grazing allotments and/or prohibition of grazing within certain pastures. See id. At 2-181 (Mgmt. Action #7433), 2-182 (Mgmt. Action #7438), 2- 184 (Mgmt. Action #7443). | See DEIS Volume I Glossary definition for 'No Surface Occupancy (NSO). See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13585-40 | III. BLM's Visual Resource Management Classifications Fail to Adequately Consider the Underlying Resource Allocations The BLM has proposed over 2.1 million acres for designation as Visual Resource Management ("VRM") Class II under the Preferred Alternative B. DEIS at ES-3, Appendix V-22. Even under Alternative D, the BLM is doubling the amount of VRM Class II designations from the Green River RMP - expanding it to include over 1.178 million acres. Id. As with other resources, values, and designations, both of these proposed alternatives fail to appropriately take into consideration the underlying resource allocations that were already made under the Green River RMP and that are being proposed under this current RMP revision. The Coalition has commented extensively on this issue over the last decade and the County supports and incorporates these previous comments. Sweetwater County has previously supported some VRM Class II designations (i.e. around Little Mountain) but has never agreed to such a large swath ofland to be excluded from development. According to the BLM's own policy, "the approved VRM objectives shall result from, and conform with, the resource allocation decisions made in the RMP's." BLM Manual 8400, Section 06.A.2 (Apr. 5, 1984); see also id. at Section 07.A. In referencing the provision of this BLM Manual, the Interior Board of Land Appeals ("IBLA") stated: "[i]t seems clear from the foregoing that what the Manual intends is for the resource allocation decisions to determine the VRM classification." Southern Utah Wilderness Alliance, 144 IBLA 70, 84 (1998) (explaining that VRM classifications must be made consistent with oil and gas leasing decisions and any stipulations provided in the RMP). The BLM cannot enforce VRM Classes when they conflict with the underlying resource allocation. Id. at 85-87. In addition, the management decision in the RMP must reflect the value of the visual resources, which are driven by | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | information provided in the visual resource inventories ("VRJ"). BLM Handbook 8410-1, Section V.1 - V.2 (Jan. 17, 1986). | |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13585-41 | When you compare Map 3-8 that shows existing federal oil and gas leases to Map 2-18 (Alt. B) and Map 2-20 (Alt. D), it shows that the BLM has designated VRM Class II management in areas with existing resource allocations made under the Green River RMP. Under IBLA's holding, the VRM Class II would be largely invalid and unenforceable across the planning area. Under VRM Class II, the objective is "to retain the existing character of the landscape" and "[m]anagement activities may be seen but should not attract the attention of the casual observer." BLM Handbook 8410-1, Section V.B.2. This would prevent resource development, a fact that the BLM recognizes. See DEIS at 4-136 ("The large increase in VRM Class II acreage ... would greatly increase the impacts of visual resource management on mineral development activities."), 4-223 ("More acreage managed under the lower VRM classifications ... would place greater limitations to renewable energy development projects, by restricting the availability and access of development sites and the site clearing/preparation/construction activities ... necessary for the generation, collection, and transport of the energy."). | This RMP is a revision of and will replace the existing 1997 Green River RMP. See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13585-42 | The BLM must reevaluate and revise the VRM Class II designations to exclude those areas under existing mineral leases under the Green River RMP. These revisions should be made based on an updated inventory of the visual values in the planning area. Sweetwater County requests that like Management Action #5400 for Alternatives A and C, the VRM Class I and II designations should be limited to the boundaries of those proposed special designations without expansion into other areas such as five miles on either side of a historic trail or within the Checkerboard. See DEIS at 2-106, Maps 2-17 and 2-19. These revisions should also be done in coordination with the cooperators, who have long expressed their concern for the VRM Class II designations proposed in the DEIS. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13585-55 | In addition, Preferred Alternative B's proposed ROW exclusion areas fall within the Checkerboard. DEIS at Map 2-22. Sweetwater County objects to designating any ROW exclusion areas within the Checkerboard due to the impact it will have on the alternating sections of private lands and state lands. ROW exclusion areas infringe on private property rights by preventing the ability to access the private and state lands and to develop them when infrastructure (i.e. roads, pipelines, electric lines, etc.) cannot be placed on the neighboring public lands. This raises the question of whether the ROW exclusion, in addition to other restrictions such as VRM Class II, within the Checkerboard would result in the taking or partial taking of private property. See North Mill Street, LLC v. City of Aspen, 6 F.4th 1216, 1224 (10th Cir. 2021) (When regulations "deprive an owner of 'all economically beneficial use' of her property' it will be recognized as a taking." (quoting Lingle v Chevron US.A., Inc., 544 U.S. 528,537 (2005)). | See DEIS Section 1.4 for the Planning Criteria, including information about private lands. DEIS Chapter 2.2.6 section Land Resources - Rights-of-Way and Corridors, Management Actions 6200-6210, as well as Maps 2-22, 2-23, 2-24 for a full range of alternatives regarding Right-of-Ways. See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13624-38 | WDEQ understands VRM Class I and VRM Class II to restrict most surface development or the construction of surface features such as roads or pipelines and VRM Class III also appears to limit certain types of activities. BLM should provide examples of restrictions that would occur in those areas and analyze the impacts of those designations. The Draft RMP/EIS depicts areas with potential for development of non-energy mineral leases, coal leases, known sodium lease areas, oil shale potential and coal development potential. Draft RMP/EIS, Map 3-10: Leasable Solid Minerals. When comparing Map 3-10 with Map 2-18 (provided in the Draft RMP/EIS), it appears that many of the areas identified as having leasable solid mineral opportunities are significantly impacted by restrictions related to visibility resource management. For example, Map 2-18 identifies several areas within the KSLA that could be subject to visibility resource management restrictions. Visibility resource management restrictions when added to other management restrictions including, but not limited to wilderness study areas, right-of way exclusions, or potential wild and scenic restrictions, are likely to significantly impact the quantity of available lands within the KSLA. The Draft RMP/EIS states that 49,224 acres would be closed in the KSLA. Draft RMP/EIS, p. 4-135. Considering the potential management restrictions proposed within the KSLA, including visual resource management. BLM should provide additional information and analysis to identify the total acres that would be closed within the KSLA. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13651-27 | BLM should specify the VRM Class of each National Register and National Register property. Apply this specifically to the South Pass Historic Landscape, Rock Art Sites, Playa Sites, Archeological and Historic Districts and all ACECs designated for archeological and historic values. Our comment here reemphasizes that the relationship of these types of properties listed or eligible for inclusion in the NRHP must have integrity of setting. It follows that specific identification of the quality and character of setting is a necessary component of any consideration of eligibility. The Management Action 5402 that designates "Greater Sand Dunes ACEC, South Pass Historic Landscape ACEC, and White Mountain Petroglyphs ACEC would be managed as VRM Class II areas" should extend to the setting of all existing and identified National Register and National Register eligible sites and districts in the RMP Planning Area. | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual | #13651-28 | The MA# 5410 in Alternative B should be applied more broadly to all alternatives where settings of National Register and National Register eligible sites might experience damage through the direct and indirect impacts of land use: "Prohibit, on a case-by-case basis, surface-disturbing activities that create a moderate to strong contrast (via the visual contrast rating system) in areas managed consistent with VRM Class III and IV objectives that can be observed from areas managed consistent with VRM Class I and II (e.g., wind development)." | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |

|---|---|---|---|
| Resources (5400-5413) | | | |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13702-10 | Visual Resource Management is being changed from Class III and IV to Class II in MA 5400 Alternatives B and D. The BLM cannot justify changing the VRM class for the majority of the area from Class III and IV to Class II without completing an updated VRI. BLM Manual 8410 Section 6(A)(1) states that "The Bureau shall prepare and maintain on a continuing basis an inventory of visual values on all public lands." Why is the 2011 inventory not being used? There is a reference to the 2011 inventory in Section 4.15.2 (page 4-167). However, the reference is not included in the Literature Cited section and is not included on ePlanning. In addition, Instruction Memorandum No. 2012-055 states that "Efforts to inventory and record visual values for the Bureau's lands must utilize the VRI data standard found in the attachments of this IM. All offices must use these standards when inventorying, recording, amending, or maintaining electronic VRI data sets." | See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-86 | Visual Resources: For MA #5400 Alternatives B and D, how can the BLM justify changing the VRM class for the majority of the area from Class III and IV to Class II without completing an updated VRI? BLM Manual 8410 Section 6(A)(1) states that "The Bureau shall prepare and maintain on a continuing basis an inventory of visual values on all public lands." Why is the 2011 inventory not being used? There is a reference to the 2011 inventory in Section 4.15.2 (page 4-167). However, the reference is not included in the Literature Cited section and is not included on ePlanning. | See DEIS Map 3-16 for the VRI. See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-144 | MA #5400 B C D Industry Position: Not Acceptable Reason: The VRM classifications shown in Table 2-9, Appendix V and Map 2-18 are not based on visual resource inventories and would limit activities that would disrupt the viewshed. | See DEIS Map 3-16 for the VRI. See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-145 | MA #5405 ALT B Industry Position: Not Acceptable Reason: The VRM on the checkerboard lands must take into account current and future uses of the private lands within the checkerboard. ALT C Industry Position: Not Acceptable Reason: VRM classification and management should be based on the results of visual resource inventories. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-146 | MA #5408 ALT B C D Industry Position: Not Acceptable. Reason: Management Action 5407 is related to surface disturbing actions. | See Glossary definition for 'Visual Resource Management Classes' in the DEIS. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-147 | MA #5409 ALT B C D Industry Position: Not Acceptable. Reason: Management Action 5407 is related to surface disturbing actions. | See Glossary definition for 'Visual Resource Management Classes' in the DEIS. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-148 | MA #5411 ALT B Industry Position: Not Acceptable Reason: This management action does not take into consideration distances from VR Class I and II areas. Some projects may be visible for several miles in areas of flat terrain. Mitigation may be necessary so activities should not be prohibited. Wind development is more than a surface disturbing activity. ALT C D Industry Position: Not Acceptable Reason: This management action does not take into consideration distances from VR Class I and II areas. Some project may be visible for several miles in areas of flat terrain. | See DEIS Chapter 2.2.6 Section Heritage and visual Resources - Visual Resources, management Action 5411 for a full range of alternatives analyzed in regards to surface disturbing activities within viewsheds of VRM I and II areas. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13751-149 | MA #5412 ALT B Industry position: Not acceptable. Reason: BLM Manual 8431 states that "Simulations are strongly recommended for potentially high impact projects." ALT D Industry position: Not acceptable. Reason: BLM Manual 8400 does not describe when visual simulations are required. BLM Policy 8431 states that "Simulations are strongly recommended for potentially high impact projects." | See Update to DEIS Chapter 2.2.6 Section Heritage and Visual Resources - Visual Resources, Management Action 5412 Alternative D, where text has been updated. |
| 824 - Heritage and Visual Resources–Visual | #13779-13 | The proposed alternative visual resource management (VRM) classifications will severely hinder, if not completely prevent renewable energy and transmission development. Under the proposed alternative approximately 225,785 acres would be classified as VRM Class I and 2,148,902 acres would be classified as VRM Class II. Combined this is an increase of 1.6 million acres classified as I or II. In contrast to lands designated as Class III or Class IV, which allow for development, Class II lands require that any activity "retain the existing character of the landscape." | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (5400-5413) | | Change to the land is allowed only to the extent that it does not "attract the attention of a casual observer." Clearly wind farms and transmission lines would not meet this objective. | |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13779-14 | wind will not only be prohibited on VRM Class I and II, but BLM notes that it will "[P]rohibit, on a case-by-case basis, surface-disturbing activities that create a moderate to strong contrast (via the visual contrast rating system) in areas managed consistent with VRM Class III and IV objectives that can be observed from areas managed consistent with VRM Class I and II (e.g., wind development)." In other words, if Class III or IV lands can be seen from Class I or II development will be precluded on these lands. Of note these classifications appear to specifically target renewable energy development due to the higher visual profile of wind energy and transmission infrastructure. | See DEIS Chapter 2.2.6 Section Heritage and visual Resources - Visual Resources, management Action 5411 for a full range of alternatives analyzed in regards to surface disturbing activities within viewsheds of VRM I and II areas. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-20 | Proposed Visual Resource Management Areas Based on Historic Trails and ACECs Are Unsupported. BLM fails to defend its visual resource management ("VRM") classifications for two reasons. First, BLM omitted the visual resource inventory ("VRI") analysis which is one of two sources from which BLM develops it VRM classifications. Second, BLM flouts both the VRM categorization and ACEC designation processes to issue blanket VRM Class II restrictions. One blanket restriction covers a 15-mile radius of every cross point of a National Historical Trail and Expansion Era Trail which include the Cherokee and Overland Trails. Another blanket restriction covers almost every ACEC within the Rock Springs area. | See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-21 | BLM Did Not Provide Analysis for Its VRI Finding. BLM omits the VRI analysis from the record and in doing so fails to defend its VRM classifications. In the RMP planning process, BLM is required to conduct a VRI assessment which arrives at "classifications [] based on scenic quality, visual sensitivity levels, and viewer distance zones." BLM VRM Manual H-8410-1 V.A.1. | See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-22 | The RMP does not disclose the VRI analysis which deprives interested parties of the information necessary to submit useful comments. The RMP merely acknowledges that BLM conducted the VRI analysis in 2011 and claims that BLM considered the VRI classes "along with BLM's allocated resources" to arrive at the VRM classifications. Draft EIS 3-17. The VRI process requires extensive analysis and documentation. See generally Manual H-8410-1. But the RMP declines to present that analysis and documentation to support its VRI map or VRM decisions. It offers no information on which areas fell into which zones and how they were rated for their scenic qualities and visual sensitivity. Without the information, no interested party can properly analyze and comment on BLM's designation of visual resource management areas. | See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-23 | BLM Applies Blanket VRM Class II Designations Which Contravenes the Purpose of FLPMA. Ignoring site specific considerations which form the core of VRM and ACEC analysis, BLM vastly expands the areas subject to Class II designations under Alternative B. This includes VRM Class II designations (which generally include NSO restrictions) within 15 miles of National Historic Trails ("NHTs") and Expansion Era trails as well as almost all of each Rock Springs ACEC. VRM classes should be identified based on individualized consideration of each area and its features, not as blanket management restrictions. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-24 | BLM mandates a 15-mile VRM Class II designation for all NHT and Expansion Era Trails which inherently ignores the purpose of VRI and VRM class designations and is incredibly restrictive on new development in the area. Draft EIS at 2-144. While a background zone can extend approximately 15 miles from a trail, it must be limited by the seldom-seen zone which includes areas that are not visible within the background zone. Manual H-8410-1 IV.A.3. With near certainty, every point on every trail within the RMP cannot have a 15-mile viewshed. Surely trees, hills, mountains, or other obstructions create Seldom-Seen Zones. So the VRM 15- mile Class II mandate should exclude non-existent viewsheds within the radius. Given the VRM Class II objective "to retain the existing character of the landscape," extending the classification to areas outside the viewshed is entirely unnecessary to meet the Class II objective. Manual H- 8410-1 V.B.2. When BLM asserts a Class II designation without a visual resource or its visible surroundings to support the designation, it undermines the purpose of VRI and VRM class designations and ultimately FLPMA. | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-25 | BLM goes much further still and requires almost the entirety of all ACECs to follow VRM Class II objectives "to provide greater protections against surface disturbance." Draft EIS 4-147. Surface disturbance matters in the visual resource context only to the extent that it could cause damage to the visual resource or its viewshed. And it cannot possibly be true that every inch of every ACEC is a sensitive visual resource or within its viewshed. True, ACECs do provide BLM discretion to depart from VRI findings (which, again, BLM has not disclosed), but FLPMA still requires BLM to properly scope each ACEC in both size and prescription types. | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources– Visual | #13783-26 | Manual H-8410-1 V.A.2; BLM ACEC Manual 1613.12. Recall, resources considered under FLPMA have "been subdivided into subcategories to pinpoint the basic values of the land involved so as to better provide opportunities for development which can demonstrate its compatibility with such values." S. Rep. 95-734 O, at 128 (1973). So only ACECs designated specifically to protect visual resources can command visual restrictions. And if ACECs or | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Glossary definition for 'Visual Resource Management Classes' for idea of what projects could be permitted in each |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Resources (5400-5413) | | portions of ACECs are not based on the existence or protection of visual resources, BLM cannot implement visual restrictions for those ACECs or portions thereof. But once again, BLM runs afoul of FLPMA by doing so anyway. | class. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13783-27 | The RMP fails to validate its VRI classifications which, in turn, means that the RMP fails to validate its VRM classifications as well. VRIs, after all, "provide the basis for considering visual values in the RMP process." Manual H-8410-1 V.A.1. Without the basis that the VRI classifications provide, the VRM findings cannot be defended, nor can any interested party make any useful comments. BLM also disregards the purpose of both VRMs and ACECs when it sets the 15-mile Class II mandate from Expansion Era Trails and Class II mandate for almost all of the ACECs. Until BLM shows that it has made individualized decisions based on each specific visual resource, it has failed to properly complete its duties under FLPMA. | See DEIS Map 3-16 for the VRI. See Chapter 1.4 Planning Criteria for compliance with applicable laws and policies. See Executive Summary and Chapter 4.2. 2 for adequacy of data and analysis. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13787-22 | Resource: Heritage and Visual Resources (HR) - Visual Resources (5400-5413) MA #5400 - For Alternatives B and D, how can the BLM justify changing the VRM class for the majority of the area from Class III and IV to Class II without completing an updated VRI? BLM Manual 8410 Section 6(A)(1) states that "The Bureau shall prepare and maintain on a continuing basis an inventory of visual values on all public lands." Why is the 2011 inventory not being used? There is a reference to the 2011 inventory in Section 4.15.2 (page 4-167). However, the reference is not included in the Literature Cited section and is not included on ePlanning. In addition, Instruction Memorandum No. 2012-055 states that "Efforts to inventory and record visual values for the Bureau's lands must utilize the VRI data standard found in the attachments of this IM. All offices must use these standards when inventorying, recording, amending, or maintaining electronic VRI data sets." | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13787-70 | MA #5400 HR-02, HR-11, HR-04 Visual resource classes would be retained or modified to enhance other resource objectives such as those for cultural resource and recreation management, wild horse viewing, and special management areas. The visual resource management classifications are shown in Table 2-9, Appendix V and Map 2-17. Industry Position: Acceptable Note: Although DEIS Page 4-167 states "the VRI [2009/2011 Published in February 2011] is the basis of the VRM actions" the VRM's do not match the VRI. The VRI should be included as an appendix to the DEIS for evaluation. The study was never widely available to the public and still can't be found on-line. It should also be noted that 2009/2011 information is also outdated. Designate VRM classifications as shown in Table 2-9, Appendix V and Map 2-18. Industry Position: Not acceptable Reason: The VRM classifications shown in Table 2-9, Appendix V and Map 2-18 are not based on visual resource inventories and would limit activities that would disrupt the viewshed. Designate VRM classifications as shown in Table 2-9, Appendix V and Map 2-19. Industry Position: Not acceptable Reason: The VRM classifications shown in Table 2-9, Appendix V and Map 2-19 are not based on visual resource inventories and are not consistent with the current VRM (Map 2- 17). Designate VRM classes as shown in Table 2-9, Appendix V and Map 2- 20. Industry Position: Not acceptable Reason: The VRM classifications shown in Table 2-9, Appendix V and Map 2-20 are not based on visual resource inventories and would convert several currently Class IV areas to Class II and III, which would limit activities that would disrupt the viewshed. Visual resource classes would be retained or modified to enhance other resource objectives such as those for cultural resource and recreation management, wild horse viewing, and special management areas. A Visual Resource Inventory shall be required for all activities on public lands and management objectives should adhere to the determined classification. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Map 3-16 for the VRI. |
| 824 - Heritage and Visual Resources– Visual Resources (5400-5413) | #13787-71 | MA #5405 HR-02, HR-11, HR-04 No similar action Determine visual resource management of checkerboard lands by the Visual Resource Inventory. Industry Position: Not acceptable Reason: The VRM on the checkerboard lands must take into account current and future uses of the private lands within the checkerboard. Manage all lands within the checkerboard consistent with VRM Class IV objectives. Industry Position: Not acceptable Reason: VRM classification and management should be based on the results of visual resource inventories. See MA #5400 Industry Position: Not acceptable Reason: See reason from MA #5400 See MA #5400 | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |---|---|---|---|
| | | be observed in areas managed consistent with VRM Class I and II. Determine if mitigation will reduce contrast following completion of surface disturbance. | |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13787-73 | MA #5412 HR-02, HR-11, HR-04 No similar action Require all proposed actions within areas designated as VRM Class I, II, and III objectives to conduct a visual simulation prior to analysis and/or mitigation design. Industry position: Not acceptable. Reason: BLM Manual 8431 states that "Simulations are strongly recommended for potentially high impact projects." A visual simulation would not be required. Industry Position: Acceptable Visual simulations would be required consistent with Manual 8400. Industry position: Not acceptable. Reason: BLM Manual 8400 does not describe when visual simulations are required. BLM Policy 8431 states that "Simulations are strongly recommended for potentially high impact projects." Determine, on a case-by-case basis, whether a project would cause potentially high visual impacts. If there is a potential for high visual impacts then BLM may require a visual simulation consistent with Manual 8400. Alternative C is also acceptable. Resource: Land Resources (LR) - Lands and Realty (6000-6015) | See Update to DEIS Chapter 2.2.6 Section Heritage and Visual Resources - Visual Resources, Management Action 5412 Alternative D, where text has been updated. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13811-11 | 6. Visual Resource Management Restrictions BLM currently manages impacts to visual resources under the Green River RMP through a Visual Resource Management ("VRM") system "by which BLM classifies and manages scenic values and visual quality of public lands" that is "based on research that has produced ways of assessing aesthetic qualities of the landscape in objective terms."29 This system includes four classification tiers designed to "define the degree of acceptable visual change within a characteristic landscape."30 Class I, which is the most restrictive, consists of "primitive areas, some natural areas, some wild and scenic rivers, and other similar areas where landscape modification activities should be restricted."31 Class II areas are those where "changes in any of the basic elements . . . should not be evident in the characteristic landscape."32 Class III "includes areas where changes in the basic elements . . . may be evident in the basic landscape" but which "should remain subordinate to the visual strength of the existing character."33 Finally, Class IV (which is the least restrictive) "applies to areas where changes may be subordinate to the original composition and character" but "should reflect what could be a natural occurrence within the characteristic landscape."34 Alternative B would significantly alter the Green River RMP's distribution of lands within the VRM classification system, placing a greater proportion of lands within the more restrictive classifications. Under the Green River RMP, 225,717 acres are managed as Class I; 582,672 acres are managed as Class II; 615,492 acres are managed as Class III; and 2,180,423 acres are managed as Class IV. The changes in Alternative B, would result in fewer Class IV areas and more Class II areas. Under Alternative B, 2,148,902 acres would be managed as Class II (369% increase over the Green River RMP) and only 563,754 acres would be managed as Class IV (74% reduction over the Green River RMP). This systemic shift would impose significant burdens on the Dry Creek Project and on Pacific's future projects in perpetuity. Under the Green River RMP, the Dry Creek Project would have fallen within Class III and could have proceeded with applicable mitigation. But under Alternative B, it would fall within Class II.35 BLM provides no justification for this shift, and it is not evident that the shift addresses any currently unaddressed problems.36 And the systemic shift of lands from Class III to Class II, and from Class IV to Class III, does nothing to protect sensitive Class I areas. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13811-12 | Under the Green River RMP, BLM can still use the VRM classification system to mitigate visual impacts. Moreover, there are other federal agency tools already working to address visual impacts, which would apply to the Dry Creek Project, including the requirement for projects to obtain PSD permits under the Clean Air Act, emission reduction requirements under the Regional Haze Rule, and restrictions on NOx emissions under the Good Neighbor Rule. These operational requirements are already mitigating visual impacts, and further limitations as proposed in Alternative B are unnecessary and crippling to further economic development in the Planning Area. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13831-10 | Map 2-18: Visual Resource Management - Alternative B - Lands around airport (north and west) identified as VRM Class III which states that changes in the basic elements (form, line, color, or texture) caused by a management activity may be evident. However, the changes should remain subordinate to the visual strength of the existing character. This would have a limiting impact on development on BLM managed lands around the airport. | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13848-2 | much of the current Leucite Hills Project Area would be changed from VRM Class IV, which is considered suitable for wind development, to Class III, which may not be suitable for wind turbines, and Class II where turbines would presumably be prohibited. In addition, as discussed below, BLM has proposed to allow offsite VRM designations to prevent wind development on private lands and lands classified for less-restrictive VRM. | See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. BLM does not have jurisdiction to manage visual resources on private lands. |
| 824 - Heritage and Visual Resources–Visual | #13865-35 | 9. Visual Resources PacifiCorp is concerned that the proposed extensive visual buffers in Alternative B surrounding trails and other visual resource areas will create setbacks from ROWS that are significantly greater than the original buffer. The evaluation of direct or indirect impacts on visual resources has established protocols that are consistent across all BLM Field Offices. The Visual Resource Management (VRM) system has a process to evaluate and inventory resources and landscapes for their visual values. Cultural resources such as trails, | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. |---|---|---|---|
| Resources (5400-5413) | | historic roads, petroglyph panels, and Traditional Historic Properties (THPs) have specific buffers or processes to establish indirect buffers to protect specific resources through consultation. Changing a VRM class through the establishment of an ACEC is inconsistent and contradictory with the VRM inventory process. Creating arbitrary buffers and/or increasing trail buffers that are inconsistent with adjacent BLM Field Offices and other agencies engaged in the evaluation process is problematic, creates confusion, and is an overreach of BLM's authority. Extending trail buffers up to 20 miles creates large exclusion areas that inhibit future development along linear resources across the entire field office. This hinders PacifiCorp's ability to site new power lines in response to increasing customer load, for reliability improvements, and to bring new renewable energy onto the grid. Presently, trails are inventoried with non-contributing segments of linear cultural resources allowing for development in certain areas. Extending the visual buffers to 5, 10, or 20 miles would remove this ability. BLM must follow its internal policy for inventorying visual resources and protect relevant landscapes within this process. Trail buffers must remain consistent with adjacent BLM Field Offices that manage the same resources. | Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13865-47 | [comment:13865-47; 824, 827]. In addition to the inconsistencies already discussed, Alternative B will create regulatory inconsistencies across BLM field offices and is beyond the scope of BLM regulation. There must be consistency across BLM field offices. For linear utilities or any project that straddles field office boundaries, changing how any resource is managed within multi-agency process driven protocol is going to result in confusion, inconsistencies, and the immediate need for variances and exceptions. Disregarding the VRM process or Section 106 process that ultimately finds its way to SHPO so that affects are seen differently than all other BLM Field offices will create inconsistent evaluation of the same resource. Alternative B exceeds BLM regulatory authority by, for example, changing avian seasonal stipulations and buffers that have been established by other agencies is beyond the scope of a land management agency.[comment end] | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13865-60 | A.2.1. For resources that require multi-agency agreement such as cultural, no action should take place that is inconsistent with established BLM protocol in adjacent Field Offices with agencies such as SHPO, tribal consultation or NHT. Buffers on the trail should remain the same and consistent. VRM classifications should go through the evaluation process and be defined geographically in a manner that captures the intended protection clearly if there are proposed changes. The Green River formation is shared by four Field Offices and there would be no benefit in changing the stipulations for Paleontology and the management of fossil rich strata. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13865-61 | Painting all above-ground structures, production equipment, tanks, transformers, and insulators not subject to safety requirements to blend with the natural color of the landscape, using paint that is a non-reflective "standard environmental color" approved by the BLM visual resource management specialist: All new equipment brought onto the sites should be painted the same color(s)." Power line infrastructure, including transformers, insulators, and other equipment are subject to safety requirements, are not normally available in different colors, and cannot be painted due to engineering, operational, and safety concerns. Most power line infrastructure blends with the landscape (gray or wood colors). Some avian protection devices are made in different colors, including gray or red, due to engineering and material properties intended to prevent flashovers and UV decay. Due to these considerations and the DEIS language regarding safety requirements, PacifiCorp recommends that the BLM remove these color and painting stipulations related to utility infrastructure from the RMP. | The referenced Best Management Practice as seen in the DEIS Volume II Appendix A.2.7 specifically states that this practice is only applicable to infrastructure that is not subject to safety requirements. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13905-4 | Applying a blanket Class IV designation, as in Alternative C, is completely inappropriate because the agency has a responsibility to manage for the retention of visual resources under its ownership and management, irrespective of the choices of private landowners. There are a number of important visual resources within the checkerboard, and these should be granted the maximum possible protections. The Haystacks are an integral part of the Adobe Town Very Rare or Uncommon area, where the state Environmental Quality Council found. "petitioner has proven that Area A deserves the very rare or uncommon designation due to its historical, geological, wildlife and scenic values. The area includes The Haystacks region and is beyond rare or uncommon." Black Rock is a volcanic butte which falls entirely within the checkerboard and is an important scenic landmark that deserves visual resource conservation. Delaney Rim is characterized by banded red sediments and badlands all along its northern front and is a scenic wonder that deserves maximum protection. The Kinney Rim extends northward into the checkerboard and is part of a citizens' proposed wilderness and deserves Class I protection. The areas around Aspen Mountain are popular for recreation and deserve Class II scenic conservation. The Point of Rocks - South Pass Road and the Overland Trail each cross substantial portions of the checkerboard, and the viewsheds of each should receive Class I designation in order to fulfill the NHPA directive to protect not only the historic feature, but also its setting. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13911-12 | The BLM recognized during the Rawlins RMP revision process in 2008 that VRM Class II was inappropriate in the Checkerboard and also agreed to revise its VRM Class II classifications to not affect existing leased areas. See Attach. 3, Rawlins Protest Resolution Report Excerpt at pp. 139-142 (Dec. 24, 2008). The VRM designations were remanded after the protest period to reevaluate the designations and complete an updated inventory of the visual resources within the planning area to comply with its own VRM policy. Id. The BLM last completed a visual resource inventory in the planning area in 2009 and 2011. DEIS at 3-17. In addition, the inventory included in the Analysis of the Management Situation ("AMS") that was used in formulating the alternatives was completed in 2013 and has not been updated in response to changing conditions. Id. at ES-1. So, most of the information relied | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |

|---|---|---|---|
| | | upon by the BLM in designating VRMs is over a decade old. Even with this older data, when you compare Map 3-8 that shows existing federal oil and gas leases to Map 2-18 (Alt. B) and Map 2-20 (Alt. D), it shows that the BLM has designated VRM Class II management in areas with extensive oil and gas leasing that was approved under the Green River RMP. Under IBLA's holding, the VRM Class II would be largely invalid and unenforceable across the planning area. | |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13912-11 | BLM provides little or no justification for this significant change in management for historic trails. BLM does not explain why current protections, which are applied on a case-by-case basis, are now inadequate to protect historical resources. Indeed, all federal actions in the planning area, regardless of their distance from historic trails, must undergo National Historic Preservation Act Section 106 consultation, including consultation with the State Historic Preservation Office ("SHPO"). That means that under current management, undertakings within the viewshed of these trails are already carefully examined, cautiously permitted, and subject to minimization and mitigation requirements in consultation with the SHPO. Blanket restrictions that place large swaths of public lands off limits to preserve the landscape for a handful of potential historic trail users illegally violate BLM's multiple-use obligation, and in checkerboard areas, these restrictions, make no sense where existing private surface uses affect the visual landscape and BLM cannot effectively manage to avoid interference with the historical setting. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13912-13 | The area would also be designated as visual resource management ("VRM") class II (MA# 7557), so that no activity would be allowed that might attract the attention of the casual observer.2 Specific to the class II designation, the decision does not align with the visual resource inventory ("VRI") class designations for the area of the Big Game Migration Corridor ACEC within the checkerboard. See Draft EIS, Map 3-16. Much like VRM classes, VRI classes-which BLM determines under a thorough rubric-are listed from I through IV with lower numerals representing areas of higher interest. BLM Manual H-8410-1 V.A.1. Most of the Big Game Migration Corridor ACEC falls within VRI class III designations, but BLM proposes to designate those same areas as VRM class II. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13913-1 | B. National Historic Trails west of U.S. Highway 191 For the segments of trail west of U.S. Highway 191, including the main stem of the Oregon-California-Mormon trails, the Sublette Cut-Off, and the Kinney and Slate Creek Cut-off Variants, we recommend the viewshed buffer be "up to five miles" dependent of viewshed analysis for all segments that the NPS assessment3 considers are high potential, with management actions 7002-7006 applied. For segments in poorer condition, that buffer could be reduced to "up to ½ mile" for the application of the associated management actions. | See DEIS Chapter 2.2.6 section Special Designations - Congressionally Designated Trails, Management Action 7000-7022 for a full range of alternatives analyzed regarding these trail resources. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13925-3 | Alternative B Visual Resource Management assigns Class II objectives for more than 2,148,902 acres even though BLM did not follow its own guidance. BLM cannot apply a VRM Class using only and inventory and/or future land uses (or restrictions). Instead, BLM must apply the inventory to current land uses and allocations, such as oil and gas leases. H-8410-1, V.A.1., V.A.2. BLM assigned the inventory class rather than follow the next steps. The DEIS omits entirely land rights and pre-existing land uses that conflict with VRM II objectives. If enforced, Alternative B VRM class assignments effect an inverse condemnation of RSGA land rights as well. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 824 - Heritage and Visual Resources–Visual Resources (5400-5413) | #13925-7 | There is every indication that BLM did not correctly develop the VRM Classes. We know the DEIS visual resource inventory dates from 2011. AMS at 186. In the past 13 years, BLM has approved construction of three transmission lines, solar energy, oil and gas lease development, expansion of a coal and the trona mines, to name a few projects. Thus, the inventory is out of date. Based on the close correlation between VRM Class and proposed management, e.g. ACEC or LWCs, it is apparent that BLM made the VRM Class assignments based on the inventory and future land management objectives, regardless of the existing land rights. BLM policy requires BLM to complete a visual resource inventory and then assign the class based on contrast rating of current land rights and land uses. H-8410- 1, V.A.1; V.A.2. | See DEIS Volume I Chapter 3.14.1 'Existing Visual Resource Management Classifications' for an explanation of the methodology and BLM handbook involved in designating Visual Resource Management Classes. See DEIS Volume I Maps 2-17 through 2-20 for a range of alternatives analyzed regarding Visual Resource Management Classes throughout the field office. See DEIS Volume I Chapter 2.2.6 Section Heritage and Visual Resources, Visual Resources, Management Actions 5400-5413 for a full range of alternatives analyzed regarding to Visual Resource Class. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #41-1 | I think that the fair and equitable thing to do would be to release (or dispose) of an equivalent amount of land of equal or greater quality, so as not to adversely impact the economy of this region. Further, the BLM should take a leadership position in making more land available in the areas surrounding Wyoming towns so that more affordable housing can be built. | Management actions for all four alternatives are identified for disposals and can be found in the DEIS management action 6013 and disposal criteria is identified in Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #41-2 | One solution that I ask that the BLM implement would be to take into account the long term impact of any land use changes. For example, if you wish to set-aside and further restrict land as in this case, an equivalent amount of land of similar or better quality must be released, or sold to the public. | Management actions for all four alternatives are identified for disposal actions can be found in the DEIS management action 6013-6014 and the criteria for considering land tenure (disposal, land exchanges, and land sales) actions are identified in Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #185-1 | I would also like to see you allow the sale of federal land that are within a 10 mile radius of Rock Spring for private housing purposes. It would really be nice if you would sell individual parcels to regular citizens rather than to realators or developers. | Land Sale criteria is identified in Appendix K |

|---|---|---|---|
| 825 - Land Resources–Lands and Realty (6000-6015) | #406-1 | Please allow disposal of the 27,276 acers proposed in the latest draft. I would like to see the 120 acers north off Yellowstone Rd Rock Springs is consider. Please allow individuals to purchased land instead if realtors and investors so that more people have a chance to purchase BLM Land | Land Sale criteria is identified in Appendix K |
| 825 - Land Resources–Lands and Realty (6000-6015) | #488-1 | our home and outbuildings can only be accessed by a driveway that includes a 100 yard section goes through BLM land. Obviously, we would take a huge financial loss if we were to lose those ROWs. This is the generic situation that all rural landowners will find themselves in, if the broadest brushstroke version of Alternative B is chosen and implemented. I propose that Alternative B be modified so that ROWs are maintained for property owners who would suffer financially from their loss but be removed for non-property owners. This would accomplish the Alternative B aim of dramatically limiting access and use of BLM land without causing irreparable financial damage to land owners. | Please see Planning Criteria in Section 1.4 for a discussion of private lands. Management actions for all four alternatives are identified for disposals and can be found in the DEIS management action 6000. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #7196-1 | Clearly a large problem with land in this management area is the historic checkerboard along the railroad. I think the BLM should make it an objective to consolidate, by exchange with willing private landowners, public lands so that these lands can be managed more uniformly and with less conflict. Inholdings with particular value to the public could also be purchased outright. | See Section 2.2.4 for Alternatives Considered but not Analyzed. Management actions for all four alternatives are identified for disposal actions can be found in the DEIS management action 6013-6014 and the criteria for considering land tenure (disposal, land exchanges, and land sales) actions are identified in Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #7196-3 | Wildlife migration, crucial wintering and parturition areas need to be given the maximum protection. In some cases this can be accomplished by seasonal restrictions. New ROWs should be routed so as to avoid these sensitive areas. | Management actions for all four alternatives are identified for ROW/allowable uses within big game crucial winter range and parturition areas in the DEIS management actions 6000 and 4421. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #9354-2 | 1517 Alternative B Pursue acquisition of the state parcels- I am not entirely sure what this mean but I believe you are wanting to buy or acquire all state and private land inside the allotment, and "manage" them. Again this land is for the people. To enjoy and as a rancher we pay to use these lands. | Criteria for acquisitions can be found in Appendix K of the DEIS. MA#1517 applies to the specific Lands with Wilderness Characteristics parcel WY040-2011-088. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | See Glossary for a definition of 'surface disturbing activities'. Also, Management actions for all four alternatives are identified for ROWs and can be found in the DEIS management action 6002. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13273-1 | Also, I ask that the BLM strive continuously to consolidate lands (avoiding checkerboards with private land management) to create more viable wildlife habitat. | Management actions for all four alternatives are identified for acquisitions and can be found in the DEIS management action 6014. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13287-3 | Should there be a lack of a willing party to a land exchange, the law does not actually require one. The federal government has the power of eminent domain, and can condemn private land into federal ownership for any reason implementing the public interest. All four alternatives "would not use the powers of condemnation to acquire lands" DEIS at 2-14); given that the use of condemnation is an eminently reasonable alternative, the across-the-board failure to consider the use of this tool creates legal sufficiency issues. Here, the public interest in maintaining wild horses on public lands and improving access to federal land sections could (and should) be counterbalanced with equitable compensation for private land and private mineral owners (notably, much of the checkerboard private land is "split estate" in which the landowners and miner owners are different entities). | Management actions for all four alternative are identified in the DEIS management action 6014 and Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13287-4 | A land consolidation initiative would improve conservation of migration corridors, sage grouse, and potential wilderness, obviate the need to depopulate federal public lands of wild horses for the benefit of interspersed private landowners, and would resolve long-festering public land access problems posed by the checkerboard ownership pattern. We do appreciate that the Proposed Action would consider acquiring additional lands along perennial waters and wetlands (DEIS at 2-63). But this measure hardly covers the need in a field office where perennial waters and wetlands are exceedingly scarce. And we appreciate the Preferred Alternative's direction to acquire Wyoming tansymustard habitat on Pine Mountain (DEIS at 2-78); it is odd that this direction was incorporated into the 1998 Green River RMP, but was never acted upon. Sage grouse Priority Habitats and Winter Concentration Areas; large mammal migration routes, parturition ranges, and winter ranges; and lands with wilderness characteristics (but lacking the size criterion due to private inholdings) should likewise be considered for acquisition. | Management actions for all four alternatives are identified for Acquisitions in the DEIS management action 6014. and Appendix K for lands considered for acquisition. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 825 - Land Resources–Lands and Realty (6000-6015) | #13287-19 | We recommend against zoning any part of the RSFO for geologic carbon sequestration and associated studies (see, e.g., DEIS at 2-109). While the Rock Springs Uplift has been promoted as a target for pumping CO2 into underground formations, and it has been argued that there is a "triple seal" in this area securing it from loss of injected CO2, the Rock Springs Uplift is in fact riddled with faults. We have no confidence that it can securely and permanently hold injected CO2 underground. If the CO2 is burped out to the surface, it could suffocate any animal on the surface (including people), creating a major public safety hazard. If it leaks out slowly, then the whole exercise will have been pointless. | Management actions for 3 alternatives are identified for geologic carbon sequestration exploration and site characterizations and commercial sequestration projects in management action 6001. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13490-5 | *Include provisions for consolidating checkerboard lands through land swaps with private landowners to create contiguous public land habitat for wild horses and other wildlife. This will reduce conflicts, enhance public access to public lands, and alleviate land management challenges. | Management actions for all four alternatives are identified for acquisition of lands in the DEIS management action 6014, and Appendix K for lands considered for acquisition. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13493-5 | Land exchanges also allow the BLM to reposition or consolidate lands into more manageable units…" (BLM Lands and Realty – Sales, R&PP and Exchanges; The BLM Lands Exchange Handbook 2-294) The EIS fails to hard look at alternatives. | Management actions for all four alternatives are identified for acquisition of lands in the DEIS management action 6014, and Appendix K for lands considered and criteria for land exchanges. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13515-7 | As a long-term partner in BLM lands/realty work, RMEF supports continued use of land acquisitions and conservation easements to conserve critical habitat for big game and other wildlife. BLM-managed lands across the planning area include several landlocked parcels and/or a checkerboard arrangement. RMEF supports Plan components recognizing that acquisition or land tenure adjustments should focus on consolidating land ownership, improving public access, and conserving/enhancing resources. | Management actions for all four alternatives are identified for acquisition/easement of lands in the DEIS management actions 6000 and 6014, and Appendix K for lands considered and criteria for acquisition. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13542-47 | MA#6004. Alternatives B, C, and D. 2-110 If impacts are mitigated, why is there a daily limit restriction during construction for open pipeline trenches? This will add extra time and unnecessary costs to projects when mitigation efforts are already required for livestock, wildlife, and public safety. Please analyze and disclose to the public the scientific or other industry data used to rely on for this limitation. | Management action 6004 in DEIS considers stipulation across the three alternatives to mitigate impacts to livestock, wildlife, and public safety. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13624-84 | Ch.2#2-109#6001#Alternative B "Limit geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities to the Rock Springs Uplift."#It is unclear why the BLM is proposing to limit carbon sequestration to the Rock Springs Uplift in Alternative B of the RMP, particularly given that BLM must ensure that all activities are compatible with resource objectives and given that the federal administration has prioritized addressing greenhouse gases and climate change, including through carbon capture sequestration and utilization projects. In addition, RSFO did not describe how the Rock Spring Uplift was identified, did not provide a map of the Uplift boundaries, and did not identify how carbon capture potential will be impacted by the preferred alternative. Although BLM has jurisdiction to issue right-of-way authorizations for subsurface pore space, RSFO did not coordinate with WDEQ/WQD or the Wyoming Oil and Gas Conservation Commission (WOGCC) in identifying this management action, despite the fact that WDEQ/WQD has authority for determining Class VI Underground Injection Control (UIC) potential and permitting Class VI UIC wells and WOGCC has authority to issue pore space Unitization Orders. The RSFO should also be aware of WDEQ/WQD's ongoing discussions with BLM National and State offices to inform development of a memorandum of understanding (MOU) regarding carbon capture and sequestration. In light of these ongoing discussions, it is counterproductive for the RSFO to propose management actions regarding sequestration until the MOU has been finalized.[...] To address these issues, the RSFO should 1) not include any management actions that may conflict with the MOU; 2) coordinate with WDEQ/WQD and WOGCC regarding carbon capture sequestration projects and associated management actions in the RMP; 3) if BLM decides to retain any management action that may limit carbon capture and sequestration, provide justification for why limiting sequestration helps meet management objectives and how carbon capture potential in the management area will be impacted; and 5) if RSFO decides to retain the Rock Springs Uplift as the sole area available for such activities, describe how this area was identified and include a map of the area. | See Section 5.1 about consultation & coordination. Section 5.1.2 for a list of cooperating agencies that participated in development of he DEIS. See Table 5-1 for how those agencies coordinated and their responsibilities for developing the DEIS. Management actions for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, 4.19 Lands and Realty, see also Section 4.19.1 Assumptions. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13672-3 | The planning area includes a large amount of land in the checkerboard land ownership. The large broad-brush ROW exclusion and avoidance areas prescribed in MA#7002 and MA#7003 could make it impossible in some cases for private landowners to exercise their rights for access and development. These broad-brush exclusions and avoidance areas should be removed and replaced with case-by-case assessment in the checkerboard ownership areas. Case by case assessment of development projects has worked well under the 1997 RMP in that it has protected wildlife populations and other resources and allowed development and land uses to continue. It remains a good model to follow. | Management actions for all four alternative are identified in the DEIS management action 6002 for lands available for ROWs. |

|---|---|---|---|
| 825 - Land Resources–Lands and Realty (6000-6015) | #13729-2 | Because rights of way are necessary for virtually any new economic development and because of the BLM's ownership of land in the "checkerboard" area along I-80, under Alternative B essentially no new project requiring a road, a pipeline or a broadband cable could be constructed. This would severely limit not only Wyoming's traditional industries but would also prevent Southwest Wyoming from developing renewable energy projects or carbon capture from existing point sources. This would violate the BLM's own Instruction Memorandum IM 2022-41, which encourages the BLM to "authorize the BLM to issue [right of ways] to geologically sequester CO2 in federal pore space. . ." | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." Management actions for all four alternative are identified in the DEIS management action 6001 and 6002 for lands available for CO2 and ROWs. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-62 | The cooperating agencies, in particular Sweetwater County, the City of Rock Springs and the City of Green River along with the BLM must consider alternatives for land adjustments in order to accomplish the housing needs for the future expansion and growth of the community. The future socioeconomics of the area depends on the agencies to make these proper public land tenure adjustments which must be added to Appendix K. Lacking this collaboration and required decision making, southwest Wyoming may never see these projects, which will have a long-term negative impact on the local, state and national economy, and ultimately go against the goal of E.O. 14008. | An assessment of the long term housing needs of the community are outside the scope of the RMP. Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." Management actions for all four alternatives are identified in the DEIS management action 6013 for disposal and described in Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-150 | MA #6000 ALT B Industry Position: Not Acceptable Reason: The RMP area is a checkerboard so reference to isolated private and state sections is not accurate. Restriction of access goes against FLPMA. ALT D Industry Position: Not Acceptable Reason: Restriction of access goes against FLPMA. Access to minerals and other values must continue to be available. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." Management actions for all four alternatives are identified in the DEIS management action 6000 for access and described in Appendix K. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-151 | MA #6001 ALT B Industry Position: Not Acceptable Reasoning: No logic for the restriction is provided, and it seems to be based on political reasoning rather than scientific reasoning. ALT C Industry Position: Not Acceptable Reasoning: BLM need not facilitate such actions, project proponents will do so. | There are four alternatives for consideration identified in the Draft EIS, and the four alternatives were analyzed in Chapter 4, Section 4.19, Lands and Realty. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-152 | MA #6002 ALT B C D Industry position: Not acceptable Reason: Not clear which land have been identified as not open to the consideration of granting lands/realty actions. | Map 2-21, 2-22, 2-23, and 2-24 in the DEIS identified lands open to consideration under management action 6001. See Appendix K, Table K-1. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-153 | MA #6004 ALT B C D Industry Position: Not Acceptable Reasoning: Some pipelines trenches must be left open or partially buried for extended periods of time for safety reasons. 10 days is arbitrary. | A range of alternatives has been analyzed for pipeline trenches in Chapter 2.2.6, management action 6004. Analysis of impacts for actions in each alternative is found in Chapter 4, Section 4.19. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-154 | MA #6008 ALT A Industry position: Not acceptable Reason: The land withdrawals would negatively impact the trona and coal industries. The RMP states that this action could "potentially increase the cost of developing trona resources, and could result in a reduction in trona resources extracted via mining activities." These land withdrawals would conflict with the KSLA, which has a higher value resource. ALT B Industry position: Not acceptable Reason: The land withdrawals would have the potential to close 49,224 acres to trona leasing and development within the KSLA. These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. ALT C Industry position: Not acceptable Reason: This alternative eliminates existing ACECs and other lands accounted for in the current RMP. ALT D Industry position: Not acceptable Reason: These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. | See Glossary for the definition of 'withdrawal', which applies only to land law minerals such as hard rock mining and does not apply to leasable minerals such as trona, coal, or fluid minerals. Management actions for all four alternatives are identified in the DEIS management action 2000-2419, for Minerals Resources-Locatable Minerals. Appendix V, Table 2-3 Identifies Areas Proposed for Withdrawal from Mineral Location. Specific management actions are listed 2408-2411 and Table 2-7, for Trona for Other Leasable Minerals. There were four alternatives analyzed in the DEIS and found in Chapter 4 and 4.11 Energy and Minerals. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-155 | MA #6009 AT A Industry position: Not acceptable Reason: The land withdrawals would have the potential to close 49,224 acres to trona leasing and development within the KSLA. These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. ALT B Industry position: Not acceptable Reason: The land withdrawals would have the potential to close 49,224 acres to trona leasing and development within the KSLA. These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. ALT C Industry position: Not acceptable Reason: This alternative eliminates existing ACECs and other lands accounted for in the current RMP. ALT D Industry position: Not acceptable Reason: These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. | See Glossary for the definition of 'withdrawal', which applies only to land law minerals such as hard rock mining and does not apply to leasable minerals such as trona, coal, or fluid minerals. Management actions for all four alternatives are identified in the DEIS management action 2000-2419, for Minerals Resources-Locatable Minerals. Appendix V, Table 2-3 Identifies Areas Proposed for Withdrawal from Mineral Location. Specific management actions are listed 2408-2411 and Table 2-7, for Trona for Other Leasable Minerals. There were four alternatives analyzed in the DEIS and found in Chapter 4 and 4.11 Energy and Minerals. |

| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-156 | MA #6010 ALT B Industry position: Not acceptable Reason: BLM should conduct a VRI of withdrawn lands to determine the management objectives. ALT D Industry position: Not acceptable Reason: BLM should conduct a VRI of withdrawn lands to determine the management objectives. | Management actions for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, 4.19 Lands and Realty. Appendix K identifies Land Tenure Adjustment Criteria. The VRI can be found on map 3-16. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-158 | MA #6009#LR-04, BR-29, HR-13, BR-24, HR-2.1#Withdrawals and classifications would be processed to protect important resource values (Appendix K). Industry position: Not acceptable Reason: New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws.#See MA #6008 Industry position: Not acceptable Reason: The land withdrawals would have the potential to close 49,224 acres to trona leasing and development within the KSLA. These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws.#See MA #6008 Industry position: Not acceptable Reason: This alternative eliminates existing ACECs and other lands accounted for in the current RMP.#See MA #6008 Industry position: Not acceptable Reason: These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws.#Withdrawals would be pursued. New withdrawals would be evaluated on a case-by-case basis and would be in compliance with the Federal Mining Leasing Act of 1920 as Amended. | See Glossary for the definition of 'withdrawal', which applies only to land law minerals such as hard rock mining and does not apply to leasable minerals such as trona, coal, or fluid minerals. Appendix K identifies Land Tenure Adjustment Criteria. Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." Management actions for all four alternatives are identified in the DEIS management action 2000-2419, for Minerals Resources-Locatable Minerals. Table 2-3 Identifies Areas Proposed for Withdrawals from Mineral Location, and Appendix V, Areas Proposed for Withdrawal from Mineral Location. Specific management actions are listed 2408-2411 and Table 2-7, for Trona for Other Leasable Minerals. There were four alternatives analyzed in the DEIS and found in Chapter 4 and 4.11 Energy and Minerals. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13751-159 | MA #6010#LR-03, BR-20, HR-13#Withdrawals which no longer serve the purpose for which they were established would be revoked. Prior to revocation, withdrawn lands would be reviewed to determine if any other resource values require withdrawal protection (Appendix K). Industry position: Acceptable It should be noted that Appendix K does not discuss withdrawals.#Revoke withdrawals which no longer serve the purpose for which they were established (Appendix K). Review withdrawn lands, prior to revocation or expiration, to determine if any other resource values require withdrawal protection. Manage lands within withdrawn areas that expire or are revoked in accordance with the management of the surrounding lands. Industry position: Not acceptable Reason: BLM should conduct a VRI of withdrawn lands to determine the management objectives.#Same as Alternative A Industry position: Acceptable#Same as Alternative B Industry position: Not acceptable Reason: BLM should conduct a VRI of withdrawn lands to determine the management objectives.#Alternative A is acceptable. | Management actions for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, 4.19 Lands and Realty, see also Section 4.19.1 Assumptions. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13775-2 | BLM-WY currently manages areas that are closed to mineral leasing, have NSO stipulations, or are otherwise identified as unsuitable for surface disturbance or occupancy as ROW exclusion or avoidance areas. This is an appropriate practice which protects areas and resources which require such protection will still limiting ROW exclusions to only 12 percent of the planning area. But BLM-WY presents no justification for expanding ROW exclusions beyond such areas and encompassing the majority of the planning area in such exclusion zones. Nor does BLM-WY articulate how such an expansion would enhance would provide better protection to any of the resources under its management. Such omissions call into question the need or legitimacy of such a policy change. If BLM- WY has a substantive reason for such a restriction, it should, and indeed is required to, articulate it in detail in the Draft RMP. | See Special Management sections in both Chapter 3 and Chapter 4, along with the various special management proposed management actions in Chapter 2. Management actions for all four alternatives are identified in the DEIS management action 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13787-74 | MA #6000 LR-06, LR-07, LR-02, BR- 24 Access to public lands would be provided throughout the planning area. Where necessary and consistent with off-road vehicle (ORV) designations, access would be closed, or restricted in specific areas to protect public health and safety, and to protect significant resource values. Easements would be pursued where practical, to provide access to public lands for recreational, wildlife, range, cultural/historical, mineral, special management area, and other resource management needs (about 300 acres) Appendix K. Industry Position: Acceptable Evaluate, on a case-by-case basis, access needs to public, state, and private land within the planning area. Restrict access where necessary to protect public health or safety and sensitive resources. Consider, when requested by the land owner, access across public land to isolated private and state land consistent with the guidelines and objectives set forth in FLPMA and existing regulatory requirements. Industry Position: Not acceptable Reason: The RMP area is a checkerboard so reference to isolated private and state sections is not accurate. Restriction of access goes against FLPMA. Same as Alternative A Industry Position: Acceptable Restrict or close access where necessary and consistent with OHV designations: 1) in specific areas to protect public health and safety; and 2) to protect significant resource values. Pursue easements where practical, to provide access to public lands for recreational, wildlife, range, cultural/historical, mineral, special management area, and other resource management needs (Appendix K). Industry Position: Not acceptable Reason: Restriction of access goes against FLPMA. Access to minerals and other values must continue to be available. Alternatives A and C are acceptable. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies. "Management action for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13787-75 | MA #6001 PR-01, PR-02, PR-03 No similar action Industry Position: Not acceptable Reasoning: This is new to the RMP and requires appropriate land planning. Limit geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities to the Rock Springs Uplift. Industry Position: Not acceptable Reasoning: No logic for the restriction is provided, and it seems to be based on political reasoning rather than scientific reasoning. Facilitate geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities throughout the area of review. These | Management action for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | could range from the prospective use of deep saline aquifers, e.g., Weber Sandstone and Madison limestone formations, deep unmineable coal seams, and suitable depleted oil and gas fields after the completion of Enhanced Oil Recovery. Industry Position: Not acceptable Reasoning: BLM need not facilitate such actions, project proponents will do so. Allow geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities (Appendix H). Industry Position: Acceptable Reason: Carbon sequestration exploration and commercial projects will require authorization from the WDEQ-WQD. Alternative D is acceptable. | |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13787-76 | MA #6002 LR-06, MR-03 Public lands would be made available throughout the planning area for rights-of- way, permits, and leases. Industry position: Acceptable Reason: Public lands within the planning area should be available for rights-of-way, permits, and leases. The planning area is open to the consideration of granting lands/realty actions, except where identified. Industry position: Not acceptable Reason: Not clear which land have been identified as not open to the consideration of granting lands/realty actions. Same as Alternative B Industry position: Not acceptable Reason: Not clear which land have been identified as not open to the consideration of granting lands/realty actions. The planning area is open to the consideration of granting lands/realty actions, except where identified. Industry position: Not acceptable Reason: Not clear which land have been identified as not open to the consideration of granting lands/realty actions. Alternative A is acceptable. The planning area is open to the consideration of granting lands/realty actions on a case-by- case basis. | Map 2-21, 2-22, 2-23, and 2-24 in the DEIS identifies lands open to consideration under management action 6002. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13787-77 | MA #6004 LR-06, BR-46, BR-35 No similar action Stipulate pipeline trenches are not allowed open longer than 10 days during the construction phase. Require pipeline gates to mitigate impacts to livestock, wildlife and public safety. Industry Position: Not Acceptable Reasoning: Some pipelines trenches must be left open or partially buried for extended periods of time for safety reasons. 10 days is arbitrary. Same as Alternative B Industry Position: Not Acceptable Reasoning: Some pipelines trenches must be left open or partially buried for extended periods of time for safety reasons. 10 days is arbitrary. Same as Alternative B Industry Position: Not Acceptable Reasoning: Some pipelines trenches must be left open or partially buried for extended periods of time for safety reasons. 10 days is arbitrary. Alternative A is acceptable. Potential modification: Pipeline trenches that are not backfilled at the time of construction or are exposed for maintenance purposes should be managed on a case-by-case basis as discussed and approved with the BLM and pipeline safety authority as needed. | A range of alternatives has been analyzed for pipeline trenches in Chapter 2.2.6, management action 6004. Analysis of impacts for actions in each alternative is found in Chapter 4, Section 4.19. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13787-78 | MA #6008 LR-01, LR-03, LR-04, BR-24, HR-2.1 Land withdrawals identified in the Green River RMP would be pursued. New withdrawals in addition to those identified in the Green River RMP include the top of Steamboat Mountain, the Pinnacles Geologic Feature, and two northern elk calving areas. Industry position: Not acceptable Reason: The land withdrawals would negatively impact the trona and coal industries. The RMP states that this action could "potentially increase the cost of developing trona resources, and could result in a reduction in trona resources extracted via mining activities." These land withdrawals would conflict with the KSLA, which has a higher value resource. Process land withdrawals identified in Table 2-3, Appendix V. Industry position: Not acceptable Reason: The land withdrawals would have the potential to close 49,224 acres to trona leasing and development within the KSLA. These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. Process land withdrawals identified in Table 2-3, Appendix V. Industry position: Not acceptable Reason: This alternative eliminates existing ACECs and other lands accounted for in the current RMP. Process land withdrawals identified in Table 2-3, Appendix V. Industry position: Not acceptable Reason: These land withdrawals would conflict with the KSLA, which has a higher value resource. New land withdrawals should be evaluated on a case-by-case basis and should be in compliance with other laws. Land withdrawals would be pursued. New withdrawals would be evaluated on a case-by-case basis and would be in compliance with the Federal Mining Leasing Act of 1920, as Amended. | See Glossary for the definition of 'withdrawal', which applies only to land law minerals such as hard rock mining and does not apply to leasable minerals such as trona, coal, or fluid minerals. Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." Management actions for all four alternatives are identified in the DEIS management action 2000-2419, for Minerals Resources-Locatable Minerals. Appendix V, Table 2-3 Identifies Areas Proposed for Withdrawal from Mineral Location. Specific management actions are listed 2408-2411 and Table 2-7, for Trona for Other Leasable Minerals. There were four alternatives analyzed in the DEIS and found in Chapter 4 and 4.11 Energy and Minerals. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13811-6 | The implementation of Alternative B would force the BLM to impose additional restrictions on operations and development in proximity to NHTs, which may or may not be necessary to preserve and protect the NHTs. Under the proposed Alternative B, a five-mile wide buffer on either side of the NHT "would be managed as closed to mineral leasing and mineral material sales, as an exclusion area for ROWs, and a withdrawal would be pursued."17 The areas within the five-mile buffer "would have the most protections to soils from surface disturbing activities, as the stipulations would be more restrictive."18 Additionally, within five to 15 miles on either side of the NHT, the area would be managed as open to mineral leasing and mineral material sales with Controlled Surface Use restrictions and would be a right-of-way avoidance area.19 In short, both of these areas "would receive more protections to soils, compared to Alternative A."20 But as with the other categorical restrictions Alternative B proposes, BLM already has discretion to impose case-by-case restrictions in proximity to NHTs. Trading BLM's discretion for categorical restrictions does no more to achieve its conservation goals while at the same time unduly restricting economic development in the Planning Area. Indeed, the technical and economic viability of the Dry Creek Project is detrimentally affected by these proposed restrictions due to the categorical five-mile development prohibition around the NHTs, limiting required access and mineral processing support features critical to reasonable mineral extraction within the KSLA. | Management action for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |

|---|---|---|---|
| 825 - Land Resources–Lands and Realty (6000-6015) | #13831-8 | * The Airport is the only Commercial Service Airport in the lower 48 that must truck both potable and fire suppression water to serve its facilities. The Airport is not connected to the municipal water supply. In partnership with Sweetwater County, the City of Rock Springs, the Joint Powers Water Board, Simplot Phosphates, Sweetwater Economic Development Coalition, and several others, plans are underway to develop robust water infrastructure east of town to not only support the airport but industrial development between the airport and Simplot Phosphates. The preferred alternative would render the efforts undertaken by partnership useless and eliminate the possibility of delivering a municipal water supply to the airport. | Management action for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13831-11 | Appendix B - Management #4430 - Raptor Nests: States that there shall be no surface occupancy within a 1-mile radius of raptor nests. It further specifically identifies airports as infrastructure that have the potential to cause direct avian mortality. o Map 3-4 shows a raptor nest right on the edge of the airport property (western side on the approach to Runway 9). This would eliminate the ability for surface occupancy on BLM managed lands within 1 mile which would once again have an adverse impact on any development around the airport. Surface occupancy is defined as, "Placement or construction on the land surface of semi-permanent or permanent facilities requiring continual service or maintenance". The Airport Board sees this once again impacting infrastructure leading to the airport including the roadway, water, sewer, gas, and electric. | Management action for all four alternatives are identified in the DEIS management actions 6000-6015. The four alternatives were analyzed in the DEIS and found in Chapter 4, Section 4.19 Lands and Realty. |
| 825 - Land Resources–Lands and Realty (6000-6015) | #13945-6 | Yet, the Draft EIS makes no effort to determine the extent to which Alternative B (or any alternative for that matter) will lead to grazing allotments becoming economically unviable to use for livestock grazing and the consequential sell off of private land inholdings. The Draft EIS also makes no attempt to determine the likely environmental impacts to wildlife habitat, open space and visual resources from the development of private lands that are no longer viable for livestock grazing due to loss of economically viable grazing use of the federal BLM land imposed by Alternative B. | Management action for all four alternatives are identified in the DEIS management actions. Fish and Wildlife 4400-4436, Visual Resources 5400-5413 and Livestock Grazing Management 6400-6417. The four alternatives were analyzed in the DEIS and found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #298-2 | You talk about wanting to go to clean energy. Yet you are decreasing by 61% in surface area restrictions. According to Landgate, a wind farm needs approximately 80 acres of land to have a successful wind farm | Management actions for all four alternatives were identified for renewable energy and can be found in the DEIS from management action 6105. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #8858-1 | Within the proposed RMP, a more balanced alternative (Alternative D) would allow for economic uses of the land and provide greater recreational activities. It is stated within the executive summary of the document that one of the focuses of this plan is to address climate change, which would lead one to believe that renewable energy would be the main focus of the plan. While I disagree with the federal government's current climate and renewable energy policies, this plan would even restrict the development of these renewable energy resources. This contradicts the federal government's long-term plan for addressing the climate issue. | Management actions for all four alternatives are identified for renewable energy and can be found in the DEIS management action 6104 and 6105. In addition, please see Comparison of Alternatives table listed on page ES-5 |
| 826 - Land Resources–Renewable Energy (6100-6108) | #9390-1 | Energy: Alternative B drastically restricts the land available for renewable energy deployment and for any new transmission outside of existing corridors. As a project that will require fully additional, low-carbon resources, it's very unlikely that the resources we need could be built in this area under Alternative B. • DAC footprint: While our initial footprint is likely to fall within the Kemmerer Field Office, nearby expansion opportunities include the border between Sweetwater and Lincoln Counties northwest of Green River. Much of this region is included in the ROW exclusion. Even if we built entirely on private land, it would be nearly impossible to access the potential sites. • Sequestration/storage: Similar to above (DAC footprint), nearby expansion opportunities for mineral leasing are almost completely excluded or don't allow surface occupancy under Alternative B. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis of impacts for each alternative, with the proposed management actions for Renewable Energy, can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | See Glossary for the definition of 'surface disturbing activities'. Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Best Management practices (BMPs) can be found in Appendix A. See also Chapter 4 Environmental Consequences: 4.20 Renewable Energy |
| 826 - Land Resources–Renewable Energy (6100-6108) | #10324-4 | A recent study estimated that there are about ten bat mortalities per wind turbine per year, which may sound like a very small number, but when you consider the amount of wind turbines in Wyoming, that is not an insignificant number.12 It was a fantastic start to discuss what precautions would be made to prevent raptor and wind turbine collisions, but it is important to protect our less charismatic species like bats in this area as well. Bats are incredibly unique species and are often misunderstood by the public, which can be a reason why people have not been concerned about the bats in the area thus far. However, bats are critical for the habitats they live in and provide incredible benefits to humans, and with bats facing risks in addition to wind turbines like White Nose Syndrome, the urgency to protect these species is increasing. One of the incredible services that bats provide to the humans in the area is the consumption of insects, including pest insects | See Chapter 4.8 for Analysis of Special Status Species |
| 826 - Land Resources–Renewable | #13287-17 | We also support proposed prohibitions on wind development in raptor concentration areas and other sensitive habitats. These protections also should be extended to solar developments, as these have been shown to block or impede antelope migrations (Sawyer et al. 2022, Attachment 6). We offer the report Wind Power in Wyoming: Doing it Smart from the Start (Attachment 7) as a comprehensive blueprint for lands where wind power | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Impacts to wildlife are analyzed in 4.7. Best Management practices (BMPs) can be found in Appendix A. See also Chapter 4 Environmental Consequences: 4.20 Renewable Energy |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Energy (6100-6108) | | development should be excluded. Importantly, this report included as a Best Management Practice to keep big game seasonal habitats as "caution areas" rather than "exclusion areas" for wind development, pending scientific research to determine whether they should become exclusion areas. That scientific research has been completed, and these lands should also be treated as exclusion areas as a result of the finding that wind farm development results in large mammal avoidance. | |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13584-1 | The DEIS does not sufficiently address the potential for solar energy development in the planning area. Additional analysis is needed to account for solar energy potential within the planning area. Section 3.21 Renewable Energy (p.3-27) states "The RMP will identify areas within the planning area that are open to both wind and solar renewable energy development. However, the focus of this section will be on wind energy development because unlike solar, there is high potential for commercially viable wind energy in the planning area." The statement that there is not high potential for commercially viable solar energy in the planning area is incorrect. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Impacts to renewable energy are analyzed in 4.20. Best Management practices (BMPs) can be found in Appendix A. See also Chapter 4 Environmental Consequences: 4.20 Renewable Energy |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13584-2 | According to Appendix P, emissions associated with the production of renewable energy are accounted for in the GHG inventory, but emissions reductions or offsets from production of renewable energy on BLM land are not addressed. | Offsets or emissions reductions from the production of renewable energy are outside the scope of this analysis for the RMP. See AQ Technical Report in Appendix P for the scope of the AQ analysis necessary for the alternatives comparison. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13624-46 | Renewable Energy Development The Draft RMP/EIS identifies an area within the Rock Springs RMP with wind energy development potential. See Draft RMP/EIS, Map 3-12: Wind Energy. A similar map identifying solar energy development potential was not provided in the Draft RMP. This is a significant omission because the Draft Programmatic Solar EIS is to be considered in parallel with the Draft RMP/EIS. BLM should provide additional information and analyses to address impacts of the Draft RMP/EIS on the following regarding renewable energy development: 1. What are the impacts and cumulative impact of Alternative B management actions on renewable energy development potential? How will the proposed right-of-way exclusions impact the ability to develop transmission pathways to markets in the western United States? 2. Most of the renewable energy produced in Wyoming is developed to serve energy markets located in states that are to the west of Wyoming. How will renewable energy that is produced north and east of the Rock Springs RMP access the electricity markets that are located west of the Rock Springs RMP? WDEQ administers the Industrial Development Information and Siting Act that identifies the statutory authority for permitting large industrial facilities. For the purposes of wind and solar, any wind project that consists of 20 or more wind turbines in all planned phases of installation is subject to jurisdiction under this Act. Solar projects that have a rated capacity of more than 30 megawatts or results in surface disturbance equal to or greater than 100 acres would also be jurisdictional. The Industrial Siting Council (ISC) is responsible for reviewing, granting and enforcing industrial permits. The ISC evaluates how an industrial project may impact local socioeconomics, the environment, and wildlife. Permittees are required to develop and implement decommissioning and reclamation plans and may be required to post a bond to cover any future decommissioning and reclamation costs. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4.20. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13665-4 | BLM's preferred alternative also could constrict renewable-energy development such as wind and solar projects. And, if oil-and-gas production in Wyoming is interrupted by selection of BLM's preferred Alternative B, then the renewable energy sources that remained would not meet local energy needs. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Chapter 4 Environmental Consequences: 4.20 Renewable Energy. See also 2.2.5 Overview of the Alternatives, p. 2-3. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13665-34 | Although BLM candidly acknowledges that Alternative B would severely constrain energy development projects-from both traditional and renewable sources-BLM's rationale for favoring that alternative does not support such a radical departure from current policy. For example, even though "[i]mpacts to wildlife and fisheries habitat from … renewable energy …would be the same as those described under Alternative A," id. at 4-67, Alterative B nonetheless restricts over two-million acres from renewable energy development-four to five times as many as are currently off-limits under Alternative A. See id. at ES-5. But if the "[i]mpacts to wildlife and fisheries" would be largely the same under Alterative B "as described under Alternative A"-the less-restrictive, "no action" alterative-then why close-off hundreds of thousands additional acres just to reach the same environmental outcome? Not only is BLM's "preferred alternative" illogical, but the agency's preference for that alternative is "arbitrary, capricious, an abuse of discretion" or "unsupported by substantial evidence" and therefore violates the Administrative Procedure Act. 5 U.S.C. §§ 706(2)(A), (E) | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. See also Appendix E for a list of laws and regulations that apply to this planning effort. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13751-157 | MA #6107 ALT B D Industry Position: Not Acceptable Reasoning: Valid existing rights should be referenced. | The Draft EIS identifies Valid Existing Rights, in Section 1.4 Planning Criteria. and Chapter 4.11.1 Assumptions and analysis can be found in Chapter 4. |
| 826 - Land Resources–Renewable | #13751-160 | MA #6107#LR-05, MR-01#No similar action#Consider the authorization of renewable energy ROWs within the KSLA on a case-by- case basis consistent with the management of other resource values and uses. |---|---|---|---|
| Energy (6100-6108) | | referenced.#No similar action#Same as Alternative B Industry Position: Not Acceptable Reasoning: Valid existing rights should be referenced.#Consider the authorization of renewable energy ROWs within the KSLA on a case-by-case basis consistent with the management of other resource values and uses. Valid existing rights must be evaluated and new renewable leases must indemnify senior lease holders for potential impacts due to valid existing rights (for example subsidence impacts). See management actions 2408-2411. | |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13752-1 | while it indicates that reasonably foreseeable development scenarios have been developed for fluid minerals (oil and gas), as well as a Mineral Potential Report, there are no indications BLM has projected potential future wind energy development in the planning area, or the potential demand for new transmission lines. The Draft RMP/DEIS contains only limited and outdated references to renewable energy policies. The only reference to policies regarding wind energy development is in Proposed Management Act 6102, which cites the 2005 Implementation of Wind Energy Development Program and Associated Land Use Plan Amendments, but no more recent policies. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. Assumptions for analysis are found in Section 4.20.1. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13752-2 | The Energy Act of 2020 directs the Secretary of the Interior to "seek to issue permits that, in total, authorize production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects by not later than 2025, through management of public lands and administration of Federal laws."9 This goal will be unachievable if BLM advances land planning decisions that would foreclose renewable development on significant portions of the land under its management. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13752-3 | The Energy Act of 2020 directs the Secretary of the Interior to "seek to issue permits that, in total, authorize production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects by not later than 2025, through management of public lands and administration of Federal laws."9 This goal will be unachievable if BLM advances land planning decisions that would foreclose renewable development on significant portions of the land under its management. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13767-1 | Alternative B of Management Action No. 6001 ("Alternative B"), the objective of which, as stated in Table 2-1 of the Draft RMP, is to "limit geologic sequestration exploration and site characterization projection and commercial sequestration projects and facilities to the Rock Springs Uplift." Further, one of the other stated goals for Management Action No. 6001 is to "improve air quality in the planning area as practicable." By limiting commercial sequestration projects and facilities to the Rock Springs Uplift, Alternative B eliminates Frontier's ability to capture any CO2 from the AOR and transport it via pipeline to the SCS Hub - and dispose of it into Class VI wells which have been constructed with funds granted by the Department of Energy. Instead, Alternative B assumes that the pore space formations underlying the Rock Springs Uplift is sufficient storage for the entirety of the AOR without any technical subsurface characterization study publicly available to support such an assumption and without regard to the location of each emissions site relative to the Rock Springs Uplift. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13767-2 | Alternative B of the Draft RMP also aims to exclude 2,480,876 surface acres from use for rights of way, which would include BLM surface acres that are checkerboarded with private lands that host CO2 emission facilities in the AOR. Alternative B would effectively condemn pore space underlying these private lands by prohibiting these private emitters from implementing a point-source capture site at its respective facilities due to the fact that the continuous, checkerboarded BLM surface acreage will be excluded from rights of way to the federal pore space. Furthermore, the exclusion of rights of way would prevent any efforts to transport the CO2 via pipeline from its source to the storage site, whether it's the SCS Hub or the Rock Springs Uplift. These consequences make it difficult to comprehend how Alternative B "improves air quality" when almost 70 percent of the BLM surface acres are excluded from rights of way, dramatically reducing the potential for any commercial carbon sequestration projects from being commissioned in the AOR. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13779-1 | Notably, on May 10, 2023, the Biden Administration called on Congress to expand clean energy targets for federal lands by establishing targets for 2030 and 2035, building on the existing goal of permitting 25 GW of solar, onshore wind, and geothermal energy on public lands by 2025.3 However, few BLM lands are open to renewable energy development and even fewer have developed projects. This is especially noticeable when compared to lands open to oil and gas development: currently 90% of the 235 million acres of BLM land are open to oil and gas leasing, and 24,932,645 acres are actively leased for such development.4 In contrast, BLM has designated fewer than 500,00 acres as priority areas for solar development, identified 19 million acres as variance lands, on which solar development may be possible, but is more difficult, and excluded a full 79 million acres from development.5 As of November 30, 2023 only 47 renewable energy projects on approximately 35,062 acres have been approved on BLM land.6 If the United States is to meet its carbon goals, and tackle the worst impacts of climate change, the pace of renewable energy development on public lands must increase. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13779-3 | Although the BLM states that one of the goals of the RMP is to "provide opportunities for assessment and development of renewable energy facilities on public lands,"9 the RMP will make it all but impossible to develop renewable energy projects in the Rock Springs Area, and potentially throughout Wyoming given the restrictions on transmission access through Rock Springs. The plan both closes millions of acres to development and imposes prohibitively restrictive management actions on many of the acres that are nominally open to such development. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 826 - Land Resources–Renewable Energy (6100-6108) | #13779-4 | Close to 2.5 million acres would be excluded from development.11 This represents a 481% increase in areas excluded as compared to current management practices.12 Importantly, renewable energy requires enough acres open to potential development to provide the flexibility for siting decisions based on a broad array of factors ranging from wildlife habitat to interconnection access. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13779-8 | BLM fails to justify the need to impose such stringent restrictions on renewable energy development in wildlife habitat. Worryingly, BLM appears to have made no attempt to understand or incorporate the state of the science on renewable energy-wildlife interactions in developing the Rock Springs RMP and the associated EIS. Instead, BLM relies on studies related to the impacts of oil and gas development to claim that "similar displacement would be expected with the development of large-scale wind facilities." However, the development of oil and gas, which requires active, year-round management by operations and maintenance staff, is fundamentally different from wind development, which once constructed requires minimal human presence or activity (most turbines are visited by operations and maintenance staff no more frequently than once per month). As a result, it cannot be assumed that impacts of wind development will be similar to those of oil and gas. | Management actions for all four alternatives for Land resources -Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13779-9 | a recent study regarding interactions of a transplanted elk population with an operating wind facility in Oklahoma found no evidence that turbines had a significant impact on elk use of the surrounding area (Walter et al. 2006). Similarly, Johnson et al. (2000) found no effect on pronghorn use of the Phase I and II Foote Creek Rim project in Wyoming."15 Beyond these studies referenced by the BLM (which concede that displacement and avoidance due to wind energy is not significant), a host of peer-reviewed research is available specifically examining the technology-specific displacement effects of wind, solar, and transmission on a wide range of taxa, including ungulates, prairie grouse, grassland passerines, raptors, and other species. | Analysis for all four alternatives for Wildlife and Fisheries can be found in Chapter 4 specifically associated with renewable energy 4.7.2. Analysis for all four alternatives for Land resources-Renewable Energy can be found in Section 4.20. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13784-69 | 4.19.3 Lands and Realty, Alternative B: "Under this alternative, areas managed as exclusion areas for ROWs would increase to 68% of the planning area (2,480,876 acres) and areas managed as avoidance areas for ROWs would decrease to 4% of the planning area (133,903 acres). This would increase the acres in which ROWs are precluded, which would potentially increase the number of ROW facilities precluded from development." (p. 4-211) Comment: Alternative B directly conflicts with the agency's push for increased renewable energy development. This would undoubtedly decrease potential for solar development. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies. "Management actions for all four alternatives for Land resources - Renewable Energy can be found in the DEIS from management action 6100-6105. Analysis for all four alternatives can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13784-70 | 4.20.2 Renewable Energy, Alternative A: "Renewable energy development requires surface disturbance...Management Actions to minimize impacts..." (p.4-218) Comment: The two paragraphs are verbatim from page 4-217. Remove from either page. | Section 4.20.2 p. 4-217 paragraph describes land usage restrictions on renewable energy development sites in the planning area and p. 4-218 paragraph describes Wind turbine structures intrusive in certain view sheds for cultural, historical or paleontological resources. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13784-71 | "The granting of ROWs is crucial to supporting national energy plans that include developing renewable energy, "(p. 4-220) Comment: This sentence indicates the agency and administration's interest in increasing renewable energy, but the Preferred Alternative B will directly conflict with this process. | See Chapter 2.2.6 of the DEIS, section Renewable Energy, Management Actions 6100-6105, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each alternative can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13784-72 | "ACEC habitat prescriptions to manage land development, occupancy, and view sheds would limit renewable energy developments. The placement of renewable energy facilities, structures, and transmission/pipe lines; allowance of surface disturbing activities associated with construction, and vehicle access to development sites would be impacted adversely by those restrictions." (p. 4-221) Comment: Again, the BLM has selected Alternative B as the Preferred Alternative, yet directly conflicts with the statement mentioned above. Alternative B increases ACEC, and prohibits surface disturbing activities throughout the Plan Revision. | Management Actions 7400 through 7570 describe management within ACECs and Chapter 4.20. See Renewable Energy, Management Actions 6100-6105, for analysis of a full range of alternatives regarding potential management decisions in these areas. Impacts from each alternative can be found in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13784-73 | "The management actions for renewable energy development under this alternative are similar to Alternative A, except ROW exclusion areas would be greater (2,480,876 acres excluded, which is 2,054,167 more acres than Alternative A." (p. 4-224) Comment: The statement is incredibly misleading. The two alternatives A and B are not similar in any way regarding renewable energy in ROW areas. Alternative B will be nearly impossible to develop with the substantial exclusion area. | Impacts to renewable energy development can be found in Section 4.20 Renewable Energy |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13787-79 | MA #6107 LR-05, MR-01 No similar action Consider the authorization of renewable energy ROWs within the KSLA on a case-by- case basis consistent with the management of other resource values and uses. See management action 2408-2411 Industry Position: Not acceptable Reasoning: Valid existing rights should be referenced. No similar action Same as Alternative B Industry Position: Not acceptable Reasoning: Valid existing rights should be referenced. Consider the authorization of renewable energy ROWs within the KSLA on a case-by-case basis consistent with the management of other resource values and uses. Valid existing rights must be evaluated and new renewable leases must indemnify senior lease holders for potential impacts due to valid existing rights (for example subsidence impacts). See Mas #2408-2411. Resource: Land Resources (LR) - Rights-of-Way and Corridors (6200-6210) | Information regarding valid existing rights is found in Chapter 2.2.3 Alternatives Development Process and the analysis for the alternatives can be found in section Chapter 4.3.2 The Draft EIS identifies Valid Existing Rights, in Section 1.4 Alternatives Development and Chapter 4.11.1 Assumptions and analysis can be found in Chapter 4. |

|---|---|---|---|
| 826 - Land Resources–Renewable Energy (6100-6108) | #13791-2 | areas that are open to wind energy in development under Alternative B are adjacent to existing transmission lines; only one north-south transmission line accesses the area protect by the proposed ACEC which would preclude wind development and the draft EIS is silent as to the demand for wind energy development in this area. Existing development along the I-80 corridor, with existing infrastructure, would continue to be allowed under Alternative B, thus protecting the potential economic and environmental benefits of industrial-scale wind energy development. | The Draft EIS identifies all ACEC proposals and evaluation of relevance and importance criteria (Appendix C), proposed management actions (7400-7570), and all impacts from the proposed alternatives (Chapter 4). |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13848-3 | (1) BLM's decision in MA#7017 to manage historic roads and trails that have not been designated by Congress as part of the National Historic Trail system as requiring vast right-of-way exclusion areas and related restrictions; and (2) BLM's decision in MA#5411 to prohibit on a case-by-case basis surface disturbing activities that create a moderate to strong visual contrast in VRM Class III and Class IV areas, if the former "can be observed from other areas managed consistent with VRM Class I and II (e.g. wind development)." These restrictions collectively may create insuperable barriers to wind development on private or federal checkerboard lands in the RSFO. | A range of alternatives were developed in Table 2-1 and the impacts are described in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13859-1 | Section 1.3.1 of the DEIS identifies renewable energy development and associated transmission infrastructure as an issue addressed in the RMP planning process. However, the DEIS does not consider or reference relevant current policies in Executive Order (EO) 14008 Tackling the Climate Crisis at Home and Abroad or the Energy Act of 2020 (Division Z of P.L. 116-260) and associated rules, both of which provide policy and direction for renewable energy development on federal land. The BLM should acknowledge and fully consider EO 14008 and the applicable provisions in the Energy Act of 2020 in their NEPA review and fully integrate these into their analysis. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." The Draft RMP analyzed four alternatives that are under consideration and the range of alternatives and the impacts are described in Chapter 4. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13865-37 | 11. Renewable Energy Alternative B will significantly impair the ability to operate existing renewable energy and the development of new renewable energy projects. The land use, time and distance, and travel prohibitions and restrictions under Alternative B will potentially limit access to renewable energy development sites, vehicular routes to renewable energy sites, the placement of renewable energy facilities, structures, and transmission lines and pipelines. The restrictions in Alternative B will also potentially limit site preparation and construction activities associated with renewable energy development and have operational restrictions on renewable energy projects. Future renewable energy projects could require additional impact minimization measures as impacts become known and better understood. Prohibiting renewable energy projects in big game crucial winter range and parturition habitat, raptor concentration areas, currently mapped unique habitats, or new areas identified as part of site-specific investigations would preclude renewable energy development in those areas. | The Draft RMP analyzed four alternatives that are under consideration and the range of alternatives and the impacts are described in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13865-64 | Wind stipulations: Wind turbine colors are regulated via the Federal Aviation Administration (FAA) and any variation would require approval from them for a color change. This is due to safety concerns for aircraft. FAA Advisory Circular (AC) 70/7460-1M, chapter 13, contains current guidance on marking and lighting standards for wind turbines. "The recommended marking and lighting of these structures is intended to provide day and night conspicuity and to assist pilots in identifying and avoiding these obstacles" (USDOT 2020). The FAA strongly recommends wind turbine masts, blades, and nacelles be painted a shade of white between Pure White and Light Grey. Further, the blades or blade tips cannot be painted to camouflage wind turbines with the surrounding terrain. | Appendix A References Best Management Practices for wind, see A.2.7 |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13865-65 | o For wind to utilize topography, turbines need to be sited along hill and ridge tops where the most stable and economical wind flows exist. Turbines also need to be sited perpendicular to general wind flow; if they are not sited in this manner, they create wind currents for downstream turbines that will negatively affect productivity. Grouping turbines would cause many acres of additional disturbance at a wind site because they need to be connected by infrastructure such as roads and buried power and data cables. Consequently, it usually less invasive as it relates to acreage to create strings of turbines. | Appendix A References Best Management Practices for wind, see A.2.7 |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13908-8 | The science evaluating impacts of wind and solar energy to big game are lacking, which should be reflected in the decision-making process. * Impacts of wind energy to antelope are variable although most studies have identified some level of avoidance behavior near turbines. * Poorly sited solar facilities can have significant negative impacts on antelope movement. We recommend considering the following scientific publications and adding additional supporting information to the EIS as necessary. Wind Energy Development Milligan, M. C., Johnston, A. N., Beck, J. L., Smith, K. T., Taylor, K. L., Hall, E., ... & Kauffman, M. J. (2021). Variable effects of wind-energy development on seasonal habitat selection of pronghorn. Ecosphere, 12(12), e03850. | Management actions 4400-4436 Fish and Wildlife describe management within Big game crucial winter range habitat. The analysis for the alternatives can be found in section 4.20 Renewable Energy and 4.7 Wildlife and Fisheries. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13908-9 | Increased displacement and avoidance was documented for antelope in close proximity to turbines. * A development threshold may exist and once exceeded may result in negative impacts of wind energy to antelope. * Wind energy development may be a less severe and less consistent impact on antelope compared to oil and gas development for other ungulates but nuanced impacts were documented. Milligan, M. C., Johnston, A. N., Beck, J. L., Taylor, K. L., Hall, E., Knox, L., ... & Kauffman, M. J. (2023). Wind-energy development alters pronghorn migration at multiple scales. Ecology and Evolution, 13(1), e9687. | Management actions 4400-4436 describe Fish and Wildlife describe management within Big game crucial winter range habitat. The analysis for the alternatives can be found in section 4.20 Renewable Energy and 4.7 Wildlife and Fisheries.. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13908-10 | Antelope continued to migrate through wind energy facilities but made important behavioral adjustments relative to turbines including: o Avoided turbines for stopover sites seasonally. o Selected areas farther from turbines seasonally. o Moved more quickly near turbines in spring. o Reduced fidelity to migration routes relative to wind turbines under construction seasonally. * Documented impacts could influence long-term migratory success and survival of antelope. Smith, K. T., Taylor, K. L., Albeke, S. E., & Beck, J. L. (2020). Pronghorn winter resource | Management actions 4400-4436 Fish and Wildlife describe management within Big game crucial winter range habitat. The analysis for the alternatives can be found in section 4.20 Renewable Energy and 4.7 Wildlife and Fisheries. |

|---|---|---|---|
| | | selection before and after wind energy development in South-Central Wyoming. Rangeland Ecology & Management, 73(2), 227-233. | |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13908-11 | Winter survival was not significantly influenced by exposure to wind energy development during their study period (3 winters). o Survival increased as distance from major roads increased and time spent in sagebrush. Solar Energy Development Sawyer, H., Korfanta, N. M., Kauffman, M. J., Robb, B. S., Telander, A. C., & Mattson, T. (2022). Trade-offs between utility-scale solar development and ungulates on western rangelands. Frontiers in Ecology and the Environment, 20(6), 345-351. * Research was focused on antelope movement at the Sweetwater Solar facility, which is located on BLM-lands within the RSFO. * Sweetwater Solar facility is located within Antelope Crucial Winter-Yearlong Range. * Solar facility is a barrier to antelope, blocking access and reducing connectivity to formerly available habitats. o The single ~570-acre facility impacted 69% of resident antelope, 86% of local migrants, and 57% of Opal herd migrants. | Management actions 4400-4436 Fish and Wildlife describe management within Big game crucial winter range habitat. The analysis for the alternatives can be found in section 4.20 Renewable Energy and 4.7 Wildlife and Fisheries.. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13911-13 | The number of acres designated as ROW exclusion will have a significant impact on resource development, recreation, and livestock grazing, as well as conflict with current federal policy to advance renewable energy on federal lands. The Proposed RMP's overarching goal is to: "Manage public lands to meet transportation and ROW needs consistent with goals and objectives of other resources while supporting the national energy plans and policies." Compare DEIS at 2-115 (Mgmt. Action #6202 and Maps 2-22 and 2-24) with id. at 2-114 (Goal LR-06). But Preferred Alternative B directly conflicts with the Energy Act of 2020 and Executive Order 14008. The Energy Act of 2020 established a minimum goal of "authoriz[ing] production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects [on public lands] by not later than 2025." 43 U.S.C. § 3004(b). Executive Order 14008 sets the goal of reaching 100 percent carbon pollution-free electricity by 2030, net-zero emissions by 2050, and doubling renewable energy production on public lands by 2030. However, this goal will be difficult, if not impossible, to obtain if the BLM closes public lands to any new development or ROWs. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13923-23 | For MA# 6100-6108, we support Alternative B with the following modification. ? MA #6101 We request that the BLM coordinate specifically with the Wyoming Game and Fish Department when considering the development of renewable resources on public lands. This will ensure that any development will not hinder wildlife or their habitat and/or movements. Further, project proponents should identify important or sensitive habitats and design projects to avoid and/or minimize impacts on these habitats. Any development that does occur should not prevent other land uses such as livestock grazing or recreational activities. | Described in Section 1.4 Planning Criteria. "The RMP will recognize the State's responsibility and authority to manage wildlife. The BLM will consult with the Wyoming Game and Fish Department. Coordination with other agencies is described in Section 1.4 and Table 1-2 of the EIS for the scope of this planning effort. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13923-24 | Additionally, we recognize that the BLM is currently conducting a programmatic Environmental Impact Assessment to revise the Western Solar Plan. If Wyoming is included in this plan, we support amendments to the RSFO RMP to manage future solar development that minimizes impacts to wildlife resources. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13925-6 | The draft RMP Alternative B also conflicts with the Energy Act of 2020 and Executive Order 14008. The Energy Act of 2020 established a minimum goal of "authoriz[ing] production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects [on public lands] by not later than 2025." 43 U.S.C. § 3004(b). Executive Order 14008 sets the goal of reaching 100 percent carbon pollution-free electricity by 2030, net-zero emissions by 2050, and doubling renewable energy production on public lands by 2030. The draft RMP makes new solar and wind energy unavailable for more than half of the planning area, because these facilities will not meet VRM II objectives, are prohibited in ACECs, and rights-of-way are necessary to link solar components together and then tie into transmission lines. The draft RMP is an object lesson in how no source of energy occurs without environmental impacts. | Described in Section 1.4 Planning Criteria. "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies. "Management actions 6100-6105, for all four alternatives for Lands and Renewable Energy can be found in the DEIS. The Impacts to the alternatives are described in Chapter 4. |
| 826 - Land Resources–Renewable Energy (6100-6108) | #13943-12 | MA #6101 We request that the BLM coordinate specifically with the Wyoming Game and Fish Department when considering the development of renewable resources on public lands. This will ensure that any development will not hinder wildlife or their habitat and/or movements. Further, project proponents should identify important or sensitive habitats and design projects to avoid and/or minimize impacts on these habitats. Any development that does occur should not prevent other land uses such as livestock grazing or recreational activities. Additionally, we recognize that the BLM is currently conducting a programmatic Environmental Impact Assessment to revise the Western Solar Plan. If Wyoming is included in this plan, we support amendments to the RSFO RMP to manage future solar development that minimizes impacts to wildlife resources. | The coordination with other local, state and federal agencies can be found in Chapter 1.5 and Table 1-2. Management actions 6100-6105, for all four alternatives for Lands and Renewable Energy can be found in the DEIS. the Impacts are described in Chapter 4. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #317-2 | However, expanding development on acreage with valid existing rights is made difficult as Alterative B would also place 2,480,876 acres as exclusion areas for rights-of-way and another 133,903 acres as avoidance. Building the necessary infrastructure to existing leases would be almost impossible across much of the field office. Companies would not be able to get electricity infrastructure built to a site, necessary to run a well; nor would they be able to install distribution pipelines necessary to get product from a site to market. When one continues to add on the additional layers of restrictions and exclusions in Alternative B, developing any new oil and gas resources in this field office will be nearly impossible. | Management actions for all four alternative are identified in the DEIS management action 6201 for lands available for ROWs. Chapter 4.19 identifies impacts analyzed for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #548-2 | The draft RMP fails to take into consideration the responsible development of future needs in the area. We could essentially be "painting ourselves into a corner" if right-of-ways are restricted in so much of the area as Alternative B details. How will the next powerline cross through the area if it is not allowed? Will ranchers be able to conserve water by piping irrigation ditches, or will this also be outlawed? Will existing right-of-ways be renewed, or will they be terminated and infrastructure required to be removed? | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #550-6 | Similarly, Alternative B would increase right-of-way exclusion areas from about 427,000 to 2,481,000 acres-an increase of two million acres, which would represent almost half the entire boundary area. Lands open to new rights-of-way (ROW) would decrease from 2.4 million to just 1 million. ROWs are critical to supporting a variety of projects, not just on public lands, but private and state lands adjacent to public lands, including the checkerboard land ownership pattern that dominates the central portion of the RMP area. Without adequate access across public lands for linear ROWs, productive economic uses of these private and state parcels becomes limited or in some cases impossible. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #551-4 | Rights of Way -- Proposed Management Actions 5104, 6015, 6201, 6205, 6206- Map 2-22 Rights of Way Alternative B. A disturbing aspect of the RMP's Alternative B are the management actions contemplated to implement Map 2-22, Rights of Way. The RMP seems to have certain internal inconsistencies, as Map 2-22 would appear to prevent any new right of way being created along the I-80 corridor, regardless of its purpose. For example, in management action 6206, the RMP proposes to "Eliminate the existing corridor identified in the WWEC ARMPA/ROD (2009) east of Flaming Gorge in the planning area (126-218)" Management action 6210 would "designate new ROW corridor (WPCl)[Wyoming Pipeline Corridor project] as shown on Map 2-22." Map 2-22 appears to create an energy corridor along 1-80 and then another corridor running east=west somewhat south ofl-80. There is no analysis in the RMP how this lack of any corridors other than the two specified would affect long planned expansions for the trona industry in Southwest Wyoming. There is no analysis of how restricting right of way corridors in this way will affect the local economy or of any adverse effects of taking this approach. Map 2-22 also appears difficult to reconcile with BLM's own Instruction Memorandum IM 2022-041 and 43 CFR Part 2800, which encourages the BLM to "authorize the BLM to issue ROWs to geologically sequester CO2 in federal pore space, including for necessary physical infrastructure and for the use and occupancy of the pore space itself." The RMP, through Map 2-22 and proposed management actions 6206 and 6210, would appear to prevent CO2 pipelines from being constructed in furtherance of IM 2022-041. | See Maps 2-22, 2-23, and 2-24 for alternatives. Chapter 4.19 identifies impacts analyzed for all four alternatives. See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #551-5 | The proposed management actions to restrict BLM rights of way would also severely hamper residents of Southwest Wyoming who own land that is landlocked. State law allows for the establishment of private roads where the landowner has no legal access. Wyoming state law provides for a process to establish private roads where landowners are landlocked. W.S. 24-9-1010 et seq. For example, several residents who live in Uinta county, Wyoming in Township 13 and Township 14 North, Range 116 West, have to cross BLM parcels to get to a county road. Although these landowners have easements across private property, they have not been granted official rights of way by the BLM. Alternative B would prevent them from ever obtaining rights of way. effectively mean that these residents, who now enjoy legal access for their property, would suddenly find themselves landlocked with no right to leave or return to their homes. The loss of legal access would be devastating to the value of these homes, as a house without legal access is difficult to market, sell or finance. Adoption of Alternative B's management actions with respect to rights of way would amount to a taking under the 5th amendment to the U.S. Constitution.The RMP does not analyze or address in any fashion the effect of landlocking residential parcels under Alternative B. The management actions contemplated under Alternative B with respect to Right of Way are arbitrary and capricious. I request that the BLM select Alternative A for the Rights of Way map, Map 2-21. | Management actions for all four alternatives are identified in the DEIS management action 6000 for access needs. Chapter 4.19 identifies impacts analyzed for all four alternatives. Refer to Glossary for Authorized/Authorized Uses, land locked, and Right-of-way grant |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #7302-1 | It is not clear to WYDOT that the RMP considers state laws, transportation plans, or WYDOT and FHWA perspectives regarding the RMP's potential impacts to I-80 ROW. As stated in the RMP, BLM land use plans must be consistent with the officially approved plans, policies, and programs of other federal agencies and state and local governments (p.69). Table 1-2 shows that transportation plans, laws, and agencies were not considered in the drafting of this RMP (p.69). For example, W.S.§31-5-1601 affords WYDOT discretion over highway ROW use for developing ORV routes and crossings, and it is unclear if Alternative B in the RMP attempts to exclude this type of new use within highway ROW. WYDOT requests that the BLM RSFO honor the cooperative relationship and aforementioned interagency agreement and take state law, transportation plans, and agency perspectives into consideration when developing land management plans affecting highway ROW. | See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #7302-2 | WYDOT is specifically concerned with Management Actions (MA) #6200-6210 pertaining to Rights of Way and Corridors. Inconsistencies exist in the RMP between the BLM's preferred Alternative Band ROW that would be designated as 'avoidance' versus 'exclusion,' as well as what these designations mean for new use within highway ROW (pipelines, utilities, fiber, ORV trails and crossings, widened roadways, high-occupancy vehicle lanes, truck pullouts, and so forth). In MA #6205, Alternative B appears to be consistent with the no action alternative (Alternative A), designating approximately 40 miles ofl-80 ROW between Green River and Point of Rocks as an avoidance area for major utility lines (p. 185). However, the map referenced for Alternative B (Map 2-22 in Appendix V) contrasts with the map for Alternative A (Map 2-21), and shows many areas along I-80 as exclusion | See Management Action 7107 for proposed actions relating to Exclusion Areas along I-80 related to Eligible but not Designated National Historic Trails. Management actions for all four alternatives are identified in the DEIS management action 6206 for rights of way corridors considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | areas. As referenced in section 4.19.3, the exclusion areas for ROW increase to 68 percent of the planning area, further precluding ROW as well as facility development within ROW (p. 526). | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #8686-1 | Removing 71% of the areas covered by Plan B from new rights-of-way for powerlines, pipelines and maintained roads is absurd! This inhibits industrial activities on state and private land. Very Unacceptable! | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #9721-9 | Alternative B's blanket prohibition on surface disturbing activities is overly drastic. Further site-specific analysis must be completed and potential mitigation or BM P's considered to determine effectiveness of surface restoration before complete prohibition is considered. | See Glossary for a definition of 'surface disturbing activities. Also, see Appendix A in the DEIS for BMPs considered |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13210-7 | 7. There is great concern by the Task Force with the footprint that comes from large-scale wind and solar utility projects on public lands. Concerns include obstructed viewshed, habitat fragmentation, loss of habitat, loss of acres for other uses, loss of access, and the inability to manage for the Multiple Use and Sustained Yield Act. | Management actions for all four alternative are identified in 6104 in the DEIS for considerations of renewable energy projects. Chapter 4.20 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13210-15 | 15. The Task Force recognizes the importance that rights-of-way play on public lands. The designation of allowance, avoidance and exclusion have direct effects to every acre within the RSFO-public, state and private. The BLM should strive for the appropriate balance in rights-of-way designations to achieve an outcome which allows for continued economic development activities within the field office upon which the communities rely, while also recognizing the role these designations contribute to resident's fulfillment while recreating, hunting, fishing, exploring and all the other multiple uses these varied lands offer. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13218-3 | In addition, & quote approximately 2,480,876 acres would be designated as right-of-way exclusion areas, & quote which is a 481% increase in acres compared to Alternative A. The increase in right-of-way exclusion areas would limit future access to mineral exploration and development sites and could restrict the placement of facilities associated with mineral exploration, development, and operations. Rights-of-way are extremely important to mineral exploration and development, as they are necessary for pipelines, transmission lines, communication facilities, and roads. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13364-1 | The practical consequences of Alt.Bare that Dominion Energy will be: (1) Required to forge a ROW path around federal lands to serve customers, at significant cost to ratepayers, new homeowners, and developers; and/or (2) Prevented from providing service altogether, adversely impacting new residential, commercial, and industrial development in Rock Springs. Approval of Alternative B will unnecessarily and significantly increase costs, and obstruct future development in and around Rock Springs. Alt. B penalizes the most impmiant Stakeholders12 involved-- the people who actually live in the Zone. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13446-3 | Wyoming is one of the largest energy producers in the nation. The proposed plan effectively undermines the functionality and independence of the nation as a whole by the draconian restrictions set forth in the RPM. Right-of-way controls, regulation of surface disturbance, removal of lease options and controls of existing perimeters cut any sustainable viability for Wyoming’s gas and oil production. The reverberations and consequences of such decisions will last for decades and cause more suffering than should be tolerated. (https://www.eia.gov/state/?sid=WY) | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13477-1 | Restrictive Land Use: The proposed ACECs and rights-of-way exclusion areas could severely hamper our ability to maintain and expand essential energy infrastructure, impacting service reliability and consumer costs. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-1 | This unique supply of natural soda ash, exclusively found in areas administered by the BLM's Rock Springs and Kemmerer Field Offices, is essential to the U.S. production of glass, electric vehicle ("EV") batteries, photovoltaic solar panels, and other prioritized domestic products. Without specific changes to the Draft RMP-especially those related to Rights-of-Way ("ROWs") and pre-existing Corridors-soda ash projects like Project West will be unable to proceed as planned. This is particularly impactful since our soda ash project will advance U.S. energy goals and the administration's priorities. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-4 | Alternative A or Alternative D Alternative A and D both adhere to the multiple-use mandate under FLPMA. In Alternative B, elimination of the WWEC corridor conflicts with Section 368 of the Energy Policy Act of 2005, and MA 6206 cannot be read consistently with MA 6201. See also MA 6201, 7017, Map 2-22. | See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-5 | MA 6201 (ROW Exclusion Areas) Alternative A Alternative A complies with the multiple-use mandate under FLPMA by considering the production of soda ash and allowing responsible development within established routes and corridors in previously disturbed areas. In Alternative B, MA 6201 cannot be read consistently with MA 6206 and 6210. | Management actions for all four alternatives are identified in the DEIS management action 6201. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-6 | MA 6207 (ROW Areas) Alternative A or Alternative D Alternative B improperly deletes portions of the WWEC and WPCI Corridors and conflicts with the retention and adoption of Corridors in MA 6206 and 6210. Alternative B also undermines BLM's longstanding ROW policies and objectives. | Management actions for all four alternatives are identified in the DEIS management action 6207. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-7 | MA 6210 (WPCI Corridor) Alternative A or Alternative D In Alternative B, MA 6210 cannot be read consistently with MA 6201. See also MA 6206, 6207. | See Management Action 7107 for proposed actions relating to Exclusion Areas along I-80 related to Eligible but not Designated National Historic Trails. Management actions for all four alternatives are identified in the DEIS management action 6206 for rights of way corridors considered available for ROWs. Please see Maps 2-21, through 2-24. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-10 | A. BLM's Proposed Alternative B ROW Exclusion Areas Directly Conflict with BLM's Existing ROW Corridors and ROW Policies and Objectives. Alternative B's ROW Exclusion Areas are materially at odds with BLM's policies and objectives. As a threshold matter, BLM's expressly stated objective from the BLM Rights-of-Way Manual 2801 (the "BLM ROW Manual") is to "[r]ecognize that ROWs are a principal or major use of the public lands."4 The BLM ROW Manual further provides policy and program direction for BLM's management of ROW grants under the multiple-use mandate5 of the Federal Land Management Policy Act ("FLPMA"). BLM's ROW objectives and policy thoughtfully encourage the co-location of ROWs and the use of ROW corridors. | See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-11 | Pursuant to The excessive ROW Exclusion Areas in Alternative B conflict with BLM's policies to "actively encourage" the use of corridors and to "minimize the proliferation of" separate ROWs.9 Alternative B states that specific corridors identified in the West-Wide Energy Corridor ("WWEC") Approved Resource Management Plan Amendment ("ARMPA") Record of Decision would be retained, except for WWEC 126-218 near Flaming Gorge.10 Additionally, the proposed ROW Exclusion Areas would affect the designated Wyoming Pipeline Corridor Initiative ("WPCI") corridor and existing Wyoming Department of Transportation ROWs. Some of the exclusion areas for ROWs near trails overlap significantly with the WWEC and WPCI Corridor. Alternative B's ROW Exclusion Areas within these existing corridors makes these corridors unusable and encourages new ROWs outside of designated corridors,11 which will cause enviro | See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-12 | B. The Proposed ROW Exclusion Areas Conflict with Section 368 of the Energy Policy Act of 2005 and Associated Supporting Documents. The WWEC was established under Section 368 of the Energy Policy Act of 2005 ("EPAct"), 42 U.S.C. § 15926, to support and encourage energy development, including the co-location of oil, gas, hydrogen, and other pipelines, and electricity transmission and distribution facilities. The specific location of the corridors was analyzed by the BLM, the U.S. Forest Service, and the U.S. Department of Energy to minimize environmental harm. Exclusion areas were intentionally not a material part of the agreed upon agency procedures12 as such breaks would create "pinch points"13 in the corridors, which would make them less useful if not completely unusable. The BLM, along with other federal agencies, must consider the following four principles when evaluating Section 368 corridor revisions, deletions, and additions and may amend or revise land use plans involving Section 368 corridors only if the agency meets the requirements of the EPAct Section Section 368 of the Energy Policy Act of 2005 as Required by the Settlement Agreement in Wilderness Society v. United States Department of the Interior, No. 3:09-cv-03048-JW (D. N.D. Cal.), https://www.blm.gov/policy/im-2014-080 (noting Congress's policy guidance established in Section 503 to "support the efficient use of the public lands"). | See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-13 | The BLM should not adopt Alternative B's MA 7017, because BLM has not addressed the required principles above, nor has BLM coordinated with the other federal agencies as required to revise or delete portions of the WWEC.16 The ROW exclusions and proposed deletions to the WWEC in Alternative B do not follow the required interagency framework or protocols agreed to by the BLM for revising and deleting Section 368 corridors. Here, in the context of the Draft RMP, if BLM adopts Alternative B's MA 7017, then BLM will have failed to satisfy those obligations. | See the range of alternatives for management action 7017 in the DEIS. Chapter 4 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-15 | In Alternative B, the Draft RMP offers no explanation of how existing impacts and prior disturbances will be considered in requests for new infrastructure within the ROW Exclusion Areas. In contrast, Alternative D allows historic roads and trails to be managed according to their historical context and designates actions within 500 feet of a contributing segment of road or trail as a ROW avoidance area.24 Alternative D also allows impacts to setting to be analyzed on a case-by-case basis for highly visible projects.25 | See planning criteria 1.4 , this plan will recognized valid existing rights |
| 827 - Land Resources–Rights-of-Way | #13512-16 | Temporary impacts should be considered in determining whether to grant new infrastructure requests on a case-by-case basis, rather than a blanket exclusion, consistent with current and past practice. For example, an underground pipeline will not have permanent visual impacts but will require only some temporary impacts for | See the glossary in the DEIS for the definition of Exclusion area and NSO. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | installation. As such, Project West requests that BLM remove or clarify the reference to "no surface occupancy"26 in the definition of "exclusion area" in the Draft RMP. Otherwise, "no surface occupancy" in the definition of exclusion area would be contradictory and confusing as including the phraseology of "no surface disturbance" without noting the exception could improperly prohibit temporary construction activity on the surface without justification. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13512-17 | The ROW Exclusion Areas in Alternative B fail to recognize ROWs as a major use and do not allow for case-by-case exceptions. Alternative A, in contrast, meets the BLM objective to recognize ROWs as a principal or major use and provides for 68% of ROWs to be open, 20% avoidance areas and 12% exclusion areas while fully employing mitigation strategies.27 Alternative B is unique in that it proposes only 27% of ROWs to be open, 4% to be avoidance areas and 69% to be exclusion areas. This approach is not consistent with nearby, and relatively recent, BLM jurisdictions' RMP amendments that took a more reasoned approach to maintaining corridors and ROWs, specifically: * The Kemmerer RMP, approved in 2010, did not include an exclusion for historic roads and trails within the utility corridor as part of that RMP.28 24 Draft RMP at 2-148 (MA 7017, Alternative D). 25 Id. 26 "No Surface Occupancy" is defined in the Draft RMP and is a "stipulation [that] can be used to prohibit other surface disturbing or disruptive activities . . .[.]" Draft RMP at GL-20. 27 Draft RMP, Table 1 Comparison of Land Use Restrictions and Allocations at pp.ES-5, ES-6; BLM RSFO Draft RMP PowerPoint, September, 2023 Public Meeting, at p.9 (shows percentages); see also BLM ROW Manual Section 2801(2)(A). 28 See Record of Decision and Approved Kemmerer Resource Management Plan, at 2-42 (May 2010) (Decision no. 6008). | See the range of alternatives for management actions for 6201 and 7017 in the DEIS. Chapter 4 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13542-48 | MA#6209. Alternative B. 2-117 Constructing pipelines, power lines, and other utilities adjacent to or collated within existing ROWs to reduce new surface disturbance is preferred, however it is not always technically feasible. By not allowing "where feasible" in Alternative B's language, the BLM's requirement could lengthen and increase surface disturbances from new construction projects. Please analyze and disclose to the public the scientific justification for any restrictions contemplated under this management action and develop then select an alternative that allows for exceptions, waivers, and modifications based on the best available information on the ground. | See the range of alternatives for management action 6209 in the DEIS. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-33 | Alternative Bis in contradiction to EO 14008 by creating energy corridors within proposed ROW exclusionary areas. According to Section 4.22.5 of the DEIS RMP, "Renewable Energy Stakeholders would view this alternative much less favorably than Alternative A. In particular, the very high acreage of this alternative that is in ROW exclusion areas (2,480,876 acres versus 426,709 acres under Alternative A) would make siting of wind energy projects and development of power transmission lines from areas with wind development difficult". According to Alternative B Map 2-18 and Table 1, over 2,148, 902 acres of land would be a Class II VRM, which would create obstacles in siting new renewable energy projects. The ROW exclusion areas will also prohibit critical transmission lines critical for wind and solar projects under Alternative B. The BLM failed to take into consideration future renewable energy projects. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Also management actions for all four alternatives are identified in the DEIS for management actions 5400, see maps 2-17, through 2-20. Chapter 4 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-34 | ROW exclusion areas should be removed from the checkerboard area and only occur in locations where adverse environmental effects can occur such as areas with special designations like WSAs or ACECs. | See the range of alternatives for management action 6201 in the DEIS. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-36 | While the BLM suggests that ACECs don't affect mineral leasing, they impact ROW exclusion areas (VRMs, NSOs, etc.) which in tum prevent access roads and pipelines to mineral sites. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Also management actions for all four alternatives are identified in the DEIS for management actions 5400, see maps 2-17, through 2-20 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-39 | Finally, the BLM's conclusion that impact to livestock grazing would not change between Alternative A and Alternative Bis false. See DEIS at 4-178, 4-259. Many of the ACEC's have a no surface occupancy "NSO" designation and this will impact permitted livestock owners' ability to drill for water wells within their grazing allotments. See DEIS at Append. V-4 - V-7. In addition, VRM Class II designations, ROW exclusions, and prohibition of surface disturbing activities within an ACEC would impact the ability of permittees to develop range improvements, such as fences, wells, or other water developments. See id. At 2-210 (Mgmt. Action #7556), 4-179. Some of the proposed ACECs also call for closure of grazing allotments and/or prohibition of grazing within certain pastures. See id. At 2-181 (Mgmt. Action #7433), 2-182 (Mgmt. Action #7438), 2- 184 (Mgmt. Action #7443). | Impacts from proposed ACEC designations are adequately addressed in Chapter 4.21, with management actions for each proposed ACEC found in management actions 7400-7570. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-48 | In addition, the BLM arbitrarily and without supporting data designates ROW exclusion areas within 5-miles on either side of a historic trail (id. at 2-143 (Mgmt. Action #7002)), for areas with significant rock sites and their viewsheds (id. at 2-91 (Mgmt. Action #5100)), among others. | See the range of alternatives for management action 7002 in the DEIS. Impacts from each alternative can be found in Chapter 4. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-49 | The number of acres designated as ROW exclusion will have a significant impact on resource development, recreation, and livestock grazing, as well as conflict with current federal policy to advance renewable energy on federal lands. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-50 | The amount of ROW exclusion and avoidance areas identified under Preferred Alternative B specifically conflicts with the Proposed RMP's overarching goal to: "Manage public lands to meet transportation and ROW needs consistent with goals and objectives of other resources while supporting the national energy plans and policies." Compare DEIS at 2-115 (Mgmt. Action #6202 and Maps 2-22 and 2-24) with id. at 2-114 (Goal LR-06). It also directly conflicts with the Energy Act of 2020 and Executive Order 14008. The Energy Act of 2020 established a minimum goal of "authoriz[ing] production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects [on public lands] by not later than 2025." 43 U.S.C. § 3004(b). | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-51 | Executive Order 14008 sets the goal of reaching 100 percent carbon pollution-free electricity by 2030, net-zero emissions by 2050, and doubling renewable energy production on public lands by 2030. However, this goal will be difficult, if not impossible, to obtain if the BLM continues its direction of closing public lands. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-52 | With the proposed closure dates of the coal plant facilities in Wyoming and renewable energy development planned in the future to replace it, such widespread ROW exclusion areas will result in the inability to provide sufficient power to Wyoming residents and others into the future. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-53 | In addition to completely contradicting this administration's energy plans and policies, the ROW exclusion areas also conflict and will significantly impact other development and use of federal land. It would limit future access to mineral exploration and development sites (id. at 4- 136) and to grazing allotments by federal permittees. The Preferred Alternative B ROW exclusion areas will have a direct and immediate impact on currently proposed projects. For example, the ROW exclusion areas will impact an existing Trona mine project that is currently working with the BLM Kemmerer Field Office. The DEIS is proposing ROW exclusion areas in Township 18 North, Range 108 West, Sections 4, 8, and 6 that will impact the future site for a Trona mine processing facility. The applicant Pacific Soda is proposing their plant in a location that will be less impactful to the environment but located within these ROW exclusion areas. The water line for the project will also be impacted in Township 18 North, Range 108 West, Section 2, which the DEIS is proposing as a ROW exclusion area. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-54 | Alternative BROW exclusion areas will also impact an economic diversification project in Sweetwater County. The County has been developing a large industrial complex south of the airport that will help to diversify the County's economy. The site requires access and development of infrastructure across federal lands that are currently proposed for ROW exclusion, including: Sections 22, 26, 28, 32, and 34 of Township 19 North, Range 108 West; and Sections 2, 6, 8, 10, and 14 of Township 19 North, Range 108 West. The ROW exclusion will prohibit construction of this future industrial complex. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Also see Appendix N for the socioeconomic report. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-55 | In addition, Preferred Alternative B's proposed ROW exclusion areas fall within the Checkerboard. DEIS at Map 2-22. Sweetwater County objects to designating any ROW exclusion areas within the Checkerboard due to the impact it will have on the alternating sections of private lands and state lands. ROW exclusion areas infringe on private property rights by preventing the ability to access the private and state lands and to develop them when infrastructure (i.e. roads, pipelines, electric lines, etc.) cannot be placed on the neighboring public lands. This raises the question of whether the ROW exclusion, in addition to other restrictions such as VRM Class II, within the Checkerboard would result in the taking or partial taking of private property. See North Mill Street, LLC v. City of Aspen, 6 F.4th 1216, 1224 (10th Cir. 2021) (When regulations "deprive an owner of 'all economically beneficial use' of her property' it will be recognized as a taking." (quoting Lingle v Chevron US.A., Inc., 544 U.S. 528,537 (2005)). | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13585-56 | Sweetwater County requests the BLM to remove all ROW exclusion areas within the Checkerboard. The County further supports Alternative Das it relates to the identification of ROW exclusion areas in areas where it is appropriate (i.e. within WSAs). DEIS at Map 2-24. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13590-1 | The BLM's preferred alternative B with respect to rights of way (management actions 6200-6210) and its associated preferred map (Map 2-22) would essentially prohibit granting new rights of way in the planning area. It would also eliminate part of the existing energy corridor that Congress mandated be designated in Section 368 of the Energy Policy Act of 2005. See Management Action 6206 (which would "eliminate the existing corridor identified in WWEC ARMPA/ROD (2009) east of the Flaming Gorge I the planning area"). | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. Management actions for all four alternatives are identified in the DEIS for management actions 6206 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13590-2 | Because rights of way are necessary for virtually any new economic development and because of the federal ownership of land in the "checkerboard" area along I-80, under Alternative B essentially no new project requiring a road, a pipeline or a broadband cable could be constructed. This would severely limit not only Wyoming's traditional industries but would also prevent Southwest Wyoming from developing renewable energy projects or carbon capture from existing point sources. This would violate the BLM's own Instruction Memorandum IM 2022-41, which encourages the BLM to "authorize the BLM to issue ROWs to geologically sequester CO2 in federal pore space ..." | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13590-3 | In addition to crippling new economic development, these management actions would also damage existing residential home values in certain areas. There are homeowners in the planning area who must cross BLM land to a reach a county road. Many of these homeowners have obtained state-law based rights to cross private and state lands, but may not have a recorded right of way granted from the BLM. For those homeowners, Alternative B would effectively landlock them, thus diminishing the value of their homes. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13607-1 | The exclusion and avoidance area in Maps 2-22 and 2-24 under MA #6201 are inconsistent with MA #6206, which states that the BLM will retain the preferred corridors identified in the WWEC ARMPA/ROD 2009. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Please see Maps 2-21, through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13624-20 | The Draft RMP/EIS repeatedly states that there will be exclusion areas for new rights-of-way or easements. The Draft RMP/EIS also states Rights-of-Way Limitations exclusion areas are described as 2,480,876 acres and avoidance areas as 133,903 acres. See Draft RMP/EIS, Ch. 4, p. 4-24; Draft RMP/EIS, Exec. Summary, p. ES-5. A right-of-way grant "[a]uthorizes public lands to be used or occupied for the construction, operation, maintenance, and termination of a project or facility passing over, upon, under, or through such land". Draft RMP/EIS, Glossary, p. GL-26. Exclusion Areas are defined as areas where certain activities are prohibited and includes rights-of-ways as an example. Draft RMP/EIS, Glossary, p. GL-26. BLM should explain how multiple use activities can occur in areas of the RMP without rights-of-way exclusions if those activities require crossing rights-of-way exclusion activities. BLM should also explain how rights-of-way exclusions impact use and access to minerals and whether the rights-of-way exclusions increase the acreage of lands and minerals that will be unavailable for multiple use activities. | Management actions for all four alternatives are identified in the DEIS management action 6201 for lands considered available for ROWs. Exclusion and avoidance areas are defined by resource concerns. Maps 2-21 2-22, 2-23, 2-24 identify the differences between the alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13624-21 | Enclosed Map 4 depicts overlays of the RMP and the Known Sodium Leasing Area (KSLA) and proposed right-of-way exclusion areas. Alternative B proposes 49,224 acres would be closed to trona leasing and development within the KSLA. See Draft RMP/EIS, Ch. 4, pp. 4- 135 and 4-167. However, approximately 2,480,876 would be designated as right-of-way exclusion areas. Id. at 4-136. BLM further stated that "[a]lthough ROW avoidance acres would decrease, the larger increase in ROW exclusion areas would result in greater impacts to mineral resources, by likely limiting future access to mineral exploration and development sites and could restrict the placement of facilities associated with mineral exploration, development, and operations, including pipelines, transmission lines, communication facilities, and roads." Id. As demonstrated in Map 4, the KSLA west of Flaming Gorge and in the southwest portion of the KSLA is effectively blocked from development due to right-of- way exclusions blocking access to the north where connections to rail and other existing transportation routes are located. Similarly, the checkerboard areas in the northern section of the KSLA have extensive ROW exclusion areas. BLM should identify the total acreage that is effectively and practically withdrawn from development of trona and other mineral resources and describe the impact of the proposed withdrawal. BLM should also provide information and an analysis of how, under Alternative B, lands available for multiple use will be accessed and used. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. See also Planning Criteria in Section 1.4. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13624-23 | The Draft RMP/EIS proposes to "limit geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities to the Rock Springs Uplift." Draft EIS, Ch. 2, p. 2-109. Limiting the area available for carbon sequestration is proposed without any scientific or regulatory basis to support that action. The Draft RMP/EIS does not include a description of the area or a map depicting the "Rock Springs Uplift". The enclosed Map 5 is a map of the uplift as defined by the Wyoming Geological Survey. Based on Map 5, the Rock Springs Uplift is a small portion of the RMP and the remainder of the RMP would be excluded from consideration for carbon sequestration. This vast exclusion ignores the federal Administration's stated priority to address climate change and only serves to limit the ability to capture and store CO2. Again, no scientific or geologic basis is provided to support this proposed management action. The current Administration has prioritized addressing climate change as a policy priority and carbon capture and sequestration is an effective tool for reducing CO2 in the atmosphere. Wyoming is well poised to successfully deploy carbon capture and sequestration solutions given the regulatory framework Wyoming has established and its primacy for the UIC Class VI program under the Safe Drinking Water Act. Wyoming recently issued its first permits to construct three Class VI wells and is reviewing applications for five additional Class VI wells. | Management actions for all four alternatives are identified in the DEIS for management action 6001. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way | #13624-24 | Limiting consideration of carbon capture and sequestration projects to the Rock Springs Uplift removes potential carbon capture and sequestration projects from most of the land within the Rock Springs RMP. Again, BLM should provide a scientific basis for removing most of the RMP from consideration for carbon sequestration and | Management actions for all four alternatives are identified in the DEIS for management action 6001. Chapter 4.19 identifies impacts analyzed for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | information provided should be "high-quality, science-based and accessible". National Environmental Policy Act Implementing Regulations Revisions Phase 2, p. 49930, 88 Fed. Reg. 49924 (July 31, 2023). BLM should also identify and describe the technical and geologic factors that led BLM to conclude areas outside of the Rock Springs uplift are unsuitable for geologic sequestration. Since part or most of the area within the Rock Springs uplift falls within right-of-way or other exclusions, BLM should specify what areas within the Rock Springs uplift would be open for carbon sequestration. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13624-25 | The Draft RMP/EIS states that 3,535,546 acres within the RMP would be closed to leasing. Draft EIS, Exec. Summary, p. ES-5. WDEQ has been approached by developers who have expressed an interest in pursuing carbon sequestration in deep underground coal seams. The Draft RMP/EIS is not clear; it states that coal is closed to leasing and does not explain whether the area is closed to coal mining only or to all activities using the coal resource. WDEQ requests BLM to clarify the proposed status of coal leasing within the RMP. | The 3,535,546 acres identified as closed to leasing on p. ES-5 are specific to coal leasing. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13624-47 | Energy Corridors The Draft RMP/EIS and accompanying GIS data, that is publicly available through the BLM, demonstrates several conflicts between the proposed right-of-way exclusion zones and existing and future energy corridors. Future development of projects within energy corridors will likely need to be permitted by the WDEQ Industrial Siting Division, in conjunction with other WDEQ divisions. Map 8 shows existing energy corridors in relation to the Proposed Alternative B right-of-way exclusion zones. The existing corridors for the GreatWest, TransWest, and Utility Corridors all pass through proposed right-of-way zones. The Draft RMP does not explain how BLM will manage the existing energy corridors that are currently located within the proposed right- of-way exclusion areas. The RMP also fails to explain how future additions or revisions to these corridors may be addressed, including corridors that are currently considered by the BLM in NEPA Register Number DOI-BLM-HQ-3500-2023-0001-RMP-EIS, § 368 Energy Corridor Amendments. Additionally, the data provided for review of the Utility Corridor appears to be incomplete because several of the corridors end abruptly at the Western RMP boundary. See Map 8. Regardless of whether the data was excluded by accident or intentionally, additional conflicts with the proposed right-of-way exclusion zones are possible. However, because a seemingly incomplete data set was released for review, WDEQ is unable to identify additional conflicts at this time. Id. | Management actions for all four alternatives are identified in the DEIS for management action 6000-6015, for Lands and Realty lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13651-50 | The information given says nothing about locations and clustering of cultural resources in relation to that for wells and oil and gas facilities, but it should. How do closures in alternatives relate to current oil and gas developed areas? Similarly the draft EIS does not address road and utility developments (pipelines, power lines) and it should. | Management actions for all four alternatives are identified in the DEIS for management action 6000-6015, for Lands and Realty lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-3 | Not only is BLM proposing to remove millions of acres from multiple use, many of the acres that BLM says remain open to multiple use will be effectively off limits due to the proposed right of way (ROW) exclusion in the agency preferred alternative. These actions will not only affect federal lands, but many acres of state and private lands, impacts which BLM has not analyzed. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 impacts analyzed for all four alternatives. See also Section 1.4 for the Planning Criteria and applicable laws and regulations that apply. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-6 | On page 1-4, one of BLM's planning criteria indicates that no decisions will be made relative to non-BLM administered lands. Unfortunately, due to Wyoming's land ownership patterns and especially in the area. of the checkerboard, any BLM decision will have significant impacts on non-BLM administered lands. BLM should acknowledge this fact and include or at least acknowledge this in the discussion of impacts related to management actions. The proposed ROW exclusion presents significant impacts to state and private lands throughout the RSFO. Especially in the checkerboard area, it will be nearly impossible to build a road, pipeline, or other infrastructure to access well locations, even if the wells are located on private or state lands. BLM must analyze these impacts to private and state lands created by BLM's proposed management actions, even if the ROW exclusion and the RMP does not apply to these lands. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Planning criteria chapter 1.4 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-7 | On page 1-5 BLM indicates all proposed management actions will be based on current scientific information, research and technology, and existing inventory and monitoring information. BLM goes further to say a Mineral Potential Report, Cultural Resources Overview Report, Biological Assessment, Socioeconomic Baseline Report, and Reasonable Foreseeable Development Scenario for Oil and Gas will be completed and used as part of the RMP revision process. The BLM should include an RFD for Renewable Energy as any analysis of impacts is incomplete without understanding the potential for wind and solar energy projects within the RSFO. | Management actions for all four alternatives are identified in the DEIS for management action 6000-6015, for Lands and Realty and management actions 6100-6108 for renewable energy. See Chapter 4, sections 4.19 and 4.20 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-10 | On page 2-3, BLM states that closing the planning area to new leasing of federal minerals, specifically fluid minerals, was considered as a method for resolving conflicts with other resource values and leases. BLM further states that this action is not reasonable in light of the BLM's multiple use mandate outlined in FLPMA and the MLA and is inconsistent with policy objectives. Yet, this is exactly what the agency's preferred alternative is doing. The agency preferred alternative includes significant ROW exclusions, which results in BLM is effectively closing the entire area to new leasing of federal minerals. No operator would lease lands that are physically undevelopable due to the management actions proposed by BLM in Alternative B. With the ROW exclusions, BLM is not only closing federal lands from leasing, but will be significantly impacting state and private lands and also will be effectively eliminating oil and gas development on previously leased but undeveloped federal minerals. The ROW | Management actions for all four alternatives are identified in the DEIS for management action 6000-6015, for Lands and Realty lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 impacts analyzed for all four alternatives |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | exclusion does so by eliminating the ability of any oil and gas operator to build infrastructure across federal lands where the ROW exclusion is applied. This ROW exclusion in the agency preferred alternative (Alt B) will almost entirely exclude any new ROWs in the north and south areas of the RSFO and will create isolated areas in the checkerboard where infrastructure could be built within an isolated area, but exclusion areas would make it difficult to connect the isolated area to the outside world. These exclusions would eliminate the ability for oil and gas operators to utilize existing rights on currently leased lands and state or private lands because without a road to access the lease or pipelines to move produced oil and gas they cannot drill the well. BLM has created a management scenario that will result in no new leasing of federal minerals and will remove the ability to develop currently leased federal minerals. In their own words this violates BLM's multiple use mandate and is not a reasonable alternative. NEPA requires the analysis of reasonable alternatives and BLM must exclude Alternative Band re-analyze a new alternative in this Draft RMP. Management for preservation purposes is not managing for multiple use when you close all unleased areas to new leasing and ROW. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-11 | The BLM creates management action 6001 related to carbon sequestration (CCS) in Table 2-1 but this is the only place in the document CCS is discussed. While there is a discussion about the Rock Springs uplift being suitable for CCS in the RFD, there is no explanation anywhere that provides reasoning for why Alternative B limits sequestration activities to the Rock Springs uplift. The RFD is also 13 years old and there have been significant advancements in knowledge and development of markets related to CCS since that time. BLM did not coordinate with the WDEQ or WOGCC in relation to CCS. Relatedly, there does not seem to be discussion of the effects of CCS projects or CO2 enhanced recovery projects on GHG emissions. While outdated, the RFD does identify 26 billion tons of CO2 storage potential. The Monell Unit CO2 flood in the project area also sequesters a significant volume of CO2 through enhanced oil recovery (EOR). It is estimated that approximately 90% of CO2 injected during tertiary recovery operations (EOR) remains in the ground. This does not appear to be accounted for in the GHG analysis. | Management actions for all four alternatives for lands and realty are identified in the DEIS for management action 6000-6015. Chapter 4.19 identifies impacts analyzed for all four alternatives. Executive Summary ES-7 identifies the Consultation and Coordination of agencies to prepare the DEIS, with a full distribution list identified in section 5.3. Chapter 1.4 Planning Criteria addresses the consultation and coordination with other agencies. The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-12 | To cure the deficiencies related to CCS, the RSFO should prepare a supplemental EIS ensuring the following are completed: 1) coordinate with WDEO/WQD and WOGCC regarding CCS proposed management actions in the RMP; 2) if BLM decides to retain any management action that may limit CCS, provide justification for how limiting sequestration helps meet management objectives and how CCS potential in the management area will be impacted; 3) if RSFO decides to retain the Rock Springs Uplift as the sole area available for such activities, include a description and map illustrating the area designated as open to CCS; and 4) Evaluate and assess the impacts of the different alternatives on CCS projects, especially as it related to ROW exclusions preventing projects both inside and outside of the RSFO planning area by preventing roads and pipelines; and 5) Include the effects of enhanced recovery projects and CCS projects on GHG emissions for each alternative. | Management actions for all four alternatives are identified in the DEIS for management action 6001. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-13 | A relationship between the significant ROW exclusion in Alternative Band its impact to CCS also needs to be recognized by BLM. BLM is providing access to pore space by issuing a ROW permit. The WOGCC assumes this is a subsurface ROW authorization, but BLM does not distinguish in the RSFO RMP if the ROW exclusion would apply to subsurface ROW the same as a surface disturbing ROW. This is another deficiency in the analysis conducted by BLM in the RMP that must be corrected in this EIS or a supplemental. Eliminating the ability to secure a ROW for use of the pore space in a CCS project could impact the viability of future projects. This would also impact the ability of the state or private pore space owners to utilize their pore space rights, especially in the checkerboard. BLM must analyze this impact. | See Glossary for definition of 'exclusion area' for ROWs. Management actions for all four alternatives are identified in the DEIS for management action 6000-6001. Chapter 4.19 identifies impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13658-24 | In section 4.19 Lands and Realty, BLM fails to include an evaluation of CCS. The RMP fails to account for the GHG emissions reductions that could be achieved by CCS projects within the RSFO. BLM has provided an incomplete and incorrect analysis of how this could impact oil and gas and other minerals within the RSFO. | Emissions analysis data can be found in Appendix P Air Quality Technical Support Data and section P.6.2 identifies Emissions Estimation Criteria |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13672-2 | In addition, several of the exclusion and avoidance areas in Maps 2-22 and 2-24 under MA #6201 are in conflict with Wyoming Department of Transportation existing rights-of-way. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13702-11 | * The BLM does not have the authority to change portions of the energy corridors to avoidance and exclusions area since the corridors were designated on federal lands under Section 368 of the Energy Policy Act of 2005. The exclusion and avoidance area in Maps 2-22 and 2-24 under MA 6201 are inconsistent with MA 6206, which states that the BLM will retain the preferred corridors identified in the WWEC ARMPA/ROD 2009. The BLM even states that "As preferred locations for energy transport rights-of-way on BLM-managed public lands, these corridors are intended to facilitate long-distance movement of oil, gas or hydrogen via pipeline, and transmission and distribution of high-voltage electric power." The energy corridors can only be modified through the NEPA process. In addition, several of the exclusion and avoidance areas in Maps 2-22 and 2-24 under MA 6201 conflict with Wyoming Department of Transportation existing rights-of-way. | Chapter 1.5 identifies the relationship to other plans to include in the DEIS. Table 1-2 lists the local, state and federal plans that may pertain to the DEIS. |

|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13715-11 | Specific BLM Proposed Management Actions with Respect to ROWs Are Arbitrary and Capricious. a. MA #1313 (Floodplains and Drainages). Alternative B prohibits surface disturbing activities and new permanent facilities within ¼ mile of floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the inner gorge of large ephemeral drainages. No linear crossings are permitted in these areas. This requirement will mean that future pipeline crossings of any drainage feature, including non-wetland ephemeral drainages, may be unavailable even if no resource damage will result. Given the prominence of ephemeral drainages in the RFSO area, the DEIS fails to fully analyze the effect of this restriction on future development of necessary ROWs for product transport, pipeline, transportation, and other uses. Alternative D provides a more reasonable alternative by allowing BLM AO to permit linear crossings on a case by case basis. | Management actions for all four alternatives are identified in the DEIS for management action 1313 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13715-12 | MA #7002-7003 (National Historic and Scenic Trails). Alternative B creates a 10 mile wide trail management corridor (5 miles per side) of right-of-way exclusion areas in the general area where the boundaries of Sublette, Lincoln, and Sweetwater counties converge, on the northwest portion of the RFSO, with an additional ROW avoidance area from mile 5 to 15. This is an area of significant and dense existing natural gas production, is currently fully-leased for oil & gas, and includes EPP's existing Bird Canyon compressor station. This is an area not deemed worthy of ACEC or other special status in any alternative. As noted in MA #7002 for Alternative D, BLM and Wyoming SHPO have agreed that the setting of the NHT in the western part of the RSFO has been compromised by existing development, justifying a ¼ mile buffer on each side of the NHT, not the 10 mile ROW exclusion zone (and combined 30 mile exclusion and avoidance zone) proposed in Alternative B. As discussed in Comment #4 above, the elimination of future right-of-way access for transportation of natural gas is an impairment of the leasehold rights of existing oil & gas lessees. In this case, where BLM has agreed with SHPO that existing development justifies only a¼ mile buffer, it is arbitrary and capricious to impose a giant exclusion zone (and co1Tesponding future leasing withdrawal) where the area is a developed field, and where the protective measures proposed in each of the other three alternatives are fully adequate to protect the NHT resource | Management actions for all four alternatives are identified in the DEIS for management actions 7002 and impacts analyzed in Chapter 4, 4.12 Cultural Resources. A.2 Best Management Practices Section A.2.1 BMPs for important Cultural Resource and Trail Settings |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13751-87 | Rights of Way and Corridors: The exclusion and avoidance area in Maps 2-22 and 2-24 under MA #6201 are inconsistent with MA #6206, which states that the BLM will retain the preferred corridors identified in the WWEC ARMPA/ROD 2009. The BLM does not have the authority to change portions of the energy corridors to avoidance and exclusions area since the corridors were designated on federal lands under Section 368 of the Energy Policy Act of 2005. The BLM even states that "As preferred locations for energy transport rights-of-way on BLM-managed public lands, these corridors are intended to facilitate long-distance movement of oil, gas or hydrogen via pipeline, and transmission and distribution of high-voltage electric power." The energy corridors can only be modified through the NEPA process. In addition, several of the exclusion and avoidance areas in Maps 2-22 and 2-24 under MA #6201 are in conflict with Wyoming Department of Transportation existing rights-of-way. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13751-161 | MA #6201#LR-06, MR-03#The planning area, with the exception of defined exclusion and avoidance areas, would be open to the consideration of granting rights-of-way (see Special Management Area section and Table 2-10, Appendix V). Industry position: Acceptable.#The planning area is open to consideration of granting rights-of- way with the exception of defined exclusion and avoidance areas (see Map 2-22). Industry position: Not acceptable. Reason: BLM using exclusions and avoidance areas around ACECs and historic trails and not taking into consideration that the KSLA has a higher value resource. Exclusion area acreage removed from right-of-way access is 2,480,876 acres which is 67 percent of the planning area BLM-administered federal land surface. Some of the exclusion and avoidance areas depicted in Map 2-22 are located on previously disturbed lands. This alternative conflicts with MA #6206 which retains the corridors established under Section 368(a) of the Energy Policy Act of 2005. BLM cannot make these corridors exclusion and avoidance areas without undergoing NEPA.#The planning area is open to consideration of granting rights-of- way with the exception of defined exclusion and avoidance areas (see Map 2-23). Industry position: Not acceptable. Reason: Not consistent with the exclusion and avoidance areas in the existing RMP.#The planning area is open to consideration of granting rights-of-way with the exception of defined exclusion and avoidance areas (see Map 2-24). Industry position: Not acceptable. Reason: Some of the exclusion and avoidance areas depicted in Map 2-24 are located on previously disturbed lands. This alternative conflicts with MA #6206 which retains the corridors established under Section 368(a) of the Energy Policy Act of 2005. BLM cannot make these corridors exclusion and avoidance areas without undergoing NEPA.#Alternative A is acceptable. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13751-162 | MA #6202#LR-06, MR-03#Areas are designated for avoidance or exclusion to rights-of-way where these uses are incompatible with management of sensitive resources and/or would have unacceptable impacts. Rights-of-way and avoidance areas are described in Table 2-10, Appendix V and shown on Map 2- 21. Industry position: Acceptable.#See MA #6201 Industry position: Not acceptable. Reason: BLM using exclusions and avoidance areas around ACECs and not taking into consideration that the KSLA has a higher value resource. Exclusion area acreage removed from right-of-way access is 2,480,876 acres which is 67 percent of the planning area BLM-administered federal land surface. Some of the exclusion and avoidance areas depicted in Map 2-22 are located on previously disturbed lands. This alternative conflicts with MA #6206 which retains the corridors established under Section 368(a) of the Energy Policy Act of 2005. BLM cannot make these corridors exclusion and avoidance areas without undergoing NEPA.#See MA #6201 Industry position: Not acceptable. Reason: Not consistent with | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |

|---|---|---|---|
| | | the exclusion and avoidance areas in the existing RMP.#See MA #6201 Industry position: Not acceptable. Reason: Some of the exclusion and avoidance areas depicted in Map 2-24 are located on previously disturbed lands. This alternative conflicts with MA #6206 which retains the corridors established under Section 368(a) of the Energy Policy Act of 2005. BLM cannot make these corridors exclusion and avoidance areas without undergoing NEPA.#Alternative A is acceptable. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13751-163 | MA #6209#LR-06, SD-37, BR-24#In the JMH area, the transportation plan also applies to the transport of gas, condensate, or water via pipelines and electric power transmission (buried power lines) within the planning area. Pipelines and buried power lines generally would be located adjacent to roads to reduce new surface disturbance. Industry position: Not applicable. Reason: Specific to the JMH planning area#Locate pipelines, power lines and other utilities adjacent to or co- located within existing ROWs to reduce new surface disturbance. Industry position: Not acceptable. Reason: Needs to allow flexibility where it may not be possible to co-locate within existing ROWs.#Locate pipelines, power lines and other utilities adjacent to or co- located within existing ROWs to reduce new surface disturbance, where feasible. Industry position: Acceptable.#Same as Alternative C Industry position: Acceptable.#Alternatives C and D are acceptable. | Management actions for all four alternative are identified in the DEIS for management action 6209. Impacts from each of the alternatives can be found in Chapter 4. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13752-5 | Installing new distribution power lines underground or converting existing lines from overhead to underground may not be feasible from engineering and operations perspectives. In addition, burying power lines can result in greater ground disturbance during construction and repairs, longer outage periods for customers, increased cost, and reduced reliability. Even where technologically feasible, the financial impacts of undergrounding are likely to be significant. BLM should remove undergrounding as a required design feature from all alternatives; it should, instead, be considered on a case-by-case basis. | See Appendix A, A.1 Project Design Features and Best Management Practices, Introduction |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13752-6 | Access to authorized facilities is critical for the safe and reliable operation of the electrical grid and is needed for inspections, maintenance, repairs and wildlife prevention activities. The preferred alternative's significant increase in ROW exclusion and avoidance areas, by limiting access to electrical infrastructure, threatens security and public safety, and could increase wildfire risks. EWAC is concerned that the ROW exclusion areas, resource-related closures and access restrictions (in particular sections 4.19.2, 4.4, and 4.5), particularly when combined with the proposed removal and reclamation of existing travel routes identified in Appendix B, have been proposed without giving adequate consideration to necessary access to critical infrastructure and the potential that electrical infrastructure could effectively be land- locked. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13754-8 | In the DRMP, the BLM makes the general statement that "[t]he RMP will recognize valid existing rights." See Draft RMP/EIS at 1-2 and 2-2 (which mentions applying Alternatives stipulations and mitigations to applications for permit to drill). Unfortunately, the BLM does not explicitly recognize that in areas proposed for ROW avoidance or exclusion that lessees will be able to maintain their valid existing rights, which in many instances will require additional rights-of-way for new or expanded production. Operators of any current oil and natural gas leases may not be granted new ROWs. | See Planning Criteria Chapter 1.4 and management actions for all four alternative are identified in the DEIS for management action 6201 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13755-8 | BLM proposes a vast increase in areas subject to right-of-way exclusion throughout the management area. Within the KSLA, most of the newly excluded areas appear to coincide with the historic Overland Trail that cross I-80 within the KLSA, and the 1850 Cherokee Trail in the southern portion of the KSLA. Current restrictions related to these trails are limited to case-bycase mitigation and avoidance of surface uses within 0.25-mile. Now, BLM would exclude uses up to 5 miles from designated or eligible historic trails. These restrictions would render exclusion zones within the KSLA completely useless for trona mining. BLM provides little justification for expanded right-of-way exclusion zones. First, for purposes of the Overland Trail in the area of the KSLA, much of trail and the associated exclusion zone is within the viewshed ofl-80 and other service roads. It makes little sense to close the area to new rights-of-way when the visual setting is already highly impacted by thousands and thousands of passing vehicles | Management actions for all four alternatives are identified in the DEIS for management action 6201 and 7017. Impacts from each alternative can be found in Chapter 4. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13767-2 | Alternative B of the Draft RMP also aims to exclude 2,480,876 surface acres from use for rights of way, which would include BLM surface acres that are checkerboarded with private lands that host CO2 emission facilities in the AOR. Alternative B would effectively condemn pore space underlying these private lands by prohibiting these private emitters from implementing a point-source capture site at its respective facilities due to the fact that the continuous, checkerboarded BLM surface acreage will be excluded from rights of way to the federal pore space. Furthermore, the exclusion of rights of way would prevent any efforts to transport the CO2 via pipeline from its source to the storage site, whether it's the SCS Hub or the Rock Springs Uplift. These consequences make it difficult to comprehend how Alternative B "improves air quality" when almost 70 percent of the BLM surface acres are excluded from rights of way, dramatically reducing the potential for any commercial carbon sequestration projects from being commissioned in the AOR. | Management action for all four alternatives are identified in the DEIS for management action 6001 and impacts for each alternative can be found in Chapter 4. |
| 827 - Land Resources–Rights-of-Way | #13775-2 | BLM-WY currently manages areas that are closed to mineral leasing, have NSO stipulations, or are otherwise identified as unsuitable for surface disturbance or occupancy as ROW exclusion or avoidance areas. This is an appropriate practice which protects areas and resources which require such protection will still limiting ROW exclusions to only 12 percent of the planning area. But BLM-WY presents no justification for expanding ROW exclusions beyond such areas and encompassing the majority of the planning area in such exclusion zones. Nor | Management actions for all four alternatives are identified in the DEIS for management action 6201. Impact analysis can be found in Section 4.19. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | does BLM-WY articulate how such an expansion would enhance would provide better protection to any of the resources under its management. Such omissions call into question the need or legitimacy of such a policy change. If BLM- WY has a substantive reason for such a restriction, it should, and indeed is required to, articulate it in detail in the Draft RMP. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13775-6 | the broad ROW exclusion and avoidance areas prescribed in MAs 7002 and 7003 could make it impossible for private landowners to exercise their rights for access and development, which could include EMA's trona producing members attempting to access operational areas. Specifically, both MAs would designate areas ranging from 5-15 miles on either side of a NHT as Trail Management Corridors. Those areas would then be subject to numerous restrictions including closure to mineral leasing, closure to mineral material sales, pursuit of withdrawal, and exclusion areas for ROWs.27 These exclusions and avoidance areas should be replaced with case-by-case assessment in the checkerboard ownership areas which is consistent with current successful management practices in the RMP area. | Management actions for all four alternatives are identified in the DEIS for management actions 7002 and 7003 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13779-5 | The vast number of acres closed to rights of way (ROW) combined with heavy restrictions applied to "open" acres will make renewable energy development near impossible in the Rock Springs Area. BLM has tools to ensure renewable energy and transmission development occurs responsibly and to mitigate impacts to wildlife, and other resources. BLM should rely on these tools, rather than excluding ROWs outright. As stated above, many of the conservation efforts BLM is hoping to achieve in this RMP are vulnerable to the impacts of climate change. | Management actions for all four alternatives are identified in the DEIS for management action 6201. Impact analysis can be found in Section 4.19. and 4.20 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13783-13 | Further, Wexpro specifically objects to BLM's proposed right-of-way exclusion area for the Cherokee Trail cutting a 4-mile-wide swath through the Vermillion Field. The below map shows the proposed ROW exclusion area (red shaded zones) in relation to the existing field. This same map is appended to this letter in full scale for ease of reference and so BLM can expand the file to better view the map key and other details. BLM's heavy-handed proposal would cripple ongoing oil and gas development, which has already been analyzed in the Vermillion Infill Environmental Assessment, by foreclosing off-lease facilities, transmission, and access in this active oil and gas field that has been in production already for 80 years. Specifically, even though Wexpro makes use of a system of existing connecting roads and gathering systems in the area,3 it is not possible to develop new wells without some off-lease rights-of-way. For Wexpro's 40-well development program in 2023, ten new rights-of-way were required for water haul routes, use of an evaporation pond, gathering pipelines, temporary surface water transfer lines, access roads, and well pads. | Management actions for all four alternatives are identified in the DEIS for management action 6201. Impact analysis can be found in Section 4.19 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13783-14 | In many cases, the rights-of-way allow Wexpro to reduce surface impacts and provide operational flexibility. For instance, in 2023, an existing multi-well drilling location within the Alkali Gulch Unit Area was used to develop wells on acreage near, but outside the unit area. If no right-of-way was available, development outside the unit area would have required the construction of a new well pad on the outside acreage, building a road to access the well pad, and the laying of pipeline (water and gas) to the well pad. Rights-of-way often provide the flexibility necessary for operators to reduce surface disturbance and mitigate wildlife and cultural impacts. At the very least, designating much of the Vermillion Field as a right-of-way exclusion zone eliminates the ability to use off-lease infrastructure to minimize disturbance. But even more importantly, disallowing rights-of-way results in the impairment of existing rights by cutting off access to leased acreage. This blatant violation of Wexpro's existing lease rights specifically in the Vermillion Field for alleged protection of the Cherokee Trail is doubly concerning given that both BLM and the SHPO agreed to appropriate mitigation for the Cherokee Trail, which is being implemented as part of the Project. | Management actions for all four alternatives are identified in the DEIS for management action 6201. Impact analysis can be found in Section 4.19 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13783-15 | Wexpro requests that BLM withdraw any proposal for a right-of-way exclusion area through the Vermillion Field and instead asks that BLM defer to the existing Programmatic Agreement and revert to Alternative A for right-of-way management in this area. | Management actions for all four alternatives are identified in the DEIS for management action 6201 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13784-63 | "The effects on livestock grazing resulting from the development of ROWs would be similar to Alternative A, except 2,480,876 acres would be excluded from ROW development (481% increase, which would decrease the extent of related forage removal, but could decrease opportunities for access to remote locations within the allotments." (p. 4-178) Comment: ROWs should not prohibit livestock grazing permittees access to their allotments. ROWs excluded from development does not equate to road closures or inability to manage range improvements using vehicular access. | See the range of alternatives in the DEIS, ROW management actions identified for management action 6201. Note that livestock grazing is a separate permitted activity and not a right-of-way. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13784-65 | "Impacts on livestock grazing from managing OHV use would be similar to those presented under Alternative A, except the areas currently designated as "limited to existing roads and trails" (2,398,839 acres) would be changed to "limited to designated roads and trails" (3,367,576 acres) and all routes would be designated as open, closed or limited." (p. 4-178) Comment: Changing the terminology from "existing" to "designated" roads and trails leaves the public unable to determine the actual impacts because the "designation" is unknown under Alternative B. Livestock grazing permittees should not lose access to administrative access for the purposes of managing their permits, livestock, and range improvements. | See Glossary page GL-7 for Designated Roads and Trails |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13784-69 | 4.19.3 Lands and Realty, Alternative B: "Under this alternative, areas managed as exclusion areas for ROWs would increase to 68% of the planning area (2,480,876 acres) and areas managed as avoidance areas for ROWs would decrease to 4% of the planning area (133,903 acres). This would increase the acres in which ROWs are precluded, which would potentially increase the number of ROW facilities precluded from development." (p. 4-211) Comment: Alternative B directly conflicts with the agency's push for increased renewable energy development. This would undoubtedly decrease potential for solar development. | Chapter 4.19 and 4.20 of the DEIS describe the impacts for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13784-71 | "The granting of ROWs is crucial to supporting national energy plans that include developing renewable energy, "(p. 4-220) Comment: This sentence indicates the agency and administration's interest in increasing renewable energy, but the Preferred Alternative B will directly conflict with this process. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See also Section 1.4 for the Planning Criteria. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13784-73 | "The management actions for renewable energy development under this alternative are similar to Alternative A, except ROW exclusion areas would be greater (2,480,876 acres excluded, which is 2,054,167 more acres than Alternative A." (p. 4-224) Comment: The statement is incredibly misleading. The two alternatives A and B are not similar in any way regarding renewable energy in ROW areas. Alternative B will be nearly impossible to develop with the substantial exclusion area. | See page 2-224 in it's entirety and chapter 4.19 for impacts under all alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-23 | Resource: Rights-of-Way and Corridors (6200-6210) The exclusion and avoidance areas in Maps 2-22 and 2-24 under MA #6201 are inconsistent with MA #6206, which states that the BLM will retain the preferred corridors identified in the WWEC ARMPA/ROD 2009. The BLM does not have the authority to change the energy corridors that were designated on federal lands under Section 368 of the Energy Policy Act of 2005. The BLM states that "As preferred locations for energy transport rights-of-way on BLM- managed public lands, these corridors are intended to facilitate long-distance movement of oil, gas or hydrogen via pipeline, and transmission and distribution of high-voltage electric power." The BLM does not have unilateral authority under Section 368 and implementing authorities to delete a Section 368 corridor. | Appendix H Biological Assessment, page 25, Management actions in the ROW corridors section of the land resources program include coordination with other agencies (Action 6200), management guidance on open areas and avoidance areas (Actions 6201- 6202, and 6205), management of the Aspen Mountain Communication Site, as well as other sites (Actions 6203-6204), management guidance on designation or closure of corridors (Actions 6206- 6208,6210), and management guidance for locating pipelines, power lines, and other utilities (Action 6209). See also Management action 6201 Special Management Area section and Table 2-10, Appendix V. See Maps 2-22, 2-23, and 2-24 for alternatives. See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-24 | The exclusion and avoidance areas in Maps 2-22 and 2-24 under MA #6201 conflict with Section 368 corridors, Wyoming Pipeline Corridor Initiative (WPCI) corridors, and Wyoming Department of Transportation existing rights-of-way. | See Maps 2-22, 2-23, and 2-24 for alternatives. See Planning Criteria 1.4 and 1.5 relationship to other plans (Table 1-2) and management action 6200 of the DEIS, maintain a transportation network with state, local agencies, and governments |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-26 | The Lander RMP follows guidance (BLM Technical Reference 6280) to establish the boundaries of the Congressionally Designated Trails, including the setting of the trails as well as their nature and purpose. The BLM Rock Springs Field Office needs to reevaluate the boundaries of the Congressionally Designated Trails consistent with guidance. BLM Technical Reference 6280-1 states that "inventory, assessment, and monitoring (IAM) is guided by Bureau of Land Management (BLM) Manual 6280-Management of National Scenic and Historic Trails under Study or Recommended as Suitable for Congressional Designation-and is the responsibility of BLM staff to carry-out." In addition, it states that "IAM results can be used to establish a National Trail Management Corridor." The RMP needs to be revised to use the IAM results to establish a National Trail Management Corridor." In addition, Section 7(a)(2) of the National Trail System Act (as Amended in 2019) states that "Pursuant to section 5(a), the appropriate Secretary shall select the rights-of-way for national scenic and national historic trails and shall publish notice thereof of the availability of appropriate maps or descriptions in the Federal Register; Provided, That in selecting the rights-of-way full consideration shall be given to minimizing the adverse effects upon the adjacent landowner or user and his operation. Development and management of each segment of the National Trails System shall be designed to harmonize with and complement any established multiple-use plans for the specific area in order to insure continued maximum benefits from the land. The location and width of such rights-of-way across Federal lands under the jurisdiction of another Federal agency shall be by agreement between the head of that agency and the appropriate Secretary. In selecting rights-of-way for trail purposes, the Secretary shall obtain the advice and assistance of the States, local governments, private organizations, and landowners and land users concerned." In accordance with this, the RSFO needs to obtain the advice and assistance of the State, local governments, private organizations, and landowners and land users concerned when establishing the alternative rights-of-way for the national scenic and national historic trails. Further, per BLM Manual 1601, Land Use Planning, Section 6(G) "Policy - Valid Existing Rights. All decisions made in land use plans, and subsequent implementation decisions, will be subject to valid existing rights. This includes, but is not limited to, valid existing rights associated with oil and gas leases, mineral leases, mining claims, and lands and realty actions (e.g., rights-of-way, easements, leases, etc.). The BLM has the discretion, subject to the agreement of holders of valid existing rights, to modify proposed actions to reduce the effect of actions on resource values and uses. These modifications may be necessary to maintain the choice of alternatives being considered during land use plan development and implementation, and may include appropriate stipulations, relocations, redesigns, or delay of proposed actions." | Management actions for all four alternatives are identified in the DEIS for management actions Special Designations Congressionally Designated Trails 7000-7022. Consultation and coordination are described in Chapter 5. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | The RMP needs to be revised to recognize valid existing rights before establishing National Trail Management Corridors. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-27 | In the checkerboard land ownership portions of the Rock Springs Management area, the large broad-brush ROW exclusion and avoidance areas prescribed in MA #7002 and MA #7003 could make it impossible for private landowners to exercise their rights for access and development. These broad-brush exclusions and avoidance areas need to be removed and replaced with case-by-case assessment in the checkerboard ownership areas. | Management actions for all four alternatives are identified in the DEIS for management action 7002 and 7003. Impacts for each of the alternatives can be found in Chapter 4. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-80 | MA #6201 LR-06, MR-03 The planning area, with the exception of defined exclusion and avoidance areas, would be open to the consideration of granting rights-of-way (see Special Management Area section and Table 2-10, Appendix V). Industry position: Acceptable The planning area is open to consideration of granting rights-of- way with the exception of defined exclusion and avoidance areas (see Map 2-22). Industry position: Not acceptable Reason: BLM using exclusions and avoidance areas around ACECs and not taking into consideration that the KSLA has a higher value resource. Exclusion area acreage removed from right-of-way access is 2,480,876 acres which is 67 percent of the planning area BLM-administered federal land surface. Some of the exclusion and avoidance areas depicted in Map 2-22 are located on previously disturbed lands. The planning area is open to consideration of granting rights-of- way with the exception of defined exclusion and avoidance areas (see Map 2-23). Industry position: Not acceptable Reason: Not consistent with the exclusion and avoidance areas in the existing RMP. The planning area is open to consideration of granting rights-of-way with the exception of defined exclusion and avoidance areas (see Map 2-24). Industry position: Not acceptable Reason: Some of the exclusion and avoidance areas depicted in Map 2-24 are located on previously disturbed lands. Alternative A is acceptable. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13787-81 | MA #6202 LR-06, MR-03 Areas are designated for avoidance or exclusion to rights-of-way where these uses are incompatible with management of sensitive resources and/or would have unacceptable impacts. Rights-of-way and avoidance areas are described in Table 2-10, Appendix V and shown on Map 2- 21. Industry position: Acceptable See MA #6201 Industry position: Not acceptable Reason: BLM using exclusions and avoidance areas around ACECs and not taking into consideration that the KSLA has a higher value resource. Exclusion area acreage removed from right-of-way access is 2,480,876 acres which is 67 percent of the planning area BLM-administered federal land surface. Some of the exclusion and avoidance areas depicted in Map 2-22 are located on previously disturbed lands. See MA #6201 Industry position: Not acceptable Reason: Not consistent with the exclusion and avoidance areas in the existing RMP. See MA #6201 Industry position: Not acceptable Reason: Some of the exclusion and avoidance areas depicted in Map 2-24 are located on previously disturbed lands. Alternative A is acceptable. | Management actions for all four alternatives are identified in the DEIS for management action 6200 thru 6210 rights-of-way and corridors. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13795-3 | The proposed increase in exclusion areas outlined in Maps 2-22 would result in the isolation of existing and potential future trona mines, effectively barring extraction and development of the resources in the KSLA. This risk of the BLM-WY stranding resources by prohibiting ROWs for the transport of operational equipment, personnel, and materials, threatens to derail expansion plans in the KSLA. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. Impact analysis to Leasable Minerals can be found in Section 4.11 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13795-4 | As the global demand for soda ash continues to grow, the United States is well positioned to benefit from the natural advantage of Wyoming's rich trona reserves. As the current Administration remains focused on cultivating a more robust and resilient mineral supply chain, BLM-WY's approach to ROWs in the Preferred Alternative would effectively prohibit domestic production of a plentiful resource. Not only does BLM-WY's approach run in opposition to national supply chain priorities, but the Bureau does not provide meaningful justification for proposing such a drastic increase. | Analysis of the global supply of trona is outside the scope of this DEIS. See Section 1.4 for the Planning Criteria. Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. Impact analysis to Leasable Minerals can be found in Section 4.11 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13811-2 | Furthermore, BLM has not provided sufficient justification for the shift. BLM states that a reduction in rights-of-way would reduce associated emissions-generating activities, but it then concedes that "[e]stimated emissions are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts."8 Alternative B's shift to exclusion areas would thus no better achieve BLM's conservation goals than the currently applicable Green River RMP, but it would have drastic socioeconomic effects on the Planning Area. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. Impact analysis to Leasable Minerals can be found in Section 4.11 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13811-3 | Alternative B also ignores BLM's inherent discretion in granting ROWs, and in requiring mitigation for potentially damaging activities. Moreover, Alternative B's dramatic shift to exclusion areas runs contrary to what BLM and stakeholders have been discussing throughout the entire RMP/DEIS development process. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. See Maps 2-21 through 2-24. Impact analysis Section 4.19 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13826-5 | LR-06: Manage public lands to meet transportation and ROW needs consistent with goals and objectives of other resources while supporting the national energy plans and policies. My Concern: This Goal or objective supports a concern that I commented on in a previous comment I submitted. That the roads and ROWs within the Rock Springs management district need to be maintained as they currently are and not closed to public access in order for the public (residents, tourists, and local industries that support our national energy needs). Closing roads and | Management actions for all four alternatives are identified in the DEIS for management action 6000-6015 lands and realty considered available for ROWs. Impact analysis Section 4.19 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | ROWs as suggested in the Alternative B plan or (mentioned and then pulled and placed in a separate plan) is in opposition of this BLM goal and objective. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13826-27 | My specific concerns are: * The impact of increasing the amount of 'ROW Exclusion' & 'ROW Avoidance' areas found on (Map 2-22: Rights-of-Way - in the proposed Alternative B) - Source: Vol. 1 Rock Springs RMP Revision Draft EIS - pg. 642. * This map shows an extreme increase in the amount of 'ROW Exclusion' and 'ROW Avoidance' areas from the current plan shown on (Map 2-21: Rights-of-Way - in the current Alternative A) - Source: Vol. 1 Rock Springs RMP Revision Draft EIS - pg. 641. * I cannot find anything in your plan to support such a large increase in the land areas to support this extreme amount of road closures to the residents of the area. Especially the area of my concern, which is the areas between General Chemical trona plant and the ghost town of Bryan, Wyoming and Little America. Most of the information I have located concerns ROWs and road restrictions in other areas of the BLM land. | Management actions for all four alternatives are identified in the DEIS for management action 6200 thru 6210 rights-of-way and corridors. Impact analysis Section 4.19. See also sections on Special Management, including ACECs and National Historic Trails, for more specific actions on proposed rights-of-way restrictions. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13826-32 | The plan as written is not complete and it is not clearly stated as to how this will impact my desired use of these roadways. I also could not clearly understand the difference between 'ROW Exclusion' and 'ROW Avoidance' in areas or why these would apply to the areas where my grandfather's homestead is located as well as the areas surrounding the ghost town of Bryan, Wyoming where my grandfather worked on the railroad as a pumper for the UPRR. These are areas I want to visit and contribute historical and family history to the local historical societies and museums. I therefore want access to these areas as well. I think I have located the area where his accident occurred. Again, I am not sure I can go to and explore these locations and I couldn't find information within the plan to help me determine if I could have access to these locations. Mr. Dudley Gardner was interested in working with me on some of this family history since very little is known about the early history of the Blacks Fork River and Bryan, Wyoming areas.I am experiencing confusion about the terms ROW exclusion & closure | See Glossary (GL-3 and GL10) for ROW avoidance and exclusion definition |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13826-33 | Also, are these roads closed to just the oil and gas industries or will they impact the trona, agriculture and recreational industries as well as the private citizen and resident who just wants to go for a drive? Recently, I received a copy of the 'The Wyoming Legislature's Joint Travel, Recreation, Wildlife and Cultural Resources Interim Committee' comments submitted to BLM concerning what they considered the negative impacts the RMP will have on Wyoming. In that document the committee noted that the favored RMP - Alternative Plan B. "… while closing 4,505 miles of routes to all use and a further 10,000 miles of routes and other linear disturbances to be removed for any transportation purposes." They also noted in their comments that, "It has been reported that the route closures included in the RMP were made in error but there has been no information provided by the BLM to explain what the errors were or what should be expected for route closures under the final version of the RMP." I also received a copy of the comments submitted by the 'Select Committee on Federal Natural Resource Management (Committee) of the Wyoming Legislature' on the (BLM) draft Rock Springs Resource Management Plan (RMP) and Environmental Impact Statement. This committee stated that they had previously heard testimony that the road closures were part of a separate travel management plan and had not been intended to be included in the Alternative B draft. The committee's comments suggests that they were also told that BLM intended to remove the route closures and the references to a travel management plan from the draft Rock Springs RMP. The committee's comment did say that, "However, BLM Wyoming did not specifically identify what would remain in the draft Rock Springs RMP and what would be removed." They then implied that they would include their concerns about possible road closures in the plan in their comments. Now this committee stated in their comments that "… Most significantly, "4,505 miles of routes would be closed to all use, and 10,006 miles of routes and linear disturbances would be removed from the transportation network and allowed to return to natural conditions."1 The draft Rock Springs RMP does not define "natural conditions," so it is unclear how long these roads could be removed from the transportation network. …. Under Alternative B, only 13.9% of existing roads and trails would remain open to vehicle use. The draft Rock Springs RMP also does not provide a map to show the specific routes that would be closed. The effect of these route closures may be even more significant and detrimental depending on where these closures actually are. Without a map, the Committee cannot accurately articulate the overall impact the route closures would have on recreation." I am asking that you consider allowing access to BLM roads and ROWs on a case-by-case basis instead of designating these areas as non-use or restricted. | The definition listed in the DEIS Glossary page GL-4 defines Closed Road. Management actions for all four alternatives are identified in the DEIS for Recreation for management actions 6607. See Chapter 4.17 for impacts analyzed for all four alternatives. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-1 | The Airport is located east of Rock Springs on lands that are bordered by several federally managed sections. Furthermore, all utilities and road systems serving the airport reside on or under federally managed lands. Furthermore, several critical Navigational Aids (NAVAIDs) are located on federally managed lands near the airport. The placement of and access to these NAVAIDs is critical for flight operations safety and airport viability. Unfortunately, every section of federally managed land that has a direct impact on the airport's current and future operations is included in the Plan and Draft EIS as Right-of-Way (ROW) Exclusions Areas. This creates grave concern from the Board as the long-term viability of airport will be adversely impacted if the Plan and Draft EIS are adopted as written. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. Impact analysis Section 4.19 |
| 827 - Land Resources–Rights-of-Way | #13831-4 | As previously mentioned, the federally managed lands surrounding the airport have been identified as ROW Exclusion Areas. The Airport Board is concerned that this designation in the preferred alternative will have the following adverse impacts: o Access to Navigational Aids (NAVAIDs) that sit on or are solely accessible by RSGA | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. Impact analysis Section 4.19 |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | roads through BLM managed lands. o Emergency response access on established dirt roads around the airport proper that reside on BLM managed lands. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-5 | The airport is in a contractual relationship with a private developer for carbon removal and sequestration development on airport property. The intention is to pursue pore space right-of-way agreements with the BLM for pore space surrounding the airport. This right-of-way exclusion would prohibit that and adversely impact our ability to move forward with the utilization and monetization of the airport's pore space. | Management actions for all four alternatives are identified in the DEIS for management action 6000. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-6 | o The Airport Board is concerned on the impact of the preferred alternative and the ROW Exclusion Areas on the airport's ability to seek a land conveyance of these lands from the BLM pursuant to the Airport and Airway Trust Fund of 1982 and 43 CFR 2640. If the right-of-way exclusion prohibited land conveyance, this would severely hamper future growth opportunities for the airport. 43 CFR 2640 states, "Upon receipt of the request from the Administrator, the authorized officer shall determine whether the requested conveyance is inconsistent with the needs of the Department of the Interior (DOI), or any agency thereof…" The Airport Board is concerned that the DOI would find that conveyance of these lands would not be consistent with the needs of the DOI based on this preferred alternative. | Management actions for all four alternatives are identified in the DEIS for lands and realty management action 6002. Please see Maps 2-21 through 2-24. Impact analysis Section 4.19 |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-7 | The right-of-way exclusions would prohibit the airport from seeking right-of-way agreements with BLM for airport development projects on lands around the airport. Specifically identified for exclusion are the most likely and beneficial lands for development due to terrain. Specific sections of land that are of interest to the airport, but listed as exclusion areas are: ? T19N R103W SEC 20 ? T19N R103W SEC 28 | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-8 | * The Airport is the only Commercial Service Airport in the lower 48 that must truck both potable and fire suppression water to serve its facilities. The Airport is not connected to the municipal water supply. In partnership with Sweetwater County, the City of Rock Springs, the Joint Powers Water Board, Simplot Phosphates, Sweetwater Economic Development Coalition, and several others, plans are underway to develop robust water infrastructure east of town to not only support the airport but industrial development between the airport and Simplot Phosphates. The preferred alternative would render the efforts undertaken by partnership useless and eliminate the possibility of delivering a municipal water supply to the airport. | Management actions for all four alternatives are identified in the DEIS for management action 6201 lands considered available for ROWs. Please see Maps 2-21 through 2-24. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13831-9 | "Limit geologic carbon sequestration exploration and site characterization projects and commercial sequestration projects and facilities to the Rock Springs Uplift." Please see my comment above regarding the airport's CO2 sequestration intentions. Furthermore, this exact statement tells of how this RMP is flawed. The current administration has invested billions into CCUS and our area is prime for CCUS development, yet, they now propose to eliminate that type of development on what is likely the most prolific geological storage site (Rock Springs Uplift) in the country. * | Management actions for all four alternatives are identified in the DEIS for management action 6001. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13848-1 | the alternating pattern of private lands and BLM lands means that BLM controls access to private sections for roads and transmission lines necessary for development of renewable energy on the interspersed private lands. To the extent that BLM imposes restrictions on the use of federal public land within the checkerboard area, it renders renewable energy development on tens of thousands of acres of private lands inside the checkerboard difficult or infeasible. | See 1.4 Planning Criteria |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13848-6 | The draft EIS fails to adequately analyze rights of inheld private land owners in the checkerboard to obtain reasonable access to inheld private lands under federal law, including without limitation generally-applicable provisions of the Alaska National Interest Lands Conservation Act, limiting BLM's discretion to consider wind development on private lands within the checkerboard as a connected action to access decisions on public lands. | See 1.4 Planning Criteria |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-3 | Closing areas to all solid mineral leasing or surface disturbance based on a rigid set of indices that are not clearly mapped, instead of evaluating projects on a case-bycase basis is unnecessarily restrictive, and creates difficulty in planning or siting new projects. In addition, there is no exception under Alternative B of MA #1107 for existing facilities (such as power lines or access routes) that require some occasional surface disturbance for operations and maintenance. Surface disturbance has historically been handled through cooperation between BLM specialists and PacifiCorp with the implementation of appropriate Best Management Practices (BMPs) (as Alternatives A, C, and D allow) and Alternative B could prevent PacifiCorp from fulfilling its requirements to maintain and operate its current system because there is no reasonable exception process. In addition to maintaining current infrastructure, the linear characteristics of power lines require that at some point, any new or proposed line or corridor would cross sites with soil disturbance that would fall under the list of soil types in Alternative B of MA #1107. Siting future lines and corridors includes weighing priorities of numerous resources, of which soil quality is one of many considerations. In some areas, powerlines may span soil types; however, there is no possible way to site a future line that could avoid all vulnerable soils, and under Alternative B, there is no reasonable way to determine options and implement BMPs to minimize those impacts. Under Alternative B, it would not be possible to plan future lines or corridors through the RSFO, including transmission infrastructure necessary to meet national energy goals and | See Glossary for a definition of 'surface disturbance'. Management actions for all four alternatives are identified in the DEIS for management action 1107. See Chapter 4.19 for impacts analyzed for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | bring new renewables onto the grid. Alternatives A, C, and D specifically address soil concerns by including avoidance as an option, while requiring a mitigation plan (Alternative D) or erosion control plans (Alternatives A and C) where appropriate, and PacifiCorp recommends that the BLM adopt Alternative A, C, or D for MA #1107. Reclamation and mitigation plans can and are successful in difficult-to-reclaim areas, and should be allowed to continue. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-26 | K. MA #4602 The buffers associated with rare plant species differ under the alternatives of MA #4602 from buffers around plant "communities", "locations", or boundaries of locations. Consequently, these potential buffer distances could vary greatly. If these areas are included as ROW exclusion areas, there could be impacts on the ability for electric utilities to serve customers if areas much larger than needed to protect sensitive plants are included in extensive buffers (e.g., around plant communities). To protect rare plants while not overreaching on the need for ROW exclusion areas, PacifiCorp recommends that the BLM adopt Alternative C under MA #4602. | The differences among the proposed alternatives in MA #4602 is intentional regarding boundaries and locations to provide a range of actions. Management actions for all four alternatives are identified in the DEIS for management action 4602. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-34 | 8. Paleontological Resources Paleontological resources have established protocols to identify and protect significant surface exposures. Known areas that have been traditionally exploited for petrified wood should be managed in a way to better protect buried resources without restricting travel or closing areas to ROWS or other development. The paleontology in the RSFO is part of the Green River Formation that is also shared by the Casper, Rawlins, Kemmerer and Little Snake BLM Field Offices, in both Wyoming and Colorado. Any deviation of established protocols in this Formation would be problematic for state paleontologists as well as for linear projects that span across multiple field offices. Consequently, PacifiCorp recommends that the BLM maintain current practices and adopt Alternative A for Paleontological Resources (MA #5300- 5309). | Management actions for all four alternatives are identified in the DEIS for management action 5300-5309. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-35 | 9. Visual Resources PacifiCorp is concerned that the proposed extensive visual buffers in Alternative B surrounding trails and other visual resource areas will create setbacks from ROWS that are significantly greater than the original buffer. The evaluation of direct or indirect impacts on visual resources has established protocols that are consistent across all BLM Field Offices. The Visual Resource Management (VRM) system has a process to evaluate and inventory resources and landscapes for their visual values. Cultural resources such as trails, historic roads, petroglyph panels, and Traditional Historic Properties (THPs) have specific buffers or processes to establish indirect buffers to protect specific resources through consultation. Changing a VRM class through the establishment of an ACEC is inconsistent and contradictory with the VRM inventory process. Creating arbitrary buffers and/or increasing trail buffers that are inconsistent with adjacent BLM Field Offices and other agencies engaged in the evaluation process is problematic, creates confusion, and is an overreach of BLM's authority. Extending trail buffers up to 20 miles creates large exclusion areas that inhibit future development along linear resources across the entire field office. This hinders PacifiCorp's ability to site new power lines in response to increasing customer load, for reliability improvements, and to bring new renewable energy onto the grid. Presently, trails are inventoried with non-contributing segments of linear cultural resources allowing for development in certain areas. Extending the visual buffers to 5, 10, or 20 miles would remove this ability. BLM must follow its internal policy for inventorying visual resources and protect relevant landscapes within this process. Trail buffers must remain consistent with adjacent BLM Field Offices that manage the same resources. | Management actions for all four alternatives are identified in the DEIS for management action rights-of-way corridors 6200-6210. See Chapter 4.19 for impacts analyzed for all four alternatives. See also information for Visual Resource Management and proposed alternatives throughout the planning area. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-36 | 10. Lands and Realty Alternative B will impact operations and permit requirements at BCC. Under Alternative B of MA # 6201 and #6202 ROW Exclusion areas within approximately the northern third of the BLM lands are within the BCC permit boundary. On some of these lands BCC has existing ROWs for regulatory monitoring equipment (e.g., sediment stations and air monitoring stations), topsoil piles, roads, power lines, and other essential infrastructure. If ROW exclusions are imposed over these areas, BCC will not be able to secure additional ROW if they were needed to relocate any infrastructure or to build new access routes into existing infrastructure. Regulatory compliance with permits might be impacted if BCC cannot secure ROW for these kinds of essential activities. BCC prefers Alternative D because it does not include ROW Exclusion Areas within the BCC permit boundary. Although there are some ROW Avoidance Areas, Alternative D will allow the BLM to consider ROW applications on a case-by-case basis instead of outright excluding those ROW applications. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-38 | 12. Special Designations The expansion of the special designations associated with Alternative B will significantly impair transmission and distribution operations. Alternative B will increase ACEC size by and the amount of ROW exclusion areas in the project area. In Alternative A, currently 426,709 acres are categorized as ROW exclusion. Under Alternative B, this increases to 2,480,876 acres, making the siting of transmission projects difficult across the entire project area. Alternative A is preferred to enable transmission projects to be sited with reduced impacts to resources by shorter routes. | Management actions for all four alternatives are identified in the DEIS for management action of rights-of-way corridors 6200-6210. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-40 | A. MA #7418 and #7421 Alternative B of MA #7418 will expand the Greater Red Creek ACEC to include the Sugarloaf and Salt Wells Management area. Paired with Alternative B of MA #7421 to make the Greater Red Creek ACEC a ROW Exclusion Area, these Special designations greatly reduce and/or prohibit the potential development of new electricity transmission lines on the East side of Flaming Gorge, increasing cost of potential consumption of renewable hydro-generation power in south-central Wyoming. Alternative A of MA #7418 will maintain the Greater Red Creek ACEC at 131,600 acres by not adopting the Sugarloaf and Salt Wells Management Areas. Alternative A is preferred to maintain corridors for future development. | Management actions for all four alternatives are identified in the DEIS for management actions 7418 and 7421. See Chapter 4.19 for impacts analyzed for all four alternatives. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-41 | B. MA #7456 Alternative B of MA #7456 will designate the Boars Tusk ACEC as an exclusion area for ROWs. This increase of exclusion area associated with the Boars Tusk ACEC reduces the ability to transmit energy to previously identified customers, thereby increasing future costs of energy grid delivery and reliability. Alternative A of MA # 7456 is preferred because it maintains the approved activities within this ACEC. | Management actions for all four alternatives are identified in the DEIS for management action 7456. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-42 | C. MA #7498 and #7502 Alternative B of MA # 7498 will expand the South Pass Historic Landscape ACEC to 171,300 acres (from 53,940 acres). This, paired with Alternative B of MA # 7502 making the South Pass Historic Landscape ACEC a ROW Exclusion Area, greatly reduces and/or prohibits the potential development of new electric transmission lines across South Pass to deliver cost-efficient energy. Alternative B would negatively impact the West-Wide Energy Corridor (WWEC) by reducing the area available to develop new ROWs. Specifically, Pg. 2-116 or the EIS states"[E]liminate the existing corridor identified in the WWEC ARMPA/ROD (2009) east of Flaming Gorge in the planning area (126-218). Corridor widths would be 3,500 feet wide. Designate no new corridors." The ability to site new transmission in this energy corridor is critical to renewable energy development in the west and reducing widespread impacts by line siting around areas considered exclusion zones in Alternative B. Alternative A of MA # 7498 is preferred in order to maintain the existing size of the South Pass Historic Landscape ACEC that will allow for the communities separated by the pass to grow and be delivered power reliably and cost effectively. | Management action for all four alternative are identified in the DEIS for management actions 7498 and 7502. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-44 | As stated above, ROW Exclusion areas could impact BCC's ability to comply with permits and regulations as many of its ROW are related to regulatory compliance structures and access to topsoil piles. If a structure needs to be moved, a new well drilled, or a new access road placed in these areas, the BLM would not be able to consider the request due to the ROW exclusion. The ROW avoidance areas in Alternative D would have little or no impact on BCC's operations or regulatory compliance and Alternative D or A is preferred by BCC. In addition, also as discussed above, the ROW Exclusion areas limit existing transmission and distribution O&M and the ability to construct new transmission and distribution and other energy projects. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-47 | [comment:13865-47; 824, 827]. In addition to the inconsistencies already discussed, Alternative B will create regulatory inconsistencies across BLM field offices and is beyond the scope of BLM regulation. There must be consistency across BLM field offices. For linear utilities or any project that straddles field office boundaries, changing how any resource is managed within multi-agency process driven protocol is going to result in confusion, inconsistencies, and the immediate need for variances and exceptions. Disregarding the VRM process or Section 106 process that ultimately finds its way to SHPO so that affects are seen differently than all other BLM Field offices will create inconsistent evaluation of the same resource. Alternative B exceeds BLM regulatory authority by, for example, changing avian seasonal stipulations and buffers that have been established by other agencies is beyond the scope of a land management agency.[comment end] | See Planning Criteria in Section 1.4 for applicable laws and compliance. Management actions for all four alternatives are identified in the DEIS for management action 6200-6210 lands considered available for ROWs. See Chapter 4.19 impacts analyzed for all four alternatives. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-54 | Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors. Bury distribution power lines to the extent technically feasible." These practices may not always be feasible. While new power line ROWs may be sited in existing energy corridors or along roads/highways, this may not always be practical or feasible depending on the length of the line, the surrounding land use, and the purpose/need of the line. For example, high voltage transmission lines can span hundreds of miles and there may not be corridors or other linear developments along the entire length of the route. If an existing transmission corridor is filled, there would not be room remaining in the corridor for a new line. Restrictions on corridor width limits would also impact the ability to co-locate lines in existing transmission corridors. These constraints could limit system reliability by forcing main grid transmission lines into a single corridor, rendering the entire system vulnerable to a local catastrophic event, such as a natural disaster, wildfire, plane crash, or act of terrorism. Lower voltage distribution lines, which are required to serve residential, commercial, or agricultural customers, typically tap off main lines to the customer, and the line route will be dictated by the end point service location. In such cases, there often may not be an energy corridor or other linear feature with which to co-locate. The BLM has also created a conflict within the draft RMP by including sections of the Wyoming Governor's transmission corridor in ACECs or ROW restriction areas. In addition to concerns with the co-location stipulation in this Appendix, PacifiCorp has concerns with the stipulation to underground power lines. | Management actions for all four alternatives are identified in the DEIS for management action 6200-6210 lands considered available for ROWs. See Chapter 4.19 impacts analyzed for all four alternatives. Please see Maps 2-21 through 2-24. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-55 | Installing new distribution lines underground or converting existing lines from overhead to underground may not be feasible in certain circumstances. In addition, burying power lines can result in greater ground disturbance during construction and repairs, longer outage periods for customers, increased cost, reduced reliability, and may not always be feasible from engineering and operations perspectives. Underground power lines would require continuous excavation through all habitat types. This is in contrast to overhead lines, which result in disturbance only at the structure locations and can span sensitive resources. Underground lines would also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporally over the life of the line, not just during initial construction. Ground disturbance during construction, repairs, and maintenance of underground lines can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. Even in conditions where undergrounding is technologically feasible, there would be financial impacts to PacifiCorp and its customers, as | Management actions for all four alternatives are identified in the DEIS for management action 6200-6210 lands considered available for ROWs. See Chapter 4.19 impacts analyzed for all four alternatives. Please see Maps 2-21 through 2-24. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | undergrounding distribution lines can cost $600,000 to $1.1 million per mile, and possibly more, compared to $400,000 average for overhead distribution lines. Undergrounding transmission lines is typically not technologically feasible in remote areas, and would include all of the above impacts associated with undergrounding distribution, but at a much greater scale. Likewise, undergrounding transmission lines is cost prohibitive. Because of these considerations, PacifiCorp requests that the BLM remove undergrounding as a design feature that may be required, and instead allow utilities to determine if undergrounding lines is appropriate for their facilities and customers on a case-by-case basis. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-56 | "Equip tanks and other above-ground facilities with structures or devices that discourage nesting and perching of raptors and corvids." As discussed previously under the perch discourager section above, such devices are ineffective and have unintended negative consequences. Consequently, PacifiCorp recommends that this stipulation be removed from the Appendix or clarified that it does not apply to electrical infrastructure. | See Appendix A, A.1 Project Design Features and Best Management Practices, Introduction |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-59 | "Restrict the construction of tall facilities, distribution power lines, and fences to the minimum number and amount needed." As stated previously, power lines are sited and constructed to serve customers. By this nature, lines are already built only when necessary and cannot further be restricted without impacting our ability to serve customers. In addition, this stipulation conflicts with other resource stipulations throughout the draft RMP, as the length of lines and number of structures is often increased by routing around sensitive resources. Because this stipulation is contradictory with utility requirements to serve customers and BLM's other resource stipulations, PacifiCorp recommends that it be removed from the Appendix. | See Appendix A, A.1 Project Design Features and Best Management Practices, Introduction |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-62 | "Avoiding facility placement on steep slopes, ridge tops, and hilltops." As detailed above, line routing is determined by many factors and avoiding siting poles in all of these situations is impractical and could impact other resources. | See Appendix A, A.1 Project Design Features and Best Management Practices, Introduction |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13865-68 | "Remove roads, unimproved roads, two-tracks, and restore sagebrush habitat." As discussed previously, the need for utilities to access power lines is critical to the safe operation of the electrical grid. This access may include the use of improved or unimproved roads, or two-tracks. It is a violation of FLPMA to arbitrarily restrict or remove public access without notice or input. In order to prevent safety issues by restricting access, PacifiCorp recommends that the BLM modify the above stipulation to read: "Remove roads, unimproved roads, two-tracks, and restore sagebrush habitat, where this will not interfere with access to authorized ROWs or for safety purposes. The BLM will notify authorized users, including ROW holders, in the RSFO for any access road removal proposals, and provide adequate opportunity for public comment." | See Appendix A, A.1 Project Design Features and Best Management Practices, Introduction |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13880-3 | One of the many features that make federal land management in Wyoming unique is the presence of the "checkerboard" and the requirement for heightened consistency, trust, and cooperation between federal, state, and private land managers. The previously mentioned task force on the Rock Springs RMP recognizes this importance and voted for complete consensus on the following statement: "The task force does not support any special management area designations within the checkerboard except for existing Cedar Canyon and Natural Corrals, and Special Status Plant Species ACEC. The task force does recognize the importance of wildlife migration and winter range within the checkerboard." Beyond special designations, rights of way (ROW) stipulations have an oversized impact on the ability for the state and private citizens to access and utilize property within the checkerboard. From an energy perspective, the federal land in the checkerboard area that would be designated as ROW exclusion areas under the preferred alternative, and will have a significant impact on the placement of transmission lines, access roads, and pipelines by limiting access to oil, gas, and renewable sites, and restricting placement of facilities, pipelines, transmissions lines, communication facilities and roads. ROW exclusion areas in the checkerboard would preclude any type of development on adjacent private and state parcels because it will severely limit access to the sites and options for accessing the land or getting the product out. In order to comply with the mandate that a land use plan must "use and observe the principles of multiple use and sustained yield," the entire planning area should be open to consideration of granting ROWs as set forth in alternative D. This applies to management actions: 6201, 6202, 6207, and 6209.7 | Management actions for all four alternatives are identified in the DEIS for management actions 6200 thru 6210. See Appendix V Acreage Tables and maps 2-21 through 2.24. See Chapter 4.19 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13880-8 | Additionally, the BLM does not consider any potential impacts to renewable energy development in this draft RMP. This likely reflects the fact that the scope of analysis was determined in 2015. Excluding potential impacts on renewable development is at odds with the facts on the ground, with projections about likely renewable development under various "decarbonization" scenarios for the U.S. electric sector, and with the federal government's own policy priorities. An RFD for renewable energy development should be pursued by the BLM to give a full accounting of this RMP's impacts. A variety of NGOs, government agencies, and scholars have conducted detailed techno economic analyses of the U.S. electricity sector and energy system to provide spatially explicit projections of various pathways for the United States to "decarbonize" the grid by 2050, in line with current federal policy priorities. In contrast to BLM's 2015 analysis that merely maps raw wind and solar endowments in | Management actions for all four alternatives for renewable energy are found in MA's 6100-6108. See Chapters 4.20 for impacts analyzed for all four alternatives, for Renewable Energy. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | the RSFO, these models give a much more accurate picture of likely renewable energy development scenarios given current economic conditions and federal tax incentives. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13880-9 | Overlaying projected wind projects from Wu et al. (2023) with the Alternative BROW exclusions suggests that Alternative B would preclude the development of 509,000 to 3.2 million acres worth of potential wind projects in the RSFO, representing 5,760 to 36,790 MW of installed capacity.9 A full accounting of the economic impacts of wind development is beyond the scope of this comment, but some estimates suggest that wind projects generate a 1% increase in ongoing local employment for every 100 MW increase in installed wind capacity, as well as $7,000/MW in local property taxes and $3,000/MW in lease payments to landowners.10 Alternative B could lead to $56.7 million to $368 million worth of foregone local benefits annually from wind development. While these are rough estimates, they underscore the need to carefully consider and analyze potential renewable energy impacts in any serious impact analysis of the RMP. | Management actions for all four alternatives for renewable energy are found in MA's 6100-6108. See Chapters 4.20 for impacts analyzed for all four alternatives, for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13880-10 | Finally, it is worth noting that Alternative B's impact on renewable development is at odds with existing federal priorities. Specifically, new tax incentives under the Inflation Reduction Act and the Bipartisan Infrastructure Law contain provisions designed to channel investment into communities that are historically disadvantaged and/or likely to be negatively impacted by a large-scale transition away from fossil fuels. While the BLM's analysis does discuss the former (EPA's Environmental Justice Communities) it does not consider the latter (DOE's Energy Communities), which may be much more relevant for the RSFO. In fact, all 8 census tracts in Sweetwater County, in addition to Census Tract 56013000301 in Fremont County, all qualify as "Energy Communities," making them eligible for additional federal support for renewable energy. At a high level, this puts the BLM's preference for Alternative Bat odds with crucial federal initiatives. More to the point, any commercial wind or solar projects in these 9 census tracts would qualify for a "stackable" 10% increase in the Production Tax Credit or a 10-percentage point increase in the Investment Tax Credit.11 This calls into question the BLM's assumption that wind development in the RSFO is unlikely, as well as gives credence to the scenarios projected by Wu et al. (2023). | Management actions for all four alternatives for lands and realty are found in MA's 6000-6015 and renewable energy are identified in the DEIS, MA's 6100 thru 6108. See Chapters 4.19 and 4.20 for impacts analyzed for all four alternatives, for Lands and Realty and Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13892-10 | The BLM's proposed ROW Exclusion area violates the Sublette County Federal & State Land Use Policy: "Discourage the prioritization of any one land use until after the impacts to other multiple uses are fully quantified and mitigated. Any proposal to close federal lands to a multiple use must be approved by Sublette County after a public hearing." | Management actions for all four alternatives for lands and realty are found in MA's 6000-6015 See Chapters 4.19 for impacts analyzed for all four alternatives, for Lands and Realty. Identified in Glossary definition of Multiple Use. Chapter 5 for coordination and consultation. See Section 1.5 Table 1-2 for plans considered. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13892-23 | How will ROW permit renewals be treated in ROW Exclusion areas? How will ROW permit renewals be treated in ROW Avoidance areas? | Management actions for all four alternatives for lands and realty are found in MA's 6000-6015 See Chapters 4.19 for impacts analyzed for all four alternatives, for Lands and Realty. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13895-2 | Finally, as a private landowner and lessee of other private lands in the area, there is serious concerns about how Preferred Alternative B impacts the ability to access and otherwise use and develop private and state lands due to the massive number of restrictions placed on neighboring public lands. The impact of ROW exclusion areas and restricting motorized travel to designated roads will have on grazing, and other multiple uses, is also not adequately addressed in the DEIS due to the BLM's failure to disclose the connected and foreseeable actions of future travel management planning and foreseeable road closures. Under Preferred Alternative B, the BLM is no longer managing for multiple use and sustained yield but instead closing-off public lands and unlawfully restricting access to state and private lands at the expense and to the detriment of providing healthy rangeland, forest systems, and watersheds. | See Section 1.4 for the Planning Criteria and private land management. Travel management and specific route designations is outside the scope of this RMP planning effort. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-80 | Of importance: In the public/private land checkerboard that runs east-west across the Rock Springs Field Office, we do not think rights-of-way exclusions are appropriate, except for Areas of Critical Environmental Concern and high potential segments of NHTs. The proposed Alternative B exclusion areas for Rights-of-Way in the checkerboard for National Historic Trails viewsheds, other historic trails, and big game winter range could be managed as avoidance areas so as not to obstruct necessary energy corridors or reasonable development in the Known Sodium Leasing Area. | Management actions for all four alternatives for lands and realty are found in MA's 6000-6015 and renewable energy are identified in the DEIS, MA's 6100 thru 6108. See Chapters 4.19 and 4.20 for impacts analyzed for all four alternatives, for Lands and Realty and Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-81 | We urge BLM to go further, however, by screening these lands with resource-based and technical exclusion criteria in order to identify areas where BLM will prioritize and facilitate wind development, and to a lesser extent solar development. Such areas, commonly known as designated leasing areas (DLAs), should have high resource potential, low resource conflict, and easy access to transmission infrastructure. Alternatively, if BLM is unable to complete the necessary analysis to identify DLAs and incorporate it into this planning process prior to signing the Record of Decision, BLM should expressly commit to working to identify DLAs for wind development within one year after issuing the ROD through a step-down planning process. | Management actions for all four alternatives for lands and realty are found in MA's 6000-6015 and renewable energy are identified in the DEIS, MA's 6100 thru 6108. See Chapters 4.19 and 4.20 for impacts analyzed for all four alternatives, for Lands and Realty and Renewable Energy. |
| 827 - Land Resources–Rights-of-Way | #13899-82 | BLM's ROW regulations, related policies and guidance, and prior programmatic planning documents specifically contemplate and encourage agency field offices to designate DLAs during land use planning, such as here.206 Indeed, the draft EIS expressly acknowledges this policy and recognizes the need to develop protocols for wind | Management actions for all four alternatives for renewable energy are identified in the DEIS 6100 thru 6108. See Chapter 4.20 for impacts analyzed for all four alternatives. |

|---|---|---|---|
| and Corridors (6200-6210) | | and transmission planning in the Rock Springs Field Office.207 BLM should undertake this effort, either as part of this planning process or within one year of the ROD, because the presence of DLAs in the Field Office will incentivize responsible renewable energy development in preferred areas,208 ensure competitive leasing,209 and set the stage for the future tiering of project-level environmental reviews. This is not only consistent with the smart from the start approach to renewable energy development that we advocate but will also maximize revenues and result in a more efficient and predictable process for both BLM and industry. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-83 | BLM should therefore consider the non-exhaustive list of factors found at 40 C.F.R. § 2802.11(b) to determine whether to create any DLAs on the lands left open to wind and solar | See Section 1.4 for the Planning Criteria. Management actions for all four alternatives for renewable energy are identified in the DEIS 6100 thru 6108. See Chapter 4.20 for impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-84 | BLM should also consider its West-wide Wind Mapping Project, which mapped current exclusion areas and areas with potentially developable wind resources where environmental concerns or land use restrictions will require more extensive analysis. | Management actions for all four alternatives are identified in the DEIS for management actions 6100-6108 for renewable energy. Chapter 4, Section 4.20 analyzes the impacts for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-85 | In addition, BLM should consider the four-step process for designating new solar energy zones set forth in the 2012 Western Solar Plan, which is as follows: ? Assess the demand for new or expanded DLAs; ? Establish technical and economic suitability criteria; ? Apply environmental, cultural, and other screening criteria; and ? Analyze proposed DLAs through a planning and NEPA process.213 Although BLM developed this process for solar energy zones in the six southwestern states, it is relevant here because the scope of the Western Solar Plan is currently being expanded to include Wyoming. Also, each of the four steps and the screening criteria for solar development can be adapted, as needed, to fit wind development.214 Indeed, BLM recently proposed a rulemaking that would add this four-step process to 40 C.F.R. § 2802.11(b), the regulation governing how BLM designates new DLAs for both solar and wind development. | Management actions for all four alternatives are identified in the DEIS for management actions for lands and realty 6000 thru 6015, and management actions 6100-6108 for renewable energy. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty. Chapter 4, Section 4.20 analyzes the impacts for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-86 | n addition to the list of factors at 40 C.F.R. § 2802.11(b), the exclusion criteria described in the 2012 Western Solar Plan, and additional criteria such as resource potential and access to transmission infrastructure, we recommend a multivariate analysis to identify potential DLAs in the Rock Springs Field Office. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210, and management actions 6100-6108 for renewable energy. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty. Chapter 4, Section 4.20 analyzes the impacts for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-87 | We urge BLM to take a similar approach to identify potential DLAs for wind and/or solar within the Rock Springs Field Office, either as part of this planning process or within one year of issuing the ROD. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210, and management actions 6100-6108 for renewable energy. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty. Chapter 4, Section 4.20 analyzes the impacts for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-88 | Despite the expectation that BLM would consider the corridor modifications and other recommendations in the 2022 Energy Corridor Report during future land use planning, the draft EIS does not do so. Rather, under each alternative in the draft EIS, BLM would simply retain the existing corridors established in 2009 without modification,221 except that preferred Alternative B would eliminate Corridor 126-218 east of the Flaming Gorge National Recreation Area (NRA).222 BLM should consider and integrate the new information and recommendations set forth in the 2022 Energy Corridor Report. Additionally, BLM should be clear that while Section 368 corridors (aka West-wide energy corridors) were originally intended to facilitate transmission of oil, gas and hydrogen, pipelines for Carbon Capture Utilization and Storage (CCUS) should be sited in the designated 368 corridors as well, to reduce conflicts and increase efficiency in planning. The Section 368 corridors have been vetted as low conflict routes for pipelines regardless of the resource being transported. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-89 | Recommendations for Section 368 Energy Corridors in Rock Springs Field Office The 2022 Energy Corridor Report offered new information and made several recommendations for Section 368 energy corridors in the Rock Springs Field Office that BLM must consider during this land use planning process. According to the agencies, the recommendations struck the best balance in meeting the corridor siting principles. The 2022 Energy Corridor Report also recommended additions and revisions to the IOPs, including new IOPs to avoid or minimize impacts to wildlife habitat, lands with wilderness characteristics (LWCs), historic trails, and tribal concerns. The draft EIS does not consider these recommendations | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-90 | Consistent with the suggested framework and recommendations in the 2022 Energy Corridor Report, BLM must analyze the deletions, additions, and revisions to certain corridors and make these changes in the final RMP. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |

|---|---|---|---|
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-91 | BLM must consider the general siting guidelines set forth in the 2022 Energy Corridor Report to improve corridor placement and use in the Rock Springs Field Office.231 BLM must also consider the recommendation to develop corridor-specific management plans for corridors with potential resource conflicts. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-92 | Recommendations for Corridor 121-220 The 2022 Energy Corridor Report recommended shifting Corridor 121-220232 slightly to the south to align with the recently authorized right-of-way (ROW) for the Gateway West Transmission Line Project. The draft EIS does not consider this recommendation, however, and all the proposed alternatives would maintain the status quo with respect to Corridor 121-220. BLM must consider shifting the corridor slightly south to align with the Gateway West Transmission Line ROW, as generally depicted in Figure 3.5-88c of the 2022 Energy Corridor Report.233 | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-93 | The 2012 Settlement Agreement identified Corridor 121-221234 as a "corridor of concern" due to conflicts with sage-grouse habitat, visual resources, ACECs, and historic trails.235 Indeed, nearly fifty miles of the 63-mile Corridor 121-221 intersects greater sage-grouse priority habitat management areas (from approximately mileposts 0 to 15 and 28 to 60), and much of the corridor intersects or is adjacent to VRM Class II areas and the Cedar Mountain ACEC, White Mountain Petroglyphs ACEC, Greater Sand Dunes ACEC, Killpecker Sand Dunes, Boar's Tusk, and North and South Table Mountain, among other highly scenic places. This east-west corridor also lacks existing transmission infrastructure and is mostly redundant with east-west corridors to the south. For these reasons, we previously urged BLM to delete Corridor 121-221.236 Rather than deleting Corridor 121-221, however, the 2022 Energy Corridor Report recommended (1) shifting the corridor to follow an existing pipeline and partially avoid priority sage-grouse habitat, the Greater Sand Dunes ACEC, the Killpecker Sand Dunes, and VRM Class II areas; and (2) designating the corridor as underground only. These recommendations would not address most of the conflicts with sage-grouse habitat and would push the corridor into additional VRM Class II areas and adjacent to the South Pinnacles and Alkali Basin-East Sand Dunes WSAs.237 Nonetheless, the draft EIS does not consider any changes to Corridor 121-221. For the same reasons as before, BLM should delete Corridor 121-221. Alternatively, BLM should consider shifting the corridor in several places to avoid sensitive areas, designating it as underground only, and developing a corridor-specific management plan for this corridor of concern. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-94 | Recommendations for Corridor 121-240 and Gateway West Corridor Addition The 2022 Energy Corridor Report found that much of Corridor 121-240238 lacks existing infrastructure, is somewhat redundant with Corridor 218-240 to the south, and is adjacent to several historic trails. It also found that the authorized ROW for the Gateway West Transmission Line to the north better aligns with energy demand. The report therefore recommended deleting Corridor 121-240 and replacing it with a new multi-modal corridor to the north that aligns with the Gateway West ROW. The draft EIS does not consider this recommendation, however, and all the proposed alternatives would maintain the status quo with respect to Corridor 121-240.[...] BLM must consider deleting this corridor and designating a new corridor to the north that aligns with the Gateway West ROW, as generally depicted in Figures 3.5-90c and 3.6-8 of the 2022 Energy Corridor Report.239 | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-95 | Recommendations for Corridor 126-218 The portion of Corridor 126-218240 east of the Flaming Gorge NRA presents unavoidable conflicts with greater sage-grouse management areas, big game habitat, recreation, VRM Class II areas, and existing and proposed ACECs in the Greater Little Mountain area, including the Greater Red Creek ACEC. Corridor 126-218 also mostly lacks existing infrastructure. For these reasons, we previously urged BLM to delete this corridor.241 The 2022 Energy Corridor Report did not recommend any adjustments to Corridor 126-218, however, despite a draft recommendation to delete Corridor 126-218 between mileposts 62 and 109 (east of Flaming Gorge NRA) and to reroute this portion further east to align with either an existing pipeline or existing transmission line.242 Nonetheless, under preferred Alternative B, BLM now proposes to eliminate Corridor 126-218 east of Flaming Gorge.243 Again, BLM should delete the portion of Corridor 126-218 east of the Flaming Gorge NRA due to unavoidable conflicts with sensitive resource values and we fully support BLM's proposal to do so under preferred Alternative B. Alternatively, if BLM determines not to delete this portion of the corridor, it should reroute the corridor further east along the existing pipeline and Highway 191,244 which would still impact ACECs but is a better option than rerouting along the existing transmission line. Under no circumstances should Corridor 126-218 remain as is. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-96 | Recommendations for Corridor 129-221 The 2022 Energy Corridor Report recommended slightly shifting the entire length of Corridor 129-221246 to align with the authorized ROW for the Gateway West Transmission Line Project. The draft EIS does not consider this recommendation, however, and all the proposed alternatives would maintain the status quo with respect to Corridor 129-221. BLM must consider shifting the corridor as generally depicted in Figure 3.5-95c of the 2022 Energy Corridor Report.247 | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way | #13899-97 | i. Recommendations for Corridor 218-240 The 2022 Energy Corridor Report recommended shifting the portion of Corridor 218-240248 between mileposts 18 to 23 to the north so that existing infrastructure would form the southern edge of the corridor and the overlap with priority sage-grouse habitat would be reduced. The draft EIS does not consider this recommendation, however, and all the proposed alternatives would maintain the status quo | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | with respect to Corridor 218-240. BLM must consider shifting the corridor slightly north to reduce overlap with priority sage- grouse habitat. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-98 | The 2022 Energy Corridor Report recommended shifting the entire length of Corridor 220- 221250 to align with the authorized ROW for the Gateway West Transmission Line Project. The draft EIS does not consider this recommendation, however, and all the proposed alternatives would maintain the status quo with respect to Corridor 220-221. BLM must consider shifting the corridor as generally depicted in Figure 3.5-112c of the 2022 Energy Corridor Report.251 | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13899-99 | Recommended additions and revisions to the IOPs The 2022 Energy Corridor Report recommended four new IOPs252 to avoid or minimize impacts to (1) ecological resources, such as habitat connectivity, wildlife migration corridors, sage- grouse habitat, and avian collision; (2) LWCs; (3) National Scenic Trails and National Historic Trails; and (4) Tribal concerns and ethnographic studies.253 The 2022 Energy Corridor Report also recommended revisions to existing IOPs related to visual resources, vegetation management, and agency coordination.254 BLM must consider a management action that adopts all the IOPs as best management practices for projects in Section 368 energy corridors located in the Rock Springs Field Office, including the new and revised IOPs recommended in the 2022 Energy Corridor Report. | The AMS (Analysis of the Management Situation) addresses data age in the EIS's Executive Summary page ES-1. MA #6206 and 6207 identify a range of alternatives for corridors. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13908-30 | 6206 D Add language from Alternative B regarding the corridor east of the Flaming Gorge through the Little Mountain area. Eliminate the existing corridor identified in the WWEC ARMPA/ROD (2009) east of Flaming Gorge in the planning area (126-218). | Management actions for all four alternatives are identified in the DEIS for management actions 6200 thru 6210. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13911-13 | The number of acres designated as ROW exclusion will have a significant impact on resource development, recreation, and livestock grazing, as well as conflict with current federal policy to advance renewable energy on federal lands. The Proposed RMP's overarching goal is to: "Manage public lands to meet transportation and ROW needs consistent with goals and objectives of other resources while supporting the national energy plans and policies." Compare DEIS at 2-115 (Mgmt. Action #6202 and Maps 2-22 and 2-24) with id. at 2-114 (Goal LR-06). But Preferred Alternative B directly conflicts with the Energy Act of 2020 and Executive Order 14008. The Energy Act of 2020 established a minimum goal of "authoriz[ing] production of not less than 25 gigawatts of electricity from wind, solar, and geothermal energy projects [on public lands] by not later than 2025." 43 U.S.C. § 3004(b). Executive Order 14008 sets the goal of reaching 100 percent carbon pollution-free electricity by 2030, net-zero emissions by 2050, and doubling renewable energy production on public lands by 2030. However, this goal will be difficult, if not impossible, to obtain if the BLM closes public lands to any new development or ROWs. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210, and management actions 6100-6108 for renewable energy. See Chapter 4.19 impacts analyzed for all four alternatives for Lands and Realty. Chapter 4, Section 4.20 analyzes the impacts for Renewable Energy. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13912-6 | There are six sections in the southeast corner of the KSLA in T15N R108W and T16N R108W that border the Rock Springs/Kemmerer Field Office boundary line that are not proposed ACECs, but are designated for Rights-of-Way exclusion in the BLM's Preferred Alternative B. Sweetwater holds the surrounding and intermingled surface and mineral rights with those six sections and this area holds some of the most prospective known remaining resources in the KSLA for a new greenfield trona mine. Any restrictions prohibiting the development of these sections in any way, would significantly impact the ability for the privately owned sections to be mined, for a new greenfield mine to be built in this area and would significantly impact Sweetwater, the local community, and the State of Wyoming financially and socially. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13912-8 | The proposed Rights-of-Way exclusion designations across the heart of the checkerboard in the Rock Springs Field Office management area in the map below, are checkerboarded with, encapsulate, surround, and or prevent access to a significant amount of Sweetwater's private surface and mineral estate, thereby making them inaccessible and prohibiting Sweetwater from any economic use of them. Even where the BLM right-of-way exclusion zone does not directly overlap with Sweetwater private lands, the exclusion zones foreclose access for transmission or other infrastructure needed for development in those areas. Sweetwater has numerous projects in various stages of development throughout these lands, including renewable energy, carbon sequestration and lithium mining. BLM restrictions that foreclose access to, and the economic use of, Sweetwater's private land and mineral estates amounts to a taking without just compensation in violation of the U.S. Constitution. | See Section 1.4 for the Planning Criteria and how this plan relates to private lands. Management actions for all four alternatives are identified in the DEIS for management actions 6000-6210. See maps 2-21 through 2.24. See Chapter 4.19 for the impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13923-7 | For portions of the Greater Little Mountain Area, sportsmen are requesting ROW exclusion. The impetus for this is to limit industrial scale projects that could do potential environmental harm by disrupting sensitive soils. The ROW exclusion should not, however, impact small scale agricultural operations who are in good standing with the BLM. These small operations should not be in the same category as industrial scale transmission lines, pipelines, and roads, etc. We encourage the BLM to revisit the Rights-of-Way policy to differentiate between industrial scale and small scale operations. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way | #13923-22 | For Management Action #4418, we support Alternative B that will prohibit renewable energy development projects in crucial habitat. Additionally, because these resource values are not compatible with wind energy development, ROW authorizations should not be issued within these areas. This is congruent with the 2005 Final Wind Programmatic Environmental Impact Statement and should be consistent in the planning area. | Management actions for all four alternatives are identified in the DEIS for management actions 6000 thru 6210. (Renewable Energy Management actions are found 6100-6108). Chapter 4.19 impacts analyzed for all four alternatives |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13925-1 | Many, if not all, of the management actions in the Preferred Alternative B will significantly impair RSGA's rights to use its land, to access to its lands, and to exercise its legal rights, including rights-of-way. The combined restrictions effect an unconstitutional and uncompensated taking. Knick v. Township of Scott, PA, 139 S.Ct. 2162 (2019) (holding claim of right to access property for public to visit grave sites effected a compensable takings). The Supreme Court wrote "A property owner acquires a right to compensation immediately upon an uncompensated taking because the taking itself violates the Fifth Amendment." Id. at 2169. See also North Mill Street, LLC v. City of Aspen, 6 F.4th 1216, 1224 (10th Cir. 2021) (When regulations "deprive an owner of 'all economically beneficial use' of her property' it will be recognized as a taking." (quoting Lingle v Chevron U.S.A., Inc., 544 U.S. 528, 537 (2005)). The BLM must remove all rights-of-way exclusion areas within the Checkerboard and other restrictions that impair RSGA's land rights. | Management actions for all four alternatives are identified in the DEIS for management action 6000 thru 6210. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13927-3 | Right of ways (ROW) are another issue that deserves greater consideration, including distinguishing between industrial ROW (e.g., transmission corridors) versus small ROW necessary for maintaining traditional land uses (e.g., water lines to serve livestock tanks). Within the GLMA, ROW exclusion is appropriate for new industrial-scale ROW. However, we encourage the BLM to consider the unintended consequences of ROW exclusion for small-scale infrastructure and existing traditional land uses and clarify that exclusions only apply to industrial new ROW. Trout Unlimited worked directly with the Ramsay Ranch to improve their irrigation infrastructure on BLM lands. This project stopped an active head cut allowed the ranch to maintain their water rights, allowed for fish passage, and improved trout habitat. BLM was a funder on this project. This project has a BLM ROW and would be in jeopardy if the Preferred Alternative were to be adopted for this management action. | See Glossary for definitions of ROW exclusions and avoidance areas. Management actions for all four alternatives are identified in the DEIS for management actions 6200 and 6210. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. See Section 1.4 for Planning Criteria in reference to valid existing rights. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13940-6 | Preferred Alternative B also proposes ROW exclusion areas within the Checkerboard. See id. at Map 2-22. JRB objects to these designations due to the impact it will have on the alternating sections of private lands and state lands. ROW exclusion areas infringe on private property rights by preventing the ability to access the private and state lands and to develop them when infrastructure (i.e. roads, pipelines, electric lines, etc.) cannot be placed on the neighboring public lands. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #13951-10 | Page 2-642; Map 2-22 "Restrictions on Rights - of - Way" -I am against all closed roads. Infrastructure is huge when planning and running a city, county, state, and a country. The BLM needs access for administration of our allotments. Firefighters need access to fight the inevitable. Ranchers need access to care for their livestock and properties. The list is endless…search and rescue, hunters, fisherman, recreationists, etc.. | See Section 1.4 for the Planning Criteria and private land management. Travel management and specific route designations is outside the scope of this RMP planning effort. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14023-7 | I recommend that no new roads be constructed within the District unless speci?cally approved through a special use permit. | Management actions for all four alternatives are identified in the DEIS for lands and realty management actions 6000-6015 and 6210. See Chapter 4.19 impacts analyzed for all four alternatives. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14026-2 | BLM's preferred alternative, which maximizes conservation at the expense of other uses, could have devastating effects on electric reliability and affordability; public health and safety; and the well-being of communities throughout the west and may set detrimental precedent for BLM public land management across the nation. It is critical that BLM conducts its due diligence on the potential effects of this proposed alternative, including undertaking a thorough Regulatory Flexibility Act analysis, and by issuing a detailed Statement of Energy Effects.6 NRECA encourages BLM to work with stakeholders in the electricity sector and throughout communities in the region to understand the real-world impacts of each alternative, and to best balance those impacts and the goals of the preferred alternative under the existing mandate of Multiple Use and Sustained Yield under FLPMA.7 | Management actions for all four alternatives are identified in the DEIS for management actions 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. See also Chapter 1, Section 1.4 Planning Criteria. Section 4.22 addresses socioeconomics impacts. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14026-3 | BLM proposes in this alternative, among other restrictions, to increase the size of Areas of Critical Environmental Concern (ACECs) in the region from the current 286,470 acres to over 1.605 million acres-44% of the 3.6 million acres covered by this Draft RMP/EIS.9 ACECs historically are managed to limit uses such as recreation, mineral and oil and gas production, agriculture, and electricity infrastructure siting. NRECA urges BLM to withdraw this proposed ACEC designation; or, if BLM proceeds with the designation, it should work with all stakeholders in the region to determine the appropriate size of the ACEC and to allow major and principal uses as detailed under FLPMA to continue in that region. NRECA further requests detailed information about how the preferred alternative's ACEC designation would affect electricity transmission, distribution, and project siting in the area, as well as how it may impact access to Rights-of-Way ("ROW") and vegetation management and grid hardening practices. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way | #14026-4 | Under the preferred alternative, BLM also would drastically restrict land available for electricity transmission and distribution by closing off over 2.4 million acres to Rights-of-Way and by prohibiting the creation of new transmission corridors.10 Restrictions on ROWs and transmission siting across such a large swath of the western United States may jeopardize the ability of the electricity sector to meet the growing needs of an ever-more | Management actions for all four alternatives are identified in the DEIS for management actions 6201 thru 6210. See maps 2-21 through 2.24. See Chapter 4.19 and 4.20 impacts analyzed for all four alternatives. See also Chapter 1, Section 1.4 Planning Criteria. Section 4.22 addresses socioeconomics impacts. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | electrified society, and to incorporate new and renewable sources of energy into the grid. Further, precluding the development of new transmission corridors does not effectively take into consideration the need for redundancy of some electrical transmission to ensure reliability for entire regions. NRECA urges BLM to refrain from placing any limitations on electricity ROWs and new transmission corridors. Should BLM select the preferred alternative as detailed in the Draft RMP/EIS, NRECA requests detailed information about the precise limitations on ROWs and transmission corridors, and the geographical areas where these limitations will exist. | |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14026-5 | BLM's preferred alternative also would impose restrictions on ROW width; and on the height and color of transmission infrastructure; and it would require undergrounding of distribution infrastructure.11 This alternative appears to have been drafted without due consideration of public health and safety regulations, nor with the advice of electricity stakeholders. Federal and industry safety and reliability standards govern the width of ROWs; and the height, color, materials, and construction of transmission and distribution infrastructure; and the conditions in which line undergrounding is appropriate and feasible depend on the location, geology, and engineering consideration of the area in question. The costs of meeting these requirements, even if they were somehow geologically and technically feasible everywhere, could cause severe financial distress for co-ops, which operate at cost and with extremely limited financial margins. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. Section 4.22 addresses socioeconomics impacts. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14026-6 | Adding unnecessary complexity, cost, and mandates on electricity infrastructure may chill investment in grid hardening and expansion, at a time of high wildfire risk and increased electrification of the nation. NRECA urges BLM to refrain from imposing any such requirements on electrical infrastructure in the final RMP/EIS. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. Section 4.22 addresses socioeconomics impacts. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14026-7 | NRECA also is deeply concerned about the possible restrictions imposed by the preferred alternative upon access to electricity ROW infrastructure for operations and maintenance activities. As BLM is aware, routine inspections, repairs, and vegetation management of the electrical system is critical for public safety, wildfire mitigation, and continued electric reliability. Utilities already face challenges and prolonged BLM approval processes to conduct these routine activities. Should this RMP/EIS limit access to electricity infrastructure and further complicate vegetation and grid hardening processes, risk of wildfire, outages, and other adverse events could increase. NRECA urges BLM to retract any potential limitations on ROW access and instead use this RMP process as an opportunity to improve utility access to their ROWs and to expedite and ease vegetation management and grid hardening processes on BLM-managed lands. NRECA encourages BLM to work with the electricity sector to understand vegetation management processes and access needs in the region and to incorporate those insights into the Final RMP/EIS. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14036-1 | companies have projects awaiting construction that are already approved and authorized in existing ROWs that would be impacted under Alternative B. To ensure EEI member companies can continue to fully utilize, manage, and maintain existing critical infrastructure, and construct already approved clean energy facilities in authorized ROWs, BLM should revise the Draft RMP/EIS. | Management actions for all four alternatives are identified in the DEIS for management action 6201. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. See Section 1.4 for Planning Criteria in reference to valid existing rights. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14036-2 | Electric companies require access to distribution and transmission power lines and substations for activities including inspections, operations and maintenance, vegetation management, and wildfire prevention. Access to company facilities is critical for the safe and reliable operation of the electric grid. Under Alternative B, "areas managed as exclusion areas for ROWs would increase to 68% of the planning area and areas managed as avoidance areas for ROWs would decrease to 4% of the planning area."22 This general reduction of existing access across the territory could reduce electric company access to infrastructure, resulting in public safety, security, and wildfire risks. Many power lines do not have designated access roads; rather, the electric company receives a ROW grant and uses public access routes to access facilities. | Management actions for all four alternatives are identified in the DEIS for management action 6201 and 6202. See maps 2-21 through 2.24. See Chapter 4.19 impacts analyzed for all four alternatives. See Section 1.4 for Planning Criteria in reference to valid existing rights. |
| 827 - Land Resources–Rights-of-Way and Corridors (6200-6210) | #14038-1 | ll current roads and trails need to remain open. These roads provide access for recreation, managing allotments, emergency response, hunting, mineral production, and many other uses. In an area of 3.7 million acres, there should be a substantial amount of roads that are permitted as well as maintained. Proposed ACEC's threaten routes and access for various user groups. These areas have a historical use and closing them is shutting the local communities off from their history. The environmental impact of the current transportation network is mitigated by the small number of current routes and open OHV areas. These roads, trails and recreation areas are crucial for the local economy for communities such as Lyman and Sweetwater County and other small communities that rely on access to the planning area. The U.S. Bureau of Economic Analysis showed that in 2021 the outdoor recreation industry brought in $821 billion nationwide. By limiting access to this area the BLM could be harming the local economy and robbing them of potential income. Giving preferential treatment to one user groups over another is against the BLM's multiple use mandate and permit. | See Section 1.4 for the Planning Criteria and private land management. Travel management and specific route designations is outside the scope of this RMP planning effort. |
| 827 - Land Resources–Rights-of-Way | #14038-3 | In April 2022 the Department of Interior released it's Equity Action Plan which addresses the lack of access on public lands. In order to advance equity of access on public land for those with mobility impairment disabilities, it is important to recognize that discrimination towards Americans with disabilities within federal land management agencies is deeply rooted and hidden in plain sight. Recreation, primarily motorized recreation, has taken a | Management actions for all four alternatives are identified in the DEIS for Recreation for management actions 6502 and 6503. See Chapter 4.17 for impacts analyzed for all four alternatives. As stated in Management action 6607, see maps 2-25, 2-26, 2-27, and 2-28 for OHV area designations by alternative. Map 2-25 shows existing designations under the current Green River RMP. Route specific Travel and Transportation Management |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| and Corridors (6200-6210) | | backseat to conservation and protection. Motorized recreation is often the only way those with mobility impairment disabilities are able to access public lands. BLM should ensure that the plan complies with the Department of Interior's Equity Action Plan, which recognizes that restrictions on motorized access to public land create barriers of access to those with disabilities. | decisions are outside of the scope of this DEIS. Accessibility equipment that is credibly assured to be in use in assisting a disability does not fall under the definition of 'OHV'." |
| 828 - Land Resources–Backcountry Byways(6300-6306) | #13600-9 | MA#6305, p.2118: Consider adding a Cherokee Trail back country byway. The Cherokee Trail is eligible for eventual NHT status—we want to see it remain undamaged, protected and preserved. | See Management Actions 6300-6306 for a full range of alternatives analyzed regarding potential designations of Backcountry Byways. Note that Back Country Byways are for motorized use. |
| 828 - Land Resources–Backcountry Byways(6300-6306) | #13776-6 | On a related note, closing existing scenic and backcountry routes (Management Actions 6303 and 6304) is wasteful; the routes are already developed and utilized so maintaining them per Alternative A seems prudent. | See Management Actions 6300-6306 for a full range of alternatives analyzed regarding potential designations of Backcountry Byways. |
| 828 - Land Resources–Backcountry Byways(6300-6306) | #13974-6 | On a related note, closing existing scenic and backcountry routes (Management Actions 6303 and 6304) is wasteful; the routes are already developed and utilized so maintaining them per Alternative A seems prudent. Management Action 6308 incorrectly references 6318 with regard to interpretive and directional signage; language from Alternative A could be merged with Management Action 6302. | See Management Actions 6300-6306 for a full range of alternatives analyzed regarding potential designations of Backcountry Byways. See updates to Management Action 6305 to edit erroneous reference. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #47-1 | I question whether Alternative B is sufficient in terms of ensuring adequate future management of livestock grazing to protect vulnerable resources. This grazing can degrade rangeland health, aid in invasive weed infestations, remove forage needed by wildlife, and destroy fragile riparian vegetation. I believe that BLM should identify those grazing allotments that are degraded or have serious resource impacts and then recommend them for permanent retirement. The existing grazing permits for those allotments could be acquired or allowed to expire without renewal. | Management Action 6404 provides livestock management actions that may be taken to address areas that do not meet the Wyoming Land Health Standards. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #332-2 | The intended purpose of the release of a draft plan is to provide a wide spectrum of options while identifying as a Preferred Alternative a balanced approach that meets the BLM multiple use mandate. This approach then enables all interests to recommend meaningful substantive changes to that alternative. The current Alternative B is so completely detrimental to multiple use, including livestock grazing, that it does not even lend itself to constructive comment. It completely fails to recognize the importance of the expertise and commitment of local interests, including local BLM personnel, to management of these lands. | As stated in Section 1.2.1 of EIS, "The Rock Springs RMP will address changing needs of the planning area by updating information and revising management goals, objectives, and decisions while ensuring that public lands are managed according to the principles of multiple use and sustained yield as identified in the Federal Land Policy and Management Act (FLPMA) of 1976 while maintaining the valid existing rights and other obligations already established." All management actions were developed to meet the requirements of FLPMA, including the multiple use and sustained yield mandate. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #478-1 | The BLM claims that riparian zones, or lush patches of vegetation nears small streams, need to be protected from cattle grazing. I would like to note that the ranchers have been involved with developing riparian areas throughout Wyoming. | Impacts to riparian area from livestock grazing activities are discussed in Section 4.6 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #506-1 | BLM should ensure that any future livestock grazing is properly managed to protect native pollinators. In some areas of high potential conflicts or degraded lands, it may also be appropriate to not renew existing grazing permits and to find those allotments no longer available for grazing in the revised RMP. | See updates to Section 4.6 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #531-2 | Also, prescriptive management in the form of targeted management would be the most effective management that doesn't severely impact large areas of land. For example, Steamboat Mountain ACEC should be managed for targeted areas of interest, not simply increasing the size of the ACEC acreage by ten-fold. | Management Actions 7516 through 7529 describe management within the Steamboat Mountain ACEC. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #537-3 | As with most of the EIS's BLM has done, they continue to ignore the fact they do not have the staff to meet the needs outlined in the Alternatives. For instance, if a land health evaluation shows that land health standards are not met and current livestock grazing management is determined to be among the causal factors, implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit/lease up to three consecutive years (60%) in active AUMs until land health standards are met. If they did implement it would be on inadequate data. BLM's Rangeland Health Standards (RLHS) are at least 20+ years old. | Staffing of BLM personnel is outside the scope of this Resource Management Plan revision. See Section 1.3 for Planning Criteria of this land use planning process. |
| 829 - Land Resources– | #539-1 | Surface disturbing activities may be either authorized or prohibited (WY IB-2007-029).20 These definitions appear to be targeted towards restricting oil and gas activities, but the way in which they are worded could restrict our | Impacts to livestock operations associated with these various management actions are provided in Section 4.16 of the EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Livestock Grazing Management (6400-6417) | | grazing operations. For example, under Volume 2, Appendix B, the RMP allows for no surface disturbing activities within 3 miles (!) of the Continental Divide Trail, the visual horizon, the continental divide snowmobile trail, or the south pass cross country ski trail.21 Under the current definitions noted above, grazing could be considered as a way that "vegetation" or "soil resources" could be "altered." The big game migration corridor ACEC does not allow ANY surface disturbance activities for any reason. Even if the BLM determines that grazing itself is not a surface disturbing activity, it is certainly possible that most rangeland improvements and efforts to doctor sick livestock could be. This would be detrimental to our grazing operations because the big game migration corridor ACEC runs directly through our allotments and the continental divide snowmobile trail would apply to half a mile of our little prospect allotment, which is a significant chunk of grazing rangeland. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-2 | This protocol would actually be detrimental to wildlife (ironic because it is titled "big game migration corridor") and according to the BLM's own science in the DEIS, rangeland improvements help the local wildlife.22 LSGA would encourage the BLM to specifically allow grazing and rangeland improvements under these restrictions by listing them as an exception to these rules in the plan. | Proposed management actions for all four alternatives considered for the proposed Big Game Migration Corridor can be found in actions 7555 - 7562. Impacts from all four alternatives can be found in Chapter 4. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-3 | The next ACEC issue is that the South Wind River ACEC and the Big Game Migration Corridor ACEC likely violate PRIA and the TGA. As noted above, the congressional intent of PRIA is to "prevent economic disruption and harm to the western livestock industry." The TGA created grazing districts (which FLPMA specifically kept in existence) and the Secretary has already deemed that these districts are "chiefly valuable for grazing," meaning that the primary purpose of the lands in these districts are for livestock grazing, even over other purposes such as wildlife, conservation, plant habitat, etc. | As stated in Section 2.1 of the EIS "The alternatives represent reasonable approaches to managing resources and activities consistent with law, regulation and policy." See also Appendix E. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-4 | Appendix N of Volume 2 outlines the economic analysis of the plan. However, this analysis is lacking and has failed to take a "hard look" at what economic disruption the management prescriptions in this plan would have on the livestock industry. For example, as discussed supra, grazing could be reduced by 20% in riparian areas within the ACEC if the BLM determines an allotment is not meeting the BLM's rangeland health standards, or due to restrictions related to the ACEC itself, AUMs or rangeland improvement projects could be hamstrung which could significantly affect our grazing operations and these kinds of affects were not looked into under Alternative B. We attest that significant reductions in AUMs would run our operation out of business and a further economic analysis should be done under the circumstances presented under Alternative B. | Socioeconomic impacts are provided in Section 4.22 of the EIS. In the "Methods for Livestock Grazing" portion of Section 4.22.2 details are provided regarding the methods used to evaluate impacts to livestock grazing, including rationale for the methodologies used. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-5 | Wind River Front West: Historic: Buckskin Crossing Cemetery. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA, bluehead sucker, flannelmouth sucker, round-tail chub, limber pine. South Wind River: Cultural: NHT. Wildlife: big game crucial winter range, designated Sublette mule deer migration corridor. Special Status Species: sagegrouse PHMA, bluehead sucker, flannelmouth sucker, and round-tail chub. Paleontological resources: middle Eocene fossil resources. Scenic: panoramic landscape. Big Game Migration Corridor: Cultural: NHT. Wildlife: designated Sublette mule deer migration corridor, big game crucial winter range, big game parturition. Special Status Species: sagegrouse PHMA.25 These values should not result in the heightened scrutiny of an ACEC designation for the following reasons. First, when the BLM is seeking to protect the historic and cultural values mentioned such as historic trails, cemeteries, etc., it seems extraordinarily arbitrary and capricious to designate a vast 374,710 acre land restriction rather than to make a small- targeted--ACEC for each of these areas. Or by contrast there could be specific protections through management prescriptions offered for these cultural and historic resources by simply putting guidelines for these specific resources in this RMP. Furthermore, having surface disturbance restrictions near trails such as NHT or CDNST to the tune of having multiple miles of buffer is an incredibly broad amount of land needed to "protect and prevent irreparable damage" to an area. | Appendix C of the EIS provides a report that details the evaluation of each ACEC. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-6 | Next, with regard to wildlife, the BLM should remember that the State of Wyoming is responsible for management of its wildlife in this jurisdiction. While the BLM does have a responsibility to manage the landscape, one would think that before designating vast ACECs, the BLM would seek whether the Wyoming Game and Fish Department would think it was a good concept. For example, it was the State of Wyoming, after all, that designated the sublette mule deer migration corridor. In doing so, the State's report noted that "[m]aintaining the integrity of ranching operations will benefit the continued movement of animals across the landscape, and consequently efforts to conserve ranches within the migration corridor will conserve the corridor itself."26 Additionally, if an ACEC can be designated to protect big game populations and their accompanying corridors, then the entire western United States could be designated as one big ACEC. Therefore, LSGA requests that this line of reasoning for designation either removes the ACEC or sets aside specific exceptions to allow for continued livestock grazing as it has been done along with rangeland improvements. By the BLM's own analysis, rangeland improvement projects benefit wildlife.27 | Proposed management actions for all four alternatives considered for the proposed Big Game Migration Corridor can be found in actions 7555 - 7562. Impacts from all four alternatives can be found in Chapter 4. ACEC criteria can be found in Appendix C |
| 829 - Land Resources–Livestock | #539-7 | Another wildlife value the BLM is using to justify these ACEC designations is the fact that these areas are sage grouse PHMA. The science on this matter is not clear according to recent studies coming out of CSU and USU.28 However, early data shows that, if managed properly, grazing can actually be a positive for sage grouse | Appendix C of the EIS provides a report that details the evaluation of each ACEC. The Greater Sage Grouse Amendments from 2015 and 2019 have been incorporated into the EIS as part of Alternative A. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Grazing Management (6400-6417) | | populations. In addition, the BLM and USFWS, and scores of cooperators are currently working on a sage grouse plan for the western states that will address the sage grouse issues and therefore LSGA recommends that 25 RMP/DEIS, Vol. 2, Appendix C, C.17-C.19. It states in part that water related rangeland improvements were "installed to benefit livestock that graze the forage but many also benefit wildlife and generally promote improved rangeland health within the planning area." the BLM not use sage grouse as a reason to designate vast ACECs, but rather it should let the concurrent process work itself out first. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-8 | Ultimately, Congress intended for the BLM to only use ACECs to "protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards." Livestock grazing in Wyoming has been going on since the mid-1800s.29 Before that, bison and wildlife have always grazed the landscape.30 To think that livestock grazing could create irreparable damage to the landscape is not only arbitrary and capricious, but ahistorical. Because of this, we ask the BLM to rescind the Big Game Migration Corridor ACEC and the South Wind River ACEC. If the BLM will not do that, we at least ask that livestock grazing be given exceptions to strict management protocols that would restrict our livestock operations and would restrict surface disturbance activities related to livestock grazing. | Appendix C of the EIS provides a report that details the evaluation of each ACEC. Impacts to livestock grazing are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-10 | In LSGA's situation, the BLM has made the determination that our Little Sandy allotment is not meeting the BLM's riparian habitat standards, citing livestock use as the central cause.32 The punishment for not meeting the BLM's rangeland health protocols are a 20% reduction in AUMs for up to 3 years.33 This is an extremely frustrating item to see in the RMP because LSGA is on the phone and meeting with our range conservationist either weekly or bi-weekly and this has never come up in our conversations in terms of what a riparian habitat is and its regulatory consequences. There are no maps available showing where the riparian areas are. The lack of transparency as to what ranchers are being charged with is shocking. We can only assume that the BLM considers the Little Sandy as a riparian area and much of that is private. | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-11 | Further, in conversations with our range conservationists, we have come to believe that the elk and deer degrade that water stream far harder than livestock, especially in the winter months. We request that the BLM show us proof of this declaration. If it cannot do so, we request that this be removed from the plan. Further, even if for some reason this were true, the punishment for failing to meet rangeland health standards under this provision is arbitrary and capricious because this punishment does not match the congressional intent of PRIA and the TGA. | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-12 | The congressional intent of PRIA is to "prevent economic disruption and harm to the western livestock industry." The TGA created grazing districts (which FLPMA specifically kept in existence) and the Secretary has already deemed that these districts are "chiefly valuable for grazing," meaning that the primary purpose of the lands in these districts are for livestock grazing, even over other purposes such as wildlife, conservation, plant habitat, etc. LSGA and its individual ranchers could not remain in business with a 20% reduction in AUMs for three years. | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-13 | For MA 6404, Alternative D makes the most sense and we oppose Alternative B for the reasons discussed in Section III(b) of this comment letter. MA 6405 would be nearly unmanageable for the BLM. In determining a stocking rate of between 21%-40% on each allotment would be difficult and speculative to access. Furthermore, the remedy to reach that level of stocking could de facto cancel AUMs. MA 6406 would be a violation of the TGA. As discussed above, Wyoming TGA grazing district 4 has been accessed as "chiefly valuable for grazing" and therefore the primary use of the land is for grazing and not for wildlife management experiments (which is what the BLM appears to be doing). | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-14 | MA 6411 has prescriptions that prohibit mineral block supplements within ½ mile of certain water sources, within 3 miles of an NHT, or within ¼ mile of a special species plant population. These are extremely long distances and LSGA would assert that there is no scientific or factual basis for these distances. The BLM should reconsider these arbitrary and capricious management prescriptions and come back to the table in the final RMP with more reasonable distances, | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. Also note that Alternative B has been identified in the Draft EIS as the "Agency Preferred Alternative". The BLM has the authority to select elements of any of the four alternatives analyzed as the final Proposed RMP in the Final EIS in response to public comment and further review. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-15 | Under the Special Designations section, specifically as it relates to ACEC MAs, LSGA sees a number of troubling management prescriptions. First, we would attest that MA 7402 would violate the TGA because the BLM is prioritizing watershed stabilization/improvement and wildlife over grazing. We similarly argue that MA 7414 &; 7423 would also violate the TGA for the same reason. | As stated in Section 2.1 of the EIS "The alternatives represent reasonable approaches to managing resources and activities consistent with law, regulation and policy." |
| 829 - Land Resources–Livestock Grazing | #539-16 | The last matter that LSGA would like to discuss is the BLM's assertion throughout the entirety of the document that livestock grazing contributes to landscape health degradation. And while the BLM does concede that certain rangeland improvements benefit wildlife (such as water projects), there is an increasing mountain of evidence emerging that grazing itself, when managed properly, actually improves the land.34 Professor Peter Byck from Arizona State University is currently in the final stages of premiering a documentary-series on CNN that will | Impacts to vegetation communities from grazing activities are described in Section 4.6 of the EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | discuss livestock grazing's benefits to the landscape.35 In essence, research is showing that North America developed its rich topsoil due to the presence of over 100 million buffalo grazing on the landscape. Livestock's contribution is a key part of the ecosystem, and if the BLM would look further into the emerging body of science, it would see that its new found strict approach to grazing would be harmful to the landscape for generations into the future. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #539-17 | Sweetwater County believes that the objectives of special designations can be met by well-planned and managed development of natural resources. For this reason, special designations established in a plan need to be based on identified need and supported by verifiable scientific data available to the public. A special designation must show that protection cannot be provided by other means and that the area in question is truly unique compared to other area lands. The area classified shall be the smallest area necessary. | Please refer to Section 3.22 of the EIS for a description of special designations. Appendix C of the EIS provides a report that details the evaluation of each ACEC. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #540-1 | It must also be noted that, to the extent BLM relies on the Consent Decree of 2013 as justification for planning wild horse management and livestock grazing as part and parcel of one another, the 2013 Consent Decree has expired and is no longer in effect. The 2013 Consent Decree should not be considered by BLM when selecting locations to be designated as ACECs. | Appendix C of the EIS provides a report that details the evaluation of each ACEC. See also Section 1.4 for the planning criteria and Chapter for details about specific management actions related to wild horse management and livestock grazing. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #540-2 | BLM should consider the harmful effects of livestock grazing and the benefits to the range of wild, free roaming horses, ensuring that wild horses are given priority over livestock grazing when ACECs overlap with wild horse HMAs and other lands on which wild horses roam. Often, where there is ecological degradation to the range, BLM will place fault on wild horses and prioritize their removal, to the benefit of livestock grazing and contrary to the WHBA and the goal of the RMP/EIS. However, a report by Public Employees for Environmental Responsibility (PEER) noted that BLM's own records show that cows outnumber horses on BLM lands by a ratio of 30 to 1.14 "Of the lands that failed to meet [Land Health Standards], BLM reported that in 72% of cases, 'a significant cause' was livestock grazing."15 This equates to approximately 40 million acres of BLM land [nationwide] that is failing due to overgrazing of livestock.16 Limiting livestock grazing also helps protect the natural habitats of elk, deer, moose, pronghorn, and other rangeland wildlife. | The impacts of grazing activities on vegetation communities are provided in Section 4.6 of the EIS. Impacts related to the ACEC designations, wild horse management, and livestock grazing can be found in Chapter 4 for all four proposed alternatives, including those for non-designation of a proposed ACEC. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #540-3 | BLM should also consider the benefits to the range by limiting livestock grazing in the ACECs and the planning area, allowing for thriving wild horse populations that are highly beneficial to the rangeland.17 Studies demonstrate that equids support healthy ecosystems on public land if given sufficient habitat and left alone (Lundgren et al., 2021; Lundgren et al., 2017; Downer 2014). Wild horses spread plant seeds over large areas where they roam and do not decompose the vegetation they ingest as thoroughly as ruminant grazers, such as cattle or sheep, allowing the seeds pass through their digestive tract intact into the soil fertilized by wild horse droppings. Wild horses also help to prevent catastrophic fires and help to build more moisture-retaining soils. Soil moisture dampens out incipient fires and makes the air coating the earth moister. | The impacts of grazing activities on vegetation communities are provided in Section 4.6 of the EIS. Impacts related to the ACEC designations, wild horse management, and livestock grazing can be found in Chapter 4 for all four proposed alternatives, including those for non-designation of a proposed ACEC. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #548-3 | page 2-119, Alternative B, reads, "If a land health evaluation shows that land health standards are not met and current livestock grazing management is determined to be among the causal factors, implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit/lease..." What is the definition of a causal factor? 10% caused by livestock? 1%? 0.0002%? Specific values are needed to avoid subjective and arbitrary decisions. | Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #3188-1 | livestock aum's should be available to ranch landowners with the right to use them as long as the vegetation is available. yes in dry years they should be reduced. | Management Action 6404 proposes four alternatives for the number of AUMs available for use by livestock within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #3188-2 | salt and minerals for livestock can be put in areas safe from water sources to limit the amount of traffic to streams. but remember that even antelope deer and elk will take advantage of the salt and minerals available. | Management Action 6411 proposes four alternatives regarding how salt and mineral supplements may be utilized within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing | #4026-20 | Chapter 4.16.1 Livestock Grazing Management, Assumptions. I feel an additional assumption concerning springs and seeps should be added to this section. Before a seep or spring is included in a range improvement program, the BLM should do an extensive investigation of the hydrologic, biologic, and cultural significance of that feature. In many cases, other resource values will outweigh the positive impacts of spring development. This assumption | Management of livestock grazing within the Resource Area are provided in Management Actions 6400-6417. The BLM would continue to follow all applicable laws, including the National Environmental Policy Act, when planning and constructing projects. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | could be worded as: "Seeps and springs can possess unique hydrologic, biologic, and cultural values and not all of these features are suitable for range improvement." | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9354-3 | 4111 Alternative B "Rest all treated areas a minimum of five growning season from livestock grazing. This will put all of your ranchers out of business.. You have to go with alternative D in this case. It needs to be site specific and the rancher needs to work with the BLM range manager to make sure that things grow back. | Management Action 4111 proposes four alternatives regarding treatment area management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9354-4 | 4211 All alternatives are rephering to "Emphasis would be placed on non-lethal methods of control techniques and methods would be discussed at the annual management meeting between the BLM and the APHIS-WS" I believe if the rancher can not kill a predator on site when he see's it attacking his stock, he will suffer too many losses before he can get to the Game and fish or the BLM. We need to be able to protect our stock. | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9354-5 | 4420 Alternative B livestock grazing in partutition habititats. The restrictions is going to be hard to enforce with State, and Private ground as well as Forest permits.. This will cut back all the use for camping, grazing and everything. It will cut back grazing time from May 1st to July 1st so this is going to impact the ranchers as well as the people wanting to camp and get out. | Management Action 4220 proposes four alternatives regarding parturition habitat management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9458-1 | The total sheep and Lamb Inventory in Wyoming in 1932 was 3,972,000 and it remained fairly constant through 1942 when the Inventory was 3, 934,000. In the 2023 census the sheep and lamb inventory was 335,000. There are several factors responsible for this precipitous decline but a major cause is the coyotes and other predators. Now the Preferred Alternative calls for severe restrictions on predator control as outlined below: * Designate, in coordination with APHIS-WS, the entire planning area as a "restricted control area" for animal control. Animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives. Emphasize non-lethal methods. * Allow animal damage control on BLM land only if it would benefit Special Status Species or is needed for valid safety concerns. How will the two above items in the Preferred Alternative help the existing sheep industry? | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9721-7 | The statement requiring photo point monitoring for all channel crossings and all surface disturbances greater than½ acre limits the use of best available technology or most appropriate monitoring methods to track and monitor rangelands. Monitoring programs are to be developed to accurately capture and record trends in relation to desired goals and objectives. Photo point monitoring is a good and appropriate method for monitoring some attributes of rangelands but, should not be considered the only method due to development of future monitoring protocols or management objectives. You should restate this requirement to state the BLM encourages the utilization of photo point monitoring, but other methods may be considered. | Proposed management actions for all four alternatives considered for the use of photo point monitoring on channel crossings can be found in management action 1109. Impacts from all four alternatives can be found in Chapter 4. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9759-1 | Prohibiting putting out salt for livestock will harm wildlife wh also use the salt. Reducing the grazing would also cause a reduction in water provided by wells and structures on private lands if the adjacent public land cannot be grazed. Wildlife use private water in order to live on federal land. | As described in Management Action 6411, the use of Salt and Mineral supplements would be allowed under all alternatives. As described in Management Action 6416, range improvements projects (including water wells) would still be allowed within the resource area. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9768-1 | When it is necessary to permanently retire grazing allotments through RMP decisions, it may be possible to compensate the affected ranchers for the loss of these grazing privileges through establishment of mitigation fees from BLM allowing habitat destruction for mining, fossil fuel, and other intensive developments. I believe that retiring degraded allotments, and buying out the affected grazing permits, is an appropriate and effective mitigation measure to offset habitat losses from other approved land uses. This mitigation approach would be a normal requirement during the NEPA compliance process and consistent with relevant federal laws and policies. | The range of alternatives for management action 6402 provides guidance on how and when livestock grazing use would be adjusted. Impacts from all four alternatives under this management action are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9768-2 | I think that BLM grazing reforms are needed, especially to stop grazing where it fails to meet standards and has degraded rangeland resources. This current RMP revision process provides the key opportunity to identify degraded rangelands and to designate those allotments as no longer available for future grazing. | The range of alternatives for management action 6402 provides guidance on how and when livestock grazing use would be adjusted. Impacts from all four alternatives under this management action are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing | #9774-1 | In the RMP/DEIS, some baseline data exists regarding grazing. However, the information cited in Appendix G-Land Health Standards fails to cite when this data was collected. Additionally, this data falls short of providing specific information about the baseline conditions. These baseline conditions must be descriptive and not simply categorized as "met." We urge the BLM to articulate the minimum forage conditions in high plains. | The information provided in Appendix G of the EIS is appropriate for a planning level document. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9774-2 | Data provided by PEER contradicts Wyoming LHS compared to the RMP/DEIS. In the RMP/DEIS, many grazing allotments claim to meet the LHS. The BLM should provide all available information regarding current grazing practices and land conditions. Based on outside research and from the RMP/DEIS, it is unclear what the current conditions of the land are in 2023 since this plan has taken over a decade to complete. | The information provided in Appendix G of the EIS is appropriate for a planning level document. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9774-5 | We urge the BLM to continue with this alternative and to consider being stricter in their use of grazing to reduce GHG emissions further. To reduce GHG emissions, we recommend that the BLM limit AUMs. GHG emissions "from enteric fermentation and manure deposition on public lands were…2.1 million t CO2e for Wyoming." The SCC for this statistic using the more conservative IWG figures versus the EPA's less conservative figures would be 107.1 million and 252 million dollars, respectively. According to the US Geological Survey (USGS) and US Department of the Interior (DOI), "[Methane] (CH4), are…highest for Federal lands in Wyoming [at] 28 percent." | Impacts from livestock grazing on greenhouse gas emissions are provided in Section 4.3 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9774-6 | Additionally, we know creative solutions exist that help to reduce methane emissions from cattle. In Australia, scientific studies published in the last couple of years have shown that "red seaweed (Asparagopsis taxiformis) reduces enteric methane by over 80 percent." By including red seaweed in cow feed, cows produce less methane. From a CBA standpoint, the cost of seaweed proves to be more cost-effective for the government compared to the harm caused by methane emissions. We recommend that the BLM mandate ranchers to include red seaweed or other feed additives in their cow feed as a way to reduce methane emissions on cattle grazing on public lands. One way to mandate seaweed or other feed additives proven to lower methane emissions in cow feed would be for the federal government to supply the seaweed as a subsidy. | Requiring livestock operators to provide specific types of food for their livestock is beyond the scope of this planning level document. See Section 1.4 of the EIS for the scope of this planning effort. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-3 | Through its grazing prescriptions and overlaying constraints, the DEIS fails to provide for sustainable levels of livestock grazing under each of the management scenarios or explain how the alternatives would impact the production of both food and fiber in the region. Sustainable levels of livestock grazing encompass more than simply the number of AUMs - it's also the management restrictions and/or flexibility that allow for effective and efficient management of the livestock and their grazing utilization. | Socioeconomic impacts of the various alternatives on livestock operations are provided in Section 4.22 of the EIS. Impacts to livestock operations on public land within the Resource Area are provided in Section 4.16 of the EIS. Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-4 | Worse, the DEIS discounts the impacts on grazing allocations. For example, Table 1 provides a summary of grazing allocations as follows, which is the number of acres where livestock grazing would be allowed: Table 1. Comparison of Land Use Restrictions and Allocations Livestock Grazing Allocations (Bureau of Land Management Surface Lands) Alternative A: 3,591,404 Available / 970 Unavailable Alternative B: 3,583,798 Available / 8,576 Unavailable Alternative C: 3,592,374 Available / 0 Unavailable Alternative D: 3,589,859 Available / 2,515 Unavailable But that's not the significant measure of the impact of grazing allocations. Pages 2-119 and 2-120 indicate there will be substantial differences. Under Alternative A, authorized grazing use would not exceed the recognized permitted active AUMs (318,647 AUMs.) Under Alternative B, "the total authorized livestock use for a grazing season within the RSFO would be the active use AUMs sustained on an allotment-by-allotment basis for livestock grazing." Alternative C would have the BLM "reduce total authorized use to the highest level of billed use over the last 10 years (2009-2018). A total of 160,387 active AUMs will be allocated for livestock use." Alternative D would "authorize livestock grazing at current active use AUMs within all existing grazing allotments. Total active use AUMs currently administered by the RSFO are 304,261." | Section 4.16 of the EIS has been updated as appropriate. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-5 | Thus, Alternatives A &; D would maintain authorized grazing use at current levels, while Alternative C would cut authorized use by 50%. But these pages in the DEIS do not specify exactly what the authorized use level would be under Alternative B, a violation of NEPA. The BLM must define the specific level of authorized use for this alternative. Page 4-234 mentions that total authorized AUMs would be reduced 6,202 AUMs under Alternative B, and page 4-233 assumes that authorized use would be 297,066 AUMs, but this number must be set out in the management prescription for the alternative, not just in an analysis of consequences. | MA #6404 provides a range of alternatives. Impacts from each of the alternatives are presented in Chapter 4. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-6 | The BLM needs to explain exactly what it means by the entirety of this phrase found on P 2-120: "the total authorized livestock use for a grazing season within the RSFO would be the active use AUMs sustained on an allotment-by-allotment basis for livestock grazing." This wording is substantially different than the wording used in the other three alternatives. The DEIS socio-economic analysis uses the 10-year average (2006-2015) for estimates of authorized AUMs, but does not mention that during that period, Wyoming was suffering through a historic megadrought in which livestock grazing was reduced by livestock producers in the region. | MA #6404 provides a range of alternatives. Impacts from each of the alternatives are presented in Chapter 4. |
| 829 - Land Resources–Livestock Grazing | #9792-9 | In March 2022, the United Nations, of which the United States is one of five permanent members, unanimously passed a resolution declaring 2026 the International Year of Rangelands &; Pastoralists. In part, the resolution recognizes that "pastoralism is a dynamic and transformative livelihood linked to the diverse ecosystems, cultures, identities, traditional knowledge and historical experience of coexisting with nature," while "Reaffirming that healthy rangelands are vital for contributing to economic growth, resilient livelihoods and the sustainable development of | Section 4.10 of the EIS describes how livestock grazing can reduce hazardous fuel loads which reduces wildfire occurrence. Section 4.22 of the EIS describes the socioeconomic impacts from the various alternatives, including impacts to the livestock/agricultural industries. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | pastoralism." Yet the DEIS does not discuss the positive benefits to people, land, and ecosystem services provided by pastoralism and transhumance. It does not mention how these practices are an important component of biodiversity and climate solutions, or how they are valued cultural traditions. It doesn't mention how livestock grazing reduces wildfires, or how grazing the RSFO allows the production of both high-quality food and fiber in an arid rangeland that is otherwise unsuitable for food production. Since the DEIS doesn't discuss these topics - all at the core of the BLM's mission - the record prepared by the BLM doesn't include scientific sources for any of these topics. The DEIS does not include provisions for the land to become as productive as feasible for livestock grazing. Instead, the BLM's preference is for production increases to be allocated to wild animals, not livestock. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-10 | The DEIS focuses on speculative negative impacts from livestock grazing while imposing further restrictions on livestock grazing management that will make such use economically unfeasible. | Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." Impacts to various resource values from livestock grazing are provided throughout Chapter 4 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-11 | The DEIS is unbalanced in its treatment of livestock grazing management. It fails to take note of the vital importance of private land located along waterways interspersed throughout the RSFO and how ranchers manage these lands as large units rather than on a parcel-by-parcel basis, or the impact of the BLM's management regime to these private lands. | Section 1.4 of the EIS explains "Lands covered in the RMP will consist of public land and split estate lands managed that the BLM manages. No decisions will be made relative to non-BLM administered lands." |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-13 | We are especially concerned about the lack of comprehensive and fair treatment of the impacts to livestock grazing. We request that the EIS be revised to incorporate the assessment methodology and practices as described by: Brymer, Amanda L. Bentley, et al. "Economic and social impact assessment of ranching on public lands: A guide to concepts, methods, and applications." Journal of Rangeland Applications 4 (2018). {See Attachment A to this letter.} As noted in Brymer, et al, "A problem with the average AUM scenario is that federal grazing is not typically used in isolation but rather as part of an individual ranch's overall grazing operation. If a ranch is seasonally dependent on federal grazing, as is the case for many western ranches in northern climates, a reduction in federal AUMs can create forage imbalances that produce greater reductions in grazing capacities than just the change in federal AUMs. This suggests that a production scenario based on the changes in the overall ranch production results from a change in federal grazing policy and would be an appropriate scenario to consider in the economic impact analysis." Bremer, et al, also point to the need to provide an overview of resource amenities, the need to account for the social impacts of projects and policies to rural communities, and understanding the social context, of policy shifts in federal land management decisions. | Socioeconomic impacts are provided in Section 4.22 of the EIS. In the "Methods for Livestock Grazing" portion of Section 4.22.2 details are provided regarding the methods used to evaluate impacts to livestock grazing, including rationale for the methodologies used. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-15 | Alternative B includes a reduction of 6,202 AUMs. That may not sound like a lot, but it is. An AUM is a month's use and occupancy of range by one cow, bull, steer, heifer, horse, burro, mule, five sheep or five goats over the age of six months. So Alternative B's reduction equals the loss of four months of grazing for 1,500 cows with calves, or 3 months of grazing for 2,067 cows with calves, or six months of grazing for 5,000 ewes with their lambs (5 bands of sheep). It's a huge loss. | A definition of Animal Unit Month is provided in the Glossary of the EIS. Impacts to livestock associated with management actions in Alternative B are analyzed in Section 4.16.3 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-16 | Page 2-120, Alternative B, proposes: "Establish allotment stocking rates which result in forage utilization levels in areas preferred by livestock (generally a light 21% to 40% utilization level) that provide for wildlife cover and utilization." Explain the methods and reasoning that led BLM to propose this management prescription and disclose how this grazing scheme will result in less AUMs available for permittees. The plan prescribes "light grazing" which it describes as "livestock grazing that consumes no more than about 30% of the current year's growth of forage plants. Light refers to the effect on the landscape, which is measured through utilization monitoring. You may reduce the number of animals by 30% and still not achieve 'light grazing,' if those animals that remain consume more than 30% of the current year's forage growth." What will the impact of this change mean to livestock production in the RSFO, and to the sustained yield goal enacted by Congress? | A range of alternatives was considered for Management Action 6405. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-17 | While Alternative B prescribes "light grazing" which may not be achieved even with a 30% reduction in the number of animals, the DEIS also proposes "if a land health evaluation shows that land health standards are not met and current livestock grazing management is determined to be among the causal factors, the BLM will implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit/lease up to three consecutive years (60%) in active AUMs until land health standards are met. This is a completely arbitrary restriction without any cited scientific support. It seems created to punish the permittee rather than proscribe a treatment to reach land health goals. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing | #9792-18 | Grazing management with the RMP should be guided by meeting Wyoming Land Health Standards and grazing systems should be designed and implemented based on the Wyoming Guidelines for Livestock Grazing Management rather than the "light grazing" proposed in the DEIS. | Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-21 | The BLM proposes that its livestock grazing management actions would restrict operators by providing for "decreased flexibility in managing livestock" and "additional management complexity." The plan includes a range of restrictive measures for range improvements, water developments, predator control, and salt and mineral placement, as well as changes and season or duration of use and mandatory lower utilization rates. Any changes that result in improved vegetative production will be allocated to wildlife or other resource values "before considering it for livestock," across the 1.3 million acres set aside under special designations. | Impacts to livestock operations associated from these management actions are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-24 | it failed to mention that livestock grazing management in the RSFO is primarily through seasonal migration of livestock herds | Current management of livestock grazing on BLM managed lands within the planning area is described in Section 3.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-25 | In addition, the DEIS Appendix G (reporting on compliance with Land Health Standards for individual grazing allotments) is deficient because it includes outdated information and does not include the most recent assessment data for those allotments. | Appendix G has been updated. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9792-26 | Page 2-122 shows that only Alternatives C and D (of the four alternatives) allow for livestock trailing. Alternatives C and D would authorize livestock trailing, "on a case-by-case basis, based on appropriate, site-specific NEPA compliance." The DEIS should note that livestock trailing is eligible for a categorical exemption. The BLM should not provide for additional environmental analysis for continued use of historic trailing, and the final decision on this RMP should include provisions for authorizing livestock trailing. | Livestock trailing is specifically provided for in Alternatives C & D of the EIS. While livestock trailing is not prohibited in Alternatives A & B, it is also not specifically provided for. The opportunity to authorize livestock trailing by utilizing a categorical exclusion in accordance with FLPMA Section 402(h)(2) would be provided for under all four alternatives in Management Action 6412. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #9794-4 | Bighorn Sheep Page 3-8 states, "There currently are no bighorn sheep herd management areas in the planning area due to conflicts with domestic sheep grazing allotments (primarily disease transmission from domestic to wild sheep)." This statement is factually incorrect and prejudicial. Change it to: "The RSFO is outside of Wyoming Bighorn Sheep Management Areas as designated by Wyoming Statute § 11-19-604." | Section 3.7.1 of the EIS has been reviewed and updated as necessary. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #10468-3 | Further, due to setback restrictions, water resource management, riparian area development, sediment concerns, etc., the potential AUMs even on the lands left for grazing would be so significantly decreased and regulated as to eradicate functional use by the ranchers and farmers. | Impacts to livestock operations associated from these management actions are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #10494-1 | Across all areas of the Rock Springs Field Office RMP continue all currently permitted livestock grazing and authorized annual use consistent with WY Land Health Standards. | Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #10494-2 | Place no restrictions on current authorities to authorize new range improvements, maintain existing improvements, and conduct predator control activities to protect livestock. | Management Action 6416 provides direction for managing the construction of Range Improvements. Management Action 4211 discusses predator control. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #12645-1 | Ranchers are the ones who care take the land and should be allowed to manage their permits with as much free rein as possible. There is no benefit in over grazing for them and therefore they take range conditions seriously evaluate their use with practicality. | Management of livestock grazing within the Resource Area are provided in Management Actions 6400-6417. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13064-3 | The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. Management Actions 4200-4213 discuss the management of invasive species and pests. Section 1.4 of the EIS explains that none of the decisions in this RMP Revision would apply to non-BLM administered lands. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13064-5 | Alternative B would also prohibit livestock grazing in wetland and riparian areas that are not meeting proper functioning condition.29 Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing."30 This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing."31 There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. This could significantly impact the allotment areas ranchers may graze their livestock within the Rock Springs planning area. | Management Action 4111 proposes four alternatives regarding how long a vegetation treatment will be rested from livestock grazing use. Impacts to livestock grazing from this management action are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13078-2 | Management #4111. Alternative B's proposal of resting areas affected by fires from livestock grazing for five years is a bit excessive don't you think? I would prefer Alternative C, as two years is more than sufficient for vegetation rehabilitation. Option C also allows greater flexibility with resting periods from "chemical treatments, biological treatments, mechanical methods, and livestock grazing to meet vegetation management objectives" using the BLM's current rangeland health criteria. | Management Action 4111 proposes four alternatives regarding how long a vegetation treatment will be rested from livestock grazing use. Impacts to various resource values are provided throughout Chapter 4 of the EIS, for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13141-1 | For livestock grazing "the total authorized livestock use for a grazing season within the Rock Springs Field Office would be the active use AUMs sustained on an allotment-by-allotment basis for livestock grazing, providing the Wyoming Health Standards are met." "If a land health evaluation shows that land health standards are not met and current livestock grazing management is determined to be among the causal factors, [Alternative B] would implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit / lease up to three consecutive years (60%) in active AUMs until land health standards are met." As producers we are by far the best stewards of the land. Grazing improves the health of the land and has been proven to improve habitat, including sage grouse habitat. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13153-1 | Not only does "Alternative B" constitute the most restrictive of the agency's possible alternatives– your agency admits in its Environmental Impact Statement that this alternative creates the largest socioeconomic impact due to reduced mineral development on the 3.6 million acres subject to your control. Under the Multiple Use-Sustained Yield Act of 1960, your agency is required to manage federal lands in accordance with the principles of multiple use and sustained yield. This means that all possible uses and benefits of the lands be treated equally by your agency when promulgating land use plans. Clearly, you and your agency have ignored the deeply enshrined principles of multiple use and sustained yield. "Alternative B" removes over 7,000 animal unit months of grazing, removes over 60,000 acres from any and all use to "protect wilderness characteristics," and "de-emphasizes recreation" in favor of "conservation of resource values with constraints on resource use." Your preferred plan withdraws millions of acres from mineral extraction, leasing, exploration, and development. Your plan will obliterate the tax revenue derived from mineral, agricultural, recreation and tourism industries in southwest Wyoming | Impacts to livestock grazing from the reduction in AUMs is provided in Sections 4.16 and 4.22 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-4 | 4. Across all areas of the Rock Springs Field Office, continue all currently permitted livestock grazing and authorized annual use consistent with Wyoming Land Health Standards | Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-5 | 5. Place no restrictions on current authorities to authorize new range improvements, maintain existing improvements, and conduct predator control activities to protect livestock | Management Action 6416 provides direction for managing the construction of Range Improvements. Management Action 4211 discusses predator control. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-68 | 6404 Alternative D Authorize livestock grazing at current active use AUM levels within all existing grazing allotments. Total active use AUMs currently administered by the RSFO are 304,261 (for an explanation of the difference between active use AUMs in Alternative A and Alternative D see Section 3.16). There are also two allotments that are partially within the RSFO that have grazing use administered by another BLM office. These include the Crooked Wash (2,292 active use AUMs currently available within the RSFO) and Horseshoe Wash (607 active use AUMs currently available within the RSFO) allotments. Adjust active use AUMs (increase or decrease) when site-specific monitoring/ assessment data, the results of a land health evaluation, or a site-specific NEPA analysis demonstrates that an adjustment is appropriate to facilitate proper grazing management to provide for meeting or making significant progress towards meeting the Wyoming Land Health Standards and to meet the | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| | | goals and objectives of the RMP. This supports agreements in principle # 4 and # 5 by continuing current levels of livestock grazing while providing that any adjustments to actual use be based in site specific analysis. The "current active use levels" language in the management action best represents public land health standards. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-69 | 6411 Alternative A Salt or mineral supplements for livestock are prohibited within 500 feet of water, wetlands, or riparian areas unless analysis shows that watershed, riparian, and wildlife objectives and values would not be adversely affected. Salt or mineral supplements are prohibited on areas inhabited by Special Status plant species or other sensitive areas. Alterative A is preferred because it supports agreements in principle # 4 and # 5. The task force is satisfied with the 500-foot standard and feels a ¼ mile buffer is excessive and not conducive to resource and livestock management. | Management Action 6411 proposes four alternatives regarding how salt and mineral supplements may be utilized within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-70 | 6412 Alternative D Authorize livestock trailing, on a case-by- case basis, based on appropriate, site-specific NEPA compliance. Alternative D is preferred because it represents the status quo and enables livestock trailing. | Livestock trailing is specifically provided for in Alternatives C & D of the EIS. While livestock trailing is not prohibited in Alternatives A & B. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13210-71 | 6416 Alternative B Range improvements will be directed at resolving or reducing resource concerns, improvement of wetland/riparian areas, and overall improvement of vegetation/ ground cover. New range improvements may be implemented on grazing allotments. Maintenance of range improvements will be required in accordance with the BLM Rangeland Improvement Policy. Alternative B is preferred because it supports appropriate range improvements across all allotments in accordance with agreements in principle # 4 and # 5 by enhancing the chances of grazing to meet quality objectives. | Management Action 6416 provides direction for managing the construction of Range Improvements. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13219-1 | Alternative B also limits "control of noxious weeds and other invasive species to mechanical and biological methods." The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Management Action 4207 proposes four alternatives regarding management of invasive species within the Resource Area. Impacts to livestock grazing from these management actions are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13219-2 | Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing." This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing." There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. This could significantly impact the allotment areas ranchers may graze their livestock within the Rock Springs planning area. | Management Action 4111 proposes four alternatives regarding how long a vegetation treatment will be rested from livestock grazing use. Impacts to livestock grazing from this management action are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13260-1 | In addition, there are pictures taken from highway 191 north on the east and west side of the highway. There is an obvious difference in the range conditions between these two areas which are only separated by the highway ROW. Both areas have cattle grazing allotments. The difference is the west side has an overabundance of wild horses which damage the range. Therefore, a comprehensive evaluation and management plan cannot be established without considering the damage caused by feral horses. | The analysis in Section 4.6 of the EIS has been updated as necessary. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-20 | The proposed alternatives do little to change livestock grazing. Alternative B, for example, would close a paltry 8,576 acres to livestock grazing (DEIS at 4-178), versus 970 acres closed under present management (DEIS at 4-176). It is our understanding that the acres closed under Alternative B are mostly a presently-ungrazed, vacant allotment in the Red Creek area, an area with friable soils. The acreage of lands meeting Land Health standards under each alternative needs to be estimated and disclosed; at present, the DEIS merely states that livestock grazing will be managed toward Land Health standards, a strategy that clearly is not working at present. | Information regarding Land Health Standards for Grazing Allotments within the Resource Area are provided in Appendix G of the EIS. The level of information provided in that section is appropriate for a planning level document. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-21 | Item 6403 (DEIS at 2-119) should be changed to read "Limit range and vegetation improvement projects to cases where they are necessary to restore Land Health or support native species biodiversity. Remove unnecessary fences and other range structures." Alternative B direction (DEIS at 2-123) is a move in this direction, but it needs to be clear that ecosystem health and biodiversity are the sole justification for range improvements, and the large body of science outlining the problems posed by range improvements cannot be ignored. The Project Design Features (Appendix A-1) seem to suggest the removal of unnecessary fences, but this should be given a more mandatory approach in the RMP standards themselves. There is no reason to open developed and undeveloped recreation areas to livestock grazing (DEIS at 2-121, Alt. C), as this leads directly to unnecessary user conflicts. We support strengthening restrictions on salt block siting as in Alternative B (DEIS at 2122). | Management Actions 4435, 6416, and 7466 provide proposed management for the construction of Range Improvements. |
| 829 - Land Resources–Livestock Grazing | #13287-22 | 43 CFR § 4180 requires that corrective action be taken before the next grazing season where Land Health Standards are not met and livestock are a causal factor; it is unclear that Alternatives A, C, and D contain direction consistent with 43 CFR § 4180. In addition, livestock grazing should be zeroed out with wild horse Herd Management Areas, pursuant to 43 CFR § 4710.5. | Section 1.4 explains that "The proposed RMP will be in compliance with FLPMA and all other applicable laws, regulations, and policies." All management actions comply with all laws, regulations, and policies. This would include 43 CFR 4180. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Management (6400-6417) | | | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-23 | Various alternatives call for projects to improve the ecological integrity of dunal ponds (DEIS at 2-16). But the most obvious method of correcting ecological problems is to exclude cattle from the active dunes where dunal ponds collect, largely within the Sand Dunes and Buffalo Hump WSAs. | Excluding livestock from the dunal ponds would be an implementation level action that would be beyond the scope of this planning level document. See Section 1.4 of the EIS for the scope of this planning effort. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-30 | Herbivory by cattle and sheep on public lands removes forage otherwise available to native herbivores, and therefore leasing public land for livestock grazing necessarily reduces the population of native herbivores (from large hunted species down to small mammals and even insects) substantially. This means that the interests of the recreating public (both hunters and wildlife-watchers) are materially harmed when the federal government chooses to lease public lands for livestock production. A cow that grazes on public land eats as much forage as 2 elk, 6 mule deer, or 10 pronghorn (Ogle and Brazee 2009, Attachment 10). Given that desert elk (the Steamboat Mountain and Petition Herds) and mule deer (the Red Desert to Hoback migration and others) have high public profile and value, the significant loss of population numbers due to density-dependent competition with livestock is a factor that requires detailed analysis in the EIS, but has yet to receive adequate treatment. | The BLM has reviewed the analysis of impacts to wildlife species from livestock grazing in Section 4.7 of the EIS and determined that the existing analysis is adequate for this planning level document. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-31 | The Animal Unit Month (AUM) that is the measure of grazing lease forage removal is a moving target in which cattle progressively take more forage on a per-capita basis year after year as range cattle sizes increase. When the AUM was first implemented as a measure of livestock forage removal, the average cow weighed 1,000 pounds at slaughter (Carter 2016, Attachment 11). Today, average slaughterweight is 1,338 lbs. per cow (USDA 2023, Attachment 12). Proportionately larger cattle consume proportionately more forage, yet the agency has yet to address this issue in its range management program. | The definition of an Animal Unit Month (AUM) provided in the Glossary of the EIS is consistent with the definition provided in 43 CFR 4100.5 and 43 CFR 4130.8-1(c). |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13287-32 | Livestock chronically overgraze on most livestock allotments on the Rock Springs Field Office, in substantial measure because permittees are authorized 50-65% forage utilization on each allotment by the terms of their grazing permits. According to range management experts, forage utilization should be limited to a maximum of 25-35% forage removal in arid western rangelands (Galt et al. 2000, Holechek et al. 2020, Attachments 13, 14). Alternative B comes closest to the best available range science, capping utilization at 40% (DEIS at 2-120), but more is needed, particularly in light of the likelihood of forage productivity reductions in light of climate change (Holechek et al. 2020). The RMP should re-set the maximum authorized forage utilization at 25% in allotments or pastures containing sage grouse Priority Habitat Management Areas, and a maximum of 35% in those that do not. | Management Action 6400 would "Provide, maintain, and improve opportunities for livestock grazing while meeting or making significant progress towards meeting the Wyoming Land Health Standards." Management Action 6401 would also allow for the use of livestock management techniques (including the use of stocking rates and utilization data) in the management of livestock to maintain or enhance land health. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13300-1 | Alternative B would negatively impact Wyoming's agriculture industry especially livestock grazing. Alternative B designates that, "in coordination with [Animal and Plant Health Inspection Service-Wildlife Services], the entire planning area as a 'restricted control area' for animal control." Alternative B further provides that "animal damage management may be planned, but control activities may be limited to certain methods or times of the year to achieve management objectives" and there would be an emphasis on "non-lethal methods." This would significantly expand the area of restricted animal control to the entire Rock Springs planning area. Under Alternative A, restricted animal control is imposed solely in the Jack Morrow Hills area. Alternative B also limits "control of noxious weeds and other invasive species to mechanical and biological methods." The restrictions imposed on animal control and noxious weeds control would significantly affect the agricultural industry, as many ranchers rely on animal damage management that occurs on public lands to protect livestock located on both private and public land, and many farmers rely on controlling noxious weeds to protect their crops. | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Management Action 4207 proposes four alternatives regarding management of invasive species within the Resource Area. Impacts to livestock grazing from these management actions are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13300-2 | Alternative B would also prohibit livestock grazing in wetland and riparian areas that are not meeting proper functioning condition. Further, Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing." This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing." There is no evidence in the draft Rock Springs RMP that supports an increase of three growing seasons for resting treated areas from livestock grazing. | Management Action 4111 proposes four alternatives regarding how long a vegetation treatment will be rested from livestock grazing use. Impacts to livestock grazing from this management action are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13300-3 | "If a land health evaluation shows that land health standards are not met and current livestock grazing management is determined to be among the causal factors, [Alternative B] would implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit / lease up to three consecutive years (60%) in active AUMs until land health standards are met." This is by far the most restrictive of all the alternatives and would decrease the number of AUMs authorized for livestock grazing. Overall, Alternative B is clearly the most detrimental to Wyoming's agriculture industry. Alternative B would reduce the number of AUMs authorized for livestock grazing, increase operating costs for operators, and alter their management practices far beyond current practice and any of the other alternatives. Alternative B would alter management practices by imposing more restrictive measures for range improvements, water developments, and salt and mineral placements. In addition, livestock operations would incur additional management c | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-7 | * MA # 4420: Sweetwater County Farm Bureau does not prefer any of the Alternatives, but Alternative D seems most favorable to keeping historical AUM grazing rights. Sweetwater County Farm Bureau is opposed to the prohibition of livestock grazing in the big game parturition habitat from May 1 to June 30. (page 2-68). The delayed turnout of cattle from May 1st to July 1st would force producers to keep their cows on hay fields and their private property during peak hay growing season. This places an enormous financial burden on livestock operations due to the extra two months of required feeding. Hay producers would also lose their first cutting of hay. This would change the historical dynamic of the agricultural industry in the area. This blatantly violates the grazing rights by not honoring the agreement with each individual permittee. | Management Action 4220 proposes four alternatives regarding parturition habitat management within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-8 | * MA # 4430: Sweetwater County Farm Bureau prefers alternative A. The least adequate is alternative B to "prohibit surface occupancy within one mile of occupied and historic raptor nests and associated feeding grounds." This is excessive restriction of multiple use. Including "historical" raptor nests is especially ambiguous and sets a dangerous precedent to restrict access of a changed habitat with no current proof of viability. Alternative B is grasping at straws to restrict access on inaccurate (old) data incongruent with the science of present-day raptor sites. | Management Action 4430 proposes four alternatives regarding activities near raptor nests. Impacts to the various resource values are provided throughout Chapter 4 of the EIS, for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-9 | * MA # 6404: Sweetwater County Farm Bureau prefers Alternative A. Sweetwater County Farm Bureau is opposed to the annual 20% reduction of AUMs from the 10-year average of actual billed AUMs for 3 years. (page 2-119) If land and health standards are not being met and grazing has been determined to be the cause. The management action does not state what other actions for additional causal factors will be. Will there be a 20% annual reduction in wild horse numbers for the affected management areas? A 20% reduction in elk numbers? This management action also fails to account for droughts and other factors not relating to the number of AUMs in the area. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-10 | The length of time a salt or mineral supplement is left in one location also effects the land health (page 2-122). | Under all alternatives, Management Action 6411 describes the location where salt and mineral supplements may be placed. None of the alternatives describe a length of time a salt or mineral supplement is allowed to be present on the land. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-11 | Sweetwater County Farm Bureau is opposed to the reduction of AUMS when grazing activity conflicts with industrial activity. (page2-122) This management action is too restrictive and does not promote negotiation and compromise between affected parties. | The language in Management Action 6413 does not include any actions that would prohibit negotiation or compromise between affected parties. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-12 | * MA # 6510: Sweetwater County Farm Bureau prefers Alternative C. Alternative B is the least favorable as "management of the Green River, Sweetwater River, Big Sandy River, and the Little Sandy River with priority given to other resource values" could potentially restrict and/or eliminate the designated AUMs of the area. | The language in Management Action 6510 does not indicate an associated reduction in AUMs for livestock. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-15 | MA # 7438: Sweetwater County Farm Bureau prefers Alternative C. Sweetwater County Farm Bureau is opposed to the prohibition of grazing in Jane's Meadow and Upper Currant Creek Pastures within the Sugarloaf Grazing Allotment. (page 2-182). This management action does not state the reasoning to close this area to grazing. Is it being recommended for closure due to land health standards not being met or is this recommended closure arbitrary? | Management Action 7438 proposes four alternatives regarding livestock grazing within the Currant Creek Portion of the Greater Red Creek ACEC. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13330-16 | MA # 7443: Sweetwater County Farm Bureau prefers Alternative C. Sweetwater County Farm Bureau is opposed to the prohibition of grazing in the Red Creek Allotment. (page 2-184) This management action does not state the reasoning to close this area to grazing. Is it being recommended for closure due to land health standards not being met or is this recommended closure arbitrary? | Management Action 7443 proposes four alternatives regarding livestock grazing within the Red Creek Portion of the Greater Red Creek ACEC. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13377-1 | Alternative B would "rest all treated areas a minimum of five growing seasons from livestock grazing" This is a significant increase as currently, "all treated areas would be rested a minimum of two growing seasons from livestock grazing" There is no evidence in the draft Rock Springs RMPthat supports an increase of three growing seasons for resting treated areas from livestock grazing. If there was ample evidence to support this extended resting period, it could potentially be discussed with the permittees and practices found to make this applicable. | Management Action 4111 proposes four alternatives regarding how long a vegetation treatment will be rested from livestock grazing use. Impacts to livestock grazing from this management action are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13446-2 | According to the USDA 2021 ranking statistics, Wyoming ranks nationally as number two for lamb and wool production respectfully and ranks number four overall. For all cattle, Wyoming ranks 23. These alone are strong contributors to the national and international textile and food production pipelines and should not be so easily dismissed.(https://www.nass.usda.gov/Statistics_by_State/Wyoming/Publications/Annual_Statistical_Bulletin/WY-2021-Bulletin.pdf) | Socioeconomic impacts are provided in Section 4.22 of the EIS. In the "Methods for Livestock Grazing" portion of Section 4.22.2 details are provided regarding the methods used to evaluate impacts to livestock grazing, including rationale for the methodologies used. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13490-4 | *Reduce or eliminate commercial livestock grazing within wild horse HMAs. The BLM is legally mandated to protect wild horses, while livestock grazing is a discretionary use of the public lands. It is widely known that the Taylor Grazing Act (43 U.S.C. §§ 315-315r) grants the BLM the discretion to issue permits for livestock grazing on public lands, but it also clear: “the issuance of a permit . . . shall not create any right, title, interest, or estate in or to the lands.” More important, the federal Wild and Free-Roaming Horses and Burros Act (43 C.F.R. § 4710.5) compels the BLM to “close appropriate areas of the public lands to grazing” in order “to provide habitat for wild horses” or “to protect wild horses.” | Wild horse management within the Resource Area was updated via a 2023 Record of Decision and Resource Management Plan Amendment. All management actions from that amendment have been incorporated into this RMP Revision. See the Wild Horse Management Actions, beginning with Management Action 4900. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13513-1 | Livestock grazing needs to be included in the prescriptions to meet vegetative management objectives | Goals BR-09 and BR-10 in Table 2-1 establish goals related to grazing for the management of vegetation communities. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13526-1 | Grazing is presently heavily regulated by the BLM. It does not need further restrictions, since present management already accounts for appropriate numbers, season of use, weed control, response to drought, etc. The BLM should continue to work with APHIS and local animal damage control boards to allow for necessary predator control, which also benefits wildlife species. Mule deer and antelope populations were especially impacted by the brutal winter of 2022-2023. | Management Action 4211 proposes four alternatives regarding animal damage management within the Resource Area. Impacts to various resource values are provided for throughout Chapter 4 of the EIS, for all four alternatives related to this management action. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-1 | One such concern is 6414 page 2-123 that states "prohibit livestock grazing in riparian areas that are not meeting PFC" According to the Riparian Area Management book issued by the NRCS, U.S. Department of Interior, and U.S. Department of Agriculture in the Introduction on page 1 states: 1) "PFC is also an appropriate starting point for determining and prioritizing the type and location of quantitative inventory or monitoring necessary. 2) Also in Appendix E on page 105 states "PFC isn't the sole methodology for assessing the riparian-wetland area". 3) "PFC isn't desired condition. It is a pre-requisite to achieving desired condition. Therefore: to obtain a complete picture of the riparian-wetland area health, including the biological side, one must have information on both physical status, provided through the PFC assessment and biological habitat quality. Neither will provide a complete picture when analyzed in isolation. In most cases, proper functioning condition will be a pre-requisite to achieve and maintaining habitat quality". "PFC isn't designed to be a long-term monitoring tool, but it maybe an appropriate part of a well-designed monitoring program". | Management Action 6414 proposes four alternatives regarding livestock management in riparian areas. Impacts to livestock grazing are provided for in Section 4.16 of the EIS, for all four alternatives related to this management action. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-2 | According to this book PFC has an important role but not a solitary role in range monitoring nor determination. In the RMP on 4300 page 2-61 according to proposed alternative B while everyone wants the range to meet PFC and have a desired condition having PFC be the only monitoring data and placing a time-line of 5 or 10 years is not site-specific. Each area has its own issues and needs to be monitored not only with PFC but other site-specific methods of collecting data. The reduction of AUMs based solely on PFC 4300 page 2-61 is not following the monitoring book explained earlier. | Management Action 6414 proposes four alternatives regarding livestock management in riparian areas. Impacts to livestock grazing are provided for in Section 4.16 of the EIS, for all four alternatives related to this management action. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-3 | Another area of concern is 6404 page 2-119 two different concerns are brought about with this. First is the Active vs Billed AUMs. Many ranchers are conservatives, this is in their best interest to leave forage for other years. This being said many ranchers pay for ( billed ) AUMs that are not used that year. This helps the range also the Bureau and giving the rancher forage in the future. When ranchers are cut to the Active AUMs they don't have the freedom to help out. This is left completely to the overworked BLM range cons to determine each site specific allotment. Giving the ranchers some movement is in the best interest of the range because they are trying to be there year after year after year. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-5 | The second issue with this same section is putting a percentage rate on reduction of AUMs. Again some sites need more time to rest and others need less. To set a specific reduction and time reduction does not work for all areas. This needs to be determined by a management team on a site-by-site basis. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock | #13549-6 | In section 4408 page 2-64 states in proposed Plan B that water developments only if wildlife habitat and resource conditions would be improved. Now wildlife certainly is important the BLM is a multi-use organization and needs to consider all animals. When ranchers put in a new water development this helps out the wildlife in many aspects | Management Action 4408 proposes four alternatives regarding the development of range improvements in important wildlife habitat. Impacts to livestock grazing are provided for in Section 4.16 of the EIS, for all four alternatives related to this management action. |

| Comment Category | Comment ID # | Comment Text | BLM Response |
|---|---|---|---|
| Grazing Management (6400-6417) | | not only providing them with water but also distributing the animals across the landscape so not to overgraze one area to give more feed for all animals throughout. To say it is good for wildlife is to only look at one part of the whole picture. | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-7 | In 6413 page 1-122 if industrial activities is making the rangeland management objectives turn out negatively it should be addressed. This can not be determined without a site-specific analysis. | The language in Management Action 6413 would not eliminate the need for site specific analyses in these situations. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13549-8 | The last area I would like to address is 7490-7497 page 2-194. This states that the Pine Springs ACEC would be expanded to 6,480 acres. These extra acres would inhibit water development or maintenance because there is no live water in the area and because of this animal dispersement. Wildlife and livestock would be more congregated around other water resources which would impact range health. | As shown in Map 2-30 of the EIS, the majority of the Pine Springs ACEC is located within the Devil's Playground and Twin Buttes WSAs. See Wilderness Study Areas in Chapter 3 and impacts in Chapter 4. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13585-39 | Finally, the BLM's conclusion that impact to livestock grazing would not change between Alternative A and Alternative Bis false. See DEIS at 4-178, 4-259. Many of the ACEC's have a no surface occupancy "NSO" designation and this will impact permitted livestock owners' ability to drill for water wells within their grazing allotments. See DEIS at Append. V-4 - V-7. In addition, VRM Class II designations, ROW exclusions, and prohibition of surface disturbing activities within an ACEC would impact the ability of permittees to develop range improvements, such as fences, wells, or other water developments. See id. At 2-210 (Mgmt. Action #7556), 4-179. Some of the proposed ACECs also call for closure of grazing allotments and/or prohibition of grazing within certain pastures. See id. At 2-181 (Mgmt. Action #7433), 2-182 (Mgmt. Action #7438), 2- 184 (Mgmt. Action #7443). | The language in Section 4.16 of the EIS has been updated as appropriate. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13585-66 | e. Sweetwater County objects to Management Action #6413 under Alternatives B, C, and D. DEIS at 2-122. Alternative B calls for the reduction of areas open to grazing and available AUMS when "industrial activity conflicts with grazing operation and rangeland management objectives." Id. The BLM then lists examples of conflicts including loss of forage, unsuccessful rehabilitation of disturbed areas, invasive species, safety hazards, and improper livestock distribution | The language in Management Action 6413 does not include any actions that would prohibit negotiation or compromise between affected parties. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13585-67 | The County does not support the reduction in grazing when industrial activity is the cause of loss of forage, invasive species, unsuccessful rehabilitation, or others. The permittees should not be the ones to face reductions when their grazing activities were not the cause of any issue. Grazing permittees also have had longstanding relationships with resource developers and have had limited conflicts arising between grazing operations and development. This is due to proper planning and coordination between the developer and permittee, as well as implementation of a proper reclamation plan by the developer. | The language in Management Action 6413 does not include any actions that would prohibit negotiation or compromise between affected parties. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13615-1 | To close grazing areas to livestock grazing at specific times is opposite to much research which shows changing season of use is beneficial to ecosystem improvement. | Impacts associated with the closure of specific areas to livestock grazing under the various alternatives are provided in Section 4.16 of the EIS. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13668-4 | Management # 7433 Page 2-181 Prohibit livestock grazing in the portion of the Mellor Mountain grazing allotment that intersects the Sage Creek portion (Map 2- 30). I would prefer any alternative other than B, because it would maintain the rangeland health. The stream is at PFC and the sheep help suppress the cheatgrass by grazing in the early summer. So why remove the livestock as they are a tool in helping maintain healthy land conditions? | Management Action 7433 proposes four alternatives regarding livestock grazing within the Sage Creek Portion of the Greater Red Creek ACEC. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13668-5 | Management # 6414 Page 2-123 Prohibit livestock grazing in riparian areas that are not meeting PFC. This is not feasible, nor is it reasonable. Suggesting you would have to rest, or worse yet, fence whole areas that are watered by that stream would be expensive and more importantly, would conflict with sagegrouse running into the fence. It also states "no grazing". PFC is too vague of a monitoring tool to make decisions. PFC is used as an inventory; not the trend-data tracking tool it could be to help make lasting improvements and decisions. Additionally, an inadequate PFC may be caused by a stream geomorphology or a long-term drying trend as is common, and presently taking place, in this high desert. It's ridiculous and difficult to prove that a cow or a sheep caused a headcut. | Management Action 6414 proposes four alternatives regarding livestock management in riparian areas. Impacts to livestock grazing are provided for in Section 4.16 of the EIS, for all four alternatives related to this management action. |
| 829 - Land Resources–Livestock | #13668-6 | Management #6404 Page 2-119 "The total authorized livestock use for a grazing season within the RSFO would be the active use AUMs sustained on an allotment- by-allotment basis for livestock grazing, providing the Wyoming Land Health Standards are met. If a land health evaluation shows that land health standards are not met and | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. |

|---|---|---|---|
| Grazing Management (6400-6417) | | current livestock grazing management is determined to be among the causal factors, implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit/lease up to three consecutive years (60%) in active AUMs until land health standards are met. Adjust reductions if it has been determined that significant progress has been made toward achieving land health standards. A much better option would be Alternative A or parts of Plan D. Rangeland health decisions should be made off of monitoring data - not an across the board rule of thumb. Generally speaking, rangeland health problems are often due to distribution, not stocking rates. For example, being able to create alternative water sources for all species so not just one trail takes the beating. But just for the record, rangeland health standards have been monitored and continue to meet, and more times than not, even exceed requirements and expectations | |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13669-1 | In addition, with the drought which has plagued the west in recent years, total cattle population numbers are reduced which in turn has created a demand situation for cattle in the total food supply. Prices for beef have increased dramatically in recent years and with increases in the world population, the demand for protein in beef will increase accordingly further exacerbating the problem of world hunger. | The demand for beef and the associated prices are beyond the scope of this BLM Resource Management Plan. See Section 1.4 for the scope of this planning level document. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13678-1 | We have spent the past decade monitoring the forage in our allotments along with monitoring our riparian areas. We recently completed the range land health assessment on our allotments along the wind river front. The data and results of these monitoring are not being used in this document due to a lack of a signature from the BLM district manager. Why was this not signed and used in the information gathering for the RMP? | Appendix G of the EIS provides information on the current status of Land Health Evaluations within the Resource Area. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13687-1 | I have a planned grazing rotation that changes each year consisting of 5 different pastures. In two of these pastures, we have not one but two National historic Trails that cut through the center of them. If I cannot place salt or mineral within 3 miles either side of those trails, I can no longer place the salt or mineral, which is benefiting not only livestock, but wildlife as well., in those two pastures. | Management Action 6411 proposes four alternatives regarding how salt and mineral supplements may be utilized within the Resource Area. Impacts to livestock grazing are provided in Section 4.16 of the EIS for all four alternatives considered for analysis. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13691-1 | Approximately 10%(2) of breeding cows with a home base in Duchesne County, go to the range within the Rock Springs Field Office (RSFO) management area near Farson, Wyoming. This represents a significant portion of the economy to not only Duchesne County, but also to Sweetwater County Wyoming and other surrounding counties in Wyoming. Needless to say, any reduction in cattle numbers permitted to graze on areas within the jurisdiction of the RSFO of the BLM, may be detrimental, if not catastrophic to the economies of both areas. In addition, with the drought which has plagued the west in recent years, total cattle population numbers are reduced which in turn has created a demand situation for cattle in the total food supply. Prices for beef have increased dramatically in recent years and with increases in the world population, the demand for protein in beef will increase accordingly further exacerbating the problem of world hunger. | Socioeconomic impacts are provided in Section 4.22 of the EIS. In the "Methods for Livestock Grazing" portion of Section 4.22.2 details are provided regarding the methods used to evaluate impacts to livestock grazing, including rationale for the methodologies used. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13691-3 | Adopting Alternative B may increase forages available to the point that fire risk would be dramatically increased. In this fire sensitive culture in which we live, responsible livestock grazing to protect the environment is a mutually beneficial way to mitigate fire risk. In addition, if Alternative B is selected, control of any wildfire will be hampered due to restrictions in mobilizing fire suppression equipment to the scene. | Section 4.10 of the EIS describes the correlation between livestock grazing and hazardous fuel removal. Section 4.10 also discusses the impacts to fire suppression from various other management actions. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13748-1 | The current preferred Alternative B suggests an overly burdensome blanket reduction in AUMs by 20% for three years. We support adjusting AUMs based on site-specific monitoring or when a NEPA analysis demonstrates it is appropriate to change. Furthermore, the BLM does not have current Land Health Standards (we address below) in the draft RMP, which could inaccurately result in a permittee's reduction in AUMs in Alternative B's MA. Alternative D allows flexibility for the agency to monitor and alter plans on a site-specific basis and appropriate current analysis. | A range of alternatives was considered for Management Action 6404. Impacts to livestock operations from all four alternatives are provided in Section 4.16 of the EIS. Appendix G of the EIS provides information on the current status of Land Health Evaluations within the Resource Area. |
| 829 - Land Resources–Livestock Grazing Management (6400-6417) | #13748-2 | By focusing on desired outcomes, such as improved soil health, increased biodiversity, and enhanced water quality, ranchers can contribute to sustainable land management. The plans provide flexibility in adjusting grazing strategies based on changing conditions, and ranchers can adapt their practices to respond to weather patterns, forage availability, and other ecological factors, allowing for more resilient and adaptive land management. By strategically managing grazing patterns, ranchers can also promote the growth of high-quality forage. This benefits both livestock and wildlife, contributing to improved animal health and productivity. Outcome-based grazing can help conserve water resources. By preventing overgrazing and promoting healthy vegetation cover, ranchers contribute to better water retention in soils and reduced erosion. Outcome-based grazing plans also consider the needs of wildlife species, like greater sage grouse, by maintaining or restoring habitat conditions. This can lead to increased biodiversity, supporting various plant and animal species on the ranching land. Effective grazing management can reduce the need for supplemental feed, as livestock can graze on healthier and more abundant | None of the Management Actions within the EIS would prohibit the use of Outcome Based Grazing management. |

|---|---|---|---|
| | | forage. This can result in cost savings for ranchers. By focusing on ecological outcomes, ranchers and land managers contribute to the long-term sustainability of their operations. Healthy ecosystems are more resilient to external challenges, fostering sustainable agricultural practices. Overall, outcome-based grazing plans provide a holistic and environmentally conscious approach to land management, benefiting both the ranchers and the ecosystems they operate within. | |
