**Bureau of Land Management**
**August 2024**

**Volume 2: Acronyms, Glossary, Literature Cited, and Appendices A–W**

# Rock Springs Field Office

## Proposed Resource Management Plan and Final Environmental Impact Statement

BLM MISSION

It is the mission of the Bureau of Land Management to sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

# GLOSSARY

**2008 WAFWA Sage-grouse MOU:** A memorandum of understanding (MOU) among Western Association of Fish and Wildlife Agencies, U.S. Department of Agriculture, Forest Service, U.S. Department of the Interior, Bureau of Land Management, U.S. Department of the Interior, Fish and Wildlife Service, U.S. Department of the Interior, Geological Survey, U.S. Department of Agriculture, Natural Resources Conservation Service, and the U.S. Department of Agriculture, Farm Service Agency. The purpose of the MOU is to provide for cooperation among the participating state and federal land, wildlife management and science agencies in the conservation and management of sage-grouse (Centrocercus urophasianus) sagebrush (Artemisia spp.) habitats and other sagebrush-dependent wildlife throughout the western United States and Canada and a commitment of all agencies to implement the 2006 WAFWA Conservation Strategy.

**Acquired Lands:** Federal lands obtained by purchase, condemnation, exchange, or gift under laws other than public land laws. Legally defined as: "… land obtained by the United States through purchase or transfer from a State or private individual and normally dedicated to a specific use." McKenna v. Wallis, 200 F. Supp. 468 (1961). See also Bobby Lee Moore, et al, 72 I.D. 505 (1965).

**Actively Managed:** Management of the forestlands or woodlands by prescription to accomplish specific resource objectives. In addition, the forestlands are managed with an allowable sustainable periodic sale quantity.

**Activity Area:** An area of land impacted by a management activity or activities. It can range from a few acres to an entire watershed. It is commonly a timber sale cutting unit, a burn unit, or a pasture in an allotment.

**Activity Planning:** Site-specific planning that precedes development. This is the most detailed level of Bureau of Land Management (BLM) planning. An activity plan details management of one or more resources on a specific site. Examples are allotment management plans and recreation area management plans. Activity plans implement decisions made in the Resource Management Plan (RMP).

**Actual Use:** Where, how many, what kind or class of livestock, and how long livestock graze on an allotment or on a portion or pasture of an allotment.

**Adaptive Management:** A systematic process for continually improving management policies and practices by learning from the outcomes of actions over time. It employs management programs that are designed to continuously compare selected policies or practices and is an integrated method for addressing uncertainty that focuses on implementing actions, thoroughly monitoring results, and modifying actions when warranted. It recognizes that the complex interrelationships of physical, biological, and social components of the ecosystem and how they would react to land management practices are often not fully understood when land-use management plans are developed.

**Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project (BLM Manual Section 1794).

**Administrative Access:** Access for resource management and administrative purposes such as fire suppression, cadastral surveys, permit compliance, law enforcement, and military in the performance of their official duty, or other access needed to manage BLM-administered lands or uses.

**Age Class:** A distinct aggregation of trees originating from a single natural event or regeneration activity, or grouping of trees, e.g. 10-year age class, as used in inventory or management.

**Allotment:** An area of land designated and managed for livestock grazing. Allotments generally consist of BLM-administered lands but may include other federally managed, state-owned, and private lands. An allotment may include one or more separate pastures. Livestock numbers and periods of use are specified for each allotment.

**Allotment Management Plan (AMP):** A documented program developed as an activity plan, consistent with the definition at 43 USC 1702(k), that focuses on, and contains the necessary instructions for, management of livestock grazing on specified public lands to meet resource condition, sustained yield, multiple use, economic, and other objectives.

**Allowable Sale Quantity (ASQ):** The quantity of timber that may be sold from the area of suitable land covered by the forest plan for a time period specified by the plan. This allowable sale quantity (ASQ) is usually expressed on an annual basis as the "average annual allowable sale quantity." (FSM 1900)

**Alluvium:** Any sediment deposited by flowing water, as in a river bed, floodplain, or delta.

**Ambient (noise level):** Sometimes called background noise level, reference sound level, or room noise level is the background sound pressure level at a given location, normally specified as a reference level to study a new intrusive sound source.

**Amendment:** The process for considering or making changes in the terms, conditions, and decisions of approved RMPs or Management Framework Plans using the prescribed provisions for resource management planning appropriate to the proposed action or circumstances. Usually only one or two issues are considered that involve only a portion of the planning area.

**Animal Damage Control (ADC):** The control of animals that are causing economic losses to agriculture, damage to property, or hazards to human health. Such control usually results in the killing of the offending animal(s). (See also Wildlife Services.)

**Animal Unit:** Considered to be one mature cow of about 1,000 pounds (450 kg), either dry or with calf up to six months of age, or their equivalent, consuming about 26 pounds of forage/day on an oven dry basis.

**Animal Unit Month (AUM):** The amount of forage necessary for the sustenance of one cow or its equivalent for a period of one month (43 CFR 4100.0-5). For the purpose of calculating grazing fees, an animal unit month is defined as a month's use and occupancy of range by one cow, bull, steer, heifer, horse, burro, mule, five sheep or five goats over the age of six months (43 CFR 4130.8-1(c)).

**Anthropogenic Disturbances:** Human-created features that include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells and associated facilities, geothermal wells and associated facilities, pipelines, landfills, agricultural conversion, homes, and mines.

**Application for Permit to Drill (APD):** An application to drill a well submitted by a lessee or operator to the BLM. The APD consists of a Drilling Plan that discusses downhole specifications and procedures (reviewed by the BLM) that examines surface uses, including access roads, well site layout, cut and fill diagrams, reclamation procedures, production facility locations, etc.

**Aquatic Ecosystem:** Waters of the United States, that serve as habitat for interrelated and interacting communities and populations of plants and animals. (40 CFR 230.3) Waters of the United States, including wetlands, that serve as habitat for interrelated and interacting communities and populations of plants and animals. (FSM 2526.05)

**Aquifer Recharge Area:** An aquifer is a layer of underground rock or sand that stores and carries water. A recharge area is the place where water is able to seep into the ground and refill an aquifer because no confining layer is present. Recharge areas are necessary for a healthy aquifer.

**Area of Critical Environmental Concern (ACEC):** Areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards. The identification of a potential ACEC shall not, of itself, change or prevent change of the management or use of public lands.

**Assessment:** The act of evaluating and interpreting data and information for a defined purpose.

**Authorized/Authorized Use:** This is an activity (i.e., resource use) occurring on the public lands that is either explicitly or implicitly recognized and legalized by law or regulation. This term may refer to those activities occurring on the public lands for which the BLM or other appropriate authority (e.g., Congress for RS 2477 rights-of-way, FERC for major, interstate rights-of-way), has issued a formal authorization document (e.g., livestock grazing lease/permit; right-of-way grant; coal lease; oil and gas permit to drill; etc.). Formal authorized uses can involve both commercial and noncommercial activity, facility placement, or event. These authorized uses are often spatially or temporally limited. Unless constrained or bounded by statute, regulation, or an approved land use plan decision, legal activities involving public enjoyment and use of the public lands (e.g., hiking, camping, hunting, etc.) require no formal BLM authorization.

**Authorized Officer:** Any employee of the BLM to whom authority has been delegated to perform the duties described.

**Available Lands (Oil and Gas):** Any lands subject to oil and gas leasing under the Minerals Leasing Act.

**Avoidance/Avoidance Area:** These terms usually address mitigation of some activity (i.e., resource use). Paraphrasing the CEQ Regulations (40 CFR 1508.20), avoidance means to circumvent, or bypass, an impact altogether by not taking a certain action, or parts of an action. Therefore, the term "avoidance" does not necessarily prohibit a proposed activity, but it may require the relocation of an action, or the total redesign of an action to eliminate any potential impacts resulting from it.

**Avoidance Mitigation:** Avoiding the impact altogether by not taking a certain action or parts of an action (40 CFR 1508.20(a)) (e.g., may also include avoiding the impact by moving the proposed action to a different time or location).

**Baseline:** The pre-existing condition of a defined area and/or resource that can be quantified by an appropriate metric(s). During environmental reviews, the baseline is considered the affected environment that exists at the time of the review’s initiation, and is used to compare predictions of the effects of the proposed action or a reasonable range of alternatives.

**Best Management Practices (BMPs):** A suite of techniques that guide or may be applied to management actions to aide in achieving desired outcomes. BMPs are often developed in conjunction with land use plans, but they are not considered a planning decision unless the plans and authorizations specify that they are mandatory. BMPs may be updated or modified without a plan amendment (BLM Manual Handbook H-1601-1).

**Big Game:** Large species of wildlife that are hunted, such as elk, deer, bighorn sheep, moose, and pronghorn.

**Billed Use:** The amount of livestock use that grazing permit holders were actually billed for in a given year.

**Biological Assessment (BA):** The gathering and evaluation of information on proposed endangered and threatened species and critical habitat and proposed critical habitat. Required when a management action potentially conflicts with endangered or threatened species, the BA is the way federal agencies enter into formal consultation with the U.S. Fish and Wildlife Service and describe a proposed action and the consequences to the species from the action.

**Biological Diversity:** The variety of life forms and processes within an area. Included in the consideration of diversity are the complexities of genetic variation, number and distribution of species, and the ways in which the variety of biologic communities interact and function.

**Biotic:** All the natural living organisms in a planning area and their life processes.

**Board Foot:** A unit of solid wood one foot square and one inch thick.

**Bureau Sensitive Species:** species that require special management consideration to avoid potential future listing under the ESA and that have been identified in accordance with procedures set forth in BLM Manual 6840 – Special Status Species Management. Candidate Species: Plants and animals for which the U.S. Fish and Wildlife Service has sufficient information on their biological status and threats to propose them as endangered or threatened under the Endangered Species Act (ESA), but for which development of a proposed listing regulation is precluded by other higher priority listing activities.

**Canopy:** The uppermost layer consisting of the crowns of trees or shrubs in a forest or woodland.

**Casual Use:** Casual use means activities ordinarily resulting in no or negligible disturbance of the public lands, resources, or improvements for example, activities that do not involve the use of mechanized earth-moving equipment or explosives or, in areas designated as closed to OHVs, do not involve the use of motorized vehicles. This can also be activities occurring by chance or taking place at irregular intervals without ceremony or formality. Examples for rights of ways, see 43 CFR 2801.5 or 2881.5. The definition related to 3809-surface management of locatable minerals is found at 43 CFR 3809.5. Other activities which do not unduly disturb surface resources. If, however, the Authorized Officer determines that appreciable impacts to surface resources may occur, he/she may require the potential applicant to obtain a land use authorization with appropriate terms and conditions.

**Channel:** An open conduit either naturally or artificially created that periodically or continuously transports moving water (and, in natural systems, also transports sediment, nutrients, and woody material) or forms a connecting link between two bodies of water.

**Checkerboard:** This term refers to a land ownership pattern of alternating sections of federal-owned lands with private or state-owned lands for 20 miles on either side of a land grant railroad (e.g. Union Pacific, Northern Pacific, etc.). On land status maps this alternating ownership is either delineated by color coding or alphabetic code resulting in a "checkerboard" visual pattern.

**Cherry-stemmed/Cherry-stemming:** This term refers to a narrow, linear, intrusion or extrusion of a delineated block of Federal lands resulting in what appears on a map as a boundary inlet or peninsula. Although this term may be used in any resource program, the most common use is in relation to dead- end road intrusions along WSA boundaries.

**Closed:** Generally denotes that an area is not available for a particular use or uses; refer to specific definitions found in law, regulations, or policy guidance for application to individual programs.

**Closed Area or Trail:** Designated areas and trails where the use of off-road vehicles is permanently or temporarily prohibited. The use of off-road vehicles in closed areas may be allowed only with the approval of the Authorized Officer.

**"Closed" Designation (OHV):** An area where off-highway vehicle use is prohibited. Use of off-highway vehicle in closed areas may be allowed for certain reasons; however, such use shall be made only with the approval of the Authorized Officer.

**Closed Road:** A road or segment of road that is restricted from certain types of use during certain seasons of the year. The prohibited use and the time period of closure are specified.

**Code of Federal Regulations (CFR):** The official, legal tabulation or regulations directing Federal Government activities.

**Collaboration:** Working together, sometimes with individuals or groups of opposing points a view, to reach a common agreement.

**Co-locate:** Installation of new linear improvements (e.g., equipment or facilities) on or within existing linear improvements.

**Commercial Forestland:** Forestland that is now producing or is capable of producing at least 20 cubic feet of wood fiber per acre per year from commercial coniferous tree species and that has met certain economic, environmental, or multiple use criteria for inclusion in the commercial forestland base.

**Commodity:** An economic good such as a product of agriculture or mining.

**Common Variety Minerals:** Category of minerals including varieties of sand, gravel, stone, pumicite, cinders, pumice (except that occurring in pieces over 2 inches on a side), clay, and petrified wood; authorized under the 1947 Materials Act and the 1955 Multiple Surface Use Act for sale as "salable minerals". (FSM 2800)

**Communication Site:** A site right-of-way that includes broadcast types of uses (e.g., television, AM/FM radio, cable television, broadcast translator) and non-broadcast uses (e.g., commercial or private mobile radio service, cellular telephone, microwave, local exchange network, passive reflector).

**Community:** An assemblage of plant, animal, and/or human populations in a common spatial arrangement.

**Compensatory Mitigation:** Compensating for the (residual) impact by replacing or providing substitute resources or environments (40 CFR 1508.20).

**Compensatory Mitigation Projects:** Specific, on-the-ground actions to improve and/or protect habitats (e.g., chemical vegetation treatments, land acquisitions, conservation easements).

**Compensatory Mitigation Sites:** The durable areas where compensatory mitigation projects will occur.

**Condition of Approval:** Condition or provision (requirement) under which an application for a permit to drill or sundry notice is approved.

**Conformance:** That a proposed action shall be specifically provided for in the land use plan or, if not specifically mentioned, shall be clearly consistent with the goals, objectives, or standards of the approved land use plan.

**Connectivity:** Condition in which the spatial arrangement of land cover types allows organisms and ecological processes (such as disturbance) to move across the landscape. Connectivity is the opposite of fragmentation.

**Conservation Plan:** The recorded decisions of a landowner or operator, cooperating with a conservation district, on how the landowner or operator plans, within practical limits, to use his/her land according to its

capability and to treat it according to its needs for maintenance or improvement of the soil, water, animal, plant, and air resources.

**Consistency:** The proposed land use plan does not conflict with officially approved plans, programs, and policies of tribes, other federal agencies, and state, and local governments to the extent practical within Federal law, regulation, and policy.

**Contributing Segment:** A trail segment that contributes to the significance of the trail, wherein it retains integrity of place, setting, feel, or association. This may include an intact trail segment, a good two-track, an intact (unspoiled) setting, or a good historical association; thus, these trail segments retain elements that convey the nineteenth century "feel" to the visitor. If a piece of trail is destroyed, such as by a paved road, and the setting is compromised, then the trail segment is noncontributing.

**Controlled Surface Use (CSU):** A category of moderate constraint stipulations that allows some use and occupancy of public land while protecting identified resources or values and is applicable to fluid mineral leasing and all activities associated with fluid mineral leasing. The stipulation identifies the location protected, activities prohibited or restricted, and the resources protected. The extent of protection may range from a limited area for only one activity to all uses. Typically used in use authorizations. For the protected resource, some activities may be prohibited while others are allowed. Activities may be allowed but only under certain conditions. Examples include (1) seismic operations are prohibited within a certain distance of an unstable resource (i.e., historic structure) and (2) only tracked construction vehicles are allowed access to the site (see also Stipulation Category).

**Corridor:** A tract of land forming a passageway or designation for linear utilities, transportation, Right-of-Way, multiple pipelines (such as for oil and gas), electricity transmission lines and related infrastructure, recreation and trails, and wildlife migration. See definitions: Designated Corridor, Right-of-Way Corridor, Utility Corridor, and Utility Window.

**Council on Environmental Quality (CEQ):** An advisory council to the President of the United States established by the national Environmental Policy Act of 1969. It reviews federal programs for their effect on the environment, conducts environmental studies, and advises the President on environmental matters.

**Cover:** Cover is any part of an animal's environment that provides protection and enhances the survival or reproduction of the animal. Wildlife cover has two components:

- It provides shelter from adverse weather conditions (winter or thermal cover), and
- It provides protection from predators (screening or escape cover).

**Critical Habitat:** An area occupied by a threatened or endangered species "on which are found those physical and biological features (1) essential to the conservation of the species, and (2) which may require special management considerations or protection." These irreplaceable and vital areas are designated as critical by the Secretary of the Interior for the survival and recovery of listed threatened and endangered species.

**Crucial Habitat:** Any particular range or habitat component that directly limits a community, population, or subpopulation to reproduce, and maintain itself at a certain level over the long term.

**Crucial Winter Range:** The portion of the winter range to which a wildlife species is confined during periods of heaviest snow cover. Any portion of winter range that is the determining factor in a population's ability to maintain and reproduce itself at a certain level over the long term may be crucial winter range.

**Cultural Resource:** A fragile and nonrenewable remnant of human activity, occupation, or endeavor reflected in districts, sites, structures, buildings, objects, artifacts, ruins, works of art, architecture, or natural features.

**Cultural Resource Inventory:** A descriptive listing and documentation, including photographs and maps, of cultural resources. Processes involved are locating, identifying, and recording of sites, structures, buildings, objects, and districts through library and archival research; collecting information from persons knowledgeable about cultural resources; and conducting on-the-ground field surveys of varying levels of intensity. (See also Cultural Resource Inventory Classes.)

**Cultural Resource Inventory Classes:** A class I inventory is a professionally prepared study that includes a compilation and analysis of all reasonably available cultural resource data and literature, and a management-focused, interpretive, narrative overview, and synthesis of the data. The overview also defines regional research questions and treatment options.

A class II probabilistic field survey is a statistically based sample survey, designed to aid in characterizing the probable density, diversity, and distribution of cultural properties in an area, to develop and test predictive models, and to answer certain kinds of research questions. Within individual sample units, survey aims, methods, and intensity are the same as those applied in class III survey.

A class III intensive survey describes the distribution of properties in an area; determines the number, location and condition of properties; determines the types of properties actually present within the area; permits classification of individual properties; and records the physical extent of specific properties.

**Cultural Resource Management Plan (CRMP):** A plan designed to inventory, evaluate, protect, preserve, or make beneficial use of cultural resources and the natural resources that figured significantly in cultural systems. The objectives of such plans are the conservation, preservation, and protection of cultural values and the scientific study of those values.

**Cultural Resource Site (Cultural Property):** A definite location of human activity, occupation or use identifiable through field inventory (survey), historical documentation, or oral evidence. The term includes archaeological, historic, or architectural sites, structures, or places with important public and scientific uses, and may include definite locations (sites or places) of traditional cultural or religious importance to specified social and/or cultural groups.

**Cumulative Impact (Effect):** The impact on the environment that results from the incremental impact of the action when added to other past, present, or reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

**Deferred/Deferred Use:** To set-aside, or postpone, a particular resource use(s) or activity(ies) on the public lands to a later time. Generally, when this term is used the period of the deferral is specified. Deferments sometimes follow the sequence timeframe of associated serial actions (e.g., action B will be deferred until action A is completed, etc.).

**Designated Corridor:** A parcel of land with specific boundaries identified by law, a Secretarial Order, the land use planning process or other management decisions as being preferred locations for existing and future ROWs. Established and new corridor(s) may be suitable to accommodate more than one type of ROW or more ROWs that are similar, identical, or compatible. (see Corridor definition)

**Designated Roads and Trails:** Those roads and trails that are specifically identified by the BLM as the only allowable routes for motor vehicle travel in the specific area involved. Travel on designated roads and

trails may be allowed seasonally or yearlong. Additional roads or trails may be constructed and authorized for travel as need dictates in conformance with the land use plan or activity plan.

**Desired Condition:** Alluvial stream channels (i.e., those not formed in bedrock) are considered to be physically functioning properly when they can adjust their form and gradient, over a period of time, to transport the water, wood, and sediment being delivered to them. They are resilient to disturbance. Channel cross-section form is generally maintained, even with lateral migration of the channel, or is moving toward a form that allows for improved channel function. Instream levels of fine sediment are within a natural range except for short periods of time after disturbance. Stream bank stability reflects stream type and potential.

**Desired Future Condition:** A future land or resource condition that achieves a set of compatible multi-resource goals and objectives.

**Desired Plant Community:** The vegetation community that provides the vegetation attributes required for meeting or exceeding RMP vegetation objectives. The desired vegetation community must be within an ecological site's capability to produce these attributes through natural succession, management action, or both (BLM Wyoming Instruction Memorandum 91-290, May 29, 1991).

**Developed Recreation:** Recreation that requires facilities, resulting in concentrated use of an area. An example of a developed recreational site is a campground. Facilities might include roads, parking lots, picnic tables, restrooms, drinking water, and buildings.

**Development:** Active drilling and production of wells.

**Development Area:** Areas primarily leased with active drilling and wells capable of production in payable quantities.

**Direct Impacts (Effects):** Direct impacts are caused by the action and occur at the same time and place.

**Directional Drilling (Oil and Gas):** Drilling boreholes with the directional course of the hole planned before drilling. Such holes are usually drilled with rotary equipment at an angle to the vertical and are useful in avoiding obstacles or in reaching side areas or the mineral estate beneath a restricted surface.

**Discharge (Water):** The rate of flow or volume of water flowing in a stream at a given place or within a given period of time.

**Discovery:** The knowledge of the presence of valuable minerals within or close enough to a location to justify a reasonable belief in their existence. Discovery is extremely important to public lands mining because the Mining Law of 1872 provides that mining claims can be located only after a discovery is made.

**Dispersal:** The movement, usually one way and on any time scale, of plants or animals from their point of origin to another location where they subsequently produce offspring.

**Dispersed Recreation:** Recreational use outside developed recreational sites. This includes activities such as scenic driving, hiking, bicycling, backpacking, hunting, fishing, snowmobiling, horseback riding, cross-country skiing, and recreation in primitive environments.

**Disposal:** Transfer of ownership of a tract of public land from the United States to another party through sale, exchange, or transfer under the Recreation and Public Purposes Act, Small Tracts Act, Bankhead-Jones Farm Tenant Act, General Exchange Act or other appropriate authorities.

**Disruptive Activities:** Land resource uses/activities that are likely to alter the behavior, displace, or cause excessive stress to existing animal or human populations occurring at a specific location and/or time. In this context, disruptive activity/activities refers to those actions that alter behavior or cause the displacement of individuals such that reproductive success is negatively affected, or an individual's physiological ability to cope with environmental stress is compromised. This term does not apply to the physical disturbance of the land surface, vegetation, or features. When administered as a land use restriction (e.g., No Disruptive Activities), this term may prohibit or limit the physical presence of sound above ambient levels, light beyond background levels, and/or the nearness of people and their activities. The term is commonly used in conjunction with protecting wildlife during crucial life stages (e.g., breeding, nesting, birthing, etc.), although it could apply to any resource value on the public lands. The use of this land use restriction is not intended to prohibit all activity or authorized uses. For actions other than those taken for human health and safety, regulatory compliance or emergency, an activity is "disruptive" if the activity would require people and/or the structure or activity to be present in these habitats for a duration of more than one hour during any one 24-hour period during the applicable season in the site-specific area.

**Distribution Line:** An electrical utility line with a capacity of less than 100 kV or a natural gas, hydrogen, or water pipeline less than 24" in diameter.

**Disturbance:** A discrete event, either natural or human induced, that causes a change in the existing condition of an ecological system.

**Diurnal:** Describes a cyclic event recurring daily; or the nature or habit of an organism to be active during daylight hours.

**Diversity:** The distribution and relative abundance of wildlife species, plant species, communities, habitats, or habitat features per unit of area.

**Drainage (Oil and Gas):** 1) Drainage occurs when oil and gas migrate in the subsurface from areas of high pressure to areas of lower pressure, such as is found near a producing well. 2) Production of migrated oil and gas without compensation to the owner and/or lessee from whose estate the hydrocarbons moved is called drainage.

**Durability (Protective and Ecological):** The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist (BLM Manual Section 1794).

**Easement:** A right held by a person or agency to make limited use of another's real property for access or other purposes.

**Ecological Site:** A kind of land with a specific potential natural community and specific physical site characteristics, differing from other kinds of land in that the site has the ability to produce distinctive kinds and amounts of vegetation and to respond to management. Ecological sites are defined and described with information about soil, species composition, and annual production.

**Ecological Site Descriptions (ESDs):** Are reports that provide detailed information about a particular kind of land - a distinctive Ecological Site. ESDs provide land managers the information needed for evaluating the land as to suitability for various land-uses, capability to respond to different management activities or disturbance processes, and ability to sustain productivity over the long term. ESD information is presented in four major sections: 1) Site Characteristics - physiographic, climate, soil, and water features; 2) Plant Communities – plant species, vegetation states, and ecological dynamics; 3) Site Interpretations – management alternatives for the site and its related resources; 4) Supporting Information – relevant literature, information and data sources.

**Ecosystem:** A complete, interacting system of living organisms and the land and water that make up their environment; the home places of all living things, including humans.

**Emergency Use:** These are activities occurring on the public lands outside the scope of normal resource use and operations, and which require immediate attention. Emergency use activities are typically driven by imminent concerns for human health and safety, or protection of property (e.g., wildfire suppression, HAZMAT response, disease outbreaks, etc.). Emergency use is typically exempted from other land use restrictions, with the exercise of reasonable and prudent care.

**Endangered Species:** Any plant or animal species that is in danger of extinction throughout all or a significant portion of its range, as defined by the U.S. Fish and Wildlife Service under the authority of the Endangered Species Act of 1973.

**Enhance:** The improvement of habitat by increasing missing or modifying unsatisfactory components and/or attributes of the plant community to meet Greater Sage-Grouse objectives.

**Environmental Assessment (EA):** Concise, analytical documents, authorized by the National Environmental Policy Act (NEPA) of 1969, that are prepared with public participation to determine whether an Environmental Impact Statement (EIS) is needed for a particular project or action. If an EA determines an EIS is not needed, the EA becomes the document allowing agency compliance with NEPA requirements.

**Environmental Impact Statement (EIS):** A document required by the National Environmental Policy Act (NEPA) for certain actions "significantly affecting the quality of the human environment." An EIS is a tool for decision making. It describes the positive and negative environmental effects of a proposed action, and it usually also lists one or more alternative actions that may be chosen instead of the action described in the EIS.

**Ephemeral Channels/Streams:** A defined channel formed in response to ephemeral surface flow conditions. Defined channels typically can be identified by an abrupt bank along a water flow path with evidence of scouring, sorting, and/or vegetation removal during flood events. These channels generally form in concave erosional features such as gullies, ravines, swales, etc. These channels are above the water table at all times, and lose water to the groundwater system.

**Ephemeral Surface Waters:** Streams, lakes, or other surface water bodies that have open water only during or immediately after periods of rainfall or snowmelt. These water bodies are above the water table at all times, and lose water to the groundwater system.

**Erosion:** The wearing away of the land surface by running water, wind, ice, or other geological agents.

**Essential Nexus:** The degree of the actions demanded by the permit conditions bears the required relationship to the projected impact of the proposed development.

**Evaporation Pond:** An industrial containment area designed to allow briny water to evaporate by using solar energy and wind.

**Exception:** A one-time exemption for a particular site within the leasehold; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the leasehold. An exception is a limited type of waiver (H-1624-1 – Planning for Fluid Mineral Resources).

**Exclusion Areas:** An area on the public lands where a certain activity(ies) is prohibited to insure protection of other resource values present on the site. The term is frequently used in reference to lands/realty actions and proposals (e.g., rights-of-way, etc.), but is not unique to lands and realty program activities. This restriction is functionally analogous to the phrase "no surface occupancy" used by the oil and gas program,

and is applied as an absolute condition to those affected activities. The less restrictive analogous term is avoidance area.

**Exotic Species:** Species which occur in a given place, area, or region as the result of direct or indirect, deliberate or accidental introduction of the species by humans, and for which introduction has permitted the species to cross a natural barrier to dispersal.

**Exploration:** Active drilling and geophysical operations to:

a. Determine the presence of the mineral resource; or

b. Determine the extent of the reservoir or mineral deposit.

**Extensive Recreation Management Area (ERMA):** BLM administrative units where recreation management is only one of several management objectives and where limited commitment of resources is required to provide extensive and unstructured types of recreation activities.

**Feasible:** Something is capable of being accomplished.

**Federal Lands:** As used in this document, lands owned by the United States, without reference to how the lands were acquired or what federal agency administers the lands. The term includes mineral estates or coal estates underlying private surface but excludes lands held by the United States in trust for Indians, Aleuts, or Eskimos. (See also Public Land.)

**Federal Land Policy and Management Act of 1976 (FLPMA) as amended:** Public Law 94-579. October 21, 1976, often referred to as the BLM' s "Organic Act," which provides the majority of the BLM's legislated authority, direction, policy, and basic management guidance.

**Federal Register (FR):** A daily publication that reports Presidential and federal agency documents.

**Fire Management:** All activities for the management of wildland fires to meet land management objectives. Fire management includes the entire scope of activities from planning, prevention, fuels or vegetation modification, prescribed fire, hazard mitigation, fire response, rehabilitation, monitoring and evaluation.

**Fire Management Plan (FMP):** A compilation of goals, objectives, and requirements from the land/resource management planning process necessary to implement wildland fire management decisions.

**Fire Regime Condition Class:** A measure describing the degree of departure from historical fire regimes, possibly resulting in alterations of key ecosystem components such as species composition, structural stage, stand age, canopy closure, and fuel loadings. One or more of the following activities may have caused this departure: fire suppression, timber harvesting, livestock grazing, introduction and establishment of exotic plant species, introduced insects or disease, or other management activities. The fire regime condition classes defined as follows:

- **Condition Class 1:** Fire regimes are within a historical range, and the risk of losing key ecosystem components from fire is low. Vegetation attributes (species composition and structure) are intact and functioning within an historical range.
- **Condition Class 2:** Fire regimes have been moderately altered from their historical range. The risk of losing key ecosystem components from fire is moderate. Fire frequencies have departed from historical frequencies by one or more return intervals (either increased or decreased). This results in moderate changes to one or more of the following: fire size, frequency, intensity, severity, and landscape patterns. Vegetation attributes have been moderately altered from their historical range.

- **Condition Class 3:** Fire regimes have been significantly altered from their historical ranges. The risk of losing key ecosystem components from fire is high. Fire frequencies have departed from historical frequencies by multiple return intervals. This results in dramatic changes to one or more of the following: fire size, frequency, intensity, severity, and landscape patterns. Vegetation attributes have been significantly altered from their historical range.

**Fire Suppression:** All work and activities connected with control and fire-extinguishing operations, beginning with discovery and continuing until the fire is completely extinguished.

**Fishery:** Habitat that supports the propagation and maintenance of fish.

**Flight Distance (Displacement Distance):** That to which a person can approach a wild animal without causing it to flee.

**Floodplain:** The relatively flat area or lowlands adjoining river channel constructed by the river in the present climate and overflowed at times of high discharge.

**Flow Connected Surface Feature:** A surface waterbody, including, but not limited to, a river, stream, lake, or pond, whose water is hydrologically connected to surface or groundwater.

**Fluid Minerals:** Oil, gas, coalbed natural gas, and geothermal resources.

**Forage:** All browse and herbaceous foods available to animals that may be grazed or harvested for feeding.

**Forage Reserve:** A determination for an allotment, or a portion of an allotment, on which there is no current term permit obligation for some or all of the estimated livestock grazing capacity and where it has been determined to use the available forage for management flexibility when there is a loss of forage availability on other allotments because of factors such as drought, hail, or fire (either prescribed or wild).

**Forest Management:** The practical application of scientific, economic, and social principals to the administration and working of a forest for specified objectives.

**Forest Resource:** A community of one or more forest tree species in varying stages of ecological succession that constitutes the primary dominant life form by which certain understory plants and forest dwelling animals are associated, and in whole or part, dependent.

**Formation Fracturing:** See Hydraulic Fracturing.

**Fossil:** Any remains, trace, or imprint of a plant or animal that has been preserved in the Earth's crust since some past geologic or prehistoric time (AGI Glossary of Geology).

**Frac:** See Hydraulic Fracturing.

**Fuelwood:** Wood that is round, split, or sawn and/or otherwise generally refuse material cut into short lengths or chipped for burning.

**Full Suppression:** All work and activities connected with control and fire-extinguishing operations, beginning with discovery and continuing until the fire is completely extinguished.

**Functional Habitat:** Habitat that is capable of serving the ecological requirements of a species, which includes providing for the seasonal and life cycle needs on a sustained basis.

**Furbearing Animal:** Badger, beaver, bobcat, marten, mink, muskrat, and weasel.

**Game Birds:** Grouse, partridge, pheasant, ptarmigan, quail, wild turkey, and migratory game birds.

**Geophysical Operation:** Prospecting for minerals or mineral fuels by measuring the various physical properties of the rocks and interpreting the results in terms of geologic features or the economic deposits sought. Physical measurements are taken at the surface, concerning the differences in the density, electrical resistance, or magnetic properties of the rocks. There are four main methods employed in geophysical prospecting: gravitational, magnetic, electrical, and seismic, with several modifications of each.

**General Habitat Management Areas:** Occupied (seasonal or year-round) habitat outside of priority habitat. These areas have been identified by the BLM in coordination with respective state wildlife agencies.

**Goal:** A broad statement of a desired outcome. Goals are usually not quantifiable and may not have established time frames for achievement.

**Grazing Preference:** Grazing preference means a superior or priority position against others for the purpose of receiving a grazing permit or lease. This priority is attached to base property owned or controlled by the permittee or lessee (43 CFR 4100.0-5).

**Grazing Relinquishment:** A grazing "relinquishment" is the voluntary and permanent surrender by an existing permittee or lessee, (with concurrence of any base property lienholder(s)), of their priority for a livestock forage allocation on public land (their preference) as well as their permission to use this forage (their grazing permit or lease), in whole or in part.

**Grazing System:** Scheduled grazing use and non-use of an allotment to reach identified goals or objectives by improving the quality and quantity of vegetation. Include, but are not limited to, developing pastures, utilization levels, grazing rotations, timing and duration of use periods, and necessary range improvements.

**Guidelines:** Actions or management practices that may be used to achieve desired outcomes, sometimes expressed as best management practices. Guidelines may be identified during the land use planning process, but they are not considered a land use plan decision unless the plan specifies that they are mandatory. Guidelines for grazing administration must conform to 43 CFR 4180.2 (H-1601-1, Land Use Planning Handbook).

**Habitat:** An environment that meets a specific set of physical, biological, temporal, or spatial characteristics that satisfy the requirements of a plant or animal species or group of species for part or all of their life cycle. In wildlife management, the major components of habitat are food, water, cover and the adequate juxtaposition of the three.

**Habitat Management Plan (HMP):** An officially approved activity plan for a specific geographic area of public land. An HMP identifies wildlife habitat and related objectives, defines the sequence of actions to be implemented to achieve the objectives, and outlines procedures for evaluating accomplishments.

**Habitat Type:** Place where an animal or plant normally lives, often characterized by a dominant plant form or physical characteristic.

**Hazard Reduction:** Any treatment of living and dead fuels that reduces the potential spread or consequences of fire.

**Hazard Fuels:** A fuel complex defined by kind, arrangement, volume, condition, and location that presents a threat of ignition and resistance to control.

**Hazardous Materials:** 1) any substance, pollutant, or contaminant (regardless of quantity) listed as hazardous under the Comprehensive Environmental Response, Compensation, and Liability Act

(CERCLA) of 1980, as amended, 42 USC 9601 et seq., and the regulations issued under CERCLA; 2) any hazardous waste as defined in the Resource Conservation and Recovery Act (RCRA) of 1976, as amended, and 3) any nuclear or nuclear byproduct as defined by the Atomic Energy Act of 1954, as amended, 42 USC 2011 et seq.

**Healthy Stream Channel Form and Function:** Stream channel function includes both physical and biological attributes, and applies to intermittent and perennial water bodies. Function includes water transport, sediment transport, and transport of wood and chemicals (including nutrients) delivered to streams. Physical attributes of streams include landscape setting, cross-section form, longitudinal gradient, particle size distribution, and response/adjustment to disturbance. Biological attributes of streams include nutrient dynamics, biological productivity, and aquatic habitat characteristics.

**Herbaceous:** Pertaining to or characteristic of an herb (fleshy-stem plant) as distinguished from the woody tissue of shrubs and trees.

**Herd Area:** The geographic area identified as having been used by a herd of wild horses or burros as its habitat in 1971.

**Herd Management Area (HMA):** Areas established by the Authorized Officer for the maintenance of wild horse and burro herds. Herd management areas are established in consideration of the appropriate management level for the herd, the habitat requirements of the animals, the relationships with other uses of the public and adjacent private lands, and the constraints contained in 43 CFR 4710.4.

**Hibernaculum:** A shelter occupied during the winter by a dormant animal.

**High-voltage Transmission Line:** An electrical power line that is 100 kilovolts or larger.

**Historic:** Referring to the time after written records or after the Europeans first came and wrote about the people and events in America.

**Historic District:** A district possesses a significant concentration, linkage or continuity of sites, buildings, structures, united historically or aesthetically by plan or physical development.

**Historic Property:** Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion on, the National Register of Historic Places, including artifacts, records, and material remans related to such a property or resource.

**Historical Raptor Nests:** Any raptor nest or site that has been destroyed but was historically recorded and documented. Temporal and spatial stipulations will not apply.

**Home Range:** The area in which an animal travels in the scope of natural activities.

**Holder:** An individual or entity that holds a valid special use authorization.

**Hydraulic Fracturing:** The breaking or parting of reservoir rock through the use of injected fluids. Hydraulic fracturing is a method of stimulating production or injection at a specific depth in a formation of low permeability by inducing fractures and fissures in the formation by applying high fluid pressure to its face. Fluids (liquids, gases, foams, and emulsions) are injected into reservoir rock at pressures that exceed the strength of the rock and overcome internal stresses of the rock. The fluid enters the formation and parts or fractures it. Sand grains, aluminum pellets, glass beads, or similar materials are carried in suspension by the fluid into the fractures. These are called propping agents or proppants. When the pressure is released at the surface, the fracturing fluid returns to the wellbore as the fractures partially close on the proppants, leaving paths with increased permeability for fluid flow.

**Identified 100-Year Flood Plains:** Those areas delineated by the Federal Emergency Management Agency as having a 1% probability of being inundated in any given year.

**Impacts (or Effects):** Consequences (the scientific and analytical basis for comparison of alternatives) as a result of a proposed action. Effects may be either direct, which are caused by the action and occur at the same time and place, or indirect, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable, or cumulative.

**Implementation Plan:** A site-specific plan written to implement decisions made in a land use plan. An implementation plan usually selects and applies best management practices to meet land use plan objectives. Implementation plans are synonymous with "activity" plans. Examples of implementation plans include interdisciplinary management plans, habitat management plans, and allotment management plans.

**Important Habitats:** Areas of especially high value for a diversity of wildlife or areas that provide certain habitat elements essential to the existence of certain groups of wildlife.

**Indicators:** Factors that describe resource condition and change and can help the BLM determine trends over time.

**Indicator Species:** Species that indicate the presence of certain environmental conditions, seral stages, or previous treatment. One or more plant species selected to indicate a certain level of grazing use (See Management Indicator Species).

**Indirect Impacts (Effects):** Indirect impacts are caused by the action and occur later in time or further removed in distance.

**Infiltration Pond:** An industrial containment area designed to allow groundwater recharge and the downward entry of water into the soil or other material. Infiltration impoundments constructed in-channel may allow for overflow under given storm events.

**Initial Attack:** An aggressive action to put the fire out by the first resources to arrive, consistent with firefighter and public safety and values to be protected.

**In-kind Mitigation:** The replacement or substitution of resources or values that are of the same type and kind as those impacted.

**Integrated Ranch Planning:** A method for ranch planning that takes a holistic look at all elements of the ranching operations, including strategic and tactical planning, rather than approaching planning as several separate enterprises.

**Intensive Management:** Use of proper distance restrictions, seasonal or timing restrictions, rehabilitation standards, and the application of the Wyoming Mitigation Guidelines for Surface-disturbing and Disruptive Activities to adequately protect the resources for which the intensive management is applied. Intensive management actions would be applied with the goal of maintaining or enhancing sensitive resources (plant communities, wildlife habitats, archaeological or paleontological resources, etc.).

**Interdisciplinary Team:** A group of individuals with different training, representing the physical sciences, social sciences, and environmental design arts, assembled to solve a problem or perform a task. The members of the team proceed to a solution with frequent interaction so that each discipline may provide insights on any stage of the problem, and disciplines may combine to provide new solutions. The number and disciplines of the members preparing the plan vary with circumstances. A member may represent one or more discipline or program interest.

**Interior Board of Land Appeals (IBLA):** The Department of the Interior, Office of Hearings and Appeals, board that acts for the Secretary of the Interior in responding to appeals of decisions on the use and disposition of public lands and resources. Because the IBLA acts for and on behalf of the Secretary of the Interior, its decisions usually represent the Department's final decision but are subject to the courts.

**Intermittent Surface Waters:** Streams, lakes, or other surface water bodies that generally flow or contain during a portion of the year when they receive water from springs or during runoff from rain or snow. In the case of streams, this term can also refer to spatially noncontinuous flow because of groundwater interaction (i.e., portions of the stream are generally dry and portions are generally wet in most years).

**Invasive Species (Invasive Plant Species, Invasives):** A non-native species whose introduction does or is likely to cause economic or environmental harm or harm to human health. The species must cause, or be likely to cause, harm, and be exotic to the ecosystem it has infested before considered invasive.

**Irreversible and Irretrievable Commitment of Resources:** An irretrievable commitment of a resource is one in which the resource or its use is lost for a period of time. An irreversible commitment of a resource is one that cannot be reversed. NEPA §102(2)C requires a discussion of any irreversible or irretrievable commitments of resources that would be involved in a proposal should it be implemented.

**Isolated Parcel:** An individual parcel of land that may share a corner, but does not have a common border with another parcel.

**Jurisdiction:** The legal right to control or regulate use of a transportation facility. Jurisdiction requires authority but not necessarily ownership.

**Land Locked:** This term refers to the situation when any parcel of land (i.e., private, State, or Federal) has no legal access without crossing another ownership due to the existing land ownership pattern.

**Lands with Wilderness Characteristics:** Lands that have been inventoried and determined by the BLM to contain wilderness characteristics as defined in section 2(c) of the Wilderness Act.

**Landscape:** A distinct association of land types that exhibit a unique combination of local climate, landform, topography, geomorphic process, surficial geology, soil, biota, and human influences. Landscapes are generally of a size that the eye can comprehend in a single view.

**Land Tenure Adjustment:** This term refers to a change in land ownership patterns, or legal status, to improve their administrative manageability and/or their usefulness to the public.

**Land Use Plan:** A set of decisions that establish management direction for land within an administrative area, as prescribed under the planning provisions of FLPMA; an assimilation of land-use-plan-level decisions developed through the planning process, regardless of the scale at which the decisions were developed.

**Large Scale Anthropogenic Disturbances:** Features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, agricultural conversion, homes, and mines.

**Late Brood Rearing Area:** Habitat includes mesic sagebrush and mixed shrub communities, wet meadows, and riparian habitats as well as some agricultural lands (e.g., alfalfa fields).

**Leasable Minerals:** Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920, as amended. These include energy-related mineral resources such as oil, natural gas, coal, and

geothermal, and some non-energy minerals, such as phosphate, sodium, potassium, and sulfur. Geothermal resources are also leasable under the Geothermal Steam Act of 1970.

**Lease:** Section 302 of the Federal Land Policy and Management Act of 1976 provides the BLM's authority to issue leases for the use, occupancy, and development of public lands. Authorizations are issued for purposes such as a commercial filming, advertising displays, commercial or noncommercial croplands, apiaries, livestock holding or feeding areas not related to grazing permits and leases, native or introduced species harvesting, temporary or permanent facilities for commercial purposes (does not include mining claims), residential occupancy, ski resorts, construction equipment storage sites, assembly yards, oil rig stacking sites, mining claim occupancy if the residential structures are not incidental to the mining operation, and water pipelines and well pumps related to irrigation and nonirrigation facilities. The regulations establishing procedures for processing these leases and permits are found in 43 CFR 2920.

**Lease Notice:** Provides more detailed information concerning limitations that already exist in law, lease terms, regulations, or operational orders.

**Lease Stipulations (Oil and Gas):** Additional specific terms and conditions that modify the lease rights or change the manner in which an operation may be conducted.

**Lentic:** Wetland or riparian areas with standing water habitat such as lakes, ponds, seeps, bogs, and meadows.

**Level of Acceptable Change:** Federally established threshold of acceptable change to maintain conditions of acid-sensitive lakes.

**Level of Concern:** Federally established atmospheric deposition threshold concentration amount related to undesirable effects on the ecosystem.

**Light Grazing:** Light grazing is related to forage utilization, and can be expressed as livestock grazing that consumes no more than about 30% of the current year's growth of forage plants. Light refers to the effect on the landscape, which is measured through utilization monitoring. You may reduce the number of animals by 30% and still not achieve "light grazing", if those animals that remain consume more than 30% of the current year's forage growth.

**Limited Designation (OHV):** An area restricted at certain times, in certain areas, or to certain vehicular use. These restrictions may be of any type but can generally be accommodated within the following categories: Number of vehicles; type of vehicles; time or season of vehicle use; permitted or licensed use only; use on existing roads and trails; use on designated roads and trails; and other restrictions.

**Limited Reclamation Potential:** Limited Reclamation Potential soils are as defined by the Wyoming Reclamation Policy. Site- specific evaluations will be conducted using current site conditions and up-to-date databases such as the NRCS Soil Web Survey and other information as needed to define soils as having Limited Reclamation Potential.

**Livestock Conversion:** A discretionary action changing permitted use from one kind or class of animal to another.

**Locatable Minerals:** Mineral disposable under the General Mining Act of 1872, as amended, that were not excepted in later legislation. They include hard rock, placer, industrial minerals, and uncommon varieties of rock found on public domain lands (see definition at 43 CFR 3830.10 and examples of minerals that are to be located by lode or placer claim at 43 CFR 3832.20).

**Lotic:** Riparian areas with running water habitat such as rivers, streams, creeks, and springs.

**Lynx Analysis Unit (LAU):** An LAU is a project analysis unit upon which direct, indirect, and cumulative effects analysis are performed. LAU boundaries should remain constant to facilitate planning and allow effective monitoring of habitat changes over time. An LAU is an area of at least the size used by an individual lynx, from about 25 to 50 square miles.

**Major Pipeline:** A pipeline that is 24 inches or more in outside-pipe diameter (Mineral Leasing Act of 1920 30 USC § 181; 36 CFR 251.54(f)(1)).

**Management Area:** An area identified by the BLM for the management of a specific resource or resources such as a geographic or watershed area; where activities are managed to ensure the combination of resource values are adequately maintained.

**Management Decision:** A decision made by the BLM to manage public lands. Management decisions include both land use plan decisions and implementation decisions.

**Management Indicator Species:** A plant or animal species selected because their status is believed to (1) be indicative of the status of a larger functional group of species, (2) be reflective of the status of a key habitat type, or (3) act as an early warning of an anticipated stressor to ecological integrity. The key characteristic of a MIS species is that its status and trend provide insights to the integrity of the larger ecological system to which it belongs.

**Master Development Plans:** A set of information common to multiple planned wells, including drilling plans, Surface Use Plans of Operations, and plans for future production.

**Mineral:** Any naturally formed inorganic material, solid or fluid inorganic substance that can be extracted from the earth, any of various naturally occurring homogeneous substances (as stone, coal, salt, sulfur, sand, petroleum, water, or natural gas) obtained usually from the ground. Under federal laws, considered as locatable (subject to the general mining laws), leasable (subject to the Mineral Leasing Act of 1920), and salable (subject to the Materials Act of 1947).

**Mineral Entry:** The filing of a claim on public land to obtain the right to any minerals it may contain.

**Mineral Estate:** The ownership of minerals, including rights necessary for access, exploration, development, mining, ore dressing, and transportation operations.

**Mineral Leasing Act of 1920, as amended (MLA) 30 USC 181, 43 CFR 3000 and 2880:** An Act to promote the mining of coal, phosphate, oil, oil shale, gas and sodium on the public domain.

**Mineral Location:** The act of marking out and establishing rights by a claimant for mining purposes in accordance with the Mining Law of 1872, as amended.

**Mineral Materials:** Materials such as common varieties of sand, stone, gravel, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws but that can be acquired under the Materials Act of 1947, as amended; pursuant to the mineral material regulations at 43 CFR Part 3600 or 36 CFR 228 Subpart C.

**Minimization Mitigation:** Minimizing impacts by limiting the degree or magnitude of the action and its implementation (40 CFR 1508.20 (b)).

**Mining Claim:** A parcel of land that a miner takes and holds for mining purposes, having acquired the right of possession by complying with the Mining Law and local laws and rules. There are four categories of mining claims: lode, placer, millsite, and tunnel site.

**Minor Pipeline:** A pipeline less than 24 inches in outside diameter which doesn't require Congressional Notification.

**Mitigation:** Includes specific means, measures or practices that could reduce, avoid, or eliminate adverse impacts. Mitigation can include avoiding the impact altogether by not taking a certain action or parts of an action, minimizing the impact by limiting the degree of magnitude of the action and its implementation, rectifying the impact by repairing, rehabilitation, or restoring the affected environment, reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, and compensating for the impact by replacing or providing substitute resources or environments.

**Modification (Oil and Gas Leasing):** A change to the provisions of a lease stipulation, either temporarily or for the term of the lease. May maintain, increase, or decrease the level of environmental protection. Depending on the specific modification, the stipulation may or may not apply to all sites within the leasehold to which the restrictive criteria are applied (H-1624-1 – Planning for Fluid Mineral Resources).

**Monitoring:** The orderly collection, analysis, and interpretation of resource data to evaluate progress toward meeting management objectives. This process must be conducted over time in order to determine whether or not management objectives are being met. Monitoring also includes observations to evaluate baseline (i.e., pre-activity) conditions, evaluation of whether activities met desired goals and permit requirements (implementation monitoring), and evaluation of how well mitigation measures protected resource conditions (effectiveness monitoring).

**Moraine:** An accumulation of boulders, stones, and other earth debris carried and deposited by a glacier.

**Multiple Use:** Management of the public lands and their various resource values so that they are used in the combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output, as provided in the Multiple Use Sustained Yield Act.

**National Ambient Air Quality Standards (NAAQS):** The allowable concentrations of air pollutants in the ambient (public outdoor) air. National ambient air quality standards are based on the air quality criteria and divided into primary standards (allowing an adequate margin of safety to protect the public health) and secondary standards (allowing an adequate margin of safety to protect the public welfare). Welfare is defined as including, but not limited to, effects on soils, water, crops, vegetation, human-made materials, animals, wildlife, weather, visibility, climate, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being.

**National Environmental Policy Act of 1969 (NEPA):** The National Environmental Policy Act (NEPA) [42 USC 4321 et seq.] was signed into law on January 1, 1970. The Act establishes national environmental policy and goals for the protection, maintenance, and enhancement of the environment and provides a process for implementing these goals within the federal agencies. The Act also establishes the Council on Environmental Quality (CEQ).

**National Historic Preservation Act (NHPA):** The National Historic Preservation Act (Public law 113-287; 54 USC 300101 et seq.) is legislation intended to preserve historical and archaeological sites in the

United States of America. The act created the National Register of Historic Places, the list of National Historic Landmarks, and the State Historic Preservation Offices.

**National Historic Trail:** A congressionally designated trail that is an extended, long-distance trail, not necessarily managed as continuous, that follows as closely as possible and practicable the original trails or routes of travel of national historic significance. The purpose of a National Historic Trail is the identification and protection of the historic route and the historic remnants and artifacts for public use and enjoyment. A National Historic Trail is managed in a manner to protect the nationally significant resources, qualities, values, and associated settings of the areas through which such trails may pass, including the primary use or uses of the trail.

**National Register of Historic Places (NRHP):** The official list of United States government's historic districts, sites, buildings, structures, and objects deemed worthy of preservation. Authorized by the National Historic Preservation Act of 1966, the National Register of Historic Places is a national program to coordinate and support public and private efforts to identify, evaluate, and protect America's historic and archaeological resources.

**National Scenic Trail:** A congressionally designated trail that is a continuous and uninterrupted extended long-distance trail so located as to provide for maximum outdoor recreation potential and for the conservation and enjoyment of the nationally significant resources, qualities, values, and associated settings and the primary use or uses of the areas through which such trails may pass. National Scenic Trails may be located so as to represent desert, marsh, grassland, mountain, canyon, river, forest, and other areas, as well as landforms that exhibit significant characteristics of the physiographic regions of the Nation.

**National Wild and Scenic Rivers (WSR):** The system of congressionally designated rivers and their immediate environments that have outstanding scenic, recreational, geologic, fish and wildlife, historic, cultural, and other similar values and are preserved in a free-flowing condition.

**Native Plant Species:** Species that were found here before European settlement, and consequently are in balance with these ecosystems because they have well developed parasites, predators, and pollinators.

**Necessary Tasks:** Administrative duties or work requiring the use of motor vehicles, such as retrieving big game kills, repairing range improvements, management of livestock, geophysical exploration activities and other types of leasable mineral exploration activity (other than casual use), or performing mining claim functions resulting in less than 5 acres of surface disturbance as described in 43 CFR 3809. Mining claimants may exercise their rights to cause more than 5 acres disturbance as part of exploring for or mining locatable minerals 36 CFR 3809.5.

**Net Conservation Gain:** The actual benefit or gain above baseline conditions.

**No Surface Occupancy (NSO):** Land use allocation or approval restriction used when surface disturbance cannot be mitigated and must be prohibited. The land use decision or stipulation identifies the NSO area and allowed or excepted uses in the area. NSO stipulations are used on oil and gas leases where drilling and/or operations impacts cannot be adequately mitigated but fluid mineral resources may be recovered by directional drilling. Exclusion Area designations in the Realty Program are NSO land use decisions. This stipulation can be used to prohibit other surface disturbing or disruptive activities such as commercial recreational activities, mining, and timber harvest (see also Stipulation Category) (IBWY-2007-029).

**Noncommercial Forestland:** Land that is not capable of yielding at least 20 cubic feet of wood per acre per year of commercial species; also, land that is capable of producing only noncommercial tree species.

**Non-Point Source Pollution:** A pollution source that is not specific in location. The source of the discharge is dispersed, not well defined, or constant.

**[3809] Notice-level Mining Activities:** A notice is required for exploration activity greater than casual use that will cause surface disturbance of 5 acres or less on BLM-administered lands and split-estate. Mining activity, regardless of acreage disturbed, may not be conducted under a notice filed under the current regulations. For activities under BLM jurisdiction, the content of the notice will determine whether the operation qualifies as a notice-level operation and will not cause undue and unnecessary degradation (43 CFR 3809.21).

**Noxious Weeds:** A plant species designated by federal or State law as generally possessing one or more of the following characteristics: aggressive and difficult to manage; parasitic; a carrier or host of serious insects or disease; or nonnative, new, or not common to the United States.

**Objective:** A description of a desired outcome for a resource. Objectives can be quantified and measured and, where possible, have established timeframes for achievement (H-1601-1, Land Use Planning Handbook).

**Off-Highway Vehicle (OHV):** Any motorized tracked or wheeled vehicle designed for cross-country travel over any type of natural terrain. Exclusions (from 43 CFR 8340.0-5(a) (1-5)) are non-amphibious registered motorboats; any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; any vehicle whose use is expressly authorized by the authorizing officer or otherwise officially approved; vehicles in official use; and any combat support vehicle in times of national defense emergencies. The term Off-Road Vehicle (ORV) is used synonymously with OHV.

**Off-Highway Vehicle Management Designations:** An area where all types of vehicle use is permitted at all times, anywhere in the area subject to the operating regulations and vehicle standards set for within 43 CFR 8341 – 8342 The off-road vehicle (ORV) designation definitions have been developed in cooperation with representatives of the U.S. Forest Service, U.S. Park Service, and BLM State and District personnel. It is recognized that there are differences between OHVs and over-the-snow vehicles in terms of use and impact. Therefore, travel by over-the-snow vehicles is permitted off existing routes and in all open or limited areas (unless otherwise specifically limited or closed to over-the-snow vehicles) if they are operated in a responsible manner without damaging the vegetation or harming wildlife. Designations include—

**OHV Closed Route:** OHV Travel is prohibited on the route. Access by means other than OHVs, such as by motorized vehicles that fall outside of the definition of an OHV or by mechanized or non- mechanized means, is permitted. The BLM designates routes as closed to OHV if necessary to protect resources, promote visitor safety, reduce use conflicts, or meet a specific resource goal or objective.

**OHV Open Route:** OHV travel us permitted where there are no special restrictions or no compelling reassure protection needs, user conflicts, or public safety issues to warrant limiting the timing or season of use, the type of OHV or the type of OHV user.

**OHV Limited Route:** OHV Travel on routes, roads, trails or other vehicle ways is subject to restrictions to meet specific resources management objectives. Examples of restrictions include numbers or types of vehicles; time or season of use; permitted or licensed use only; or other restrictions necessary to meet resource management objectives, including certain competitive or intensive uses that have special limitations.

**Offsite Mitigation:** Compensating for resource impacts by replacing or providing substitute resources or habitat at a different location than the project area.

**Oil and Gas Lease:** A legal contract granting the right to explore for, develop and produce oil and gas resources for a specific period of time under certain agreed-upon terms and conditions.

**Open Designation (OHV):** An area where all types of vehicle use is permitted at all times, anywhere in the area subject to the operating regulations and vehicle standards set for in 43 CFR 8341 – 8342.

**Out-of-kind Mitigation:** The replacement or substitution of resources or values that are not the same type and kind as those impacted, but are related or similar.

**Overstory:** The portion of vegetation in a forest that forms the uppermost foliage layer.

**Paleontological Resources:** Any fossilized remains, traces, or imprints of organisms, preserved in or on the earth's crust, that are of paleontological interest, and that provide information about the history of life on earth. The term does not include: (1) Any materials associated with an archaeological resource (as defined in section 3(1) of the Archaeological Resources Protection Act of 1979 (16 U.S.C. 480bb(1)); or (2) Any cultural item (as defined in section two of the Native American Graves Protection and Repatriation Act [25 USC 3001]). The term does not apply to petrified wood or fossiliferous units.

**Particulate Matter (PM):** Fine liquid or solid particles suspended in the air and consisting of dust, smoke, mist, fumes, and compounds containing sulfur, nitrogen, and metals.

**Partners:** an association of individuals or groups with like interests due to the scope or location of a project on federal lands or in regard to a federal permitting process.

**Parturition Area:** Documented birthing areas commonly used by females. They include calving areas, fawning areas, and lambing grounds. These areas may be used as nurseries by some big game species.

**Passerine Birds:** Birds of the order Passeriformes, which includes perching birds and songbirds such as blackbirds, jays, finches, warblers, and sparrows. More than half of all birds belong to this order.

**Paved Road:** This road provides access between major points and includes major and minor highways.

**Perennial Surface Waters:** Streams, lakes, or other surface water bodies that flow or contain water year-round in most years. These water bodies are primarily fed by groundwater during the low-flow season. These systems would generally only dry up during drought conditions. In the case of streams, this term can refer to the persistence of surface waters along a channel (i.e., few reaches where the infiltration into the stream aquifer exceeds the flow).

**Permittee:** A person or company authorized to use or occupy BLM-administered land.

**Persistent Woodlands:** Long-lived pinyon-juniper woodlands that typically have sparse understories and occur on poor substrates in the assessment area.

**Personal Income:** The sum of wage and salary disbursements, other labor income, proprietors' income, rental income of persons, personal dividend income, personal interest income, and transfer payments to persons, less personal contributions for social insurance.

**pH:** A measure of acidity or hydrogen ion activity. Neutral is pH 7.0. All values below 7.0 are acidic, and all values above 7.0 are alkaline.

**Plan:** A document that contains a set of comprehensive, long-range decisions concerning the use and management of BLM-administered resources in a specific geographic area.

**Plan of Operations:** A [3809] Plan of Operations is required for all locatable mining exploration activity greater than 5 acres or surface disturbance greater than casual use on certain special category lands. Special category lands are described under 43 CFR 3809.11(c) and include such lands as designated Areas of

Critical Environmental Concern, lands within the National Wilderness Preservation System, and areas closed to off-road vehicles, among others. In addition, a plan of operations is required for activity greater than casual use on lands patented under the Stock Raising Homestead Act with Federal minerals where the operator does not have the written consent of the surface owner (43 CFR 3814 & 3809.31(d)). The Plan of operations needs to be filed in the BLM field office with jurisdiction over the land involved. The Plan of Operations does not need to be on a particular form but must address the information required by 43 CFR 3809.401(b).

**Planning Area:** A geographical area for which land use and resource management plans are developed and maintained.

**Planning Criteria:** The standards, rules, and other factors developed by managers and interdisciplinary teams for their use in forming judgments about decision making, analysis, and data collection during planning. Planning criteria streamline and simplify the resource management planning actions.

**Planning Base:** Law, regulation, policy, land use plan decisions (e.g., RMPs, Resource Management Plan Amendments, and Management Framework Plan Amendments), NEPA documents (e.g., EISs Administrative Determinations, EAs, and Categorical Exclusion Reviews), and supporting data (e.g., automated databases, research, and evaluations).

**Point Source Pollution:** Any discernable, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, or container from which pollutants are or may be discharged to a receiving water body, wetland, etc.

**Policy:** This is a statement of guiding principles, or procedures, designed and intended to influence planning decisions, operating actions, or other affairs of the BLM. Policies are established interpretations of legislation, executive orders, regulations, or other presidential, secretarial, or management directives.

**Population:** A group of organisms, all the same species, which occupies a particular area. The term is used to refer to the number of individuals of a species within an ecosystem or of any group of like individuals.

**Potential Wild and Scenic River:** A body of water or estuary or a section, portion, or tributary thereof, including rivers, streams, creeks, runs, kills, rills, and small lakes that possess free-flowing condition and outstandingly remarkable values and therefore may have potential for addition to the National System.

**Preference:** See Grazing Preference.

**Prehistoric:** Information about past events prior to the recording of events in writing. The period of prehistory differs around the world depending upon when written records became common in a region.

**Prescribed Fire:** A wildland fire originating from a planned ignition in accordance with applicable laws, policies, and regulations to meet specific objectives.

**Prescribed Fire Plan (Burn Plan):** A plan required for each fire application ignited by management. Plans are documents prepared by qualified personnel, approved by the agency administrator, and include criteria for the conditions under which the fire will be conducted (a prescription). Plan content varies among the agencies.

**Prescription:** In the context of wildland fire, a prescription is measurable criteria that define conditions under which a prescribed fire may be ignited. Prescriptions may also be used to guide selection of management responses to wildfire to define conditions under which management actions are most likely to achieve incident management objectives. Prescription criteria typically describe environmental conditions

such as temperature, humidity and fuel moisture, but may also include safety, economic, public health, geographic, administrative, social, or legal considerations.

**Primitive Road:** A linear route managed for use by four-wheel drive or high-clearance vehicles. These routes do not customarily meet any BLM road design standards (H-8342-1, Travel and Transportation Management Handbook).

**Primitive Route:** A transportation linear feature located within a WSA or lands with wilderness characteristics designated for protection by a land use plan and not meeting the wilderness inventory road definition.

**Produced Water:** Groundwater produced in conjunction with the extraction of minerals.

**Proper Functioning Condition (PFC):** A riparian-wetland area is considered to be in proper functioning condition when adequate vegetation, landform, or large woody debris is present to dissipate stream energy associated with high water flow, thereby reducing erosion and improving water quality; filter sediment, capture bedload, and aid floodplain development; improve flood-water retention and ground-water recharge; develop root masses that stabilize streambanks against cutting action; develop diverse ponding and channel characteristics to provide the habitat and the water depth, duration, and temperature necessary to fish production, waterfowl breeding, and other uses; and support greater biodiversity. The functioning condition of riparian-wetland areas is a result of interaction among geology, soil, water, and vegetation. There are two categories of wetlands—lentic areas, which are created by a stable water table such as playas, fens, around lakes, marshes etc., and lotic areas, which are in riverine environments.

**Proposed Species:** Species that have been officially proposed for listing as threatened or endangered by the Secretary of the Interior as determined by the US Fish and Wildlife Service. A proposed rule has been published in the Federal Register.

**Public Domain:** The term applied to any or all of those areas of land ceded to the Federal Government by the Original States and to such other lands as were later acquired by treaty, purchase, or cession, and are disposed of only under the authority of Congress.

**Public Lands:** As used in this document, any land and interest in land owned by the United States and administered by the Secretary of the Interior through the Bureau of Land Management, without regard to how the United States acquired ownership.

**Range Improvement:** The term range improvement means any activity, structure or program on or relating to rangelands which is designed to improve production of forage, change vegetative composition, control patterns of use, provide water, stabilize soil and water conditions, and provide habitat for livestock and wildlife. The term includes, but is not limited to, structures, treatment projects, and use of mechanical means to accomplish the desired results.

**Range Trend:** The direction of change in range condition over time, either toward or away from desired management objectives.

**Rangeland:** Land on which the indigenous (climax or natural potential) vegetation is predominantly grasses, grass-like plants, forbs, or shrubs and is managed as a natural ecosystem. If plants are introduced, they are managed similarly. Rangelands include natural grasslands, savannas, shrublands, many deserts, tundras, alpine communities, marshes and meadows.

**Raptor:** Bird of prey with sharp talons and strongly curved beaks such as hawks, owls, vultures, ravens, and eagles.

**Raptor Concentration Area (RCA):** A localized area where raptors congregate that may provide thermal protection, increased forage availability, and a minimal level of stress-inducing disturbances.

**Reasonably Foreseeable Development (RFD):** A projection of likely exploration, development, and production of oil and gas within a study area based on existing and credible geologic data, technology, economics, and activity trends.

**Reclamation:** The suite of actions taken within an area affected by human disturbance, the outcome of which is intended to change the condition of the disturbed area to meet pre-determined objectives and/or make it acceptable for certain defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

**Reclamation Plans:** Plans that guide the suite of actions taken within an area affected by human disturbance, the outcome of which is intended to change the condition of the disturbed area to meet pre-determined objectives and/or make it acceptable for certain defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

**Recreation Opportunity Spectrum (ROS):** A planning process that provides a framework for defining classes of outdoor recreation environments, activities, and experience opportunities. The settings, activities, and opportunities for experiences are arranged along a continuum or spectrum of six classes: primitive, back country, middle country, front country, rural, and urban. The resulting analysis defines specific geographic areas on the ground, each of which encompasses one of the six classes.

**Reference State:** The reference state is the state where the functional capacities represented by soil/site stability, hydrologic function, and biotic integrity are performing at an optimum level under the natural disturbance regime. This state usually includes, but is not limited to, what is often referred to as the potential natural plant community.

**Reserve Common Allotment:** An area which is designated in the land use plan as available for livestock grazing but reserved as an area available for use as an alternative to grazing in another allotment in order to facilitate rangeland restoration treatments and recovery from natural disturbances such as drought or wildfire. The reserve common allotment would provide needed flexibility that would help the agency apply temporary rest from grazing where vegetation treatments and/or management would be most effective.

**Residual Impacts:** Impacts from an authorized land use or implementation-level decision that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

**Restoration:** Implementation of a set of actions that promotes plant community diversity and structure that allows plant communities to be more resilient to disturbance and invasive species over the long term. The long-term goal is to create functional, high quality habitat that is occupied by Greater Sage-Grouse. Short-term goal may be to restore the landform, soils and hydrology and increase the percentage of preferred vegetation, seeding of desired species, or treatment of undesired species.

**Resource Damage:** Damage to any natural or cultural resources that results in impacts such as erosion, water pollution, degradation of vegetation, loss of archaeological resources, or the spread of weeds.

**Resource Management Plan (RMP):** A land use plan as described by the Federal Land Policy and Management Act. The resource management plan generally establishes in a written document: (1) Land areas for limited, restricted or exclusive use; designation, including ACEC designation; and transfer from Bureau of Land Management Administration; (2) Allowable resource uses (either singly or in combination) and related levels of production or use to be maintained; (3) Resource condition goals and objectives to be attained; (4) Program constraints and general management practices needed to achieve the above items; (5) Need for an area to be covered by more detailed and specific plans; (6) Support action, including such measures as resource protection, access development, realty action, cadastral survey, etc., as necessary to

achieve the above; (7) General implementation sequences, where carrying out a planned action is dependent upon prior accomplishment of another planned action; and (8) Intervals and standards for monitoring and evaluating the plan to determine the effectiveness of the plan and the need for amendment or revision. It is not a final implementation decision on actions which require further specific plans, process steps, or decisions under specific provisions of law and regulations

**Restriction/Restricted Use:** A limitation or constraint on public land uses and operations. Restrictions can be of any kind, but most commonly apply to certain types of vehicle use, temporal and/or spatial constraints, or certain authorizations.

**Right-of-Way Corridor:** A parcel of land (often linear in character) that has been identified through the land use planning process as being a preferred location for existing and future utility rights-of-way and that is suitable to accommodate one or more rights-of-way that are similar, identical, or compatible. Corridors may accommodate multiple pipelines (such as for oil and gas), electricity transmission lines, and related infrastructure, such as access and maintenance roads, compressors, pumping stations, and other structures (see Corridor definition).

**Right-of-Way Grant:** Authorizes public lands to be used or occupied for the construction, operation, maintenance, and termination of a project or facility passing over, upon, under, or through such land. A ROW grant is an authorization of use for either site or linear projects (e.g. communication sites, power lines, pipelines and roads) on public lands. A grant authorizes rights and privileges for a specific use of the land for a specific period of time (43 CFR 2800, 2880).

**Riparian:** Referring to or relating to areas adjacent to water or influenced by free water associated with streams or rivers on geologic surfaces occupying the lowest position in the watershed. (See definition for Lentic and Lotic). (See also Wetland/Riparian.)

**Riparian Area:** A form of wetland transition between permanently saturated wetlands and upland areas. These areas exhibit vegetation or physical characteristics reflective of permanent surface or subsurface water influence. Lands along, adjacent to, or contiguous with perennially and intermittently flowing rivers and streams, glacial potholes, and the shores of lakes and reservoirs with stable water levels are typical riparian areas (See BLM Manual 1737). Included are ephemeral streams that have vegetation dependent upon free water in the soil. All other ephemeral streams are excluded.

**Riparian Communities:** Communities of vegetation associated with either open water or wetlands. Examples are cottonwood and willow communities, meadows, aspens near water sources, and other trees, grasses, forbs, and shrubs associated with water.

**River Eligibility:** A river or river segment found to meet criteria found in Sections 1(b) and 2(b) of the Wild and Scenic Rivers Act of being free flowing and possessing one or more outstandingly remarkable value.

**Road:** A linear route declared a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use (H-8342-1, Travel and Transportation Management Handbook).

**Road Category Level:** Defines the level of service provided by, and maintenance required for, a specific road, consistent with road management objectives and maintenance criteria. There are five maintenance levels:

- **Level 1:** Assigned to intermittent service roads during the time they are closed to vehicular traffic. The closure period is one year or longer. Basic custodial maintenance is performed.

- **Level 2:** Assigned to roads open for use by high-clearance vehicles. Passenger car traffic is not a consideration.
- **Level 3:** Assigned to roads open and maintained for travel by a prudent driver in a standard passenger car. User comfort and convenience are not considered priorities.
- **Level 4:** Assigned to roads that provide a moderate degree of user comfort and convenience at moderate travel speeds.
- **Level 5:** Assigned to roads that provide a high degree of user comfort and convenience. Normally, roads are double-lane and paved or aggregate-surfaced with dust abatement.

**Rough Proportionality:** The required dedication is related both in nature and extent to the proposed development's impact.

**Runoff:** The total stream discharge of water, including both surface and subsurface flow, usually expressed in acre-feet of water yield.

**Salable Minerals:** Minerals that may be disposed of through sales and free use permits under the Materials Act of 1947, as amended. Included are common varieties of sand, stone, gravel, and clay (See also Mineral Materials).

**Sawtimber:** Trees containing at least one eight-foot sawlog and meeting regional specifications for freedom from defect. Softwood trees must be at least eight inches in diameter at breast height (4.5 feet above the ground). (Forest Standards).

**Scenery Management System (SMS):** A planning and management tool used to delineate, define, and integrate scenery resources in land and resource management planning. An SMS inventory is required for every Forest Plan revision."

**Scenic Integrity:** An indicator of an areas visual appearance, either stated as an objective or current condition, related to the characteristic landscape."

**Scenic Integrity (Existing or Objective):** State of naturalness or, conversely, the state of disturbance created by human activities or alteration. Integrity is stated in degrees of deviation from the existing landscape character in a national grassland or forest. The scenic integrity levels are:

- **Very High (Unaltered):** Preservation. This level refers to landscapes where the valued landscape character is intact with only minute, if any, deviations. The existing landscape character and sense of place is expressed at the highest possible level.
- **High (Appears Unaltered**): Retention: This level refers to landscapes where the valued landscape character appears intact. Deviations may be present but must repeat the form, line, color, texture and pattern common to the landscape character so completely and at such scale that they are not evident.
- **Moderate (Slightly Altered**): Partial retention: This level refers to landscapes where the valued landscape character appears slightly altered. Noticeable deviation must remain visually subordinate to the landscape character being viewed.

- **Low (Moderately Altered): Modification:** This level refers to landscapes where the valued landscape character appears moderately altered. Deviations begin to dominate the valued landscape character being viewed, but they borrow valued attributes such as size, shape, vegetative type changes or architectural styles outside the landscape being viewed. They should not only appear as valued character outside the landscape being viewed but compatible or complimentary to the character within.

- **Very Low (Heavily Altered): Maximum Modification:** This level refers to landscapes where the valued landscape character appears heavily altered. Deviations may strongly dominate the valued landscape character. They may no borrow from valued attributes such as size, shape, vegetative type changes or architectural styles within or outside of the landscape being viewed. However, deviations must be shaped and blended with the natural terrain (landforms) so that elements such as roads and structures do not dominate the composition.
- **Unacceptably Low:** This level refers to landscapes where the valued landscape character being viewed appears extremely altered. Deviations are extremely altered. Deviations are extremely dominate and borrow little if any form, line, color, texture, pattern, or scale from the landscape character. Landscapes at this level of integrity need rehabilitation.

**Scenic Resource:** Attributes, characteristics, and features of landscapes that provide varying responses from, and varying degrees of benefits to, humans.

**Scenic Quality:** The relative worth of a landscape from a visual perception point of view. Scenic quality is rated as Class A (high), Class B (medium), or Class C (low).

**Scoping:** The process of identifying the range of issues, management concerns, preliminary alternatives, and other components of an environmental impact statement or land-use planning document. It involves both internal and public viewpoints.

**Season of Use:** A livestock grazing permit term and condition identifying the time during which livestock graze a given area to achieve management and resource condition objectives.

**Secondary Paved Road:** This is a paved road, not a highway, with other roads of lesser quality branching from it. It is not usually striped and connects primary roads and major points.

**Secondary Unpaved Road:** This one-lane road is regularly maintained with other roads of lesser quality branching from it. It usually connects primary roads and major points.

**Sensitive Soils:** Land areas that have a moderate to very high hazard for soil compaction, erosion, or displacement. These soils include, but are limited to, red soils, saline soils, sandy soils, highly calcareous, and shallow.

**Sensitive Species:** Those species designated by a State Director, usually in cooperation with the State agency responsible for managing the species and state natural heritage programs. They are those species that: (1) could easily become endangered or extinct in a state; (2) are under status review by the U.S. Fish and Wildlife Service and/or National Marine Fisheries Service; (3) are undergoing significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution; (4) are undergoing significant current or predicted downward trends in population or density such that federal listing, proposal, or candidate status may become necessary; (5) typically have small and widely dispersed populations, or (6) inhabit ecological refugia or other specialized or unique habitats (see Bureau Sensitive Species).

**Seral Stage:** The relatively transitory communities that develop under plant succession generally described as early, mid, and late seral stages. The mix of seral or successional stages on the landscape can be the result of disturbances, topography and soil, climate, uses of the land, management prescriptions, vegetation classification categories, and evaluation procedures.

**Setting:** Setting is one of the seven aspects of integrity examined when evaluating a cultural resource for NRHP eligibility. "Setting is the physical environment of a historic property. Whereas location refers to the specific place where a property was built or an event occurred, setting refers to the character of the place in

which the property played its historical role. It involves how, not just where, the property is situated and its relationship to surrounding features and open space.

Setting often reflects the basic physical conditions under which a property was built and the functions it was intended to serve. In addition, the way in which a property is positioned in its environment can reflect the designer's concept of nature and aesthetic preferences.

**Shrub:** A plant that has persistent woody stems and a relatively low growth habit, and that generally produces several basal shoots instead of a single bole.

**Significant Paleontological Resource:** Any paleontological resource that is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be scientifically important because it is a rare or previously unknown species, it is of high quality and well preserved, it preserves a previously unknown anatomical or other characteristic, provides new information about the history of life on earth, or has identified educational or recreational value. Paleontological resources that may be considered to not have paleontological significance include those that lack provenience or context, lack physical integrity because of decay or natural erosion, or that are overly redundant or are otherwise not useful for research. Vertebrate fossil remains and traces include bone, scales, scutes, skin impressions, burrows, tracks, tail drag marks, vertebrate coprolites (feces), gastroliths (stomach stones), or other physical evidence of past vertebrate life or activities.

**Site-Specific:** Created, designed, or selected for a specific site.

**Size Class:** Tree size recognized by distinct ranges, usually of diameter or height.

**Smoke Management:** The policies and practices implemented by air and natural resource managers directed at minimizing the amount of smoke entering populated areas or impacting sensitive sites, avoiding significant deterioration of air quality and violations of National Ambient Air Quality Standards, and mitigating human-caused visibility impacts in Class I areas.

**Social Cost of Carbon:** The social cost of carbon (SCC) is an estimate of the monetized damages associated with incremental increases in CO2 emissions (typically one metric ton) in a particular year. Federal agencies use the SCC to incorporate the social benefits of reducing CO2 emissions into the analyses of certain regulatory actions.

**Spatial Management:** As used in this document, intensive control of the location and level of surface disturbance that is allowed in a particular area.

**Special Area Designation:** A title conferred on a specified area through the land use planning process, which identifies the area as being in need of special management attention. Examples of special area designations include Special Recreation Management Areas, Areas of Critical Environmental Concern, Special interest area, and Wildlife Habitat Management Areas.

**Special Recreation Management Area (SRMA):** An administrative unit where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, or distinctiveness, especially compared to other areas used for recreation.

**Special Status Species:** Proposed species, listed species, and candidate species under the Endangered Species Act; state-listed species; and BLM State Director-designated sensitive species (see BLM Manual 6840—Special Status Species Policy).

**Split Estate:** This is the circumstance where the surface of a particular parcel of land is owned by a different party than the minerals underlying the surface. Split estates may have any combination of surface/subsurface owners: Federal/State; Federal/private; State/private; or percentage ownerships. When referring to the split estate ownership on a particular parcel of land, it is generally necessary to describe the surface/subsurface ownership pattern of the parcel.

**Standard:** Standards of land health are expressions of levels of physical and biological condition or degree of function required for healthy lands and sustainable uses and define minimum resource conditions that must be achieved and maintained.

**Standard Lease Term:** The terms incorporated into every oil and gas lease. Standard lease terms require compliance with all laws and regulations to ensure protection of other energy, mineral, and surface resources, such as soil, water, vegetation, cultural, and threatened and endangered species. It is important to recognize that the Authorized Officer has the authority to modify the siting and design of facilities, control the rate of development and timing of activities as well as require other mitigation under Sections 2 and 6 of the standard lease terms (BLM Form 3100-11 and 43 CFR 3101.1-2).

**Stakeholders:** Individuals or groups who are involved in or affected by a course of action that is being proposed in a project plan affecting federal lands or a federal permitting process.

**State:** A state is comprised of an integrated soil and vegetation unit having one or more biological communities that occur on a particular ecological site and that are functionally similar with respect to the three attributes (soil/site stability, hydrologic function, and biotic integrity) under natural disturbance regimes.

**State Listed Species:** Species proposed for listing or listed by a state in a category implying but not limited to potential endangerment or extinction. Listing is either by legislation or regulation.

**Stipulation (General):** A term or condition in an agreement, contract, or written authorization.

**Stipulation (Oil and Gas):** A restriction placed on an oil and gas lease or other use authorization to protect other resources (e.g., a seasonal restriction to protect big game in their winter range or in their calving areas) or land uses and is attached to and made a part of the lease. The restriction precludes or restricts activities.

**Stipulation Category:** Land use decisions or authorization requirements intended to mitigate impacts of surface disturbing or disruptive activities. These include RMP decisions, oil and gas lease stipulations, conditions of approval, and terms and conditions. These stipulations may prohibit surface use, allow surface use under certain conditions, or allow surface use during certain times (see also No Surface Occupancy, Controlled Surface Use, and Timing Limitation).

**Stochastic:** Randomly determined event, chance event, a condition determined by predictable processes and a random element.

**Substrate:** The mineral or organic material that forms the bed of a stream; the base upon which an organism lives; the surface on which a plant or animal grows or is attached.

**Succession:** The progressive replacement of plant communities on a site which leads to a potential natural plan community, attaining stability.

**Surface Discharge:** The release of produced water onto the unconfined land surface or into an existing drainage system.

**Surface Disturbance:** Any disturbance that causes the destruction or alteration of vegetation and the disturbance of the soil surface, and that will cause a lasting impact to the affected area.

1. Long-term removal occurs when vegetation is physically removed through activities that replace the vegetation community, such as a road, power line, well pad or active mine. Long-term removal may also result from any activities that cause soil mixing, soil removal, and exposure of the soil to erosive processes.
2. Short-term removal occurs when vegetation is removed in small areas, but is restored to desirable vegetation communities within a few years (<5) of disturbance, such as a successfully reclaimed pipeline, or successfully reclaimed drill hole or pit.
3. Habitat rendered unusable due to numerous anthropogenic disturbances
4. Anthropogenic surface disturbances are surface disturbances meeting the above definitions which result from human activities .

**Surface Disturbing Activities:** An action that alters the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other Public Land values. Examples of surface disturbing activities may include: operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; and conducting several types of vegetation treatments (e.g., prescribed fire, etc.). Surface disturbing activities may be either authorized or prohibited (WY IB-2007-029).

**Surface Management:** Operations conducted on BLM administered lands pursuant to the 43 CFR Subpart 3809 regulations. The three levels of operations under these regulations are defined in this glossary include Casual Use, Notice and Plan of Operations. Use and Occupancy of mining claims pursuant to 43 CFR Subpart 3715 that is reasonably incident to Notices and Plans of Operations may also take place pursuant to review and approval by the BLM Authorized Official (AO).

**Surface Occupancy:** Placement or construction on the land surface of semi-permanent or permanent facilities requiring continual service or maintenance. Casual use is not included.

**Surface Use:** These are all the various activities that may be present on the surface or near-surface (e.g., pipelines), of the public lands. It does not refer to those subterranean activities (e.g., underground mining, etc.) occurring on the public lands or federal mineral estate. When administered as a use restriction (e.g., No Surface Use [NSU]), this phrase prohibits all but specified resource uses and activities in a certain area to protect particular sensitive resource values and property. This designation typically applies to small acreage sensitive resource sites (e.g., plant community study exclosure, etc.), and/or administrative sites (e.g., government ware-yard, etc.) where only authorized, agency personnel are admitted.

**Take:** As defined by the Endangered Species Act, "to harass, harm, pursue, hunt, shoot, wound, kill, capture, or collect, or attempt to engage in any such conduct."

**Tall Structures:** A wide array of infrastructures (e.g., poles that support lights, telephone and electrical distribution, communication towers, meteorological towers, high-tension transmission towers, and wind turbines) that have the potential to disrupt nesting birds by creating new perching/nesting opportunities and/or decreasing the use of an area. A determination as to whether something is considered a tall structure would be based on local conditions such as vegetation or topography.

**Technically/Economically Feasible:** Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the BLM's sole responsibility to determine which actions are technically and economically feasible. The BLM will consider whether implementation of the proposed action is likely given past and current practice and technology; this consideration does not necessarily require a cost-benefit analysis or speculation about

an applicant's costs and profit (modified from the CEQ's 40 Most Asked Questions and BLM NEPA Handbook, Section 6.6.3.).

**Temporal Management:** As used in this document, intensive control of the period during which BLM will allow activities that are physiologically disturbing or disruptive to normal wildlife activities such as elk migration.

**Temporary Special Use Permit:** A type of permit that terminates within one year or less after the approval date. All other provisions applicable to permits apply fully to temporary permits. Temporary special use permits are issued for seasonal or short-duration uses involving minimal improvement and investment.

**Temporary/Temporary Use:** A relative term that must be considered in the context of the resource values affected and the nature of the resource use/uses/activity/activities taking place. Generally, a temporary activity is considered to be one that is not fixed in place and is of short duration.

**Thermal Cover:** Cover used by animals to ameliorate the effects of weather. Optimally, thermal cover is provided by a stand of coniferous trees, 30 to 60 acres in size, at least 40 feet tall, with a canopy cover of at least 70%.

**Threatened Species:** Any plant or animal species defined under the Endangered Species Act as likely to become endangered within the foreseeable future throughout all or a significant portion of its range; listings are published in the Federal Register as determined by the US Fish and Wildlife Service and the Secretary of Interior.

**Thrust Fault:** A reverse fault that is characterized by a low angle of inclination with reference to a horizontal plane.

**Timeliness:** The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun (BLM Manual Section 1794).

**Timing Limitation:** A stipulation that prohibits surface disturbing or disruptive activities during specified times to protect identified resource values during sensitive periods (see also Stipulation Category). The stipulation does not apply to the operation or maintenance of production facilities unless the finding analysis demonstrates the continued need for such mitigation and the insufficiency of less stringent, project-specific mitigation measures."

**Traditional Cultural Property (TCP):** A Traditional Cultural Property is defined as a property that is eligible for inclusion in the National Register of Historic Places based on its association with the cultural practices, traditions, beliefs, lifeways, arts, crafts, or social institutions of a living community. TCPs are rooted in a traditional community's history and are important in maintaining the continuing cultural identity of the community.

**Trail:** Linear routes managed for human-powered, stock, or off-road vehicle forms of transportation, or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high- clearance vehicles (H-8342-1, Travel and Transportation Management Handbook).

**Transition:** A shift between two states. Transitions are not reversible by simply altering the intensity or direction of factors that produced the change. Instead, they require new inputs such as revegetation or shrub removal. Practices, such as these, that accelerate succession are often expensive to apply.

**Transmission Line:** An electrical utility line with a capacity greater than or equal to 100 kV or a natural gas, hydrogen, or water pipeline greater than or equal to 24" in diameter.

**Trophy Game Animal:** Black bear, gray wolf, or mountain lion.

**Turbidity:** interference to the passage of light through water due to insoluble particles of soil, organics, microorganisms and other materials.

**Unavailable for Leasing:** No new oil and gas leases would be sold in areas with this designation. This term may be used interchangeably with "closed to leasing" for fluid minerals.

**Unitization:** Operation of multiple leases as a single lease under a single operator.

**Unpaved Road:** This road is regularly maintained, wide enough for at least two vehicles, provides access between major points, and serves a large area branching from it.

**Unsuitability Criteria:** Criteria of the federal coal management program by which lands may be assessed as unsuitable for all or certain stipulated methods of coal mining.

**Uplands:** Lands at higher elevations than alluvial plains or low stream terraces; all lands outside the riparian-wetland and aquatic zones.

**Utility Window:** Short segments of right-of-way corridor utilized when designating a full-length right-of-way corridor is not feasible (see Corridor definition).

**Utility-Scale and/or Commercial Energy Development:** A project that is capable of producing 20 or more megawatts of electricity for distribution to customers through the electricity-transmission-grid system.

**Utilization:** The proportion of the current year's forage production that is consumed or destroyed by animals. Utilization is usually expressed as a percentage.

**Valid Existing Rights:** Documented, legal rights, or interests in the land, which allow a person or entity to use said land for a specific purpose and that are still in effect. Such rights include but are not limited to fee title ownership, mineral rights, and easements. Such rights may have been reserved, acquired, granted or otherwise authorized under various statutes of law.

**Vegetative Cover:** The proportion of land or ground surface of an area covered by vegetation.

**Vegetation Treatments:** Management practices that change the vegetation structure to a different stage of development. Vegetation treatment methods include wildfire for resource benefit, prescribed fire, chemical, mechanical, and seeding.

**Viability:** For purposes of NFMA and its enabling regulations, viability is the availability of habitat that allows a species to persist on landscapes for long-periods (multi-generational) of time. It assumes that populations are abundant (sufficient numbers) and well-distributed (sufficient redundancy of populations) to provide for long-term population persistence on a landscape.

**Viewshed:** The landscape that can be directly seen under favorable atmospheric conditions from a viewpoint or along a transportation corridor.

**Visual Contrast Degree (BLM Handbook H-8431-1 – Visual Resource Contrast Rating):**

- **None:** The element contrast is not visible or perceived.
- **Weak:** The element contrast can be seen but does not attract attention.
- **Moderate:** The element contrast begins to attract attention and begins to dominate the characteristic landscape.

- **Strong:** The element contrast demands attention, will not be overlooked, and is dominant in the landscape.

**Visual Quality Objectives (VQOs):** A desired level of excellence based on physical and sociological characteristics of an area. Refers to degree of acceptable alteration of the characteristic landscape. Visual Quality Objectives include:

- **Maximum Modification:** Activity may dominate the characteristic landscape but should appear as a natural occurrence when viewed as background.
- **Modification:** Activity may dominate the characteristic landscape but must, at the same time, utilize naturally established form, line, color, and texture. It should appear as a natural occurrence when viewed in foreground or middleground.
- **Partial Retention:** Activities may be evident but must remain subordinate to the characteristic landscape.
- **Preservation:** Provides for ecological change only.
- **Retention:** Activities are not evident to the casual forest visitor.

**Visual Resource:** Visible feature of the landscape, such as land, water, vegetation, animals, and other features that make up the scenery of an area.

**Visual Resource Management (VRM):** The system by which BLM classifies and manages scenic values and visual quality of public lands. The system is based on research that has produced ways of assessing aesthetic qualities of the landscape in objective terms. After inventory and evaluation, lands are given relative visual ratings (management classes), which determine the amount of modification allowed for the basic elements of the landscape.

**Visual Resource Management (VRM) Classes:** Visual resource management classes define the degree of acceptable visual change within a characteristic landscape. A class is based on the physical and sociological characteristics of any given homogeneous area and serves as a management objective. The four classes are described below:

- Class I provides for natural ecological changes only. This class includes primitive areas, some natural areas, some wild and scenic rivers, and other similar areas where landscape modification activities should be restricted.
- Class II areas are those areas where changes in any of the basic elements (form, line, color, or texture) caused by management activity should not be evident in the characteristic landscape.
- Class III includes areas where changes in the basic elements (form, line, color, or texture) caused by a management activity may be evident in the characteristic landscape. However, the changes should remain subordinate to the visual strength of the existing character.
- Class IV applies to areas where changes may subordinate the original composition and character; however, they should reflect what could be a natural occurrence within the characteristic landscape.

**Waiver (Oil and Gas):** Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold (H-1624-1 – Planning for Fluid Mineral Resources).

**Water Disposal Pit:** A pit designed under the authority of Onshore Oil and Gas Order #7 for containment of produced water (water produced in conjunction with oil and gas production) as defined in said order. Water disposal pits can be temporary or permanent.

**Water Evaporation Pit:** A water disposal pit that disposes of produced water via the process of evaporation.

**Water Influence Zone:** The water influence zone (WIZ) includes the geomorphic floodplain, riparian ecosystem, and inner gorge. Its minimum horizontal width (from top of each bank) is the greater of 100 feet or the mean height of mature dominant late-seral vegetation. It includes adjacent unstable and highly-erodible soils. The WIZ protects interacting aquatic, riparian, and upland functions by maintaining natural processes and resilience of soil, water, and vegetation systems.

**Water Table:** The plane surface between the zone of saturation and the zone of aeration. Measured as the elevation where the groundwater surface is at equilibrium with atmospheric pressure. The water table is typically measured with a shallow groundwater well and is equal to the elevation of the water surface in the well. This term is typically not used in reference to confined aquifers or aquifers under pressure. Also known as the groundwater table, groundwater surface, water level, and saturated surface, among others.

**Watershed:** The area of land, bounded by a divide, that drains water, sediment, and dissolved materials to a common outlet at some point along a stream channel, or to a lake, reservoir, or other body of water. Also called drainage basin or catchment.

**West Nile Virus:** A virus that is found in temperate and tropical regions of the world and most commonly transmitted by mosquitoes. West Nile virus can cause flu-like symptoms in humans and can be lethal to birds.

**Wetlands:** Those areas that are inundated by surface water or groundwater with a frequency sufficient to support, and under normal circumstances do or would support, a prevalence of vegetative or aquatic life that requires saturated or seasonally saturated soil conditions for growth and reproduction. Wetlands generally include swamps, marshes, bogs, and similar areas such as sloughs, potholes, wet meadows, river overflows, mudflats, and natural ponds.

**Wild, Scenic, or Recreational River Areas:** The three classes of what is traditionally referred to as a "wild and scenic river." Designated river segments are classified as wild, scenic, and/or recreational, but the segments cannot overlap.

- **Wild River Areas:** Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.
- **Scenic River Areas:** Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.
- **Recreational River Areas:** Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

**Wildcat Well:** A well drilled in an area where oil and gas have not been previously discovered.

**Wilderness:** A congressionally designated area defined by the Wilderness Act of 1964, 16 USC §1131(a), as undeveloped federal land retaining its primeval character and influence, without permanent improvements or human habitation, that is protected and managed to preserve its natural conditions and that (1) generally appears to have been affected mainly by the forces of nature, with human imprints substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least 5,000 acres or is large enough to make practical its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historic value.

**Wilderness Characteristics:** These attributes include the area's size, its apparent naturalness, and outstanding opportunities for solitude or a primitive and unconfined type of recreation. They may also include supplemental values. Lands with wilderness characteristics are those lands that have been inventoried and determined by the BLM to contain wilderness characteristics as defined in section 2(c) of the Wilderness Act.

**Wilderness Study Area (WSA):** A roadless area that has been inventoried and found to be wilderness in character, has few human developments, and provides outstanding opportunities for solitude and primitive recreation, as described in Section 603 of the Federal Land Policy and Management Act of 1976 and in Section 2(c) of the Wilderness Act of 1964. "A Wilderness is (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value." When these characteristics were found within a defined boundary, the presence of the wilderness resource was documented and the area was classified as a WSA (BLM Manual 6330).

**Wildfire:** A wildland fire originating from an unplanned ignition, such as lightning, volcanos, unauthorized and accidental human caused fires, and prescribed fires that are declared wildfires.

**Wildfire Suppression:** A response to wildfire, escaped wildland fire use, or prescribed fire that results in curtailment of fire spread and eliminates all identified threats from the particular fire.

**Wildland Fire:** A general term describing any non-structure fire that occurs in the wildland. Wildland fire is categorized into two distinct types: wildfire (unplanned) and prescribed fire (planned) (2009 Guidance for Implementation of Federal Wildland Fire Management Policy).

**Wildland Urban Interface (WUI):** Wildland Urban Interface (WUI): The line, area, or zone where structures and other human development meet or intermingle with undeveloped wildland or vegetation fuels.

**Wildlife Services (WS):** A division of the USDA Animal and Plant Health Inspection Service (APHIS) that is responsible for the control of animals that are causing economic losses to agriculture, damage to property, or hazards to human health. (See also Animal Damage Control.)

**Withdrawal:** Withholding an area of Federal land from settlement, sale, location, or entry under some or all of the general land laws for the purpose of limiting activities under those laws in order to maintain other public values in the area or reserving the area for a particular public purpose or program; or transferring jurisdiction over an area of federal land, other than property governed by the Federal Property and Administrative Services Act (40 U.S.C. 472), from one department, bureau, or agency to another department, bureau, or agency.

**Wyoming Connectivity Areas:** Condition in which the spatial arrangement of land cover types allows organisms and ecological processes (such as disturbance) to move across the landscape preventing population isolation. These connectivity areas could provide linkage within a state's sub-populations or between interstate sub populations.

# APPENDIX A—PROJECT DESIGN FEATURES AND BEST MANAGEMENT PRACTICES

## A.1 PROJECT DESIGN FEATURES

### A.1.1 Introduction

Project design features establish specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each project design feature cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some project design features may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations (e.g., a larger or smaller protective area). All variations of project design features would require that at least one of the following be demonstrated in the National Environmental Policy Act of 1969 (NEPA) analysis associated with the project/activity:

- A specific project design feature is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that a project design feature be varied or rendered inapplicable.
- Through the coal planning process, it will be determined if areas are suitable for further coal leasing consideration. The coal planning process (see 43 CFR 3420.1-4 and 43 CFR 3461) will identify areas where coal leasing is not suitable or acceptable and those areas will be removed from further coal consideration for coal leasing and development (i.e., they will not be leased, so no development and no further protection needed).
- Mines (particularly large surface coal mines) do not have the flexibility to move operations, so it is assumed that if a lease is ultimately offered, sold, and issued, the federal coal lessee can use the entire coal lease for mining operations once they receive their federal permit. The following measures would be applied as project design features for all solid minerals. The measures would also apply to locatable minerals subject to valid existing rights and consistent with applicable law.

### A.1.2 Project Design Features for Lands and Realty, Range Management, Fluid Minerals, Coal Exploration, Wild Horses, Vegetation Management, Wildfire and Fuels Management, and Noise

Priority Habitats: Project design features and best management practices (BMP) are continuously improving as new science and technology become available and therefore are subject to change. Include from the following project design features those that are appropriate to mitigate effects from the approved action.

- When possible, require perch deterrents on existing or new overhead facilities. Encourage installation of perch deterrents on existing facilities.
- Where existing leases or rights-of-way (ROW) have had some level of development (road, fence, well, etc.), and are no longer in use, reclaim the site by removing these features and restoring the habitat.
- Work cooperatively with permittees, lessees, and other landowners to develop grazing management strategies that integrate both public and private lands into single management units.

Coordinate project design features, BMPs, and vegetative objectives with the Natural Resources Conservation Service (NRCS) for consistent application across jurisdictions where the BLM, Forest Service, and NRCS have the greatest opportunities.

- Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses. If these seedings are part of an Allotment Management Plan/Conservation Plan, then no restoration would be necessary. Assess the compatibility of these seedings as a component of a grazing system during land health assessments. For example, some introduced grass seedings are an integral part of a livestock management plan and reduce grazing pressure or serve as a strategic fuels management area.
- Where the federal government owns the surface, and the mineral estate is in non-federal ownership, apply appropriate BMPs to surface development.

## A.1.3 Roads

Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose. Locate roads to avoid important areas and habitats.

Coordinate road construction and use among federal fluid mineral lessees and ROW or special use authorization (SUA) holders.

Construct road crossings of ephemeral, intermittent, and perennial streams to minimize impacts to the riparian habitat, such as by crossing at right angles to ephemeral drainages and stream crossings.

Establish trip restrictions or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).

Do not issue ROWs or SUAs to counties on energy development roads, unless for a temporary use consistent with all other terms and conditions including this document.

Designate all newly constructed routes for authorized use only (using signage, gates, etc.). Apply dust abatement on roads, well pads, and other surface disturbances.

Close and rehabilitate duplicate roads by restoring original landform and establishing desirable habitat conditions.

## A.1.4 Operations

Conduct reclamation on unused roads as soon as possible. Reclaim the permitted ROWs used in the construction of the running surface immediately.

Site and/or minimize linear ROWs or SUAs to reduce disturbance and fragmentation of sagebrush habitats.

Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.

Bury distribution power lines to the extent technically feasible.

Cover all fluid-containing pits and open tanks with netting (maximum 1.5-inch mesh size).

Equip tanks and other above-ground facilities with structures or devices that discourage nesting and perching of raptors and corvids.

Control the spread and effects of invasive non-native plant species, including treating weeds prior to surface disturbance and washing vehicles and equipment at designated wash stations when constructing in areas with weed infestations.

Clean up refuse.

Eliminate sumps.

Cluster disturbances, operations (hydraulic fracture stimulation, liquids gathering, etc.), and facilities. If the geology is exploratory and there is the potential that subsequent wells may not be drilled, do not disturb additional habitat until geology has proven additional wells can go on the pad and it is necessary to do so.

Use directional and horizontal drilling to the extent feasible as a means to reduce surface disturbance in relation to the number of wells.

Place infrastructure in already disturbed locations where the habitat has not been fully restored. Apply a phased development approach with concurrent reclamation.

Place liquid gathering facilities outside priority areas. To reduce truck traffic and perching and nesting sites for ravens and raptors, do not place tanks at well locations within priority habitat areas.

Pipelines must be under or immediately adjacent to the road.

Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use.

Restrict the construction of tall facilities, distribution power lines, and fences to the minimum number and amount needed.

Use only closed-loop systems for drilling operations, with no reserve pits.

Consider using oak (or other material) mats for drilling activities where topography permits to reduce vegetation disturbance and for temporary roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.

## A.1.5 Noise

Limit noise to less than 10 decibels above ambient measures (20-24 dBA) at sunrise at the perimeter of a lek during active lek season.

Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.

Locate new compressor stations outside priority habitats and design them to reduce noise that may be directed toward priority habitat.

## A.1.6 Reclamation

Include objectives for ensuring habitat restoration in reclamation practices/sites. Address post-reclamation management in reclamation plan such that goals and objectives are to protect and improve habitat needs.

Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling, and revegetating cut-and-fill slopes where practicable; material used for irrigation must be removed thereafter.

Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.

Implement irrigation during interim or final reclamation for sites where establishment of seedlings has been shown or is expected to be difficult due to dry conditions.

Use mulching, soil amendments, and/or erosion blankets to expedite reclamation and to protect soils.

Identify and work with partners to increase native seed availability and work with plant material centers to develop new plant materials.

Consider potential changes in climate when proposing seedings using native plants. Consider seed collections from the warmer component within a species' current range for selection of native seeds.

Use Ecological Site Descriptions (ESD) or other protocols (e.g., Terrestrial Ecological Unit Inventory or Lands System Inventory) to identify the understory species and sagebrush subspecies needed to restore desirable habitat conditions.

## A.1.7 Vegetation Treatments/Fire and Fuels Management

During vegetation management project design, consider the utility of using livestock to strategically reduce fine fuels, and implement grazing management that will accomplish this objective. Consult with ecologists to minimize impacts to native perennial grasses.

Provide planning vegetation treatments information to personnel on habitat requirements, and identification of areas utilized locally.

Use vegetation treatment prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable plant species and reduce risk of hydrophobicity).

Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned and the fire risk to habitat. Additionally, develop maps for habitat which spatially display existing fuels treatments that can be used to assist suppression activities.

Restore prior perennial grass/shrub plant communities infested with invasive species to a species composition characterized by perennial grasses, forbs, and shrubs as outlined in ESDs.

Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.

Reduce the risk of vehicle or human-caused wildfires and the spread of invasive species into habitats. This could be minimized by planting perennial vegetation (e.g., green-strips) paralleling road ROWs.

Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, and strictly managed grazed strips) to aid in controlling wildfire, should wildfire occur near key habitats or important restoration areas (such as where investments in restoration have already been made).

As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines to minimize the spread of fire.

Design vegetation treatments in habitats to strategically reduce wildfire threats in the greatest area. This may involve spatially arranging new vegetation treatments with past treatments, vegetation with fire-resistant seral stages, natural barriers, and roads in order to constrain fire spread and growth. This may require vegetation treatments to be implemented in a more linear versus block design.

Design post-Emergency Stabilization and Rehabilitation (ES&R) and Burn Area Emergency Rehabilitation (BAER) management to ensure long-term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horses, etc., to achieve and maintain the desired condition of ES&R and BAER projects.

Make reestablishment of sagebrush and desirable understory plant cover (relative to ecological site potential) a high priority for restoration efforts. Write specific vegetation objectives to reestablish sagebrush cover and desirable understory cover.

Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit habitat.

Provide training to fuels treatment personnel on habitat requirements, and identification of areas utilized locally.

Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).

Ensure proposed sagebrush treatments are planned with full interdisciplinary input from the BLM (pursuant to NEPA) and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding seasonal habitats and landscape.

Power-wash all vehicles and equipment involved in vegetation treatment and fuels management activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species.

Give priority for implementing specific habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by priority/core habitat or that reestablish continuity between priority habitats. Annual grasslands are a second priority for restoration when the sites are not adjacent to priority/core habitat but within two miles of priority/core habitat. The third priority for annual grassland habitat restoration projects is sites beyond two miles of priority/core habitat. The intent is to focus restoration outward from existing, intact habitat.

As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of those referenced in land use planning documentation.

Design fuel treatments that would increase fire suppression efficiencies to protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas. Where applicable, incorporate roads and natural fuel breaks into fuel break design.

Develop state-specific reference information and resource materials containing maps, a list of resource advisors, contact information, local guidance, and other information relevant to agency administrators and fire suppression resources.

During periods of multiple fires, ensure line officers are involved in setting priorities.

Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.

Assign a resource advisor with expertise or who has access to all extended attack fires in or near habitat. Prior to the fire season, provide training to resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through the following:

- Instructing resource advisors during preseason trainings

- Qualification as resource advisors
- Coordination with resource advisors during fire incidents
- Contributing to incident planning with information such as habitat features or other key data useful in fire decision making

On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in habitat areas.

Locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas and heli-bases) in areas where physical disturbance to habitat can be minimized. These include disturbed areas, grasslands, near roads/trails, or other areas where there is existing disturbance or minimal sagebrush cover.

Minimize unnecessary cross-country vehicle travel during fire operations in habitat.

Minimize burnout operations in key habitat areas by constructing a direct fire line whenever safe and practical to do so.

Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.

As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.

Adequately document the fire operation activities in habitat for potential follow-up coordination activities.

Compile the District/Forest-level information into state-wide tool boxes. Tool boxes will contain maps, a listing of resource advisors, contact information, local guidance, and other relevant information for each District/Forest, which will be aggregated into a state-wide document.

# A.2 BEST MANAGEMENT PRACTICES

The BMPs shown in this appendix are not intended to encompass all potentially applicable BMPs. Instead, Appendix A was developed to address specific issues brought forward during scoping, alternative development, and comments from the public and cooperating agencies.

## A.2.1 Best Management Practices for Important Cultural Resource and Trail Settings

The BLM should use standard measures to reduce the visual impact of proposed actions within trail settings, where setting is a contributing element of eligibility to the National Register of Historic Places and the setting has integrity. Standard measures should be used as stipulations or conditions of approval attached to authorizations. Standard measures, or BMPs, for reducing the visibility of proposed actions include, but are not limited to:

- Apply a controlled surface use stipulation to surface-disturbing activities or surface occupancy.
- Visual Contrast Ratings and, as appropriate, require visual simulations.
- Consolidate project facilities among oil and gas developers; maximize use of existing locations.
- Develop coordinated road and pipeline systems.
- Reduce the amount of surface development by consolidating facilities.

- Use low profile facilities.
- Locate projects to maximize the use of topography and vegetation to screen development.
- Design projects to blend with topographic forms and existing vegetation patterns.
- Use environmental coloration or camouflage techniques to reduce the visual impact of facilities that cannot be completely hidden.
- Use broken linear patterns for road developments to screen roads as much as possible. This can include feathering or blending of the edges of linear ROWs to soften the dominant line form.
- For livestock control, use electric fencing with low-visibility fiberglass posts and environmental colors.
- Design linear facilities and seismic lines to run parallel to key observation points rather than perpendicular.
- Position facilities to present less of a visual impact (e.g., a facility with several tanks lined up so that one obscures the visibility of the others).

## A.2.2 Decontamination Procedure for Aquatic Invasive Species

To prevent the spread of aquatic invasive species, the Wyoming Game and Fish Department recommends following the guidelines outlined in the *Aquatic Invasive Species in Wyoming* brochure. Specific BMPs to aquatic invasive species spread prevention include, but are not limited to:

Decontamination should first occur before arrival at a project site, so aquatic invasive species are not transferred from the last visited area. Decontamination should occur again before leaving a project site, so aquatic invasive species are not transferred to the next site.

- Decontamination may consist of either:
  - Drain all water from equipment and compartments, clean equipment of all mud, plants, debris, or animals, and dry equipment for five days in summer (June, July, and August); 18 days in spring (March, April, and May) and fall (September, October, and November); or three days in winter (December, January, and February) when temperatures are at or below freezing.
  - Use a high pressure (2,500 pounds per square inch [psi]) hot water (140°F) pressure washer to thoroughly wash equipment and flush all compartments that may hold water.

## A.2.3 Wyoming Forestry Best Management Practices

The Wyoming Forestry Best Management Practices: Forestry BMPs Water Quality Protection Guidelines (link below) describes BMPs for the management of forest lands. These BMPs are a set of voluntary preferred methods of forestland management designed to protect water quality and forest soils, and are intended for use on non-industrial private, forest industry, state-owned and federal forests. http://wsfd.wyo.gov/forest-management/bmp-s

## A.2.4 Reseeding Best Management Practices

The following recommendations may be required depending on the project size and location:

- Proposed actions where native brush species located on lands proposed to be disturbed are unique and desirable for interim and final reclamation purposes, and the seed supply for these desirable brush species is not commercially available, will be collected from the area and stored using the procedures of the Seeds of Success program. Seedlings or plugs of common dominant species will

be propagated, preferably locally, in preparation for use in portions of area to be reclaimed to expedite vegetation recovery.

- Areas of sustainable plant communities and populations (where they do not conflict with other allowable resource uses) will be identified as sources for native plant material and will be managed under consideration of the need to consistently produce seed stocks of noncommercially available materials for use in reclamation and restoration work (e.g., to support reclamation of abandoned mine lands or well pads or to supplement commercially available seeds in high fire years).

## A.2.5 Engineering Best Management Practices

Road maintenance, construction, and any other related travel will be mandated by BLM Manual 9113. BLM Manual 9113 provides for BMPs to be used in evaluating, maintaining, and constructing BLM travel and transportation routes. As stated in Manual 9113, "Bureau roads must be designed to an appropriate standard no higher than necessary to accommodate their intended functions adequately (timber hauling administrative access, public travel); and design, construction, and maintenance activities must be consistent with national policies for safety, aesthetics, protection and preservation of cultural, historic, and scenic values, and accessibility for the physically handicapped. The following is a list of BMPs that are recommended but not binding for road maintenance practices:

Design roads to minimize total disturbance, to conform with topography, and to minimize disruption of natural drainage patterns.

- Base road design criteria and standards on road management objectives such as traffic requirements of the proposed activity and the overall transportation plan, economic analysis, safety requirements, resource objectives, and minimizing damage to the environment.
- Locate roads on stable terrain such as ridge tops, natural benches, and flatter transitional slopes near ridges, and valley bottoms, and moderate side slopes and away from slumps, slide prone areas, concave slopes, clay beds, and where rock layers dip parallel to the slope. Locate roads on well-drained soil types; avoid wet areas when possible.
- Construct, cut, and fill slopes to be approximately three horizontal (h):one vertical (v) or flatter where feasible. Locate roads to minimize heights of cutbanks. Avoid high, steeply sloping cutbanks in highly fractured bedrock.
- Avoid headwalls, midslope locations on steep, unstable slopes, fragile soils, seeps, old landslides, side slopes in excess of 70%, and areas where the geologic bedding planes or weathering surfaces are inclined with the slope. Implement extra mitigation measures when these areas cannot be avoided.
- Construct roads for surface drainage by using outslopes, crowns, grade changes, drain dips, waterbars, and in-sloping to ditches as appropriate.
- Sloping the road base to the outside edge for surface drainage is normally recommended for local spurs or minor collector roads where low-volume traffic and lower traffic speeds are anticipated. This is also recommended in situations where long intervals between maintenance will occur and where minimum excavation is wanted. Out-sloping is not recommended on steep slopes. Sloping the road base to the inside edge is an acceptable practice on roads with steep side slopes and where the underlying soil formation is very rocky and not subject to appreciable erosion or failure.
- Crown and ditching is recommended for arterial and collector roads where traffic volume, speed, intensity and user comfort are considerations. Recommended gradients range from 0% to 15% where crown and ditching may be applied, as long as adequate drainage away from the road surface and ditch lines is maintained.

- Minimize excavation, when constructing roads, through the use of balanced earthwork, narrowing road widths, and end hauling where side slopes are between 50% and 70%.
- If possible, construct roads when soils are dry and not frozen. When soils or road surfaces become saturated to a depth of three inches, BLM-authorized activities should be limited or ceased unless otherwise approved by the Authorized Officer.
- Consider improving inadequately surfaced roads that are to be left open to public traffic during wet weather with gravel or pavement to minimize sediment production and maximize safety.
- Retain vegetation on cut slopes unless it poses a safety hazard or restricts maintenance activities. Roadside brushing of vegetation should be done in a way that prevents disturbance to root systems and visual intrusions (i.e., avoid using excavators for brushing).
- Retain adequate vegetation between roads and streams to filter runoff caused by roads.
- Avoid riparian/wetland areas where feasible; locate in riparian/wetland areas only if the roads do not interfere with the attainment of resource objectives.
- Minimize the number of unimproved stream crossings. When a culvert or bridge is not feasible, locate drive-through (low water crossings) on stable rock portions of the drainage channel. Harden crossings with the addition of rock and gravel if necessary. Use angular rock if available.
- Locate roads and limit activities of mechanized equipment within stream channels to minimize their influence on riparian areas. When crossing a stream is necessary, design the approach and crossing perpendicular to the channel, where practicable. Locate the crossing where the channel is well defined, unobstructed, and straight.
- Avoid placing fill material in floodplains unless the material is large enough to remain in place during flood events.
- Use drainage dips instead of culverts on level 2 roads where gradients will not present a safety issue. Locate drainage dips in such a way so that water will not accumulate or where outside berms prevent drainage from the roadway. Locate and design drainage dips immediately upgrade of stream crossings and provide buffer areas and catchment basins to prevent sediment from entering the stream.
- Construct catchment basins, brush windrows, and culverts in a way to minimize sediment transport from road surfaces to stream channels. Install culverts in natural drainage channels in a way to conform with the natural streambed gradients with outlets that discharge onto rocky or hardened protected areas.
- Design and locate water crossing structures in natural drainage channels to accommodate adequate fish passage, provide for minimum impacts to water quality, and to be capable of handling a 100-year event for runoff and floodwaters.
- Use culverts that pass, at a minimum, a 25-year storm event or have a minimum diameter of 24 inches for permanent stream crossings and a minimum diameter of 18 inches for road cross drains.
- Replace undersized culverts and repair or replace damaged culverts and downspouts. Provide energy dissipaters at culvert outlets or drainage dips.
- Locate culverts or drainage dips in such a manner as to avoid discharge onto unstable terrain such as headwalls or slumps. Provide adequate spacing to avoid accumulation of water in ditches or road surfaces. Culverts should be placed on solid ground to avoid road failures.
- Proper sized aggregate and riprap should be used during culvert construction. Place riprap at culvert entrances to streamline waterflow and reduce erosion.

- Establish adapted vegetation on all cuts and fill immediately following road construction and maintenance.
- Remove berms from the downslope side of roads, consistent with safety considerations.
- Leave abandoned roads in a condition that provides adequate drainage without further maintenance. Close abandoned roads to traffic. Physically obstruct the road with gates, large berms, trenches, logs, stumps, or rock boulders as necessary to accomplish permanent closure.
- Abandon and rehabilitate roads that are no longer needed. Leave these roads in a condition that provides adequate drainage. Remove culverts.
- When plowing snow for winter use of roads, provide breaks in snow berms to allow for road drainage. Avoid plowing snow into streams. Plow snow only on existing roads.
- Maintenance should be performed to conserve existing surface material, retain the original crowned or out-sloped self-draining cross section, prevent or remove rutting berms (except those designed for slope protection) and other irregularities that retard normal surface runoff. Avoid wasting loose ditch or surface material over the shoulder where it can cause stream sedimentation or weaken slump-prone areas. Avoid undercutting back slopes.
- Do not disturb the toe of cut slopes while pulling ditches or grading roads. Avoid sidecasting road material into streams.
- Grade roads only as necessary. Maintain drain dips, waterbars, road crown, in-sloping and outsloping, as appropriate, during road maintenance.
- Maintain roads in special areas according to special area guidance. Generally, retain roads within existing disturbed areas and sidecast material away from the special area.
- When landslides occur, save all soil and material usable for reclamation or stockpile for future reclamation needs. Avoid sidecasting of slide material where it can damage, overload, and saturate embankments, or flow into down-slope drainage courses. Reestablish vegetation as needed in areas where vegetation has been destroyed due to sidecasting.
- Strip and stockpile topsoil ahead of construction of new roads, if feasible. Reapply soil to cut and fill slopes prior to revegetation.

## A.2.6 Best Management Practices for Livestock Grazing

The purpose of this section is not to attempt to select certain practices and require that only those be used. It is not possible to evaluate all the known practices and make determinations as to which are best. What is best must be determined as a result of a site-specific investigation of the proposed management action. No one management practice is best suited to every site or situation. BMPs must be adaptive and monitored regularly to evaluate effectiveness.

The following sources contain information regarding grazing BMPs. Over time, other sources of information will become available and will be considered in proposed management actions.

1. The National Range and Pasture Handbook

   http://www.glti.nrcs.usda.gov/technical/publications/nrph.html

2. Best Management Practices for Grazing

   http://deq.state.wy.us/wqd/watershed/Downloads/NPS%20Program/92602.pdf

## A.2.7 Best Management Practices for Visual Resources

The following BMPs would be considered to reduce impacts to all visual resource management classes within the planning area:

- Burying of distribution power lines and flow lines in or adjacent to access roads
- Repeating elements of form, line, color, and texture to blend facilities and access roads with the surrounding landscape
- Painting all above-ground structures, production equipment, tanks, transformers, and insulators not subject to safety requirements to blend with the natural color of the landscape, using paint that is a non-reflective "standard environmental color" approved by the BLM visual resource management specialist: All new equipment brought onto the sites should be painted the same color(s).
  - Semi-gloss paints will stain and fade less than flat paints
  - Typically, the background is a vegetated background, and seldom a solid background
  - The selected color should be one or two shades darker than the background
  - Consider the predominant season of public use; however, never paint an object to match snow
- Performing final reclamation recontouring of all disturbed areas, including access roads, to the original contour or a contour that blends with the surrounding topography
- Avoiding facility placement on steep slopes, ridge tops, and hilltops
- Screening facilities from view
- Following contours of the land to reduce unnecessary disturbance
- Recontouring and revegetating disturbed areas to blend with the surrounding landscape
- Reclaiming unnecessary access roads as soon as possible to the original contour
- Using gravel of a similar color to adjacent dominant soil and vegetation colors for road surfacing
- Use dust abatement to reduce fugitive dust, as well as minimize the light colors of the routes
- Avoiding locating pads in areas visible from primary roads
- Using subsurface or low-profile facilities to prevent protrusion above horizon line when viewed from any primary road
- Co-locating wells when possible
- Locating facilities far enough from the cut and fill slopes to facilitate recontouring for interim reclamation
- Locating wells away from prominent features, such as rock outcrops
- Completing an annual transportation plan for an entire area before beginning construction and making a layout that will minimize disturbance and visual impact
- Designing and constructing all new roads to a safe and appropriate standard "no higher than necessary" to accommodate their intended use
- Locating roads far enough off the back of ridgelines so they aren't visible from state, county, or BLM roads
- Using remote monitoring to reduce traffic and road requirements
- Removing unused equipment, trash, and junk immediately

- Construction activities scheduled to occur between 7 a.m. and 6 p.m. will not take place before or past daylight hours (which vary according to season) near residences. This will eliminate the need to introduce high-wattage lighting sources to operate in the dark near residences.
- Building design will be required to include low-intensity interior safety lighting for use during after-hours instead of using standard interior lighting for safety purposes. This practice will decrease the amount of nighttime light that would occur from using standard interior lighting as safety lighting.
- Use of interior lights to ensure building safety will be allowed, but the unnecessary overuse of interior nighttime lighting would be prevented by requiring that interior spaces implement a "lights-off" policy. This practice requires that all non-safety lighting be turned off at night (such as in offices and hallways), after business hours. This may be accommodated by utilizing automatic motion sensor lighting that is programmed for use after-hours.
- Use of harsh mercury vapor or low-pressure sodium bulbs will be prohibited.
- All artificial outdoor lighting will be limited to safety and security requirements, designed using the Illuminating Engineering Society's design guidelines, and in compliance with International Dark-Sky Association approved fixtures.
- All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. Therefore, lights will be installed at the lowest allowable height and cast low-angle illumination while minimizing incidental light spill onto adjacent lands, open spaces, or backscatter into the nighttime sky.
- The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized to the highest degree possible.
- Light fixtures will have non-glare finishes that will not cause reflective daytime glare. Lighting will be designed for energy efficiency and have daylight sensors or be timed with an on/off program.
- Lights will provide good color rendering with natural light qualities with the minimum intensity feasible for security, safety, and personnel access. Lighting, including light color rendering and fixture types, will be designed to be aesthetically pleasing.
- LED lighting will avoid the use of blue-rich white light lamps and use a correlated color temperature that is no higher than 3,000 Kelvin, consistent with the International Dark-Sky Association's Fixture Seal of Approval program.

**Wind:**

- Considering topography when siting wind turbines
- Clustering or grouping turbines to break up overly long lines of turbines
- Creating visual order and unity among turbine clusters
- Siting wind turbines to minimize shadow flicker
- Relocating turbines to avoid visual impacts
- Using audio visual warning system (AVWS) technology to reduce night sky impacts
- Creating visual uniformity in shape, color, and size
- Using fewer, larger turbines
- Using non-reflective coatings on wind turbines and other facility components

- Prohibiting commercial messages and symbols on wind turbines
- Keeping wind turbines in good repair
- Cleaning nacelles and towers

**Solar:**

- Developing a glint and glare assessment, mitigation, and monitoring plan
- Using dry-cooling technology for CSP facilities
- Siting and operate solar collectors to avoid offsite glare
- Screening solar collectors to avoid off-site glare
- Using color-treated solar collectors and support structures
- Maintaining color-treated surfaces of solar collectors
- Avoiding complete removal of vegetation beneath solar collector array
- Prohibiting commercial messages and symbols on solar power towers and solar collector arrays

**Geothermal:**

- Using dry-cooling technology
- Screening pipelines from roads and other sensitive viewpoints
- Painting or coat aboveground pipelines
- Minimizing drill rig and well test facility lighting

## A.2.8 Best Management Practices for Water Resources

BMPs would be appropriate for consideration to mitigate potential water quality impacts when proposed oil and gas activities are within 500 feet of riparian areas and surface waters of the state, Source Water Protection Areas identified in Wellhead, or Source Water Protection Plans approved by the local governing body, and "High" and "Moderately High" sensitivity aquifers (identified throughout the use of the Wyoming Groundwater Vulnerability Assessment Handbook (as updated over time). BMPs to mitigate impacts to water resources include, but are not limited to, the following:

- Those management approaches for oil and gas activities required by Source Water and Wellhead Protection Plans approved by the local governing body
- Use closed loop drilling systems.
- Do not use evaporation ponds in proximity to shallow aquifers.
- Do not use unlined ponds or pits overlying sensitive aquifers.
- Line surface impoundment ponds (evaporation ponds or drilling pits) with synthetic liners and subsequently decommission them by removing all contaminants and liner and reclaiming the area.
- Identify water supply wells and implement appropriate protection measures for the affected aquifer(s) as necessary to prevent the introduction of contaminants into the well.
- Require a monitoring plan which includes collection of baseline and periodic water quality data from potentially affected water supply wells, identification of parameters to monitor, reporting results to BLM and well owners, and reporting to Wyoming Department of Environmental Quality-Air.

- Review the geology of shallow aquifers to determine well construction requirements, which may include cementing to surface and drilling with a fresh water mud system.
- Requirement for surface casing and cement to a specific formation or depth to protect aquifers at depth that need protection:
  - Set surface casing below the lowermost underground sources of drinking water and set into a confining (e.g., shale) layer.
  - Set an intermediate string of casing and cement in the event of deep aquifers.
  - Require submittal of a well logging plan and document submittal of plan to ensure proper well construction to protect groundwater. If a lost circulation event occurs during the installation of surface casing, a cement bond log will be required to be run on the surface casing to determine if the cement is adequate and protective.
  - Review the geology of shallow aquifers in proximity to groundwater development activities to determine potential impacts to flow patterns supporting water elements such as fen, wetlands, springs, and seeps, and ponds.

## A.2.9 Reducing Impacts from Fluid Mineral Construction, Operation, and Reclamation

The following BMPs would be considered to reduce impacts from fluid mineral construction, operation, and reclamation:

- Directional drilling
- Drilling of multiple wells from a single pad
- Transportation planning (to reduce road density and traffic volumes)
- Remote well monitoring
- Piping of produced liquids to centralized tank batteries offsite to reduce traffic to individual wells
- Submersible pumps
- Belowground wellheads
- Bussing of workers (to reduce traffic volume)
- Flareless well completions
- Pitless drilling
- Burying of distribution power lines and flow lines in or adjacent to access roads
- Design and construction of all new roads to a safe and appropriate standard “no higher than necessary” to accommodate their intended use
- Reuse of old roads or pads
- Interim reclamation of well locations and access roads soon after the well is put into production
- Avoidance of facility placement on steep slopes, ridge tops, and hilltops
- Storage of chemicals within secondary containment in case of a spill
- Onsite bioremediation of oil field wastes and spills
- Removal of trash, junk, waste, and other materials not in use

# APPENDIX B—STIPULATIONS: EXCEPTION, MODIFICATION, AND WAIVER CRITERIA

## INTRODUCTION

This appendix lists the stipulations on oil and gas leases referenced in Chapter 2 of this Proposed Resource Management Plan (RMP) and final Environmental Impact Statement (EIS). Three types of surface stipulations can be applied to oil and gas leases to protect identified resource values: (1) no surface occupancy (NSO), (2) timing limitation stipulations (TLS), and (3) controlled surface use (CSU).

- No Surface Occupancy: Use of occupancy of the land surface for fluid mineral exploration of development is prohibited to protect identified resources values.
- Timing Limitation: Prohibits surface use during specified time periods to protect identified resource values. This stipulation does not apply to the operation and maintenance of production facilities unless the findings of analysis demonstrate the continued need for such mitigation and that less stringent, project specific mitigation measures would be insufficient.
- Controlled Surface Use: Use and occupancy is allowed (unless restricted by another stipulation) but identified resource values require special operational constraints that may modify the lease rights. CSU is used for operating guidance, not as a substitute for the NSO or TLS.

The BLM may apply TLS and CSU restrictions, as conditions of approval (COA) on an Application for Permit to Drill (APD) consistent with lease rights. The criteria for exceptions to COAs on APDs are the same as that for leasing in Table 2-4 (Appendix V). Additionally, COAs on APDs do not apply to other portions of the lease such as maintenance and operation of existing facilities.

The RMP serves as the vehicle for explaining the conditions under which waivers, exceptions, or modifications of lease stipulations may be granted.

### Lease Notices

A lease notice provides more detailed information concerning limitations that already exist in law, lease terms, regulations, or operational orders. A lease notice also addresses special items the lessee should consider when planning operations, but does not impose new or additional restrictions (Uniform Format for Oil and Gas Lease Stipulations, March 1989. Rocky Mountain Regional Coordinating Committee). "An information [lease] notice has no legal consequences, except to give notice of existing requirements, and may be attached to a lease by the authorized officer (AO) at the time of lease issuance to convey certain operational, procedural or administrative requirements relative to lease management within the terms and conditions of the standard lease form. Information [lease] notices shall not be a basis for denial of lease operations (43 Code of Federal Regulations [CFR] 3101.1-3)." There are three standard lease notices that are attached to every lease issued by the BLM within Wyoming.

### LEASE NOTICE NO. 1

Under Regulation 43 CFR 3101.1-2 and terms of the lease (BLM Form 3100-11), the authorized officer may require reasonable measures to minimize adverse impacts to other resource values, land uses, and users not addressed in lease stipulations at the time operations are proposed. Such reasonable measures may include, but are not limited to, modification of siting or design of facilities, timing of operations, and specification of interim and final reclamation measures, which may require relocating proposed operations up to 200 meters, but not off the leasehold, and prohibiting surface disturbance activities for up to 60 days.

The lands within this lease may include areas not specifically addressed by lease stipulations that may contain special values, may be needed for special purposes, or may require special attention to prevent

damage to surface and/or other resources. Possible special areas are identified below. Any surface use or occupancy within such special areas will be strictly controlled or, if absolutely necessary, prohibited. Appropriate modifications to imposed restrictions will be made for the maintenance and operation of producing wells.

1. Slopes in excess of 25%.
2. Within 500 feet of surface water and/or riparian areas.
3. Construction with frozen material or during periods when the soil material is saturated or when watershed damage is likely to occur.
4. Within 500 feet of Interstate highways and 200 feet of other existing rights-of-way (i.e., U.S. and state highways, roads, railroads, pipelines, powerlines).
5. Within 0.25 mile of occupied dwellings.
6. Material sites.

**GUIDANCE:**

The intent of this notice is to inform interested parties (potential lessees, permittees, operators) that when one or more of the above conditions exist, surface-disturbing activities will be prohibited unless or until the permittee or the designated representative and the surface management agency (SMA) arrive at an acceptable plan for mitigation of anticipated impacts. This negotiation will occur prior to development and become a condition for approval when authorizing the action. Specific threshold criteria (e.g., 500 feet from water) have been established based upon the best information available.

However, geographical areas and time periods of concern must be delineated at the field level (i.e., "surface water and/or riparian areas" may include both intermittent and ephemeral water sources or may be limited to perennial surface water).

The referenced oil and gas leases on these lands are hereby made subject to the stipulation that the exploration or drilling activities will not interfere materially with the use of the area as a materials site/free use permit. At the time operations on the above lands commence, notification will be made to the appropriate agency. The name of the appropriate agency may be obtained from the proper BLM Field Office.

THIS NOTICE APPLIES TO ALL PARCELS.

**LEASE NOTICE NO. 2**

**BACKGROUND:**

The BLM, by including National Historic Trails within its National Landscape Conservation System, has recognized these trails as national treasures. Our responsibility is to review our strategy for management, protection, and preservation of these trails. The National Historic Trails in Wyoming, which include the Oregon, California, Mormon Pioneer, and Pony Express Trails, as well as the Nez Perce Trail, were designated by Congress through the National Trails System Act (Public Law [P.L.] 90-543; 16 United States Code [U.S.C.] 1241-1251) as amended through P.L. 106-509 dated November 13, 2000.

Protection of the National Historic Trails is normally considered under the National Historic Preservation Act (NHPA) (P.L. 89-665; 16 U.S.C. 470 et seq.) as amended through 1992 and the National Trails System Act.

Additionally, Executive Order 13195, “Trails for America in the 21st Century,” signed January 18, 2001, states in Section 1: “Federal agencies will...protect, connect, promote, and assist trails of all types

throughout the United States. This will be accomplished by: (b) Protecting the trail corridors associated with national scenic trails and the high priority potential sites and segments of national historic trails to the degrees necessary to ensure that the values for which each trail was established remain intact."

Therefore, the BLM will be considering all impacts and intrusions to the National Historic Trails, their associated historic landscapes, and all associated features, such as trail traces, grave sites, historic encampments, inscriptions, natural features frequently commented on by emigrants in journals, letters and diaries, or any other feature contributing to the historic significance of the trails. Additional National Historic Trails will likely be designated amending the National Trails System Act. When these amendments occur, this notice will apply to those newly designated National Historic Trails as well.

**STRATEGY:**

The BLM will proceed in this objective by conducting a viewshed analysis on either side of the designated centerline of the National Historic Trails in Wyoming, except, at this time, for the Nez Perce Trail, for the purpose of identifying and evaluating potential impacts to the trails, their associated historic landscapes, and their associated historic features. Subject to the viewshed analysis and archeological inventory, reasonable mitigation measures may be applied. These may include, but are not limited to, modification of siting or design of facilities to camouflage or otherwise hide the proposed operations within the viewshed. Additionally, specification of interim and final reclamation measures may require relocating the proposed operations within the leasehold. Surface-disturbing activities will be analyzed in accordance with the National Environmental Policy Act (NEPA) of 1969 (P.L. 91190; 42 U.S.C. 4321-4347) as amended through P.L. 94-52, July 3, 1975, and P.L. 94-83, August 9, 1975, and the NHPA, supra, to determine if any design, siting, timing, or reclamation requirements are necessary. This strategy is necessary until the BLM determines that, based on the results of the completed viewshed analysis and archeological inventory, the existing land use plans (RMP) have to be amended. The use of this lease notice is a predecisional action, necessary until final decisions regarding surface-disturbing restrictions are made. Final decisions regarding surface-disturbing restrictions will take place with full public disclosure and public involvement over the next several years if BLM determines that it is necessary to amend existing land use plans.

**GUIDANCE:**

The intent of this notice is to inform interested parties (potential lessees, permittees, operators) that when any oil and gas lease contains remnants of National Historic Trails or is located within the viewshed of a National Historic Trails' designated centerline, surface-disturbing activities will require the lessee, permittee, operator or, their designated representative, and the SMA to arrive at an acceptable plan for mitigation of anticipated impacts. This negotiation will occur prior to development and become a condition for approval when authorizing the action.

THIS NOTICE APPLIES TO ALL PARCELS.

The following three stipulations are applied to all BLM-administered fluid mineral leases within Wyoming.

**LEASE STIPULATION NO. 1: CULTURAL RESOURCES**

This lease may be found to contain historic properties and/or resources protected under the NHPA, American Indian Religious Freedom Act, Native American Graves Protection and Repatriation Act, Executive Order 13007, or other statutes and executive orders. The BLM will not approve any ground-disturbing activities that may affect any such properties or resources until it completes its obligations (e.g., State Historic Preservation Officer [SHPO]) and tribal consultation) under applicable requirements of the NHPA and other authorities. The BLM may require modification to exploration or development proposals to protect such properties, or disapprove any activity that is likely to result in adverse effects that cannot be successfully avoided, minimized or mitigated.

**LEASE STIPULATION NO. 2: ENDANGERED SPECIES ACT SECTION 7 CONSULTATION**

The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other Special Status Species. BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. The BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. The BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended., 16 U.S.C. § 1531 et seq., including completion of any required procedure for conference or consultation.

**LEASE STIPULATION NO. 3: MULTIPLE MINERAL DEVELOPMENT**

Operations will not be approved which, in the opinion of the authorized officer, would unreasonably interfere with the orderly development and/or production from a valid existing mineral lease issued prior to this one for the same lands.

# EXCEPTIONS, MODIFICATIONS, AND WAIVERS

An operator submitting a plan of operations to the BLM may request an exception, modification, or waiver of a stipulation included in a lease.

- Exception: Case-by-case exemption from a lease stipulation. The stipulation continues to apply to all other sites within the leasehold to which the restrictive criteria apply.
- Modification: Fundamental change to the provisions of a lease stipulation, either temporarily or for the term of the lease. A modification may, therefore, include an exemption from or alteration to a stipulated requirement. Depending on the specific modification, the stipulation may or may not apply to all other sites within the leasehold to which the restrictive criteria applied.
- Waiver: Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold.

> *According to 43 CFR 3101.1-4, "A stipulation included in an oil and gas lease shall be subject to modification of waiver only if the authorized officer determines that the factors leading to its inclusion on the lease have change sufficiently to make the protection provided by the stipulation no longer justified or if the proposed operations would not cause unacceptable impacts." Exceptions, modifications, and waivers must be supported by appropriate environmental analysis and documentation. If the authorized officer has determined, prior to lease issuance, that a stipulation involves an issue of major concern to the public, modification or waiver of the stipulation shall be subject to public review for at least a 30-day period. In such cases, the stipulation shall indicate that public review is required before modification or waiver. If subsequent to lease issuance the authorized officer determines that a modification or waiver of a lease term or stipulation is substantial, the modification or waiver shall be subject to public review for at least a 30-day period.*

Table B-1 includes the criteria for considering request for exceptions, modifications, and waivers according to stipulations applied for the Proposed RMP.

# Table B-1

| Description | Proposed RMP |
|---|---|
| **Management #** | 1107 |
| **Protected Resource** | Soils with low reclamation potential. |
| **RMP Affected Area** | Areas with low reclamation potential (as per Natural Resources Conservation Service [NRCS] soil rating map). |
| **Stipulation** | CSU |
| **Action Text** | Avoid surface-disturbing activities in areas with limited reclamation potential (as per NRCS soil rating), subject to adequate mitigation of impacts following BLM mitigation policies. The operator must submit an approved mitigation plan before a proposed project will be approved.<br>CSU for fluid minerals. |
| **Stipulation Description** | **Stipulation:** Surface occupancy or use is restricted on limited reclamation potential areas such as areas possessing sensitive geologic formations, limited reclamation potential soils, biological crusts, soils with low reclamation potential, and soils with highly erosive characteristics.<br>(1) Prior to surface disturbance on limited reclamation potential areas, a site-specific construction, stabilization, and reclamation plan (Plan) must be submitted to the BLM by the applicant as a component of the APD (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The Plan must include designs approved and stamped by a licensed engineer. The operator shall not initiate surface-disturbing activities unless the BLM AO has approved the Plan (with conditions, as appropriate). The Plan must demonstrate to the BLM AO's satisfaction how the operator will meet the following performance standards:<br>• The disturbed area will be stabilized with no evidence of accelerated erosion features.<br>• The disturbed area shall be managed to ensure soil characteristics approximate an appropriate reference site with regard to erosional features to maintain soil productivity and sustainability.<br>• Slope stability is maintained preventing slope failure and erosion.<br>• Sufficient viable topsoil is maintained for ensuring successful final reclamation. At locations where interim reclamation will be completed, this will be accomplished by respreading all salvaged topsoil over the areas of interim reclamation.<br>• The original landform and site productivity will be partially restored during interim reclamation and fully restored as a result of final reclamation.<br>(2) As mapped by the NRCS SSURGO Order 3 soil survey or as determined by BLM evaluation of the area. For the purpose of (3) ensuring successful reclamation and erosion control on limited reclamation potential areas in order to meet the standards outlined in Chapter 6 of the BLM's Oil and Gas Gold Book, and Wyoming Reclamation Policy.<br>**Purpose:** To protect soils with low reclamation potential. |

| Description | Proposed RMP |
|---|---|
| | **Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a NRCS soil survey and BLM evaluation. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** This stipulation may be waived over the entire leasehold if the BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon NRCS mapping and BLM evaluation. |
| **Management #** | 1116 |
| **Protected Resource** | Scientific and scenic values of Pilot Butte and Emmons Cone. |
| **RMP Affected Area** | Pilot Butte (121 acres), and Emmons Cone (60 acres). |
| **Stipulation** | NSO |
| **Action Text** | The natural values of Boars Tusk, Pilot Butte, and Emmons Cone would be protected.<br>Surface occupancy and surface-disturbing activities are prohibited in these areas, unless such activity would enhance management of these geologic features. Interpretive facilities would be allowed. |
| **Stipulation Description** | **Stipulation:** No surface occupancy or use will be allowed in the areas surrounding Pilot Butte and Emmons Cone as shown on Map 2-10.<br>**Purpose:** To protect the scientific and scenic values of Pilot Butte and Emmons Cone.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review.<br>The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 1313 |
| **Protected Resource** | 100-year floodplain, wetlands, riparian areas, perennial streams, and 500 feet of the edge of the inner gorge of large ephemeral drainages. |
| **RMP Affected Area** | See Map 2-10 |
| **Stipulation** | CSU |

| Description | Proposed RMP |
|---|---|
| **Action Text** | Avoid placement of permanent facilities within 100-year floodplains, and within 1,320 feet (¼ mile) of wetlands, riparian areas, and perennial streams. Avoid surface-disturbing and construction activities within 500 feet of the outer edge of wetland/riparian areas or perennial streams. Avoid surface-disturbing and construction activities within 100 feet of the edge of the inner gorge of intermittent channels or ephemeral drainages. Designate these areas as a ROW avoidance area. Allow linear crossings if a site-specific analysis by a BLM AO determines that no adverse impacts would be likely to occur and a plan to mitigate potential impacts on water quality is approved. Allow structures that would enhance the protection and management of streams, wetlands, and riparian areas. Approval will be on a case-by-case basis and subject to adequate mitigation of impacts following BLM mitigation policies and Wyoming BLM Mitigation Guidelines for Surface-Disturbing and Disruptive Activities.<br>CSU for fluid minerals. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities within 1,320 feet (1/4 mile) of 100-year floodplains, wetlands, riparian areas, perennial streams, and within 500 feet from of the edge of the inner gorge of large ephemeral drainages, unless a plan is first approved by the AO that demonstrates the proposed action will not affect the resource.<br>**Purpose:** To protect 100-year floodplains, wetlands, riparian areas, perennial streams, and 500 feet of the edge of the inner gorge of large ephemeral drainages.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include 100-year floodplains, wetlands, riparian areas, perennial streams, or large ephemeral drainages. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 1317 |
| **Protected Resource** | Aquifer recharge areas. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | CSU |
| **Action Text** | Manage activities in aquifer recharge areas to protect groundwater quality and quantity to ensure continued function. Manage activities in aquifer recharge areas to maintain, at a minimum, recharge volume and groundwater quality by limiting road density, chemical use and storage, and surface occupancy to maintain a healthy aquifer recharge area.<br>CSU for fluid minerals. Apply the above actions to identified and mapped aquifer recharge areas. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities on lands identified as the aquifer recharge areas unless a plan is first approved by the AO that demonstrates the proposed action will not affect the resource. |

| Description | Proposed RMP |
|---|---|
| | **Purpose:** To protect the aquifer recharge areas.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not impair the function or utility of the site.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include aquifer recharge areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 1319 |
| **Protected Resource** | Aquifer recharge area for the towns of Superior and McKinnon. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | Closed |
| **Action Text** | Avoid surface-disturbing activities and subsurface mineral activity in the identified or designated aquifer recharge area for the towns of Superior and McKinnon.<br>Unavailable to fluid minerals leasing.<br>Designate as a ROW avoidance area. |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 1325 |

| **Management #** | 2218 |
| **Protected Resource** | JHM Area 3. |
| **RMP Affected Area** | Map 3-20 |
| **Stipulation** | Closed |
| **Action Text** | Close JMH Area 3 to fluid mineral leasing (about 92,000 acres).<br>As existing leases expire in Area 3, they would not be reoffered for lease (Table 2-4, Appendix V), including the perimeter of Area 3 identified above. |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 4421 |
| **Protected Resource** | Big game crucial winter range and parturition areas. |
| **RMP Affected Area** | Map 3-3 |
| **Stipulation** | TLS |
| **Action Text** | Allow surface-disturbing activities on big game crucial winter ranges and parturition areas (see Map 3-3) subject to adequate mitigation of impacts following BLM mitigation policies. Avoid disruptive activities in big game crucial winter range between November 15 and April 30.<br>Avoid disruptive activities in big game parturition areas between May 1 and June 30.<br>Grant exceptions if impacts could be mitigated in accordance with exception criteria (see specific exception/waiver/modification criteria, Appendix B).<br>Determine and apply mitigation of impacts (e.g., noise and traffic) on all habitats and habitat functionality. |
| **Stipulation Description** | **Stipulation:** No disruptive activities will be allowed in big game crucial winter range between November 15 and April 30.<br>**Stipulation:** No disruptive activities will be allowed in big game parturition areas between May 1 and June 30.<br>**Purpose:** To protect big game winter range and parturition areas from activities that would adversely harm them during winter months and in breading season.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above. Exception requests will be reviewed in consultation with the WGFD.<br>**Modification:** The AO may modify the area subject to the stipulations based upon a BLM evaluation in coordination with the WGFD and/or USFWS, as necessary. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards. |

| Description | Proposed RMP |
|---|---|
| | **Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation of the area in coordination with the WGFD and/or USFWS, as necessary. |
| **Management #** | 4424 |
| **Protected Resource** | Big game migration corridors. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | CSU |
| **Action Text** | Allow fluid mineral surface occupancy and use within WGFD designated big game migration corridors if the fluid mineral operator and the BLM arrive at an acceptable conservation plan for avoidance, minimization, rectification, and/or restoration within the migration corridor. The purpose of the conservation plan is to ensure that fluid mineral development activities are pursued in a manner that maintain habitat function and result in no significant declines in species distribution or abundance. The BLM will consult with the WGFD to evaluate the adequacy of the conservation plan prior to finalization.<br>CSU for fluid minerals. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities unless the operator and BLM arrive at an acceptable migration corridor conservation plan for avoidance, minimization, rectification, and/or restoration is required prior to the approval for surface occupancy or use within a designated big game migration corridor. The purpose of the conservation plan is to ensure that development activities are completed in a manner that is compatible with maintaining designated big game migration corridor functionality (i.e., unimpeded big game movement and use within the corridor).<br>**Purpose:** To protect big game migration corridors to ensure that development activities do not affect their functionality.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** None<br>**Waiver:** None |
| **Management #** | 4430 |
| **Protected Resource** | Raptor nests. |
| **RMP Affected Area** | One-mile radius of raptor nests per BLM Map 3-4 |
| **Stipulation** | CSU |
| **Action Text** | Allow surface occupancy within the identified buffer of occupied and historic raptor nests, subject to adequate mitigation of impacts following BLM mitigation policies. This includes project components such as permanent and/or high-profile structures (e.g., buildings, storage tanks, powerlines, roads, well pads):<br>• Ferruginous hawk – ½ mile |

| Description | Proposed RMP |
|---|---|
| | • Bald eagle – 1 mile<br>• Golden eagle – ¼ mile<br>• Burrowing owl – ¼ mile<br>• General raptor – ¼ mile<br>CSU for fluid minerals.<br>Modify buffer recommendations, on a site-specific or project-specific basis, based on field observations and local conditions.<br>Require implementation of USFWS recommendations to locate structures away from high avian-use areas such as those used for nesting, foraging, roosting or migrating, and the travel between high-use areas on infrastructure (or facilities) that have potential to cause direct avian mortality (e.g., wind turbines, guyed towers, airports, wastewater disposal facilities, or transmission lines). |
| **Stipulation Description** | **Stipulation:** Restrict surface occupancy or use unless the operator submits a plan that adequately addresses mitigation of impacts following the BLM mitigation policy for raptor nests within a 1-mile radius.<br>**Purpose:** To protect nesting raptors during critical breeding periods.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above. The determination may include consultation with the WGFD or USFWS.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards. The determination may include consultation with the WGFD or USFWS.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. The determination may include consultation with the WGFD or USFWS. |
| **Management #** | 4431 |
| **Protected Resource** | Raptor nests. |
| **RMP Affected Area** | One-mile radius of raptor nests, per BLM Map 3-4 |
| **Stipulation** | TLS |
| **Action Text** | Avoid surface-disturbing and disruptive activities seasonally within the identified buffer of occupied and historic raptor nest sites (see Appendix J). |
| **Stipulation Description** | **Stipulation:** No surface occupancy or disturbing activities within 1-mile radius during raptor seasonal restrictions (generally February 1 to August 15) unless the operator submits a plan that adequately addresses mitigation of impacts following the BLM mitigation policy to raptor nests.<br>**Purpose:** To protect nesting raptors during critical breeding period. |

| Description | Proposed RMP |
|---|---|
| | **Exception:** The AO may grant an exception if the operator demonstrates that there are no active nests during the period of concern, subject to confirmation by the BLM in coordination with the WGFD and/or USFWS, as necessary.<br><br>**Modification:** The BLM AO may modify the area subject to the stipulations based upon a BLM evaluation in coordination with the WGFD and/or USFWS, as necessary.<br><br>The stipulation may be modified based on monitoring results; or if it is determined that the action will not impair the function or the suitability of the habitat, or cause nest abandonment.<br><br>**Waiver:** The stipulation may be waived if the BLM AO determines that the entire lease area does not include seasonal buffer zones for nests of raptor species of conservation concern. This determination shall be based upon field studies of the area by a qualified representative and subject to confirmation from BLM, in coordination with the WGFD and/or USFWS, as necessary. |
| **Management #** | 4435 |
| **Protected Resource** | Game fish and Special Status fish populations during spawning season. |
| **RMP Affected Area** | Fish-bearing streams. |
| **Stipulation** | TLS |
| **Action Text** | Avoid surface-disturbing and construction activities (e.g., mineral exploration and development activities, pipelines, power-lines, roads, recreation sites, fences, wells) within the 100-year floodplains that could adversely affect fish-bearing streams.<br><br>Allow linear crossings in these areas on a case-by-case basis only if the BLM determines that no adverse impacts would likely occur and a plan to mitigate potential impacts on water quality and fish habitat is approved.<br><br>Avoid surface-disturbing activities within fish-bearing streams to protect spawning habitat, egg incubation, and fry from March 15 to July 31 and fall TLS from September 15 to November 30. Critical dates often vary based on site location and species composition.<br><br>Evaluate requests for exceptions to timing limitations and consider reducing or increasing these standard dates (see Appendix B for specific exception/waiver/ modification criteria). Consult with the WGFD on evaluations of requests. |
| **Stipulation Description** | **Stipulation:** No surface disturbing activities within fish-bearing stream from March 15 to July 31 and from September 15 to November 30.<br><br>**Purpose:** To protect spawning activities and egg incubation of fish during reproductive periods.<br><br>**Exception:** The AO may grant an exception if the operator demonstrates that spawning habitat is not occupied during the period of concern, subject to confirmation by the BLM in coordination with WGFD as appropriate; or if it is determined that the action will not impair the function or the suitability of the habitat.<br><br>**Modification:** The BLM AO may modify the area subject to the stipulations based upon a determination by the BLM in coordination with WGFD, as appropriate, that the lease area does not contain fish-bearing streams or suitable fish spawning habitat or fish passage compatible stream segments. |

| Description | Proposed RMP |
|---|---|
| | **Waiver**: The AO may grant a waiver if it is determined that the entire lease area does not contain fish-bearing streams or suitable fish spawning habitat or fish passage compatible stream segments. This determination shall be based upon a BLM evaluation in coordination with the WGFD, as appropriate. |
| **Management #** | 4602 |
| **Protected Resource** | Special Status plant species. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | NSO |
| **Action Text** | Prohibit surface-disturbing activities or any disruptive activity within 100 feet of the boundary of known locations of Special Status plant species.<br>NSO for fluid minerals.<br>Petition to segregate and pursue a withdrawal from locatable mineral entry.<br>Close to mineral material sales.<br>Close to solid mineral leasing.<br>Designate as a ROW avoidance area.<br>Close to all OHV use, including those vehicles used for geophysical exploration activities, surveying, etc.<br>Prohibit the use of explosives and blasting. |
| **Stipulation Description** | **Stipulation:** No surface occupancy or use within 100 feet of any Special Status plant species.<br>**Purpose:** To protect Special Status plants from activities that could adversely affect the plants or their habitat.<br>**Exception:** The BLM AO can approve exceptions where applicants could demonstrate that proposed activities would not impact sensitive plant species.<br>**Modification:** The AO may modify the boundaries of the stipulation area if a portion of the area is not being used by the identified species.<br>**Waiver:** This stipulation may be waived if the AO determines that the entire leasehold does not contain any Special Status plant species. |
| **Management #** | 4610 |
| **Protected Resource** | Special status plant species. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | CSU |

| Description | Proposed RMP |
|---|---|
| **Action Text** | Allow surface-disturbing activities in Special Status plant species' mapped habitat, subject to adequate mitigation of impacts following BLM mitigation policies.<br>1) CSU for fluid minerals<br>2) Designate as a ROW avoidance area |
| **Stipulation Description** | **Stipulation:** Restrict surface disturbing activities unless the operator submits a plan that adequately addresses mitigation of impacts following the BLM mitigation policies for Special Status plant species.<br>**Purpose:** To protect Special Status plants from activities that could adversely affect the plants or their habitat.<br>**Exception:** The BLM AO can approve exceptions where applicants could demonstrate that proposed activities would not impact sensitive plant species.<br>**Modification:** The AO may modify the boundaries of the stipulation area if: (1) a portion of the area is not being used by the identified species as determined by survey; (2) habitat outside of stipulation boundaries is being used and needs to be protected.<br>**Waiver:** This stipulation may be waived if the AO determines that the entire leasehold can be occupied without adversely affecting the resources. |
| **Management #** | 4613 |
| **Protected Resource** | Big sagebrush/lemon scurfpea. |
| **RMP Affected Area** | Base of Steamboat Mountain. |
| **Stipulation** | CSU |
| **Action Text** | Protect some basin big sagebrush/lemon scurfpea areas along the base of Steamboat Mountain by controlling surface use or implementing other intense mitigation to preserve the character of vegetation communities. |
| **Stipulation Description** | **Stipulation:** Restrict surface occupancy or use unless the operator submits a plan that adequately address mitigation of impacts following the BLM mitigation policies for big sagebrush/lemon scurfpea.<br>**Exception:** None<br>**Modification:** None<br>**Waiver:** None |

| **Protected Resource** | The Continental Divide Snowmobile Trail and South Pass Cross Country Ski Trail. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | NSO |
| **Action Text** | The integrity of the Continental Divide Snowmobile Trail and the South Pass Cross Country Ski Trail would be maintained by limiting (and in some cases precluding) surface-disturbing activities or facilities on or within ¼ mile of the trails. The only exceptions would be the establishment of facilities to provide services to the users of the trails and to provide for public health and safety. |
| **Stipulation Description** | **Stipulation:** Restrict surface disturbing activities within ¼ mile of the Continental Divide Snowmobile Trail unless the operator can submit a plan that demonstrates that impact from the proposed action can be fully mitigated or activities be shown to benefit the resource objectives.<br>**Purpose:** To protect the Continental Divide Snowmobile Trail and South Pass Cross Country Ski Trail.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 6525 |
| **Protected Resource** | Continental Divide National Scenic Trail (CDNST) and Connecting Side Trail consistent with the National Direction for the CDNST. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | None |
| **Action Text** | No similar action; see the Congressionally Designated Trails Section (7000-7022) |

| Description | Proposed RMP |

| **Management #** | 7331 |
| **Protected Resource** | Sugarloaf Basin. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | CSU |
| **Action Text** | Allow surface-disturbing activities if the operator and the BLM arrive at an acceptable plan for avoidance, minimization, rectification, and/or restoration within the Sugarloaf Basin area. The purpose of the plan is to ensure that fluid mineral development activities are pursued in a manner that maintain habitat function and result in no significant declines in species distribution or abundance. The BLM will consult with the WGFD to evaluate the adequacy of the conservation plan prior to finalization. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities unless the operator and BLM arrive at an acceptable conservation plan for avoidance, minimization, rectification, and/or restoration, which is required prior to the approval for surface occupancy or use within the Sugarloaf Basin area. The purpose of the plan is to ensure that development activities are completed in a manner that is compatible with maintaining sensitive resources that occur within the area.<br>**Purpose:** To protect sensitive resources to ensure that development activities do not affect their functionality.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above. |

| Description | Proposed RMP |
|---|---|
| | **Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 7333 |
| **Protected Resource** | Sugarloaf Basin. |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | CSU |
| **Action Text** | Management of habitat or Special Status species, if identified, would be developed on a case-by-case basis.<br>Restrictions for protection of raptors, big game crucial winter range, and big game calving/fawning areas would apply (see Wildlife section and Appendix J). Exceptions to this restriction may be approved if conditions and criteria described in Appendix B. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities in the Sugarloaf Basin unless the operator can provide a plan to the AO that shows that the impacts from the proposed action are acceptable and can be adequately mitigated.<br>**Purpose:** To protect the resource values of the Sugarloaf Basin.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review.<br>The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 7337 |
| **Protected Resource** | The Pinnacles Geographic Area. |
| **RMP Affected Area** | 8,950 acres |
| **Stipulation** | NSO |
| **Action Text** | Manage as: (1) closed to mineral material sales/disposal; (2) exclusion area for ROW.<br>Pursue withdrawal from mineral location. |

| Description | Proposed RMP |
|---|---|
| | Limit surface disturbing activities to actions that would preserve or enhance the values of the area. |
| **Stipulation Description** | **Stipulation:** Prohibit surface occupancy and use in the Pinnacles Geologic Area.<br>**Purpose:** To protect the resource values of the Pinnacles Geologic Area.<br>**Exception:** None<br>**Modification:** None<br>**Waiver:** None |
| **Management #** | 7338 |
| **Protected Resource** | Pinnacles Geologic Feature. |
| **RMP Affected Area** | 1,345 acres |
| **Stipulation** | None |
| **Action Text** | Manage the Pinnacles Geologic Feature as a portion of the Pinnacles ACEC (Table 2-12 and Map 2-39). |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 7341 |
| **Protected Resource** | Monument Valley Management Area. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | None |
| **Action Text** | No similar action; the Monument Valley Management Area would not be retained. |

|---|---|
| **Management #** | 7456 and 7457 |
| **Protected Resource** | Boars Tusk Area. |
| **RMP Affected Area** | 1400 acres |
| **Stipulation** | None |
| **Action Text** | Designate the Boars Tusk ACEC an exclusion area for ROW. Close the area to mineral location, mineral material sales, and leasable minerals. Pursue a withdrawal from entry under land laws and mineral location.<br>Limit surface-disturbing activities to actions that would preserve or enhance the values of the area. |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 7466 |
| **Protected Resource** | Crucial big game winter ranges, big game birthing areas. |
| **RMP Affected Area** | Map 3-3 |
| **Stipulation** | TLS |
| **Action Text** | Restrict surface-disturbing activities, geophysical activities, and oil and gas exploration and development activities seasonally on crucial big game winter ranges, big game birthing areas, and winter concentration areas. Grant no exceptions, waivers. or modifications. |
| **Stipulation Description** | **Stipulation:** No surface occupancy or use is allowed in big game winter range, big game birthing areas, and winter concentration areas. During timing restrictions based on the area and wildlife species.<br>**Exception:** None<br>**Modification:** None<br>**Waiver:** None |
| **Management #** | 7478 |
| **Protected Resource** | Natural Corrals ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | None |
| **Action Text** | The ACEC would be closed to consideration of fluid mineral exploration and development. |
| **Stipulation Description** | **Stipulation:** None |

| Description | Proposed RMP |
|---|---|
| **Management #** | 7492 |
| **Protected Resource** | Pine Springs ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | Closed |
| **Action Text** | Designate the ACEC an exclusion area for: (1) surface-disturbing activities that could adversely affect resource values or preclude meeting ACEC management objectives; (2) ROW.<br>Pursue a withdrawal from mineral location and entry under the U.S. mining laws.<br>Close the area to: (1) mineral material sales for sand, gravel, or other types of construction or building materials; (2) mineral leasing.<br>Retain and petition to extend the withdrawal when it expires.<br>Write cultural resource management plans for the site. Allow interpretive and visitor management efforts as necessary. |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 7502 |
| **Protected Resource** | South Pass Historic Landscape ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | CSU |
| **Action Text** | The portion of the ACEC that is visible from the NHT and NST:<br>Allow surface occupancy and disturbance only if the project causes no more than a weak contrast to the setting of the trails and does not cause an adverse effect on the trails, NHL, or ACEC values.<br>CSU for fluid minerals. |
| **Stipulation Description** | **Stipulation:** Restrict surface-disturbing activities within the South Pass Historic Landscape ACEC if the project is visible and will cause an adverse effect or cause more than a weak contrast to the setting of the NHT.<br>**Purpose:** To protect the National Historic Trails and their setting.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review.<br>**Waiver:** The BLM AO determines that the entire lease area is not within the ACEC. This determination shall be based upon BLM evaluation or environmental record of review. |

| Description | Proposed RMP |
|---|---|
| **Management #** | 7510 |
| **Protected Resource** | Special Status Plant Species ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | NSO |
| **Action Text** | Prohibit surface disturbing activities.<br>1) NSO for fluid minerals<br>2) Segregate and pursue a withdrawal from locatable mineral entry<br>3) Close to mineral material sales<br>4) Close to solid mineral leasing<br>5) Designate as a ROW exclusion area<br>6) Prohibit the use of explosives and blasting<br>Retain existing withdrawals for the following plant species: Small rockcress (*Arabis pusilla*) (1,020 acres) and Uinta greenthread, (*Thelesperma pubescens*) (3,646 acres). |
| **Stipulation Description** | **Stipulation:** Prohibit surface occupancy and use within the Special Status Plant Species ACEC.<br>**Purpose:** To protect Special Status plants from activities that could adversely affect the plants or their habitat.<br>**Exception:** The BLM AO may grant an exception if it is determined that the action will not result in a failure to meet the performance standards above.<br>**Modification:** The BLM AO may modify the area subject to the stipulation based upon a BLM evaluation or environmental record of review. The stipulation and performance standards identified above may be modified based on monitoring results from similar actions on similar sites or revisions to national or state performance standards.<br>**Waiver:** The BLM AO determines that the entire lease area does not include limited reclamation potential areas. This determination shall be based upon BLM evaluation or environmental record of review. |
| **Management #** | 7519 |
| **Protected Resource** | Steamboat Mountain ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | NSO |
| **Action Text** | Designate the ACEC an exclusion area for direct surface-disturbing activities or any disrupting activities (e.g., off-site dust, air pollutants) that could adversely affect the Special Status plant species and their habitat. |

| Description | Proposed RMP |
|---|---|
| | Pursue a withdrawal from mineral location and entry under the land laws. Stipulate no surface occupancy and surface disturbing activities for leasable mineral exploration and development activities or construction of long-term placement of facilities or structures. Close to mineral material sales and use of explosives and blasting. |
| **Stipulation Description** | **Stipulation:** No surface-disturbing activities are allowed that could adversely affect the Special Status plant species and their habitat.<br>**Purpose:** To protect the Special Status plant species in the Steamboat Mountain ACEC.<br>**Exception:** None<br>**Modification:** None<br>**Waiver:** None |
| **Management #** | 7539 |
| **Protected Resource** | South Wind River ACEC. |
| **RMP Affected Area** | Map 2-39 |
| **Stipulation** | NSO |
| **Action Text** | No similar action. Management of this area is addressed through management of the National Trails Corridor. |
| **Stipulation Description** | **Stipulation:** None |
| **Management #** | 7559 |
| **Protected Resource** | Big Game Migration Corridor |
| **RMP Affected Area** | Map 2-10 |
| **Stipulation** | None |
| **Action Text** | No similar action; the Big Game Migration Corridor would not be designated as an ACEC. |
| **Stipulation Description** | **Stipulation:** None |

# APPENDIX C—AREAS OF CRITICAL ENVIRONMENTAL CONCERN EVALUATION

# INTRODUCTION

As part of the process for developing the Rock Springs Resource Management Plan (RMP), the Bureau of Land Management (BLM) planning team members reviewed all BLM administered public lands in the planning area to determine if any areas should be considered for designation as areas of critical environmental concern (ACEC) or if any existing ACEC designations should be modified or terminated. Only BLM-administered public lands can be considered for ACEC designation.

ACECs are BLM lands where special management attention is needed to protect important and relevant values. Special management attention refers to management prescriptions developed during preparation of an RMP or amendment expressly to protect the important and relevant values of an area from the potential effects of actions permitted by the RMP, including proposed actions deemed to be in conformance with the terms, conditions, and decisions of the RMP (BLM Manual 1613).

To be eligible for designation as an ACEC, an area must meet the relevance and importance criteria described in 43 Code of Federal Regulations (CFR) 1610.7-2 and BLM Manual 1613. If the relevance and importance criteria are met, an area must be identified as a potential ACEC and considered for designation and management in the resource planning process. Designation is based on whether a potential ACEC requires special management attention in the selected plan alternative.

Relevance and importance are defined as follows:

- **Relevance**. There shall be present a significant historic, cultural, or scenic value; a fish or wildlife resource or other natural system or process; or natural hazard.
- **Importance**. The above described value, resource, system, process, or hazard shall have substantial significance and values. This generally requires qualities of more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern. A natural hazard can be important if it is a significant threat to life or property.

An area meets the "relevance" criterion if it contains one or more of the following:

1. A significant historic, cultural, paleontological, or scenic value (including but not limited to rare or sensitive archaeological resources and religious or cultural resources important to Native Americans).
2. A fish and wildlife resource (including but not limited to habitat for endangered, sensitive, or threatened species; or habitat essential for maintaining species diversity).
3. A natural process or system (including but not limited to endangered, nonsensitive, or threatened plan species; rare, endemic, or relic plants or plant communities which are terrestrial, aquatic, or riparian; or rare geological features).
4. Natural hazards (including but not limited to areas of avalanche, dangerous flooding, landslides, unstable soils, seismic activity, or dangerous cliffs). A hazard caused by human action may meet the relevance criteria if it is determined through the resource management planning process that it has become part of a natural process.

An area meets the "importance" criterion if it further meets one or more of the following:

1. Has more than locally significant qualities, which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared with any similar resource.
2. Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change.

3. Has been recognized as warranting protection to satisfy national priority concerns or to carry out the mandates of the Federal Land Policy and Management Act (FLPMA).
4. Has qualities that warrant highlighting to satisfy public or management concerns about safety and public welfare.
5. Poses a significant threat to human life and safety or to property.

This report presents the completed evaluation forms for the nominated ACECs in the planning area. An ACEC that meets both relevance and importance criteria can be included in at least one management alternative analyzed in the RMP and environmental impact statement.

The rationale for designating or not designating ACECs is provided in the Final Environmental Impact Statement (EIS).

# C.1 CEDAR CANYON ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **Cedar Canyon** |
| **General Location** | T 22 N R 103 W sec 6, 8, 10, 16 and 18 |
| **General Description** | Native American rock art panels |
| **Public Land Acres** | 2,537 |
| **Values Considered** | Cultural resources: prehistoric rock art sites. Wildlife: raptor nesting and big game crucial winter range. |

**History**: This area was reviewed in the Green River RMP and found to meet relevance and importance criteria for cultural, raptor and wildlife values when originally designated as an ACEC. The Green River RMP recommended the designation be retained.

(See Chapter 2 Management Action 7404)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Native American rock art panels | Yes | Culturally significant to the Tribes and to modern local culture. |
| **A fish and wildlife resource:**<br>Raptor nesting area<br>Big game crucial winter range | Yes | The area is a known raptor nesting area and is within big game crucial winter range habitat. |
| **A natural process or system:** | No | -- |
| **Natural hazards:** | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area contains some well-developed Native American rock art panels. The area's remote and little-known location has served to protect the area from vandalism common to rock art panels. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The fragile nature of sandstone rock art panels makes this resource extremely vulnerable to vandalism and seismic activity, whether human or naturally caused. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The rock art panels have been recognized as having high cultural significance to the tribes. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for significant historic, cultural and wildlife values and is evaluated for future management actions in the final EIS.

## Figure C-1. Map of the Cedar Canyon ACEC

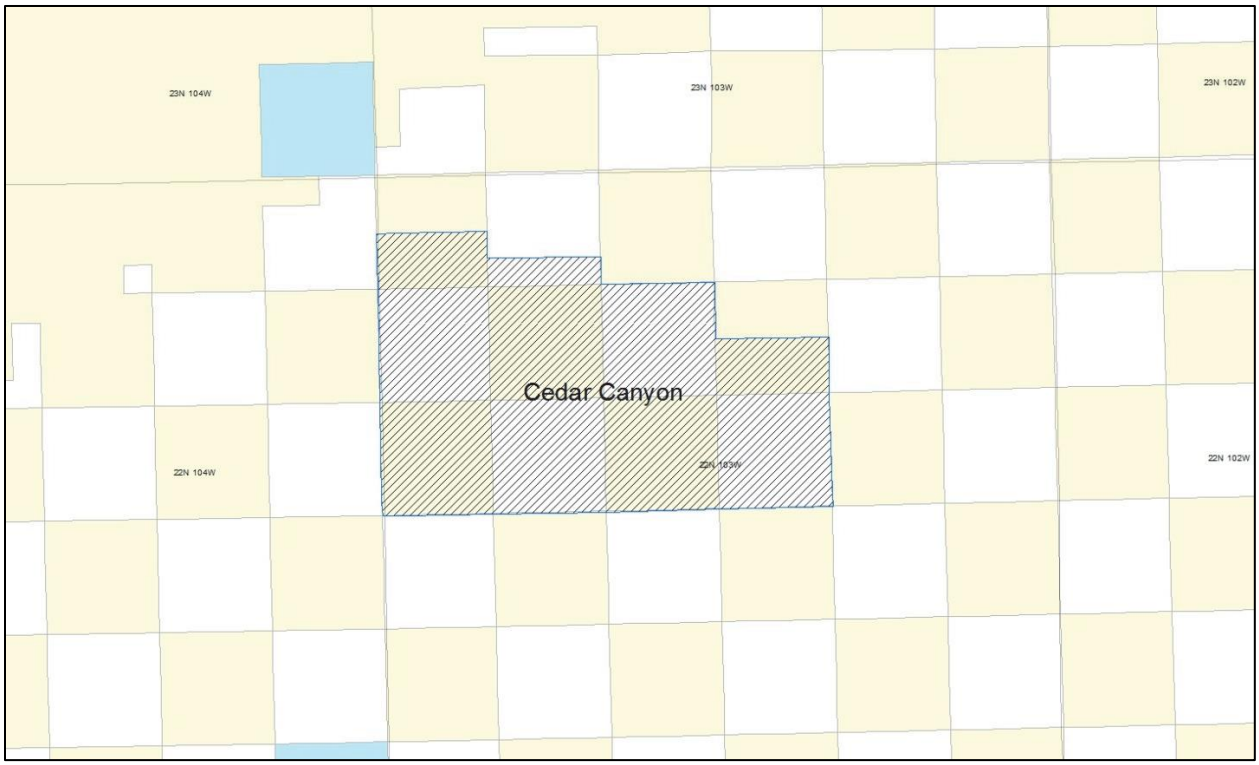

**Figure C-2. Cedar Canyon Rock Art**

# C.2 GREATER RED CREEK ACEC EVALUATION

## C.2.1 Red Creek Portion of the Greater Red Creek ACEC Evaluation

| Area Considered | Red Creek |
|---|---|
| General Location | The area is located north of the Utah/Wyoming border, approximately 32 miles south of the City of Rock Springs and contains the tributaries to Red Creek. |
| General Description | This area contains the Red Creek Escarpment and the Red Creek Drainage, in addition to the Red Creek Wilderness Study Area (WSA). |
| Public Land Acres | 55,718 |
| Values Considered | Red Creek Escarpment scenic values. Special Status Species: sage-grouse, raptor nesting habitat, Colorado River cutthroat trout. Big game crucial winter range and parturition habitat. Historic era graves: Bill Pidgeon. Paleontological resources: formations known to yield important reptile and avian fossil specimens. |

**History**: The Greater Red Creek ACEC was identified in the Green River RMP as meeting relevance and importance criteria for unstable fragile sensitive soils, unique ecological features, watershed and cultural values, and sensitive species of regional, national, and international importance. The values for the existing Red Creek ACEC remain the same as identified when Red Creek was originally designated an ACEC and was retained in the Green River RMP. It was also expanded to include the Current Creek and Sage Creek portions at that time.

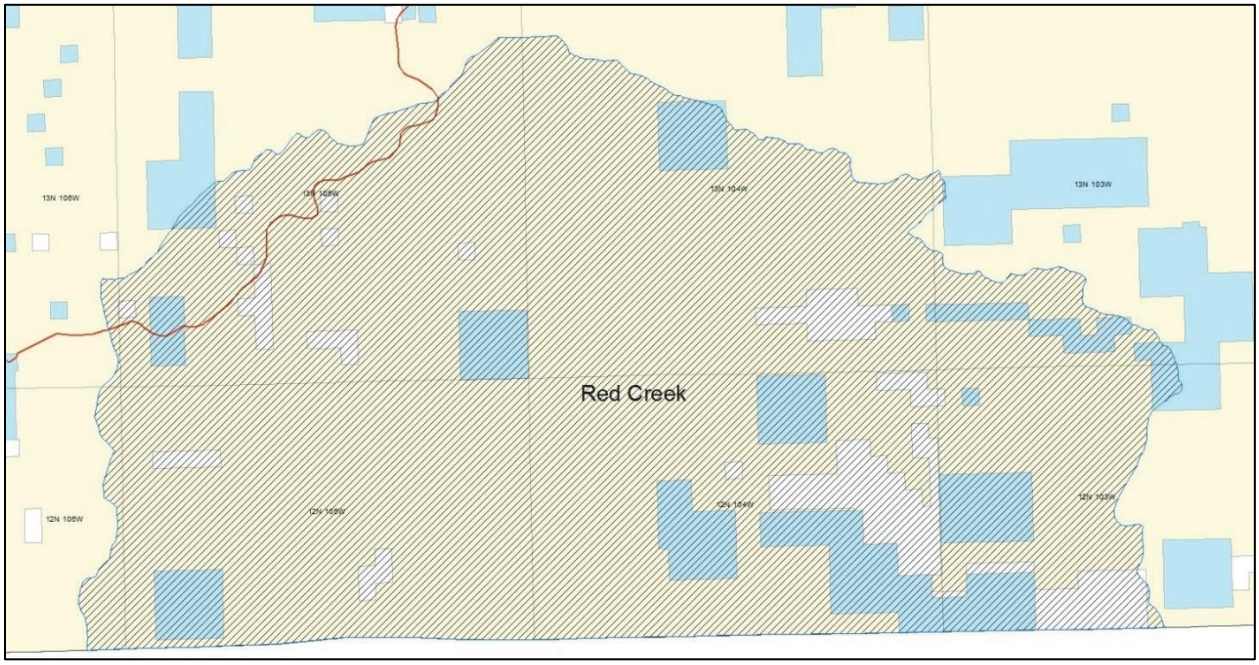
(See Chapter 2 Management Action 7418 & 7439)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Bill Pidgeon's grave<br>Red Creek Escarpment<br>Red Creek WSA | Yes | This area contains the grave of notorious outlaw Bill Pidgeon. It is also a favorite location for scenery photography and scenery painters because of its diverse visual variety. The Red Creek WSA, along with the scenic values of Teepee Mountain, Richards Gap, Minnie's Gap, and the Red Creek Escarpment make this area one of the more impressive scenic vistas in the planning area. |
| **A fish and wildlife resource:**<br>Colorado River cutthroat trout<br>Big game crucial winter range<br>Big game parturition | Yes | The area contains significant habitat for the Colorado River cutthroat trout, a BLM sensitive species. It also contains significant big game crucial winter range and parturition habitat. |
| **A natural process or system:**<br>Red Creek Escarpment<br>Old growth juniper communities<br>Special Status plant species<br>Paleontological resources | Yes | The area contains the Red Creek Escarpment, a unique geologic feature. This area contains relic plant communities and old growth juniper. It also has surface expressions of formations known to yield important reptile and avian fossil specimens in addition to more common fossil resources. |
| **Natural hazards:**<br>Red Creek Escarpment | Yes | Due to the fragile nature of the unstable soils that make up the escarpment, and the highly erodible nature and salt content of soils in the balance of the Red Creek area, the Red Creek drainage is part of the Colorado River Basin Salinity Control Act of 1974. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area contains big game crucial winter range and parturition habitat, as well as habitat for the Colorado river cutthroat trout. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | Due to the fragile nature of the unstable soils that make up the escarpment, and the highly erodible nature and salt content of soils in the balance of the Red Creek area, the Red Creek drainage is part of the Colorado River Basin Salinity Control Act of 1974.. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | In addition to special status habitat, the Red Creek drainage is part of the Colorado River Basin Salinity Control Act of 1974.<br>This area contains relic old growth juniper. It also has surface expressions of formations known to yield important reptile and avian fossil specimens in addition to more common paleontological resources. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, paleontological, wildlife, and scenic values and is evaluated for future management actions in the final EIS.

**Figure C-3. Map of Red Creek Portion of the Greater Red Creek ACEC**



## C.2.2 Currant Creek Portion of the Greater Red Creek ACEC Evaluation

| Area Considered | Current Creek |
|---|---|
| **General Location** | The Currant Creek drainage basin is located approximately 25 miles south and west of the City of Rock Springs. The area is west of State Highway 191 North, east of Flaming Gorge Reservoir, between Currant Creek Ridge and Big Ridge. |
| **General Description** | The area generally contains varying habitats, including riparian along the stream, sagebrush and juniper habitats, and some aspen and pine habitat. |
| **Public Land Acres** | 23,685 |
| **Values Considered** | Cultural resources: historic graves and Cherokee Trail. Wildlife: big game crucial winter range, big game parturition habitat, Special Status Species: Colorado River cutthroat trout, sage-grouse priority habitat management areas (PHMA).<br>Paleontological resources. |

**History**: The Greater Red Creek ACEC was identified in the Green River RMP as meeting relevance and importance criteria for unstable fragile sensitive soils, unique ecological features, watershed and cultural values, and sensitive species of regional, national, and international importance. The values for the existing Red Creek ACEC remain the same as identified when Red Creek was originally designated an ACEC and was retained in the Green River RMP. It was also expanded to include the Currant Creek and Sage Creek portions at that time.

(See Chapter 2 Management Action 7434)

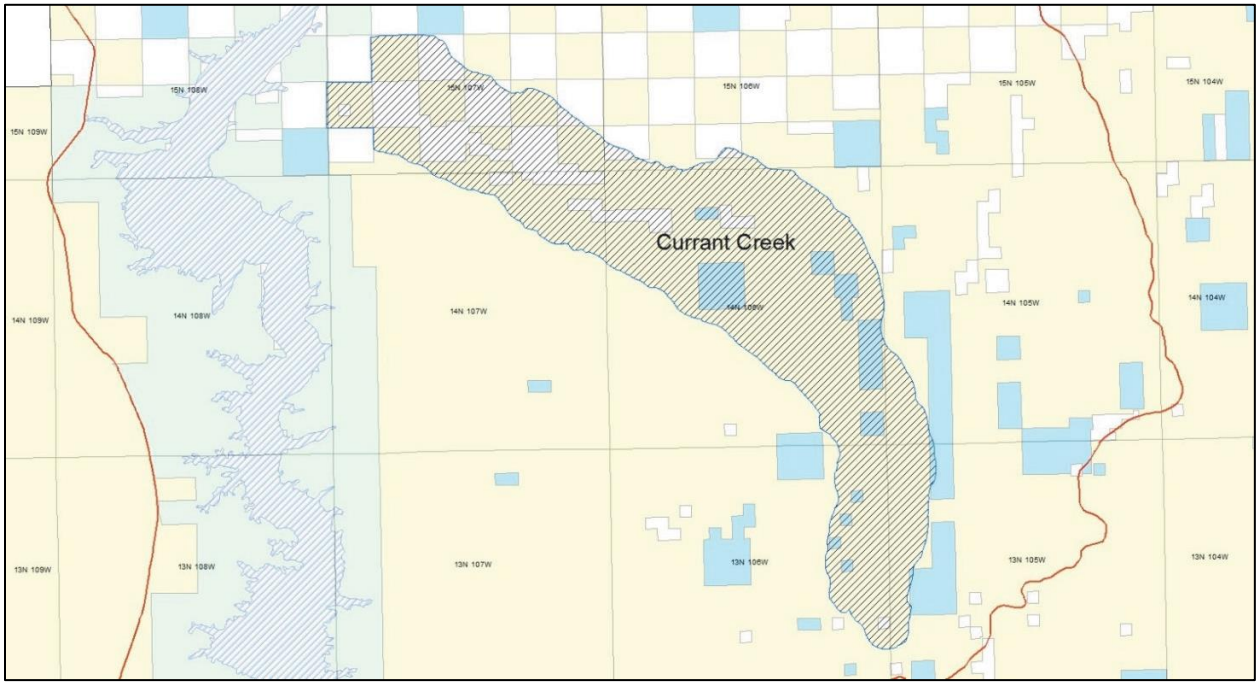
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Cherokee Trail | Yes | This area contains intact contributing sections of the Cherokee Trail. It also includes sweeping vistas of the adjacent Flaming Gorge National Recreation Area. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Colorado River cutthroat trout Elk and deer crucial habitat<br>Sage-grouse PHMA | Yes | The area contains significant habitat for BLM sensitive species including sage-grouse PHMA and the Colorado River cutthroat trout. It also contains significant big game crucial winter range and parturition habitat. |
| **A natural process or system:**<br>Special Status plant species<br>Paleontology resources | Yes | This area contains relic plant communities, old growth juniper, and habitat for the Ownbey's thistle, a BLM sensitive species. It also has surface expressions of formations known to yield important reptile and avian fossil specimens in addition to more common fossil resources. |
| **Natural hazards:**<br>Pine bark beetle kill | Yes | Natural hazards include large zones of standing dead timber, which significantly increases the potential for wildfire. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area contains Jayne's Meadow, an important area for sensitive species protection. The area has significant habitat for the Colorado River cutthroat trout, a BLM sensitive species.<br>The area also contains the Cherokee Trail which is a candidate to become a designated National Historic Trail. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area contains sage-grouse PHMA, big game crucial winter range and parturition habitat, and contains in-stream structures designed to protect Colorado River cutthroat trout. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The protection of a pure strain of Colorado River cutthroat trout is a national priority in order to sustain the species. The area has sage-grouse PHMA, and intact sections of the Cherokee Trail. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, paleontological, scenic and wildlife values, and is evaluated for future management actions in the final EIS.

**Figure C-4. Map of Currant Creek Portion of the Greater Red Creek ACEC**



## C.2.3 Sage Creek Portion of the Greater Red Creek ACEC Evaluation

| **Area Considered** | **Sage Creek** |
|---|---|
| **General Location** | The Sage Creek drainage is located 20 miles south of the City of Rock Springs, seven miles north of the Utah/Wyoming border, east of Big Ridge, and 18 miles west of U.S. Highway 430. |
| **General Description** | This area contains varying habitat types, including sagebrush, juniper, and riparian, and also includes important habitat for a variety of wildlife species. In addition, the area contains scientifically significant fossil resources. |
| **Public Land Acres** | 52,199 |
| **Values Considered** | Cultural resources: Cherokee Trail, historic graves, Logan School House, and numerous prehistoric sites. Wildlife: big game crucial winter range and parturition habitat. Special Status Species: Colorado River cutthroat trout, sage-grouse PHMA. Paleontological resources: important reptile and avian fossil specimens. |

**History**: The Greater Red Creek ACEC was identified in the Green River RMP as meeting relevance and importance criteria for unstable fragile sensitive soils, unique ecological features, watershed and cultural values and sensitive species of regional, national, and international importance. The values for the existing Red Creek ACEC remain the same as identified when Red Creek was originally designated an ACEC and was retained in the Green River RMP. It was also expanded to include the Current Creek and Sage Creek portions at that time.

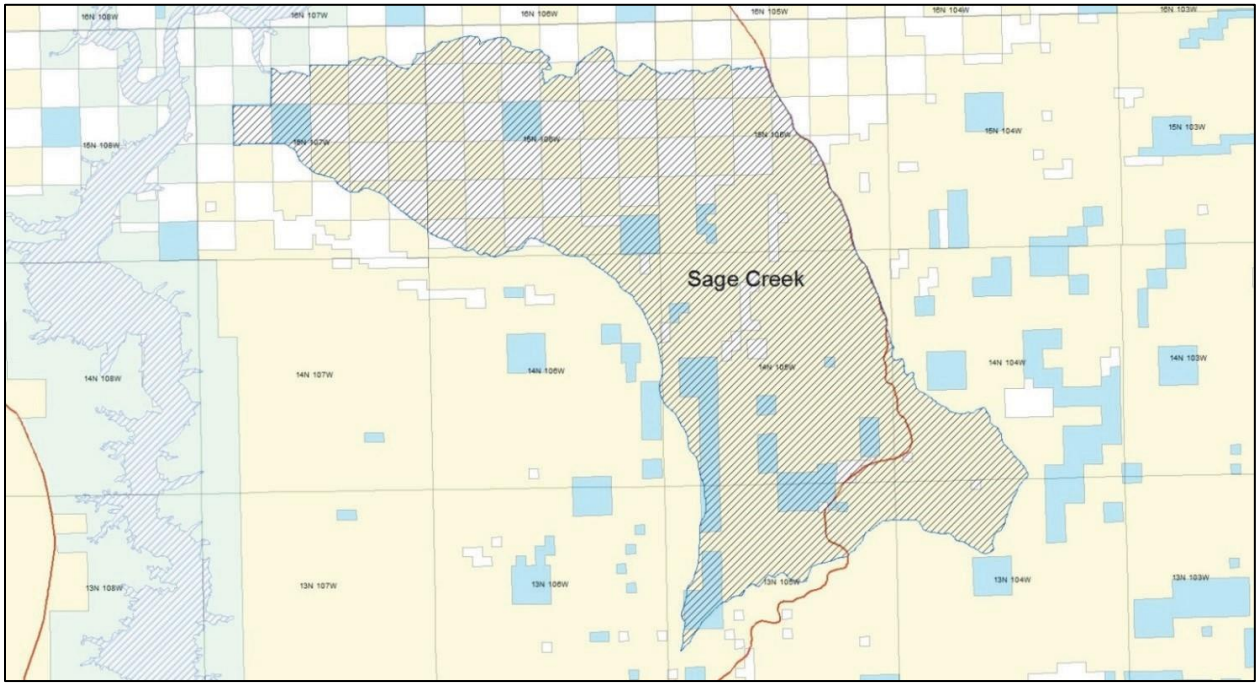
(See Chapter 2 Management Action 7431)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Melinda Armstrong's Grave<br>Surveyor Grave (Mike Gibbons)<br>Cherokee Trail<br>Logan School House | Yes | This area contains two identified human graves, one belonging to pioneer woman Melinda Armstrong who is buried beside the Cherokee Trail. The trail through this area contains some of the best expressions of intact setting along the Cherokee Trail found in the planning area. The other grave is Mike Gibbons, a surveyor who died on the job and was buried here. In addition, the historic Logan School House still stands where it was built to educate children from the surrounding ranches. |
| **A fish and wildlife resource:**<br>Colorado River cutthroat trout<br>Sage-grouse PHMA<br>Big game crucial winter range<br>Big game parturition | Yes | The area contains big game crucial winter range and parturition habitat. It is also contains sage-grouse PHMA and habitat for the Colorado River cutthroat trout. |
| **A natural process or system:**<br>Relic plant communities<br>Fossil assemblages | Yes | The area contains some of the oldest old-growth juniper in the planning area. It also contains habitat for the Ownbey's thistle, a BLM sensitive species. It has surface expressions of formations known to yield important reptile and avian fossil specimens in addition to more common fossil resources. |
| **Natural hazards:**<br>Greater than 25% slopes<br>Numerous springs<br>Occurrence of natural cause wildfire | Yes | The area is composed of many slopes that are greater than 25%. When combined with unstable fragile soils and a high occurrence of natural springs, there may be a high probability of landslides. In addition, the area has some of the highest probability for naturally ignited wildfires in the planning area. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area contains known human burials, the nationally significant Historic Cherokee Trail, which is a candidate to be designated as a National Historic Trail (NHT), as well as historic structures including the Logan School House. It also contains habitat for Ownbey's thistle and Colorado River cutthroat trout. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | This area contains fragile soils, sage-grouse PHMA, Colorado River cutthroat trout, and Ownbey's thistle habitat. It also has historic structures and other cultural/historical sites. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The Sage Creek drainage is part of the Colorado River Basin Salinity Control Act of 1974 area. The inventory unit also contains sage-grouse PHMA, Colorado River cutthroat trout, and Ownbey's thistle habitat. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | Yes | This area has a higher occurrence for wildfire, which poses a threat to life and property. |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, paleontological, soils and wildlife values, and is evaluated for future management actions in the final EIS.

**Figure C-5. Map of Sage Creek Portion of the Greater Red Creek ACEC**



# C.3 SALT WELLS ACEC EVALUATION

| **Area Considered** | **Salt Wells** |
|---|---|
| **General Location** | The area is 25 miles south of Interstate 80 and bounded by the checkerboard lands. It is west of Adobe Town Rim, east of and directly adjacent to the existing Red Creek ACEC, and north of the Colorado/Wyoming border. |
| **General Description** | Salt Wells includes important bird areas along with other important wildlife habitats. It also includes several historic trails. |
| **Public Land Acres** | 249,326 |
| **Values Considered** | Cultural: Cherokee and Overland Trails. Paleontological resources: scientifically important paleo-botany fossil assemblages. Wildlife: sage-grouse PHMA, raptor nesting, and big game crucial winter range. |

**History**: The Greater Red Creek ACEC was identified in the Green River RMP as meeting relevance and importance criteria for unstable fragile sensitive soils, unique ecological features, watershed and cultural values, and sensitive species of regional, national, and international importance. The values for the existing Red Creek ACEC remain the same as identified when Red Creek was originally designated an ACEC and was retained in the Green River RMP. It was also expanded to include the Current Creek and Sage Creek portions at that time. The Salt Wells and Sugarloaf Basin portions are proposed to be added with this effort.

(See Chapter 2 Management Action 7312)

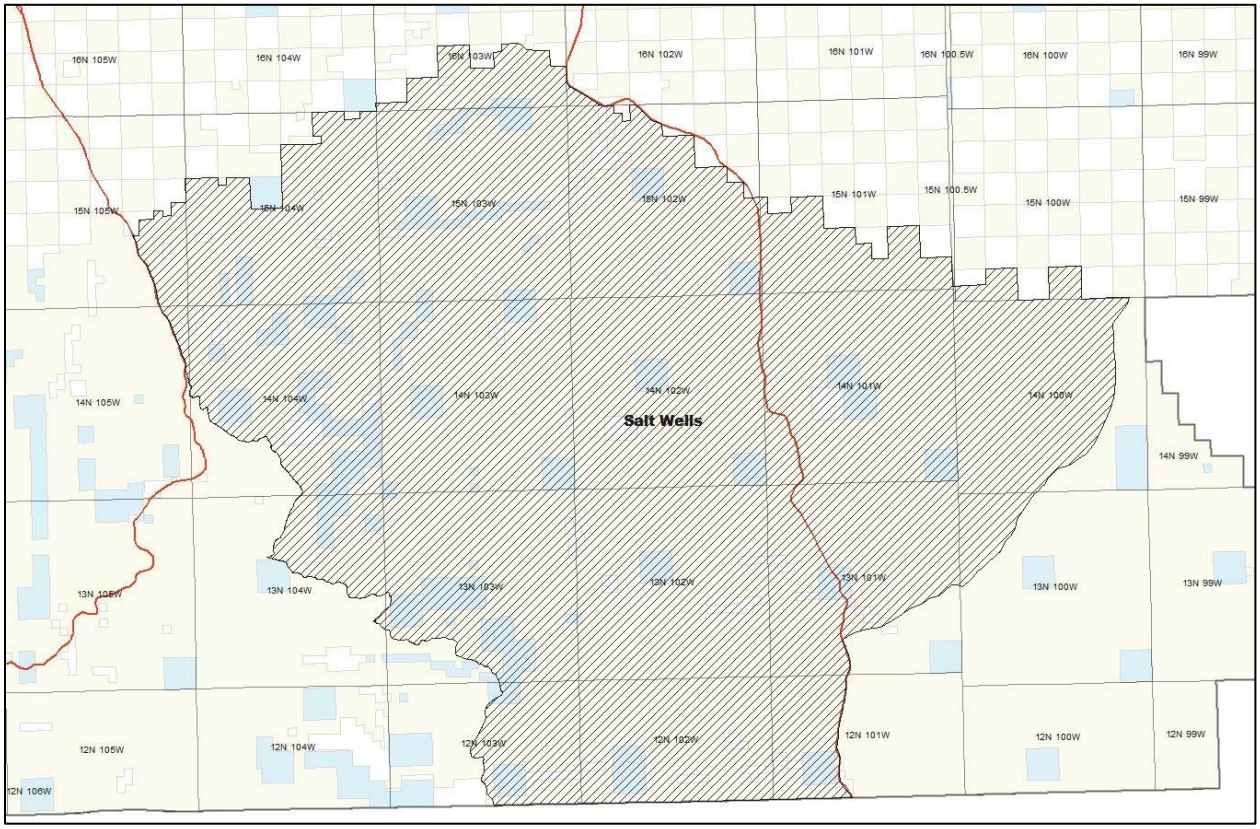
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:** Cherokee and Overland Trail Brown's Park Wagon Road | Yes | The area contains intact contributing sections of the Cherokee Trail and the Pine Butte Variant of the Overland Trail, which are both candidates to be designated as NHTs. Also, the Brown's Park Wagon Road crosses north-south through the area. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Raptor nesting area<br>Sage-grouse core<br>Big game crucial habitat | Yes | Pine Mountain and Four J Rim are significant raptor nesting areas. It also contains sage-grouse PHMA and big game crucial winter habitat. |
| **A natural process or system:**<br>Old growth juniper | Yes | Portions of the Salt Wells area contain some of the oldest juniper communities in the planning area. |
| **Natural hazards:**<br>Steep cliffs<br>Fragile soils<br>Pine bark beetle killed trees | Yes | The steep cliffs and fragile, highly erodible soil indicate a high landslide potential. In addition, large areas of pine bark beetle infested trees pose a threat from wildfire. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | Intact sections of the Cherokee Trail and Browns Park Wagon Road cross the area. In addition, the area contains big game crucial winter range, sage-grouse PHMA, and significant raptor nesting habitat. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | This area is a type location for scientifically important paleo- botany fossil assemblages. It contains sage-grouse PHMA and highly erosive sensitive soils. The area contains intact sections of the Cherokee Trail, Overland Trail and Browns Park Wagon Road. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area contains sage-grouse PHMA and highly erosive sensitive soils. Intact sections of the Cherokee Trail, Overland Trail and Browns Park Wagon Road cross the area. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, paleontological, and important wildlife values, and is evaluated for future management actions in the final EIS.

**Figure C-6. Map of Salt Wells Area**



# C.4 SUGARLOAF BASIN ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **Sugarloaf Basin** |
| **General Location** | The area is located 30 miles south and west of the City of Rock Springs. It is between the existing Red Creek ACEC and the Flaming Gorge National Recreation Area and north of the Utah/Wyoming border. |
| **General Description** | This area contains the Sugarloaf Basin Petroglyphs, as well as habitat for Special Status Species. |
| **Public Land Acres** | 87,243 |
| **Values Considered** | Cultural: Sugarloaf Basin rock art site, scenic – Flaming Gorge vistas. Wildlife: big game crucial winter range and parturition habitat. Special Status Species: sage- grouse PHMA, Ownbey's thistle. Paleontology: Middle-Eocene fossil assemblages. |

**History:** This is a new ACEC proposal.

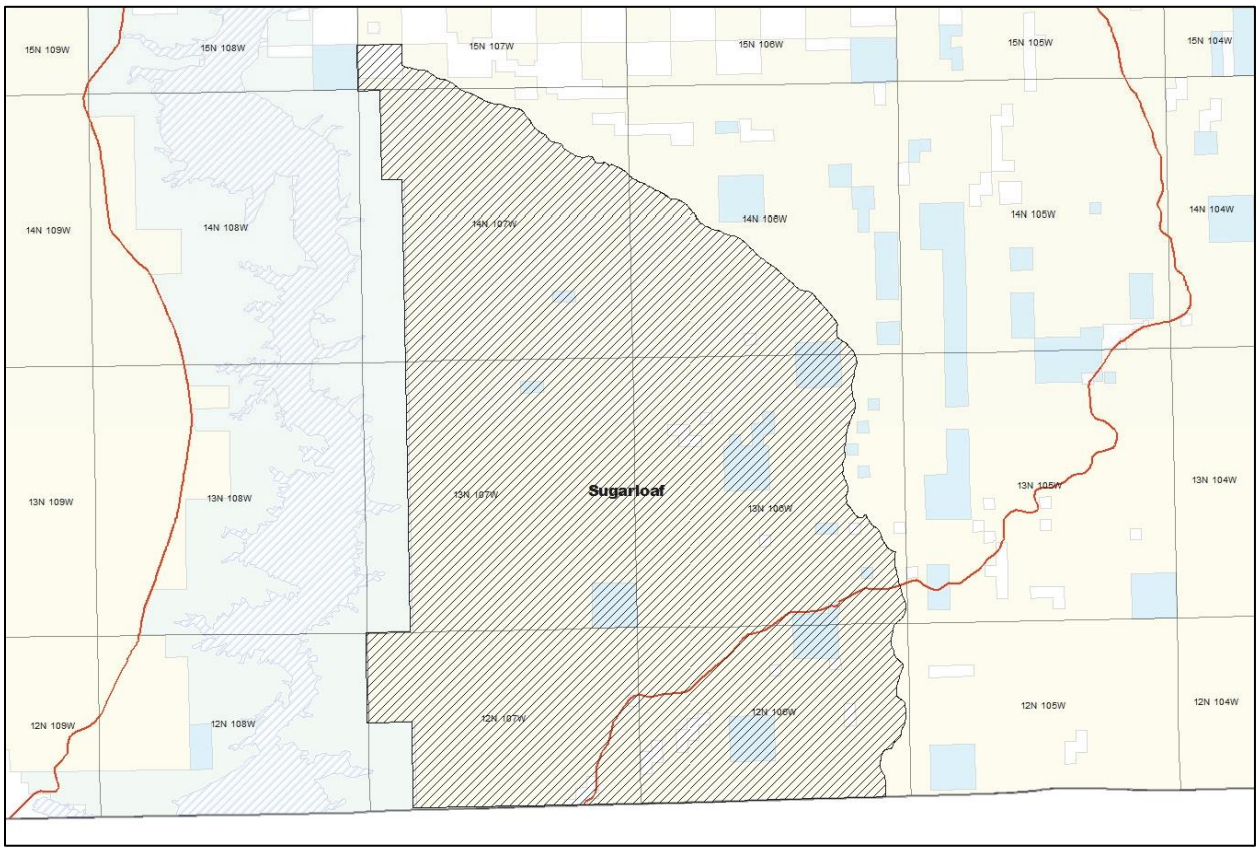
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Sugarloaf Petroglyphs<br>Native American religious concerns<br>High scenic values | Yes | This area contains the Sugarloaf Basin Petroglyphs site, which is highly significant to the Tribes. It also contains sweeping vistas of adjacent Flaming Gorge National Recreation Area and includes surface expressions of the Glenwood formation and other high scenic value areas. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Midget faded rattlesnake habitat<br>Pygmy rabbit habitat<br>Sage-grouse PHMA<br>Big game crucial winter range<br>Big game parturition | Yes | This area contains habitat for BLM sensitive species, including known populations of midget faded rattlesnakes, pygmy rabbits, and is sage grouse PHMA (see BLM GSG Plans). In addition, it contains big game crucial winter range and parturition habitat. |
| **A natural process or system:**<br>Little Mountain<br>Relic pinion-juniper plant communities<br>Type location for Middle-Eocene fossil assemblages | Yes | The area includes the western portion of Little Mountain which has local cultural significance. The area contains relic pinion- juniper plant communities and is also a type-location for Middle- Eocene fossil assemblages. |
| **Natural hazards:**<br>Unstable soil Fire | Yes | The area contains highly erosive unstable soils making it more susceptible to landslide. The area also has one of the highest occurrences of naturally caused wildfire in the planning area. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area has high significance to Native American Tribes and local culture. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | This area contains known locations of BLM sensitive species, including midget faded rattlesnake, pygmy rabbits, and contains sage-grouse PHMA. It also contains a relic pinion-juniper plant community and known locations of Ownbey's thistle. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area is a sage-grouse PHMA area and contains known locations of Ownbey's thistle, a BLM sensitive plant species. Drainages that feed into Flaming Gorge reservoir are part of the Colorado River Basin Salinity Control Act of 1974. It also contains a portion of the West-Wide Energy Corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | Yes | Higher wildfire occurrence poses a threat to human life and property. |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, paleontological, wildlife and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-7. Map of Sugarloaf Basin Area**



# C.5 GREATER SAND DUNES ACEC EVALUATION

## C.5.1 East Portion of the Greater Sand Dunes ACEC Evaluation

| Area Considered | Greater Sand Dunes |
|---|---|
| **General Location** | The east portion of the Greater Sand Dunes is located 23 miles north and east of the City of Rock Springs, east of the Sand Dunes WSA and west of the Steamboat ACEC. |
| **General Description** | This area contains the Killpecker Sand Dunes Open Play Area and the Crookston Homestead cultural site. |
| **Public Land Acres** | 12,927 |
| **Values Considered** | Cultural resources: Crookston historic homestead. Recreation resources: Killpecker Sand Dunes Open Play Area. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA. Plant communities: basin big sagebrush/lemon scurfpea. |

**History**: This area was reviewed in the Green River RMP and the Jack Morrow Hills Coordinated Activity Plan (CAP) and found to meet the relevance and importance criteria for outstanding geological features, prehistoric and historic values of national significance, and recreation values of regional and national importance as identified when originally designated an ACEC. The ACEC designation was retained.

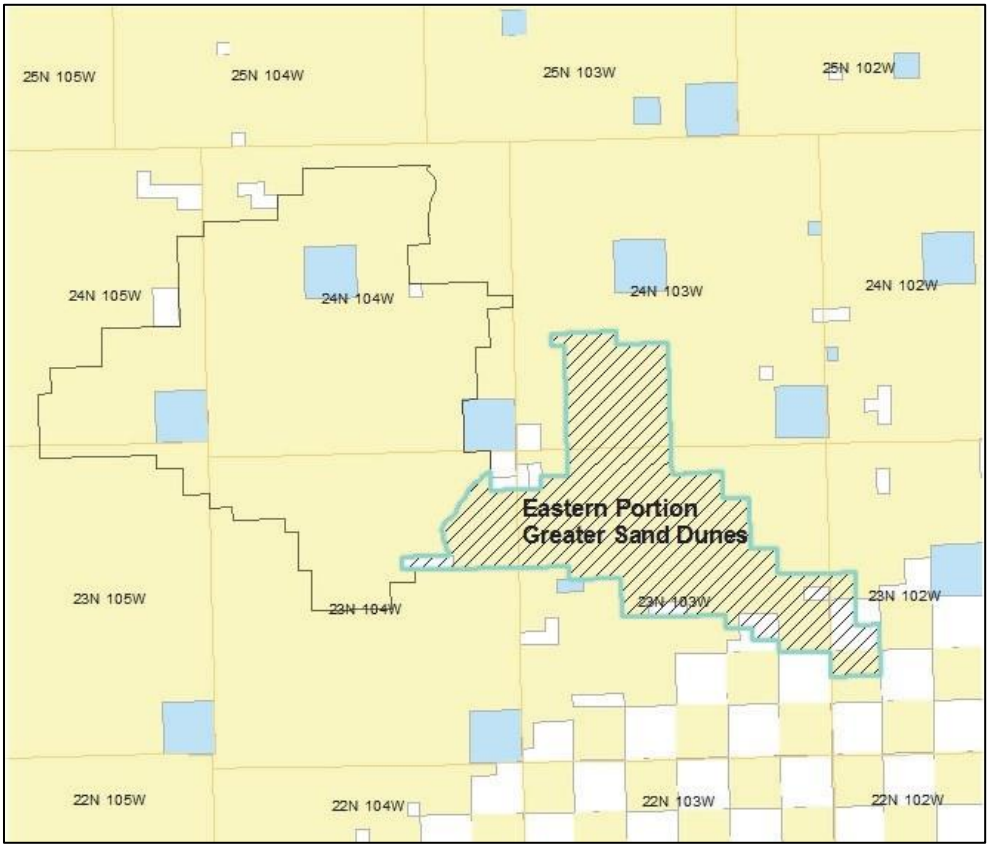
(See Chapter 2 Management Action 7446)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Stabilized sand dunes (cultural sites)<br>Crookston Homestead | Yes | The area has significant stabilized sand dunes which have in the past yielded intact historic and prehistoric information in intact provenience. The historic Crookston Ranch Homestead is also located within the area. |
| **A fish and wildlife resource:**<br>Sage-grouse PHMA<br>Big game crucial winter range<br>Big game parturition<br>Flockets | Yes | This area contains a small portion of sage-grouse PHMA. It also includes big game crucial winter range and parturition habitat. These animals use the dunal ponds called "flockets" in the sand dunes as watering locations when water becomes scarce elsewhere. |
| **A natural process or system:**<br>Flockets<br>Basin big sage/lemon scurf pea plant community<br>Old growth sage<br>Rare geologic features | Yes | The area includes basin big sagebrush/scurfpea plant communities identified as needing protection. In addition, the area includes known rare geologic features that are unique and fragile, including the sand dunes and flockets. |
| **Natural hazards:**<br>Active sand dunes | Yes | The entire area is part of the nationally and internationally significant Greater Sand Dunes dune system. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area includes the historic Crookston Ranch Homestead which is part of the Greater Sand Dunes dune system. Portions of the designated Sublette mule deer migration corridor cross through this area. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The flockets (interdunal pond areas) and basin big sagebrush/lemon scurfpea communities are both rare, fragile, and irreplaceable. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The historic Crookston Ranch Homestead is eligible for listing on the National Register of Historic Places (NRHP). The Sand Dunes Open Play Area is a nationally known dune riding location due to its remoteness and relatively pristine character. It is a Special Recreation Management Area (SRMA). It also contains a small portion of sage-grouse PHMA, and basin big sagebrush/lemon scurfpea plant communities.<br>Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | Yes | The stabilized sand dunes are co-located with a working natural gas field. These two uses, while not incompatible, are potentially hazardous to have co-located. |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, geological, and wildlife values, and is evaluated for future management actions in the final EIS.

**Figure C-8. Eastern Portion of the Greater Sand Dunes ACEC**



## C.5.2 Western Portion of the Greater Sand Dunes ACEC Evaluation

| **Area Considered** | **Western Greater Sand Dunes** |
|---|---|
| **General Location** | This area is located 23 miles north and east of the City of Rock Springs. It is east of the West Sand Dunes Archeological District and west of the Killpecker Sand Dunes Open Play Area. |
| **General Description** | The Indian Gap and associated Indian Gap Trail are located in this area, as well as important geologic features and known human burials. |
| **Public Land Acres** | 26,364 |
| **Values Considered** | Cultural: Boar's Tusk, Indian Gap. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA. Plant community: basin big sagebrush/lemon scurfpea. |

**History**: This area was reviewed in the Green River RMP and the Jack Morrow Hills CAP and found to meet the relevance and importance criteria for outstanding geological features, prehistoric and historic values of national significance, and recreation values of regional and national importance as identified when originally designated an ACEC. The ACEC designation was retained.

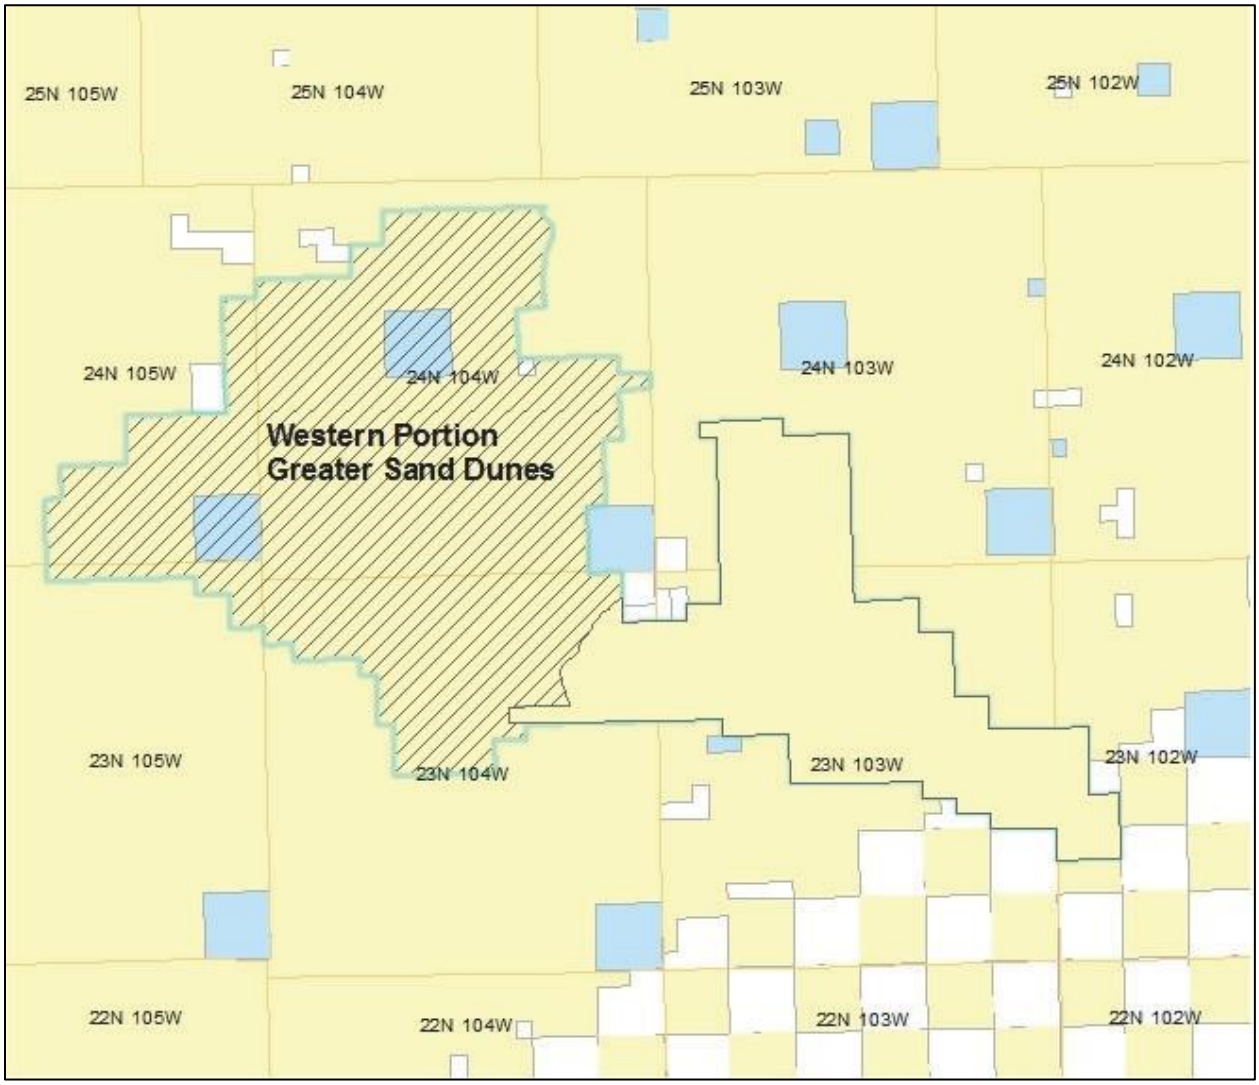
(See Chapter 2 Management Action 7446)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Know human burials<br>Boar's Tusk geologic feature<br>Indian Gap Trail | Yes | This area includes the prehistoric Indian Gap Trail and also has locations of known human burials. The Boar's Tusk geologic feature is significant to the Native American Tribes. |
| **A fish and wildlife resource:**<br>Sage-grouse PHMA<br>Big game crucial winter range<br>Big game parturition<br>Flockets | Yes | This inventory unit contains portions of sage-grouse PHMA. It also contains big game crucial winter range and parturition habitat. These animals use the dunal ponds called "flockets" in the sand dunes as watering locations when water becomes scarce elsewhere. |
| **A natural process or system:**<br>Sand Dunes and Buffalo Hump WSAs<br>Boar's Tusk geologic feature<br>Basin big sagebrush/lemon scurfpea plant community<br>Flockets | Yes | The area contains the Boar's Tusk geologic feature, which meets relevance and importance on its own merits. It also includes portions of the Sand Dunes and Buffalo Hump WSAs. In addition, the area includes the basin big sagebrush/lemon scurfpea plant communities, a rare community identified as needing protection. |
| **Natural hazards:**<br>Stabilized sand dunes. | Yes | The vegetated upper layer of these dunes is extremely fragile and once disturbed, the dune becomes an active sand dune and is susceptible to erosion. An active sand dune is extremely difficult to stabilize again. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The inventory unit contains portions of sage-grouse PHMA. The area also contains significant big game crucial winter range and parturition habitat. In addition, the flockets are individual ecosystems which have not been adequately studied. It also contains basin big sagebrush/lemon scurfpea plant communities. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The inventory unit contains portions of sage-grouse PHMA. The area also contains significant big game crucial winter range and parturition habitat. In addition, the flockets are individual ecosystems which have not been adequately studied. It also contains basin big sagebrush/lemon scurfpea plant communities. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | Known human burials exist in several locations in the area. Boar's Tusk geologic feature is fragile and irreplaceable. In addition, the area includes portions of the Sand Dunes and Buffalo Hump WSAs which require protections under FLPMA. The area also includes basin big sagebrush/lemon scurfpea plant communities.<br>Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | Yes | The Boar's Tusk geologic feature is listed as a desirable climbing location in numerous publications despite it being closed to activities that would damage the feature, such as climbing. The base material is delicate and friable. |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, geological, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-9. Western Portion of the Greater Sand Dunes ACEC**



## C.5.3 Boar's Tusk Portion of the Greater Sand Dunes ACEC Evaluation

| **Area Considered** | **Boar's Tusk** |
|---|---|
| **General Location** | T 23 N R 104 W sec 16. |
| **General Description** | The Boar's Tusk is a unique geological feature. It is a volcanic neck composed of volcanic material intermixed with broken bits of wall-rock. It is similar in age to Devil's Tower and is a known raptor area with existing nests along the various cracks in the surface. |
| **Public Land Acres** | 500 |
| **Values Considered** | Cultural: Tribal significance of Boar's Tusk Geologic Feature. Scenic: high visual qualities. Wildlife: raptor nesting habitat. |

**History**: Boars Tusk is located within the Greater Sand Dunes ACEC but meets relevance and importance criteria on its own merits. It can be designated as part of the Greater Sand Dunes ACEC or as part of the Boar's Tusk ACEC.

(See Chapter 2 Management Action 7455)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Boar's Tusk burial<br>Culturally significant landmark | Yes | The area surrounding Boar's Tusk contains known Native American burial site and has deep traditional and cultural affiliation with the Tribes. In addition, it is a unique feature and is highly significant for significant visual qualities and is a landmark of current cultural significance. |
| **A fish and wildlife resource:**<br>Raptor nesting | Yes | The area is a known raptor nesting location for eagles and other raptors. |
| **A natural process or system:**<br>Boar's Tusk geologic feature | Yes | Boar's Tusk is a unique geologic feature similar in age and significance to Devil's Tower. The feature is referred to as a volcanic core, composed of material that remained in the vent of the volcano as it became dormant. The visible remnants remained after the softer layers around it eroded away. |
| **Natural hazards:** | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | This area is significant to Native American tribes and is a unique geologic feature. It also has local cultural significance. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The Boar's Tusk feature is composed of friable material and is considered unique. It is also a known navigational landmark. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area has local and Tribal significance, and is a unique geologic feature. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | Yes | Activities such as climbing would damage the feature. The friable nature of the rock makes it a public safety issue. |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, scenic, wildlife, and natural values, and is evaluated for future management actions in the final EIS.

**Figure C-10. Boar's Tusk Geologic Feature**

## C.5.4 Crookston Homestead Portion of the Greater Sand Dunes ACEC Evaluation

| Area Considered | Historic Crookston Homestead |
|---|---|
| General Location | T 23 N R 103 W sec 21, center N ½. |
| General Description | Historic homestead site, late 1800s stone construction, located next to Killpecker Sand Dunes. |
| Public Land Acres | 500 |
| Values Considered | Historic Crookston Ranch Homestead site |

**History**: The Crookston Ranch Homestead is part of the Greater Sand Dunes ACEC but meets relevance and importance criteria on its own merits. It could be included as part of the Greater Sand Dunes ACEC or be designated as part of the Greater Sand Dunes ACEC.

(See Chapter 2 Management Action 7471)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:** Crookston Homestead buildings | Yes | The historic Crookston Ranch Homestead is one of the few examples of late 1800s natural stone construction ranch buildings. It is eligible for the NRHP. |
| **A fish and wildlife resource:** None identified | No | -- |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A natural process or system:** Unknown water source for the spring | Yes | The spring runs year-long—even during the driest part of the season. The water source for this spring is unstudied but is most likely fed by the flockets in the sand dunes above it. |
| **Natural hazards:** Destabilized sand dunes | Yes | The shifting sand of the destabilized sand dunes is encroaching on the buildings and riparian area associated with the spring. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | This highly significant cultural site is one of the best examples of late 1800s stone construction architecture found in this area. The area is part of a nationally and internationally recognized dune system. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The buildings are sensitive to seismic activity, whether natural or human caused. Buildings are deteriorating and will require stabilization in the future to retain their characteristic values. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The site is eligible for the NRHP. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic and cultural values, and is evaluated for future management actions in the final EIS.

**Figure C-11. Crookston Homestead**

## C.6 MONUMENT VALLEY ACEC EVALUATION

| Area Considered | Monument Valley |
|---|---|
| General Location | The area is located 15 miles south of Interstate 80, mile marker 156, 12 miles north of the Colorado border, 28 miles east of U.S. Highway 430, and west of the Rock Springs Field Office boundary. |
| General Description | The area contains several outstanding geologic features including high cliffs and deep ravines with highly erodible clay soils. |
| Public Land Acres | 69,955 |
| Values Considered | Cultural: local and national significance. Scenic values: photographed geologic features, WSA. Wildlife: big game crucial winter range, raptor nesting.<br>Paleontology: fossils of scientific interest. |

**History**: This area was evaluated in the Green River RMP for potentially outstanding geologic features, prehistoric and historic clause of national significance and recreation values. Designation determinations were deferred at that time.

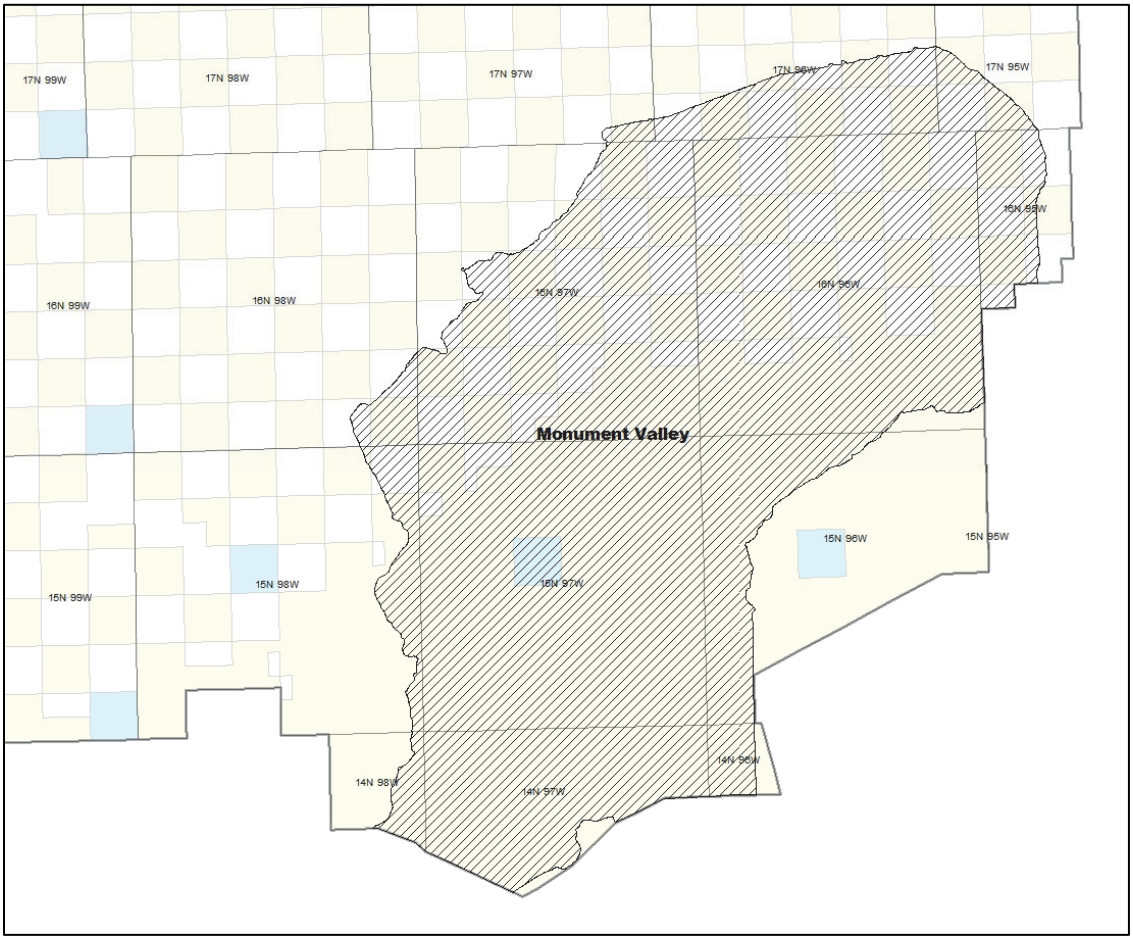
(See Chapter 2 Management Action 7340)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Adobe Town WSA<br>High scenic values | Yes | This includes the north section of the Adobe Town WSA. In addition, areas around the WSA have similar geologic features including high cliffs and deep ravines. The area also contains high scenic values and is a well-known location for photography. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Raptor nesting | Yes | High cliffs found in the area provide excellent raptor nesting habitat. In addition, the area contains larger expanses of crucial winter range habitat for big game species. |
| **A natural process or systems:**<br>Geologic features | Yes | The area has some of the most photographed geologic features in the field office, including steep, colorful cliffs and deep ravines. |
| **Natural hazards:**<br>The area is composed of highly erosive clay soils | Yes | The highly erodible clay soils are extremely unstable. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area includes portions of the nationally recognized Adobe Town WSA. The high relief, steep colorful cliffs, and deep ravines provide visual variety. Photographers come from all areas of the country to photograph the features. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | Fossils of scientific interest have been and continue to be studied in the areas inside and outside the WSA. These features are extremely susceptible to adverse change. In addition, the area includes big game crucial winter range habitat. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | This area contains portions of the Adobe Town WSA. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant cultural, paleontological, wildlife and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-12. Map of Monument Valley Area**



# C.7 NATURAL CORRALS ACEC EVALUATION

| Area Considered | Natural Corrals |
|---|---|
| General Location | T 21 N R 102 W sec 12 and 18. |
| General Description | The Natural Corrals is a geographic feature composed of a spring that has eroded a steep valley. The area also contains some unique volcanic features. This valley contains intact archaeological data and serves as a watering location for surrounding wildlife. |
| Public Land Acres | 631 |
| Values Considered | Cultural/Historic: NRHP listed site, Natural Corrals and the ice caves. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA. |

**History**: This area was evaluated in the Green River RMP. It was found to meet relevance and importance criteria for unique volcanic monoliths, prehistoric values of national significance, and outstanding recreation opportunities as identified when designated as an ACEC. The designation was retained.

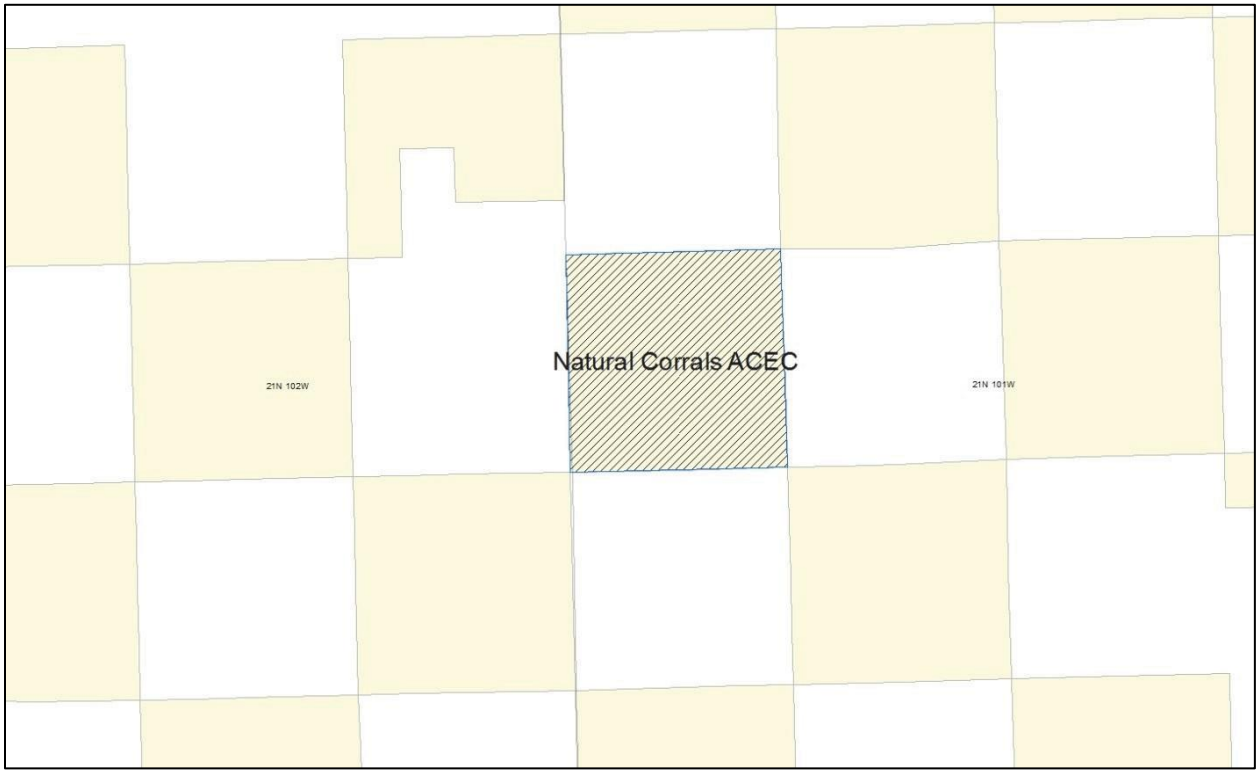
(See Chapter 2 Management Action 7477)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Intact cultural resources<br>Unique geologic features | Yes | The associated cultural site is listed with the NRHP and is a significant location with intact cultural resources. It is also nationally known for the geologic features which make up the 'ice caves'. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Big game parturition<br>Sage-grouse PHMA | Yes | The area contains big game crucial winter range and parturition habitat and is located within a portion of the designated Sublette mule deer migration corridor. It is also is within sage- grouse PHMA. |
| **A natural process or system:**<br>Ice caves | Yes | The area contains some features that are similar to caves, where water is stored in the form of ice through the winter. In the warmer months, the ice remains shaded by the surrounding rock and the ice stays frozen long into the warmer months. |
| **Natural hazards:** | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area is listed with the NRHP as having high cultural significance. In addition, the area includes several volcanic features that are study locations for local schools. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area contains big game crucial winter range and parturition habitat as well as sage-grouse PHMA. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The 'caves' are actually naturally occurring stacks of rocks which shade the interior and provide a cool location where stored ice remains frozen even through warmer summer months. The site also contains sage-grouse PHMA.<br>Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | Yes | The area is an aquifer recharge area for the water supply that serves the Town of Superior. |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, wildlife and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-13. Map of Natural Corrals ACEC**



# C.8 OREGON BUTTES ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **Oregon Buttes** |
| **General Location** | T 26 N R 101 W sections 2, 3, 10 and 11 and portions of sections 4, 9, 14 and 15. |
| **General Description** | The area is entirely within the Oregon Buttes and Whitehorse Creek WSAs but does not cover either of the WSAs in their entirety. |
| **Public Land Acres** | 3,440 |
| **Values Considered** | Cultural: historic navigation feature. Scenic values: Oregon Buttes feature and Continental Divide National Scenic Trail (CDNST). Geologic: unique feature with high cliffs. Wildlife: big game parturition, designated Sublette mule deer migration corridor, raptor nesting habitat. Special Status Species: sage-grouse PHMA |

**History**: This area was evaluated in the Green River RMP and found to meet relevance and importance criteria for historic values and Geologic Landmark of National Significance. The ACEC designation was retained.

(See Chapter 2 Management Action 7486)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Cultural and historic<br>Continental Divide National Scenic Trail | Yes | The Oregon Buttes served as an important landmark during the emigration period of U.S. history. In addition, the CDNST spur route connecting the CDNST to the county road is found in this area. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Big game parturition<br>Raptor nesting<br>Sage-grouse PHMA | Yes | The high cliffs of the Oregon Buttes provide nesting habitat for raptors. The area also contains big game parturition habitat and sage-grouse PHMA. |
| **A natural process or system:**<br>Unique geologic feature<br>Paleontology resources | Yes | The area contains the Oregon Buttes, a nationally significant landmark and a unique geologic feature. In addition, the area includes type locations for geological study. |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The geologic feature is a nationally recognized landmark. Pioneers emigrating to the west would look to that landmark to know when they had crossed the divide. In addition, the area is of high scenic value. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area is entirely within the Oregon Buttes and Whitehorse Creek WSAs. The area also contains fragile soils which increases the management difficulties at the site. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area is entirely within the Oregon Buttes and Whitehorse Creek WSAs. The area is a nationally recognized landmark used in the NHT. In addition, the area contains sage-grouse PHMA habitat. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, wildlife, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-14. Map of Oregon Buttes ACEC**

# C.9 PINE SPRING EXPANDED ACEC EVALUATION

| **Area Considered** | **Pine Springs and surrounding area** |
|---|---|
| **General Location** | The Pine Spring expanded ACEC portions of T 13 N R 109 W sec 5, 6, 7 and 8; T 13 N R 110 W sec 1 and 12; T 14 N R 109 W sec 29, 30, 31 and 32; T 14 N R 110 W sec 25 and 36. |
| **General Description** | Pine Spring is a Native American sacred landscape. It also includes portions of the Twin Buttes and Devils Playground WSAs and is an important study location for cultural and paleontology resources. Both WSA areas have outstanding scenic, recreation, archaeological, and paleontological values. The area is also representative of the sagebrush-steppe ecosystem in the Wyoming Basin Province ecoregion. |
| **Public Land Acres** | 6,480 |
| **Values Considered** | Cultural: - Pine Spring cultural site and significant tribal concerns. Paleontology: intact paleo-sequencing for the Eocene. Plant community: old growth juniper. |

**History**: The existing site was determined to meet relevance criteria 1 and importance criteria 1 and 2 as a Landmark of National Significance as identified when originally designated as an ACEC. The Green River RMP retained this designation and expanded it to 6,030 acres. Subsequent research revealed other culturally significant sites which warrant protection and the area is recommended for expansion in this effort.

(See Chapter 2 Management Action 7490)

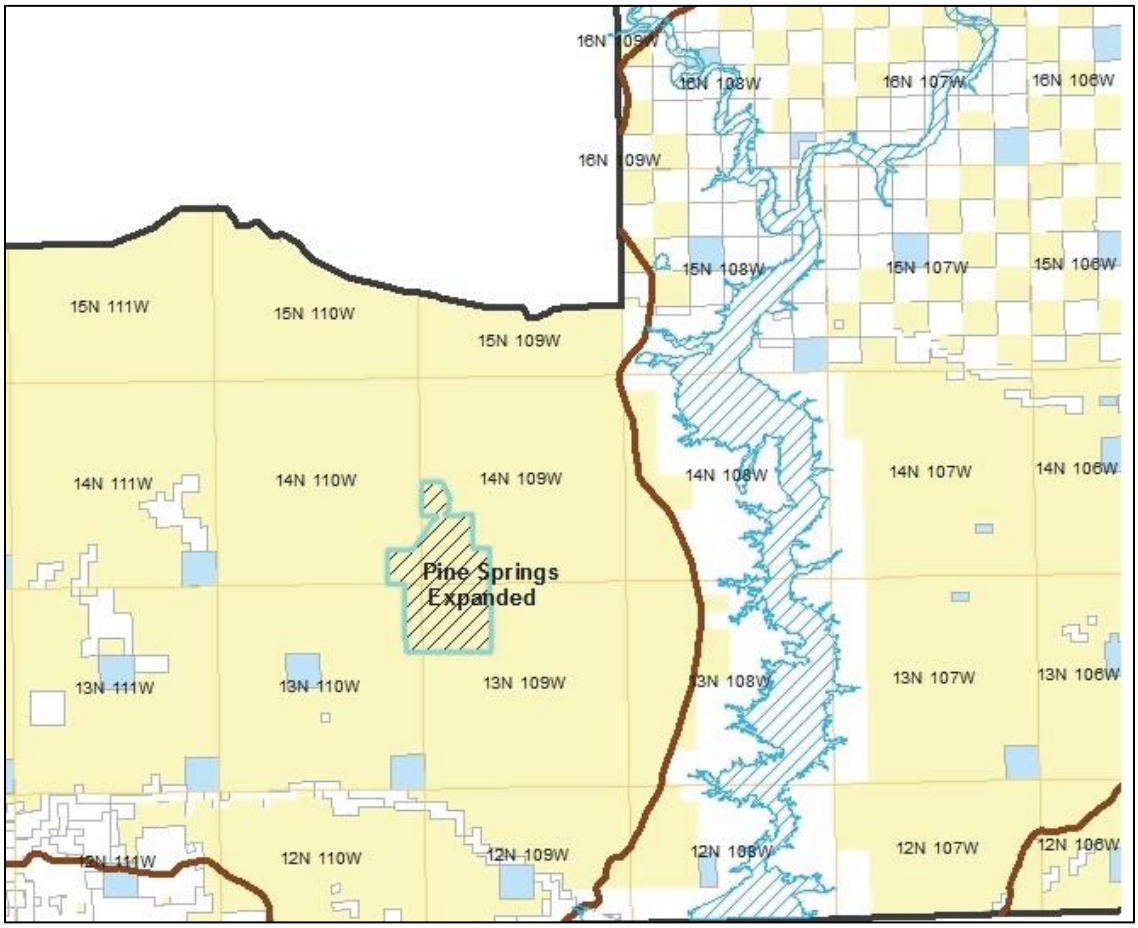
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Native American Sacred Landscape<br>WSAs | Yes | This inventory unit includes the Pine Spring Archaeological Site, and numerous other sites of cultural significance as well as a culturally important Native American landscape. In addition, the inventory unit is a known location for scientifically important fossil assemblages. The area contains portions of the Twin Buttes and Devils Playground WSAs. |
| **A fish and wildlife resource:**<br>None identified | No | -- |
| **A natural process or system:**<br>Paleontology study location<br>Geology interpretation<br>Old-growth juniper | Yes | The area contains significant paleontology resources and is used as a teaching area by several universities to study intact paleo-sequencing for the Eocene, specifically the Bridger series. There are also known concentrations of chromium diopside and Pyrope garnet found along drainages. This inventory unit includes a portion of the Devils Playground WSA, so called because of the unusual erosion features found in the northeast portion of the WSA. The area also includes a portion of the Twin Buttes WSA, an erosion feature so unique it is considered a landmark. In addition, the entire unit includes stands of old growth juniper, considered to be a unique plant community. |
| **Natural hazards:**<br>None identified | Yes | Due to the fragile nature of the unstable soils that make up the Devils Playground and Twin Buttes features, and the highly erodible nature and salt content of soils in the balance of the inventory unit, the area is prone to unstable soils. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | Intact provenience of 9,000 years of human habitation at the Pine Spring cultural site is of national scientific importance. The presence of numerous fossil localities in conjunction with paleontological data of similar strata in adjacent areas suggests that the inventory unit could contain intact faunal sequences of significant scientific interest. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area is recognized as a Traditional Cultural Property (TCP) and a Sacred Landscape. Numerous stone circle sites are present within the proposed area and these have been determined to be of cultural significance. The Twin Buttes and Devils Playground WSAs are of high scenic value, meet the wilderness characteristics required under FLPMA and are highly susceptible to adverse change. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | Several cultural sites located within the inventory unit are eligible for listing with the NRHP. The area contains portions of the Twin Buttes and Devils Playground WSAs. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, and paleontological values, and is evaluated for future management actions in the final EIS.

**Figure C-15. Map of Pine Springs Expanded Area**



# C.10 THE PINNACLES ACEC EVALUATION

| Area Considered | The Pinnacles Geographic Area |
|---|---|
| **General Location** | Portions of T 24 N R 100 W sec 1, 2, 3, 4, 9, 10, 11, 12, 13, 14, 15, 21, 22, 23, 24, 25, 26 and 27. |
| **General Description** | Areas of high desert sagebrush communities surrounding the Pinnacles Geologic Feature. |
| **Public Land Acres** | 1,969 |

| **Area Considered** | **The Pinnacles Geographic Area** |
|---|---|
| **Values Considered** | Scenic: Pinnacles Feature, focal landscape. Wildlife: big game crucial winter range, raptor nesting. Geology: unique fractured and friable rock feature. |

**History**: Evaluation of The Pinnacles was deferred in the Green River RMP due to location within the Jack Morrow Hills planning area. The Jack Morrow Hills CAP evaluation determined that The Pinnacles met relevance 1 and importance 1 and 2 as having significant scenic value and natural processes or systems, for more than locally significant qualities that make the area fragile, sensitive, rare and vulnerable to adverse change. The management area was further determined to be effectively manageable as part of the Red Desert Watershed Management Area. The added relevance criterion for wildlife elevates the significance of the area. This area is also part of the Red Desert and may be considered for management as part of the Red Desert ACEC or as an independent ACEC.

(See Chapter 2 Management Action 7336)

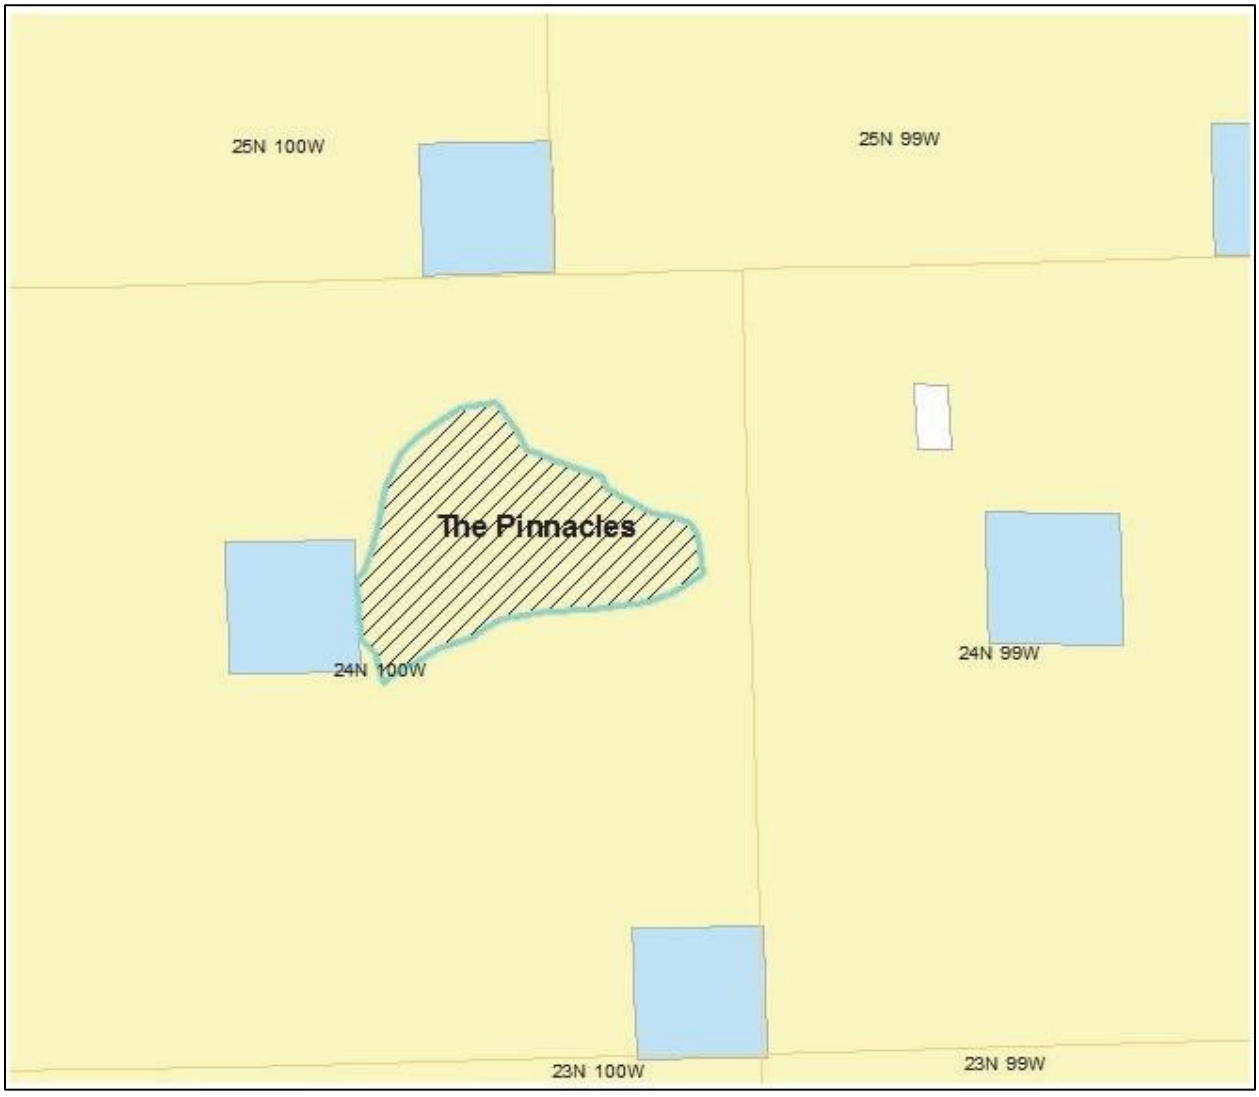
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Scenic | Yes | The area is a focal landscape, meaning the eye is automatically drawn to the feature and that feature presents a striking difference from the surrounding area providing a higher than normal degree of visual variety. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Raptor nesting | Yes | The area is identified as big game crucial winter range. The steep sides of The Pinnacles provide nesting habitat for raptors. |
| **A natural process or system:**<br>The geologic feature | Yes | The base rock which makes up the feature is fragile and friable. Such features are considered unique and irreplaceable. |
| **Natural hazards:**<br>None identified | No | -- |

| **Importance Value** | **Yes/No** | **Rationale for Determination** |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area is listed with the Visual Resource Inventory (VRI) Class II. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The Pinnacles feature is considered a unique resource, fragile, friable and not replaceable. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | No | -- |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant wildlife, geologic, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-16. Map of The Pinnacles Area**



# C.11 WESTERN PORTION OF THE RED DESERT WATERSHED ACEC EVALUATION

| Area Considered | West portion of the Red Desert |
|---|---|
| **General Location** | The west portion of the Red Desert is that area south of the north boundary of Honeycomb Buttes WSA, west of the Continental Divide, north of the checkerboard lands, and west of the Jack Morrow Hills planning area boundary. |

| **Area Considered** | **West portion of the Red Desert** |
|---|---|
| **General Description** | The area generally consists of high-desert sagebrush communities and includes The Pinnacles geologic feature and all of the Alkali Draw, South Pinnacles and Honeycomb Buttes and portions of the Oregon Buttes WSAs. |
| **Public Land Acres** | 162,983 |
| **Values Considered** | Scenic: VRI Class II, CDNST. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA, large-fruited bladderpod. Geology: Pinnacles feature, hydrologically closed basin. |

**History**: In the Green River RMP the entire Red Desert Watershed area met relevance criteria 1 and 3 but failed to meet importance criteria. It was deferred in the Green River RMP due to portions of the area being located within the Jack Morrow Hills planning area. The west portion of the Red Desert is the area inside the Jack Morrow Hills boundary. This area could be added to the Steamboat Management Area or could be managed as an independent ACEC. The eastern portion is outside the Jack Morrow Hills planning area and did not meet the relevance and importance criteria.

(See Chapter 2 Management Action 7446)

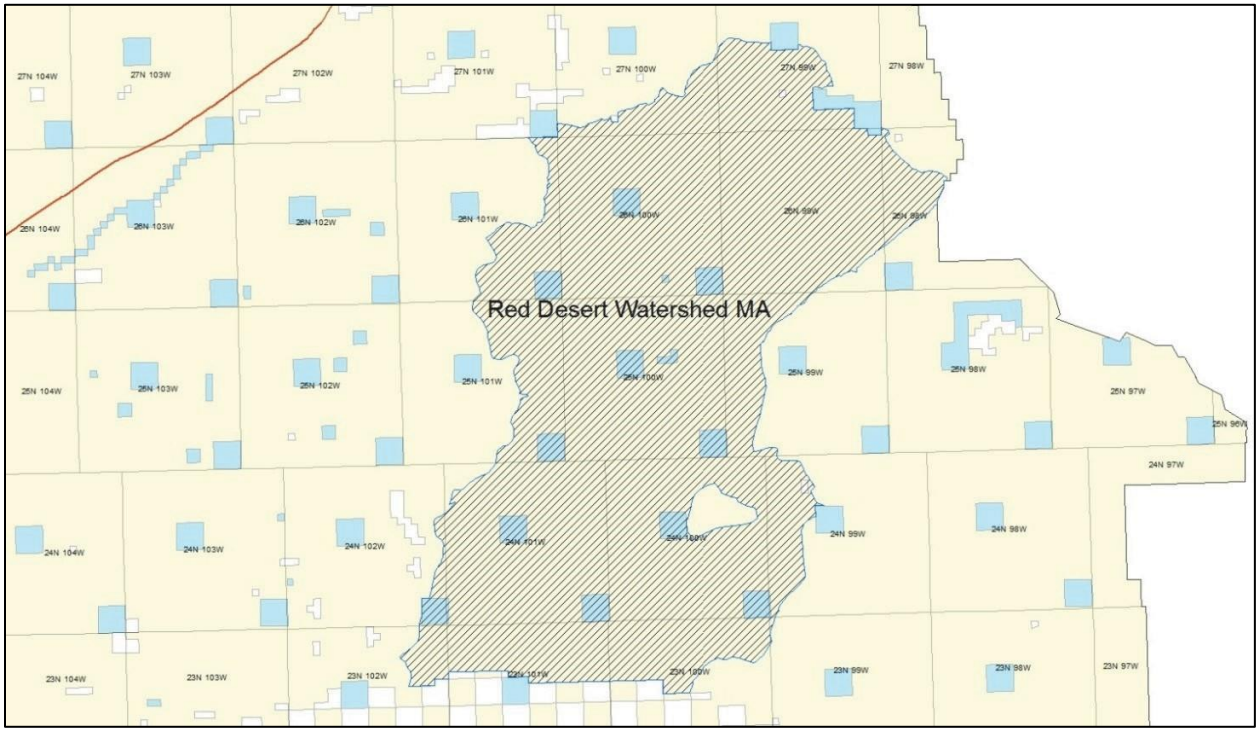
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Scenic values<br>Continental Divide National Scenic Trail | Yes | The entire area is inventoried as VRI Class II. Further the entire area is identified as a location where maintaining visual quality has high value. The area also contains part of the Continental Divide Connecting Side Trail portion of the CDNST. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Sage-grouse PHMA<br>Sublette mule deer migration corridor | Yes | The area contains big game crucial winter range and parturition habitat, as well as portions of the designated Sublette mule deer migration corridor. It contains a small portion of sage- grouse PHMA. |
| **A natural process or system:**<br>The Pinnacles Water recharge area<br>BLM sensitive plants | Yes | The area is important as a hydrologically closed basin along the Continental Divide, making it an aquifer recharge area. Further, the area contains habitat for the large-fruited bladderpod, a BLM sensitive species. In addition, the area contains The Pinnacles, a unique geologic feature. |
| **Natural hazards:**<br>None identified | No | -- |

| **Importance Value** | **Yes/No** | **Rationale for Determination** |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The northern boundary is the Connecting Side Trail to the CDNST giving it national significance. In addition, the area includes all of three WSAs and part of a fourth WSA. The area is also a hydrologically closed basin and contains the Pinnacles feature. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | This area includes the laterite layers of the badlands making up the south portion of the Oregon Buttes WSA. These easily erodible features are extremely fragile. The area includes the Pinnacles Geologic Feature, considered to be unique and distinctive, is also rare, fragile, and irreplaceable and would require additional protection measures. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area is a hydrologically closed basin. The area contains BLM sensitive plant species. The area contains portions of sage-grouse PHMA. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant wildlife, geology, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-17. Red Desert Watershed Area, Western Portion**



# C.12 WIND RIVER FRONT ACEC EVALUATION

## C.12.1 Wind River Front East Portion of the South Wind River ACEC Evaluation

| Area Considered | South Wind River |
|---|---|
| **General Location** | The area includes everything west of the Continental Divide Road, north of State Highway 28, and west of the Rock Springs Field Office boundary. |
| **General Description** | The area includes the west slopes of the Wind River Front. The Lander Cutoff of the Oregon Trail, the Sweetwater Wild and Scenic River (WSR), and the CDNST are all found in this area. |

| **Area Considered** | **South Wind River** |
|---|---|
| **Public Land Acres** | 86,937 |
| **Values Considered** | Historic: Lander cutoff of the Oregon Trail, prehistoric steatite quarry. Scenic: CDNST, WSR. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage- grouse PHMA, Fremont County rockcress, meadow pussytoes, limber pine. |

**History:** This is a new ACEC proposal.

(See Chapter 2 Management Action 7539)

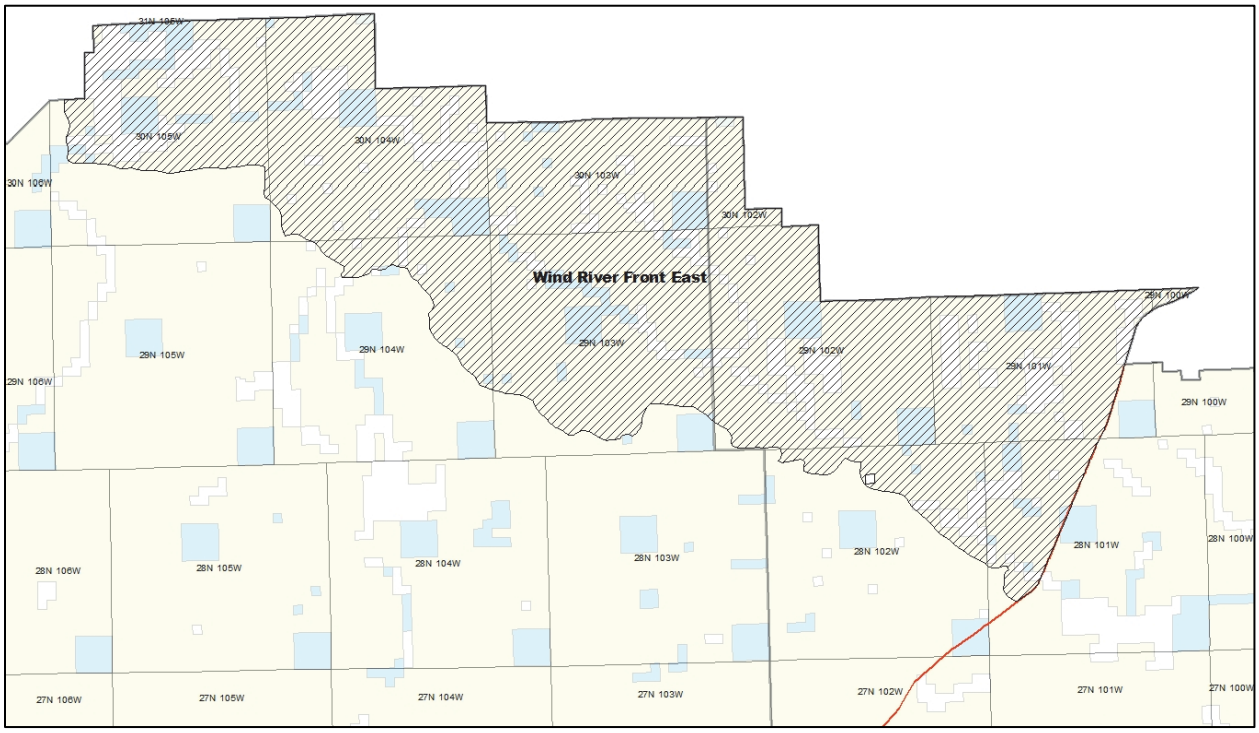
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Wind River Front SRMA<br>Lander Cutoff NHT<br>Continental Divide National Scenic Trail | Yes | The boundaries for this portion coincide with the Wind River Front East SRMA. The area includes portions of NHT, WSR and CDNST. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Big game parturition<br>Sublette mule deer migration corridor<br>Sage-grouse PHMA | Yes | This area contains large portions of big game crucial winter range and parturition habitat. The designated Sublette mule deer migration corridor also crosses the inventory unit. Most of the area contains sage-grouse PHMA. |
| **A natural process or system:**<br>Fremont county rockcress<br>Meadow pussytoes<br>Known regional aquifer recharge area | Yes | The slopes of the Wind River range provide important water recharge due to the location as the Continental Divide. In addition, there are known locations for BLM sensitive plant species, including Fremont county rockcress, meadow pussytoes and limber pine. |
| **Natural hazards:**<br>None identified | No | -- |

| **Importance Value** | **Yes/No** | **Rationale for Determination** |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area includes a prehistoric steatite quarry used by Native American Tribes. The area also contains high value scenic resources that are considered extremely important, including the CDNST. The area is also characterized by high recreation use. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The CDNST and NHT which cross this area are rare, and unique. The settings for these trails are extremely vulnerable to adverse change. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area contains NHT. The area contains BLM sensitive plant species. This area contains large portions of sage-grouse PHMA. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, wildlife, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-18. Map of the Wind River Front Area, East Portion**



## C.12.2 Wind River Front West Portion of the South Wind River ACEC Evaluation

| **Area Considered** | **Wind River Front West** |
|---|---|
| **General Location** | The area includes lands east of State Highway 191, north of the Township 27/28 line, and south and west of the Continental Divide Road and the northern boundary of the Rock Springs Field Office. |
| **General Description** | The area generally consists of high desert sagebrush plant communities and contains portions of the Big and Little Sandy River drainages. |
| **Public Land Acres** | 171,172 |
| **Values Considered** | Historic: Buckskin Crossing Cemetery. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA, bluehead sucker, flannelmouth sucker, round-tail chub, limber pine. |

**History:** This is a new ACEC proposal.

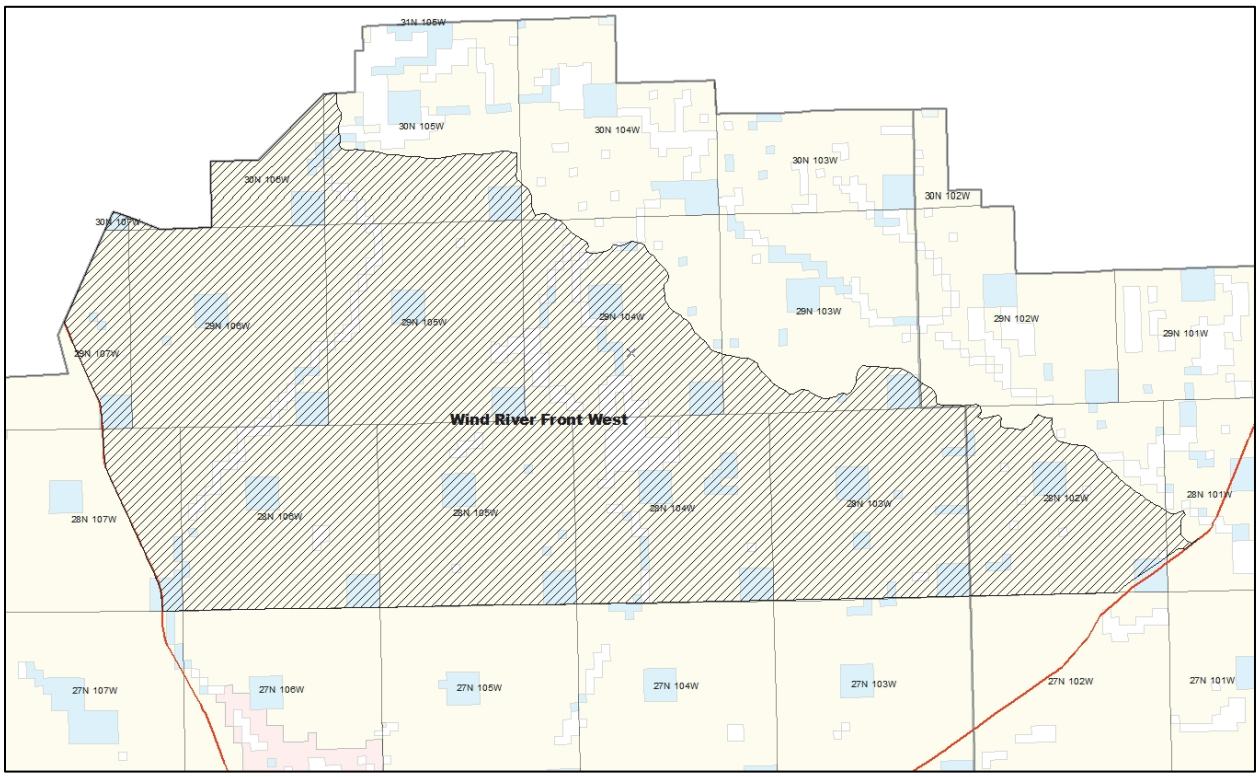
(See Chapter 2 Management Action 7538)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Recreation management (rivers)<br>Buckskin Crossing Cemetery | Yes | The area includes the Big Sandy River; a known fishing destination. In addition, there is a historic cemetery near where the Lander Cutoff crosses the Sandy River referred to as Buckskin Crossing Cemetery. |
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Big game parturition<br>Sage-grouse PHMA<br>Special Status fish species<br>Sublette mule deer migration corridor | Yes | The area contains large portions of big game crucial winter range and some big game parturition habitat. The unit also is entirely within sage-grouse PHMA, contains portions of the Big Sandy river, which has known populations of BLM sensitive fish species, including bluehead sucker, flannelmouth sucker, and round-tail chub. |
| **A natural process or system:**<br>None identified | No | -- |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The entire area is within sage-grouse PHMA and contains large portions of big game crucial winter range. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area contains habitat for multiple Special Status Species, including sage-grouse PHMA, bluehead sucker, flannelmouth sucker, and round-tail chub. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The entire area is within sage-grouse core PHMA. The area contains habitat for BLM sensitive fish species. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, wildlife, and recreation values, and is evaluated for future management actions in the final EIS.

**Figure C-19. Map of Wind River Front Area, West Portion**



# C.13 SANDY RIVERS PORTION OF THE SOUTH WIND RIVER ACEC EVALUATION

| **Area Considered** | **Sandy Rivers (South Wind River)** |
|---|---|
| **General Location** | This area includes lands east of U.S. Highway 191 near the town of Farson, WY, north of U.S. Highway 28, and south of the Township 27/28 line. |
| **General Description** | The area includes the longest intact sections of the Oregon, California, Pony Express, and Mormon Pioneer NHTs and several nationally significant associated sites, including The Parting of the Ways. The area is a known location for aquatic Special Status Species. |
| **Public Land Acres** | 117,184 |
| **Values Considered** | Cultural: NHT. Wildlife: big game crucial winter range, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA, bluehead sucker, flannelmouth sucker, and round-tail chub. Paleontological resources: middle Eocene fossil resources. Scenic: panoramic landscape. |

**History:** This is a new ACEC proposal.

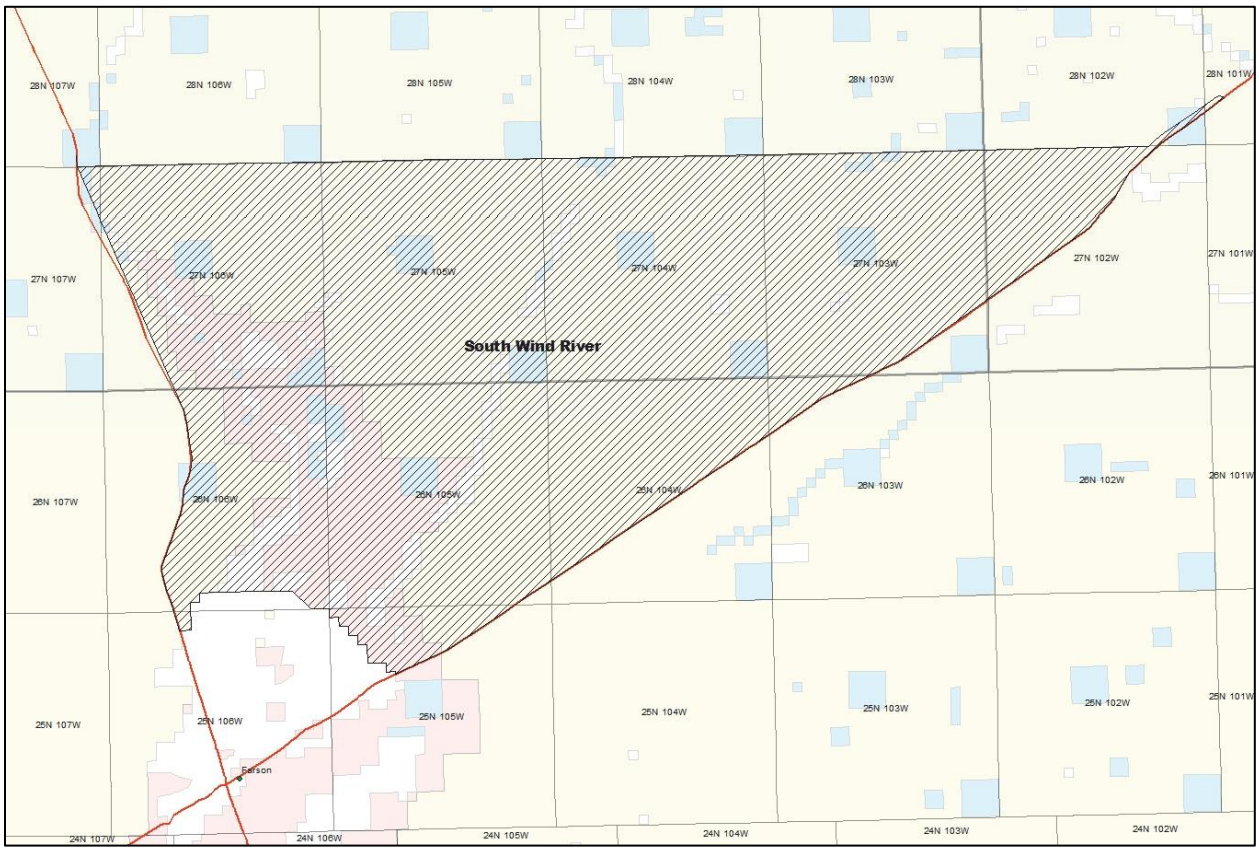
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>NHTs<br>Historic tourism recreation use | Yes | The most intact sections of the Oregon, California, Pony Express, and Mormon Pioneer trails cross through this area. The area also includes several nationally significant sites associated with the trails, including The Parting of the Ways. As a result, the area is extremely important for heritage tourism. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>BLM sensitive species Sage-grouse PHMA<br>Big game crucial winter range<br>Sublette mule deer migration corridor | Yes | The area contains several BLM sensitive species, including sage-grouse PHMA, bluehead sucker, flannelmouth sucker, and round-tail chub. The area is also big game crucial winter range habitat and is crossed by portions of the designated Sublette mule deer migration corridor. |
| **A natural process or system:**<br>Aquifer recharge area<br>Paleontology | Yes | This area is an important aquifer recharge area. In addition, surface geology includes the Laney member of the Green River formation, a study location for the middle Eocene fossil resources. |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | This area contains four NHTs and other sites including The Parting of the Ways. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area contains large expanses of undisturbed landscape. This situation is described in the BLM Visual Resource Management Manual as a panoramic landscape and is identified in the VRI as a location where maintaining visual quality has high value. The area is also crossed by the designated Sublette mule deer migration corridor. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area contains NHT, sage-grouse PHMA, and BLM sensitive fish species. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, wildlife, paleontological, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-20. Map of the Sandy Rivers Area**



# C.14 BIG SANDY OPENINGS ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **Big Sandy Openings** |
| **General Location** | T 30 N R 104 W sec 5, 6, 7 and 8. |
| **General Description** | The area is a section of the Big Sandy River as it crosses from the National Forest to BLM managed and includes half a mile on either side of the high-water mark. |
| **Public Land Acres** | 757 |
| **Values Considered** | Scenic: visual variety. Wildlife: big game crucial winter range, big game parturition. Special Status Species: sage-grouse PHMA. |

**History**: The area meets relevance and importance criteria and could be considered as an independent ACEC or be managed as part of the (proposed) South Wind River ACEC.

(See Chapter 2 Management Action 7563)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:** Scenic | Yes | The river and associated canyon are considered pristine; that is, the area appears unchanged by human interaction. The river and canyon system through this 1 ½ miles present a high degree of visual variety. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Big game crucial winter range<br>Big game parturition<br>Sublette mule deer migration corridor<br>Sage-grouse PHMA | Yes | The inventory unit includes big game crucial winter range and parturition habitat. It also contains a portion of the designated Sublette mule deer migration corridor. The unit also contains sage-grouse PHMA. |
| **A natural process or system:**<br>None identified | No | -- |
| **Natural hazards:**<br>Pine bark beetle | Yes | The area includes large areas of beetle-killed pine trees and as such is a significant hazard for fire. |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | No | -- |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | This is an undeveloped area where retaining the visual setting has a high value. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area includes sage-grouse PHMA habitat. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant wildlife and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-21. Map of the Big Sandy Openings Area**

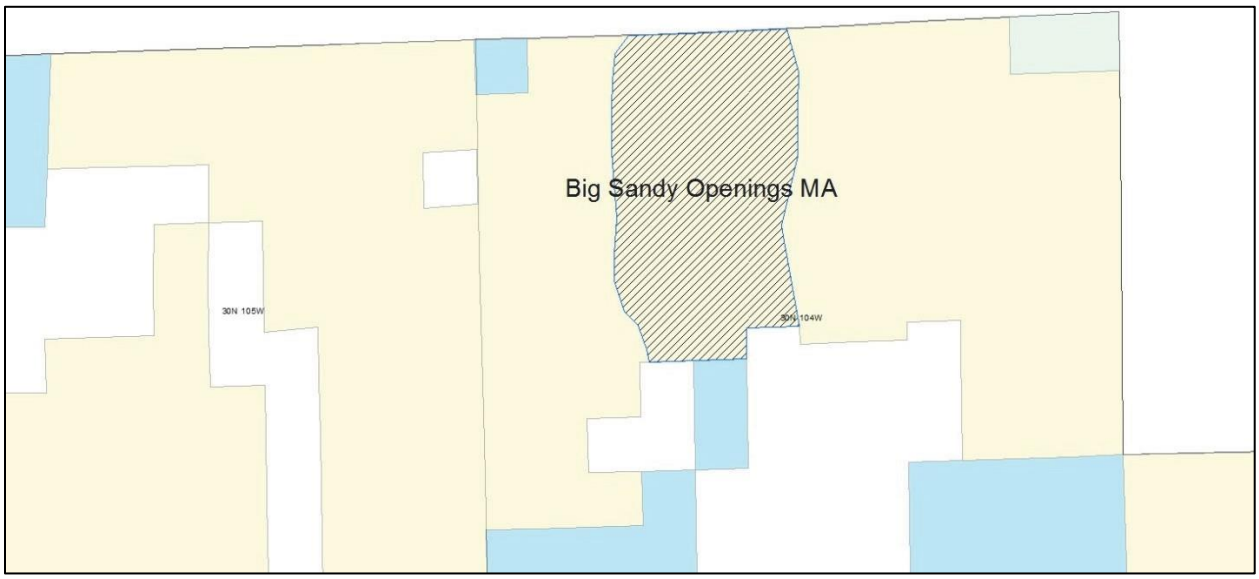


**Figure C-22. Big Sandy Openings**

# C.15 SOUTH PASS HISTORIC LANDSCAPE ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **South Pass** |
| **General Location** | The lands east of U.S. Highway 28, north of the Oregon Buttes and Honeycomb Buttes WSA boundary roads and the White Horse Creek road, west of the field office boundary, and south of Slaughterhouse Creek. |
| **General Description** | The area includes four NHTs where they crossed the Continental Divide at the only location available to do so during the westward emigration period. |
| **Public Land Acres** | 171,300 |
| **Values Considered** | Cultural: four National Historic Trails including the Oregon Trail, the California Trail, the Mormon Pioneer Trail and the Pony Express Trail, National Historic Landmark, Tribal significance. Scenic: National Scenic Trail. Wildlife: designated Sublette mule deer migration corridor, big game crucial winter range and parturition habitat. Special Status Species: sage-grouse PHMA, limber pine, meadow pussytoes, Fremont County rockcress. |

**History**: The area was identified in the Green River RMP as an ACEC, meeting relevance and importance criteria for historic and scenic values of national significance and for outstanding geographic features. The values were thought to need special emphasis to be effectively managed. The ACEC designation was carried forward in the Jack Morrow Hills process. The proposed boundary would be altered to take in the valleys between the existing boundaries and the WSA in the south and the existing boundaries and the rim of Slaughterhouse Gulch. This will allow boundaries to match the ACEC boundary in the Lander Field Office.

(See Chapter 2 Management Action 7498)

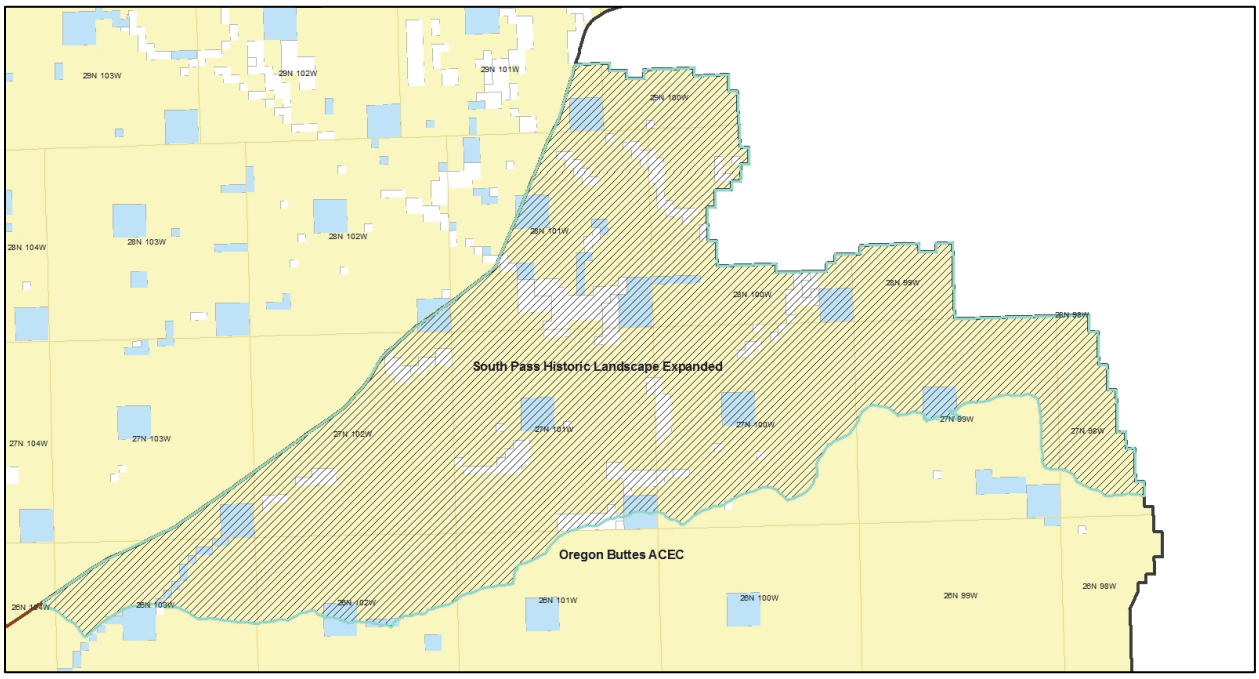
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Cultural<br>Scenic | Yes | The area contains South Pass, the only location where the mountains could be crossed by wagons and handcarts during the westward emigration period of U.S. history. The area also takes in several of the visual landmarks used to navigate the trail system. These landmarks and surrounding landscape are part of the panoramic landscape associated with the Continental Divide.<br>The South Pass National Historic Landmark was designated in 1961. Four nationally significant NHTs cross through this area. South Pass is centrally located in the unit. Three known human burials along with countless unknown burials and many sites associated with the westward emigration.<br>This area is also of high significance currently, historically, and prehistorically to the Native American Tribes. |
| **A fish and wildlife resource:**<br>Sublette mule deer migration corridor<br>Big game crucial winter range<br>Big game parturition<br>Sage-grouse PHMA | Yes | The area is part of the designated Sublette mule deer migration corridor. It is also known big game crucial winter range and parturition habitat. In addition, it is sage-grouse PHMA. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A natural process or system:** BLM sensitive plant species aquifer recharge area | Yes | This area contains BLM Sensitive Species including limber pine, meadow pussytoes and Fremont County rockcress.<br>In addition, due to the proximity of the Continental Divide the area is a known aquifer recharge area. |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The NHTs and South Pass are both on the NRHP due to their national significance. The south boundary is the CDNST connecting side trail. The designated South Pass National Historic Landmark is within this area. This area is also of high significance to Native American Tribes. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area contains populations of BLM sensitive plant species, including limber pine, meadow pussytoes and Fremont County rockcress. The trail segments include several known and many unknown human burial sites, as well as other trail related sites. The area is also sage-grouse PHMA and includes portions of the designated Sublette mule deer migration corridor. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The National Scenic and Historic Trails and the South Pass National Historic Landmark warrant extra protection in order to preserve their scenic value and context. Protections are in place for sage-grouse PHMA. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant cultural, scenic, and wildlife values, and is evaluated for future management actions in the final EIS.

**Figure C-23. Map of the South Pass Historic Landscape Expanded Area**



# C.16 SPECIAL STATUS PLANT ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **Special Status Plants** |
| **General Location** | Identified locations for Special Status plant species and their habitats. |
| **General Description** | Special Status plant species and habitats throughout the planning area. |
| **Public Land Acres** | 1,122 |
| **Values Considered** | Special Status plants including BLM sensitive and species being considered for listing under the Endangered Species Act (ESA). |

**History**: The Special Status Plant ACEC was reviewed in the Green River RMP and found to meet relevance and importance criteria for natural processes or systems and importance criteria of more than local significant qualities, fragile, sensitive, rare and vulnerable to adverse change, and warrants protection to satisfy national priority concerns and carry out the mandates of FLPMA. The values in this area need special emphasis to be effectively managed. The Special Status plant areas known to exist in the Jack Morrow Hills area were reevaluated for that effort and designation was retained for species in that area.

(See Chapter 2 Management Action 7508)

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:** None identified | No | -- |
| **A fish and wildlife resource:** None identified | No | -- |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A natural process or system:** Special status plant species | Yes | The areas that are known to contain Special Status plant species and the surrounding habitat necessary to maintain them. |
| **Natural hazards:** None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | Special Status Species are considered of state-wide or national significance, including species that have been petitioned for listing as threatened or endangered under the ESA. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | Species are designated as Special Status due to their fragile, sensitive, and rare nature. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | These areas are protected in order to prevent the species from being listed as threatened or endangered under the ESA. The designation as an ACEC and associated protections were identified in recent ESA listing decisions as factors preventing the need for listing. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for Special Status Species values and is evaluated for future management actions in the final EIS.

Current listings found in the Rock Springs Field Office include *Arabis pusilla* (Fremont County rockcress), *Astragalus proimanthus* (precocious milkvetch), *Descurainia torulosa* (Wyoming tansymustard), *Thelesperma caespitosum* (Green River greenthread), *Thelesperma pubescens* (Uinta greenthread), and *Townsendia microcephala* (Cedar Mountain Easter daisy). This proposed area also includes *Lesqurella macrocarpa* (large-fruited bladderpod) and the basin big sage/lemon scurfpea plant community. These species could be removed from the list or other species may be added to the list as Special Status Species listings change over time.

# C.17 STEAMBOAT ACEC EVALUATION

| **Area Considered** | **Steamboat Mountain Area** |
|---|---|
| **General Location** | This area includes lands east of U.S. Highway 191, north of the checkerboard lands, west of the Continental Divide, and south of U.S. Highway 28, exclusive of other ACEC boundaries. |
| **General Description** | This area encompasses several wildlife and Special Status Species habitat. In addition, there are significant visual and cultural resources throughout the area. |
| **Public Land Acres** | 268,202 |
| **Values Considered** | Cultural: Tribal significance, Tri-territory Historic Site. Scenic: Steamboat Mountain. Wildlife: big game crucial winter range, big game parturition, designated Sublette mule deer migration corridor. Special Status Species: sage-grouse PHMA, limber pine, basin big sagebrush/lemon scurfpea communities. |

**History**: The Steamboat area was evaluated in the Green River RMP and found to meet relevance and importance criteria for wildlife and cultural values. Unique habitat features exist which are found nowhere else in the planning area. Special emphasis was considered to be required for effective management. A portion of this proposed expansion was recommended to be retained as an ACEC. In the Jack Morrow Hills effort, the Steamboat expansion was reviewed again. The expansion was found to meet relevance and importance criteria for wildlife, cultural values, and natural systems, and determined to require special management to be effectively managed. The area originally identified in the Green River RMP was retained with the Jack Morrow Hills effort.

(See Chapter 2 Management Action 7516)

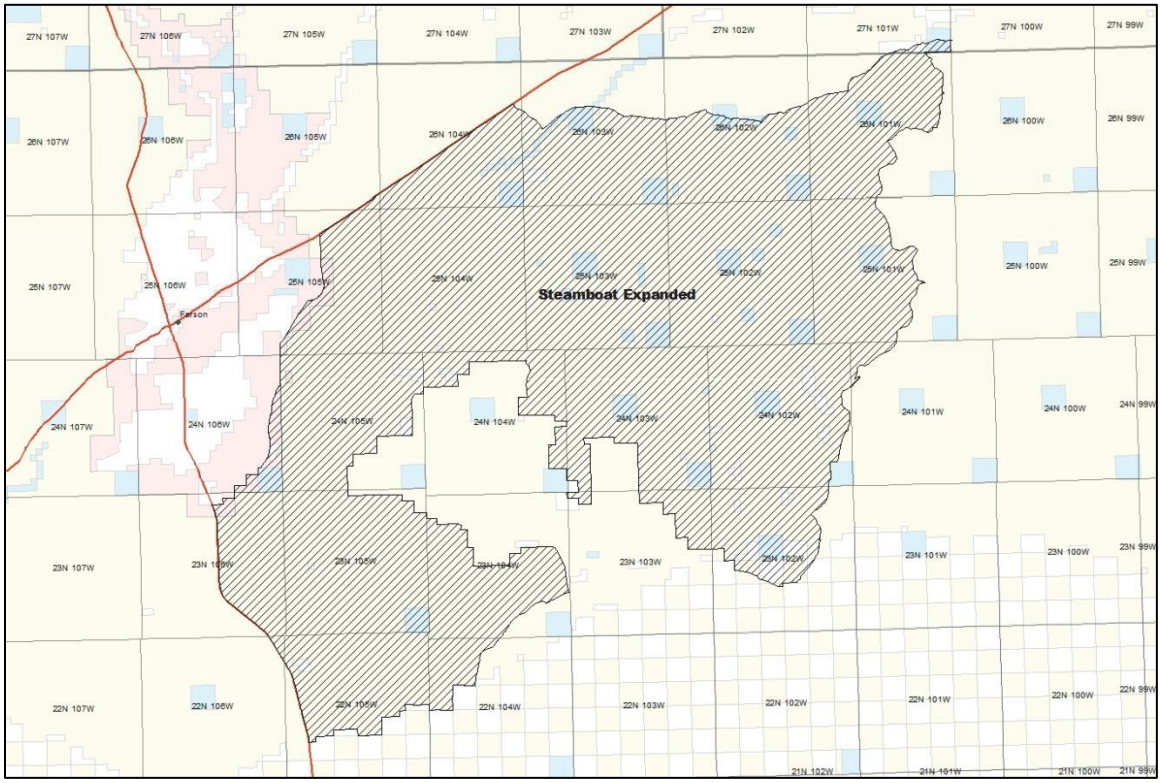
| **Relevance Value** | **Meets Value (Yes/No)** | **Rationale for Determination** |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Indian Gap and associated trail Tri-territory Site<br>Scenic | Yes | The area includes the Indian Gap and associated Indian Gap Trail used by Tribes to travel between Fort Washakie and Fort Hall and access the White Mountain Petroglyphs and Boar's Tusk sites for traditional cultural purposes. The trail has high cultural significance to the Tribes.<br>This area includes the Tri-territory Historic Site marking a historic boundary between The Louisiana Purchase, Northwest Territory, and Mexico.<br>The entire area was inventoried at Visual Resource Inventory Classes I (WSA only) and II, and maintaining visual integrity has high value. |
| **A fish and wildlife resource:**<br>Big game winter and parturition habitat<br>Big game parturition closure<br>Sublette mule deer migration corridor<br>Sage-grouse PHMA | Yes | The area has crucial winter range and parturition habitat for big game species. It is also includes portions of the designated Sublette mule deer migration corridor. In addition, the entire area is listed as sage-grouse PHMA. This area contains the only seasonal closure for big game parturition in the planning area. |
| **A natural process or system:**<br>Special Status plant species<br>Volcanic features and rare earth mineral potential | Yes | The area contains relic plant communities. The area also has known locations for basin big sagebrush/lemon scurfpea communities, limber pine, and old growth sagebrush communities.<br>In addition, the area contains several locations where volcanic features are present and has been identified as potential for rare earth minerals. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The area includes the Tri-territory Historic Site, which is a site of national significance. The area also has a higher than normal density of cultural sites including human burials and pit-house features.<br>The inventory unit also includes portions of the designated Sublette mule deer migration corridor as well as sage-grouse PHMA. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | These unique plant communities are by their very nature considered fragile, sensitive, and rare.<br>The inventory unit includes the only big game parturition closure in the planning area to provide protection for big game during the birthing season. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The area includes the Tri-territory Historic Site, which is a site of national significance. The area also has a higher than normal density of cultural sites including human burials and pit-house features. The sage-grouse PHMA area and Special Status plant areas are considered national priority concerns. Interior Secretarial Order 3362 mandates protections for areas such as the designated Sublette mule deer migration corridor. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant historic, cultural, wildlife, and scenic values, and is evaluated for future management actions in the final EIS.

**Figure C-25. Map of the Steamboat Expanded Area**



# C.18 WHITE MOUNTAIN PETROGLYPHS ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **White Mountain** |
| **General Location** | T 22 N R 105 W sec 11 and 12. |
| **General Description** | White Mountain Petroglyphs Rock Art Site. |
| **Public Land Acres** | 21 |
| **Values Considered** | Cultural: White Mountain Petroglyphs/rock art. Wildlife: raptor nesting, big game crucial winter range. Special Status Species: sage-grouse PHMA. Recreation: developed site with off-site facilities. |

**History**: The area was evaluated in the Green River RMP and found to meet relevance and importance criteria for cultural values of national significance when the area was originally designated an ACEC. The designation was retained.

(See Chapter 2 Management Action 7530)

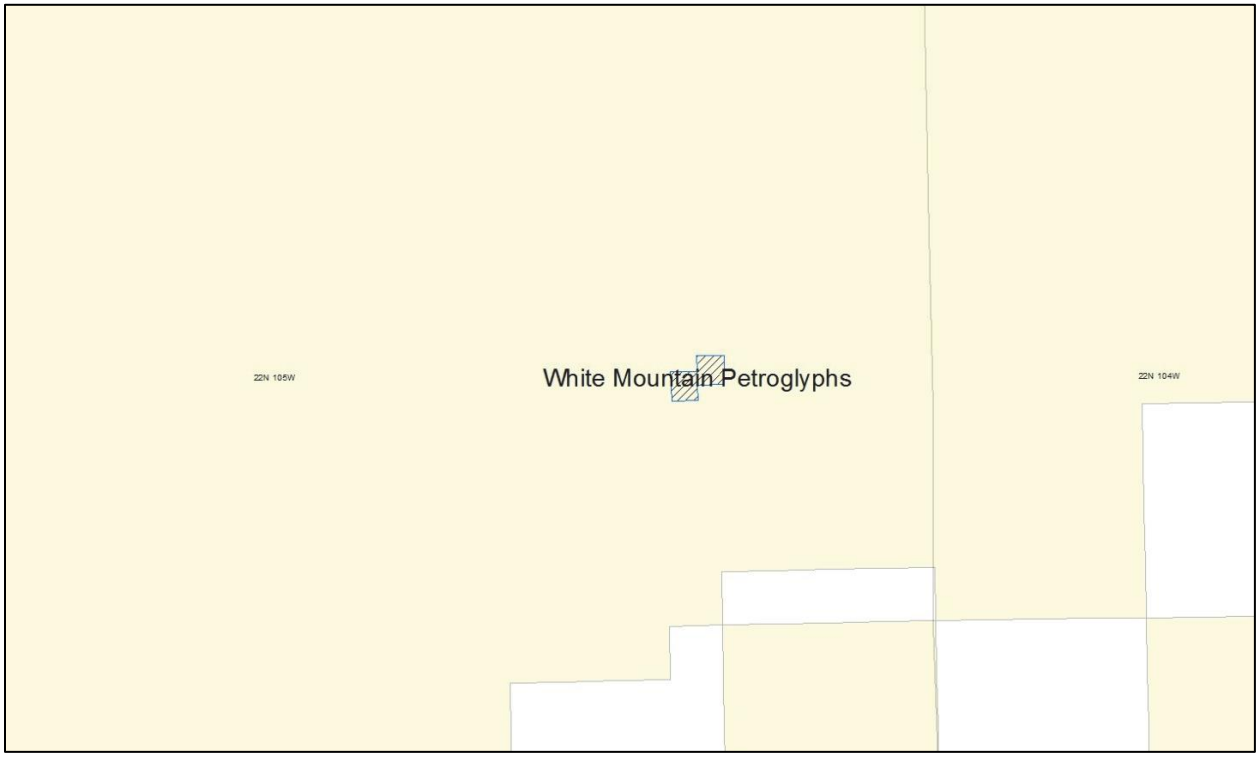
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>Rock art site<br>Native American sacred and respected place<br>High recreation use area | Yes | The White Mountain Petroglyphs is a Native American sacred and respected place of significance to Tribes and is still used as a TCP. In addition, the site has been developed as a recreation site where visitor controls have been installed to protect the site from vandalism and improve the visitor experience. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A fish and wildlife resource:**<br>Raptor nesting<br>Big game crucial winter range<br>Sage-grouse PHMA | Yes | The area has raptor nests above the rock art panels, that are often active. In addition, several of the big game species carved into the rock art panels frequent the area still, and the area is within big game crucial winter range. In addition, the area is sage-grouse PHMA. |
| **A natural process or system:**<br>White Rocks cave | Yes | The rock art panels also include a shallow cave eroded out of the sandstone. The presence of this cave increases the significance of this site as a TCP. |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The rock art panels have tribal significance, as well as having special meaning and worth. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The rock art and the cave, being sandstone, are fragile and sensitive. Rock art sites are by definition rare, irreplaceable, and vulnerable to adverse change. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | The White Mountain Petroglyphs site is a Native American sacred and respected place of significance to several Tribes and is still used as a TCP. In addition, the site has been developed as a recreation site where visitor controls have been installed to protect the site from vandalism and improve the visitor experience. The area is within sage-grouse PHMA. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for a significant cultural, wildlife, and recreation values, and is evaluated for future management actions in the final EIS.

**Figure C-26. Map of the White Mountain Petroglyphs ACEC**



# C.19 EAST SAND DUNES – RED LAKE ACEC EVALUATION

| | |
|---|---|
| **Area Considered** | **East Sand Dunes – Red Lake** |
| **General Location** | T 23 N R 97 W, T 23 N R 98 W, T 23 N R 99 W and T 23 N R 100 W. |
| **General Description** | The area includes the East Sand Dunes and Red Lake WSAs, both of which have outstanding scenic, recreation, and wildlife values. The area is also part of the Greater Sand Dunes system providing opportunities for scientific study of natural sand dunes. |
| **Public Land Acres** | 22,338 |
| **Values Considered** | Wildlife: big game crucial winter range. Scientific study: study of active dunes and perennial wetlands. Geology: active sand dunes. |

**History:** This is a new evaluation based on a citizen proposed ACEC.

(See Chapter 2 Management Action 7548)

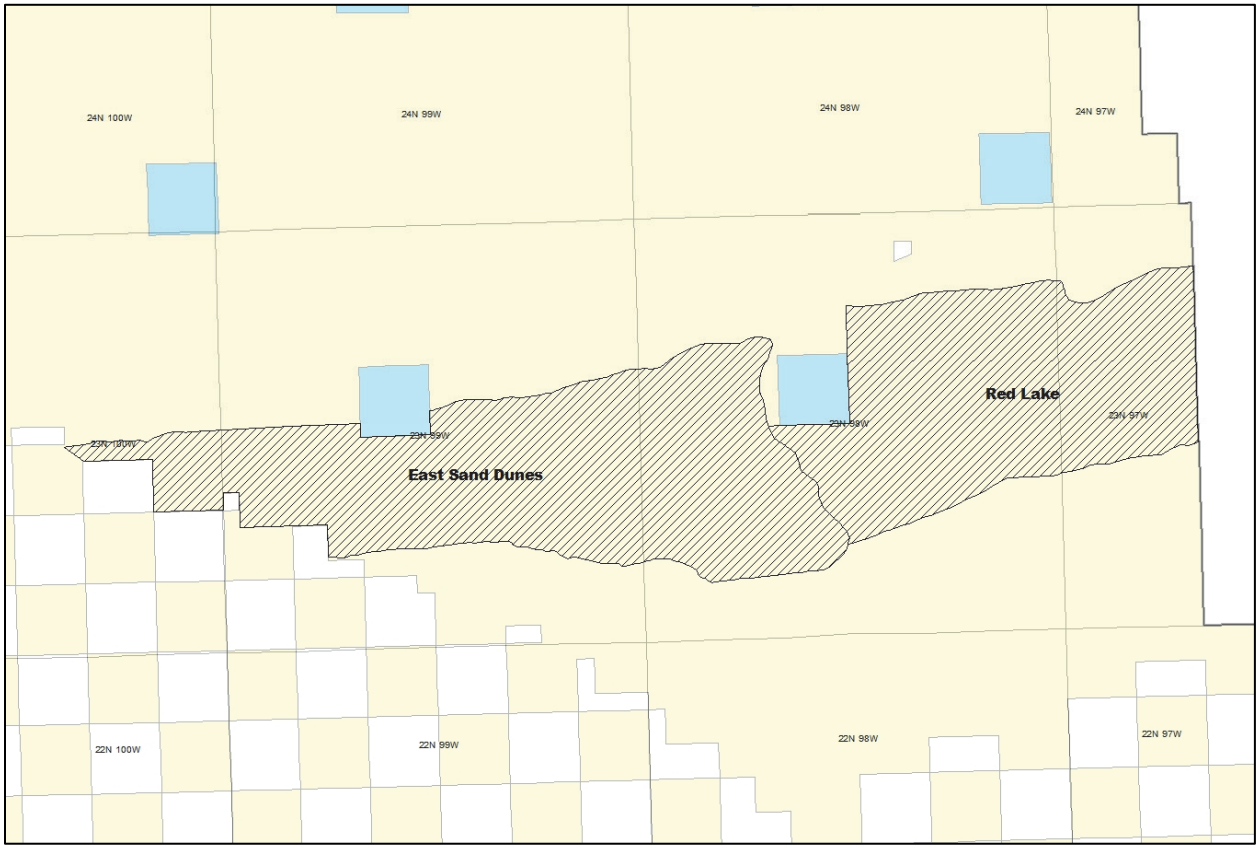
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:** None identified | No | This area does not contain any known significant or important historic or cultural resources. Because this area contains active sand dunes, there is high potential for cultural resources. |
| **A fish and wildlife resource:** Big game crucial winter range | Yes | This area contains big game crucial winter range habitat. |

| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A natural process or system:** Greater Sand Dunes system | Yes | This area is a part of the Greater Sand Dunes system. The combination of active dunes and cold environment produces many unique conditions. The area is of significant scientific value for the study of active sand dunes, the associated perennial wetlands that are directly linked to the active dunes, and how they interact in response to weather and climate. |
| **Natural hazards:** None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | No | While there is potential for cultural resources, these resources have not been identified. Known resource values in the area do not rise to the level of significance to meet this criterion. Active dunes are valuable for scientific study. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The area, being an active sand dune, is susceptible to motor vehicle trespassing. Any resource values with intact provenience within the dunes would be destroyed by motor vehicle trespassing. The remnant dunal ponds are unique ecosystems useful for scientific study. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | No | The boundary of this area is the same as the two WSAs. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: This nomination meets the relevance and importance criteria for significant wildlife and scientific study values, and is evaluated for future management actions in the final EIS.

**Figure C-27. Map of the East Sand Dunes – Red Lake Area**



# C.20 BIG GAME MIGRATION CORRIDOR ACEC EVALUATION

| Area Considered | Big Game Migration Corridor |
|---|---|
| General Location | T 20 N R 101, 102 W sec Various; T 21 N R 101,102,103,104 W sec Various; T 22 N R 102, 103, 104 W sec Various; T 23 N R 102, 103, 104 W sec Various; T 24 N R 101, 102, 103, 104 W sec Various; T 25 N R 100, 101, 102, 103, 104 W sec Various; T 26 N R 100, 101, 102, 103, 104 W sec Various; T 27 N R 99, 100, 101, 102, 103, 104 W sec Various; T 28 N R 99, 101, 102, 103, 104 W sec Various; T 29 n R 101, 102, 103, 104, 105 W sec Various; T 30 N R 102, 103, 104, 105 W sec Various. |
| General Description | The 150-mile Red Desert to Hoback migration corridor crosses private, state trust and National Forest land, but a significant portion of the corridor is public land managed by the BLM. All the public land sections are within the administration of the High Desert District. Most are within the Rock Springs Field Office and are known as the Red Desert and Big Sandy sections of the corridor. Researchers have estimated that roughly 500 deer leave winter range in the Red Desert to travel to the Hoback Basin. Along the way, they pick up 4,000-5,000 other deer that winter in the Prospect Mountains. |
| Public Land Acres | 224,402 |
| Values Considered | Cultural: NHT. Wildlife: designated Sublette mule deer migration corridor, big game crucial winter range, big game parturition. Special Status Species: sage- grouse PHMA. |

**History:** This is a new evaluation based on a citizen proposed ACEC.

(See Chapter 2 Management Action 7555)

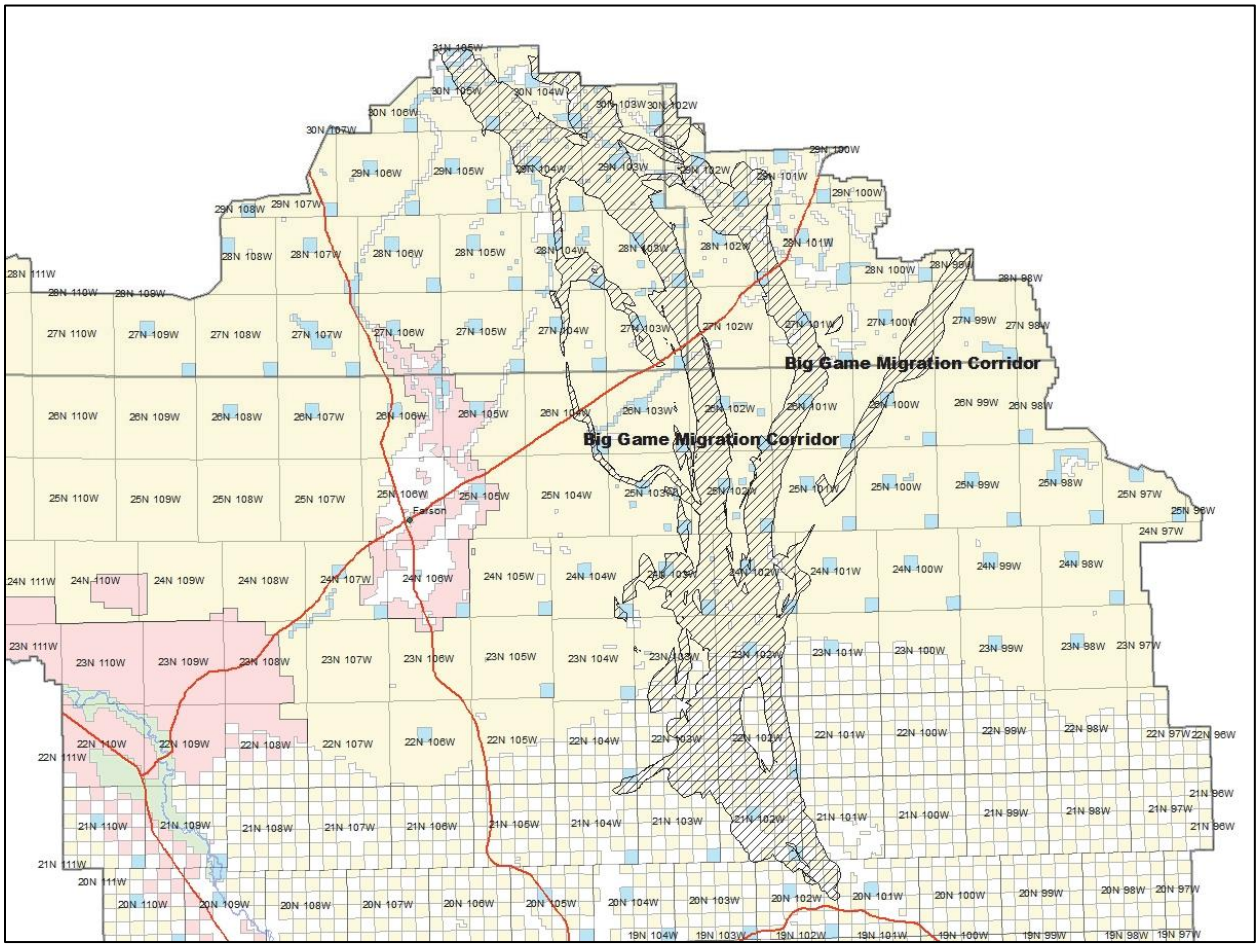
| Relevance Value | Meets Value (Yes/No) | Rationale for Determination |
|---|---|---|
| **A significant historic, cultural, or scenic value:**<br>WSAs<br>Historic landscapes<br>NHTs | Yes | The corridors include portions of the Oregon Buttes, White Horse Creek, and Honeycomb Buttes WSAs. These areas have been set aside, in part, because of high scenic value.<br>The corridors cross the South Pass Historic Landscape, the South Pass National Historic Landmark and several sections of the Emigrant Trail as well as the Natural Corrals Cultural Site and other significant cultural sites. The Natural Corrals and the NHT are listed with the NRHP. |
| **A fish and wildlife resource:**<br>Sublette mule deer migration corridor<br>Sage-grouse PHMA | Yes | The area is a significant migration corridor for large game species. The area also contains sage-grouse PHMA. |
| **A natural process or system:**<br>Wind River Front SMA<br>Basin big sagebrush/lemon scurfpea plant communities<br>BLM sensitive plants | Yes | The corridors include the Wind River Front Special Management area, an area set aside because of the high scenic value and recreation resource use.<br>The corridor includes portions of basin big sagebrush/lemon scurfpea plant communities. The corridors also include populations of two BLM sensitive plant species, meadow pussytoes and large-fruited bladderpod. |
| **Natural hazards:**<br>None identified | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource. | Yes | The scenic values present in the corridors are considered significant and essential for recreation, public appreciation, and tourism.<br>The Emigrant Trail is a part of the American Westward expansion. It is a unique and irreplaceable resource.<br>The migration corridor is the longest known mule deer migration corridor in the U.S. and is traveled by up to 5,000 deer twice each year. |
| Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change. | Yes | The basin big sagebrush/lemon scurfpea communities are fragile, rare, and vulnerable to adverse change. The meadow pussytoes and large-fruited bladderpod populations and their habitat are fragile, sensitive, and vulnerable to adverse change.<br>The Emigrant Trail and the South Pass are unique and irreplaceable.<br>The area is also sage-grouse PHMA. |
| Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA. | Yes | Protection of scenic values and preservation and management of the Historic Trails is recognized as a national priority concern, which contains portions of the migration corridor.<br>The area contains protections related to various other resources, including sage-grouse PHMA, raptor nesting, trails and other cultural sites, the Superior aquifer recharge area, ACECs and WSAs. |
| Has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare. | No | -- |

| Importance Value | Yes/No | Rationale for Determination |
|---|---|---|
| Poses a significant threat to human life and safety or to property. | No | -- |

**Findings**: The corridors meet relevance criteria for wildlife resources but also for scenic and cultural resources and rare plant communities, and is evaluated for future management actions in the final EIS.

## Figure C-28. Map of the Big Game Corridor



# APPENDIX D—FEDERAL OIL AND GAS OPERATIONS ON SPLIT ESTATE LANDS

## D.1 PURPOSE

The purpose of this appendix is to summarize the Bureau of Land Management's (BLM) procedures for considering proposals to conduct exploration and production operations on split estate federal oil and gas leases. This appendix is provided for information purposes only, and is not necessarily a complete statement of rights, obligations, or processes. This appendix is not a part of the BLM's land use plan decision for the Resource Management Plan (RMP). Any conflict with any statute or regulation is unintentional. In the event of a conflict, the statute or regulation controls. Federal oil and gas lessees and operators, and private surface owners, are advised to confer with the BLM at the time an action is proposed for BLM's consideration, in order to obtain information about the current regulations and policies that may apply to the proposal. Nothing in this appendix affects the authority of any Tribe or of the Bureau of Indian Affairs in any way. This RMP applies to federal lands as defined by the Federal Land Policy and Management Act of 1976 (FLPMA), and does not apply to lands held in trust for any Tribe or for any individual Indian or Indians.

## D.2 DEFINITIONS

*Casual use (operations)*: "Casual use means activities involving practices that do not ordinarily lead to any appreciable disturbance or damage to lands, resources, or improvements. This term does not apply to private surface. Casual use includes surveying activities" (43 Code of Federal Regulation [CFR] §3171, part II).

*Lease*: "Means any contract, profit share arrangement, joint venture or other agreement issued or approved by the United States under a mineral leasing law that authorizes exploration for, extraction of or removal of oil or gas" (43 CFR §3171, part II).

*Lease facility* or *production facility*: "Production facilities means a lessee's or lease operator's pipes and equipment used on the leasehold to aid in extracting, processing, and storing oil and gas…" (64 Federal Register [FR] 32140). See also BLM Manual Section 2880 ("Mineral Leasing Act Rights-of-Way") at page 9.

*Lease site*: "Means any lands, including the surface of a severed mineral estate, on which exploration for, or extraction and removal of, oil or gas is authorized under a lease" (43 CFR 3160.0-5).

*Lessee*: "Means any person holding record title or owning operating rights in a lease issued or approved by the United States" (43 CFR 3160.0-5).

*Operator*: "Means any person or entity including but not limited to the lessee or operating rights owner, who has stated in writing to the Authorized Officer that it is responsible under the terms and conditions of the lease for the operations conducted on the leased lands or a portion thereof" (43 CFR 3160.0-5).

*Public lands*: "Means any land and interest in land owned by the United States within the several States and administered by the Secretary of the Interior through the Bureau of Land Management…" (FLMPA, Sec. 103(e)).

*Private surface owner*: "Private Surface Owner means a non-federal or non-state owner of the surface estate and includes any Indian owner of surface estate not held in trust by the United States" (Onshore Oil and Gas Order No. 1, part II).

*Split estate*: "Split Estate means lands where the surface is owned by an entity or person other than the owner of the Federal or Indian oil and gas" (43 CFR §3171, part II). "When tribal lands are held in trust or are subject to federal restrictions against alienation the Bureau of Indian Affairs is the Surface Managing Agency, but if lands are held in unrestricted fee, those lands are treated the same as private surface" (Preamble to 43 CFR §3171 revisions, 72 FR 10322-10323, March 7, 2007).

*Surface Managing Agency*: "Surface Managing Agency means any Federal or state agency having jurisdiction over the surface overlying Federal or Indian oil and gas" (43 CFR §3171, part II).

# D.3 GENERAL

In considering and authorizing exploration and development of split estate federal oil and gas leases, the BLM prefers that the operator and split estate surface owner reach a Surface Access Agreement for proposed oil and gas operations. The BLM coordinates with both the operator and surface owner, in accordance with the requirements of 43 CFR §3171, and generally provides the surface owner's lands the same level of resource (soil, water, vegetation, air, visual, cultural, etc.) protection as would be required on BLM-administered public lands.

"The BLM will offer the surface owner the same level of surface protection that the BLM provides on Federal surface. The BLM will not apply standards or conditions that exceed those that would normally be applied to Federal surface, even when requested by the surface owner" (The Gold Book, page 12).

Federal mineral lessees may enter onto a privately owned surface to the extent necessary to explore and produce the federal minerals in compliance with the relevant statutes, BLM regulations, and land use designations. The BLM does not have the authority to regulate a surface owner's use of the surface estate, but does have the authority to regulate the activities of federal mineral lessees and mining claimants. The BLM adds lease stipulations to split estate federal oil and gas leases in order to ensure that leasing decisions conform to the approved RMP for the area.

# D.4 OPERATIONS

## D.4.1 Geophysical

The BLM's authority to permit geophysical operations is described under 43 CFR §3150.0-1:

> *Geophysical exploration on public lands, the surface of which is administered by the Bureau, requires Bureau approval. The procedures in this part also apply to geophysical exploration conducted under the rights granted by any Federal oil and gas lease unless the surface is administered by the U.S. Forest Service. However, a lessee may elect to conduct exploration operations outside the rights granted by the lease, in which case authorization from the surface managing agency or surface owner may be required… The procedures of this part do not apply to… operations conducted on private surface overlying public lands unless such operations are conducted by a lessee under the rights granted by the Federal oil and gas lease…*

As BLM Handbook H-3150-1[1] at pages 1–2 explains:

> *In those situations where Federal minerals are underlying private surface and the private surface owner's consent is obtained, the BLM is not to become involved. However, when landowner consent for access to the surface cannot be obtained for geophysical*

[1] *Onshore Oil and Gas Geophysical Exploration Surface Management Requirements. January 9, 2007.*

> *exploration operations on a Federal lease by the lease operator, the geophysical operation is to be authorized using the Sundry Notice process…*[2]
>
> *When the geophysical exploration operator is the Federal lessee or designated operator of the lessee, it is to file a Sundry Notice… with the BLM and provide notification to the surface owner by certified mail that it intends to enter onto the lands and conduct lease operations. The lessee/operator must then submit proof to the BLM Authorized Officer that the surface owner has been notified. The lessee or operator must also submit proof to the BLM Authorized Officer that it has a current and adequate bond payable to the United States for use by the surface owner for damages caused during exploration operations. The Authorized Officer must give the surface owner 30 days to comment on the proposed action before approving the Sundry Notice.*

When a surface access agreement is reached to conduct geophysical operations on split estate lands with leased or unleased federal oil and gas, the BLM does not become involved.

The BLM will not accept a Notice of Intent (NOI) to Conduct Geophysical Operations, BLM Form 3150-4 or bond to permit entry to split estate lands with unleased federal oil and gas, since the BLM has not issued an oil and gas lease to allow for operations under 43 CFR Part 3160 (see 43 CFR 3150.0-1).

In order to conduct geophysical operations on split estate lands where a federal oil and gas lease has been issued and where an agreement with the surface owner has not been reached, the lessee or the operator must first obtain BLM authorization through an NOI that proposes entry to those lands in order to conduct geophysical operations. The lessee or designated operator must provide to the BLM a certification that a good-faith effort was made to: (a) notify the landowner prior to entry; (b) obtain a Surface Access Agreement; and (c) deliver a copy of the proposed NOI to the surface owner.[3] The NOI must also identify the surface owner and include the owner's name, address, and telephone number, if known. A good and sufficient bond to secure payment of applicable damages for the use and benefit of the surface owner must be provided to the BLM on BLM Form 3160-19. The lessee or designated operator must also submit to the BLM evidence of service of a copy of the bond upon the surface owner. Prior to authorizing the NOI proposing entry to the lands for which the bond has been submitted, the BLM notifies the surface owner and provides a 30-day period during which the surface owner may protest the sufficiency of the bond. If the sufficiency of the bond is protested, the BLM reviews the bond amount and determines if it is adequate. That decision by the BLM is subject to State Director Review (SDR) upon a request by any adversely affected party and the State Director's decision is subject to appeal to the Interior Board of Land Appeals (IBLA).[4]

## D.4.2 Notice of Staking/Application for Permit to Drill

### Surveying and Staking Activities

The lessee or operator is encouraged to contact the surface owner of split estate lands early in the process of planning for exploration and development of a federal lease. This facilitates early discussion about the goals and objectives of both the surface owner and operator. Communication between the lessee or operator

[2] *In BLM Washington Office Instruction Memorandum (IM) 2009-121, "Approval of Notice of Intent to Conduct Geophysical Exploration to Federal Oil and Gas Lessee on Split Estate", dated May 8, 2009, the BLM recognized that the Sundry Notice form (BLM Form 3160-5) is an imperfect form to use for permitting of geophysical operations. This policy clarified that the BLM will "no longer require the lessee or its operator to file a Sundry Notice" for the purpose of proposing entry to federal leases where a surface owner denies access to the lessee or its operator. In its place the BLM would use the NOI form (BLM Form 3150-4).*

[3] *See 43 CFR §3171, Part VI.*

[4] *See 43 CFR §3165.3(b). See, e.g., William P. Maycock, 176 IBLA 206 (2008).*

and surface owner can reduce potential conflicts, thereby reducing misunderstandings and permit processing times.

For surveying and staking activities, "[t]he operator is responsible for making access arrangements with the appropriate Surface Managing Agency (other than the BLM and the Forest Service) or private surface owner" (43 CFR §3171, part III.D.2.a).

"No entry on split estate lands for surveying and staking should occur without the operator first making a good faith effort to notify the surface owner. Also, operators are encouraged to notify the BLM or the Forest Service, as appropriate, before entering private lands to stake for Federal mineral estate locations" (43 CFR §3171, part III.D.2.b).

Aside from surveying and staking the proposed well location, road, pipeline, and/or other lease facilities, the operator may also be required to conduct resource condition surveys of the leased lands.

"As provided in the oil and gas lease, the BLM may request that the applicant conduct surveys or otherwise provide information needed for the BLM's National Historic Preservation Act consultation with the State Historic Preservation Officer or Indian tribe or its Endangered Species Act consultation with the relevant fisheries agency. The Federal mineral lessee has the right to enter the property for this purpose, since it is a necessary prerequisite to development of the dominant mineral estate. Nevertheless, the lessee or operator should seek to reach agreement with the surface owner about the time and method by which any survey would be conducted" (43 CFR §3171, part VI).

## Onsite Inspection(s)

On split estate lands, the onsite inspection provides the opportunity for the BLM, operator, and surface owner to evaluate and discuss the proposed well location or lease facility in the field.

"Within 10 days of receiving the application, the BLM, in coordination with the operator and Surface Managing Agency, including the private surface owner in the case of split estate minerals, will schedule a date for the onsite inspection (unless the onsite inspection has already been conducted as part of a Notice of Staking)" (43 CFR §3171, part III.E.2.a).

"On Non-National Forest System lands, the BLM will invite the Surface Managing Agency and private surface owner, if applicable, to participate in the onsite inspection. If the surface is privately owned, the operator must furnish to the BLM the name, address, and telephone number of the surface owner if known" (43 CFR §3171, part III.C).

At the onsite inspection, the BLM will consider applicable Best Management Practices (BMP) that would avoid or mitigate environmental impacts to natural resources. The onsite inspection provides the surface owner with the opportunity to review the proposed well location and/or lease facilities; provide information to the BLM and operator about resources, improvements, and land uses; and express preferences for BMPs to be used for lease operations.

"All parties who attend the onsite inspection will jointly develop a list of resource concerns that the operator must address in the application for permit to drill (APD). The operator will be provided a list of these concerns either during the onsite inspection or within 7 days of the onsite inspection. Surface owner concerns will be considered to the extent practical within the law" (43 CFR §3171, part III.C).

"The BLM will invite the surface owner to the onsite inspection to assure that their concerns are considered" (43 CFR §3171, part VI).

## Required Components of a Complete Application for Permit to Drill for Split Estate Operations

### Description of Surface Ownership

A description of the surface ownership (with name, address, and telephone number, if known) along with a certification must be included in the APD submitted by the operator to the BLM.

"The operator must indicate (in a narrative) the surface ownership at the well location, and of all lands crossed by roads that the operator plans to construct or upgrade, including, if known, the name of the agency or owner, phone number, and address. The operator must certify that they have provided a copy of the Surface Use Plan of Operations (SUPO) required in this section to the private surface owner of the well site location, if applicable, or that they made a good faith effort if unable to provide the document to the surface owner" (43 CFR §3171, part III.D.4.k).

### Surface Access Agreement or Waiver

For operations on leased split estate lands, the operator must undertake a good faith effort to reach a Surface Access Agreement.

"[I]n the case of actual oil and gas operations, the operator must make a good faith effort to notify the private surface owner before entry and make a good faith effort to obtain a Surface Access Agreement from the surface owner… The Surface Access Agreement may include terms or conditions of use, be a waiver, or an agreement for compensation. The operator must certify to the BLM that: (1) It made a good faith effort to notify the surface owner before entry; and (2) That an agreement with the surface owner has been reached or that a good faith effort to reach an agreement failed" (43 CFR §3171, part VI).

"The operator must make a good faith effort to provide a copy of their Surface Use Plan of Operations to the surface owner" (43 CFR §3171, part VI). The operator must also provide a copy of any revisions to the SUPO to the surface owner. If required under Onshore Oil and Gas Order No. 6 ("Hydrogen Sulfide Operations"), the BLM requires the operator to provide a copy of the Public Protection Plan to the surface owner.

"The surface use agreement between the surface owner and the operator is confidential. However, the APD Surface Use Plan of Operations must contain sufficient detail about any aspects of the agreement necessary for National Environmental Policy Act of 1969 (NEPA) documentation and to determine that the operations will be in compliance with laws, regulations, Onshore Orders, and agency policies" (The Gold Book, page 12).

"If the BLM's requirements conflict with provisions in the Surface [Access] Agreement, the operator or surface owner should disclose that conflict at the onsite or to the BLM in writing, and the BLM should consider those conflicts in making its final decision" (BLM's Split Estate Report to Congress at page 15). Thus, to the extent terms of the agreement may conflict with Conditions of Approval to the APD, the BLM should be made aware of those terms, so that they can be considered in the BLM's final decision.

"The BLM does not review the Surface Use Agreement and does not enforce portions of the Surface Use Agreement that are not contained within the approved APD" (BLM's Split Estate Report to Congress at page 17.)

### Bonding In Lieu of a Surface Access Agreement or Waiver

It is the preference of the BLM that the operator and surface owner reach a Surface Access Agreement. However, in those cases where an agreement is not reached, the BLM follows the procedural requirements

in the BLM's regulations and policies. A good and sufficient bond to secure payment of applicable damages for the use and benefit of the surface owner must be provided to the BLM on BLM Form 3160-19. The lessee or designated operator must also submit to the BLM evidence of service of a copy of the bond upon the surface owner. Prior to authorizing the APD proposing entry to the lands for which the bond has been submitted, the BLM notifies the surface owner and provides a 30-day period during which the surface owner may protest the sufficiency of the bond. If the sufficiency of the bond is protested, the BLM reviews the bond amount and determines if it is adequate. That decision by the BLM is subject to SDR upon a request by any adversely affected party and the State Director's decision is subject to appeal to the IBLA.[5]

"If no agreement was reached with the surface owner, the operator must submit an adequate bond (minimum of $1,000) to the BLM for the benefit of the surface owner sufficient to: (1) pay for loss or damages; or (2) as otherwise required by the specific statutory authority under which the surface was patented and the terms of the lease. Surface owners have the right to appeal the sufficiency of the bond. Before the approval of the APD, the BLM will make a good faith effort to contact the surface owner to assure that they understand their rights to appeal" (43 CFR §3171, part VI).

"The bond amount will be reviewed by the BLM to assure that it is sufficient based on the appropriate law" (Preamble to 43 CFR §3171 revisions, 72 FR 10323, March 7, 2007).

If operations under an approved APD result in loss or damages that are compensable under the statutes by which the lands were patented, the surface owner may obtain judgment from a court of competent jurisdiction. The BLM will then release from the bond the amount ordered by the court to the surface owner.

### Approval of the APD

The BLM considers the views of the surface owner before approving the APD. The BLM must prepare an environmental record of review (43 CFR 3162.5-1(a)) to document its evaluation of potential resource impacts, including documentation of NEPA compliance.

"The BLM must comply with NEPA, the National Historic Preservation Act, the Endangered Species Act, and related Federal statutes when authorizing lease operations on split estate lands where the surface is not federally owned and the oil and gas is Federal. For split estate lands within Forest Service administrative boundaries, the BLM has the lead responsibility, unless there is a local BLM/Forest Service agreement that gives the Forest Service this responsibility" (43 CFR §3171, part VI).

"After the APD is approved the operator must make a good faith effort to provide a copy of the Conditions of Approval to the surface owner. The APD approval is not contingent upon delivery of a copy of the Conditions of Approval to the surface owner" (43 CFR §3171, part VI).

## D.4.3 Sundry Notices

Operations proposed by Sundry Notice that will result in additional surface disturbance or re-disturbance of previously reclaimed areas require a SUPO.

"Prior to commencing any operation on the leasehold which will result in additional surface disturbance, other than those authorized under § 3162.3–1 or § 3162.3–2 of this title, the operator shall submit a proposal on Form 3160–5 to the Authorized Officer for approval. The proposal shall include a surface use plan of operations" (43 CFR 3162.3-3).

[5] *See 43 CFR §3165.3(b). See, e.g., William P. Maycock, 176 IBLA 206 (2008).*

"The operator must certify on Form 3160–5 that they have made a good faith effort to provide a copy of any proposal involving new surface disturbance to the private surface owner in the case of split estate" (43 CFR §3171, part VIII.A).

For review of Final Abandonment Notices submitted by an operator on split estate lands, the BLM will consider the views of the surface owner.

"If applicable, the private surface owner will be notified and their views will be carefully considered" (43 CFR §3171, part XII).

"In cases where the Surface Managing Agency or private surface owner desires to acquire an oil and gas well and convert it to a water supply well or acquire a water supply well that was drilled by the operator to support lease operations, the Surface Managing Agency or private surface owner must inform the appropriate BLM office of its intent before the approval of the APD in the case of a dry hole and no later than the time a NOI to Abandon is submitted for a depleted production well. The Surface Managing Agency or private surface owner must reach agreement with the operator as to the satisfactory completion of reclamation operations before the BLM will approve any abandonment or reclamation. The BLM approval of the partial abandonment under this section, completion of any required reclamation operations, and the signed release agreement will relieve the operator of further obligation for the well. If the Surface Managing Agency or private surface owner acquires the well for water use purposes, the party acquiring the well assumes liability for the well" (43 CFR §3171, part IX.B).

"Completion of a well as plugged and abandoned may also include conditioning the well as water supply source for lease operations or for use by the surface owner or appropriate Government Agency, when authorized by the Authorized Officer. All costs over and above the normal plugging and abandonment expense will be paid by the party accepting the water well" (43 CFR 3162.3-4(b)).

### D.4.4 Emergency Operations

"In the event of an emergency, the operator may take immediate action without prior Surface Managing Agency approval to safeguard life or to prevent significant environmental degradation. The BLM or the Forest Service must receive notification of the emergency situation and the remedial action taken by the operator as soon as possible, but not later than 24 hours after the emergency occurred. If the emergency only affected drilling operations and had no surface impacts, only the BLM must be notified. If the emergency involved surface resources on other Surface Managing Agency lands, the operator should also notify the Surface Managing Agency and private surface owner within 24 hours" (43 CFR §3171, Part IV.d).

# APPENDIX E—FEDERAL LAWS, REGULATIONS, AND POLICIES

## E.1 ENVIRONMENTAL POLICY

### National Environmental Policy Act of 1969

NEPA (42 United States Code [USC] 4321 et seq.) requires the preparation of EISs for federal projects that may have a significant effect on the environment. It requires systematic, interdisciplinary planning to ensure the integrated use of the natural and social sciences, and the environmental design arts in making decisions about major federal actions that may have a significant effect on the environment. The procedures required under NEPA are implemented through the CEQ regulations in 40 CFR §1500.

### Federal Compliance with Pollution Control Standards (EO 12088)

Federal Compliance with Pollution Control Standards (EO 12088) states that federal agencies must comply with applicable pollution control standards.

### Protection and Enhancement of Environmental Quality (EO 11514)

Protection and Enhancement of Environmental Quality (EO 11514, as amended by EO 11991) establishes the policy for federal agencies to provide leadership in environmental protection and enhancement.

### Organic Administration Act of 1897

This Act authorizes the Secretary of Agriculture to issue rules and regulations for the occupancy and use of the National Forests. This is the basic authority for authorizing use of NFS lands for other than ROWs.

## E.2 LAND USE AND NATURAL RESOURCES MANAGEMENT

### Federal Land Policy and Management Act of 1976

The FLPMA, as amended (43 USC 1701, et seq.), provides for public lands to be generally retained in federal ownership for periodic and systematic inventory of the public lands and their resources; for a review of existing withdrawals and classifications; for establishment of comprehensive rules and regulations for administering public lands statutes; for multiple-use management on a sustained yield basis; for protection of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource and archaeological values; for receiving fair market value for the use of the public lands and their resources; for establishment of uniform procedures for any disposal, acquisition or exchange; for identification and protection of areas of critical environmental concern; for recognition of the nation's need for domestic sources of minerals, food, timber and fiber from the public lands, including implementation of the Mining and Mineral Policy Act of 1970; and for payments to compensate states and local governments for burdens created as a result of the immunity of federal lands from state and local taxation. The general land management regulations are provided in 43 CFR §2000, Subchapter B.

## The Forest and Rangelands Renewable Resources Planning Act of 1974

This Act directs the Secretary of Agriculture to include, as appropriate, research activities when managing forest and rangeland resource, and to periodically assess the national situation of the forest and rangeland resources. This assessment is called the Renewable Planning Act assessment. See FSM 1906 and FSM 1910 for detailed requirements.

## Taylor Grazing Act of 1934

The Taylor Grazing Act of 1934, as amended (43 USC 315), provides authorization to the Secretary of the Interior to establish grazing districts from any part of the public domain of the United States (exclusive of Alaska) which, in the Secretary's opinion, are chiefly valuable for grazing and raising forage crops; to regulate and administer grazing use of the public lands; and to improve the public rangelands. Regulations for grazing permits are provided in 43 CFR §4100.

## Public Rangelands Improvement Act of 1978

The Public Rangelands Improvement Act of 1978 (43 USC 1901, et seq.) provides for the improvement of range conditions on public rangelands, research on wild horse and burro population dynamics, and other range management practices.

## Federal Noxious Weed Act of 1974

The Federal Noxious Weed Act of 1974, as amended (7 USC 2814), provides for the designation of a lead office and a person trained in the management of undesirable plants, establishment and funding of a management program for undesirable plants, completion and implementation of cooperative agreements with state agencies, and establishment of integrated management systems to control undesirable plant species.

## Healthy Forests Restoration Act of 2003

The Healthy Forests Restoration Act serves to further the Healthy Forests Initiative to reduce the threat of destructive wildfires while upholding environmental standards and encouraging early public input during review and planning processes. The Act strengthens public participation in developing high-priority forest health projects; reduces the complexity of environmental analysis, allowing federal land agencies to use the best science available to actively manage land under their protection; provides a more effective appeals process, encouraging early public participation in project planning; and issues clear guidance for court action against forest health projects.

## Grazing Fees of 1986 (EO 12548)

EO 12548 provides for establishment of appropriate fees for the grazing of domestic livestock on public rangelands and directs that the fee shall not be less than $1.35 per animal unit month.

## Wilderness Act of 1964

The Wilderness Act of 1964 (16 USC 1131, et seq.) provides for the designation and preservation of wilderness areas.

## Wild and Scenic Rivers Act of 1968, as amended (16 U.S.C. 1271-1287)

This Act establishes the National Wild and Scenic Rivers System, designates the rivers included in the system, establishes policy for managing designated rivers, and prescribes a process for designating additions to the system.

## Federal Land Exchange Facilitation Act of 1988

The Federal Land Exchange Facilitation Act amended FLPMA with respect to BLM land exchanges. It was designed to streamline land exchange procedures.

## Recreation and Public Purposes Act of 1926

In 1954, the Congress enacted the Recreation and Public Purposes Act (43 USC 869 et. seq.) as a complete revision of the Recreation Act of 1926 in response to the public need for a nationwide system of parks and other recreational and public purposes areas. This law is administered by the BLM. The Act authorizes the sale or lease of public lands for recreational or public purposes to state and local governments and to qualified nonprofit organizations. Examples of typical uses under the Act are historic monument sites, campgrounds, schools, fire houses, law enforcement facilities, municipal facilities, landfills, hospitals, parks and fairgrounds.

## National Trails System Act of 1968, as amended (16 U.S.C. 1241-1251)

In order to provide for the ever-increasing outdoor recreation needs of an expanding population and in order to promote the preservation of public access to travel within, and for the enjoyment and appreciation of the open-air, outdoor areas and historic resources of the Nation, trails should be established (i) primarily, near the urban areas of the Nation, and (ii) secondarily, within scenic areas and along historic travel routes of the Nation, often more remotely located.

The purpose of this Act is to provide the means for attaining these objectives by instituting a national system of recreation, scenic and historic trails, by designating the Appalachian Trail and the Pacific Crest Trail as the initial components of that system, and by prescribing the methods by which, and standards according to which, additional components may be added to the system.

## Airport and Airway Improvement Act of 1982

The Airport and Airway Improvement Act established the Airport Improvement Program which provides grants to public agencies and, in some cases, to private owners and entities for the planning and development of public-use airports that are included in the National Plan of Integrated Airport Systems.

## Wyoming Range Legacy Act of 2009

This Act established the Wyoming Range Withdrawal Area and affects all NFS lands and federal minerals in the identified withdrawal area located in the Bridger-Teton National Forest. The Act withdrew the area to: (1) all forms of appropriation or disposal under the public land laws; (2) location, entry and patent under the mining laws; and (3) disposition under laws relating to mineral and geothermal leasing.

# E.3 AIR QUALITY

## The Clean Air Act of 1990

The Clean Air Act of 1990, as amended (42 USC 7401, 7642), requires the BLM to protect air quality, maintain federal and state designated air quality standards, and abide by the requirements of the state implementation plans.

## Wyoming Air Quality Standards and Regulations

Wyoming air quality standards and regulations, Chapters 1 to 11, specify the requirements for air permitting and monitoring to implement Clean Air Act and state ambient air quality standards.

# E.4 WATER QUALITY

## The Clean Water Act of 1987

The Clean Water Act of 1987, as amended (33 USC 1251), establishes objectives to restore and maintain the chemical, physical and biological integrity of the Nation's water. The Act also requires permits for point source discharges to navigable waters of the United States and the protection of wetlands and includes monitoring and research provisions for protection of ambient water quality.

## The Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply. The law was amended in 1986 and 1996 and requires many actions to protect drinking water and its sources: rivers, lakes, reservoirs, springs and groundwater wells. SDWA authorizes the U.S. Environmental Protection Agency (EPA) to set national health-based standards for drinking water to protect against both naturally occurring and manmade contaminants that may be found in drinking water. The U.S. EPA, states and water systems work together to ensure that these standards are met.

## Wyoming Water Quality Standards and Regulations

Wyoming water quality standards and regulations implement permitting and monitoring requirements for the National Pollutant Discharge Elimination System, operation of injection wells, ground water protection requirements, prevention and response requirements for spills, and salinity standards and criteria for the Colorado River Basin.

## Colorado River Basin Salinity Control Act of 1974

The Colorado River Basin Salinity Control Act of 1974, Public Law 93-320, authorizes the construction, operation and maintenance of works in the Colorado River Basin to control the salinity of water delivered to Mexico.

## Protection of Wetlands (EO 11990)

Protection of Wetlands (EO 11990) requires federal agencies to take action to minimize the destruction, loss or degradation of wetlands, and preserve and enhance the natural and beneficial values of wetlands.

## Floodplain Management (EO 11988)

Floodplain Management (EO 11988) provides for the restoration and preservation of national and beneficial floodplain values, and enhancement of the natural and beneficial values of wetlands in carrying out programs affecting land use.

# E.5 MINERALS

## General Mining Law of 1872

The General Mining Law of 1872, as amended (30 USC 22, et seq.), provides for locating and patenting mining claims where a discovery has been made for locatable minerals on public lands in specified states. Regulations for staking and maintenance of claims on BLM-administered lands are listed in 43 CFR §3800. Regulations for staking and maintenance of claims on NFS lands are listed in 36 CFR Part 228.

## Mineral Leasing Act of 1920

The Mineral Leasing Act of 1920, as amended (30 USC 181, et seq.), provides for the leasing of deposits of coal, phosphate, sodium, potassium, oil, oil shale, native asphalt, solid and semisolid bitumen, bituminous rock or gas, and lands containing such deposits owned by the United States, including those in national forests but excluding those acquired under other acts subsequent to February 25, 1920, and those lands within the national petroleum and oil shale reserves. Regulations for onshore oil and gas leasing are provided in 43 CFR §3100. Regulations concerning oil and gas leases on NFS lands are listed in 36 CFR Part 228.

## Materials Act of 1947

The Materials Act of 1947, as amended (30 USC 601–604, et seq.), provides for the sale of common variety materials for personal, commercial or industrial uses and for free use for local, state, and federal governmental entities. The sales of mineral materials are controlled by the regulations listed in 43 CFR §3600 and 36 CFR Part 228.

## Common Varieties of Mineral Materials Act of 1947

The Common Varieties of Mineral Materials Act of 1947 provides for the disposal of mineral materials on the public lands through bidding, negotiated contracts or free use.

## Mineral Leasing Act for Acquired Lands of 1947

The Mineral Leasing Act for Acquired Lands of 1947 states that all deposits of coal, phosphate, oil, oil shale, gas, sodium, potassium and sulfur that are owned, may be acquired, and are within lands acquired by the United States, may be leased by the Secretary of the Interior under the same conditions as contained in the leasing provisions of the mineral leasing laws. No mineral deposits shall be leased without the consent of the head of the executive department having jurisdiction over the lands containing the deposit and subject to such conditions as that official may prescribe.

## Multiple Use Mining Act of 1955

The Multiple Use Mining Act of 1955 allows the sale of mineral materials, such as sand and gravel, and provides direction for use of surface resources of mining claims.

## Mining and Minerals Policy Act of 1970

The Mining and Minerals Policy Act of 1970 states that the continuing policy of the federal government is to foster and encourage private enterprise in the development of economically sound and stable domestic mining and minerals industries and the orderly and economic development of domestic mineral resources.

## Federal Coal Leasing Amendments Act of 1976

The Federal Coal Leasing Amendments Act of 1976 (30 USC 201, et seq.) requires competitive leasing of coal on public lands and mandates a broad spectrum of coal operations requirements for lease management. Coal leasing regulations for BLM-administered and NFS lands are provided in 43 CFR §3400.

## Federal Onshore Oil and Gas Leasing Reform Act of 1987

The Federal Onshore Oil and Gas Leasing Reform Act of 1987 authorized the Secretary of Agriculture the opportunity to object to leasing NFS lands reserved from the public domain and to regulate surface disturbing activities conducted pursuant to any lease issued under this Act. The BLM may issue oil and gas leases on NFS lands reserved for the public domain unless the Forest Service objects to the leasing.

## Energy Policy and Conservation Act of 2000

The purposes of the Energy Policy and Conservation Act of 2000, as amended (42 USC 6217 et seq.), are to:

- Grant specific authority to the President to fulfill obligations of the United States under the international energy program,
- Provide for the creation of a Strategic Petroleum Reserve capable of reducing the impact of severe energy supply interruptions,
- Conserve energy supplies through energy conservation programs, and, where necessary, the regulation of certain energy uses,
- Provide for improved energy efficiency of motor vehicles, major appliances and certain other consumer products,
- Provide a means for verification of energy data to ensure the reliability of energy data,
- Conserve water by improving the water efficiency of certain plumbing products and appliances.

## Actions to Expedite Energy-Related Projects (EO 13212)

EO 13212 of May 18, 2001, directs the federal agencies to expedite their review of permits for energy-related projects while maintaining safety, public health and environmental protections.

## Energy Policy Act of 2005

The Energy Policy Act of 2005 requires the BLM and Forest Service to enter into a Memorandum of Understanding to establish joint BLM and Forest Service policies and procedures to managing oil and gas leasing and operational activities such that there is consistency in lease stipulations across jurisdictional boundaries.

# Bureau of Land Management Energy and Non-Energy Mineral Policy

This statement sets forth BLM policy for the management of energy and non-energy mineral resources (mineral resources) on public lands. It reflects the provisions of five important acts of Congress relating to mineral resources: the Domestic Minerals Program Extension Act of 1953; the Mining and Minerals Policy Act of 1970; the Federal Land Policy and Management Act of 1976; the National Materials and Minerals Policy, Research and Development Act of 1980; and the Energy Policy Act of 2005. This policy represents a commitment by the BLM to implement the requirements of these statutes consistent with BLM's other statutory obligations, as follows:

The Domestic Minerals Program Extension Act of 1953 states that each department and agency of the Federal Government charged with responsibilities concerning the discovery, development, production, and acquisition of strategic or critical minerals and metals shall undertake to decrease further, and to eliminate where possible, the dependency of the United States on overseas sources of supply of each such material.

The Mining and Minerals Policy Act of 1970 declares that it is the continuing policy of the Federal Government to foster and encourage private enterprise in the development of a stable domestic minerals industry and the orderly and economic development of domestic mineral resources. This act includes all minerals, including sand and gravel, geothermal, coal, oil and gas.

The Federal Land Policy and Management Act of 1976 reiterates that the 1970 Mining and Minerals Policy Act shall be implemented and directs that public lands be managed in a manner which recognizes the Nation's need for domestic sources of minerals and other resources.

The National Materials and Minerals Policy, Research and Development Act of 1980 requires the Secretary of the Interior to improve the quality of minerals data in Federal land use decision-making.

The Energy Policy Act of 2005 encourages energy efficiency and conservation; promotes alternative and renewable energy sources; reduces dependence on foreign sources of energy; increases domestic production; modernizes the electrical grid; and encourages the expansion of nuclear energy.

The BLM recognizes that public lands are an important source of the Nation's energy and non-energy mineral resources, some of which are critical and strategic. The BLM is responsible for making public lands available for orderly and efficient development of these resources under principles of multiple use and sustained yield, in accordance with FLPMA.

The following principles will guide the BLM in managing mineral resources on public lands:

> Except for Congressional withdrawals, public lands shall remain open and available for mineral exploration and development unless withdrawal or other administrative actions are clearly justified in the national interest in accordance with the DOI Land Withdrawal Manual 603 DM 1, and BLM regulations at 43 CFR §2310. Petitions to the Secretary of the Interior for revocation of land withdrawals for mineral exploration and development will be evaluated through the land use planning process.
>
> The BLM actively encourages development by private industry of public land mineral resources, and promotes practices and technology that least impact natural and human resources.
>
> The BLM will adjudicate and process mineral patent applications, permits, operating plans, mineral exchanges, leases and other mineral use authorizations for public lands in a manner to prevent unnecessary or undue degradation, in a timely and efficient manner, and will require financial assurances to provide for reclamation of the land and for other purposes authorized by law. Mine closure and reclamation considerations include alternative forms of use such as for landfills, wind farms,

biomass facilities and other industrial uses, to attract partnerships to utilize the existing mine infrastructure for a future economic opportunity.

The BLM land use planning and multiple-use management decisions will recognize that, with few exceptions, mineral exploration and development can occur concurrently or sequentially with other resource uses. The least restrictive stipulations that effectively accomplish the resource objectives or uses will be used. The BLM will coordinate with surface owners when the Federal minerals estate under their surface ownership is proposed for development.

Land use plans will reflect geological assessments and mineral potential on public lands through existing geology and mineral resource data, and to the extent feasible, through new mineral assessments to determine mineral potential. Partnerships with State Geologists and the U.S. Geological Survey for obtaining existing and new data should be considered.

The BLM will work closely with Federal, State and Tribal governments to reduce duplication of effort while processing mineral related permit applications.

The BLM will monitor locatable, salable and leasable mineral operations to ensure proper resource recovery and evaluation, production verification, diligence and enforcement of terms and conditions. The BLM will ensure receipt of fair market value for mineral materials, and appropriate royalty rates for leasable commodities unless otherwise provided for by statute.

The BLM will continue to develop e-Government solutions that will provide for electronic submission and tracking of applications for exploration and development of mineral resources. The BLM will continue to provide public access to mineral records, including spatial display of all types of authorizations and mineral resource data.

The BLM will maintain and enhance the understanding, skills, and abilities of effective professional, technical, and managerial personnel knowledgeable in adjudication, geology, mineral exploration and development.

To the extent provided by law, regulation, secretarial order, and written agreement with the Bureau of Indian Affairs, the BLM will apply the above principles to the management of mineral resources and operations on Indian Trust lands in order to comply with its Trust Responsibilities.

# E.6 CULTURAL RESOURCES

## The Antiquities Act of 1906

The Antiquities Act of 1906 (16 USC 431-433) protects objects of historic and scientific interest on public lands. It authorizes the President to designate historic landmarks and structures as national monuments and provides penalties for people who damage these historic sites. The Act has two main components: (1) a criminal enforcement component, which provides for the prosecution of persons who appropriate, excavate, injure or destroy any historic or prehistoric ruin or monument, or any object of antiquity on lands owned or controlled by the United States, and (2) a component that authorizes a permit for the examination of ruins and archaeological sites and the gathering of objects of antiquity on lands owned or controlled by the United States.

## Historic Sites Act of 1935

The Historic Sites Act (16 USC 461) declares national policy to identify and preserve historic sites, buildings, objects, and antiquities of national significance, thereby providing a foundation for the National Register of Historic Places (NRHP).

## National Historic Preservation Act of 1966

The National Historic Preservation Act of 1966 (NHPA), as amended (16 USC 470), expands protection of historic and archaeological properties to include those of national, state, and local significance. The NHPA (in Section 106) requires federal agencies to take into account the potential effects of agency actions on properties listed on or eligible for the NRHP. Agencies are also required to consult with the State Historic Preservation Office (SHPO), and sometimes with the Advisory Council on Historic Preservation, concerning those effects. The SHPO is also sometimes consulted concerning applicable methods for determining whether there are NRHP-eligible properties in the area of potential effect of an agency undertaking, whether properties are eligible, and appropriate mitigation measures. The NHPA (in Section 110) also requires federal agencies to identify properties that may qualify for listing on the NRHP, to evaluate and nominate such places to the register, and to develop plans for their management. Section 110 of the NHPA requires federal agencies to develop proactive programs to interpret archaeological resources for the benefit of the public. The 1992 amendments to the NHPA call for federal agencies to conduct Native American consultation on projects that may affect sites or resources that Tribes consider sensitive, sacred or culturally important.

## Protection and Enhancement of the Cultural Environment of 1971 (EO 11593)

Protection and Enhancement of the Cultural Environment directs federal agencies to locate, inventory, nominate and protect federally owned cultural resources eligible for the NRHP, and to ensure that their plans and programs contribute to preservation and enhancement of nonfederally owned resources.

## American Indian Religious Freedom Act of 1978

The American Indian Religious Freedom Act (42 USC 1996) clarifies U.S. policy pertaining to the protection of Native Americans' religious freedom. The special nature of Native American religions has frequently resulted in conflicts between federal laws and policies and religious freedom. The Act establishes a policy of protecting and preserving the inherent right of individual Native Americans (including American Indians, Eskimos, Aleuts, and Native Hawaiians) to believe, express and exercise their traditional religions.

## Archaeological Resources Protection Act of 1979

The Archaeological Resource Protection Act, as amended (16 USC 470a, 470cc, 470ee), requires permits for the excavation or removal of federally administered archaeological resources, encourages increased cooperation among federal agencies and private individuals, provides stringent criminal and civil penalties for violations, and requires federal agencies to identify important resources vulnerable to looting and to develop a tracking system for violations. ARPA requires federal agencies to establish a program to increase public awareness of the significance of the archaeological resources located on public lands and Indian lands and the need to protect such resources.

## Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act (25 USC 3001) is a federal law passed in 1990 that provides a process for museums and federal agencies to return certain Native American cultural items—human remains, funerary objects, sacred objects, and objects of cultural patrimony—to lineal descendants, culturally affiliated Native American tribes and Native Hawaiian organizations. It also addresses consultation with Native Americans for the excavation and/or removal of cultural items, and the discovery of cultural items made during land use activities.

The NAGPRA requires: 1) that Federal Agencies consult with tribes in regards to the repatriation of human remains and four types of cultural objects held in their collections; 2) that they consult with Native Americans in regards to the protection of burial sites on Federal land, both those known/suspected and those inadvertently discovered; 3) that the agency consults with Tribes on disposition/control of cultural items and human remains found on federal lands [25 USC 3002(a)]; 4) that Federal agencies will only allow excavation and removal of Native American items and human remains from Federal lands with a permit which is issued only after consultation with tribes [25 USC 3002(c)]; and 5) provides penalties for illegal trafficking [18 USC 1170].

## Indian Sacred Sites (EO 13007)

EO 13007, signed in 1996, requires each executive branch agency with statutory or administrative responsibility for the management of federal lands to accommodate access to and ceremonial use of Native American sacred sites by Native American religious practitioners and avoid adversely affecting the physical integrity of such sacred sites, whenever possible. Where appropriate, agencies shall maintain the confidentiality of sacred sites.

Indian Sacred Sites, as defined in Executive Order (EO) 13007, are "any specific, discrete, narrowly delineated location on federal land that is identified by an Indian tribe or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion." Indian Sacred Sites are not always eligible for the NRHP; however, pursuant to the guidelines in EO 13007, they receive the same protective measures as NRHP-eligible historic properties. Indian Sacred Sites [EO 13007] also mandates that Federal agency permitted actions cannot block Tribal access to sacred sites. To protect traditional Native American cultural resources, the locations are often kept confidential and not released to the public (BLM 2003[1]).

## Consultation and Coordination with Indian Tribal Governments (EO 13175)

EO 13175, signed in 2000, required federal agencies to establish regular and meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications, to strengthen the United States government-to-government relationships with Indian tribes, and to reduce the imposition of unfunded mandates upon Indian tribes.

## Trails for America in the 21st Century (EO 13195)

EO 13195, signed in 2001, requires federal agencies, to the extent permitted by law and where practicable—and in cooperation with tribes, states, local governments and interested citizen groups—to protect, connect, promote and assist trails of all types throughout the United States.

[1] *BLM Handbook H-1780-1: https://www.blm.gov/sites/blm.gov/files/uploads/H-1780-1__0.pdf.*

## Preserve America (EO 13287)

EO 13287, signed in 2003, requires the Federal Government to lead the preservation of America's heritage by actively advancing the protection, enhancement, and contemporary use of the historic properties owned by the government and by promoting intergovernmental cooperation and partnerships for the preservation and use of historic properties.

# E.7 HAZARDOUS MATERIALS

## Comprehensive Environmental Response, Compensation and Liability Act of 1980

The Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986 (42 USC 9601–9673), provides for liability, risk assessment, compensation, emergency response and cleanup (including the cleanup of inactive sites) for hazardous substances. The Act requires federal agencies to report sites where hazardous wastes are or have been stored, treated, or disposed of and requires responsible parties, including federal agencies, to clean up releases of hazardous substances.

## Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act, as amended by the Federal Facility Compliance Act of 1992 (42 USC 6901–6992), authorizes the U.S. EPA to manage, by regulation, hazardous wastes on active disposal operations. The Act waives sovereign immunity for federal agencies with respect to all federal, state and local solid and hazardous waste laws and regulations. Federal agencies are subject to civil and administrative penalties for violations and to cost assessments for the administration of the enforcement.

## Emergency Planning and Community Right-to-Know Act of 1986

The Emergency Planning and Community Right-to-Know Act of 1986 (42 USC 11001–11050) requires the private sector to inventory chemicals and chemical products, to report those in excess of threshold planning quantities, to inventory emergency response equipment, to provide annual reports and support to local and state emergency response organizations, and to maintain a liaison with the local and state emergency response organizations and the public.

# E.8 PALEONTOLOGICAL RESOURCES

## Paleontological Resources Preservation Act (summarized)

### Significance of the Law:

This is the first legislation specifically addressing the management of paleontological resources on Federal lands. BLM's management of paleontological resources was primarily authorized under the Federal Land Policy and Management Act (FLPMA) of 1976, the National Environmental Protection Act (NEPA) of 1969, and a host of lesser laws prior to enactment of this legislation.

As most of these existing laws did not specifically address paleontological resources directly, management was based on phrases such as "protect...the quality of scientific...and other values" (FLPMA) or that "important historic, cultural and natural aspects of our national heritage..." should be protected (NEPA). This left words like "quality," "scientific," "important" and "natural aspects" open for interpretation, especially when dealing with issues of permitting requirements, theft, and mitigation; and these

interpretations differed among agencies. Additionally, the broader implications of management were not considered, such as hobby collecting, commercial sales of non-scientific fossils, and just how far our management of the resource could legally extend. These FLPMA and NEPA statements were also focused solely on 'protection' rather than overall 'management,' therefore leaving unaddressed the opportunities for public interpretation, research, educational activities or other proactive efforts.

A Federal law addressing paleontological resources on Federal lands will eliminate or reduce most of these concerns. It will also recognize that paleontological resources are a legitimate, important resource that should be managed; beyond the vague 'protect important public values' principles. The mandates in the Paleontological Resources Preservation Act (PRPA) are actually quite similar to BLM's current management policies and practices, therefore little shift in our present approaches will result. However, this now gives us firm, clear direction - with the weight of law - to manage in this manner.

In summation, most of our management of paleontological resources has been based on our interpretations of indirect legislation, regulations, and policies, therefore it's been somewhat tenuous and subject to questioning. This Act will now provide us with firm legislative footing to properly manage all aspects of this resource.

## Management Issues:

This law states that casual (hobby) collection of fossils will be allowed; limited to reasonable amounts of common invertebrate and plant fossils, for non-commercial personal use. BLM did allow hobby collection of common invertebrate and plant fossils previously, but this was authorized under regulation and therefore was potentially subject to change at any time.

There will now be stricter penalties for unlawful collection of paleontological resources. Because paleontological resources were not specifically identified in other laws, which would then bring them under any penalty sections those laws may contain, it was always difficult to charge offenders with anything more stringent than theft of government property and a $500 fine, plus damages. Many of the more complete dinosaur skeletons sell for $50,000 to several million dollars, so a $500 fine was inconsequential and of little deterrent. The PRPA includes criminal and civil penalties for theft of paleontological resources, with possible penalties including up to five years in jail, and fines based on market or scientific value, costs of restoration, and any other factors considered relevant by the agency. Multiple offenses can be assessed for double the amount.

We will also have better consistency between agencies. This has not been a major issue; as most land managing agencies were similar in their overall approach, especially in recent years. But, there were a number of inconsistencies in the details of management approaches – the USGS, for example, has wanted to make specific locality data available to the public (primarily researchers) through written publications or web sites, but the BLM and other agencies treat this information as proprietary, and even exempt it from FOIA requests.

## Significant points and details:

Although many of these points reflect current policy, these now carry the weight of law, rather than regulations, policy statements, Instruction Memoranda or simple guidance; all subject to agency modification.

- Casual collecting is defined as "the collecting of a reasonable amount of common invertebrate and plant paleontological resources for non-commercial personal use...resulting in only negligible disturbance to the Earth's surface and other resources." It's further stated that "the terms 'reasonable amount', 'common invertebrate and plant paleontological resources' and 'negligible disturbance' shall be determined by the Secretary."

- Paleontological Resource is defined as "any fossilized remains, traces, or imprints of organisms, preserved in or on the earth's crust, that are of paleontological interest and that provide information about the history of life on earth..." and goes on to specifically exclude archaeological and cultural (human graves, mostly) resources. Sec. 6301
- "The Secretary shall manage and protect paleontological resources on Federal land using scientific principles and expertise." Sec. 6302 (a)
- Permits are required for collecting of paleontological resources, except:
- "The Secretary shall allow casual collecting without a permit..." on BLM, BOR, and National Forest System lands, consistent with other laws and policies. Sec. 6304 (a)(1) and (2)
- Criteria for issuance of a permit include: the applicant is qualified; the activity is undertaken to further paleontological knowledge or for public education; the activity is consistent with any management plans; the methods of collecting will not threaten significant natural or cultural resources. Sec. 6304 (b)
- Permits will contain such terms and conditions as necessary, and shall include requirements that: fossils collected from public lands remain the property of the United States; the paleontological resources and copies of associated records will be preserved in an approved repository; specific locality data will not be released by the permittee or repository without the written permission of the Secretary. Sec. 6304 (c)
- Areas may be closed to collecting or access restricted to protect paleontological resources. Sec. 6304 (e)
- Prohibited Acts include: trafficking or offering to traffic in paleontological resources, if the person knew or should have known they were illegally collected from public lands; sell or purchase, or offer for sale or purchase, any paleontological resource, if the person knew or should have known they were illegally collected from public lands. Sec. 6306 (a)
- No false labeling. Includes false records, accounts and identifications. Sec. 6306 (b)
- This would mean intentional false labeling; not honest mistakes or preliminary identifications.
- Penalties include fines based on value of the fossils and up to five years in jail; second or subsequent violations may result in doubling the penalties. Sec. 6306 (c)
- Amount of penalties should consider: the scientific or fair market value of the paleontological resource; the cost of restoration and repair of the resource and the locality; any other factors considered relevant by the agency. Sec. 6307 (a)
- Penalties collected can be used only to: protect, restore, or repair the paleontological resources and the sites they came from; provide educational materials to the public; payment of rewards. Sec. 6307 (d). Penalty fees do not go into the general fund or any other fund or activity.
- Rewards are authorized for furnishing information which leads to a conviction or violation, up to 1/2 the penalties assessed. Sec. 6308 (a)
- All paleontological resources associated with a violation or conviction is subject to forfeiture. Sec. 6308 (b) (the final legislation eliminated the draft provision that would have allowed seizure of equipment and vehicles used in connection with the violation)
- Seized paleontological resources may be transferred to Federal or non-Federal educational institutions. Sec. 6308 (c) (Will probably be limited to approved repositories)
- Information concerning the nature and specific location of a paleontological resource shall be exempt from FOIA, with a few key exemptions. Sec. 6309

- This law does not apply to, or require a permit for, casual collecting of a rock or mineral. Sec. 6311 (3)
- This law does not affect any land other than Federal land or affect the lawful collection or sale of paleontological resources from land other than Federal land. Sec. 6311 (4)
- (These last two points are in contrast to much of the misinformation that was circulating among rock club websites and other communications prior to passage).

### Next Steps:

The BLM (and other agencies) will develop formal regulations that will expand on these points, create the additional details needed for implementation, and assure consistency with all other laws, regulations, and policies. Because of the mandate for the DOI and DOA to coordinate (Sec. 6302 (b), regulations may be cooperatively developed, to result in Uniform Regulations. Whether all the regulations will be developed in this manner, or whether some will be done within a specific agency, is unknown at this time. Uniform Regulations will probably be written initially by interagency paleontology staff, followed by reviews at each agency. For the BLM, this review will include all paleontology staff, other resource staff, the BLM solicitors (lawyers) and agency management people. At this time, time frames and procedures for this process have not been determined. It is expected that implementation of the provisions of the law will be accomplished in stages, with some PRPA sections enacted with little or no regulations needed, while other sections may not be fully implemented for several years.

# E.9 WILDLIFE AND FISHERIES

## Endangered Species Act of 1973

The purpose of the Endangered Species Act (ESA) is to protect and recover imperiled species and the ecosystems upon which they depend. It is administered by the USDI's USFWS and the Department of Commerce's National Marine Fisheries Service (NMFS). The USFWS has primary responsibility for terrestrial and freshwater organisms, while the responsibilities of NMFS are mainly marine species such as salmon and whales.

## Bald and Golden Eagle Protection Act

The Bald Eagle Protection Act (16 USC 668) prohibits the take, possession, sale, purchase, barter, offer to sell, purchase, transport, export or import, of any bald eagle, alive or dead, or any part, nest, or egg thereof. "Take" includes pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb (50 CFR §22.3).

## Fish and Wildlife Coordination Act

The Act of March 10, 1934, (16 USC 661 et seq.) as amended, authorizes the Secretaries of Agriculture and Commerce to provide assistance to and cooperate with federal and state agencies to protect, rear, stock, and increase the supply of game and fur-bearing animals, as well as to study the effects of domestic sewage, trade wastes, and other polluting substances on wildlife. The Act also directs the Bureau of Fisheries to use impounded waters for fish-culture stations and migratory-bird resting and nesting areas and requires consultation with the Bureau of Fisheries before the construction of any new dams to provide for fish migration. In addition, the Act authorizes the preparation of plans to protect wildlife resources, the completion of wildlife surveys on public lands, and the acceptance by the federal agencies of funds or lands for related purposes provided that land donations receive the consent of the state in which they are located.

The amendments enacted in 1946 require consultation with the USFWS and the fish and wildlife agencies of states where the "waters of any stream or other body of water are proposed or authorized, permitted or licensed to be impounded, diverted…or otherwise controlled or modified" by any agency under a federal permit or license. Consultation is to be undertaken for the purpose of "preventing loss of and damage to wildlife resources."

## Fish and Wildlife Improvement Act of 1978

The Fish and Wildlife Improvement Act of 1978 (16 USC 7421; 92 Stat. 3110), Public Law 95-616, authorizes the Secretaries of the Interior and Commerce to establish, conduct, and assist with national training programs for state fish and wildlife law enforcement personnel. It also authorized funding for research and development of new or improved methods to support fish and wildlife law enforcement. The law provides authority to the Secretaries to enter into law enforcement cooperative agreements with state or other federal agencies and authorizes the disposal of abandoned or forfeited items under the fish, wildlife, and plant jurisdictions of these Secretaries. Public Law 105-328, signed October 30, 1998, amended the Act to allow the USFWS to use the proceeds from the disposal of abandoned items derived from fish, wildlife, and plants to cover the costs of shipping, storing and disposing of those items.

## Fish and Wildlife Conservation Act of 1980

The Fish and Wildlife Conservation Act (USC 2901–2911), commonly known as the Nongame Act, encourages states to develop conservation plans for nongame fish and wildlife of ecological, educational, aesthetic, cultural, recreational, economic or scientific value. The states may be reimbursed for a percentage of the costs of developing, revising, or implementing conservation plans approved by the Secretary of the Interior. Amendments adopted in 1988 and 1989 directed the Secretary to undertake research and conservation activities for migratory nongame birds.

## Migratory Bird Treaty Act of 1918 and EO 13186

The Migratory Bird Treaty Act (16 USC 703–712. § 703) makes taking, killing, or possessing migratory birds unlawful. It shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill, possess, offer for sale, sell, offer to barter, barter, offer to purchase, purchase, deliver for shipment, ship, export, import, cause to be shipped, exported, or imported, deliver for transportation, transport or cause to be transported, carry or cause to be carried, or receive for shipment, transportation, carriage, or export, any migratory bird, any part, nest, or eggs of any such bird, or any product, whether or not manufactured, which consists, or is composed in whole or part, of any such bird or any part, nest, or egg thereof, included in the terms of the conventions between the United States and Great Britain for the protection of migratory birds concluded August 16, 1916 (39 Stat. 1702); the United States and the United Mexican States for the protection of migratory birds and game mammals concluded February 7, 1936; the United States and the Government of Japan for the protection of migratory birds and birds in danger of extinction, and their environment concluded March 4, 1972 [1]; and the convention between the United States and the Union of Soviet Socialist Republics for the conservation of migratory birds and their environments concluded November 19, 1976 (50 CFR §10.12). Under Executive Order 13186, federal agencies are responsible for implementing the provisions of the Migratory Bird Treaty Act by promoting conservation principles and management practices into agency activities. Federal agencies must ensure that federal actions are evaluated for potential impacts on migratory birds.

## Sikes Act of 1960

The Sikes Act (16 USC 670a–670o, 74 Stat. 1052), as amended, Public Law 86-797, approved September 15, 1960, provides for cooperation by the Departments of the Interior and Defense with state agencies in

planning, development, and maintenance of fish and wildlife resources on military reservations throughout the United States. Key amendments to the Act that affect this EIS are highlighted below:

- An amendment enacted August 8, 1968 (Public Law 90-465, 82 Stat. 661), authorized a program for development of outdoor recreation facilities.
- Public Law 93-452, signed October 18, 1974 (88 Stat. 1369), authorized conservation and rehabilitation programs on Department of Energy (DOE), National Aeronautics and Space Administration (NASA), Forest Service, and BLM lands. These programs are carried out in cooperation with the states by the Secretary of the Interior and on Forest Service lands by the Secretary of Agriculture.
- Public Law 97-396, approved December 31, 1982 (96 Stat. 2005), provided for the inclusion of endangered plants in conservation programs developed for BLM, Forest Service, NASA, and DOE lands.
- Public Law 105-85, approved November 18, 1997 (11 Stat. 2017, 2018, 2020, 2022), added that each integrated natural resources management plan (INRMP) prepared under this act should provide for the sustainable use by the public of natural resources, to the extent that the use is not inconsistent with the needs of fish and wildlife resources. Public Law 105-85 also requires that the Secretary of the Interior, in consultation with state fish and wildlife agencies, submit a report annually on the amounts expended by the USDI and state fish and wildlife agencies on activities conducted pursuant to INRMPs to respective congressional committees with oversight responsibilities.

### Federal Cave Resources Protection Act of 1988

The purpose of the Federal Cave Resources Protection Act (16 USC 63) is to secure, protect and preserve significant caves on federal lands for the perpetual use, enjoyment, and benefit of all people and to foster increased cooperation and exchange of information between governmental authorities and those who use caves located on federal lands for scientific, education, or recreational purposes.

## E.10 WILD HORSES

### Wild Free Roaming Horse and Burro Act of 1971

The Wild Free Roaming Horse and Burro Act of 1971 provides for the management, protection and control of wild horses and burros on public lands and authorizes “adoption” of wild horses and burros by private individuals. Regulations applicable to wild horse and burro management on BLM-administered lands are provided in 43 CFR §4700.

## E.11 OTHER POLICY

### Regional Mitigation Strategies – Managing Large-scale Projects

Regional Mitigation Strategies are an effective tool for involving stakeholders in planning and efficiently managing Greater Sage-Grouse mitigation on a regional or landscape-level basis where the BLM anticipates large-scale projects and intensive, new development. The intent of Regional Mitigation Strategies, beyond fulfilling the concepts identified in §1.6(B)(1) includes the following:

- Increasing permitting efficiency and financial predictability for applicants by preplanning mitigation needs; and

- Enhancing the ability of Federal and State governments, Tribes, nongovernmental organizations, and resource users to invest in larger scale mitigation efforts through prioritization of investments and pooling of financial resources.

Regional Mitigation Strategies should include the following elements:

- A transparent stakeholder engagement process;
- A description of regional baseline conditions against which unavoidable impacts are assessed;
- The establishment and prioritization of regional mitigation objectives;
- The establishment of a method for calculating mitigation fees for unavoidable adverse impacts that warrant mitigation;
- The evaluation of appropriate mitigation sites, projects and/or measures;
- The identification and establishment of a structure to hold and apply mitigation investment funds; and
- The development of long-term monitoring and adaptive management requirements to evaluate and maximize the effectiveness of mitigation projects and measures.

A CCAA is a voluntary agreement whereby landowners agree to manage their lands to remove or reduce threats to species at risk of being listed under the ESA. In return for managing their lands to the benefit of a species at risk, landowners receive assurances against additional regulatory requirements should that species ever be listed under the ESA. Under a CCAA, the USFWS will issue enrolled landowners Enhancement of Survival permits pursuant to section 10(a)(1)(A) of the ESA for a period of 20 years. Since the agreement is voluntary, the landowner can end it at any point, although in doing so they would give up any assurances. Permits would be issued to participating landowners contingent on development of a site-specific sage-grouse conservation plan that is consistent with this CCAA.

# APPENDIX F—PREDATOR MANAGEMENT

## F.1 INTRODUCTION

The U.S. Department of the Interior, Bureau of Land Management (BLM) will implement strategies and techniques in land management decisions that minimize the threat predators pose. The land management agencies will also support and encourage other landowners and agencies in their efforts to minimize impacts from predators where needs have been documented.

## F.2 REQUIRED DESIGN FEATURES RELATIVE TO PREDATORS IN LAND MANAGEMENT DECISIONS

Project proponents are encouraged to include all appropriate conservation measures in their proposals. The BLM will require application of all appropriate conservation measures, warranted by site-specific analysis, in order to avoid, minimize, rectify, reduce, or compensate for impacts. Conservation measures not included in project proposals and determined appropriate from the site-specific analysis will be required as Conditions of Approval (COA), stipulations, terms and conditions, etcetera. Additional COAs developed through consultation with other federal, state, and local regulatory and resource agencies may be applied when supported by site-specific analysis.

Required Design Features include but are not limited to the following:

- Prohibit open garbage dumps
- Require appropriate disposal of animal carcasses
- Construct or modify vertical structures in a manner that prevents nesting or perching by scavengers or raptors
- Require raptor perch deterrents on power poles as a component of permit issuance or renewal according to Avian Power Line Interaction Committee (APLIC) 2012 standards (APLIC 2012. Suggested Practices for Raptor Protection on Power Lines and Mitigating Bird Collisions with Power Lines. http://aplic.org)
- Remove vertical structures, such as utility poles, buildings, or windmills, where feasible and where these structures are either no longer necessary or operational
- Minimize creation of new roads
- Remove roads, unimproved roads, two-tracks, and restore sagebrush habitat
- Dispose of all garbage in containers that cannot be opened by animals
- Inventory and monitor predator populations by project proponents
- Identify and replace operational windmills with solar pumps

# G.2 STANDARDS FOR HEALTHY RANGELANDS AND GUIDELINES FOR LIVESTOCK GRAZING MANAGEMENT FOR PUBLIC LANDS ADMINISTERED BY THE BUREAU OF LAND MANAGEMENT IN THE STATE OF WYOMING AUGUST 12, 1997

## Introduction

According to the Department of the Interior's final rule for grazing administration, effective August 21, 1995, the Wyoming Bureau of Land Management (BLM) State Director is responsible for the development of standards for healthy rangelands and guidelines for livestock grazing management on 18 million acres of Wyoming's public rangelands. The development and application of these standards and guidelines are to achieve the four fundamentals of rangeland health outlined in the grazing regulations (43 Code of Federal Regulations [CFR] 4180.1). Those four fundamentals are: 1) watersheds are functioning properly; 2) water, nutrients, and energy are cycling properly; 3) water quality meets state standards; and 4) habitat for special status species is protected.

Standards address the health, productivity, and sustainability of the BLM-administered public rangelands and represent the minimum acceptable conditions for the public rangelands. The standards apply to all resource uses on public lands. Their application will be determined as use-specific guidelines are developed. Standards are synonymous with goals and are observed on a landscape scale. They describe healthy rangelands rather than important rangeland by-products. The achievement of a standard is determined by measuring appropriate indicators. An indicator is a component of a system whose characteristics (e.g., presence, absence, quantity, and distribution) can be measured based on sound scientific principles.

Guidelines provide for and guide the development and implementation of reasonable, responsible, and cost-effective management practices at the grazing allotment and watershed level. The guidelines in this document apply specifically to livestock grazing management practices on BLM-administered public lands. These management practices will either maintain existing desirable conditions or move rangelands toward statewide standards within reasonable timeframes. Appropriate guidelines will ensure that the resultant management practices reflect the potential for the watershed, consider other uses and natural influences, and balance resource goals with social, cultural/historic, and economic opportunities to sustain viable local communities. Guidelines, like standards, apply statewide.

Implementation of the Wyoming standards and guidelines will generally be done in the following manner:

- Grazing allotments or groups of allotments in a watershed will be reviewed based on the BLM's current allotment categorization and prioritization process.
- Allotments with existing management plans and high-priority allotments will be reviewed first.
- Lower priority allotments will then be reviewed as time allows or when it becomes necessary for BLM to review the permit/lease for other reasons such as permit/lease transfers, permittee/lessee requests for change in use, etc.
- The permittees and interested publics will be notified when allotments are scheduled for review and encouraged to participate in the review.
- The review will first determine if an allotment meets each of the six standards.
- If it does, no further action will be necessary.
- If any of the standards aren't being met, rationale explaining the contributing factors will be prepared.

- If livestock grazing practices are found to be among the contributing factors, corrective actions consistent with the guidelines will be developed and implemented before the next grazing season in accordance with 43 CFR 4180.
- If a lack of data prohibits the reviewers from determining if a standard is being met, a strategy will be developed to acquire the data in a timely manner.

On a continuing basis, the Standards for Healthy Rangelands will direct on-the-ground management on the public lands. They will serve to focus the ongoing development and implementation of activity plans toward the maintenance or the attainment of healthy rangelands.

Quantifiable resource objectives and specific management practices to maintain or achieve the standards will be developed at the local BLM District and Resource Area levels and will consider all reasonable and practical options available to achieve desired results on a watershed or grazing allotment scale. The objectives shall be reflected in site-specific activity or implementation plans as well as in livestock grazing permits/leases for the public lands. These objectives and practices may be developed formally or informally through mechanisms available and suited to local needs (such as Coordinated Resource Management [CRM] efforts).

The development and implementation of standards and guidelines will enable on-the-ground management of the public rangelands to maintain a clear and responsible focus on both the health of the land and its dependent natural and human communities. This development and implementation will ensure that any mechanisms currently being employed or that may be developed in the future will maintain a consistent focus on these essential concerns. This development and implementation will also enable immediate attention to be brought to bear on existing resource concerns.

These standards and guidelines are compatible with BLM's three-tiered land use planning process. The first tier includes the laws, regulations, and policies governing BLM's administration and management of the public lands and their uses. The previously mentioned fundamentals of rangeland health specified in 43 CFR 4180.1, the requirement for BLM to develop these state (or regional) standards and guidelines, and the standards and guidelines themselves, are part of this first tier. Also, part of this first tier are the specific requirements of various federal laws and the objectives of 43 CFR 4100.2 that require BLM to consider the social and economic well-being of the local communities in its management process.

These standards and guidelines will provide for statewide consistency and guidance in the preparation, amendment, and maintenance of BLM land use plans, which represent the second tier of the planning process. The BLM land use plans provide general allocation decisions concerning the kinds of resource and land uses that can occur on BLM-administered public lands, where they can occur, and the types of conditional requirements under which they can occur. In general, the standards will be the basis for development of planning area-specific management objectives concerning rangeland health and productivity, and the guidelines will direct development of livestock grazing management actions to help accomplish those objectives.

The third tier of the BLM planning process, activity or implementation planning, is directed by the applicable land use plan and, therefore, by the standards and guidelines. The standards and guidelines, as BLM statewide policy, will also directly guide development of the site-specific objectives and the methods and practices used to implement the land use plan decisions. Activity or implementation plans contain objectives which describe the site-specific conditions desired. Grazing permits/leases for the public lands contain terms and conditions which describe specific actions required to attain or maintain the desired conditions. Through monitoring and evaluation, the BLM, grazing permittees, and other interested parties determine if progress is being made to achieve activity plan objectives.

Wyoming rangelands support a variety of uses which are of significant economic importance to the state and its communities. These uses include oil and gas production, mining, recreation and tourism, fishing, hunting, wildlife viewing, and livestock grazing. Rangelands also provide amenities which contribute to the quality of

life in Wyoming such as open spaces, solitude, and opportunities for personal renewal. Wyoming's rangelands should be managed with consideration of the state's historical, cultural, and social development and in a manner that contributes to a diverse, balanced, competitive, and resilient economy in order to provide opportunity for economic development. Healthy rangelands can best sustain these uses.

To varying degrees, BLM management of public lands and resources plays a role in the social and economic well-being of Wyoming communities. The National Environmental Policy Act (part of the above-mentioned first planning tier) and various other laws and regulations mandate the BLM to analyze the socioeconomic impacts of actions occurring on public rangelands. These analyses occur during the environmental analysis process of land use planning (second planning tier), where resource allocations are made, and during the environmental analysis process of activity or implementation planning (third planning tier). In many situations, factors that affect the social and economic well-being of local communities extend far beyond the scope of BLM management or individual public land users' responsibilities. In addition, since standards relate primarily to physical and biological features of the landscape, it is very difficult to provide measurable socioeconomic indicators that relate to the health of rangelands. It is important that standards be realistic and within the control of the land manager and users to achieve.

## Standards for Healthy Public Rangelands

### Standard #1

**Within the potential of the ecological site (soil type, landform, climate, and geology), soils are stable and allow for water infiltration to provide for optimal plant growth and minimal surface runoff.**

**This means that:**

The hydrologic cycle will be supported by providing for water capture, storage, and sustained release. Adequate energy flow and nutrient cycling through the system will be achieved as optimal plant growth occurs. Plant communities are highly varied within Wyoming.

**Indicators may include but are not limited to:**

- Water infiltration rates
- Soil compaction
- Erosion (rills, gullies, pedestals, capping)
- Soil microorganisms
- Vegetative cover (gully bottoms and slopes)
- Bare ground and litter.

The above indicators are applied as appropriate to the potential of the ecological site.

## Standard #2

**Riparian and wetland vegetation have structural, age, and species diversity characteristic of the stage of channel succession and is resilient and capable of recovering from natural and human disturbance in order to provide forage and cover, capture sediment, dissipate energy, and provide for groundwater recharge.**

**This means that:**

Wyoming has highly varied riparian and wetland systems on public lands. These systems vary from large rivers to small streams and from springs to large wet meadows. These systems are in various stages of natural cycles and may also reflect other disturbance that is either localized or widespread throughout the watershed. Riparian vegetation captures sediments and associated materials, thus enhancing the nutrient cycle by capturing and utilizing nutrients that would otherwise move through a system unused.

**Indicators may include but are not limited to:**

- Erosion and deposition rate
- Channel morphology and floodplain function
- Channel succession and erosion cycle
- Vegetative cover
- Plant composition and diversity (species, age class, structure, successional stages, desired plant community, etc.)
- Bank stability
- Woody debris and instream cover
- Bare ground and litter.

The above indicators are applied as appropriate to the potential of the ecological site.

## Standard #3

**Upland vegetation on each ecological site consists of plant communities appropriate to the site, which are resilient, diverse, and able to recover from natural and human disturbance.**

**This means that:**

In order to maintain desirable conditions and/or recover from disturbance within acceptable timeframes, plant communities must have the components present to support the nutrient cycle and adequate energy flow. Plants depend on nutrients in the soil and energy derived from sunlight. Nutrients stored in the soil are used over and over by plants, animals, and microorganisms. The amount of nutrients available and the speed with which they cycle among plants, animals, and the soil are fundamental components of rangeland health. The amount, timing, and distribution of energy captured through photosynthesis are fundamental to the function of rangeland ecosystems.

**Indicators may include, but are not limited to:**

- Vegetative cover
- Plant composition and diversity (species, age class, structure, successional stages, desired plant community, etc.)
- Bare ground and litter

- Erosion (rills, gullies, pedestals, capping)
- Water infiltration rates.

The above indicators are applied as appropriate to the potential of the ecological site.

## Standard #4

**Rangelands are capable of sustaining viable populations and a diversity of native plant and animal species appropriate to the habitat. Habitats that support or could support threatened, endangered, species of special concern, or sensitive species will be maintained or enhanced.**

**This means that:**

The management of Wyoming rangelands will achieve or maintain adequate habitat conditions that support diverse plant and animal species. These may include listed threatened or endangered species (U.S. Fish and Wildlife [USFWS]-designated), species of special concern (BLM-designated), and other sensitive species (USFWS-designated), species of special concern (BLM-designated), and other sensitive species (State of Wyoming-designated). The intent of this standard is to allow the listed species to recover and be delisted, and to avoid or prevent additional species becoming listed.

**Indicators may include, but are not limited to:**

- Noxious weeds
- Species diversity
- Age class distribution
- All indicators associated with the upland and riparian standards
- Population trends
- Habitat fragmentation.

The above indicators are applied as appropriate to the potential of the ecological site.

## Standard #5

**Water quality meets state standards.**

**This means that:**

The State of Wyoming is authorized to administer the Clean Water Act (CWA). BLM management actions or use authorizations will comply with all federal and state water quality laws, rules and regulations to address water quality issues that originate on public lands. Provisions for the establishment of water quality standards are included in the CWA, as amended, and the Wyoming Environmental Quality Act, as amended. Regulations are found in Part 40 of the CFR and in *Wyoming's Water Quality Rules and Regulations*. The latter regulations contain Quality Standards for Wyoming Surface Waters.

Natural processes and human actions influence the chemical, physical, and biological characteristics of water. Water quality varies from place to place with the seasons, the climate, and the kind substrate through which water moves. Therefore, the assessment of water quality takes these factors into account.

**Indicators may include but are not limited to:**

- Chemical characteristics (e.g., pH, conductivity, dissolved oxygen)

- Physical characteristics (e.g., sediment, temperature, color)
- Biological characteristics (e.g., macro- and micro-invertebrates, fecal coliform, and plant and animal species).

### Standard #6

**Air quality meets Wyoming standards.**

**This means that:**

The State of Wyoming is authorized to administer the Clean Air Act (CAA). BLM management actions or use authorizations will comply with all federal and state air quality laws, rules, regulations, and standards. Provisions for the establishment of air quality standards are included in the CAA, as amended, and the Wyoming Environmental Quality Act, as amended. Regulations are found in Part 40 of the CFR and in Wyoming Air Quality Standards and Regulations.

**Indicators may include but are not limited to:**

- Particulate matter
- Sulfur dioxide
- Photochemical oxidants (ozone)
- Volatile organic compounds (hydrocarbons)
- Nitrogen oxides
- Carbon monoxide
- Odors
- Visibility.

## BLM Wyoming Guidelines for Livestock Grazing Management

1. Timing, duration, and levels of authorized grazing will ensure that adequate amounts of vegetative ground cover, including standing plant material and litter, remain after authorized use to support infiltration, maintain soil moisture storage, stabilize soils, allow the release of sufficient water to maintain system function, and to maintain subsurface soil conditions that support permeability rates and other processes appropriate to the site.
2. Grazing management practices will restore, maintain, or improve riparian plant communities. Grazing management strategies consider hydrology, physical attributes, and potential for the watershed and the ecological site. Grazing management should maintain adequate residual plant cover to provide for plant recovery, residual forage, sediment capture, energy dissipation, and groundwater recharge.
3. Range improvement practices (instream structures, fences, water troughs, etc.) in and adjacent to riparian areas will ensure that stream channel morphology (e.g., gradient, width/depth ratio, channel roughness and sinuosity) and functions appropriate to climate and landform are maintained or enhanced. The development of springs, seeps, or other projects affecting water and associated resources shall be designed to protect the ecological and hydrological functions, wildlife habitat, and significant cultural, historical, and archaeological values associated with the water source. Range improvements will be located away from riparian areas if they conflict with achieving or maintaining riparian function.
4. Grazing practices that consider the biotic communities as more than just a forage base will be designed in order to ensure that the appropriate kinds and amounts of soil organisms, plants, and animals to support the hydrologic cycle, nutrient cycle, and energy flow are maintained or enhanced.

5. Continuous season-long or other grazing management practices that hinder the completion of plants' life-sustaining reproductive and/or nutrient cycling processes will be modified to ensure adequate periods of rest at the appropriate times. The rest periods will provide for seedling establishment or other necessary processes at levels sufficient to move the ecological site condition toward the resource objective and subsequent achievement of the standard.
6. Grazing management practices and range improvements will adequately protect vegetative cover and physical conditions and maintain, restore, or enhance water quality to meet resource objectives. The effects of new range improvements (water developments, fences, etc.) on the health and function of rangelands will be carefully considered prior to their implementation.
7. Grazing management practices will incorporate the kinds and amounts of use that will restore, maintain, or enhance habitats to assist in the recovery of federal threatened and endangered species or the conservation of federally-listed species of concern and other state-designated special status species. Grazing management practices will maintain existing habitat or facilitate vegetation change toward desired habitats. Grazing management will consider threatened and endangered species and their habitats.
8. Grazing management practices and range improvements will be designed to maintain or promote the physical and biological conditions necessary to sustain native animal populations and plant communities. This will involve emphasizing native plant species in the support of ecological function and incorporating the use of non-native species only in those situations in which native plant species are not available in sufficient quantities or are incapable of maintaining or achieving properly functioning conditions and biological health.
9. Grazing management practices on uplands will maintain desired plant communities or facilitate change toward desired plant communities.

## Definitions

**Activity plans:** Allotment Management Plans (AMP), Habitat Management Plans (HMP), Watershed Management Plans (WMP), Wild Horse Management Plans (WHMP), and other plans developed at the local level to address specific concerns and accomplish specific objectives.

**Coordinated Resource Management (CRM):** A group of people working together to develop common resource goals and resolve natural resource concerns. CRM is a people process that strives for win-win situations through consensus-based decision making.

**Desired plant community:** A plant community which produces the kind, proportion, and amount of vegetation necessary for meeting or exceeding the land use plan/activity plan objectives established for an ecological site(s). The desired plant community must be consistent with the site's capability to produce the desired vegetation through management, land treatment, or a combination of the two.

**Ecological site:** An area of land with specific physical characteristics that differs from other areas both in its ability to produce distinctive kinds and amounts of vegetation and in its response to management.

**Erosion:** (v.) Detachment and movement of soil or rock fragments by water, wind, ice, or gravity. (n.) The land surface worn away by running water, wind, ice, or other geological agents, including such processes as gravitational creep.

**Grazing management practices:** Grazing management practices include such things as grazing systems (rest-rotation, deferred rotation, etc.), timing and duration of grazing, herding, salting, etc. They do not include physical range improvements.

**Guidelines (for grazing management):** Guidelines provide for and guide the development and implementation of reasonable, responsible, and cost-effective management actions at the allotment

and watershed level which move rangelands toward statewide standards or maintain existing desirable conditions. Appropriate guidelines will ensure that the resultant management actions reflect the potential for the watershed, consider other uses and natural influences, and balance resource goals with social, cultural/historic, and economic opportunities to sustain viable local communities. Guidelines, and, therefore, the management actions they engender, are based on sound science, past and present management experience, and public input.

**Indicator:** An indicator is a component of a system whose characteristics (e.g., presence, absence, quantity, and distribution) can be measured based on sound scientific principles. An indicator can be measured (monitored and evaluated) at a site- or species-specific level. Measurement of an indicator must be able to show change within timeframes acceptable to management and be capable of showing how the health of the ecosystem is changing in response to specific management actions. Selection of the appropriate indicators to be monitored in a particular allotment is a critical aspect of early communication among the interests involved on the ground. The most useful indicators are those for which change or trend can be easily quantified and for which agreement as to the significance of the indicator is broad based.

**Litter:** The uppermost layer of organic debris on the soil surface, essentially the freshly fallen or slightly decomposed vegetal material.

**Management actions:** Management actions are the specific actions prescribed by the BLM to achieve resource objectives, land use allocations, or other program or multiple use goals. Management actions include both grazing management practices and range improvements.

**Objective:** An objective is a site-specific statement of a desired rangeland condition. It may contain qualitative (subjective) elements, but it must have quantitative (objective) elements so that it can be measured. Objectives frequently speak to change. They may measure the avoidance of negative changes or the accomplishment of positive changes. They are the focus of monitoring and evaluation activities at the local level. Objectives may measure the products of an area rather than its ability to produce them, but if they do so, it must be kept in mind that the lack of a product may not mean that the standards have not been met. Instead, the lack of a particular product may reflect other factors such as political or social constraints. Objectives often focus on indicators of greatest interest for the area in question.

**Range improvements:** Range improvements include such things as corrals, fences, water developments (reservoirs, spring developments, pipelines, wells, etc.) and land treatments (prescribed fire, herbicide treatments, mechanical treatments, etc.).

**Rangeland:** Land on which the native vegetation (climax or natural potential) is predominantly grasses, grass-like plants, forbs, or shrubs. This includes lands revegetated naturally or artificially when routine management of that vegetation is accomplished mainly through manipulation of grazing. Rangelands include natural grasslands, savannas, shrublands, most deserts, tundra, alpine communities, coastal marshes, and wet meadows.

**Rangeland health:** The degree to which the integrity of the soil and ecological processes of rangeland ecosystems are sustained.

**Riparian:** An area of land directly influenced by permanent water. It has visible vegetation or physical characteristics reflective of permanent water influence. Lakeshores and streambanks are typical riparian areas. Excluded are such sites as ephemeral streams or washes that do not have vegetation dependent on free water in the soil.

**Standards:** Standards are synonymous with goals and are observed on a landscape scale. Standards apply to rangeland health and not to the important by-products of healthy rangelands. Standards relate to the current capability or realistic potential of a specific site to produce these by-products, not to the

presence or absence of the products themselves. It is the sustainability of the processes, or rangeland health, that produces these by-products.

**Terms and conditions:** Terms and conditions are very specific land use requirements that are made a part of the land use authorization in order to assure maintenance or attainment of the standard. Terms and conditions may incorporate or reference the appropriate portions of activity plans (e.g., AMPs). In other words, where an activity plan exists that contains objectives focused on meeting the standards, compliance with the plan may be the only term and condition necessary in that allotment.

**Upland:** Those portions of the landscape which do not receive additional moisture for plant growth from run-off, streamflow, etc. Typically, these are hills, ridgetops, valley slopes, and rolling plains.

This page intentionally left blank.

# APPENDIX H—BIOLOGICAL ASSESSMENT

Section 7 consultation with the U.S. Fish and Wildlife Service is ongoing. The Biological Assessment and Biological Opinion will be posted to the ePlanning site (https://eplanning.blm.gov/eplanning-ui/project/13853/510) prior to issuance of the Record of Decision.

This page intentionally left blank.

# APPENDIX I—RECLAMATION PLAN

## I.1 INTRODUCTION

Reclamation of public land is required for any surface disturbing activity. A reclamation plan tailored to a specific surface disturbing activity will be required for Federal actions authorized, conducted, or funded by the Bureau of Land Management (BLM) that causes surface disturbance. This appendix details the elements that need to be considered during project planning, project implementation, and post-disturbance steps required to assure timely and proper recovery of the site.

This plan provides a framework for project-specific and site-specific reclamation actions that guide land management toward a future condition for any surface disturbance. Early coordination between the BLM and project proponents is necessary to produce a comprehensive, site specific plan. The site-specific reclamation plan will serve as a binding agreement between project proponents and the land management agencies for the expected reclamation condition of the disturbed lands and may be periodically reviewed and modified as necessary. The reclamation plan will include sufficient monitoring requirements, reports, and components to ensure sufficiency.

Although the proponent will typically develop the reclamation plan, appropriate BLM involvement in preplanning, data inventory, and approval is essential to develop the optimum reclamation proposal. Most determinations regarding what is expected should be made before the reclamation plan is approved and implemented. However, the BLM Authorizing Officer (AO) can modify a plan through adaptive management, to adjust to changing conditions or to correct for an oversight using the best available science; changes should be agreed upon by the project proponent. Approved reclamation and weed control plans and reporting obligations will be required prior to any surface disturbing activity.

## I.2 ECOLOGICAL SITE DESCRIPTION

To understand the variations across the landscape, Natural Resource Conservation Service (NRCS) has classified these different parts into units called ecological sites. Ecological site is defined as “a distinctive kind of land with specific characteristics that differs from other kinds of land in its ability to produce a distinctive kind and amount of vegetation.” Any land inventory, analysis, and resulting management decisions require the knowledge of these individual sites and their interrelationships to one another on the landscape.

The Ecological Site Description (ESD) application provides the capability to produce automated ESD from the data stored in its database. An ESD is the official repository for all data associated with the development of forestland and rangeland ESD by the NRCS.

The data comprising an ESD is presented in four major categories:

- Site Characteristics – Identifies the site and describes the physiographic, climate, soil, and water features associated with the site.
- Plant Communities – Describes the ecological dynamics and the common plant communities comprising the various vegetation states of the site. The disturbances that cause a shift from one state to another are also described.
- Site Interpretations – Interpretive information pertinent to the use and management of the site and its related resources.
- Supporting Information – Provides information on sources of information and data utilized in developing the site description and the relationship of the site to other ecological sites.

This information and the ESDs the NRCS have developed to date may be found at the following website: http://esis.sc.egov.usda.gov/Welcome/pgECOLOGICALSITEDESCRIPTIONWelcome.aspx

## I.2.1 Reclamation Plan Requirements/Minimum Standards

Reclamation plans should incorporate the standards set forth in Wyoming BLM Reclamation Policy as described in IM WY-2012-032 and the High Desert District Policy for Reclamation of Disturbed Lands in IM WYD-2012-0005.

## I.2.2 Reclamation Goals

### Goals:

- Short term goal: immediately stabilize disturbed areas and provide conditions necessary to achieve the long-term goal.
- Long term goal: facilitate eventual ecosystem reconstruction to maintain a safe and stable landscape and meet the desired outcomes of the land use plan.
- Reclaim vegetative communities within disturbed areas that will mirror those of healthy communities as described in the ESD.

## I.2.3 Reclamation Objectives:

- Restore vegetative cover and landforms sufficient to maintain healthy, biologically active topsoil; control erosion; and, minimize habitat loss during the life of the well, facilities, or other surface disturbing activities.

In addition:

- Provide conditions and use methods to allow for successful reclamation in the least amount of time relative to site condition.
- Return the land to the desired condition based on ESDs. This includes restoration of the landform and natural vegetative community, hydrologic systems, visual resources, and wildlife habitats. To ensure that the long-term objective will be reached through human and natural processes, actions will be taken to ensure standards are met for site stability, visual quality, hydrological function, vegetative productivity, and habitat function.

## I.2.4 Pre-Disturbance Baseline

Pre-disturbance inventory is a critical part of reclamation planning and provides information on ecological structure and function. This should include inventory of wildlife habitat, species composition, watershed protection, and visual qualities; as well as, characteristics that underlie those values and functions – the plants, soil, and landscape features that may require restoration. The inventory establishes a framework for successful reclamation, monitoring, and evaluation.

The inventory includes two steps necessary to compile complete and accurate information:

1. Gathering existing site-specific information from reliable sources
2. Evaluating on-site ecosystem function and characteristics that may require subsequent restoration.

**Table I-1. Description of Baseline Inventory**

| Activity | Critical Components |
|---|---|
| Initiating baseline inventory | • Identify site location<br>• Contact BLM<br>• Consult soil survey maps<br>• Determine ESD<br>• Consult Wyoming Geographic Information Center (WyGISC) to access aerial photography in color, grayscale, or color infrared (CIR)<br>• Identify wildlife presence or use |
| Conducting baseline inventory | • Travel to site<br>• Verify ESD and soil types<br>• Record vegetation types and distribution on the site using an accepted method for collecting the data<br>• Record topographical landforms and surface hydrological features<br>• Take photographs to provide a visual reference<br>• Document data gathering and photos with GPS coordinates. |

## I.2.5 General Reclamation Best Management Practices

This section identifies best management practices (BMP) that could be suggested as recommendations during interim and final reclamation. These would be BMPs for species other than GSG.

"Live-hauling" topsoil from one location to another location may aid in reclamation success, but should only be considered on a "case-by-case basis" because the ESD for topsoil from one location could be different from its destination. Timing problems could also occur when stripping topsoil from one location and hauling to another location. The quantity of topsoil could likely vary from one location to another location.

The BLM AO may direct the use of containerized plants in not more than gallon-sized pots and germinated from a local seed source. These plants would be planted in clusters to catch snow, retain moisture, and provide a seed source. This would mostly apply to native shrubs such as sagebrush and saltbush with the purpose of quickly establishing the shrub component. Some or all the following practices may be implemented to expedite reclamation:

- Planting bare-root seedlings (shrubs such as sagebrush)
- Importing topsoil to add to spots where it is absent or not productive
- Erecting fences (wildlife friendly) around reclaimed areas to allow for enhanced establishment of vegetation
- Using snow fences or an alternate snow-capture device to capture moisture
- Irrigating reclamation (enough to simulate typical spring and summer moisture) to establish roots
- Irrigating reclamation could be repeated for the first two years but not more than three. A pause in irrigation after three years provides a period for the vegetation to demonstrate persistence before the reclamation can be accepted as complete.

## Vegetation Management

- Reduce vegetation damage during reclamation in adjacent areas.
- Choose native seed mixes that will provide vegetative cover for land use. Where native seed mixes of local genotype are not available, consider the use of appropriate cultivars of native species.
- Plan time of year for seed planting based on the optimal growing conditions for that species, site specific conditions, and the environmental conditions of that growing season.
- BLM approved non-native species used solely for site stabilization should be sterile, or a species unlikely to persist as natives are established.

## Additional Monitoring Components

Project proponent should start post-disturbance collection of cover and composition data in the first growing season after disturbance. Data must be collected using repeatable methods approved by the appropriate land management agency and will be the same methods that were used to describe vegetation for baseline (or reference area). The same methods will be used each time the vegetation is monitored.

## Pre-Development Habitat Management

Use native site seed collection and local seed sources to the maximum extent practicable to maintain genetic diversity of local plant populations. Consider the use of cultivars of native species in the absence of sources of native seeds.

## Exceptions

To facilitate reclamation seeding during the optimal growing seasons, exceptions may be approved providing that the exception granted would minimize surface disturbance outside of the action area.

## Proponent Agreements

The land management agencies will encourage cooperative agreements between the agencies, proponent project proponents, and interested proponents to ensure the success of habitat reclamation.

## Criteria for Determining Reclamation Success

The end result of reclamation success is the return of functional wildlife habitat within the disturbance area.

A. The Rangeland Ecological Site Interagency Manual (WO IB 2011-004) has the following objectives that address the use of ESD which include State and Transition Models:
   - To implement a standardized system to define and describe a common unit for inventory, monitoring, evaluation, and management of rangeland ecosystems.
   - To provide direction for the cooperative development and application of rangeland ESD.

B. The Rangeland Ecological Site Interagency Handbook (mentioned above) goes into detail on use of State and Transition Models and ESD and can be used as a reference when developing reclamation plans using these methods.

C. The current BLM Handbook H-4180-1 contains references to ecological sites, ESD, and reference areas. The site potential is related to transitions and thresholds in the handbook. The handbook also recognizes the Ecological Site Index and ESD may not be available for all assessment areas, but that

where they exist, they should be used. Other vegetation succession models are not mentioned in H-4180-1.

D. The National Range Handbook (H-4410-1) addresses State and Transition Models and ESD and can be used as a reference.

E. The NCRS Ecological Site Inventory Technical Reference (TR 1734-07) also discusses succession and State and Transition Model pathways, and ESD.

F. The NRCS Riparian-Wetland Ecological Site Inventory Technical Reference (TR-1737-7) does the same as TR 1734-07 which also discusses succession and State and Transition Model pathways, and ESD.

If ESDs, which include State and Transition Models, are not written for the project site, the project proponent should work with the land management agencies, WGFD, NRCS, and other local experts to create these products.

## General Reclamation Requirements

Vegetation would be reestablished on a site-specific basis that would meet BLM approval.

### Vegetative Criteria

**Native Forbs:** The average frequency of desirable forbs must be a minimum of 75% of the ESD reference site. Reference sites must be selected in areas of the same ESD and must be mutually agreed upon with the land management agency and WGFD. If this is not possible, the desired plant community for the site may be used. Diversity of forbs on a reclaimed site must be equal to or greater than pre-disturbance composition. Timeframes to determine whether replanting or developing another strategy to meet native forb establishment will be determined upon establishing the ESD.

**Native Shrubs:** The average frequency of the shrub component must be at least 50% of the ESD reference site. This includes both shrubs and sub-shrubs (e.g., winterfat (*Krascheninnikovia lanata*), fringed sage (*Artemisia frigida*), etc.). At least 15% density or frequency of the shrub component must be by the dominant species relative to pre-disturbance composition. The diversity of shrubs must be equal to or greater than the desired plant community. Timeframes to determine whether replanting or developing another strategy to meet native shrub establishment will be determined upon establishing the ESD.

**Native Grasses:** Reclaimed sites must have growth forms and plant diversity representative of the ESD reference site. These are to be planted at rates appropriate to achieve abundance and diversity characteristic of those found in the ESD reference site. Timeframes to determine whether replanting or developing another strategy to meet native grass establishment will be determined upon establishing the ESD.

**Non-Native and Invasive Species:** Reclaimed sites must be free from all species listed on the Wyoming Noxious Weed List. All local, state, and federal invasive[1] plant laws and regulations must be adhered to. Other highly competitive invasive plants, such as downy brome grass, will be controlled. Site specific weed management plans will address management goals and priorities.

**Plant Vigor:** Plants must be resilient as evidenced by well-developed root systems, flowers, and seed heads. All sites to be considered reclaimed must exhibit the sustainability of the above desired attributes. A minimum of one growing season without external influences (irrigation, mat pads, fences, etc.) may satisfy this requirement.

[1] *Invasive species. A species that is not native (or is alien) to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health (Executive Order 13112).*

## Final Reclamation Criteria

### Ground Cover and Ecological Function

To ensure soil stability and nutrient cycling, canopy must be equal to or greater than the pre-disturbance composition and vegetative litter must be decomposing into the soil.

### Vegetative Criteria

**Native Forbs:** The average percent composition and total diversity of forbs must be equal to or greater than pre-disturbance composition. Timeframes to determine whether replanting or developing another strategy to meet native forb establishment will be determined upon establishing the ESD.

**Native Shrubs:** The average frequency of the shrub component must be at least 80% of pre-disturbance composition within eight years. This includes both shrubs and half shrubs (e.g. winterfat, fringed sage, etc.). At least 25% density or frequency of the shrub component must be the dominant species from the reference site. The diversity of shrubs must be equal to or greater than the reference site.

**Native Grasses:** Reclaimed sites must exhibit grass percent composition equal to the reference site. Timeframes to determine whether replanting or developing another strategy to meet native grass establishment will be determined upon establishing the ESD.

**Non-Native/Noxious/Invasive Weeds:** Sites must be free from all species listed on the Wyoming and Federal noxious weed list. All state and federal laws regarding non-native species and noxious weeds must be followed. Aggressive action to eliminate highly competitive invasive species such as cheatgrass and other invasive brome grasses must be taken to prevent spread.

**Plant Vigor:** Plants must be resilient as evidenced by well-developed root systems and flowers. Shrubs will be well established and will exhibit age class structure.

## An Alternative Determination for Reclamation Success

Standards for success will be developed based on performance-based criteria and the ESD. The objectives for each reclamation plan are set with site specific criteria at the field office level, thereby maximizing the unique conditions within each field office.

# I.2.6 Weed Management

- Control the spread of and/or eradicate noxious weeds or other invasive species infestations.
- Mitigation will be applied to all activities to control noxious weeds or other invasive species.
- Weed control will be achieved through Integrated Pest Management approach.
- All vegetation treatments will be assessed for the potential to introduce invasive species before a treatment method is selected.
- BLM will support and cooperate with efforts to manage and control noxious weeds or other invasive plant species, including collaboration with local plans and control efforts.
- All approved revegetation plans will include a weed management plan.

# I.2.7 Monitoring

1. Standard Monitoring Requirements:

    a. Project proponents must use the same locations and methods used at baseline for repeat

photography. Additional locations may be selected to document progress of reclaimed area to demonstrate interim[2] and final reclamation[3] success, and to monitor any identified problems such as erosional features. The site should be photographed once every year normally at the same time period, from the same locations and direction so that photographs are repeated through time. Photographs should be taken during the growing season.

b. Weed inventory: Disturbed and reclaimed areas will be evaluated for noxious and invasive weeds annually until the timeline determined by the ESD has been satisfied. A weed control plan will be written separately under the BLM Integrated Weed Management Program.

c. Erosion control/soil stability: The reclaimed area should be evaluated for any signs of erosion problems annually (until the timeline determined by the ESD has been satisfied) and when the site is subject to erosional events. Identified erosion features should be monitored using repeat photography. Absence of erosion features is a positive indication that the soil is stabilizing.

d. Hydrological function measurements should be documented using Technical Note #346 Erosion condition classification system and the determination of erosion condition class sheet to ensure the of erosion control methods worked during the development phase and the final pad contouring; resulting in the return of the original hydrologic function of the site.

e. Restoration of the landforms visual resource should also be documented, whether returning the location to the original visual classification under the RMP or the original topographic features.

f. Wildlife habitat communities should be monitored to ensure that the goals for sensitive wildlife species are also being met. Reclamation actions will be initiated before the first growing season following disturbance.

2. Following each growing season:

   a. Review and complete a site-specific vegetation monitoring report for areas being reclaimed.

   b. Prepare a written, site-specific prescription for actions to be implemented, including:

      – Reseeding of areas not attaining reclamation success

      – Soil stabilization

      – Weed control needs

      – Mulching/fertilization or other cultural practices prescribed for the following season.

3. If the treatment area is found, through site-specific monitoring data, to be successfully reclaimed, monitoring to confirm reclamation success will continue until the timeline determined by the ESD has been satisfied. The site will also comply with additional management needs, including control of weed infestations.

4. Within one to three years of initiation of reclamation, sites will demonstrate the establishment of a viable desirable seedling frequency. (Pro-action may want to be taken if reclamation is not successful during a good moisture year.) Desirable seedling density or frequency, compared to pre-disturbance composition information, shall consist of a vigorous, diverse, native (or otherwise approved) plant community or ecologically comparable species as approved by BLM AO. If this does not occur the project proponent should coordinate with the BLM, NRCS, WGFD, or other local experts to determine an alternative course of action to ensure full site recovery, the actions prescribed will be implemented as planned and further monitoring will occur as detailed beginning with the first action listed above.

[2] *Interim reclamation may proceed if a project will be dormant for an undetermined amount of time, to provide cover to prevent erosion events and to provide forage for wildlife).*

[3] *Final reclamation occurs when all activities on the location have been completed, recontouring occurs and the seed mix contains all species necessary for habitat recovery.*

If at any time pre-disturbance composition data is not suitable for reclamation success determinations, the project proponent may select a desired plant community in the reference state from the ESD State and Transition model.

## I.2.8 Standard Reporting

The project proponent will provide the BLM with an annual report for all sites disturbed. The report will include:

- Copies of the completed individual site review forms or a BLM-approved electronic report.
- A summary of monitoring data and results, including:
  - Individual site reclamation monitoring reporting data
  - Identification of sites successfully reclaimed by reclamation years (starting with the first growing season)
  - Identification of sites needing additional work or more reclamation activities (adaptive management) by reclamation year
  - Sites proposed for the end of monitoring (i.e., sites that were successfully reclaimed).
- The BLM's useable shape file(s) or geographic information system (GIS) layer(s) that details location, name, type, and extent of:
  - New disturbances
  - Unreclaimed disturbance
  - New reclamation
  - Failed or unsuccessful reclamation
  - Locations of noxious/invasive weed infestation
  - Further vegetation treatments planned (e.g., mulching, matting, and weed control).

On these shape files or GIS layers, *location* shall be given as the legal location and geo-referenced location of the site; *name*, as appears on the BLM Application for Permit to Drill (APD), lease, or other BLM file name for the site; *extent*, as the appropriate component boundary.

## QUALITATIVE MONITORING SHEET

Well Name/ Number _____

Monitoring Date _____

Company _____

Inspector _____

☐ Well Pad ☐ Access Road ☐ Pipeline ☐ Other _____

Topsoil Storage ☐ Stockpile (> 3ft) ☐ Stockpile (< 3ft) ☐ Direct Haul ☐ None

Length of Topsoil Storage (months) _____

Seeding Method ☐ Broadcast ☐ Drill ☐ Other _____

Date Seeded_____ Seed Mix_____

Soil Amendment_____ Date of Amendment Application_____

| Item | Monitoring Requirement | Description | Yes | No |
|---|---|---|---|---|
| 1 | Is seed germination apparent? | Seeds have germinated, seedlings are emerging. | | |
| 2 | Is the area free of undesirable materials? | Trash, construction materials, etc. | | |
| 3 | Is the soil stable with no indications of subsidence, slumping and/or significant erosion? | Rills greater than 2 inches, accelerated erosion is obvious and soils are not being held by plants on site, sheet flow, head cutting in drainages, slopes occurring on or adjacent to reclaimed areas. | | |
| 4 | Absence of noxious weeds? | Perennial pepperweed, Canada thistle, black henbane, leafy spurge, yellow or Dalmatian toadflax, spotted knapweed, Russian knapweed, etc. | | |
| 5 | Absence of other undesirable species? | Cheatgrass, Halogeton, Russian thistle, etc. | | |
| 6 | Is there evidence of good reproductive capability? | Seed production is evident.<br>Amount of tillers, rhizomes, flowers, and/or seed stalks are comparable to the reference site.<br>To answer yes, must have for all three plant types: grass, forb, and shrub. | | |

Item 7: Year of Reclamation

☐ Years 2 - 3 ☐ Years 4 - 5 ☐ Years 6 -7 ☐ Years 8+

**If any of the items are answered "No" above, please identify the problem, attach explanation and photographs, and contact BLM Reclamation Specialist.**

Tech Note #346
U.S. Department of the Interior- Bureau of Land Management
Erosion Condition Classification System by Ronnie Clark

**Well name and number:** _____ **Date:** _____

**Operator:** _____ **Collector:** _____

| Erosional Feature | Potentially Present Yes/ No | Identified Factors (Form 7310-12) | Possible Factor |
|---|---|---|---|
| | | | |
| Soil Movement | | | 14 |
| Surface Litter | | | 14 |
| Surface Rock Fragments | | | 14 |
| Pedestalling | | | 14 |
| Row Patterns | | | 15 |
| Rills | | | 14 |
| Gullies | | | 15 |
| | | | |
| Column Totals | | | |
| **Soil Surface Factor Total** | | | |
| **Class** | | | |

| SSF | Class |
|---|---|
| 1-20% | Stable |
| 21-40% | Slight |
| 41-60% | Moderate |
| 61-80% | Critical |
| 81-100% | Severe |

*Procedure:*
*1. Observe the total sample area and determine an average condition for each of the seven items above.*
*2. Determine if each item is potentially present as only these items will be considered.*
*3. For the items potentially present, indicate appropriate numerical value. (Form 7310-12)*
*4. Total both the weighted values and the potential values for each item.*
*5. Calculate the total percent SSF: (identified factors/ possible factors) X 100.*
*6. Indicate corresponding condition class site is in.*

# ATTACHMENT A—RECOMMENDED RECLAMATION PRACTICES FOR ENSURING SUCCESSFUL AND TIMELY ECOSYSTEM RECLAMATION

## RECOMMENDED BEST MANAGEMENT PRACTICES FOR HANDLING SUITABLE SOILS TO MAINTAIN SOIL QUALITY

### Suggestions on Stockpiling Suitable and Unsuitable Soils to Maintain Soil Quality

*The methods suggested in this section have been documented to improve reclamation success; however, it is up to the project proponent to utilize their judgment, expertise, and the latest research and information to achieve desired results.*

Stockpiled topsoil should not be piled too deeply or too shallow. The taller or deeper the piles the more soil is buried under large amounts of pressure resulting in compaction. Soil buried deep in the pile also has little exposure to oxygen resulting in anaerobiosis; deeply buried soil also has no organic matter input. Both of these problems reduce soil quality.

Shallow or small topsoil stockpiles have large footprints on the land surface with the disadvantage of covering greater areas of undisturbed soil which will, in turn, require revegetation, resulting in a greater overall amount of disturbed soil. Smaller or shallow stockpiles also have a greater surface area per amount of soil stored which increases exposure of the stockpiled soil to wind and water erosion. The surface of soil stockpiles should always be vegetated to minimize erosion losses.

- Salvaged stockpiles of suitable soil should be no deeper than four meters (13 feet) and should be less where possible with the understanding that greater surface disturbance may occur.
- Stockpile slopes should not exceed 5:1 angles (20% slopes) to allow for seeding and minimize erosion.
- Suitable soil stockpiles should be located in areas to prevent their disturbance and contamination by project activities. They should not be placed in streambeds or ephemeral drainages where they may be washed away. They should be protected from wind erosion.
- A perimeter ditch/berm can be constructed around the stockpile for topsoil conservation and sediment control where necessary.
- All suitable soil stockpiles should be seeded with native cool season grass to provide cover and protect them from water and wind erosion. Before seeding, the stockpile may be scarified along contours to minimize wind and water erosion.
- If soil horizons or layers are to be stratified during soil salvage (stripping) operations, soil maps should be made of the well pad area to identify depths of soil horizons and surface slope. The area to be cleared of soils should then be divided into strips the size of the blades or equipment being used for soil removal. The depth of soil removal from each swath should be clearly marked so that equipment operators are removing a uniform layer from each strip. After the topsoil is removed from the area in this manner, the subsoil can then be removed in the same fashion, strip by strip, each strip at a uniform depth.

# SOIL AMENDMENTS

- Soil amendment(s) may be used in reclamation if the soil is lacking the necessary chemical, biological, physical and/or organic materials to support sustaining growth of suitable plant materials. The soil type, soil characteristics, geographic location, along with soil mapping resources available should provide the information necessary to define the soil amendment.
- The Project Proponent should state what applying soil amendments is intended to accomplish. Soil amendment plans should be provided, including what amendments will be applied, method of application, and timing relative to other reclamation activities (i.e. stockpiling, seeding, and ripping).
- The soil type is defined by the soil samples obtained prior to, or in some cases, after disturbance takes place. Soil amendments must be scientifically calculated based on the soil characteristics to provide the most cost efficient and best assurances for successful reclamation.
- Soil amendments include but are not limited to the following: Weed free grass hay, weed free wood chips or other weed free cellulosic materials, gypsum, elemental sulfur, and fertilizer.

## Limited Reclamation Potential (LRP)

Areas possessing unique landscape characteristics such as sensitive geologic formations, extremely limiting soil conditions, biological soil crusts, badlands, rock-outcrops, etc., often make reclamation success impractical and/or unrealistic due to physical, biological, and/or chemical challenges. When disturbed, these areas may require unconventional reclamation strategies to address the requirements established by the Wyoming Reclamation Policy and the HDD Policy for Reclamation of Disturbed Lands.

LRP areas such as powdery soil, moisture limited soils, etc., would be avoided if mitigating/reclaiming them is not possible. Pre and post construction soil sampling would be required in these areas. Seed collection or transplanting plants may be required to reestablish these areas.

# SUGGESTIONS ON VEGETATION AND SOIL MONITORING

Examples of monitoring components are listed below:

- Reference: http://agriculture.wy.gov/forms/natres/rangelandmonitoring.pdf

# SUITABLE SOIL INVENTORY

- Soil characteristics may strongly influence reclamation efforts. Fundamental characterization of soils ahead of disturbance can identify potential problems, so they can be addressed during disturbance, soil stockpiling and reclamation, instead of waiting for reclamation failure.
- The phrase “suitable soil” is used mainly because of confusion over the definition of topsoil. Soil depth, pH, electrical conductivity, texture, surface features (e.g. barren, rocky, crusty, plant litter), and organic matter content are characteristics that may be used to determine if a soil is suitable. Other information may be needed. See: “Successful restoration of severely disturbed lands: Overview of critical components,” B-1202, (and available for free at http://ces.uwyo.edu/PUBS/B1202.pdf.).
- Soil characteristics that can signal a high probability of reclamation problems include: pH, electrical conductivity, soil texture, surface/subsurface features, sodium adsorption ratio, calcium carbonate content, soil compaction, and saturation percentage. The listed characteristics below will be addressed by the Proponent in the site-specific reclamation plan approved by the BLM.

- Soils with pH 7.8 and higher progressively become less suitable for reclamation and will be addressed by the Operator in the site-specific reclamation approved by the BLM.
- An electrical conductivity of soil greater than eight deciSiemens per meter (dS/m) and any increase in salt content of the soil above 0.5 dS/m will progressively negatively affect the establishment and growth of plants. Soils exhibiting these characteristics will be addressed by the Operator in the site-specific reclamation plan approved by the BLM.
- Soils with textures representing clay, sand, or loamy sand will be addressed by the Operator in the site-specific reclamation plan approved by the BLM.
- Surface and subsurface soil in and through the root zone dominated by coarse material greater than two millimeters in diameter and greater than 40% in the soil profile to be stockpiled may signify reclamation difficulties and will be considered in the site-specific reclamation plan by the BLM and Proponent.
- Sodium adsorption ratio (SAR) is a key diagnostic soil trait that may be determined for soils to be disturbed and placed in the suitable soil stockpile and will be addressed by the Operator in the site-specific reclamation plan approved by the BLM.
- Calcium carbonate content (percent lime) will control the amount of plant available phosphorus and will determined in the site-specific reclamation plan by the Operator and approved by the BLM.
- The soil saturation percentage will control the ability for plants to germinate and survive after reclamation actions have been taken by the Operator and will be addressed by the Operator in the site-specific reclamation plan approved by the BLM.

## SITE PREPARATION

It is important to consider diversity in seedbed preparation to account for various seed sizes and establishment strategies of different species. Consideration should be given for seed-safe sites, water infiltration and collection, shade, and frost protection.

## RECONTOURING

Trees, shrubs, and ground cover adjacent to disturbance areas but not cleared from rights-of-way (ROW) require protection from construction damage. Recontouring to preconstruction condition as well as restoration of normal surface drainage is required.

## ROAD RECLAMATION GUIDELINES

Road reclamation guidelines are as follows:

- Determine the desired level of obliteration and reclamation. Determine whether there are alternative short- or long-term uses for roads.
- Determine short and long-term reclamation objectives and goals. Identify the monitoring methods to determine reclamation success or failure and possible mitigation.
- Reclaim the road; the effort may include ripping and scarifying the surface, removing culverts and other flow structures, recontouring cut and fill slopes to provide for complete removal of the road, and total recontouring to the original topographic profile.
- Reclaim vegetation to standards outlined in the section on “criteria for reclamation.”
- Establish mitigation measures to remedy problems identified by monitoring.

# NON-NATIVE AND INVASIVE SPECIES

One of the land management agencies' highest priorities is to promote ecosystem health, and one of the larger obstacles to achieving this goal is the rapid expansion of non-native and invasive species across public lands. Invasive plants can dominate sites and often cause long-term changes to native plant communities. If not eradicated or controlled, invasive species will jeopardize the success of reclamation. Invasive species can slow reclamation success or halt it altogether. Right-of-Way (ROW), mineral lease, mining claim, and permit holders are required to monitor and control invasive species on public land as stipulated within their permits and authorizations.

# INVASIVE PLANT MANAGEMENT PLAN FOR CONSTRUCTION AND RECLAMATION ACTIVITIES

Disturbed sites can provide ideal opportunities for invasive plant species to propagate. Invasive plants can be transferred to the disturbed site from adjoining areas and out-compete desired vegetation during reclamation and/or spread to new areas. The best approach to combat invasive species is to use careful suitable soil handling and an appropriate seed mix. Pre-disturbance planning, including early weed management for invasive species is vital to reduce costs and ensure successful reclamation.

- Assess for noxious and invasive weed species before initiating surface disturbing activities, during disturbance, during interim and final reclamation, and after reclamation is completed.
- Web address for the Wyoming Weed and Pest Council: http://www.wyoweed.org/.
- Apply invasive species control treatments.
- Monitor invasive plant species at least annually to evaluate success of control treatments and determine if continued treatment is necessary.

The vegetation will consist of species included in the seed mix and/or occurring in the surrounding natural vegetation or as deemed desirable by land management agencies in review and approval of the reclamation plan. No single species will account for more than 30% total vegetative composition unless it is evident at higher levels in the adjacent landscape. Vegetation canopy cover production and species diversity shall approximate the surrounding undisturbed area.

# SEED

On all areas to be reclaimed, seed mixtures are required to be certified noxious weed free and site specific, composed of the same native species as determined in the Desired Plant Community/ESD or early successional species consisting of pioneer species, including seasonal or annual species (that may only be evident at certain times of the year), that will lead to a similar climax community as that disturbed. Site preparation and species choices must ensure soil stability.

A Desired Plant Community/ESD species composition list must be developed for each site to ensure proper community composition, function, and structure. This will ensure that the type of vegetative community replaced is compatible with climate and soil types and should make it easier for the project proponent to successfully restore and stabilize specific sites.

Livestock palatability and wildlife habitat needs should be given consideration in seed mix formulation during reclamation within areas of important wildlife habitat (crucial winter range, etc.); provision shall be made for the replacement of native browse and forb species. Bureau of Land Management guidance for native seed use is the BLM Manual 1745 and Executive Order (E.O.) 13112 (Invasive Species, 64 Code of Federal Regulations [CFR] 6183).

## Describe Seeding Methods

- Different plant species may require different conditions (e.g. seeding depth, seed scarification, mixing, and timing) for optimal germination success. Seeding methods should match germination characteristics of species in the seed mix and consider timing of planting to maximize germination and establishment of all reclamation species.
- The Proponent will describe when seeding will occur and specify the methods they will use for seeding, including differential handling for different species (e.g. broadcast vs. drilling vs. imprinting), and seeding depth in the site-specific reclamation plan. Re-seeding may need to occur if invasive and/or noxious weeds prevent establishment of the seed mix.

A germination test for Pure Live Seed (PLS) basis should be used (http://efotg.sc.egov.usda.gov/references/public/WY/pm6.pdf).

## Germination Test

A germination test samples for total viability, including the sum of all seeds (of a "kind" listed on the label) actually germinating using standard laboratory methods plus hard seed and/or dormant seed.

**Percent Germination:** A germination test determines the capability of a seed lot to produce normal seedlings under favorable controlled conditions. Total germination is the percent germination added to the percent hard and/or dormant seed. Anything under 100% total germination represents the presence of dead seed and/or seed that doesn't produce a shoot or root. Germination may also be estimated by the use of a tetrazolium chloride test (TZ test) in which seeds are stained with a dye to determine viability. Viable seed with live (respirating) tissues will stain a red color. However, not all states recognize the use of a TZ test for all species.

**Dormant Seed:** Includes hard seed, refers to the portion of the seed sample that doesn't germinate during the seed test. Reasons for dormant seed are: 1) the seed coat is impervious to water, and/or 2) internal structures within the seed prohibit oxygen exchange. Hard seed may germinate at a later date and produce a viable plant, or it may germinate and succumb to competition, or it may never germinate at all.

The higher the germination percentage, the better. Germination of most grass species is normally above 80% and should not be lower than 60%. Germination of some native grasses, forbs, and shrubs may be lower, but can vary widely according to species.

The germination test date should also be current. Grass, forb and legume seed should be updated every nine to 18 months depending on state laws. Flower, shrub, and tree seed should be updated every nine months.

## Standard Seed Mixtures

Care and planning must be taken to choose mixes and amounts that will benefit under site-specific conditions. Planning and thought must also go into selecting successful planting and site-preparation techniques. All sites must be planted with a diverse mix of grasses, forbs, and shrubs to be considered successful. The project proponent is ultimately responsible for successful restoration of disturbed sites. Seed mixes should be based on and the Desired Plant Community that is achievable according to the ESD. When appropriate native plant materials are not commercially available, use of local collections or adapted species that perform similar function may be used in lieu of the exact species described the ESD that has been shown to be successful in previous trials. Return of cover should be gauged by comparison with actual pre-disturbance site conditions and/or reference areas. Alternate seed mixes can be submitted by the project proponent to the BLM for review and approval prior to use. The final goal is to restore disturbed sites so that they closely resemble predisturbance native plant communities. Some standard seed mixes are available

for the Field Office and contain only native species. If the use of a non-native species is desired, documentation of the need is required by the BLM policy. Non-native species may be considered for erosion and weed control. Seed mixtures consisting of sterile annual cover crops, such as triticale hybrid, can be used. Non-native species may be considered in some circumstances to aid the revegetation of native species as outlined in the Wyoming Reclamation Plan. As stated in the Wyoming Reclamation Plan (IM WY2012-032) "Select non-native plants only as an approved short term and non-persistent (i.e. sterile) alternative to native plant materials. Ensure the non-natives will not hybridize, displace, or offer long-term competition to the endemic plants, and are designed to aid in the re-establishment of native plant communities." Follow-up seeding or corrective erosion control measures will be required on areas of surface disturbance that fail to meet reclamation success standards within a reasonable time.

## Seed Mixes

The need to provide multifunctional and sustainable seed mixes for interim and final reclamation and soil stability is driven by a desire to increase potential for successful and timely re-vegetation and site stability. Plant diversity and habitat functionality are directly impacted by the seed choices applied to an area slated to be reclaimed or restored. To maintain as much stability and ecological function this section makes recommendations to specifically aid a proponent's selection process.

- Select site-appropriate, adapted native plant materials based on the ESD, Desired Plant Community, and commercially available native species adapted to the species identified in the Desired Plant Community/ESD. Seeds may be obtained from commercial sources of certified weed-free seed mixes. Alternatively, local collections may be used provided they are collected in an area without weedy species. Any seed used for reclamation should be certified weed free and have the same standards required as commercially purchased seed.
- Perennial naturalized species may be used when attempts to reclaim using native plants have not succeeded for a minimum of five full growing seasons. Reclamation should succeed using native species if soils are properly managed, precipitation is not limiting, seed mixes are carefully selected, and seeded areas protected from grazing.
- Based upon site-specific conditions, a decision may be made to use non-natives sooner than identified above and will be used in only unique conditions defined in the site-specific reclamation plan and approved by the AO.

## Mulch

Use of mulch during reclamation may enhance chances for successful vegetation reestablishment. Mulches can help control wind and water erosion, retain and collect seed, increase and prolong soil water capacity, and add organic compounds to the soil. Mulches are best applied after seeding to ensure proper seed contact with soil. Mulch may include hay, small-grain straw, wood fiber, live mulch, cotton, jute, or synthetic netting. Straw mulch should contain fibers long enough to facilitate crimping and provide the greatest cover.

When mulching with cereal grain straw or grass hay, apply in sufficient amounts to provide 70% ground cover. Mulch rate shall be determined using current erosion prediction technology to reach the soil erosion objective (NRCS 2006[4]).

When mulching with wood products such as wood chips, bark, or shavings or other wood materials, apply to a 2-inch thickness if the soil is not well-drained and to a 3- to 4-inch thickness if drainage is good. More finely textured mulches, which allow less oxygen penetration than coarser materials, should be no thicker than one or two inches. The mulch material shall provide no greater than 80% ground cover in order to ensure adequate air drainage (NRCS 2006).

[4] *Land Resource Regions and Major Land Resource Areas of the United States, the Caribbean, and the Pacific Basin: https://www.nrcs.usda.gov/sites/default/files/2022-10/AgHandbook296_text_low-res.pdf.*

Gravel or other inorganic material shall be applied approximately two inches thick and shall consist of pieces 0.75 inch to two inches in diameter. The mulch material shall provide no more than 90% ground cover in order to ensure adequate air drainage (NRCS 2006).

Mulch shall be applied at a rate that achieves 50% ground cover to provide protection from erosion and runoff and yet allow adequate light and air penetration to the seedbed to ensure proper germination, emergence, and disease suppression (NRCS 2006).

Any mulch used must be certified free from noxious or invasive weed seeds.

## Live Plantings

Live plants can be planted on disturbed sites and, with proper site preparation, can greatly enhance restoration efforts and shorten time frames. Proponents can buy bare root and container stock directly from vendors or can contract seed collection and growth from local growers. Another strategy is to use an excavator to collect clumps of plants from the site and plant them either on reserved topsoil piles and/or on restoration sites during recontouring. These clumps can provide native seed and soil flora as well as collect precipitation and provide shade for newly emerging plants.

# APPENDIX J—SEASONAL WILDLIFE RESTRICTIONS

## J.1 ALTERNATIVE A

**Table J-1. Seasonal Wildlife Restrictions**

| Affected Areas | Restriction | Restricted Area |
|---|---|---|
| Big game crucial winter range | November 15–April 30 | Pronghorn, elk, moose, and mule deer crucial winter ranges |
| Big game birthing areas | May 1–June 30 | Designated birthing areas |
| Elk calving areas | May 1–June 30 | Designated calving areas |
| Mountain plover aggregation areas | April 10–July 10 | ¼ mile of aggregation areas |
| Golden eagle | February 1–July 31 | ½ mile of active nests |
| Ferruginous hawk | February 1–July 21 | 1 mile of active nests |
| Other raptors | February 1–July 31 | ½ mile of active nests |

## J.2 ALTERNATIVE B

**Table J-2. Seasonal Wildlife Restrictions**

| Affected Areas | Restriction | Restricted Area |
|---|---|---|
| Big game crucial winter range | November 15–April 30 | Pronghorn, elk, moose, and mule deer crucial winter ranges |
| Big game birthing areas | May 1–June 30 | Designated birthing areas |
| Fisheries | March 15–July 31 and September 15–November 30 | Within a ¼ mile of riparian areas |
| Mountain plover aggregation areas | April 10–July 10 | ¼ mile of aggregation areas |
| Raptors | February 1–July 31 | Within 2 miles of active and historic nests |

## J.3 ALTERNATIVE C

**Table J-3. Seasonal Wildlife Restrictions**

| Affected Areas | Restriction | Restricted Area |
|---|---|---|
| Big game crucial winter range | November 15–April 30 | Pronghorn, elk, moose, and mule deer crucial winter ranges |
| Big game birthing areas | May 1–June 30 | Designated birthing areas |
| Mountain plover aggregation areas | April 10–July 10 | 100 feet of aggregation areas |
| Raptors | February 1–July 31 | Within ½ mile of active nests |

# J.4 ALTERNATIVE D

**Table J-4. Seasonal Wildlife Restrictions**

| Affected Areas | Restriction | Restricted Area |
|---|---|---|
| Big game crucial winter range | November 15–April 30 | Pronghorn, elk, moose, and mule deer crucial winter ranges |
| Big game birthing areas | May 1–June 30 | Designated birthing areas |
| General raptor | March 1–August 15 | ½ mile of occupied and historic nest sites |
| Bald eagle | February 1–August 15 | 2 ½ miles of occupied and historic nest sites |
| Burrowing owl | April 1–September 15 | ¼ mile of occupied and historic nest sites |
| Ferruginous hawk | February 1–July 31 | 1 mile of occupied and historic nest sites |
| Golden eagle | February 1–July 31 | ½ mile of occupied and historic nest sites |
| Mountain Plover | April 10–July 10 | ¼ mile of active nest |
| Migratory birds | February 1–August 31 | Immediate area of nest |
| Fisheries | March 15–July 31<br>September 15–November 30 | Fish bearing streams |

# J.5 PROPOSED RMP

**Table J-5. Seasonal Wildlife Restrictions**

| Affected Areas | Restriction | Restricted Area |
|---|---|---|
| Big game crucial winter range | November 15–April 30 | Pronghorn, elk, moose, and mule deer crucial winter ranges |
| Big game birthing areas | May 1–June 30 | Designated birthing areas (including Elk Parturition area within Steamboat Mountain ACEC) |
| General raptor | March 1–August 15 | ½ mile of occupied and historic nest sites |
| Bald eagle | February 1–August 15 | 2 ½ miles of occupied and historic nest sites |
| Burrowing owl | April 1–September 15 | ¼ mile of occupied and historic nest sites |
| Ferruginous hawk | February 1–July 31 | 1 mile of occupied and historic nest sites |
| Golden eagle | February 1–July 31 | ½ mile of occupied and historic nest sites |
| Mountain Plover | April 10–July 10 | ¼ mile of active nest |
| Migratory birds | February 1–August 31 | Immediate area of nest |
| Fisheries | March 15–July 31<br>September 15–November 30 | Fish bearing streams |

# APPENDIX K–LAND TENURE ADJUSTMENT CRITERIA

The Federal Land Policy and Management Act of 1976 (FLPMA) provides for retention of the public lands in federal ownership and management by the Bureau of Land Management (BLM) for multiple uses. FLPMA and other federal laws, executive orders, and policies suggest criteria to use when categorizing public lands for retention or disposal, and for identifying acquisition priorities. Disposal by sale, exchange, or Recreation and Public Purpose (R&PP) patent remains an option if such an action would serve an important objective and have a public benefit.

The following is a list of suggested criteria to consider in land tenure adjustment proposals, but it is not considered all-inclusive. These criteria are meant to guide and streamline consideration of land tenure adjustment proposals.

Criteria for Retention or Acquisition:

- Important, crucial, or critical habitat for fish, wildlife, and plants
- Riparian areas and wetlands
- Parcels that provide access to larger blocks of public land
- Lands with special designation or management emphasis
- Significant cultural resources
- Recreation opportunities and benefits
- Contaminated and physical hazard conditions
- Mineral development potential.

Criteria for Disposal:

- Parcels difficult or costly to administer
- Parcels more suitable for management by another federal or state agency
- Parcels of special importance to local communities.

Transfer to other public agencies will also be considered if improved management efficiency would result. Prior to any disposal, a site-specific analysis must determine that the lands considered contain no significant wildlife, recreation, or other resource values, the loss of which could not be mitigated, have no overriding public values, and represent no substantial public investments. Land tenure adjustments must serve the public interest. Exchange will be the preferred method for disposals.

## K.1 EXCHANGES

Land exchanges are the preferred method of land tenure adjustments, based on the following criteria:

- Land exchanges that serve the national interest and are beneficial to BLM programs or that support the programs of other agencies (reference Sections 102, 205, and 206 of FLPMA) would be promoted.
- Transfer of leasable minerals out of federal ownership should be avoided except when non-federal leasable minerals are to be received in return. It is preferable to trade both surface and subsurface (mineral) estates.

- Exchanges should involve lands similar in character and/or value. Lands acquired by the BLM in an exchange will be retained under federal ownership or control.
- Land considered for disposal by exchange will include reservations for public and administrative access to adjacent Federal and state managed lands.
- Exchanges for consolidation of ownership within BLM and Congressionally designated management units.
- Exchanges should not be made solely for the purpose of blocking up federal land ownership.

## K.2 SALES

Public land sale proposals are the result of a BLM initiative or in response to expressed public interest or need. Lands to be considered for disposal, at a minimum, must meet the following criteria as outlined in Section 203 of the FLPMA:

- They are difficult and uneconomical to manage and are not suitable for management by another federal department or agency.
- Disposal would serve important public objectives, including but not limited to, community expansion or economic development, that could not be achieved prudently or feasibly on land other than public lands and that outweigh other public objectives or values.
- The tract was acquired for a specific purpose, and the tract is no longer required for that purpose or any other federal purpose.
- Land sales will include reservations for public and administrative access to adjacent Federal and state managed lands.

## K.3 SALES AND EXCHANGES INVOLVING WETLANDS

Bureau policy is to retain wetlands in federal ownership unless federal, state, public, and private institutions, and parties have demonstrated the ability to maintain, restore, and protect wetlands and riparian habitats on a continuous basis (BLM Manual 6740). Sales and exchanges may be authorized when:

- The tract of public wetlands is either so small or remote that it is uneconomical to manage.
- The tract of public wetlands is not suitable for management by another federal agency.
- The patent contains restrictions of uses as prohibited by identified federal, state, or local wetlands regulations.
- The patent contains restrictions and conditions that ensure the patentee can maintain, restore, and protect the wetlands on a continuous basis.

## K.4 RECREATION AND PUBLIC PURPOSES LEASE/PATENT

The objective of the R&PP Act is to meet the needs of state and local governmental agencies and other qualified organizations for public lands required for recreational and public purposes. Use of the R&PP Act protects public values in the land through its reversionary provisions and helps qualified entities obtain the more liberal pricing authorized under the Act.

Public lands shall be conveyed or leased only for an established or definitely proposed project for which there is a reasonable timetable of development and satisfactory development and management plans. No more land than is reasonably necessary for the proposed use shall be conveyed.

# K.5 DESERT LAND ENTRIES

The purpose of the Desert Land Law is to permit the reclamation by irrigation of arid public land through individual effort and private capital (reference 43 Code of Federal Regulations §2520), based on the following criteria:

- Lands that will not produce any reasonably remunerative agricultural crop by the usual means or methods of cultivation, without artificial irrigation, may be considered for a desert land entry. The lands must be untimbered, surveyed, unreserved, and unappropriated. Tracts need not be contiguous, but shall be sufficiently close to each other to be managed satisfactorily as an economic unit.
- The proposed crop may include any agricultural product to which the land under consideration is generally adapted and which would return a fair reward for the expense of producing it.
- All Desert Land Entry applications will be coordinated with the Wyoming State Engineer and the Soil Conservation Service.

# K.6 ACQUISITION

Acquisition of lands will be considered, if in compliance with the Resource Management Plan (RMP), to facilitate various resource management objectives and to acquire lands with high resource values, based on the following criteria (Sec 203 of the FLPMA):

- The preferred method for acquisition will be through exchange.
- Acquisitions of private lands will be pursued only with willing landowners.
- BLM would extend applicable management to acquired lands similar to adjacent or similar BLM managed lands.

# K.7 LANDS SUITABLE FOR DISPOSAL AND ACQUISITIONS

The identification of a public land as having met FLPMA criteria for disposal is NOT, in itself, a decision to dispose of public lands. The process for disposing of public lands via FLPMA Section 203 (Sales), Section 206 (Exchanges), or FLPMA section 212 (R&PP Act) is a lengthy multi-decisional process requiring a comprehensive site-specific analysis, survey, and follow-on decisions prior to a final decision being made by the Department of Interior. There are no official plans to dispose of public lands within the Rock Springs Field Office planning area. Table K-1 lists lands identified for disposal by exchange, sale, or R&PP.

**Table K-1. Lands Identified for Disposal**

| Acres | Township | Range | Section | Description |
|---|---|---|---|---|
| 78.71 | T. 12 N. | R. 105 W. | 15 | Lot 7, SE¼NW¼ |
| 130.64 | T. 12 N. | R. 111 W. | 2 | Lots 7-10 |
| 305.31 | T. 12 N. | R. 111 W. | 3 | Lots 11-12, S½SW¼, SE¼ |
| 17.53 | T. 12 N. | R. 111 W. | 6 | Lots 11, 12, 13 |
| 3.61 | T. 12 N. | R. 111 W. | 7 | Lots 16-17 |
| 30.88 | T. 12 N. | R. 111 W. | 20 | Lot 9 |

# APPENDIX L—WILD AND SCENIC RIVER ELIGIBILITY CRITERIA

## L.1 INTRODUCTION

The following tables display the identification and classification of Bureau of Land Management (BLM)-administered public lands within the Rock Springs Resource Management Plan (RMP) planning area determined to meet the wild and scenic rivers eligibility criteria. Table L-16 provides a summary of the suitability reviews for all stream and river segments considered for wild and scenic river eligibility.

## L.2 LITTLE RED CREEK (PART OF RED CREEK UNIT)

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include scenic. The red eroded geologic features are remarkable scenic badlands which are unusual in this area. The watershed is relatively untouched and pristine.

**Table L-1. Little Red Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 103 W., T. 12 N., Section 18, from border of state land northwest to private land border. | Low riparian; two 2-tracks in waterway corridor; one 2-track crosses creek. | Scenic | 0.5 | 2.0 |
| 2 | R. 104 W., T. 12 N., Section 12, from border of private land north to border of private land in Section 1. | Low riparian; road parallels entire east bank of creek through BLM-administered parcel and crosses creek; seismic line parallels west bank and crosses creek; 1/4 mile is part of public water reserve. | Recreational | 1.0 | 0.2 |
| 3 | R. 104 W., T. 12 N., Section 1, from border of private land northwest to border of private land, R. 104 W., T. 13 N., Section 35. | Low riparian; adjacent private lands within waterway corridor; road and two 2-tracks in corridor parallel both banks. | Recreational | 0.7 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **4.4** |
| **Total Miles Across BLM Lands** | | | | **2.2** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **50%** | -- | -- |

*BLM-Administered Public Land

## L.3 JUNE CREEK (PART OF RED CREEK UNIT)

Outstandingly remarkable values of BLM-administered lands in the waterway review segment include scenic. The red eroded geologic features are remarkable scenic badlands which are unusual in this area. The watershed is relatively untouched and pristine.

**Table L-2. June Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 104 W., T. 12 N., Section 9, from border of state land north to junction with Red Creek, R. 104 W., T. 13 N., Section 34. | Low-moderate riparian; 2-track parallels entire west bank of creek; four 2-track crossings of creek. | Recreational | 2.6 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **2.6** |
| **Total Miles Across BLM Lands** | | | | **2.6** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **100%** | -- | -- |

*BLM-Administered Public Land

# L.4 BEEF STEER CREEK (PART OF RED CREEK UNIT)

Outstandingly remarkable values of BLM-administered lands in the waterway review segment include scenic. The red eroded geologic features are remarkable scenic badlands which are unusual in this area. The watershed is relatively untouched and pristine.

**Table L-3. Beef Steer Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 105 W., T. 13 N., Section 12, from headwaters southeast to junction with Red Creek, R. 104 W., T. 13 N., Section 13. | Low-moderate riparian; three seismic crossings; four 2-track access points on west side of creek. | Scenic | 4.0 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **4.0** |
| **Total Miles Across BLM Lands** | | | | **4.0** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **100%** | -- | -- |

*BLM-Administered Public Land

# L.5 LITTLE RED CREEK (PART OF RED CREEK UNIT)

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include scenic. The red eroded geologic features are remarkable scenic badlands which are unusual in this area. The watershed is relatively untouched and pristine.

**Table L-4. Little Red Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 103 W., T. 12 N., Section 4, from headwaters spring north to border of state land, R. 103 W., T. 13 N., Section 34. | Adjacent state lands within waterway corridor. Low riparian. Heavily timbered in corridor with stock trails cut to creek. Beaver pond stocked with Colorado River cutthroat trout. 2-track in corridor on ridgetop above creek. | Recreational | 0.8 | 0.3 |
| 2 | R. 103 W., T. 13 N., Section 34, from border of state land northwest to border of state land in Section 33. | Low-moderate riparian. Heavily timbered in corridor. Series of dry historic beaver ponds. Two-track in corridor on ridgetop above creek. | Recreational | 0.2 | 3.0 |
| 3 | R. 104 W., T. 13 N., Section 36, from border of state land west to border of state land. | Low-moderate riparian; 2-track parallels south bank of creek. | Recreational | 0.25 | 0.4 |
| 4 | R. 104 W., T. 13 N., Section 35, from border of private land northwest to border of private land, Section 34. | Adjacent low riparian private lands within waterway corridor; 2-track parallels creek on north 0.2 mile. | Scenic | 0.3 | 0.5 |
| 5 | R. 105 W., T. 12 N., Section 1, from border of private land west to border of state land, Section 31. | Low riparian; two 2-track crossings, two 2-tracks parallel south bank of creek along 20% of distance through BLM-administered parcel; one seismic crossing. | Recreational | 3.5 | 0.8 |
| 6 | R. 105 W., T. 12 N., Section 1, from border of state land southwest to border of private land Section 15. | Low riparian, no crossings; eight 2-track access points on both sides of creek through BLM-administered parcel. | Scenic | 2.6 | 1.0 |
| 7 | R. 105 W., T. 12 N., Section 22, from border of private land south to Wyoming-Utah state line and private land border. | Low riparian; road crosses creek and parallels 50% of creek through BLM-administered parcel, ranch ¾ mile SE of lower end of BLM-administered parcel. | Recreational | 0.6 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **14.25** |
| **Total Miles Across BLM Lands** | | | | **8.25** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **58%** | -- | -- |

*BLM-Administered Public Land

# L.6 CURRANT CREEK (PART OF CURRANT CREEK UNIT)

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include fisheries. There are populations of the Colorado River cutthroat trout in the watershed. This candidate species is a pure strain.

**Table L-5. Currant Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 106 W., T. 13 N., Section 1, from border of state land north to border of state land, R. 106 W., T. 14 N., Section 36. | Moderate riparian; no roads in waterway corridor through BLM-administered land; nearest access is 2-track parallel to creek ½ mile west on bench. | Wild | 1.2 | 0.6 |
| 2 | R. 106 W., T. 14 N., Section 36, from border of state land northwest to border of state land in Section 25. | Moderate riparian; no roads in waterway corridor through BLM-administered land; nearest access is 2-track parallel to creek ½ mile west on bench. | Wild | 0.5 | 0.8 |
| 3 | R. 106 W., T. 14 N., Section 25, from border of state land northwest to border of state land, Section 24. | Moderate riparian; one 2-track parallels east bank of creek in lower end of BLM-administered parcel; public water reserve covers 80% of creek through BLM-administered land; adjacent state lands within waterway corridor. | Scenic | 0.8 | 1.5 |
| 4 | R. 106 W., T. 14 N., Section 11, from border of state land northwest to border of private land, Section 10. | Moderate to heavy riparian; 2-track parallels 1 ½ miles of creek on north side; ¼ mile of creek through BLM-administered land covered by public water reserve. | Scenic | 2.0 | 1.25 |
| 5 | R. 106 W., T. 14 N., Section 5, from border of state land west to border of private land, Section 31. | Moderate to heavy riparian; entire creek through BLM-administered land is covered by public water reserve; one two 2-track parallels entire distance through BLM-administered land and crosses once; another 2-track follows opposite side of creek along 50% of distance through BLM-administered land. | Scenic | 0.5 | 2.0 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 6 | R. 107 W., T. 14 N., Section 1, from border of private land northwest to border of private land. | Heavy riparian; 2-track parallels both sides creek; adjacent private lands within waterway corridor at each end (up and downstream) of BLM-administered parcel; ranch approximately ½ mile downstream from BLM-administered parcel. | Scenic | 0.5 | 4.5 |
| 7 | R. 107 W., T. 15 N., Section 30, from border of private land west to private land border. | Low-moderate riparian; road parallels north bank of creek entire distance through BLM-administered parcel; one 2-track access to creek. | Recreational | 0.6 | 0.2 |
| 8 | R. 107 W., T. 15 N., Section 30, from border of private land west to border of Flaming Gorge NRA. | Low-moderate riparian; road and 2-track parallel entire distance of creek through BLM-administered parcel on north side. | Recreational | 0.2 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **17.15** |
| **Total Miles Across BLM Lands** | | | | **6.3** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **37%** | -- | |

*BLM-Administered Public Land

# L.7 DRIPPING SPRINGS FORK, CURRANT CREEK (PART OF CURRANT CREEK UNIT)

Outstandingly remarkable values of BLM-administered lands in the waterway review segment include fisheries. There are populations of the Colorado River cutthroat trout in the watershed. This candidate species is a pure strain.

**Table L-6. Dripping Springs Fork, Currant Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 105 W., T. 13 N., Section 7, from headwaters north to border of state land, R. 106 W., T. 14 N., Section 36. | Heavy riparian; one powerline crossing; 2-track parallels upstream half (southern) of creek; one-mile of creek across BLM-administered land is covered by public water reserve; adjacent state lands within waterway corridor. | Scenic | 2.0 | End of waterway segment reviewed. |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |

## L.11 PACIFIC CREEK

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include historic. The Oregon, Mormon Pioneer, California, and Pony Express National Historic Trails parallel much of Pacific Creek. There were many pioneer camping spots along the creek. A Pony Express station was located immediately beside Pacific Springs.

**Table L-10. Pacific Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 101 W., T. 27 N., Section 5, from headwaters north to border of private land, R. 102 W., T. 27 N., Section 1. | Low riparian; road/2-track along entire length and right next to creek; historic trail within waterway corridor. | Recreational | 3.5 | 2.0 |
| 2 | R. 102 W., T. 27 N., Section 11, from border of private land southwest to border of private land in Section 21. | Low-moderate riparian; three 2-track crossings; dam/structure in channel, 2-tracks on both sides of creek upstream half (northeast portion) and one on downstream half; other 2-tracks within waterway corridor; historic trail within waterway corridor. | Recreational | 4.0 | 1.0 |
| 3 | R. 102 W., T. 27 N., Section 29, from border of private land southwest to border of private land. | Moderate-heavy riparian; two 2-tracks within waterway corridor parallel north bank of creek. | Scenic | 0.5 | 0.8 |
| 4 | R. 102 W., T. 27 N., Section 31, from border of private land southwest to border of private land. | Low riparian; road parallels north bank of creek within waterway corridor. | Scenic | 0.2 | 0.25 |
| 5 | R. 103 W., T. 26 N., Section 1, from border of state land southwest to border of state land. | Low riparian; two seismic crossings of creek; adjacent state lands within waterway corridor. | Scenic | 0.2 | 0.25 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 6 | R. 103 W., T. 26 N., Section 2, from border of state land southwest to border of state land. | Low riparian; old railroad grade access ½ mile north of creek; no roads within corridor; adjacent state lands within waterway corridor. | Wild | 0.3 | 0.6 |
| 7 | R. 103 W., T. 26 N., Section 2, from border of state land southwest to border of state land. | Low riparian; railroad grade within waterway corridor; adjacent state lands within waterway corridor. | Scenic | 0.1 | 0.2 |
| 8 | R. 103 W., T. 26 N., Section 2, from border of state land southwest to border of state land. | Low riparian; one seismic crossing; railroad grade within waterway corridor; adjacent state lands within waterway corridor. | Recreational | 0.1 | 1.0 |
| 9 | R. 103 W., T. 26 N., Section 10, from border of state land south to border of state land. | Low riparian; railroad grade crosses creek; adjacent state lands within waterway corridor. | Recreational | 0.1 | 0.1 |
| 10 | R. 103 W., T. 26 N., Section 10, from border of state land southwest to border of state land. | Low riparian; railroad grade within waterway corridor; 2-track crosses creek; one other 2-track to creek; adjacent state lands within waterway corridor. | Recreational | 0.2 | 2.0 |
| 11 | R. 103 W., T. 26 N., Section 17, from border of state land southwest to border of state land. | Low riparian; railroad grade within waterway corridor; two 2-tracks within waterway corridor and one 2-track along creek through BLM-administrated parcel; adjacent state lands within waterway corridor. | Recreational | 0.1 | 1.0 |
| 12 | R. 103 W., T. 26 N., Section 19, from border of state land southwest to border of state land. | Low riparian; one 2-track within waterway corridor. | Scenic | 0.1 | 0.3 |
| 13 | R. 103 W., T. 26 N., Section 19, from border of state land southwest to border of state land. | Low riparian; one 2-track within waterway corridor. | Recreational | 0.3 | 0.2 |
| 14 | R. 103 W., T. 26 N., Section 24, from border of state land southwest to border of state land. | Low riparian; one 2-track parallels north bank of creek. | Recreational | 0.1 | 1.5 |
| 15 | R. 103 W. T. 26 N., Section 26, from border of state land southwest to border of state land. | Low riparian; railroad grade within waterway corridor; three 2-tracks in corridor (one crosses creek). | Recreational | 0.2 | 0.1 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 16 | R. 103 W., T. 26 N., Section 26, from border of state land southwest to border Bureau of Reclamation lands, R. 105 W., T. 25 N., Section 23. | Low riparian; railroad grade within waterway corridor entire length of creek through BLM-administered parcel; railroad crosses one time, 2-tracks parallel entire creek distance through BLM-administered parcel; two road and three 2-track crossings of the creek. | Recreational | 12.0 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **34.05** |

*BLM-Administered Public Land

## L.12 NORTH FORK OF BEAR CREEK

Outstandingly remarkable values of BLM-administered lands in the waterway review segment include geologic, scenic, recreation, and scientific. The creek flows through the Honeycomb Buttes Wilderness Study Area. The geology of the area is rare and the contrasting colors are scenic. Popular for recreationists and good opportunities for studying high plains desert ecology. The waterway review segment is intermittent.

**Table L-11. North Fork of Bear Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 100 W., T. 27 N., Section 1, from headwaters southeast to junction with Bear Creek, R. 98 W., T. 25 N., Section 5. | Very low riparian; one faint 2-track within waterway corridor for approximately one-mile at upstream end, and one 2-track road crosses at downstream end of BLM-administered parcel. | Wild | 12.0 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **12.0** |
| **Total Miles Across BLM Lands** | | | | **12.0** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **100%** | -- | -- |

*BLM-Administered Public Land

# L.13 CANYON CREEK

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include scenic and historic. The creek has steep sloped bordering the toe slopes of Pine Mountain giving scenic contrasting views of geology and vegetation. The creek is along the route used by Western outlaws to reach hideouts in Brown's Park, in Colorado. The creek is also adjacent to the diamond fields of the Great Diamond "Hoax" at the base of Diamond Peak, just south of the Wyoming state line.

**Table L-12. Canyon Creek Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 103 W., T. 12 N., Section 22, from headwaters northeast to border of private land, Section 24. | Low-moderate riparian; road and 2-track parallel 50% of creek distance through BLM-administered parcel; three seismic crossings; adjacent state lands within corridor at upstream end of BLM-administered parcel; adjacent private lands within corridor at downstream end of BLM-administered parcel | Recreational | 1.3 | 0.7 |
| 2 | R. 102 W., T. 12 N., Section 18, from border of private land northeast to border of private land. | Low riparian; two 2-tracks to creek; road parallels south side of creek (within ¼ mile) through BLM-administered parcel. | Recreational | 0.25 | 0.5 |
| 3 | R. 102 W., T. 12 N., Section 18, from border of private land northeast to border of state land. | Low riparian; 2-track parallels creek on south side. | Recreational | 0.2 | 1.0 |
| 4 | R. 102 W., T. 12 N., Section 17, from border of state land southeast to border of private land, Section 16 (SE corner). | Low riparian; road parallels north side of creek through BLM-administered parcel; one old irrigation diversion; two roads and three seismic crossings. | Recreational | 1.1 | 1.0 |
| 5 | R. 102 W., T. 12 N., Section 23, from border of private land east to border of private land. | Low-moderate riparian; road parallels north side of creek through BLM-administered parcel; one new irrigation diversion. | Recreational | 1.1 | 0.7 |
| 6 | R. 102 W., T. 12 N., Section 13, from border of private land east to border of private land, R. 101 W., T. 12 N., Section 18. | Moderate riparian; road crosses creek and parallels north side of creek through BLM-administered parcel. | Recreational | 0.6 | 1.6 |
| 7 | R. 101 W., T. 12 N., Section 20, from border of state land southeast to border of private land. | Moderate riparian; bench road parallels north side of creek (1/8 mile from creek) through BLM-administered parcel. | Recreational | 0.1 | 0.6 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 8 | R. 101 W., T. 12 N., Section 21 from border of private land southeast to Wyoming-Colorado state line. | Moderate-heavy riparian; no roads in waterway corridor; nearest access 2-track to creek at upstream end of BLM-administered parcel. | Wild | 0.4 | End of waterway segment reviewed |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **11.15** |
| **Total Miles Across BLM Lands** | | | | **5.05** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **45%** | -- | -- |

*BLM-Administered Public Land

## L.14 SWEETWATER RIVER

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include scenic, historic, and recreational. The river played a major role in the Oregon, Mormon Pioneer, California, and Pony Express National Historic Trails. It was crossed nine times by the trails. The rugged Sweetwater Canyon is only accessible by foot. Campsites along the river are very popular recreation areas.

**Table L-13. Sweetwater River Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 102 W., T. 30 N., Section 19, from Bridger Forest border south to beginning of Sweetwater Canyon, Section 19. | Heavy riparian; one road leading to Guard Station Campground and network of roads in the campground. Recreational usage. | Recreational | 0.6 | 0 |
| 2 | R. 102 W., T. 30 N., Section 19, from beginning of Sweetwater Canyon to Sweetwater Campground. | No access to canyon other than by foot; three 2-tracks to rim of canyon from west; road access to Sweetwater Campground at southern end of BLM-administered parcel. | Wild | 3.0 | 0 |
| 3 | R. 102 W., T. 29 N., Section 5, from Sweetwater Campground southeast to border of state lands, Section 16. | Heavy riparian; road access into BLM-administered parcel and road parallels 0.1 mile of the river within this parcel. | Recreational | 2.8 | 3.0 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 4 | R. 102 W., T. 29 N., Section 27, from border of private land southeast to border of state land. | Heavy riparian; nearest access 2-track ½ mile south of BLM-administered parcel; no roads in corridor. | Wild | 0.6 | 0.5 |
| 5 | R. 102 W., T. 29 N., Section 34, from border of state land south to border of private land. | Heavy riparian; 2-track parallels west bank; one 2-track access from east; two 2-tracks access from west. | Scenic | 0.5 | 0.25 |
| 6 | R. 102 W., T. 28 N., Section 4, from border of state land south to border of private land. | Heavy riparian; no roads in corridor; nearest access is 2-track ¼ mile above north end of BLM-administered parcel. | Wild | 1.0 | 0.2 |
| 7 | R. 102 W., T. 28 N., Section 10, from border of private land southeast to border of private land Section 11. | Heavy riparian; no roads in corridor; nearest access is parallel road ¾ mile east of river. | Wild | 1.2 | 3.2 |
| 8 | R. 101 W., T. 28 N., Section 19, from border of private land southeast to border of private land. | Heavy riparian; two 2-tracks in corridor, adjacent private lands within corridor. | Scenic | 0.6 | 8.5 |
| 9 | R. 100 W., T. 28 N., Section 29, from border of state land northeast to border of private land Section 27. | Moderate-heavy riparian; two 2-tracks in corridor each side of river. | Scenic | 2.5 | 0.3 |
| 10 | R. 100 W., T. 28 N., Section 29, from border of state land northeast to border of private land Section 26. | Heavy riparian; diversion and irrigation ditch along north bank of river; two 2-tracks in corridor; adjacent private lands within corridor. | Recreational | 0.3 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **29.05** |
| **Total Miles Across BLM Lands** | | | | **13.1** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **45%** | -- | -- |

*BLM-Administered Public Land

## L.15 BIG SANDY RIVER

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include historic. The river played a major role in the Oregon, Mormon Pioneer, California, and Pony Express National Historic Trails as a major campsite. Jedediah Smith's party which discovered South Pass traveling east to west, crossed the upper reaches of the river.

**Table L-14. Big Sandy River Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 100 W., T. 27 N., Section 1, from Section 5. | Heavy riparian; one faint 2-track to river at north end of BLM-administered parcel. | Wild | 1.5 | 2.0 |
| There are a total of 36 BLM-administered land parcels along the 74.6-mile review segment of the Big Sandy River. The 36 BLM-administered parcels represent a total of 16.15 miles of the review segment. Only the one parcel, involving 1.5 miles of the waterway, was determined to meet the WSR eligibility criteria. | | | | -- | -- |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **74.6** |
| **Total Miles Across BLM Lands** | | | | **16.15** | -- |
| **Percent BLM Jurisdiction of Waterway Segment Reviewed** | | | **22%** | -- | -- |

*BLM-Administered Public Land

## L.16 GREEN RIVER

Outstandingly remarkable values of the BLM-administered lands in the waterway review segment include wildlife, historic, and recreational. The river played a major role in the Oregon, Mormon Pioneer, California, and Pony Express National Historic Trails as it was one of the most dangerous crossings along the trails. Wildlife populations along the Green River are extensive and varied. The river is popular for floating, fishing, camping, and retracing historic expeditions.

**Table L-15. Green River Segment Review**

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 1 | R. 112 W., T. 28 N., Section 24, from border of private land southeast and west (loop) to border of private land. | Heavy riparian; cottonwood bottom; 2-track access on west bank of river. | Scenic | 0.25 | 1.2 |
| 2 | R. 112 W., T. 28 N., Section 24, from border of private land southeast to border of private land. | Heavy riparian; cottonwood bottom; two old channels and sandbars; 2-track parallels east side; one 2-track to bottom adjacent state lands within corridor. | Recreational | 0.4 | 6.0 |

| Parcel Number* | Waterway Review Segment and Location of Parcel* | Notes/Description/Outstandingly Remarkable Values of Parcel* | Tentative Classification of Waterway Across Parcel* | Length of Waterway Across Parcel* (miles) | Distance to Next BLM Land Parcel (miles) |
|---|---|---|---|---|---|
| 3 | R. 112 W., T. 27 N., Section 20, from border of private land southwest to border of private land, Section 29. | Moderate riparian; U.S. 179 within corridor west of BLM-administered parcel; one parallel 2-track between highway and river. | Recreational | 0.4 | 0.25 |
| 4 | R. 112 W., T. 27 N., Section 31, from border of private land south to border of private land. | Moderate riparian; two 2-tracks, one on each side of river through BLM-administered parcel. | Recreational | 0.25 | 1.2 |
| 5 | R. 112 W., T. 27 N., Section 31, from border of private land south to border of private land. | Moderate riparian; U.S. 189 within corridor; adjacent private lands within corridor; bridge crosses river; BLM-administered parcel approximately ½ mile north of LaBarge. | Recreational | 0.3 | 6.0 |
| 6 | R. 112 W., T. 26 N., Section 33, from border of private land southwest to border of private land and Bureau of Reclamation land forks. | Moderate-heavy riparian; river splits around island; adjacent private lands within corridor; roads and 2-tracks parallel both banks. | Recreational | 0.25 | 56.0 |
| 7 | R. 112 W., T. 18 N., Section 6, from border of private land southeast to border of private land. | Moderate riparian; adjacent private lands within corridor; I-80 crosses river approximately 100 yards below BLM-administered parcel; 2-track access to river south side. | Recreational | 0.1 | 2.0 |
| 8 | R. 107 W., T. 18 N., Section 8, from border of private land southeast to border of private land. | Low-moderate riparian; adjacent private lands, Union Pacific railroad, and Rio Vista subdivision within corridor. | Recreational | 0.5 | 0.9 |
| 9 | R. 107 W., T. 12 N., Section 16, from border of private land southeast to border of private land. | Low riparian; 1-80 within corridor, pipeline or powerline crosses river; 2-track to river both sides. | Recreational | 0.4 | End of waterway segment reviewed. |
| **Total Length of Waterway Segment Reviewed (miles)** | | | | | **71.0** |

*BLM-Administered Public Land

# L.17 RESULTS OF THE WILD AND SCENIC RIVERS SUITABILITY REVIEW OF BUREAU OF LAND MANAGEMENT-ADMINISTERED PUBLIC LANDS ALONG WATERWAYS IN THE ROCK SPRINGS RESOURCE MANAGEMENT PLAN PLANNING AREA

## L.17.1 Red Creek (includes Little Red Creek, June Creek, and Beef Steer Creek)

It was determined that the 12 BLM-administered public land parcels along the Red Creek Unit review segments (including Little Red Creek, June Creek, and Beef Steer Creek) do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on (1) the potential conflicts with management and activities conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over, (2) the inability of the BLM to manage the BLM-administered public lands involved in the context of a wild and scenic river because of the interspersed parcels of private and state land, and (3) the BLM-administered public lands do not constitute a worthy addition to the National Wild and Scenic River System. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.2 Currant Creek (includes Dripping Springs, East, Middle, and West Forks)

It was determined that the 14 BLM-administered public land parcels along the Currant Creek Unit review segments (including Dripping Springs, East, Middle, and West Forks) do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on (1) the potential conflicts with management and activities conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over, and (2) the inability of the BLM to manage the BLM-administered public lands involved in the context of a wild and scenic river because of the interspersed parcels of private and state land. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.3 Pacific Creek

It was determined that the 16 BLM-administered public land parcels along the Pacific Creek review segment do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on (1) the potential conflicts with management and activities conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over, and (2) the inability of the BLM to manage the BLM-administered public lands involved in the context of a wild and scenic river because of the interspersed parcels of private and state land. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.4 North Fork of Bear Creek

It was determined that the BLM-administered public land parcel along the North Fork of Bear Creek review segment does not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on (1) the BLM-administered lands involved do not constitute a worthy addition to the National Wild and Scenic River System, and (2) the lack of public. state, local, tribal. or federal interest in designation or non-designation of any part or all of the creek. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.5 Canyon Creek

It was determined that the eight BLM-administered public land parcels along the Canyon Creek review segment do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on (l) the potential conflicts with management and activities conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over, (2) potential use conflicts with Canyon Creek which could occur if it is included in the National Wild and Scenic River System, and (3) the inability of the BLM to manage the BLM-administered public lands involved in the context of a wild and scenic river because of the interspersed parcels of private and state land. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.6 Sweetwater River

It was determined that seven of the BLM-administered public land parcels along the upstream portion of the Sweetwater River review segment meet the wild and scenic river suitability factors and should be managed to maintain or enhance their outstandingly remarkable values for any possible future consideration for inclusion in the wild and scenic river system. The suitable determination is based on the uniqueness of the diverse BLM-administered land resources and their regional and national significance, making them worthy of any future consideration for addition to the wild and scenic river system.

The outstanding scenic, historic, and recreational values associated with the BLM-administered lands involved make this a uniquely diverse waterway segment in the region. Within this portion of the review segment, the Sweetwater Canyon and recreational opportunities at the Sweetwater campgrounds are of particularly high value.

Making up over 70% of the lands along this portion of the review segment, the BLM-administered public lands are manageable by the BLM as a wild and scenic river under the provisions of the Wild and Scenic River Act. Other factors that complement and enhance this manageability include (1) the existing public access to existing recreational areas in the review segment, and (2) there are no anticipated conflicts with the management objectives on the intermingled state and private lands within the review segment and the intermingled private lands are not large or extensive parcels as with ownership patterns along other waterways in the RMP planning area.

It was determined that the remaining three BLM-administered public land parcels within the downstream portion of the Sweetwater River review segment do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination for these three parcels is based on (1) the potential conflicts with management and activities

conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.7 Big Sandy River

It was determined that the one BLM-administered public land parcel along the Big Sandy River review segment does not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic river system. The non-suitable determination is based on the inability of the BLM to manage the small amount of BLM-administered public lands involved in the context of a wild and scenic river. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation.

## L.17.8 Green River

It was determined that the nine BLM-administered public land parcels along the Green River review segment do not meet the wild and scenic river suitability factors and will be given no further consideration for inclusion in the wild and scenic over system. The non-suitable determination is based on (1) the potential conflicts with management and activities conducted on the adjacent (and up or downstream) state and private lands that the BLM has no jurisdiction or control over, and (2) the inability of the BLM to manage the BLM-administered public lands involved in the context of a wild and scenic river because of the interspersed parcels of private and state land. The land and resource values on the BLM-administered lands involved can and will continue to be appropriately managed under all other applicable BLM mandates and regulations for multiple use, sustained yield, and environmental integrity, and should suffer no adverse effects for lack of a wild and scenic river designation. The BLM administers only a minute amount of land (4%) along the 71 miles of the Green River flowing through the Green River Resource Area. However, other Department of the Interior agencies (Bureau of Reclamation [BOR] and U.S. Fish and Wildlife Service [USFWS]) manage a large part of the remaining lands along the river. In addition, there was quite a bit of public interest for designation of the Green River as a Recreational River. The BLM would participate in any future joint study efforts or wild and scenic river reviews along the Green River.

**Table L-16. Summary of Wild and Scenic River Suitability Review**

| Waterway Reviewed | Determination | Justification |
|---|---|---|
| Red Creek Unit (all BLM land parcels along Red Creek and all other tributaries in the unit)[2] | BLM Lands Not Suitable | Not a worthy addition to the Wild and Scenic River System; land ownership conflicts; manageability. |
| Currant Creek Unit (all BLM land parcels along Currant Creek and all other tributaries in the unit)[2] | BLM Lands Not Suitable | Land ownership conflicts; manageability. |
| Pacific Creek[2] | BLM Lands Not Suitable | Land ownership conflicts; manageability. |
| North Fork of Bear Creek[2] | BLM Lands Not Suitable | Not a worthy addition to the Wild and Scenic River System; lack of interest for designation. |
| Canyon Creek[2] | BLM Lands Not Suitable | Potential use conflicts; manageability. |
| Green River[1] | BLM Lands Not Suitable | Manageability; land ownership conflicts. |
| Sweetwater River (upstream portion of review segment)[2] | 7 BLM Land Parcels Suitable | Scenic, historic, and recreational values, unique land and resource diversity. |

| Waterway Reviewed | Determination | Justification |
|---|---|---|
| Sweetwater River (downstream portion of review segment)[2] | 3 BLM Land Parcels Not Suitable | Land ownership conflicts. |
| Big Sandy River[2] | BLM Lands Not Suitable | Manageability. |

[1]Green River - The portion of the Green River administered by the BLM did not meet the suitability factors based upon the inability of the BLM to manage the BLM-administered lands in the context of a wild and scenic river because of the large and numerous separations of the few BLM administered parcels by interspersed private and state lands and by other federal lands administered by the BOR and USFWS. However, the BLM would participate in any future joint WSR reviews or studies that may be conducted on the Green River.
[2]The BLM would participate in any future study, or joint efforts, or wild and scenic river reviews (re-evaluation) along streams and waterways for potential WSR designation within the planning area.

# APPENDIX M—ASPEN MOUNTAIN COMMUNICATIONS SITE MANAGEMENT PLAN

This page intentionally left blank.

Department of the Interior
Bureau of Land Management

# ASPEN MOUNTAIN COMMUNICATIONS SITE MANAGEMENT PLAN

**Prepared by the Bureau of Land Management**
**Rock Springs Field Office, Wyoming**

**Approved by:** _____ 1 Sept. 2011
**Field Manager** **Date**

# ASPEN MOUNTAIN COMMUNICATIONS SITE MANAGEMENT PLAN

# I. INTRODUCTION

Demand for new communication sites continues to be active in the United States including carrier requests to locate cellular facilities on public lands in the western states. This demand is due to advances in communication technology, strong consumer interest, and a 1983 Federal Communication Commission (FCC) decree establishing wireless carrier coverage requirements.

Aspen Mountain is an established communication site with characteristics desired by wireless carriers, TV and radio stations, and other communication providers. The communication site overlooks a rural but growing population area of the city of Rock Springs to the north. Interstate Highway 80 runs in a generally west/east direction through the area about 12 miles north of Aspen Mountain. A number of State Highways and other secondary roads also run through the surrounding area.

This Communication Site Management Plan has been developed to document and evaluate the existing communication site and facilities located on Aspen Mountain. The plan also provides an outline for orderly future development of the site in conformance with the Rock Springs Field Office's (RSFO) current land use planning document, the Green River Resource Management Plan (RMP).

Current BLM program guidance for resource management planning specifies that every planning document shall contain determinations relevant to communication sites. The Green River RMP, Record of Decision signed August 8, 1997, does not discuss specific details needed for proper management of the communication site. Therefore, in order to supplement the land use planning document, this site management plan has been prepared to address specific issues encountered on Aspen Mountain.

Approved lessees or right-of-way (ROW) holders with facilities currently located on Aspen Mountain are shown in the Users' Table, Appendix B. Additional tenants or customers may be accommodated within the confines of existing authorized communication facilities as long as such additions are in compliance with the terms and conditions of authorized leases or ROW grants and with the supplemental direction contained in this site plan. Requests for new communication site facilities may be authorized at the discretion of BLM's Authorized Officer (AO) through the issuance of new Communications Use Leases, or in some cases, by the issuance of additional ROW grants.

This site plan will be incorporated into all future new leases issued for the Aspen Mountain Communication Site. This plan will also be included as a part of all existing leases and renewed leases or ROW grants as the terms of those authorizations allow. Provisions of the site plan are enforced through the terms and conditions of the ROW or lease authorization. Each lessee is expected to incorporate mandatory BLM lease and site plan requirements into any subsequent agreements with the lessee's tenants and customers. The lessee is also responsible for enforcement of said requirements involving the lessee's tenants and customers.

## A. Terms and Definitions

The terms used in this Communications Site Management Plan conform to the definitions listed in the April 22, 2005, Federal Register notice "Rights-of-Way, Principles and Procedures: Rights-of-Way under the Federal Land Policy and Management Act and the Mineral Leasing Act", with further clarification provided in Bureau of Land Management (BLM) Handbook 2860-1 and the United States Code of Federal Regulations (CFR) 43 CFR 2800. In the event of a conflict, between the plan and these sources, the Federal Register notice and the BLM Handbook will govern.

The words "lease" and "lessee" as used in this plan refer to the relationship between the BLM and the communications use lease lessee, or ROW holder. The words "customer" and "tenant" refer to the relationship between the lessee or holder and the occupants in the lessee's facilities.

LEASE OR ROW – A use authorization issued to a communication Facility Owner or Facility Manager allowing for the use of public land to construct and or operate a communications facility and, unless specifically prohibited, to sublease to occupants in that facility.

LESSEE, LEASE HOLDER, OR ROW HOLDER – A Facility Owner or Facility Manager.

CUSTOMER – A facility occupant who is paying a facility manager, facility owner, or tenant for using all or any part of the space in the facility, or for communication services, and is not selling communication services or broadcasting to others.

TENANT – A facility occupant who is paying a facility manager, facility owner, or other entity for occupying and using all or part of a facility. A tenant operates communication equipment in the facility for profit by broadcasting to others or selling communication services.

COMMUNICATIONS SITE – An area of BLM-managed public land designated through the land and resource management planning process as being used or is suitable for communications uses. A communications site may be limited to a single communications facility, but most often encompasses more than one. Each site is identified by name; usually a local prominent landmark, such as Aspen Mountain Communications Site.

FACILITY – The building, tower, and related incidental structures or improvements authorized under the terms of the grant or lease.

FACILITY MANAGER – The holder of a BLM communications use authorization who leases space for other communication users. A facility manager does not own or operate communications equipment in the facility for personal or commercial purposes.

FACILITY OWNER – Individuals, commercial entities, organizations, or agencies, that own a communications facility on Federal land; own and operate their own communications equipment; and hold a communications use authorization. Facility owners may or may not lease space in the facility to other communications users.

NON-BROADCAST – This category includes Commercial Mobile Radio Service, Facility Managers, Cellular Telephone, Private Mobile Radio Service (PMRS), Microwave, Local Exchange Network, and Passive Reflector.

BROADCAST – This category includes Television Broadcast, AM and FM Radio Broadcast, Cable Television, Broadcast Translator, Low Power Television, and Low Power FM Radio.

RIGHT-OF-WAY (ROW) – The public land authorized to be used or occupied pursuant to a ROW grant.

RIGHT-OF-WAY GRANT – A use authorization issued pursuant to Title V of the Federal Land Policy and Management Act of October 21, 1976 (43 U.S.C. 1701 *et seq.*) or issued on or before October 21, 1976, pursuant to then existing statutory authority, authorizing the use of a ROW over, upon, under or through public land for construction, operation, maintenance and termination of a project.

HOLDER – Any applicant who has received a ROW grant, lease or temporary use permit.

USERS – All ROW and lease holders, lessees, customers, and tenants that own or operate a facility or communication equipment at the communication site.

SENIOR USE – Any use whose implementation date is prior to the implementation date of the use in question.

RANALLY METRO AREA (RMA) – A series of nine population zone areas, the highest of which is greater than 5 million and the lowest being 25,000 or less. These zones are determined annually and published in the Ranally Metro Area Population Ranking, an independent publication from Rand McNally, and are used in rent determination under guidelines established in 43 CFR 2806.

## B. Purpose

This plan will be used by BLM officials administering communications uses at Aspen Mountain, existing lessees, holders, and applicants desiring a lease, grant, or an amendment to an existing lease or ROW grant. The plan will be kept updated by amending pages or sections of the plan rather than issuing a revised edition of the plan. When an administrative revision is necessary (such as the addition of a user), a letter will be sent to the holders from the RSFO enclosing a copy of revised pages or sections. The amendments will be consecutively numbered. Other proposed revisions to the plan will be circulated to holders for comment prior to implementation.

Overall management direction for the administration of communications sites is outlined in the CFR and the BLM Handbook and applicable BLM Instructional Memoranda. Specific direction for site management planning on designated communications sites is contained in BLM Handbook 2860-1. Primary regulations and policy pertaining to issuance of ROW authorizations by the BLM are found in Title 43 CFR Sections 2801- 2808 and BLM Handbook 2860-1.

This Site Management Plan provides applicable guidance and adds current policy and technical standards for better management of the Aspen Mountain Communications Site. This plan governs development and management of Aspen Mountain and will be modified in the future as needs and conditions warrant. Any future such uses must be designed, installed, operated, and maintained to be compatible and not interfere with the senior uses as defined in Section A above. This site-specific plan is administrative in nature and is Categorically Excluded from further review under the National Environmental Policy Act (NEPA) in accordance with 516.DM 2, Appendix 1, item 1.10, which states " – Policies, directives, regulations, and guidelines that are of an administrative, financial, legal, technical, or procedural in nature and whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case". Any additional development of Aspen Mountain will be addressed in a site-specific NEPA document.

## C. Site Description

The site is located approximately 12 miles south of Rock Springs, Wyoming and approximately 9.5 miles east of US Highway 191. It is on Aspen Mountain, a prominent landmark in the area. The area is managed by the RSFO. It is specifically located in the SE¼SE¼ of sec. 22, T. 17 N., R. 104 W., 6th Principal Meridian, Sweetwater County, Wyoming at approximately 41º 25' 50.7" North Latitude and 109º 07' 15.6" West Longitude. The elevation at the Aspen Mountain Communications Site is approximately 7,858 feet above mean sea level. A site map is provided as Appendix A.

## D. Area Served

This site does not serve an RMA. The largest population zone served is less than 25,000. This zone may be adjusted in the future as populations change. This information will be used for rental fee determination.

## E. Access

From US Highway 430, travel south on County Road 4-27 approximately 7.5 miles to Radio Telephone Road. Turn left (east) and travel approximately 2.2 miles to Aspen Mountain.

## F. Site History and Development

There are currently five communications facilities at Aspen Mountain. On July 8, 1975 the first communications facility was granted to the BLM under serial number WYW 52096.

Colorado Interstate Gas Co. was the second entity to construct a facility granted under authorization WYW 53936 on January 21, 1977 for their internal communications.

The Qwest Corporation was authorized to construct their facilities on September 15, 1988 to include microwave under ROW grant WYW107566.

The fourth entity issued a communication site ROW (WYW105090) was Ted Higgins on May 24, 1991. The ROW was assigned to Communications Technologies Inc, the current holder.

The last user issued a ROW (WYW167451) was to Sterling Communications in July 25, 2008. Previously, the Industrial Communications was the previous holder until their ROW was terminated on October 3, 2005.

A list of all authorized facilities as of the date of this plan can be found in Appendix B. Any modifications to existing facilities or proposals for new facilities must be approved by the RSFO according to the appropriate NEPA process and guidance described in this document.

The site currently appears to be relatively clean from interference, receiver sensitivity, and noise. If additional new uses deteriorate the receiving/transmitting operation of the existing uses, the new uses may be required to institute additional studies, equipment upgrades, frequency isolation, or physically separate from the existing uses. This may be particularly required if they are continuously transmitting in nature, or if there is an increase in transmitter power from communications uses on private land.

## G. Goals and Objectives of the Site Management Plan

1. Manage the Aspen Mountain site for low-power uses including two-way radio, microwave, cellular, cable television reception, in addition to high power uses such as radio broadcast. All uses must be

designed, operated and maintained so as not to physically or electronically interfere with the senior uses.

2. Manage communication equipment on the Aspen Mountain site to maintain the radio frequency radiation (RFR) to be within the Public Standard as defined by the FCC.

3. Systematically develop the site to maximize the number of compatible uses while ensuring safety and protection of resources. Development of new towers or buildings within each of the authorized owner's facilities will be authorized only after their respective tower or building space area is filled to near capacity.

4. Help fulfill the public need for adequate communications sites.

5. Protect the interests of holders, lessees, tenants and customers, by preserving a safe and electronically "clean" environment.

6. Encourage the efficient development and use of space and facilities within the designated site.

7. Achieve visual quality objectives by requiring design standards that are unobtrusive and utilizing earth tone colors and non-reflective surface material and stringent site maintenance requirements.

8. Describe the BLM's policy for road maintenance.

9. Develop new facilities only after the appropriate site-specific NEPA analysis and coordination with current lease or ROW holders and users.

10. Amend this Communications Site Management Plan as necessary in coordination with local, state and federal regulations and to be consistent with the management objectives of current and future RMPs. The BLM will provide authorization holders with proposed amendments to this plan and will allow a reasonable period of time for the holders to review and comment on the proposed changes.

# II. AUTHORITY AND DIRECTION

## A. Authority

The authority used by BLM to authorize communications uses on public land (administered by the BLM) is the Federal Land Policy and Management Act of 1976, 90 Stat. 2776 (43 U.S. C. 1761-1771) and is reflected in Title 43, CFR, Sections 2801- 2808 and various BLM Washington Office Information Bulletins and Instruction Memoranda.

BLM authority for communications site management planning is contained in BLM Handbook 2801- 1, Plan of Development. Direction on and policy for communication use authorizations is contained in BLM Manual Section 2860.

Authority for the issuance of authorizations and/or licenses for the transmission and reception of electronic radiation for communication purposes is granted by Congress and administered by the FCC and/or the National Telecommunication and Information Administration – Interagency Radio Advisory Committee (NTIA/IRAC).

## B. Relationship to Communications Site Leases/Right-Of-Way Grants

This site plan will be incorporated into all leases and ROW grants issued (now and/or in the future) for this communications site and must be used in conjunction with the granting authorization. **PROVISIONS OF THIS SITE PLAN ARE ENFORCED THROUGH THE GRANTING AUTHORIZATION (LEASE OR ROW GRANT).** Each lessee or holder is expected to include the requirements of the authorization and this site plan into any documents, which describe the business relationship between the lessee and their tenants and customers. The lessee or holder is responsible for enforcing those provisions.

# III. GENERAL RESPONSIBILITIES

## A. The Bureau of Land Management

The BLM retains the responsibility for issuing and amending authorizing instruments to Facility Owners and Facility Managers, only for the areas actually occupied by the authorized improvements. The issuance of an FCC license (authorization), or frequency assignment, does not authorize occupancy of public land. Granting occupancy and use of public land, administered by the BLM, rests exclusively with the BLM. This includes:

1. Approving any new facility(ies) at the site.

2. Approving amendments to existing facilities (i.e. additions to tower, building, support facilities), and approving assignments of leases and ROW grants to qualified buyers of facilities on the site.

3. Approving any modifications to existing facilities including the tower, antenna, equipment or building. Also, approving any changes to the existing FCC licenses, prior to the submission of an application to the FCC. Federal Radio are licensed through the NTIA.

4. Frequency Management. The BLM is not normally responsible for the resolution of conflicts when the licensees or agencies are operating within the limits of the FCC and NTIA/IRAC authorizations.

## B. Facility Owners and Facility Managers

Facility owners and facility managers (or their designated representatives) are responsible for:

1. Complying with their use authorization and all provisions of this site plan.

2. Ensuring that all new facilities, expansions, or improvements are consistent with the RSFO land use planning documents; any environmental document(s)/decisions for the site; and, this site plan.

3. Ensuring facilities/equipment not complying with Federal/State/local laws/regulations/ ordinances will be removed or modified within one year of the approval of this plan. Any modification needs pre-approval by the BLM.

4. Keeping all facilities within the established limits of their authorized area.

5. Providing the BLM with the name, address and phone number for a local contact person. The Facility Owner and Facility Manager and the contact person may be the same individual. The contact person will be available for emergencies and will have the authority to make decisions about construction issues, facility maintenance and all equipment within the facility.

6. Providing 30-day notice to all facility owners/facility managers at the site, as well as the BLM, of all new frequencies proposed for the site. A completed BLM technical data sheet or equivalent must be sent with the 30-day notice to allow for comment of potential interference. This notification requirement applies to new frequencies for facility owners/facility managers as well as their tenants and customers

7. Adhering to the lease/ROW grant as follows:

    a. Facility Owners and Facility Managers with Communications Use Leases are authorized to rent building/tower space to tenants and/or customers without prior written approval from the BLM.

    b. Tenants and/or customers may not construct their own equipment shelter (building, shelter, generator pad, cabinet, etc.) or antenna support structure (tower or mast). The facility owner must own all communication shelters and towers under their lease or grant. [If that is not possible, a separate SF-299 application, cost-recovery fees, analysis, and authorization are required. This may also result in the use being a tenant/customer of the original lease/ROW in addition to being a separate facility for billing purposes.]

    c. Tenants and/or customers using a facility covered by a Facility lease/ROW will not have separate BLM leases/ROWs to authorize their use except in situations where regulations or policy require them.

    d. Facility Owners and Facility Managers are responsible for complying with the terms and conditions of the facility lease/ROW. Facility Owners/Facility Managers are also responsible for ensuring that their tenants and customers are in compliance with the terms and conditions of the lease/ROW and applicable FCC or NTIA/IRAC license terms and conditions.

    e. The Facility Owner and Facility Manager may not place any unreasonable restrictions nor any restriction restraining competition or trade practices on tenants and/or customers, or potential tenants and/or customers.

8. Ensuring that all communications equipment is properly installed, operated, and maintained.

9. Ensuring that all communication equipment meets American National Standard Institute (ANSI), FCC and BLM regulations, guidelines and standards concerning radiation limitations by:

    a. Monitoring radiation levels at their facility; and,

    b. Immediately correcting any radiation levels that are, or could be a hazard to human health. (FCC 47 CFR sections 1.1307(b), 1.1310 and 2.1093) and FCC OET Bulletin 65, August 1997.

10. Providing a certified copy of all uses and the correct category of uses within the facility, along with the current phone numbers and addresses of all tenants and customers as of September 30th each year. This report is due by October 15th each year.

11. Keeping the premises around their buildings free of trash and debris.

12. Placing the BLM lease/ROW serial number on the door of their communications site building, or on a gate if a fenced compound.

13. Correcting all interference problems. The users are normally responsible for the resolution of conflicts when the licensees or agencies are operating within the limits of the FCC and NTIA/IRAC authorizations.

### C. Federal Communication Commission and National Telecommunication and Information Administration – Interagency Radio Advisory Committee

The FCC and NTIA/IRAC are responsible for Frequency Management. The FCC and NTIA/IRAC are not normally responsible for the resolution of conflicts when the licensees or agencies are operating within the limits of the authorizations.

## IV. AUTHORIZED USES AND USERS WITHIN A FACILITY

### Use by Multiple Users

Use of all facilities and improvements by more than one user, known as co-location, will be required except where the facility owner is a government agency. Site applicants will take the lead in this area and design their proposals to accommodate multiple uses of facilities and improvements. This includes multiple uses of buildings, towers, back-up generators, grounding systems, fuel containers, access ways and parking areas.

BLM will not authorize a ROW expansion or modification until it is determined that existing authorized space and facilities are being used to capacity. Development or expansion of a ROW solely to preclude potential competitors from locating nearby is unacceptable and will not be authorized by the BLM.

Facility Owners and Facility Managers are not required to lease facility space to others if they can prove to the authorized BLM officer that:

1. Space is not available.

2. The use is incompatible with the existing facilities.

3. Additional space is needed by the facility owner/manager.

4. Additional users would violate system security needs.

5. Potential interference is not resolvable.

## V. FEES

The BLM will charge Facility Owners and Facility Managers annual rental fees pursuant to federal regulations contained in 43 CFR 2806. The fees are based on two factors- the type of communications use, and the population served by the use. These fees are considered fair market value for the use of public land. The population Zone 9 (less than 25,000) will be used for these calculations unless something else is specifically agreed to in writing by the authorizing officer or until populations change.

Fees that Facility Owners and Facility Managers may charge their tenants and customers are to be reasonable (consistent with, and not in excess of, other fees for similar facilities) and commensurate with the uses and occupancy of the facilities and services provided to tenants and customers.

# VI. GENERAL OPERATION AND MAINTENANCE DIRECTION

## A. Unique Resource Considerations at this Communication Site

There are no currently identified special resource coordination considerations with on-site or adjacent resource values. Should special conditions arise through the revision process of the land use plan or other situations, this site plan will be amended accordingly.

## B. Wiring and Grounding

1. All equipment is to be installed within existing buildings and in metal equipment racks or within metal equipment cabinets and in accordance with manufacturers' specifications. All equipment, racks, cabinets and overhead ladder trays are to be grounded and shielded in compliance with National Electrical Code (NEC) and in accordance with accepted industry standards.

2. All electrical wiring and grounding must meet the NEC and applicable State/local codes. All permanent wiring shall be installed in metallic conduit. Surge protection shall be installed between the electric service meter and the first power distribution panel.

3. Lightning protection shall be in accordance with NEC part 810-20 Antenna Discharge Units and Part 810-21 Grounding Conductors. Periodic bonding of the antenna feed lines to the tower (when galvanized steel) shall be made with proper bonding connectors that are stainless steel (preferred), tin plated or made of brass.

4. Each building is to have its own separate grounding system for all users in that structure. Wherever practical, interconnection of individual grids and/or the simultaneous placement of a large sized copper ground wire with any new grounding systems that are buried on the site will be required.

5. Site or facility grounding must be constructed of copper, with #2 AWG or larger wire or 2" or larger solid copper strap, connected to an adequate site/facility ground electrode system. The site/facility ground electrode system shall be bonded to the power service entrance grounding electrode conductor. Guy wires should also be grounded using manufacturers approved methods to preclude bi-metallic junction and corrosion. All equipment on the site (buildings, towers, power units, transmitters, receivers, antennas, combiners, telephone systems, power cabinets, HVAC units, etc.) must be connected to the site/facility ground by direct connection. Electrical system ground wiring is required for electrical ground fault protection and circuit breaker coordination. The grounding systems shall comply with applicable laws, codes and in accordance with standard engineering practice. Below ground connections must use either an exothermic welding process (i.e. Cadweld, Thermoweld, etc.), copper wedge pressure devices (i.e. Ampact, Burndy, Wrench-lock, etc.), or brazed copper connections in conjunction with a mechanical UL listed connector (to be used as a physical strength enhancement component). Brazing by itself is not an acceptable method of bonding below earth grade (buried).

## C. Communications Equipment

Equipment Ownership

All equipment shall be labeled (or the information available at the site, as applicable) with:

1. The owner's name.

2. Transmitter frequency(ies).

3. A valid FCC, or IRAF, authorization.

4. Transmitting power output(s).

5. A current 24-hour phone contact number.

Transmitting Equipment

All transmitters will have protective devices (shields, filters, isolation components), designed into or externally installed, to prevent interference with other users. All transmitters will meet FCC licensing requirements. Two-way transmitters should have dual section isolators for a total of 60 dB of isolation.

The re-radiation of intercepted signals from any unprotected transmitter and its associated antenna system will be prevented by the use of appropriate filters (wide band and narrow band broadcast transmitters).

The direct radiation of out-of-band emissions (i.e. noise or spurious harmonics) will be reduced to a level such that they may not be identified as a source of interference as defined in the FCC Rules and Regulations (e.g. Part 90.209(e) for non-broadcast uses, and Parts 73 and 74 for broadcast uses). If site noise (electromagnetic noise) becomes an issue, noise threshold limits will be established, and amended into the site plan, prior to authorizing any new uses.

Direct radiation of out-of-bound emissions, (i.e. transmitter wide band noise, spurious emissions, harmonics, etc.) shall be reduced to a noninterference level by using bandpass, lowpass, and/or harmonic filtering. Where duplexing is used, use of a notch type device should be avoided.

Re-radiation of signals from a transmitter and its associated antenna system shall be prevented by installing appropriate devices (i.e. ferrite isolators), with minimum return loss of 25 dB.

All transmitters not in immediate use and not specifically designated as standby equipment shall be removed. Loads connected to circulators are to be capable of dissipating the total power output of the transmitter.

Receiving Equipment

All receivers shall comply with all applicable parts of the FCC rules, including Parts 2 and 15.

All receivers shall have sufficient “front end” pre-selection to prevent receiver spurious response. The use of bandpass, band-reject cavity or crystal filters may be required to prevent receiver-produced intermodulation or adjacent-channel interference.

Where duplexing is used, a bandpass cavity duplexer is required. Use of the notch-type device is not permitted. Where notch-type devices are currently in place and there are no interference problems, their use may continue until the equipment is replaced, at which time they must be replaced with bandpass devices.

Tower

Generally, only one tower is authorized for each facility owner. Facility Owners and Facility Managers may obtain permission to construct the second tower only after submitting evidence that demonstrates that their existing tower is completely filled and full use has been made of combining systems.

1. All towers will be left unpainted, if they are dull, galvanized steel. Paint is required only if the tower has a shiny (i.e., reflective) surface. If paint is required, the BLM will approve only non-reflective colors from the Munsell Soil Color Chart, Standard Environmental Colors, or the equivalent.

2. Maximum tower height for future towers at this site is 80 feet.

3. Anti-climb devices, removable steps, or other means to discourage unauthorized climbing, are highly recommended to reduce or avoid liability claims.

4. All new towers will be self-supporting. No guy lines are permitted.

5. To avoid possible impacts to birds or bats, follow the most current version of the U.S. Fish and Wildlife Service's Interim Guidelines on the Siting, Construction, Operation and Decommissioning of Communication Towers, available at the following website: *http://migratorybirds.fws.gov/issues/towers/comtow.html*

Antennas

1. Microwave (dish) antennas (other than ground mounted satellite dishes) will be limited to a maximum of eight (8) feet in diameter. The smallest diameter dishes are preferred if technically feasible.

2. Dishes should be mounted as low as possible to reduce visual impacts.

3. All antennas must meet all Occupational Safety and Health Administration safety standards. If an antenna exceeds FCC public radiation standards (see FCC OET Bulletin 65) at ground level in publicly accessible areas, it will be remedied within 24 hours after measurements are taken or isolated (e.g., fencing, signing, relocation, lowering power levels are all possible remedies). Ground measurements of RFR levels will be taken before mitigation measures are implemented.

4. Color(s) for dish antennas, or covers, must be pre-approved by the BLM. New white dish antennas and/or covers will not be approved. Existing white dishes and covers must be repainted or replaced with dishes of approved color (typically dark grey), as repairs or replacement become necessary.

5. Antennas will be purchased with or treated to have a non-reflective surface.

Interference

The responsibility for correcting interference problems is a matter for resolution between the lease/ROW holder of the facility(ies), the user causing the interference, and the affected party(ies). First users on a site have seniority with respect to the resolution of interference complaints. Senior holders have an obligation to maintain their equipment to industry standards, to operate their systems in accordance with the terms of both the FCC license and NTIA/IRAC frequency authorization, and to comply with the BLM authorization.

New users on a site must correct, at their expense, interference problems that they create. They may be required to furnish an intermodulation study, electromagnetic noise study, or other interference-related data and must agree to accept financial responsibility for elimination or prevention of any interference caused by the facility before their application can be evaluated. They must cease operation of the suspect equipment until the problem is corrected. If interference problems cannot be resolved or corrected within a reasonable time, the new use that is causing the interference may be terminated and the equipment removed.

All users shall cooperate with the Site Users Association, if one is formed, and the BLM in identification and correction of any interference. The BLM does not have authority for correcting interference problems but can act as a mediator to help all affected parties. Interference problems must be coordinated with the FCC or NTIA/IRAC, whichever is appropriate.

Interference with law enforcement and/or emergency communications must be corrected immediately. The operation of equipment covered by this site plan shall not interfere with United States Government radio or electronic operations already in existence on public land within two (2) miles of this site. The user causing this interference, shall, at its own expense, take all action necessary to prevent or eliminate such interferences. If it does not eliminate such interference within ten (10) days after receipt of notice from the BLM to do so, this use will be terminated.

If electromagnetic noise becomes an issue, noise thresholds will be established and this site plan will be amended accordingly.

## D. Cables and Transmission Line (Wave Guides)

All new cabling will be jacketed and shielded and shall either be flexible or semi-rigid type. Existing substandard cables will be upgraded as repairs or replacement become necessary.

Cables will be properly installed and will be strapped and fastened down. Use of ports at building entrance points will be kept to a minimum by use of combiners.

When attaching power cables onto a tower, conduits should be used. Coax and wave guides should be installed in a wave guide ladder or equally divided among all tower legs.

All transmission lines (wave guides) are to be supported in accordance with manufacturer's specifications.

Unjacketed transmission line of any type is prohibited. No transmission line shall be left unterminated.

Double shielded braided or solid shielded cable will be used. No RG-8 type cable is permitted. No connector-type adapters will be used on transmission lines. Only correct connectors that will mate to connected devices are to be used.

Conduits will be shared when they service common areas and will be buried where possible.

## E. Radiation

All communications uses must meet ANSI, FCC and BLM regulations guidelines and standards concerning radiation limitations. This site is considered uncontrolled for the purposes of compliance with RFR standards.

Monitoring radiation levels at the site is the responsibility of all site users and will occur at intervals to comply with FCC regulations and guidelines. A copy of these monitoring reports will be provided to the BLM upon request. The FCC is responsible for enforcement of the monitoring and standardization for compliance. The FCC could revoke the license and/or issue a fine for failure to comply. Additionally, the BLM could terminate or suspend the use authorization for failure to comply.

Onsite RFR measurements will be taken using appropriate equipment that can adequately measure and record both on-tower and on-the-ground levels before mitigation measures related to RFR are implemented pursuant to FCC standards and requirements.

Security fences with RFR notice signs are required around areas that exceed public use levels including anchor points outside the primary facility compound fence, if necessary. Raising higher power transmitting antenna on the tower or modifying the antenna type to half wavelength may be necessary to eliminate RFR hazards. Reducing power may also be required if other alternatives are not feasible. All fencing location and design or new tower construction must be pre-approved by the BLM.

Warning signs will comply with ANSI C95.2 color, symbol, and content conventions. Contact information including name and telephone number will also be included on warning signs.

Existing warning signs compliant with FCC 47 CFR 1.1307(b) which do not currently include name and telephone number will be accepted as long as the name and telephone number is clearly posted on other signage at the Lessee's site.

Lowering power levels for on-tower access during maintenance will be coordinated between affected users.

Any identified RFR problems that are, or could be, a human health hazard must be corrected within 24 hours after measurement tests have been completed or be removed from the site by the site user(s). If the proposed corrective action involves any new ground disturbance, it must be pre-approved by the BLM.

## F. Utilities-Availability of and Requirements for:

Commercial Electrical Power

Commercial power is provided to the site under a separate ROW grant to Pacific Power and Light (WYW 266495). The current electrical service to the site has the capacity to service additional users at the site. Future upgrades of the electrical service will be part of the ROW to Pacific Power and Light and may need to be paid for by the benefiting user(s).

Telephone Service

If telephone service is ever deemed necessary, a separate ROW grant will be issued. Site users will also pay for the cost of:

1. The necessary resource surveys and reports for service connections.

2. The cost of constructing service connections.

For visual reasons, overhead utility poles may not be authorized.

Fuel Tanks

Facility Owners and Facility Managers are responsible for providing fuel storage (propane and diesel) and emergency power for their tenants and customers. No tenants or customers will be authorized to have separate fuel tanks and/or generators. Each facility owner will preferably consolidate fuel storage into a tank large enough in size to accommodate all tenants and customers within their facility. At a minimum, tanks will be grouped together in a consolidated area adjacent to their facilities. All fuel, storage tanks

(e.g. LPG, propane and diesel) must meet current fire department, Federal, State and local government safety and hazardous materials requirements. Propane is the preferred fuel for future generators.

1. All tanks will be:

    a. Signed in red letters, "SMOKING OR OPEN FLAME PROHIBITED WITHIN 20 FEET"

    b. In conformance with National Fire Protection Association requirements

    c. Painted an approved color or screened by an enclosure to blend in with the natural environment. If an enclosure is used, it must be pre-approved and painted an approved color from the Munsell Soil Color Chart, Standard Environmental Colors.

2. Diesel tanks will also be:

    a. Enclosed in BLM and fire department approved secondary containment vaults that are painted a BLM approved color from the Munsell Soil Color Chart, Standard Environmental Colors.

    b. Constructed with underground fuel lines. Fuel line must be constructed of black, treated pipe and fittings, and must be posted.

    c. A containment basin must be maintained below all diesel tanks which are not designed and approved to be self-contained.

## G. Sanitary Facilities

Plans for any sanitary facilities must be pre-approved by the BLM. If it is determined by the BLM that the users need such facilities, they will be provided by the lease/ROW holder in a manner and location satisfactory to the BLM and within the requirements of the Sweetwater County Health Department.

## H. Security and Law Enforcement

The Sweetwater County Sheriff's Department is the key law enforcement agency for the area. They are responsible for most civil and criminal matters. The BLM will be responsible for enforcing matters related to uses of BLM lands (e.g. resource protection issues).

Patrolling and policing for security purposes is the user's responsibility.

None of the facilities on Aspen Mountain are currently fenced. If fencing is ever deemed necessary for security purposes at other facilities on the site, it must meet the following criteria:

1. All fences must meet health and safety requirements.

2. All fence locations and design require BLM pre-approval. The standard fencing type will be chain-link (i.e. cyclone).

3. The standard fence height will be eight (8) feet.

4. Fencing will be designed, installed, maintained, and of a type to minimize interference issues as described in the Motorola R-56 standards.

5. Fences will be signed with RFR notices if RFR is above public levels.

## I. Site Maintenance

The objective of maintenance activities is to present a clean, neat, and orderly appearance at the site and have all of the authorized improvements safe for workers and the public. All users will keep up the overall appearance of the site.

Miscellaneous debris remaining after any construction and/or equipment installation, removal or modification, is not only a hazard, but can cause interference or intermodulation problems. In particular, all loose wire or metal objects are to be removed from the site.

The users of the site will remove all graffiti within 10 working days of finding it, weather permitting.

Users will not be permitted to leave or dispose of trash, garbage or cut brush on public lands. No outside trash or litter containers will be provided. Site users will remove litter from the site as it is produced.

Policing of litter in common areas (i.e. areas between buildings and developed sites) is the shared responsibility of those holders bordering these areas.

During construction and/or maintenance, excess materials (e.g. cement, wire, metal, building materials) will be removed from public land.

Peeling paint on buildings and/or towers will be re-painted within thirty (30) days of discovery by the facility owner or facility manager and within 10 days of notification of the holder by the BLM, weather permitting.

The Lessee is responsible for the abatement and control of noxious weeds within the bounds of their lease site and common use areas. Abatement practices are to be implemented in accordance with the RSFO weed abatement programs.

## J. Inspections

Enforcement authority is vested in the BLM as the Communications Site Administrator for Aspen Mountain via 43 CFR 2800. The BLM may conduct an annual inspection of each user's facility. This inspection will verify:

1. Compliance with technical standards.

2. Structural integrity.

3. As-built plan accuracy.

4. Electromagnetic compatibility.

5. General site health, safety, and cleanliness.

The BLM shall provide written notice of the scheduled inspection date at least 30 days in advance. Each user shall arrange to have personnel available at the site at the time of the inspection.

Any non-compliance found by a user shall be reported to the BLM. The BLM will conduct an inspection and a written copy of the inspection report shall be forwarded to the violating user within 30 working days following the inspection. The report shall include:

1. A description of the violation.

2. Corrective action required.

3. Name, address, and organization of the responsible party.

4. Time allowed for completion of corrective measures.

5. Anticipated action in the event of noncompliance with remedial instructions.

## K. Fire Prevention and Hazard Reduction Requirements

Facility Owners and Facility Managers will be required to control vegetation within the fenced area around their facilities. Gravel or mineral soil (i.e. bare ground) must be maintained to a minimum of (10) feet clearance around buildings and a minimum of (10) feet clearance around any propane tanks. Identified threatened, endangered, or sensitive plant species must remain within the minimum clearance areas.

Smoking is prohibited in flammable vegetation areas.

Roof structures shall be kept reasonably clear of debris at all times.

No explosives will be stored at this site. Flammable materials shall be stored in conformance with the requirements of local fire regulations. Flammables will be placed in closed containers and stored away from sources of ignition and combustible materials. If flammables are stored within a building, the building will be locked, properly signed and well ventilated.

Approved spark arresters will be required and maintained on all internal combustion engines.

At least one (1) U.L. rated 20 lb. A:B:C dry chemical fire extinguisher is required inside each building. Prior to each June, fire extinguisher(s) shall be inspected by holders and refilled, if necessary.

Any fire will be immediately reported to “911”, the nearest BLM office and/or Sweetwater County Sheriff.

BLM Officers will make periodic fire prevention inspections. They will call to the holder’s attention any lack of compliance with the above regulations, plus any other existing hazards. Compliance with these inspections is required within the time limits specified in the inspection report.

All fire protection standards must be accomplished by the beginning of fire season unless otherwise agreed to, and then maintained throughout the fire season.

For new construction, the BLM will provide the Holder with a separate Construction Fire Plan which will be prepared at that time as applicable

## L. Access Maintenance and Restrictions

Roads

If a user association is formed on Aspen Mountain, the costs of road maintenance will be assessed by the association and enforced through this management plan. If a user association is not formed, maintenance

costs will be assessed depending on the amount of use on the road. If there is disagreement among users as to the assessed costs, BLM will determine the costs to be borne by each leaseholder.

Individual users who damage or disturb the access road, or any associated structures, such as ditches, culverts, roadside vegetation, signs and/or underground utilities or facilities, will be required to repair the road and/or associated structures, to conditions equal to or superior to those prior to any damage or disturbance. This work must be done according to applicable road maintenance standards per BLM manual Section 9113 and may require the appropriate NEPA analysis.

Interior Site Driveways/ Parking Areas

Interior site driveways within the communications site will be maintained by the site users. Interior roads will be planned and approved during establishment of new facilities. Interior roads will be maintained in a manner to allow only one entrance to the site. Off-road vehicle use by a user in and around the communication site will be avoided.

Road Closures

Native surface roads are subject to periodic closures to entry during periods of extreme fire danger, inclement weather, or wet conditions. Authorized site users may use the site during these periods but should use judgment and may need to seek advance approval from the BLM.

## VII. CONDITIONS FOR CONSTRUCTION, MODIFICATIONS OR EXPANSION

### A. Facility Owner/Manager Responsibilities

In addition to the responsibilities listed in Section III, new applicants and existing Facility Owners/Managers proposing new, modified, or expanded facilities are responsible for:

1. Submitting a complete application to the RSFO (ATTN: "Realty Specialist") prior to any new construction or modifications to existing improvements, unless new electronic equipment is being installed in/on an existing tower and/or an existing building. The application must include:

    a. The appropriate cost recovery and application fees as determined by BLM.

    b. A copy of the approved Site Plan Base Map showing all of the proposed (new) facilities including structures, towers, and auxiliary equipment.

    c. Completed drawings/plans prepared by a registered engineer and Plan of Development approved by the BLM.

    d. Identification of any microwave beam paths, a plot of their azimuth(s), and their proposed elevation(s) on the tower.

    e. Documentation that shows that proposed facilities will not be obstructing, or interfering with, any existing fixed point to point antennas, omni-directional broadcast antennas, or microwave beam paths in the directions of primary population targets. Proposed beam path needs must be shown on Site Plan Base Map.

    f. Any needed recommendations, changes or modifications to their original proposal, based on any required resource surveys and/or reports.

2. Demonstrating that their proposals will not cause undue interference with any existing uses before the BLM can approve new facilities. In addition, it is the applicant's responsibility to show that any new facilities will make the most efficient use of the limited amount of space at the site.

3. Showing their proposals will provide for future users without additional construction.

4. Providing engineering and geotechnical investigations for development of specific foundation designs and grading plans.

5. Provide for erosion control as part of the Plan of Development prior to construction activities. At a minimum, erosion control must include: sediment control, stipulations that cut/fill slopes will be graded and contoured to prevent erosion and/or excessive runoff, and recommendations for temporary erosion control measures, (e.g. netting, silt fences, swales, and/or sediment collection areas).

6. Coordinating with other Federal (e.g., FCC and Federal Aviation Administration (FAA)), State and County agencies and obtain all required approvals and/or permits.

7. Providing 30-day notice to all facility owners/facility managers at the site, as well as the BLM, of all new frequencies proposed for the site. A completed BLM technical data sheet or equivalent must be sent with the 30-day notice to allow for comment of potential interference. This would be for new frequencies for themselves and their tenants and customers.

8. Insuring that all written approvals have been obtained from the BLM prior to construction. In addition:

    a. Directional antennas will only be protected within the arch between their licensed 3 dB points.

    b. New and/or modified facilities will not obstruct existing fixed point-to-point antennas or omni-directional broadcast antennas in directions of primary population targets.

## B. Construction Methods and Resource Protection

Plans submitted by an applicant for any new construction or modifications shall specify provisions for soil rehabilitation measures including, but not limited to, soil replacement and stabilization and for proper handling of runoff from buildings, parking area, access roads, and undeveloped common areas.

The following methods and resource protection measures will be required to minimize impacts during construction:

1. Avoid and protect sensitive resource areas, as identified by the BLM.

2. Compliance with the Plan of Development and the Erosion Control Plan.

3. During construction and/or maintenance, no paint or paint thinners will be disposed of on site.

4. Minimize ground disturbance and vegetation removal as much as possible during construction activities. All ground-disturbing activities require BLM pre-approval.

5. Disturbed areas will be re-vegetated with species pre-approved by BLM as soon as possible after construction. If necessary, reseeding will be required until vegetation is successfully established as determined by the BLM.

6. No grading material will be cast off during construction/reconstruction activities. Excess soil can be used for fill material on road and/or building/tower pads.

7. Temporary, on-site storage of construction materials will require pre-approval by the BLM.

8. Construction materials and supplies, except for hazardous materials (see number 9 below), may be left unattended at the construction site at the end of each workday, but at the owner's risk.

9. Hazardous materials, including, but not limited to all fuels, oils, and lubricants are not to be left unattended at the site at any time. During construction, these materials are to be removed from the site at the end of each workday, or temporarily stored inside a locked and signed building until the following workday.

10. All surplus construction materials and/or waste debris must be removed from the site no later than thirty (30) days after construction has been completed.

11. Any earth moving or heavy equipment (e.g. dozers, graders, cranes, backhoes, etc.) leaving the designated roadway and/or approved parking area(s) to perform authorized activities at the site, will be washed off prior to being brought onto public lands to prevent the introduction and spread of noxious weeds into the area.

## C. Construction Inspection

1. All new construction, reconstruction, or major modification shall conform to the established technical standards and accepted engineering practices (i.e., the Uniform Building Code).

2. Any construction inspections required by other applicable agencies are the responsibility of the lessee/holder. Copies of completed inspections are to be provided to the RSFO, AO, either as they occur or as part of the final as-built plan. Inspection information shall become a permanent part of the holder's lease/ROW case file.

3. The Lessee/Holder agrees that corrective work detailed in BLM, or other agency required compliance inspections, would be completed by the scheduled completion date. If the Lessee/Holder disagrees or has questions about specific items, the Lessee/Holder must contact the BLM in order that the disagreement or item may be resolved.

4. A final set of as-built plans will be submitted to the RSFO, AO, within 90 days of acceptance of structure (if contracted) or of completion date.

## D. New or Remodeled/Expanded Buildings

1. Any new buildings must be designed to accommodate multiple users along with fitting into the physical environment as defined in a site-specific environmental analysis developed at the time of the proposal.

2. Buildings are required to be one-story. The roof must be metal or covered with metal to be fire resistant. Roofs can be equipped with antenna support structures, such as poles and railings that can extend up to 25-feet above ground level.

3. Facility Owners and Facility Managers are encouraged to construct the interior of their buildings in a modular fashion, so that they can:

a. Sublease sections to others.

b. Provide tenants and customers with internal separation and security.

c. Reduce physical interference.

d. Increase management effectiveness.

4. The following materials are approved for construction of new facilities (i.e. buildings)

a. Floors – Concrete slab with drainage.

b. Walls – Concrete block metal or pre-fabricated concrete.

c. Roof – Metal, or concrete, if painted to eliminate shiny surfaces, or other fireproof material as approved by the BLM. Proposals for wooden roofs will not be approved.

d. Partitions – If it is felt partitions are necessary in buildings, ensure they are constructed with fire resistant material (e.g., concrete block, reinforced concrete, or properly grounded fencing.

e. Color – Proposed color for use on all exterior building surfaces must be pre-approved by the BLM. The goal of the color selection for the facilities is to make the building as inconspicuous as possible and make buildings located on the skyline look inconspicuous when viewed from a distance. The intent is to reduce or eliminate glare from reflective and/or illuminated surfaces such as windowpanes, sheeting and reflective paints. Non-reflective, BLM approved colors will be used on equipment buildings.

5. Building entry lights must:

a. Only light the immediate area in the vicinity of the door.

b. Be motion activated and have a limited time duration (e.g., 3-5 minutes).

c. Have a shielded beam that is pointed at the building door.

Requests for all-night (i.e. "dusk-to-dawn") lighting, or entry lighting that would be visible from outside of the site will not be approved. FAA required lighting would be the only exception.

## E. New or Remodeled/Expanded Towers

1. All new construction, reconstruction, and modifications to towers will be pre-approved by the BLM prior to implementation.

2. It is the applicant/holder's responsibility to assure that a new, or modified, structure will not unduly interfere electronically or physically with any existing equipment at the site. Towers must be spaced, so as to prevent ground level radiation and/or interference problems. This must be clearly demonstrated in writing to the BLM prior to issuance of a new lease/ROW or amendment.

3. All new towers will comply with current structural and safety specifications and design standards, including safety-climbing devices. Towers should be as narrow and "open" as safety and structural integrity allow. New towers will be designed using maximum wind, snow, and/or tower loading anticipated for the site.

## VIII. SITE ASSOCIATION/ADVISORY GROUP

A Site Users' Association is recommended at this site. If formed in the future, all lease and ROW holders would be encouraged to join the association. The goal of the association would be to maximize the effective use of the site, coordinate access and maintenance. The objective of a sanctioned association would also be to represent all site users as a group when dealing with the BLM RSFO on matters relating to the site administration. The association would be able to work in cooperation with the BLM to identify problems or opportunities and make recommendations to the BLM for any changes in management strategies at the site. The association could also provide input to the BLM regarding the future addition of equipment and facilities at the site.

While the advice and recommendations of the association would not be binding on the BLM, the BLM could use the input for administration of the site. The BLM would be a member of such a group and would help jointly develop the charter (i.e., the ground rules).

The goal of the Site Association would also be to maximize the effective use of the site. The objective of a sanctioned association will be to represent all site users as a group when dealing with the RSFO on matters relating to the Site administration. The association would be able to work in cooperation with the BLM to identify problems or opportunities and make recommendations to these entities for any changes in management strategies at the site. The association could also provide input to these entities regarding the future addition of equipment and facilities at the site. While the advice and recommendations of the association would not be binding on these entities, they could use the input for administration of the site. The BLM would be a member of such a group and would help jointly develop the charter (i.e., the ground rules).

In the absence of a formal Site Association, the BLM may utilize a Site Advisory Group that can make suggestions and/or recommendations to specific problems associated with the administration of the site.

# APPENDIX N—TECHNICAL REPORT: SOCIAL AND ECONOMIC IMPACT ANALYSIS METHOD

## N.1 GENERAL ASPECTS OF THE METHODOLOGIES

### N.1.1 Assumptions

The following basic assumptions underlie all of the social and economic analyses:

- Economic contributions to the socioeconomic study area, in terms of labor earnings and employment, would accrue from activities on Bureau of Land Management (BLM)-administered land such as oil and gas development, coal production, trona (soda ash) production, livestock grazing, and recreation.
- Nonmarket values, including both use and nonuse values would accrue from BLM lands, including ecosystem services on those lands.
- Employment and income (especially labor earnings) would continue to be a driver of economic and population growth in the socioeconomic study area.
- Housing supply and costs and community infrastructure and services may be constraints on population growth in some locations within the planning area.
- Tax and royalty revenues derived from activities on BLM-administered lands would continue to have fiscal implications for communities within the socioeconomic study area, the state, and the Federal Government.
- Activities and resources available in and around the planning area would continue to be important to the quality of life of current and future residents.

- The pace and timing of mineral development activities is dependent on a variety of factors outside the management decisions of the BLM. These include national and international energy and sodium product demand and prices, production factors within the planning area, and business strategies of operators.
- Future oil and gas drilling and production will be as projected in the Reasonable Foreseeable Development (RFD). As discussed above, actual drilling and production of federal minerals, and the economic impacts associated with these activities, may deviate from the RFD for variety of reasons outside the management decisions of the BLM. Actual economic impacts could vary if actual development or production varies from the RFD projections, or if prices change.
- Demand for use of BLM-administered land for livestock grazing will continue through the study period.
- Demand for use of BLM-administered land for recreational activities, including off-highway vehicle (OHV) use, throughout the planning area will remain steady or increase through the study period.

The discussions below of the specific methodologies for each resource use provide additional assumptions used in the analyses.

## N.1.2 Quantitative Economic Impact Analysis Using IMPLAN

The economic impact analysis uses two general approaches. These are quantitative analysis, and qualitative analysis.

The quantitative analysis approach is used when possible, given adequate available information and resources. In this study, adequate data was available for five resource uses:

- Oil and gas development and production
- Coal production
- Trona (soda ash) production
- Livestock grazing
- Recreation

The basic strategy used in quantitative economic impact analysis is to first identify the direct impacts of an economic activity affected by management decisions. For instance, direct impacts include expenditures made by oil and gas companies to drill a well, and to complete the well for production. Primary impacts also include the value of the oil and gas that is produced and sold. Next, where primary impacts can be quantified, they can generally also be run through an economic model to estimate the total economic activity that is generated as the primary impact ripples through the economy, as the directly affected industries purchase goods and services that are necessary inputs to production, and as labor income generated from production is spent by the households that receive the income.

The total economic effects are estimated in this study through use of the IMPLAN (IMPact analysis for PLANning) model. The IMPLAN model was originally developed by the U.S. Forest Service and is commonly used by the BLM and many other government and private sector organizations to estimate the total economic impacts of various activities, actions, and policies. The model tracks inter-industry and consumer spending in a local (or regional) economy, allowing estimation of indirect and induced economic impacts in the local economy that result from the original economic activity or a change in economic activity. Indirect impacts result from local inter-industry purchases caused by the direct impact, and induced impacts results from re-spending of labor income (i.e., local purchases by households of employees and

proprietors of the affected industries). The re-spending represented by indirect and induced impacts is often referred to as the "multiplier effect."

Outputs of the IMPLAN model include economic output, labor income, and employment. These are defined as follows:[1]

**Employment (jobs) –** A job in IMPLAN equals the annual average of monthly jobs in that industry.[2] Thus, one job lasting 12 months equals two jobs lasting six months each, equals three jobs lasting four months each. It is important to note that IMPLAN, based on some of its data sources, does not distinguish between full-time and part-time jobs. Sectors with higher labor earnings per job are likely to reflect a high proportion of full-time jobs, while sectors with low labor earnings per job often reflect a significant number of part-time jobs.

**Labor Income (earnings) –** All forms of employment income, including Employee Compensation (wages and benefits) and Proprietor Income.

**Economic Output (gross regional economic output) –** Output represents the value of industry production. In IMPLAN these are annual production estimates for the year of the data set and are in producer prices. For manufacturers, output is sales plus or minus change in inventory. For service sectors, output equals sales. For retail and wholesale trade, output equals gross margin, not gross sales.

By constructing "social accounts" that describe the structure and function of a specific economy, IMPLAN creates a *localized* model to investigate the consequences of projected economic activity in a geographic region. The IMPLAN model uses data specific to the local economy wherever possible, but also uses some data based on national-level economic relationships. Therefore, the model benefits from "calibration" of some of its data to better reflect the local economy. For this study, IMPLAN was calibrated based on work the University of Wyoming has done with the model in Wyoming over many years, and with data specific to this study. The specific IMPLAN impact analysis methodologies and assumptions for each resource use are described below.

The analyses used Version 3.0 of the IMPLAN modeling system. The IMPLAN model is managed by and available from the IMPLAN Group, LLC (http://implan.com/).

## Study Area

The economic impact analyses were conducted for activities on federal lands administered by the Rock Springs Field Office (RSFO), with the economic impacts calculated for a study area consisting of the five counties in and around the field office that could potentially be most directly impacted by the management alternatives. These counties were:

- Fremont
- Lincoln
- Sublette
- Sweetwater
- Uinta

[1] *Based on the glossary from the website of the previous publisher of IMPLAN, the Minnesota IMPLAN Group. This website is no longer available.*

[2] *This is the same definition used nationally by the Quarterly Census of Employment and Wages, United States Bureau of Labor Statistics, and United States Bureau of Economic Analysis.*

The rationale for defining the study area as these counties is provided in the Socioeconomic Baseline Report.

### Timeframe of the Analyses

Economic impacts were estimated across a 16-year time period (2016–2031). The oil and gas RFD scenario provided estimates for 2012–2031. However, the BLM determined the study period would begin in 2016 and it was not useful to incorporate estimates or actual values for years that had already passed when the IMPLAN analysis was conducted in mid-2016 and re-run in October of 2019 for final changes to the management alternatives. All other analyses were scoped to the same period.

### Base Year Dollars and Discounting

All dollar figures throughout the economic analysis are in constant 2014 dollars. This is the base year used in the IMPLAN model.

Some of the results tables of Chapter 4 represent the total value across the period 2016 to 2031. Values for future years are discounted to adjust for the "time value of money." This is an economic concept that refers to the value of a given amount of money being less in the future. Most people, presented with a choice, would rather have a dollar now than a dollar 10 years from now, or even one year from now because the dollar can be put to productive use now. When monetary values of an action vary over time, economists adjust for the time value of money by applying an annual discount rate to the amounts in future years. This is different than adjusting for inflation, which is a loss in money's value in the future due to a rise over time in prices for given products and services across the economy. The result of adjusting for the time value of money is known as the "present value." Providing present values for 2016–2031 for all the economic impact analyses allows for comparison – based on a reasonably lengthy period, and subject to some differences in approach noted in each resource use summary section – of the relative economic impacts of each resource use.

The choice of a discount rate is a key analytical decision, because as the discount rate increases, the value of future dollars when "brought back to the present" decreases. Often economists use the discount rates recommended by the federal Office of Management and Budget (OMB) in Circular A-94, "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs," and Circular A-4, "Regulatory Analysis." These documents recommend use of multiple discounts rates to reflect different economic perspectives. Specifically, OMB recommends use of a 7% discount rate to reflect the average before-tax rate of return to private capital in the U.S. economy. Use of this discount rate reflects how industry makes capital allocation decisions. OMB additionally recommends a lower discount rate, 3%, to reflect the "social rate of time preference," which addresses how policy affects private consumption decisions (OMB 1992, OMB 2003, OMB 2011). Accordingly, the BLM uses these discount rates in this Resource Management Plan (RMP)/Environment Impact Statement (EIS).

## N.1.3 Qualitative Economic Impact Analysis

In the other approach, where primary impacts cannot be readily quantified, often the economic impacts can still be described qualitatively. In such cases, the focus of the analysis is to describe the type of impact in a base scenario (in this planning effort, Alternative A) and then assess the relative changes (qualitative indications of increases or decreases in economic values) that would be likely under other alternatives. This approach may be used with impacts to market values and is often used with impacts to nonmarket values. The term nonmarket values refers to the benefits individuals attribute to experiences of the environment or uses of natural and cultural resources that do not involve market transactions and therefore lack prices. Because these values are not priced, they are difficult to estimate, but nonetheless BLM guidance calls for efforts to be made to identify and assess impacts to nonmarket values in the planning process (BLM

Instruction Memorandum No. 2013-131, Guidance on Estimating Nonmarket Environmental Values, May 31, 2013).

Some of the management decisions under this planning action would result in increased expenses to operators – the firms or individuals who undertake the activities – or to project proponents. The economic impacts of decisions that increase expenses for operators and/or project proponents are many and can be complex. Expense increases may cut into profitability and drive delays to, reductions in, or cessation of operations or projects. However, where operations or projects are not delayed, reduced, or terminated, increased expenses also represent increased economic activity. For instance, if restrictions under an alternative result in a new power line having to take a longer route, additional expenditures for materials, equipment, and labor would be made. These increased expenditures would support some amount of additional income and employment. However, increased expenses may also represent opportunity costs; that is, the project proponent or society may have benefited more if the additional funds were used in another way. In the socioeconomic analysis in Chapter 4, where management actions would potentially increase expenses to operators or project proponents, these increased expenses are pointed out and discussed qualitatively. Readers should keep in mind that these increased expenses may negatively impact operators, may benefit others in society, and may incur opportunity costs.

## N.1.4 Social Impact Analysis

Social impacts may be driven by economic impacts, such as when changes in employment due to management decisions lead to impacts on population, housing, and community services. Other impacts may be more purely social and cultural in nature and can include impacts on quality of life, recreation and amenity values, and traditional land uses and associated cultural values. Social impacts may be marginal or substantial, depending on the degree to which new and revised management actions alter the course set in previous BLM decisions.

Sometimes social impacts can be quantified; however, in this analysis social impacts are described qualitatively. This is because social impacts of BLM management decisions may vary considerably depending on the nature of the community(ies) involved. For a planning effort that covers as large a geographic area as this effort, analysis of social impacts must necessarily use a broad brush.

A key aspect of the social impacts analysis approach is to address impacts based on the varying points of view of key types of stakeholders. The Socioeconomic Baseline Report identifies several broad categories of stakeholders to BLM management decisions in the RSFO. These categories reflect different linkages people have to public lands. They also reflect distinct sets of attitudes, beliefs, values, opinions, and perceptions about public resources and the effects of various management policies and actions.

Categorization of stakeholders is not meant to imply that all individuals and social groups fit neatly into a single category; many specific individuals or organizations may have multiple interests and would see themselves reflected in more than one stakeholder category. The point of categorization is to allow differentiation of social impacts based on broad differences in points of view. The social impacts analysis assesses the alternatives against the different points of view in the broad stakeholder categories.

## N.1.5 Environmental Justice Impact Analysis

Definitions and methods for analysis of potential environmental justice issues are described in the Socioeconomic Baseline Report. In short, the socioeconomic study area was screened to identify geographic subareas with minority and low-income populations that qualify as potential environmental justice populations based on guidance for environmental justice analysis from the Council on Environmental Quality. These subareas and their potential environmental justice populations are noted in Chapter 3 of the EIS as well as the Socioeconomic Baseline Report. Further assessment of the likelihood of impacts to these populations was conducted as described in Chapter 4 of the EIS.

# N.2 METHODOLOGIES BY RESOURCE USE

## N.2.1 Oil and Gas

### Introduction

The analysis for oil and gas economic impacts was divided into two phases of oil and gas economic activity:

- Development (Drilling and Completion)
- Production

The analysis focuses only on *new* BLM-managed oil and gas wells on federal mineral estate within the RSFO. This is because the management decisions under consideration in the RMP essentially only apply to new oil and gas leasing and not to existing leases. The economic impact figures for the new oil and gas wells are a subset of the economic impacts of all oil and gas wells (new *and* existing) on federal mineral estate in the field office, which in turn are a subset of the economic impacts of all oil and gas wells on all federal *and non-federal* mineral estate in the field office (i.e., including wells on privately and state-owned mineral estate). Put another way, the impact estimates do *not* include the economic impacts of any existing wells on federal mineral estate, nor of any wells (new and existing) on non-federal mineral estate.[3]

Likewise, the percentage differences for Alternatives B, C, D, and the Proposed Alternative in comparison to Alternative A only represent changes for new wells on federal mineral estate; they do *not* represent the percentage change to *total* economic activity resulting from all oil and gas development and production. The percentage change to total oil- and gas-related economic activity would be smaller, because while the absolute difference between alternatives in dollars or jobs would be as shown in the tables in Chapter 4, the base for comparison, all oil- and gas-related economic activity, would be larger because it would include the contributions of existing wells on federal mineral estate and of wells on non-federal mineral estate.

### IMPLAN Model Modifications

The IMPLAN modeling system utilizes national production coefficients. To better reflect local production practices, the oil and gas sectors of each model were modified. In IMPLAN, oil and gas development and production is divided into three sectors:

| Number | Sector Name |
|---|---|
| 20 | Oil and Gas Extraction |
| 37 | Drilling Oil and Gas Wells |
| 38 | Support Activities for Oil and Gas Operations |

The following protocol was used to modify the individual sectors. Total output for the Oil and Gas Extraction Sector was based on county level production quantities reported by the Wyoming Oil and Gas Commission and U.S. Energy Information Administration (EIA) 2016–2031 oil and gas price projections for Dakotas/Rocky Mountain Region (adjusted to 2014 dollars). Total output for the other two sectors was estimated from output per employee ratios derived from the United States Census Bureau's Economic Census. Employment estimates were based on United States Bureau of Labor Statistics (BLS) covered employment data. These estimates were adjusted to account for self-employment using United States Bureau of Economic Analysis (BEA) data. Earnings were also based on BLS data. These estimates were adjusted to account for benefits using BEA data. Intermediate payments for oil and gas production were scaled based on estimated cost of production for oil and gas production in the Rocky Mountain region.

[3] *A nuance here is that the figures for oil and gas production do include estimated production from the wells the RFD estimated would be placed into service from 2012–2015. In the production estimates for each year from 2016 to 2031, it was not possible to separate out the production from the 2012–2015 wells from the total production.*

Additional industry sectors that receive some direct expenditures from oil and gas development did not require modification.

## Development (Drilling and Completion) Impacts

Information on the number of wells to be drilled in the RSFO for each alternative was obtained from the RFD scenario estimates provided by the BLM's RRD scenario. The RFD estimates were broken down between conventional and coalbed natural gas (CBNG) wells and by Bureau-managed wells and all wells. Conventional wells include both vertical or directional wells and horizontal wells. Only Bureau-managed wells were considered in this analysis.

The RFD estimated total wells drilled across the planning period. As shown by recent history, drilling activity can vary substantially from year to year. Therefore, the total estimated wells from the RFD were allocated equally to each year of the study period for the purposes of conducting the economic impact analysis. Based on data from three recent oil and gas EISs in the RSFO, the analysis assumed that approximately 84% of the new wells would be vertical/directional wells, and 16% would be horizontal wells. The success (completion) rate for new wells was assumed to be 85% for conventional wells and 95% for CBNG wells, based on recent experience as observed by the RSFO petroleum staff.

Table N-1 summarizes the oil and gas well drilling and completion costs used in the analysis. Estimates of per well drilling and completion costs for vertical/directional wells were based on data provided by industry for the Wyoming Greater Sage-Grouse Land Use Plan Amendments/EIS and validated by RSFO petroleum staff for this RMP/EIS. Estimates for horizontal well costs were provided by RSFO petroleum staff. Estimates for CBNG well costs were provided by BLM district office staff for the Wyoming Greater Sage-Grouse Land Use Plan Amendments/EIS and validated by RSFO petroleum staff for this RMP/EIS.

**Table N-1. Estimated Oil and Gas Costs Per Well in the Rock Springs Field Office (millions of 2014 dollars)**

| -- | Conventional Drilling | Conventional Completion | Conventional Total | CBNG Drilling | CBNG Completion | CBNG Total |
|---|---|---|---|---|---|---|
| Vertical/ Directional | $1.016 | $1.357 | $2.373 | N.A. | N.A. | N.A. |
| Horizontal | $5.500 | $4.500 | $10.000 | N.A. | N.A. | N.A. |
| CBNG | N.A. | N.A. | N.A. | $0.740 | $0.185 | $0.925 |

The percent of total well costs that were spent within the socioeconomic study area was estimated to be 71.4% for conventional well drilling, 74.6% for conventional well completion,[4] 83.1% for CBNG drilling, and 53.5% for CBNG completion. The percentages for the conventional well estimates were developed from Authority for Expenditure (AFE) data for directional wells in the study area and EIA estimates for horizontal wells. The percentages for the CBNG wells were based on a previous analysis conducted for the Wyoming Greater Sage-Grouse Land Use Plan Amendments/EIS.

The local spending figure (i.e., direct impact) per well was parsed into various industrial sectors of the IMPLAN model based on breakdowns of the different types of costs for drilling and completion (each addressed separately) taken from various sources – mainly AFEs provided by industry and EIA estimates. The expenditure data was disaggregated across the following 14 IMPLAN sectors. Following standard regional economic analysis practices, expenditures in the wholesale trade sector were "margined" (reduced to account for the cost of goods from outside the study area).[5]

[4] *These figures are for a "composite well" as defined for analysis purposes. The cost structure of a composite well is weighted by the expected ratio between vertical/directional wells and horizontal wells, as noted in the previous paragraph.*

[5] *Margin represents sales receipts less the cost of the goods sold.*

| Number | Sector Name |
|---|---|
| 37 | Drilling Oil and Gas Wells |
| 38 | Support Activities for Oil and Gas Operations |
| 54 | Power and Communication Structures |
| 56 | Highways and Streets |
| 395 | Wholesale Trade (margin of 17.3%) |
| 411 | Truck Transportation |
| 427 | Wired Telecommunications Carriers |
| 438 | Insurance |
| 445 | Commercial and Industrial Machinery and Equipment Rental and Leasing |
| 447 | Legal Services |
| 448 | Accounting |
| 449 | Architectural, Engineering, and Related Services |
| 471 | Waste Management Remediation Services |
| HH | Households (Contract Labor) |

The IMPLAN model provided estimates of direct, indirect, and induced output, employment, and labor earnings. Induced impacts were reduced by 60% for sectors 37 and 38 to account for non-local workers involved with drilling and completion of oil and gas wells in Wyoming. This estimate was based on information provided by industry for previous oil and gas economic impact analyses in Wyoming and is consistent with Wyoming Department of Employment data.

Once the economic impacts per well were estimated for drilling and for completion, those figures were multiplied by the total number of wells drilled or completed. The resulting figures were then summed to yield the total impacts of the development stage by year.

## Production Impacts

The analyses for production utilized the oil and gas production volumes by year from the RFD scenario. The RFD provides projected production volumes for all wells. These volumes were adjusted to reflect production for only Bureau-managed wells by multiplying the all wells production by the ratio between Bureau-managed wells drilled and all wells drilled.

The production volume data was then multiplied by price estimates to estimate total annual sales value revenue streams for oil and gas production. The market prices for oil and gas were based on EIA 2016–2031 oil and gas price projections for the Dakotas/Rocky Mountain Region, using the average of the price projections for all those years, and expressed in 2014 dollars. These revenue streams were then entered into the IMPLAN model, Sector 20, Natural Gas and Crude Production, to estimate the total economic impacts from production.

Per unit ad valorem and severance tax revenues estimates were developed from per unit tax revenue rates from the Wyoming Department of Revenue's 2015 Annual Report. These estimated rates were applied to the forecasted market sales values, with the assumption that the Wyoming tax structure will remain constant over the analysis period. The estimates for Federal Mineral Royalties were based on the current total royalty rate of 12.5% of market value. Wyoming's share amounts to 6% of the market value; the Federal Government retains the remainder. Royalties do not include bonus bids (a one-time additional revenue source for some leases) or rents to the federal government, which are a very small revenue stream. Table N-2 summarizes the prices and revenue rate estimates used in the analysis.

**Table N-2. Prices and Tax Revenue Estimates for Oil and Gas Production**

| -- | Oil ($/BBL) | Gas ($/MCF) |
|---|---|---|
| Market Price (1) | $70.85 | $3.69 |
| Ad Valorem Tax (2) | $4.29 | $0.172 |
| Severance Tax (2) | $3.88 | $0.156 |
| Federal Mineral Royalties, Federal Share | $4.81 | $0.250 |
| Federal Mineral Royalties, Wyoming Share (3) | $4.05 | $0.211 |

BBL: Barrel; MCF: Million Cubic Feet
(1) Average EIA Dakota/Rocky Mountain Region 2016–2031 forecast (adjusted to 2014$)
(2) Wyoming Department of Revenue 2015 Annual Report adjusted to market prices
(3) Assumes Wyoming's share is 6% of market value

## N.2.2 Coal

### Introduction

There is only one phase of economic activity for coal – the production phase. There is no development phase equivalent to the drilling and completion activities in the oil and gas industry.

The coal production economic analysis involved two major steps:

- Estimating the amounts of production on BLM-administered coal in the planning area under each management alternative.
- Estimating the economic impacts based on the value of production.

Average production from BLM-administered coal from 2007–2015 was used as the estimate of future production. This period showed variations in production from year to year. Variations are also likely in the future, so the average value was used. The BLM identified all federal coal leases in the RSFO and obtained production volumes (and sales values and royalties) for those leases for the applicable years from the U.S. Department of the Interior's Office of Natural Resources Revenue (ONRR). The RSFO minerals specialists determined that the current availability of coal on federal minerals could support similar rates of production through the planning period. Furthermore, the BLM determined that there are no differences between the management alternatives that would result in production volume differences that could be reliably quantified.

In the RSFO, coal is produced from both surface and underground sources. These sources have different cost structures and tax and royalty rates. Future production from each source was based on the average surface to underground production ratio for 2013–2015, applied to the estimate of future production described above.

The estimated production volumes were then multiplied by the price of coal, resulting in an estimate of the total annual sales value for coal production. The estimated future price was based on EIA 2016–2031 reference case projections for western Wyoming minemouth prices, using the average of the price projections for all those years, which was $40.24, expressed in 2014 dollars. Some other sources provided higher prices, but these appeared to be prices for delivered coal, which is not the appropriate price for the impact analysis for the socioeconomic study area.

### IMPLAN Model Modifications

The IMPLAN modeling system utilizes national production coefficients. To better reflect local production practices, the coal sector (IMPLAN sector 22) was modified, using the following protocol. Total output for

the coal sector was based on mine-level production quantities from the Wyoming State Inspector of Mines and price estimates for southwest Wyoming coal from private sector data sources. Employment estimates were based on Wyoming State Inspector of Mines mine level-data. Earnings were based on BLS data for Wyoming on covered employment. These estimates were adjusted to account for employer paid benefits using BEA data. Intermediate payments were scaled based on mine-level private sector data.

### Coal Production Impacts

The coal sales values were entered into the IMPLAN model, Sector 22, Coal Mining, to estimate the total economic impact from coal production. Public revenues were estimated by multiplying the sales value by the current federal mineral royalty rates (federal and state shares) and current ad valorem and severance tax rates. The ad valorem and severance tax analysis was adjusted by the Wyoming Department of Revenue assessed to gross ratios for coal production in Wyoming.

In Chapter 4, the economic impacts of coal production are reported together with the impacts of trona production. Adding these results together was necessary in order to avoid potential disclosure of proprietary information due to the small number of operators in each industry.

## N.2.3 Trona (Soda Ash)

### Introduction

There is only one phase of economic activity for trona – the production phase. There is no development phase equivalent to the development and completion activities in the oil and gas industry. However, there are two steps in production that are both encompassed in the analysis. First, trona is mined. Second, the vast majority of the trona ore is processed into soda ash, which is then sold and shipped to other industries. Some additional trona derivative products are also created and sold. These include purge liquor, sulfide, sodium bi-carbonate, and sodium sesquicarbonate. A small amount of trona ore is also sold separately. The value of these products is not included in the economic impact analysis. Together, they represent from 7.4 to 7.9% of the total sales value of all trona-derived products from Sweetwater County according to data from the ONRR.

All trona production in Wyoming occurs on federal and non-federal minerals in the Known Sodium Leasing Area (KSLA), which is entirely located within Sweetwater County. Not all of the federal trona resource in the KSLA is managed by the RSFO; some is managed by the Kemmerer Field Office. The economic impact analysis for the RSFO RMP only addresses production from federal minerals in the RSFO. The BLM identified all federal trona leases in the RSFO and obtained production volumes (and sales values and royalties) for those leases for the applicable years from the ONRR.

Average soda ash production from BLM-administered trona from 2007–2014 was used as the estimate of future production. This period showed variations in production from year to year. Variations are also likely in the future, so the average value was used. The RSFO minerals specialists determined that the current availability of trona on federal minerals could support similar rates of production through the planning period. Furthermore, the BLM determined that there are no differences between the management alternatives that would result in production volume differences that could be reliably quantified.

The estimated soda ash production volume was then multiplied by the price of soda ash, resulting in an estimate of the total annual sales value for soda ash production. The 2014 Sweetwater County price of $133.91 per ton from the Wyoming Department of Revenue was used as the estimated future price. This assumes that soda ash prices will remain, on average, constant through the duration of the study period.

### IMPLAN Model Modifications

The IMPLAN modeling system utilizes national production coefficients. To better reflect local production practices and the trona and soda ash industry specifically, the Potash, Soda, and Borate Minerals (Sector 33) and Other Basic Inorganic Chemical Manufacturing (Sector 164) sectors were modified, as follows. Total output for the two sectors was based on state-level production quantities from the Wyoming Department of Revenue. Prices for trona and soda ash were also based on Wyoming Department of Revenue data. 2014 employment data for both sectors was based on Wyoming State Inspector of Mines data. Earnings for both sectors were based on BLS data for Wyoming on covered employment. These estimates were adjusted to account for employer-paid benefits using BEA data. Intermediate payments were scaled based on IMPLAN data for the respective sectors.

### Trona (Soda Ash) Production Impacts

The soda ash revenue was entered into the IMPLAN model, Sector 164, Other Basic Inorganic Chemical Manufacturing to estimate the total economic impact of soda ash production. The total economic impact of trona mining was estimated separately by entering trona mining revenue into the IMPLAN model, Sector 33, Potash, Soda, and Borate Minerals, after removing the linkage between Sector 164 and Sector 33 from the Sector 164 industry production account in the IMPLAN model. Removing the linkage eliminates double-counting the impacts from trona revenue.

## N.2.4 Livestock Grazing

### Introduction

The livestock grazing economic analysis involved three major steps:

- Estimating the amounts of forage utilized on BLM-administered lands in the planning area under each management alternative.
- Estimating the economic value of forage use.
- Estimating the economic impacts based on the value of production.

Each of these steps is described in detail below. There is only one "phase" of economic activity for livestock grazing – livestock production. There is no "development" phase equivalent to the drilling and completion activities in the oil and gas industry.

The analysis was based around cattle and sheep grazing, which were analyzed separately. Forage utilization for non-wild horses – a very small portion of total forage utilization – was excluded from the analysis. It was assumed that most forage utilization for horses occurs as support for ranching operations and thus is a cost of production. Therefore, forage utilization for horses is accounted for in the livestock operations budgets used in developing the value of production for marketable livestock. Further, there is no similar commodity value for horses (they are not sold for slaughter for meat as cattle and sheep are). Forage for wild horses is not included in the forage utilization estimates discussed below. The BLM allocates forage for wildlife and wild horses separately.

### Estimation of Forage Utilization

The economic impact estimates for livestock grazing were based on: a) the 10-year average (2006–2015) of billed animal unit months (AUM), and b) total authorized AUMs of forage use for cattle, sheep, and other livestock for the RSFO. One AUM is equal to the amount of forage consumed by a cow and calf during a 1-month grazing period. Billed forage use is the closest available proxy for actual forage use. Because billed use may exceed actual grazing use, the economic analyses may overstate the actual economic

impacts of grazing to some degree. Estimates were also prepared for total authorized forage use in order to indicate the maximum possible economic impact of grazing on BLM-administered land; however, billed use was considerably below authorized use for every year of the 2006–2015 period.

The total authorized AUMs are the same for Alternatives A and D. Total authorized AUMs are 6,202 less under Alternative B due to provisions of that management alternative (prohibition on grazing in certain allotments). Under Alternative C, total authorized AUMs are limited to the highest level of actual use (billed use) over the last 10 years (2009 – 2018). That figure is 160,387 AUMs, which is 142,881 less than the authorized AUMs under Alternatives A and D. Under the Proposed RMP authorized livestock use would be the same as Alternative D. Under Alternative D, total active AUMs would be 304,261. These active AUMs can be adjusted when monitoring demonstrates change is needed to meet the goals of the RMP and Wyoming Standards for Rangeland Health.

The billed use estimates did not vary between the alternatives. While forage utilization and billed use could vary somewhat under these alternatives (e.g., due to differences in treatment of voluntary relinquishment of permits or grazing preference), the differences between the alternatives could not be quantified for billed use. Also, while total authorized AUMs decrease in Alternatives B and C, total authorized AUMs are still greater than or equal to historical total billed use in the RSFO; therefore, the BLM believes that billed use would not be affected by the reduction in authorized AUMs under Alternatives B and C. Under the Proposed RMP billed use would remain the same as under Alternative D. AUMs would remain at current active levels so a reduction or change in billed use would not change.

## Estimation of the Economic Value of Forage Use

The value of grazing in a specific area can be estimated based on the grazing use of the area in AUMs as described above, and the value of an AUM. The direct value of production per AUM was estimated based on regional livestock production value data and ratios in the livestock economics literature. According to Workman (1986), it takes 16 AUMs to produce a marketable cow. Thus, the average value of an AUM can be estimated using data on the value of cattle production per bred cow and dividing by 16. A similar procedure can be used to estimate the value of an AUM used for sheep production, using 3.2 AUMs per ewe. In addition, a cow-calf operation adjustment is made by multiplying the value by 1.2 (National Agricultural Statistics Service 2015). This adjustment is made to convert from an animal unit basis to a cow-calf basis since billed AUMs do not count livestock under six months of age. In Wyoming, most livestock operators run cow-calf operations. The ewe-lamb operation adjustment is assumed to be the same.

The value per AUM for cattle was based on a 5-year average (2010–2014) of the annual value of production per bred cow estimates from the United States Department of Agriculture (USDA) Economic Research Service's (ERS) Commodity Cow-Calf Costs and Returns estimates for the Basin and Range portion of the United States. 2014 was latest year the ERS data was available. BLM used five years of data to avoid skewed values during the early years (2008–2009) of the Great Recession. The methodology and data for calculation of the average value of cattle production from one AUM of forage are shown in Table N-3. The IMPLAN inflator adjusts the nominal dollar values for value of production to constant 2014 dollars. The cow-calf adjustment factor converts generic AUMs to cow-calf AUMs. In Wyoming, most cattle operations are cow-calf operations.

The direct value of production for sheep was based on estimated gross receipts per ewe from the University of Wyoming's most recent (2014) Wyoming Range Sheep Budget (Feuz 2014). The methodology and data for this calculation are shown in Table N-4.

The figures for the value per AUM for cattle or sheep grazing were multiplied by the number of AUMs under each alternative. The result was the total economic value of livestock production, which was used as the direct impact input to the IMPLAN model.

**Table N-3. Value of an AUM for Cattle Production, Basin and Range Region**

| Year | Value of Production Per Bred Cow[1] | AUMs Per Cow[2] | Value of Production Per AUM | IMPLAN Inflator | Inflated Value of Production Per AUM* | Cow-Calf Adjustment[3] | Adjusted Value of Production per AUM |
|---|---|---|---|---|---|---|---|
| 2010 | $570.50 | 16 | $35.66 | 0.690 | $51.68 | 1.20 | $62.01 |
| 2011 | $648.59 | 16 | $40.54 | 0.720 | $56.30 | 1.20 | $67.56 |
| 2012 | $744.93 | 16 | $46.56 | 0.935 | $49.79 | 1.20 | $59.75 |
| 2013 | $780.50 | 16 | $48.78 | 0.985 | $49.52 | 1.20 | $59.43 |
| 2014 | $1,076.00 | 16 | $67.25 | 1.000 | $67.25 | 1.20 | $80.70 |

*Value times inflator.

## IMPLAN Model Modifications

The value-added components of the All Other Crop Farming sector (sector 10) in IMPLAN were modified to better reflect hay production in the study area. The modifications were based on a grass hay budget for western Colorado from the Colorado State University (Sharp 2011).

## Livestock Production Impacts

The economic impacts of livestock grazing were estimated in IMPLAN using analysis-by-parts methodology. The total value of production from the steps described above was allocated to different IMPLAN sectors based on a 2014 cattle production budget from the University of Idaho (Painter and Rimbey 2014) and a University of Wyoming range sheep budget (Feuz 2014).

The value of production was disaggregated across 14 IMPLAN sectors. Following standard regional economic analysis practices, expenditures in wholesale and retail trade (food and beverage store) sectors were "margined" (reduced to account for the cost of goods from outside the study area).[6]

| Number | Sector Name |
|---|---|
| 2 | Grain Farming |
| 10 | All Other Crop Farming |
| 11 | Cattle Ranching and Farming |
| 14 | Animal Production, Except Cattle, Poultry, and Eggs |

[6] *Margin represents sales receipts less the cost of the goods sold.*

| | |
|---|---|
| 19 | Support Activities for Agriculture and Forestry |

## N.2.5 Recreation

### Introduction

The tables for the recreation economic analysis present two views of the economic effects of recreation. Economic impact measures only the effects of "new" income in the study area; in the case of recreation, economic impact is based on all spending of non-local residents on local recreation, and the spending by local residents that would be lost to other regions if the local BLM recreational opportunity did not exist (some spending by local residents would continue, using local substitute recreation opportunities). Economic contribution includes the effects of all expenditures made by local residents (roughly, individuals who live within the socioeconomic study area), as well as the role of spending from recreators from outside the study area. In other words, economic contribution is based on all spending of local residents on local recreation and all spending of non-local residents on local recreation. Economic impact is the measure used in the analyses above of oil and gas development and production, coal production, trona (soda ash) production, and livestock grazing. Local residents buy only a very small proportion of the total output of those industries, so a measure of economic contribution would be only slightly greater than the measure of economic impact. In the case of recreation, however, local residents make considerable recreation-related expenditures (gas, food, and so on while on local trips), so it is fair to include those expenditures in an analysis of the economic role of recreation. Put another way, expenditures by local and non-local recreationists alike help keep local businesses going.

### Estimation of Recreation Usage

Recreation visitation estimates for the RSFO were taken from the BLM's Recreation Management Information System (RMIS). Recreation usage data is expressed in "visits." A visit is defined as one individual who enters and recreates on BLM-administered land for an indeterminate period of time. A visit ends when that individual spends a night off the BLM unit. The fact that some visits are for a single day or less, and some are for multiple days, is accounted for in the approach to estimating the direct impacts (expenditures) of visitors, as discussed below. Table N-5 shows the total visits in the RSFO in recent years.

**Table N-5. Total Recreation Visits to the RSFO, 2011–2015**

| Fiscal Year | Visits |
|---|---|
| 2011 | 429,861 |
| 2012 | 426,439 |
| 2013 | 452,916 |
| 2014 | 518,082 |
| 2015 | 847,318 |
| Five-Year Average | 534,923 |
| Low Year Visits | 426,439 |

| Fiscal Year | Visits |
|---|---|
| High Year Visits | 847,318 |

Source: RMIS data

While visitation in the RSFO has increased in recent years, it is unknown if this trend will continue. Therefore, the BLM conducted two economic analyses, for high and low visitation scenarios. The low scenario assumes that visitation over the 2016–2031 study period would average out as the low year visits number (426,439) and the high visitation scenario assumes that visitation would average out to the high year visits number (847,318).

While the alternatives differ in terms of recreation management actions, there is no basis for reliably estimating how the management actions will affect recreation visitation numbers. In Alternative C, a new open play area would be added. There is no basis for confidently predicting the amount of visitation the new play area would draw. Therefore, the total low and high scenario visitation numbers for Alternative C is the same as for Alternative A; however, it is likely there would be some additional visitation and economic activity under Alternative C. Alternative D and the Proposed RMP retain the Killpecker Sand Dunes OHV play area and do not add a new open play area; therefore, it is likely that visitation and economic impacts of recreation in Alternative D and the Proposed RMP be the same as Alternative A. Although the total area managed as SRMA under Alternative D and the Proposed RMP is 45-46% of Alternative A, it is anticipated that visitation and economic impacts of recreation would be similar to Alternative A.

## Estimation of the Direct Economic Impacts of Recreation

Due to the lack of recreation expenditure data for the RSFO, data from the National Visitor Use Monitoring (NVUM) program of the U.S. Forest Service (USFS) were used to estimate the economic effects of recreation for the RSFO. The NVUM program provides a robust data source that is widely used for recreation economic impact analysis for areas besides USFS-managed lands. This is done by identifying national forest units that are reasonably analogous to another recreation management area and applying the recreational expenditure data from NVUM to other area-specific recreation use data or estimates.

The USFS unit deemed most analogous to the RSFO in terms of recreation use was the Ashley National Forest, which partially overlaps the southern portion of the RSFO. The BLM used recreation market segment data and expenditure profiles for the Ashley National Forest from the latest iteration, Round 3, of the NVUM surveys (White 2016a). However, while the BLM used several components of the NVUM data for the Ashley National Forest, the NVUM recreation "trip type" data for the national forest were replaced by analogous estimates for the RSFO developed by a RSFO recreation specialist. This is because the RSFO tends to get more non-local visitation than the Ashley National Forest. The Flaming Gorge Reservoir, located on the national forest and not part of the RSFO, sees significant local use, while the "brand" of recreation on the RSFO is more remote, which attracts a higher proportion of non-local visitors. Also, due to the great distances involved in traveling to recreation sites in the RSFO, local visitors were considered to be people who live in the area and could be traveling to a site from as far away as 75 miles.

The NVUM recreation segment and expenditure data were applied to the RSFO as described below. All NVUM expenditures as applied to the RSFO were assumed to be local expenditures (within the socioeconomic study area), based on how the NVUM data was collected (surveys asked interviewees for their expenses within 50 miles of the recreation site).

- The allocation of RSFO visitation to two overarching NVUM "broad visit activity" types was assumed to equal the allocation for the Ashley National Forest of 39.6% to wildlife-related

recreation and 60.4% to all other recreation. These values were applied to the total low and high scenario visit numbers.[7]

- A RSFO recreation specialist estimated, based on familiarity with visitation patterns in the field office, the percentage of the visits to each RSFO recreation site in RMIS that fell into each of seven different recreation "trip types" utilized in the NVUM. This evaluation was done for FY2013 visitation, which was deemed sufficiently representative for the overall analysis. When summed and divided into the total visitation, the overall trip type percentages were as shown in Table N-6.
- The trip type percentages were applied to the number of wildlife-related visits and the number of other recreation visits under each of the two visitation scenarios.
- The estimates of visits by trip type for each broad visit activity type were then converted to party visits based on average party size data for each trip type from the NVUM.
- Total party visits were multiplied by party spending figures from the NVUM for each broad visit activity type and trip type to estimate direct spending by visitors. The party spending figures from NVUM were the averages for a "low-expenditure forest," which is the forest expenditure profile applicable to the Ashley National Forest. The NVUM researchers have determined that expenditure figures based on averages across multiple forests are more reliable than individual forest expenditures.
- Total direct spending across all broad visit activity types and visit types was summed to yield the total direct economic contribution estimates.
- Total direct spending was adjusted (reduced) for the local trip segments to reflect estimated out-of-area substitution, based on NVUM national data (White and Stynes 2010). The remaining direct spending across all segments was then summed to yield the total direct economic impact estimates.

**Table N-6. Overall Trip Type Percentages**

| Non-Local Visitor | | | Local Visitor | | | Non-Primary Visit* |
|---|---|---|---|---|---|---|
| Day | Overnight on BLM | Overnight off BLM | Day | Overnight on BLM | Overnight off BLM | |
| 39.7% | 18.3% | 4.6% | 22.9% | 8.8% | 1.2% | 4.5% |

*E.g., just passing by on I-80.
Source: Review of FY2013 BLM RMIS data by RSFO recreation specialist

Attachment 1 to this appendix illustrates calculation of direct economic contribution and direct economic impact using the procedure above.

The BLM acknowledges that certain recreation activities on BLM-administered land may generate visitor expenditure patterns that differ from the NVUM expenditure values. However, the BLM believes that in total – averaged across the many different recreation activities that take place in the RSFO – the per visit expenditure values from the NVUM are reasonably close to the per visit expenditures that occur in the socioeconomic study area due to recreation on BLM-administered land in the RSFO.

One recreation activity that has received considerable attention in terms of its economic impact is OHV riding. Some OHV advocacy groups maintain that OHV riders have different spending profiles from other recreationists and claim that OHV use contributes more to the local recreation economy. However, expenditure values from the literature addressing OHV riding are sometimes not comparable to each other,

[7] *Note: The use of broad visit activity types is new to NVUM Round 3. It was not used by the Forest Service in the NVUM Round 2 data used by the BLM for the Wyoming Greater Sage-Grouse Proposed Land Use Plan Amendment and Final Environmental Impact Statement, dated May 2015. Thus, the expenditure figures by segment differ between this analysis and the Greater Sage-Grouse analysis.*

and the values for the most relevant OHV studies for this RMP/EIS are not comparable to the methodology used in the NVUM. For instance, OHV recreationist expenditures have been estimated in studies in Wyoming by Nagler et al. (2013) and Foulke et al. (2006), and in Idaho by Anderson and Taylor (2014). Based on survey data, Nagler et al. (2013) report that average trip expenditures per person per day for OHV trips in Wyoming in 2012 were $40.54 for Wyoming residents and $60.61 for non-residents. NVUM data, on the other hand, are by design focused on identifying variations in spending for the seven different trip types noted above. While the NVUM program gathers data on activity types, this has never been a focus of the program. In addition, NVUM data are gathered and presented on the basis of spending for each party (one or more people) for each trip, not spending per person per day. Nonetheless, NVUM researchers have looked at spending across different types of activities identified by the survey respondents as the primary purpose of the trip. Stynes and White (2006) report that for trips where OHV use is the primary activity, expenditures per party per trip for National Forests with an average expenditure profile were, in 2003 dollars, $60 for non-local day trips, $162 for non-local overnight trips (one or more nights), $38 for local day trips, and $97 for local overnight trips. These data reflect parties that are mostly comprised of more than one person, and the overnight trips typically represent more than one day of activity. These figures cannot be readily converted and compared to the expenditure basis used in the OHV-specific studies cited above. However, it should be noted that these figures are not among the highest figures for the various activities in the NVUM data. The corresponding figures across all activity types for the same set of average expenditure forests were $52 for non-local day trips, $208 for non-local overnight trips, $33 for local day trips, and $121 for local overnight trips. In short, the expenditures for OHV trips are slightly higher than the all-activity types average for day trips, and lower for overnight trips.

For this RMP/EIS, the BLM has chosen an expenditure data source (NVUM) and methodology that provide a consistent analysis across all activity types. This approach is also consistent with most BLM RMP/EISs. Where appropriate, impacts of management actions on different types of recreation are addressed qualitatively.

## IMPLAN Model Modifications

No modifications were made to the IMPLAN model for recreation-related sectors. The coefficients used by the model for these sectors are generally considered reliable for Wyoming.

## Recreation Impacts

As noted earlier, the economic importance of recreation in the RSFO was considered both in terms of "economic contribution" which is a descriptive analysis that simply tracks the gross economic activity as the dollars cycle through the region's economy and "economic impact" which estimates the net economic activity that would be lost from the local economy without the resource. The total direct economic contributions or impacts that were developed as described above were used in the IMPLAN model to estimate the indirect, induced, and total economic effects of recreation.

The total direct economic contributions or impacts were entered into the IMPLAN model using distributions of expenditures by trip type to different recreation-affected industries. These distributions were developed by the USFS from the NVUM surveys. Specifically, the direct recreation spending was disaggregated across the following 10 IMPLAN sectors based on the spending distributions from NVUM (White 2016b). Following standard regional economic analysis practices, expenditures in retail trade sectors were "margined" (reduced to account for the cost of goods from outside the study area).[8]

| Number | Sector Name |
|---|---|
| 400 | Retail – Food and Beverages (margin of 34.6%) |
| 402 | Retail – Gasoline Stations (margin of 11.6%) |

[8] *Margin represents sales receipts less the cost of the goods sold.*

| | |
|---|---|
| 404 | Retail – Sporting Goods, Hobby, Book, Music (margin of 41.7%) |
| 406 | Retail – Miscellaneous (margin of 47.2%) |
| 442 | Automotive Equipment Rental and Leasing |
| 493 | Museums, Historical Sites, Zoos, and Parks |
| 496 | Other Amusement and Recreation Industries |
| 499 | Hotels and Motels |
| 500 | Other Accommodations |
| 501 | Full-Service Restaurants |

### N.2.6 Nonmarket Values

The analysis of nonmarket values for this RMP/EIS was partly quantitative and partly qualitative. Nonmarket values (consumer surplus value) associated with recreation were estimated quantitatively at a high level using a benefits transfer methodology described in Chapter 4 of the RMP/EIS. Total visitor days for the RSFO were taken directly from RMIS. Other nonmarket values and variations in nonmarket values across the alternatives were discussed qualitatively in Chapter 4.

## N.3 SUMMARY OF THE QUANTITATIVE ECONOMIC IMPACT ANALYSIS

This section presents multiple tables that allow for easy comparison of the quantitative economic impact results across the alternatives.

**Table N-7. Total Economic Output by Program by Alternative (1,000s of 2014$)**

| -- | Alt. A | Alt. B | Alt. C | Alt. D | Proposed RMP |
|---|---|---|---|---|---|
| **Annual Impact, 2016** | | | | | |
| Livestock Grazing (Billed Use)[1] | $13,040 | $13,040 | $13,040 | $13,040 | $13,040 |

| Total BLM-Supported | $4,014,391 | $1,699,571 | $4,103,895 | $3,985,249 | $1,699,571–$3,985,249 |

[1] Assumes constant annual activity level (based on available data).
[2] Would rise each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.
[4] Incorporates annual increases in production.

## Table N-10. Total Labor Earnings, Alternative Scenarios for Grazing and Recreation, by Alternative (1,000s of 2014$)

| -- | Alt. A | Alt. B | Alt. C | Alt. D | Proposed RMP |
|---|---|---|---|---|---|
| **Annual Impact, 2016** | | | | | |
| Livestock Grazing (Total Permitted Use)[1] | $9,083 | $8,895 | $4,803 | $9,083 | $8,895–$9,083 |
| Recreation (Economic Impact – Low Visitation)[1] | $3,938 | $3,938 | $3,938 | $3,938 | $3,938 |
| Recreation (Economic Contribution – Low Visitation)[1] | $4,679 | $4,679 | $4,679 | $4,679 | $4,679 |
| Recreation (Economic Contribution – High Visitation)[1] | $9,082 | $9,082 | $9,082 | $9,082 | $9,082 |
| **Net Present Value, 2016–2031 (3% Discount Rate)** | | | | | |
| Livestock Grazing (Total Permitted Use)[1] | $114,089 | $111,725 | $60,337 | $114,089 | $111,725 |
| Recreation (Economic Impact – Low Visitation)[1] | $49,465 | $49,465 | $49,465 | $49,465 | $49,465 |
| Recreation (Economic Contribution – Low Visitation)[1] | $58,776 | $58,776 | $58,776 | $58,776 | $58,776 |
| Recreation (Economic Contribution – High Visitation)[1] | $114,085 | $114,085 | $114,085 | $114,085 | $114,085 |
| **Net Present Value, 2016–2031 (7% Discount Rate)** | | | | | |
| Livestock Grazing (Total Permitted Use)[1] | $85,802 | $84,024 | $45,377 | $85,802 | $85,024–$85,802 |
| Recreation (Economic Impact – Low Visitation)[1] | $37,200 | $37,200 | $37,200 | $37,200 | $37,200 |
| Recreation (Economic Contribution – Low Visitation)[1] | $44,203 | $44,203 | $44,203 | $44,203 | $44,203 |
| Recreation (Economic Contribution – High Visitation)[1] | $85,799 | $85,799 | $85,799 | $85,799 | $85,799 |

[1] Assumes constant annual activity level (based on available data).

## Table N-11. Total Employment by Program by Alternative

| -- | Alt. A | Alt. B | Alt. C | Alt. D | Proposed RMP |
|---|---|---|---|---|---|
| **Annual Impact, 2016** | | | | | |
| Livestock Grazing (Billed Use)[1] | 133 | 133 | 133 | 133 | 133 |
| Oil and Gas Development[1] | 3,436 | 917 | 3,534 | 3,405 | 917–3,405 |
| Oil and Gas Production[2] | 545 | 144 | 561 | 540 | 144–540 |
| Coal and Soda Ash Production[1,3] | 997 | 997 | 997 | 997 | 997 |
| Recreation (High Visitation)[1] | 324 | 324 | 324 | 324 | 324 |
| Total BLM-Supported | 5,435 | 2,515 | 5,549 | 5,399 | 2,515–5,399 |

[1] Assumes constant annual activity level (based on available data).
[2] Would rise each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators. Net present value is not applicable for employment.

## Table N-12. Total Employment, Alternative Scenarios for Grazing and Recreation, by Alternative

| -- | Alt. A | Alt. B | Alt. C | Alt. D | Proposed RMP |
|---|---|---|---|---|---|
| **Annual Impact, 2016** | | | | | |
| Livestock Grazing (Total Permitted Use)[1] | 273 | 268 | 145 | 273 | 268–273 |
| Recreation (Economic Impact – Low Visitation)[1] | 163 | 163 | 163 | 163 | 163 |
| Recreation (Economic Contribution – Low Visitation)[1] | 194 | 194 | 194 | 194 | 194 |
| Recreation (Economic Contribution – High Visitation)[1] | 373 | 373 | 373 | 373 | 373 |

[1] Assumes constant annual activity level (based on available data). Net present value is not applicable for employment.

# N.4 QUANTIFIED ECONOMIC IMPACTS

This section presents multiple tables that summarize the economic and fiscal impacts for each alternative.

**Table N-13. Total Annual Impacts by Program, 2016, Alternative A (1,000s of 2014$)**

| -- | Livestock Grazing (Billed Use)[1] | Oil and Gas Well Development[1] | Oil and Gas Production[2] | Coal and Soda Ash Production[1,3] | Recreation (High Visitation) [1] | Total BLM-Supported |
|---|---|---|---|---|---|---|
| Direct Economic Output | $7,094 | $561,074 | $450,660 | $283,578 | $29,279 | $1,331,685 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Total Economic Output | $13,040 | $695,742 | $539,946 | $449,698 | $36,065 | $1,734,491 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Total Labor Earnings | $4,471 | $244,953 | $43,369 | $78,720 | $7,824 | $379,338 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Jobs | 133 | 3,436 | 545 | 997 | 324 | 5,435 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Ad Valorem Taxes | N.A. | N.A. | $23,069 | $9,271 | N.A. | $32,340 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Severance Taxes | N.A. | N.A. | $20,846 | $6,941 | N.A. | $27,787 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| FMR (Federal Share) | N.A. | N.A. | $30,589 | $12,104 | N.A. | $42,693 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| FMR (WY Share) | N.A. | N.A. | $25,744 | $10,187 | N.A. | $35,931 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |

[1] Based on the available data, the analysis assumes a constant annual activity level.
[2] Initial values; these would increase each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.
FMR: Federal Mineral Royalties

## Table N-14. Net Present Value (3% Discount Rate) by Program, 2016–2031, Alternative A (1,000s of 2014$)

| -- | Livestock Grazing (Billed Use)[1] | Oil and Gas Well Development[1] | Oil and Gas Production[2] | Coal and Soda Ash Production[1,3] | Recreation (High Visitation) [1] | Total BLM-Supported |
|---|---|---|---|---|---|---|
| Direct Economic Output | $89,114 | $7,047,714 | $12,469,766 | $3,562,057 | $367,775 | $23,536,426 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Total Economic Output | $163,791 | $8,739,289 | $14,940,326 | $5,648,698 | $453,010 | $29,945,115 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Total Labor Earnings | $56,161 | $3,076,884 | $1,200,026 | $988,809 | $98,284 | $5,420,164 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Average Jobs Per Year | 133 | 3,436 | 1,267 | 997 | 324 | 6,157 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Ad Valorem Taxes | N.A. | N.A. | $637,678 | $116,457 | N.A. | $754,135 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| Severance Taxes | N.A. | N.A. | $576,215 | $87,183 | N.A. | $663,398 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| FMR (Federal Share) | N.A. | N.A. | $846,385 | $152,042 | N.A. | $998,427 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |
| FMR (WY Share) | N.A. | N.A. | $712,335 | $127,962 | N.A. | $840,297 |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | N.A. |

[1] Based on the available data, the analysis assumes a constant annual activity level.
[2] Incorporates annual increases in production due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.
FMR: Federal Mineral Royalties

## Table N-15. Net Present Value (7% Discount Rate) by Program, 2016–2031, Alternative A (1,000s of 2014$)

# APPENDIX O—REMI MODEL APPLICATION AND DISCUSSION

## O.1 SUMMARY

The State of Wyoming Economic Analysis Division prepared a Regional Economic Models, Inc. (REMI) model analysis in collaboration with the Bureau of Land Management (BLM), the Cooperating Agencies, and a BLM contractor team (Booz Allen Hamilton and the University of Wyoming). The REMI analysis addressed the same resource uses as the Impact Analysis for Planning (IMPLAN) model analysis. The REMI model analysis was only conducted for Alternatives A and B for oil and gas development, oil and gas production, and recreation, and for Alternative A for livestock grazing, coal production, and trona (soda ash) production. This was because the levels of all resource use activities are expected to differ only marginally (a few percent or less) between Alternatives A, C, D, and the Proposed Resource Management Plan (RMP), and Alternative B substantially differs from Alternative A only for oil and gas development, oil and gas production, and recreation.[1]

The direct impact inputs for each model were the same. However, the methodologies for inputting those values to each model differed to varying degrees for each resource use, in large part due to differences in the industrial sectors available in REMI compared to IMPLAN, and to the need to disaggregate the inputs used for the five-county IMPLAN model to each of the five county-specific REMI models owned by the state. The process for disaggregating inputs included consultation with BLM Rock Springs Field Office (RSFO) resource specialists and review of relevant tabular and spatial data. For each resource use, the majority of the input amounts were allocated to Sweetwater County. The results from the REMI model for each of the five counties were reaggregated to socioeconomic study area totals for comparison with the IMPLAN model results.

Table O.1-1 summarizes the REMI model results and compares the results to the IMPLAN model results on a percentage difference basis. This table only addresses annual impacts for 2016; however, the comparisons based on net present value are not dramatically different. In most cases, the table shows that the results of the two models are within 20%, which is very reasonable given the many considerations involved in economic impact modeling. The differences for grazing and oil and gas production are larger. However, those differences may be explained by methodological factors described below rather than any inherent "error" in either model. Readers interested in the differences between the two models and their results should carefully review the detailed tables and discussions below, particularly regarding reasons for the differences between the two models' results for grazing and oil and gas production.

Based on the reasonable effort made toward an apples-to-apples comparison between the models, the differences in results between the IMPLAN and REMI models are not so great that they would lead to different management decisions (selection of a different preferred alternative) if REMI were used for the quantitative economic analysis instead of IMPLAN. They do not tell decisively different economic stories about the nature of the local economy or the alternatives.

[1] *The analysis in this appendix was conducted in 2016 – 2017. At that time, the analysis team understood the management decisions for recreation under Alternative B to mean that the Killpecker Sand Dunes area would be closed. It was assumed that effectively, all recreation visits to that site as indicated by available RMIS data would no longer occur. This is not the case. Under Alternative B, the Killpecker Sand Dunes Special Recreation Management Area would not be retained, but recreation could and would continue at that site. The numbers and discussion for Alternative B throughout this appendix are based on the 2016 – 2017 assumption of closure of the Killpecker Sand Dunes. It was not feasible to update the REMI analysis or the IMPLAN-REMI comparisons. This does not affect the conclusions drawn in this appendix, because the differences in the results for recreation under Alternative B would be marginal (a few percentage points).*

**Table O.1-1. REMI Results: Total Economic Impacts by Program by Alternative**

| -- | Alt. A REMI Result | Alt. B REMI Result | Alt. A Difference from IMPLAN Result | Alt. B Difference from IMPLAN Result |
|---|---|---|---|---|
| **Total Economic Output, Annual Impact, 2016 (1,000s of 2014$)** | | | | |

[1] Assumes constant annual activity level (based on available data).
[2] Would rise each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.

# O.2 INTRODUCTION

This Appendix describes the overall intent, methods, and results for the REMI Pilot Project conducted for the Rock Springs Resource Management Plan (RMP). This effort originated in 2012 in response to Cooperating Agency counties advocating for the use of the economic and demographic modeling software, REMI, for quantifying economic and demographic impacts associated with the RMP alternatives. The BLM, the State of Wyoming (hereafter, the State), and the Wyoming County Commissioners Association agreed to a joint effort to conduct a comparative analysis using REMI. The agreement is documented in an Amendment to the Memorandum of Understanding (MOU) between the BLM, the State, and the Agencies Cooperating in the revision of the Rock Springs RMP. The framework the parties agreed upon contained the following understanding and commitments:

- The quantitative economic impact analysis would proceed as originally planned for by the BLM for the RMP/Environment Impact Statement (EIS) and would be conducted by the Booz Allen Hamilton/University of Wyoming team using the IMPLAN model. The results of the IMPLAN-

based analysis are summarized in Chapter 4 and the technical approach is described in Appendix N, Technical Report: Social and Economic Impact Analysis Methodology.

- The Wyoming Economic Analysis Division (WYEAD) would lead the REMI analysis using the county-level REMI model owned by the State.
- There would be close coordination between the two efforts involving economists and social scientists representing the BLM, the State, and the Cooperating Agencies.
- The comparative REMI analysis would be briefly summarized in Chapter 4 and described in greater detail in a standalone appendix.

Since 2012, a significant amount of coordination has taken place to implement this comparative analysis. This coordination included a 2012 presentation to the Cooperating Agencies on the effort, which included an overview of input-output modeling, background information on both IMPLAN and REMI, details on parameters and inputs required for the analysis, and outputs of the models. The BLM and the WYEAD convened for several workshops and multiple conference calls to coordinate the technical details of the analysis and review and discuss results.

Subsequent sections of this Appendix include a description of the REMI model, an overview of the methodology used for analyzing RMP alternatives in REMI, detailed results, and a discussion comparing the REMI and IMPLAN results.

# O.3 WHAT IS THE REMI MODEL?

The REMI model, developed by Regional Economic Models, Inc., is a structural and dynamic economic and demographic forecasting and policy analysis and simulation tool. The tool was developed starting in 1980 to assist decision-makers in testing the economic effects of their policies before implementation. REMI's goal is to develop and support the use of economic models that inform government and corporate decisions.

The Wyoming Department of Administration and Information, Economic Analysis Division (EAD) currently uses two 70-sector version 2.1 REMI PI+ models containing baseline data through 2015: (1) a single-region model covering the entire state of Wyoming, and (2) a 23-region model of for each of the Wyoming counties. The 70 REMI sectors generally cross-walk into the North American Industry Classification System (NAICS) 3-digit industrial codes.

## O.3.1 Characteristics of the REMI Model

The REMI model incorporates aspects of four major modeling approaches: Input-Output, General Equilibrium, Econometric, and Economic Geography. Each of these methodologies has distinct advantages as well as limitations when used alone. The REMI integrated modeling approach builds on the strengths of each of these approaches. A basic overview of each modeling approaches is provided below. More detailed information is available on REMI's website at http://www.remi.com/. By comparison, the IMPLAN model is based on Input-Output modeling but does not include the other three modeling approaches used in REMI.

### Input-Output

The REMI model at its core has the inter-industry relationships found in input-output models such as IMPLAN. As a result, the industry structure of a particular region is captured within the model, as well as transactions between industries. Changes that affect industry sectors that are highly interconnected to the rest of the economy will often have a greater economic impact than those for industries that are not closely linked to the regional economy. The input-output components of REMI and IMPLAN differ in some

respects (e.g., industry sector breakdown, inter-industry coefficients based on different data or parameterization of data), but they follow the same fundamental input-output modeling principles.

## General Equilibrium

General equilibrium is reached when supply and demand are balanced. This tends to occur in the long run, as prices, production, consumption, imports, exports, and other changes occur to stabilize the economic system. For example, if real wages in a region rise relative to the U.S., this will tend to attract economic migrants to the region until relative real wage rates equalize. The general equilibrium properties are necessary to evaluate changes such as tax policies that may have an effect on regional prices and competitiveness.

## Econometric

REMI is sometimes called an "econometric model," as the underlying equations and responses are estimated using advanced statistical techniques. The estimates are used to quantify the structural relationships in the model. The speed of economic responses is also estimated, since different adjustment periods will result in different policy recommendations and even different economic outcomes.

## Economic Geography

The economic geography features represent the spatial dimension of the economy. Transportation costs and accessibility are important economic determinants of interregional trade and the productivity benefits that occur due to industry clustering and labor market access. Firms benefit having access to a large, specialized labor pool and from having access to specialized intermediate inputs from supplying firms. The productivity and competitiveness benefits of labor and industry concentrations are called agglomeration economies and are modeled in the economic geography equations.

## PI+

PI+, the next generation of REMI Inc.'s Policy Insight product, is the core product of REMI. It incorporates the modeling approaches noted above and generates year-by-year estimates of the total regional effects of any specific policy initiative or set of economic inputs. A wide range of policy variables allows the user to represent the policy or change to be evaluated, while the explicit structure in the model helps the user to interpret the predicted economic and demographic effects. The model is calibrated to many sub-national areas such as an individual county for policy analysis and forecasting, and is available in single- and multi-area configurations. Each calibrated area (or region) has economic and demographic variables, as well as policy variables so that any policy or change that affects a local economy can be tested.

Regional policy analysis models can play an important role in evaluating the economic effects of alternative courses of action. Users can answer "what if" questions about the economic effects of policies in areas such as economic development, energy, transportation, the environment, and resource use. Thus, simulation models for state and local economies can help guide decision makers in formulating strategies for these geographical areas.

The model is dynamic, with forecasts and simulations generated on an annual basis based on behavioral responses to compensation, price, and other economic factors. The model consists of thousands of simultaneous equations with a structure that is relatively straightforward. The exact number of equations used varies depending on the extent of industry, demographic, demand, and other detail in the specific model being used. The overall structure of the model can be summarized in five major blocks: (1) Output and Demand, (2) Labor and Capital Demand, (3) Population and Labor Supply, (4) Compensation, Prices, and Costs, and (5) Market Shares.

Different from a snapshot for static analysis (a specific effect in a given moment of time), a dynamic analysis looks at direct, indirect, and induced effects of a policy or scenario across time. Dynamic economic modeling is able to capture 1) the robust potential of the economy, and able to estimate future gains from innovation and increased productivity (labor or capital) through proliferation of technology in different industries throughout a forecasting period, and 2) capture interactions occurring throughout the economy between both market factors and demographic factors; e.g., interrelationship among different aspects of the economy such as labor markets, migration, market share, compensation, prices, and costs.

# O.4 METHODOLOGY

## O.4.1 Overview

Consistent with the IMPLAN-based analysis conducted for the Rock Springs RMP/EIS, the REMI analysis was conducted for the following activities/resource uses:

- Oil and natural gas development
- Oil and natural gas production
- Coal production
- Trona (soda ash) production
- Livestock grazing
- Recreation.

For readers' reference, the concept of direct, indirect, and induced impacts in the REMI model is basically not different from any other economic impact modeling tool such as IMPLAN. Once a direct impact of an economic activity is identified and inputted into REMI, the model is able to estimate indirect and induced impacts generated in the local economy as the direct impact ripples through the economy. The indirect impact is through intermediate demand or supply chain effects because of goods and services purchases generated from the direct impact, while the induced impact refers to local consumption demand effects as a result of increased spending of employees and households generated from the direct impact and indirect impact industries.

Output results from the REMI model (definitions are generally consistent with IMPLAN) include:

- Employment – Because the primary data source for REMI PI+ is the U.S. Bureau of Economic Analysis (BEA), the definition of employment is consistent with BEA's definition. Employment comprises estimates of the number of jobs, full-time plus part-time, mostly by place of work. Full-time and part-time jobs are counted at equal weight, with both on an annual basis (seasonal jobs are adjusted to annual equivalents). Wage and salary employees, sole proprietors, and active partners are included, but unpaid family workers and volunteers are not included.
- Labor Earnings – The sum of earnings by place of work for private industries, state and local government, federal civilian, federal military, and farm sectors, including wages and salaries, benefits, and proprietors' income.
- Output – The amount of production, including all intermediate goods purchased as well as value added (compensation and profit). In most cases, output represents sales or supply. The components of Output are Self Supply or Use, and Exports (Multi-regions, Rest of Nation, and Rest of World).
- Average Earnings Per Job (AEPJ) – Labor Earnings divided by Employment.
- Labor Productivity – Output divided by Employment.

All of the resource uses considered in this analysis are already established on BLM-managed lands within the RSFO. With the exception of oil and gas production, Alternative A (No Action) assumes the level of activity associated with each resource use will remain constant and equal to current levels. As noted in Appendix N, Technical Report: Social and Economic Impact Analysis Methodology, oil and gas production and development reflects only new wells. However, oil and gas production and development are present, and industries associated with this activity are well established in the region. New wells in Alternative A essentially represent continuation of recent levels of development activity. While these wells will increase production to some degree in the RSFO, they will also replace production as existing wells in the RSFO decline in productivity over time. Therefore, across all resource uses, the analysis generally tracks the economic activity supported by current levels of resource uses – commonly referred to as an economic contribution analysis. This differs from an economic impact analysis that estimates the effect of new economic activity or a "shock" impact. Consequently, the State utilized specifications for the REMI model that would better model economic contributions, versus modeling an economic shock. These specifications and additional calibrations are discussed below.

With respect to the various management alternatives, the levels of oil and gas activity under Alternatives C D, and the Proposed RMP only differ marginally (a few percent) from Alternative A. The levels of activity for all other resource uses are expected to be essentially identical (any differences cannot be confidently quantified) between Alternatives A, C, D, and the Proposed RMP. Alternative B has substantial differences from Alternative A in economic activity for oil and gas development, oil and gas production, and recreation. Therefore, the REMI model analysis, and comparisons of its results to the IMPLAN model results, were only conducted for Alternatives A and B for those three resource uses, and for Alternative A for livestock grazing, coal production, and trona (soda ash) production.

## O.4.2 REMI Model Calibration

Both the REMI and IMPLAN models require various calibrations prior to impact analysis. Calibration is manual adjustment of economic parameters in order to better match a model to the local economy compared to the unadjusted, "out of the box" parameters in a model's data and specifications of economic relationships.

The State selected a model specification for REMI where "Investment Response to Capital Stock" was turned off, versus the REMI standard model specification with that response turned on. This component of REMI estimates the economic activity associated with the investment that occurs through the capital stock adjustment process. Specifically, the investment in new housing, commercial and industrial buildings, and equipment corresponds to an economic impact or shock. However, in the economic contribution framework, the level of investment is significantly lower than in an economic impact or shock framework.

In addition, because regional economic models typically include assumptions and estimation based on regional or national data that may not align well with local conditions, the State reviewed various parameters for accuracy. Upon review, some of the county-level baseline data used in the REMI model were inconsistent with other data sources and seemed either too high or too low. Therefore, the State used data from the U.S. Census Bureau's Economic Census and U.S. Bureau of Labor Statistics (BLS) Quarterly Census of Employment and Wages to implement the following calibrations to REMI's New Regional Control (the new baseline model in REMI):

- Increased labor productivity in Oil and Gas Extraction (NAICS sector 211) for both Sweetwater and Sublette counties.
- Redistributed employment between Oil and Gas Extraction (211) and Support Activities for Mining (213) for Sublette.
- Reduced labor productivity in Support Activities for Mining (213) for Sweetwater and Sublette counties.

- Reduced compensation rate in Support Activities for Mining (213) for Sublette County.
- Reduced labor productivity and compensation rate in Chemical Manufacturing (325) for Sweetwater County.

In addition, since REMI does not automatically apply margining for wholesale trade and retail trade industries, we assumed the margin value to be 34.6% for food stores and other retail trade, and 17.3% for wholesale trade when related expenditures were inserted into the model, based on data in IMPLAN. See Appendix N for a discussion of margining.

## O.4.3 REMI Inputs by Resource Use

The State participated in multiple discussions with the BLM and representatives of local governments and other Cooperating Agencies regarding input data processing and development. Participants in those discussions mutually agreed that the direct impact input data from the BLM used in the IMPLAN analysis should be used for the REMI analysis. Therefore, the total amounts of direct economic impacts that were used as inputs to the REMI model for each resource use were identical to those for IMPLAN model. Appendix N describes the procedures and data used to derive the direct impacts used for the IMPLAN model. All expenditures from 2016 to 2031 are in 2014 constant dollars, which is consistent with the IMPLAN analysis.

While the direct impacts for each model were the same, the methodologies for inputting those values to each model differed to varying degrees for each resource use, in large part due to differences in the industrial sectors available in REMI compared to IMPLAN and to the need to disaggregate the inputs used for the five-county IMPLAN model to each of the five county-specific REMI models owned by the State. The process for determining the REMI-specific inputs was highly collaborative.

The REMI sector scheme (70 sectors) differs from the IMPLAN sector scheme that consists of 536 sectors. The State reviewed the assumed distribution of inputs to IMPLAN sectors for each resource use (see Appendix N) and identified that REMI sector that most closely matches. The BLM and its RMP/EIS contractors reviewed this crosswalk exercise. In addition, because the State's 23-region REMI model for counties treats each county as an individual region, the inputs needed to be disaggregated across the five counties in the study area. The process for disaggregating inputs included consultation with BLM resource specialists and review of relevant tabular and spatial data. For each resource use, the majority of the input amounts were allocated to Sweetwater County; the specific allocations are noted below.

### Oil and Gas Development (Drilling and Completion)

Based on the reasonable foreseeable development (RFD) projections of where the most oil and gas development will occur during the planning period (the extreme northwest and southeast corners of the RSFO), the study team estimated that most of the economic activity due to that development will occur in Sweetwater and Sublette counties. It is likely that some oil and gas development goods and services are supplied from businesses located in Fremont, Lincoln, and Uinta counties, but the amount is likely to be minimal compared to Sweetwater and Sublette counties. Therefore, 60% of the expenditures were allocated to Sweetwater County and 40% were allocated to Sublette County based on industry employment data from the BLS.

For the calibration, labor productivity for Support Activities for Mining (NAICS code 213) in both Sweetwater and Sublette counties was decreased to be roughly consistent with REMI's historical trend and U.S. Census Bureau's Economic Census results. The compensation rate in Support Activities for Mining for Sublette was also reduced, and the employment figures for Oil and Gas Extraction (NAICS code 211) and Support Activities for Mining (NAICS code 213) for Sublette were redistributed based on BLS data.

In addition, a margin value of 17.3% was assumed for wholesale trade when related expenditures were inserted into the model, based on data in IMPLAN.

Table O.4-1 and Table O.4-2 show the direct impact inputs to the REMI model by sector[2] and county for Alternative A and Alternative B. The input amounts were the same for each year from 2016 to 2031.

**Table O.4-1. Inputs for Oil and Gas Development – Alternative A (millions of 2014$)**

| Sector – NAICS Code | Sublette | Sweetwater |
|---|---|---|
| Drilling Oil and Gas Wells - 2131111 | $67.40 | $101.10 |
| Other Support Activities for Mining - 21311A (REMI sector combining 4 NAICS codes) | $91.53 | $137.26 |
| Labor Income (Contract Labor) - 213 | $9.25 | $13.88 |
| Power and Communication Structures - 233240 | $6.13 | $9.19 |
| Highways and Streets - 233293 | $2.71 | $4.06 |
| Wholesale Trade - 420000 | $17.38 | $26.07 |
| Truck Transportation - 484000 | $11.97 | $17.95 |
| Wired Telecommunications Carriers - 517110 | $0.02 | $0.03 |
| Insurance Agencies, Brokerages, and Related Activities - 524200 | $0.17 | $0.26 |
| Commercial and Industrial Machinery and Equipment Rental and Leasing - 532400 | $12.06 | $18.09 |
| Legal Services - 541100 | $1.25 | $1.88 |
| Accounting, Tax Preparation, Bookkeeping, and Payroll Services - 541200 | $0.48 | $0.72 |
| Architectural, Engineering, and Related Services - 541300 | $3.96 | $5.93 |
| Waste Management and Remediation Services - 562000 | $0.12 | $0.18 |
| **Total Input** | **$224.43** | **$336.64** |

**Table O.4-2. Inputs for Oil and Gas Development – Alternative B (millions of 2014$)**

| Sector – NAICS Code | Sublette | Sweetwater |
|---|---|---|
| Drilling Oil and Gas Wells - 2131111 | $17.99 | $26.98 |
| Other Support Activities for Mining - 21311A (multiple NAICS codes) | $24.31 | $36.46 |
| Labor Income (Contract Labor) - 213 | $2.45 | $3.68 |
| Power and Communication Structures - 233240 | $1.62 | $2.44 |
| Highways and Streets - 233293 | $0.75 | $1.12 |
| Wholesale Trade - 420000 | $4.63 | $6.94 |
| Truck Transportation - 484000 | $3.18 | $4.78 |
| Wired Telecommunications Carriers - 517110 | $0.01 | $0.01 |
| Insurance Agencies, Brokerages, and Related Activities - 524200 | $0.05 | $0.07 |
| Commercial and Industrial Machinery and Equipment Rental and Leasing - 532400 | $3.24 | $4.86 |
| Legal Services - 541100 | $0.34 | $0.50 |
| Accounting, Tax Preparation, Bookkeeping, and Payroll Services - 541200 | $0.16 | $0.25 |
| Architectural, Engineering, and Related Services - 541300 | $1.07 | $1.61 |
| Waste Management and Remediation Services - 562000 | $0.03 | $0.05 |
| **Total Input** | **$59.83** | **$89.75** |

[2] *Including the NAICS (North American Industry Classification System) code for each sector.*

## Oil and Gas Production (Extraction)

Due to the same reason as described above for oil and gas development, oil and gas production input data were allocated to only Sweetwater and Sublette counties, but the proportion of production value was 78% for Sweetwater County and 22% for Sublette County based on industry employment data from the BLS.

For the calibration, labor productivity for Oil and Gas Extraction (NAICS code 211) in both Sweetwater and Sublette counties was increased to be roughly consistent with REMI's historical trend and the U.S. Census Bureau's Economic Census results. In addition, the proportion of employment between Oil and Gas Extraction (NAICS code 211) and Support Activities for Mining (NAICS code 213) for Sublette County was assumed to be 50% each, based on BLS data. The original REMI baseline forecast assumed this distribution to be 91% in oil and gas extraction and less than 9% in support activities in mining.

Table O.4-3 and Table O.4-4 show the direct impact inputs to the REMI model by sector and county for Alternative A and Alternative B. The input amounts increased in each year from 2016 to 2031 due to additional wells coming into production each year. All direct impact inputs were allocated to the Oil and Gas Extraction (NAICS code 211) sector.

**Table O.4-3. Inputs for Oil and Gas Production – Alternative A (millions of 2014$)**

| County | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 |
|---|---|---|---|---|---|---|---|---|
| Sweetwater | $351.5 | $382.9 | $445.7 | $504.3 | $545.4 | $635.9 | $675.5 | $791.1 |
| Sublette | $99.1 | $108.0 | $125.7 | $142.2 | $153.8 | $179.4 | $190.5 | $223.1 |
| **County** | **2024** | **2025** | **2026** | **2027** | **2028** | **2029** | **2030** | **2031** |
| Sweetwater | $819.0 | $918.1 | $979.6 | $1,059.2 | $1,177.3 | $1,221.6 | $1,249.4 | $1,314.0 |
| Sublette | $231.0 | $259.0 | $276.3 | $298.7 | $332.1 | $344.6 | $352.4 | $370.6 |

**Table O.4-4. Inputs for Oil and Gas Production – Alternative B (millions of 2014$)**

| County | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 |
|---|---|---|---|---|---|---|---|---|
| Sweetwater | $93.1 | $101.5 | $118.1 | $133.6 | $144.6 | $168.5 | $179.1 | $209.7 |
| Sublette | $26.3 | $28.6 | $33.3 | $37.7 | $40.8 | $47.5 | $50.5 | $59.1 |
| **County** | **2024** | **2025** | **2026** | **2027** | **2028** | **2029** | **2030** | **2031** |
| Sweetwater | $217.1 | $243.4 | $259.7 | $280.8 | $312.1 | $323.9 | $331.2 | $348.3 |
| Sublette | $61.2 | $68.6 | $73.3 | $79.2 | $88.0 | $91.3 | $93.4 | $98.2 |

## Coal and Trona (Soda Ash) Production

Sales value for coal was inserted into only the REMI Sweetwater County regional model to estimate economic impacts from coal production. No calibrations were deemed necessary for the coal analysis.

For trona, the soda ash revenue was also entered into only the REMI Sweetwater County regional model. For the trona analysis calibration, the labor productivity and compensation rates for Chemical Manufacturing (NAICS code 325) in Sweetwater County were reduced to be roughly consistent with REMI's historical trend and the U.S. Census Bureau's Economic Census results.

The coal and trona analyses were carried out separately. However, due to the small number of operators in the coal and trona industries, the inputs and the analysis results were aggregated for public release in order to avoid releasing potentially proprietary information.

The coal and trona production direct impact inputs to the REMI model totaled $283.6 million (in 2014 dollars) for Alternative A (and all alternatives). The input amounts were the same for each year from 2016 to 2031 and were all allocated to Sweetwater County. The inputs for coal production were allocated to Coal Mining (NAICS code 2121), and for Trona, to Other Basic Inorganic Chemical Manufacturing (NAICS code 325180).

## Livestock Grazing

The total value of livestock production (estimated as described in Appendix N) was allocated based on an estimated distribution of billed animal unit months in 2015 to each of the socioeconomic study area counties, the rest of Wyoming, and outside Wyoming. The estimated distribution was prepared by a RSFO rangeland specialist based on the addresses of the permittee's base operations and the specialist's local knowledge, according to the primary (70%), secondary (20%), and tertiary (10%) locations where the specialist estimated each operator is most likely to purchase livestock supplies, services, and labor. The value of production was inputted into REMI's farm sector that includes all crop and ranching operations. There was no calibration for the farm sector.

Table O.4-5 shows the direct impact inputs to the REMI model by sector and county for Alternative A. The input amounts were the same for each year from 2016 to 2031. The inputs were allocated to a REMI sector that combines NAICS codes 111 (Crop Production) and 112 (Animal Production and Aquaculture).

**Table O.4-5. Inputs for Livestock Grazing – All Alternatives (millions of 2014$)**

| County | Amount |
|---|---|
| Fremont | $0.30 |
| Lincoln | $0.35 |
| Sublette | $0.14 |
| Sweetwater | $4.43 |
| Uinta | $1.88 |
| Total | $7.10 |

## Recreation

The total direct economic expenditures were inserted into the REMI model to recreation-related industries based on estimation of recreation expenditure distributions from U.S. Forest Service National Visitor Use Monitoring (NVUM) program data (see Appendix N). The disaggregation across counties was based on an analysis of site-level RMIS data by the RSFO. A RSFO recreation specialist estimated how recreation expenditures attributable to each site would accrue to the different counties based on the locations of the sites relative to socioeconomic study area communities and the types of recreation and visitors at each site.

Differences between Alternatives A and B were based on estimated reductions in recreation visits to the RSFO due to closure of the Killpecker Sand Dunes site under Alternative B. The BLM assumed that most of the economic activity attributable to visits to that site would be lost from the socioeconomic study area, and therefore deducted 100% of the visits to that site from the total visits. As a result, total visitation and recreation-related expenditures under Alternative B were estimated to be 86.6% of the visitation and expenditures under Alternative A. Due to the location of the Killpecker Sand Dunes within the RSFO and the socioeconomic study area, the BLM assumed the entire related economic change under Alternative B would occur in Sweetwater County. Therefore, the REMI model inputs for Alternative B changed for Sweetwater County only.

For recreation, the mapping of recreation expenditures from IMPLAN industries to REMI industries was particularly important. REMI does not have all same industries that were used in the IMPLAN analysis, so some of the expenditure data used in IMPLAN had to be combined before being input to a broader industry in REMI; e.g., "Other Retail."

For calibration, the State assumed the margin value to be 34.6% for food stores and other retail trade, respectively, when related expenditures were inserted into the model based on data in IMPLAN.

Table O.4-6 and Table O.4-7 show the direct impact inputs to the REMI model by sector and county for Alternative A and Alternative B. The input amounts were the same for each year from 2016 to 2031. Note that for these tables only, the inputs are expressed in thousands of dollars instead of millions of dollars. (Therefore, for example, the total input for Sweetwater County in Alternative A equates to approximately $19.6 million.)

**Table O.4-6. Inputs for Recreation – Alternative A (thousands of 2014$)**

| Sector – NAICS Code | Fremont | Lincoln | Sublette | Sweetwater | Uinta |
|---|---|---|---|---|---|
| Accommodation - 721 | $638.1 | $331.1 | $530.8 | $3,675.6 | $311.2 |
| Food Services and Drinking Places - 722 | $450.0 | $233.5 | $374.4 | $2,592.4 | $219.5 |
| Food and Beverage Stores - 4450 | $678.0 | $351.8 | $564.0 | $3,905.5 | $330.7 |
| Other Retail - 4A0000 (REMI sector combining 9 NAICS codes) | $1,407.2 | $730.1 | $1,170.6 | $8,105.9 | $686.3 |
| Scenic and Sightseeing Transportation and Support Activities for Transportation - 48A000 (REMI sector combining NAICS codes 487 and 488) | $9.2 | $4.8 | $7.6 | $52.8 | $4.5 |
| Museums, Historical Sites, Zoos, and Parks - 7120 | $125.4 | $65.0 | $104.3 | $722.2 | $61.1 |
| Other Amusement and Recreation Industries - 7139 | $97.2 | $50.4 | $80.8 | $559.6 | $47.4 |
| **Total Input (Thousands)** | **$3,405.0** | **$1,766.6** | **$2,832.6** | **$19,614.0** | **$1,660.7** |

**Table O.4-7. Inputs for Recreation – Alternative B (thousands of 2014$)**

| Sector – NAICS Code | Fremont | Lincoln | Sublette | Sweetwater | Uinta |
|---|---|---|---|---|---|
| Accommodation - 721 | $638.1 | $331.1 | $530.8 | $2,939.8 | $311.2 |
| Food Services and Drinking Places - 722 | $450.0 | $233.5 | $374.4 | $2,073.4 | $219.5 |
| Food and Beverage Stores - 4450 | $678.0 | $351.8 | $564.0 | $3,123.6 | $330.7 |
| Other Retail - 4A0000 | $1,407.2 | $730.1 | $1,170.6 | $6,483.2 | $686.3 |
| Scenic and Sightseeing Transportation and Support Activities for Transportation - 48A000 | $9.2 | $4.8 | $7.6 | $42.2 | $4.5 |
| Museums, Historical Sites, Zoos, and Parks - 7120 | $125.4 | $65.0 | $104.3 | $577.6 | $61.1 |
| Other Amusement and Recreation Industries - 7139 | $97.2 | $50.4 | $80.8 | $447.6 | $47.4 |
| **Total Input (Thousands)** | **$3,405.0** | **$1,766.6** | **$2,832.6** | **$15,687.5** | **$1,660.7** |

# O.5 RESULTS

Table O.5-1 through Table O.5-3 present results of the REMI-based impact analysis for Alternative A. Table O.5-4 through Table O.5-6 present the results for Alternative B. As mentioned above (Overview subsection of the Methodology chapter) the differences in inputs (and therefore results) for Alternatives C, D, and the Proposed RMP compared to Alternative A are minor, and therefore the REMI analysis was conducted only for Alternatives A and B. These tables present each alternative's results for direct and total economic output, total labor earnings, and total employment (jobs) for each resource use. They are identical in format to the IMPLAN-based tables in the alternative-specific subsections of the socioeconomics section of Chapter 4 of the EIS, except that these tables do not present the results for mineral taxes and federal mineral royalty revenues. Neither IMPLAN nor REMI were used to calculate those revenues so those figures are irrelevant to the discussions in this appendix.

Table O.5-7 through Table O.5-9 present summaries of the REMI results organized by three economic indicators: total economic output, total labor earnings, and total employment. For Alternatives A and B, these tables correspond to tables found in the "Summary of the Quantitative Economic Impact Analysis Results" subsection of Chapter 4 of the EIS. However, the tables below also differ; they include the percent difference between the REMI and IMPLAN results for the two alternatives. Also, the REMI analysis did not include the additional scenarios included in Chapter 4 of the EIS (Livestock Grazing under Total Authorized Use, Recreation Low Visitation, and Recreation Economic Contribution) so there are no tables below for those scenarios.

REMI also produces estimates of the population associated with an economic impact, and how the population changes over time. However, REMI's population estimates appear to align with a "shock" or new activity setting rather than an economic contribution (existing activity) setting. For example, REMI results show estimated population increasing over the first several years due to the model assuming migrants would enter the region to fill new jobs. However, for most of the economic activity analyzed in this EIS, most of the jobs already exist. For instance, there are no new jobs created under Alternative A for grazing, coal and trona production, and recreation. Even for oil and gas development and production, much of the economic activity from new well drilling and production is ongoing "renewal" of activity associated with recent patterns of activity. Therefore, the State, in consultation with the BLM team, determined that REMI's population estimates are not appropriate for the modeling context in this analysis and therefore they are not included in this appendix.

## Table O.5-1. REMI Results: Total Annual Impacts by Program, 2016, Alternative A (1,000s of 2014$)

| -- | Livestock Grazing (Billed Use)[1] | Oil and Gas Well Development[1] | Oil and Gas Production[2] | Coal and Soda Ash Production[1,3] | Recreation (High Visitation) [1] | Total BLM-Supported |
|---|---|---|---|---|---|---|
| Direct Economic Output | $7,094 | $561,074 | $450,660 | $283,578 | $29,279 | **$1,331,685** |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | **N.A.** |
| Total Economic Output | $8,843 | $668,110 | $899,852 | $380,065 | $32,733 | **$1,989,603** |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | **N.A.** |
| Total Labor Earnings | $1,870 | $277,766 | $79,990 | $77,420 | $9,106 | **$446,152** |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | **N.A.** |
| Jobs | 115 | 3,106 | 953 | 809 | 274 | **5,256** |
| % Difference from Alt. A | N.A. | N.A. | N.A. | N.A. | N.A. | **N.A.** |

[1] Based on the available data, the analysis assumes a constant annual activity level.
[2] Initial values; these would increase each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.
FMR: Federal Mineral Royalties

## Table O.5-2. REMI Results: Net Present Value (3% Discount Rate) by Program, 2016–2031, Alternative A (1,000s of 2014$)

| -- | Livestock Grazing (Billed Use)[1] | Oil and Gas Well Development[1] | Oil and Gas Production[2] | Coal and Soda Ash Production[1,3] | Recreation (High Visitation) [1] | Total BLM-Supported |
|---|---|---|---|---|---|---|
| Direct Economic Output | $89,114 | $7,047,714 | $12,469,766 | $3,562,057 | $367,775 | **$23,536,427** |

[1] Assumes constant annual activity level (based on available data).
[2] Would rise each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators. Net present value is not applicable for employment.

# O.6 DISCUSSION

## O.6.1 General Comparisons

Some amount of difference between the REMI and IMPLAN results is to be expected. As shown in Table O.5-7 through Table O.5-9 for the key economic indicators of total economic output, total labor earnings, and total employment, the differences between the REMI and IMPLAN results are generally not large. There are no "order of magnitude" differences. In most cases, the estimates are within 25%, which is very reasonable given the many considerations involved in economic impact modeling. The greatest differences are for grazing and oil and gas production. These may be explained by methodological factors described below rather than any inherent "error" in either model.

Different from a standard static input-output model like IMPLAN, REMI P+ is a dynamic policy analysis model with forecasts and simulations generated on an annual basis to include behavioral responses to, or interactions among, wage, price, and many other economic factors. The dynamic modeling framework forecasts how changes in the economy and adjustment to these changes will occur on a year by year basis. The dynamic aspects are best illustrated graphically, and the following figures and discussion illustrate these aspects for oil and gas development. The same positive or negative slope of the graphed REMI line for each economic indicator pertains across all the resource uses, with one exception. The only exception is for oil and gas production. For this resource use only, the direct impact used as the input to the model – in this case, total sales value of oil and gas – changes every year. Specifically, it increases every year because more wells come into production. This increase overwhelms some of the trends described below.

REMI assumes labor productivity (economic output per job) increases over time for all sectors of the economy (Figure O.6-1). Accordingly, given the constant annual inputs in this EIS for all activities except oil and gas production, the results show decreases in employment impacts each year for the whole forecasting period (Figure O.6-2 for direct employment, and Figure O.6-3 for total employment). The impacts on total earnings also generally decline as measured in constant dollars (Figure O.6-4), but the AEPJ always increase due to competition for labor and efficiency gains in business operations, which together motivate or allow employers to increase wages (Figure O.6-5). However, the impacts to total economic output always decline at a decreasing rate during the first half of the forecasting period (Figure O.6-6), but then stabilize. The possible reason is that the model assumes there are more economic activities at the early stages after an economic input change (in spite of the adjustments made in the modeling approach to better reflect a contribution analysis rather than a shock analysis), either through supply chain effects or local consumption demand.

The following subsections address the differences in results for specific resources uses (as shown in Table O.5-7 through Table O.5-9 above), and possible explanations for differences. In these discussions, any difference of 25% or less is considered "close" given the many considerations involved in economic impact modeling. Nonetheless, possible factors affecting the respective model results are addressed for all resource uses.

**Figure O.6-2. Direct Employment (Jobs) for Oil and Gas Development, REMI and IMPLAN**

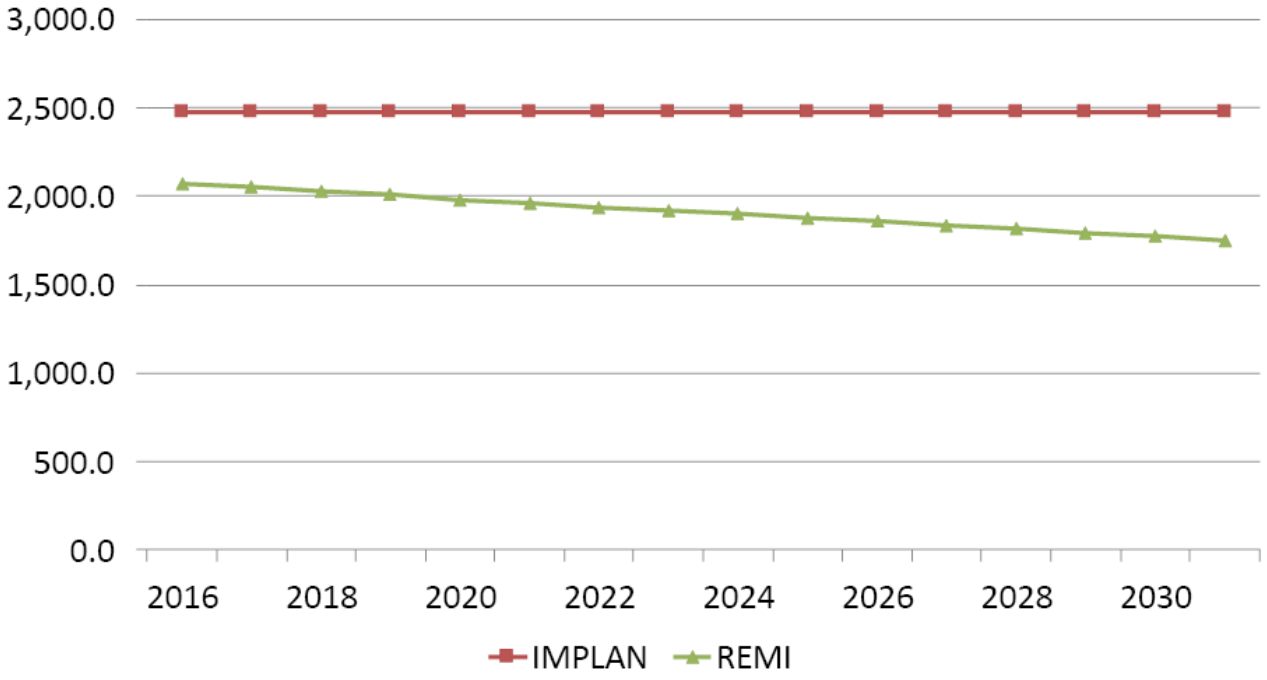

**Figure O.6-3. Total Employment (Jobs) for Oil and Gas Development, REMI and IMPLAN**

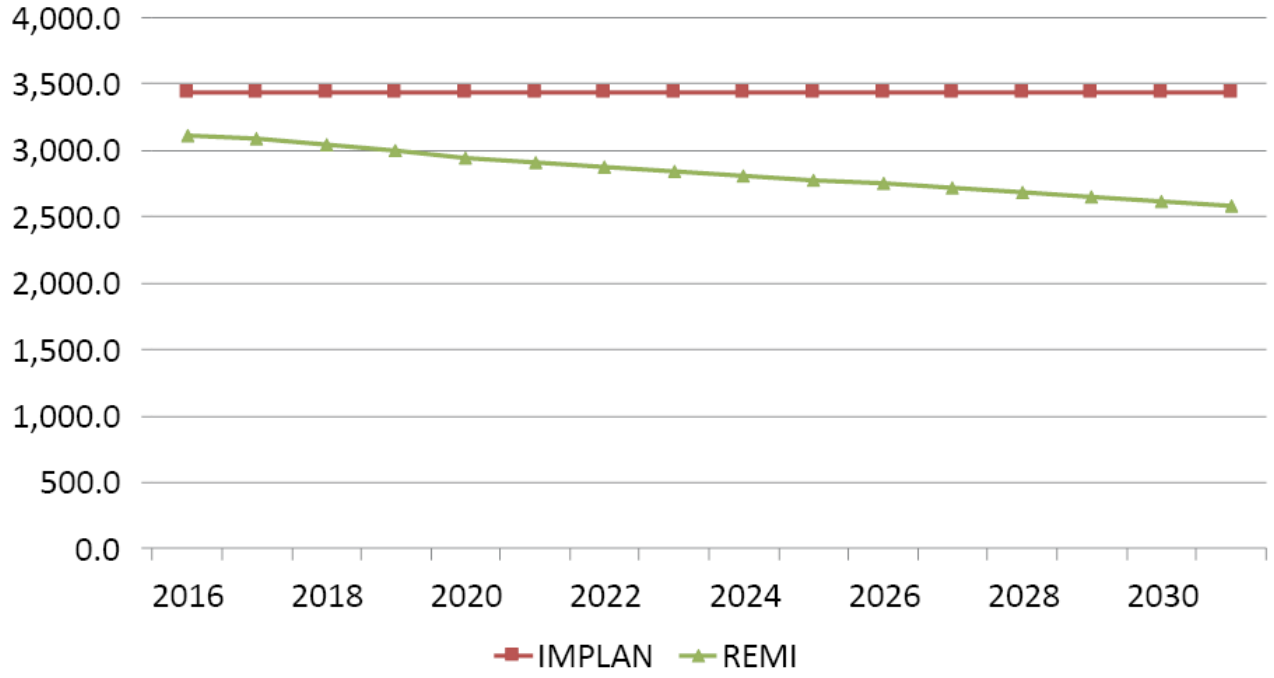

**Figure O.6-4. Total Earnings for Oil and Gas Development, REMI and IMPLAN (2014$)**

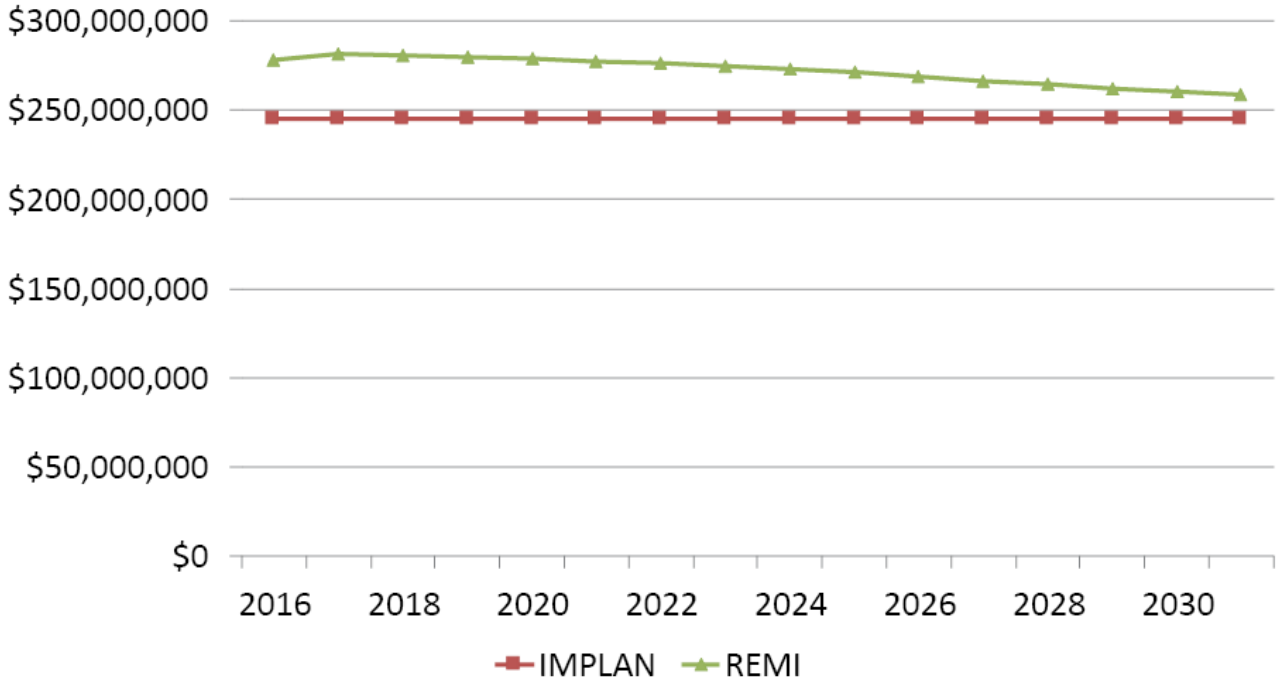

**Figure O.6-5. Average Total Earnings per Job for Oil and Gas Development, REMI and IMPLAN (2014$)**

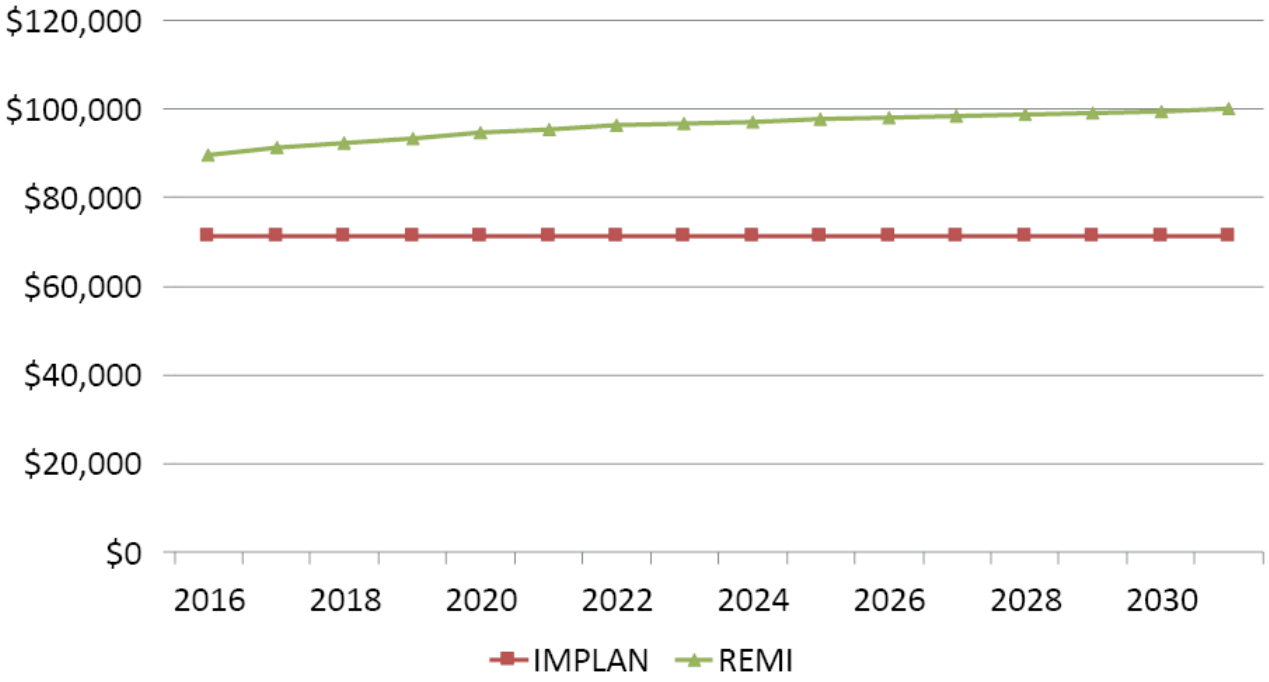

**Figure O.6-6. Total Output for Oil and Gas Development, REMI and IMPLAN (2014$)**

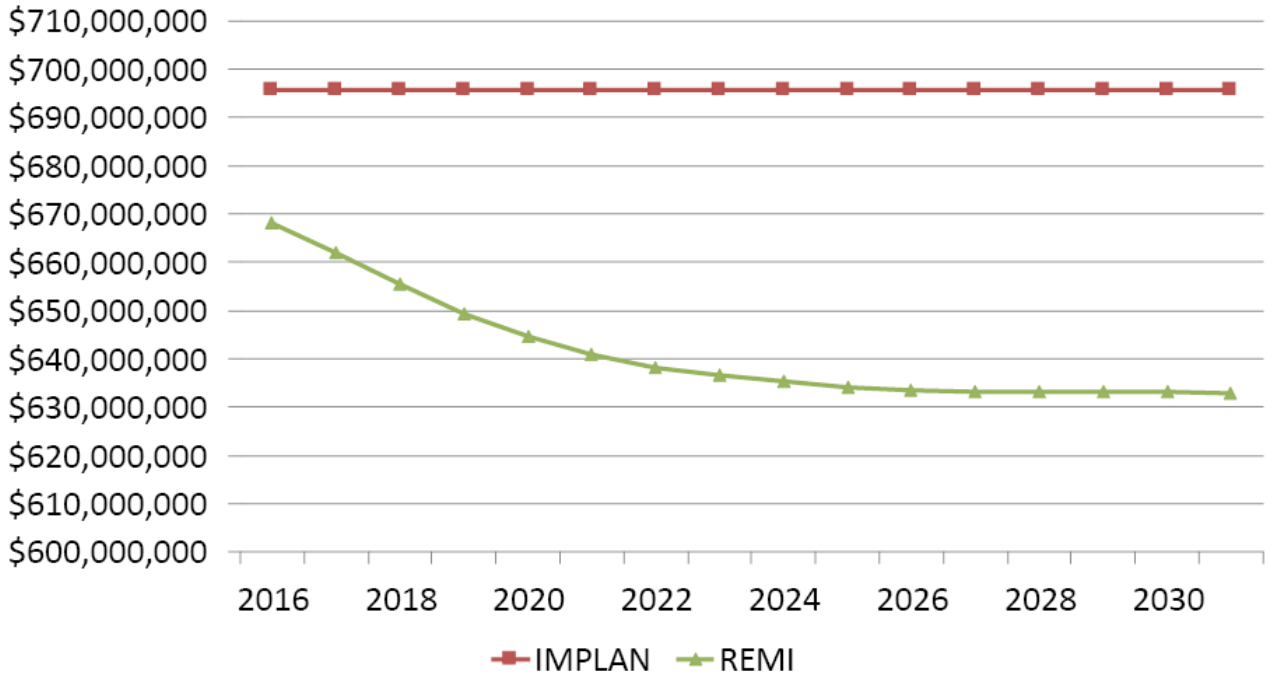

## Recreation

The REMI and IMPLAN results for recreation were close (within 25%) across all three economic indicators (total output, total earnings, and total employment).

Mapping of inputs to different sectors in the two models may be an important source of differences in the results. For example, gasoline is an expenditure category in the NVUM data, and IMPLAN has a specific industry sector for Gasoline Stations. This expenditure category/industry has the largest amount of spending in the NVUM data, comprising 32.6% of the total expenditures. The REMI model does not have a specific industry sector for gasoline stations. Therefore, the REMI analysis had to lump gasoline expenditures into a sector for Other Retail. It is highly likely that the economic relationships within the model for that generalized sector do not closely match the relationships that pertain to Gasoline Stations specifically. For instance, labor productivity and AEPJ probably differ, which would affect the employment and earnings results.

## Grazing

The total annual employment estimated by the two models for livestock grazing was close (13% less in REMI). The estimates for total output and total earnings were further apart (annually, 32% less in REMI for total output, and 58% less in REMI for total earnings).

Neither model has a specific sector for cattle ranching. IMPLAN has a sector titled "Cattle Ranching and Farming," but this sector includes feedlots and dairy cattle operations. Given the broad scope of this sector, and because cattle ranching budgets specific to cattle operations that use public lands as an important production input are available from the universities of Wyoming and Idaho, the IMPLAN analysis uses "analysis by parts" methodology, which means allocating the value of production to other specific industries based on the break-down of a typical ranch operation budget drawn from the economic literature, as described in Appendix N.

The REMI model owned by the State does not have enough granularity to allow for analysis by parts methodology. Therefore, in the REMI analysis the value of production was allocated to a combined crop production and animal production sector. The parameters (economic relationships) of this generalized sector in the REMI model may not match very well with the actual economic relationships specific to cattle ranching in Wyoming or the results of the analysis by parts methodology in IMPLAN.

In addition, analysis of economic impacts in agriculture is always challenging because farm sector earnings are very volatile (highly variable each year). In fact, net farm earnings are sometimes negative. Economic models must make adjustments to account for volatility in order to make reasonable projections. The two models probably make different assumptions about how to handle this issue.

## Coal and Trona (Soda Ash)

For coal and trona, the IMPLAN and REMI results were close for total output and total earnings. The specific numbers cannot be released due to their potential to reveal proprietary data. The results for direct and total employment were somewhat further apart, but still not remarkably so.

For coal, a possible source of differences lies in the AEPJ and employment multipliers. REMI used a higher AEPJ than IMPLAN and had a higher multiplier. The AEPJ in the coal industry itself (direct impact) would be high, but if the industry supports a large number of jobs in other industries, which would have lower wages, it is not clear why the total AEPJ is as high as it is according to REMI.

A likely source of differences in results for the trona and soda ash industry is a difference in accounting for the linkage between the mining and processing segments of trona/soda ash production. The industry is vertically integrated across these segments. Input-output models assume separation between industries, and the purchase coefficients are calibrated accordingly. Therefore, the methodology for IMPLAN included breaking the link between these segments. Specifically, the soda ash revenue was entered into the IMPLAN model, Sector 164, Other Basic Inorganic Chemical Manufacturing to estimate the total economic impact of soda ash production. The total economic impact of trona mining was estimated separately by entering

only the trona mining revenue into the IMPLAN model, Sector 33, Potash, Soda, and Borate Minerals, after removing the linkage between Sector 164 and Sector 33 from the Sector 164 industry production account in the IMPLAN model. Removing the linkage eliminates double-counting of the impacts from trona revenue. For REMI, only one industry sector, Other Basic Inorganic Chemical Manufacturing (NAICS code 325180), was applicable to inputs for the combined trona/soda ash industry. Thus, the linkage in the vertically integrated trona/soda industry could not be directly addressed. In addition, the higher-level sector used for REMI's results outputs represents a much broader industry than the two specific sectors used in IMPLAN, and therefore the economic relationships between the more generic industry and its supporting industries are different from the relationships between the two industries used in IMPLAN and their supporting industries.

## Oil and Gas Development

The REMI and IMPLAN results for oil and gas development were close (within 25%) across all three economic indicators (total output, total earnings, and total employment). This may reflect the fact that the input sectors available in both models were identical. It is also notable that other "intermediate" indicators reviewed by the modeling team – multipliers, AEPJ, and labor productivity – were all close between the two models.

## Oil and Gas Production

As shown in the results tables above, the differences between the REMI and IMPLAN results were greatest for oil and gas production. These differences may be attributable to methodology and data source considerations.

Both REMI and IMPLAN "out of the box" use data from the BEA to quantify the total number of local jobs in each industry, including the Oil and Gas Extraction sector. However, the BEA employment data for this sector is known to be artificially inflated because it includes large numbers of sole proprietors in this sector. This is probably because it counts individual people who receive royalties or rents from oil and gas companies as sole proprietorships and therefore as workers in this sector. But most of the actual jobs in this sector are wage jobs provided by medium and large-sized oil and gas extraction corporations. People who receive royalties or rents only because they own mineral estate are not actually laborers in the sector. Therefore, prior to impact analysis both models require calibration of this sector to reduce potential errors from the large number of sole proprietors included in the BEA data.

The calibrations of the Oil and Gas Extraction sector for the two models in this study used different methodologies for what was adjusted and how, and different data sources for the adjustments. The calibration for IMPLAN was based on data from the BLS. The BLS data does not include sole proprietors who are not actually laborers. The calibration for REMI used data from the U.S. Census Bureau's Economic Census, which is also more accurate than the BEA data with respect to sole proprietors. These two data sources are based on different time periods. This is a potential issue because the price of oil and gas has varied considerably in recent years. Thus, even with a roughly constant level of production, the total sales value (output) of the Oil and Gas Extraction sector can vary significantly from year to year. Thus, the two calibrated models may have very different figures for economic parameters such as labor productivity (output per worker).

In short, for oil and gas production, both models were adjusted to address an important known issue, but there were several key differences – in methodology and in data sources – that could have still resulted in the differences between the results.

## Conclusions

Based on the reasonable effort made toward an apples-to-apples comparison in this REMI Pilot Project, the differences in results between the IMPLAN and REMI models are not so great that they would lead to different management decisions (selection of a different preferred alternative) if REMI were used for the economic analysis instead of IMPLAN. They do not tell decisively different economic stories about the nature of the local economy or the alternatives.

While the results for most of the resource uses were reasonably close, one might ask why the larger differences for the livestock grazing and oil and gas production results are not decisive. There are at least two answers to this question.

First, when evaluating the economic differences between alternatives, it is the relative differences between the alternatives that are most important, not the absolute dollars or job numbers. This is in part because all economic models are imperfect in their characterization of an economy, and economic conditions change in any case, so the actual numerical results in the future are likely to differ from the forecasts of any particular model. However, each model is internally consistent, so any imperfections will at least be consistently applied across the alternatives. Therefore, the relative differences in the model results across alternatives are of greater interest for decision making than the absolute levels of output, earnings, or jobs predicted for each alternative. Clearly, the differences between Alternatives A and B from either the IMPLAN or REMI model are much greater than the difference between the results. That is, both models show that the economic indicators for Alternative B are well more than 50% less than the values of the indicators for Alternative A, whereas the predicted differences from the REMI model are just a few percentage points higher than the differences predicted by the IMPLAN model when evaluated across all resource uses, and are almost exactly the same when evaluated for each specific resource use.[3] Either model leads to the same understanding of the large differences in the economic impacts of Alternatives A and B.

Second, economic impacts measurable in models such as REMI and IMPLAN are only one factor that the BLM must take into account in making land use decisions. Other factors are equally or more important, such as the degree to which each alternative meets the various and many management goals and policies that the BLM must address in making land use decisions.

The REMI Pilot Project has also produced a number of observations about the nature of the REMI and IMPLAN models and considerations in the modeling process. Here are some of the observations of the project team:

- REMI is useful for showing how an economy is a dynamic entity. The kinds of dynamics described briefly in Section O.6.1 are almost certainly a more realistic way of portraying an economy over a long planning period than the application of a static model like IMPLAN. However, for the reasons noted above, employing a dynamic model does not necessarily provide more useful or accurate results for the purposes of the BLM land use planning process.[4]
- Careful calibration of either model is required. Both models "out of the box" have some features that are not accurate for the southwest Wyoming economy. This is almost certainly true for other locations in the western United States.
- Differences in definitions of study area geographies are of interest, but depending on context are probably not that important to the results. In this particular case, the IMPLAN model was specified

[3] *Another way of putting this is that it is the model inputs that are decisive, not the selection of the model. When one "turns the crank" on each model, the differences in results largely trace to the differences in the inputs, not the workings of the models. The physical outputs of the uses of BLM-administered land are equal for both models, and the direct economic impacts, which are estimated outside of the models, are equal as well.*

[4] *REMI is also a considerably more expensive model to obtain, and many fewer socioeconomic analysts within and outside of the BLM have the expertise necessary to use it properly.*

and applied for a combined area consisting of the five counties of the socioeconomic study area. The BLM considered this approach efficient and adequate for the purposes of the RMP/EIS analysis. The REMI model owned by the State could only be applied at the level of each county. This created extra work in specifying the inputs as the county level, and in aggregating the results for comparison to the IMPLAN results. The project team did some tests to determine the sensitivity of the results to the county-level disaggregation (for instance, putting all inputs into Sweetwater County only vs. distributing them to the five counties based on the best available information for making the distribution). The tests indicated that the REMI results were not very sensitive to the county-level distribution of the inputs.

- Differences in industrial sector definitions between the two models may be very important. For instance, REMI does not have the degree of sector granularity to allow use of analysis by parts methodology for the livestock grazing analysis. This meant that the REMI analysis had to use a higher-level sector for the inputs, and the economic relationships of that sector to other sectors in the economy may not reflect actual relationships of cattle ranching operations to other sectors of the southwest Wyoming economy. In addition, not being able to apply the analysis by parts methodology for livestock grazing meant that local data (from the universities of Wyoming and Idaho) specific to cattle ranching in the region could not be applied in the REMI analysis. The recreation analysis provides another example. Gasoline stores are one of the larger expenditure categories for recreation-related expenditures. This could be directly addressed in the IMPLAN model by using an industrial sector specific to gasoline stores, but in the REMI model expenditures at gasoline stores had to be lumped in with expenditures for several other types of retail establishments.
- REMI is more of a "black box" model. Not all of the modeling issues that emerged in this pilot project could be resolved in this demonstration project. Because of the REMI model's complexity, it is harder to "get under the hood" to make manual changes to calibrate the model for the local economy. In addition, some of the changes that are routinely made in use of the IMPLAN model simply cannot be made in the REMI model.

In summary, the REMI Pilot Project has been a revealing trial of a model not usually used by the BLM. It has highlighted the importance of a number of specific considerations in the economic impact modeling process. The BLM will be able to make use of these considerations in future impact modeling, whatever impact model is used.

# APPENDIX P—AIR QUALITY TECHNICAL SUPPORT DOCUMENT

## P.1 INTRODUCTION

This Air Quality Technical Support Document describes the processes used to conduct the air quality impact assessment and provides summaries of relevant analysis data. This document served as the basis for air quality impact analyses of all alternatives. The contents of this document are:

- Climate Resources
- Regulatory Framework
- Thresholds of Significance
- Air Quality Impact Analysis
- Emission Calculations
- Resources and References

## P.2 CLIMATE RESOURCES

Climate is the combination of temperature, humidity, atmospheric pressure, wind, precipitation, and other meteorological characteristics over a long period of time in a specific region. Climate differs from weather, which is the present condition of these characteristics and their variations over shorter periods. Climate change involves long-term trends indicating a noticeable shift in climate. Primary climate indicators that can be monitored include ambient air temperature, atmospheric pressure, wind, relative humidity, precipitation amounts and timing, annual snowpack levels, streamflow volume and timing, and solar radiation.

The planning area is buffeted by high to moderate predominant westerly winds with low precipitation and relative humidity. Climate in the planning area is designated as temperate, semi-arid with long cold winters and warm summers. Table P-1, Rock Springs Station Temperature and Precipitation Data, details the average, maximum, and minimum mean temperate and annual total precipitation for the Rock Springs area.

**Table P-1. Rock Springs Station Temperature and Precipitation Data (2007 to 2017)**

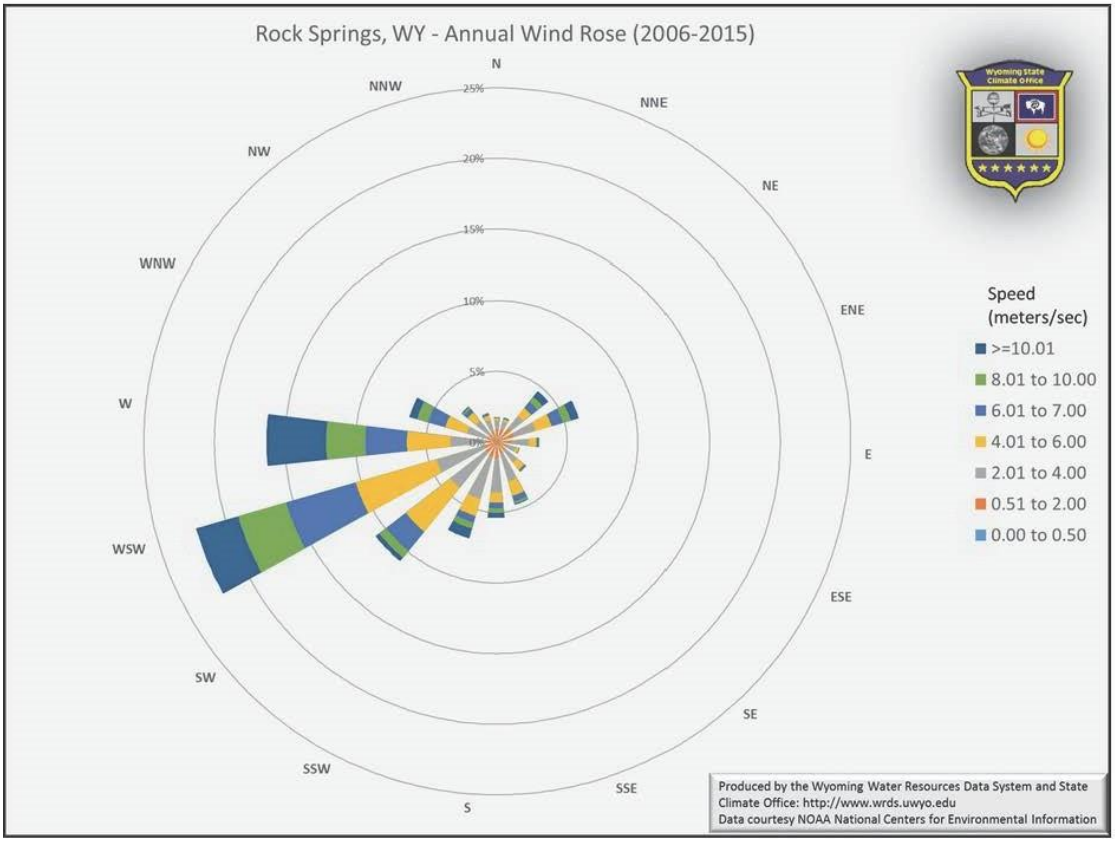
| Year | Total Precipitation (inches) | Average Mean Temperature* | Mean Maximum Temperature* | Mean Minimum Temperature* |
|---|---|---|---|---|
| 2007 | 7.15 | 45.0 | 57.3 | 32.7 |
| 2008 | 6.05 | 41.9 | 53.8 | 29.9 |
| 2009 | 8.11 | 42.7 | 54.8 | 30.7 |
| 2010 | 7.17 | 43.2 | 55.3 | 31.1 |
| 2011 | 8.73 | - | - | - |
| 2012 | 3.15 | 47.2 | 59.9 | 34.5 |
| 2013 | 4.68 | 44.0 | 55.8 | 32.3 |
| 2014 | 4.25 | 45.4 | 57.4 | 33.3 |
| 2015 | 8.63 | 45.9 | 57.6 | 34.2 |

| Year | Total Precipitation (inches) | Average Mean Temperature* | Mean Maximum Temperature* | Mean Minimum Temperature* |
|---|---|---|---|---|
| 2016 | 7.46 | 44.8 | 56.5 | 33.0 |
| 2017 | 5.59 | 45.0 | 56.8 | 33.2 |

* degrees Fahrenheit
Source: National Oceanic and Atmospheric Administration (NOAA) National Centers for Environmental Information (NCEI) https://www.ncdc.noaa.gov/cdo-web/

The daily annual wind speed average is 11.4 mph with a high to moderate prevailing westerly winds (Western Regional Climate Center, 2009). Air quality in the area is influenced by high winds that can transport air pollutants and dust from industrial sources and metropolitan areas from the west. The predominant wind direction near Rock Springs is from the west-southwest as shown in Figure P-1.

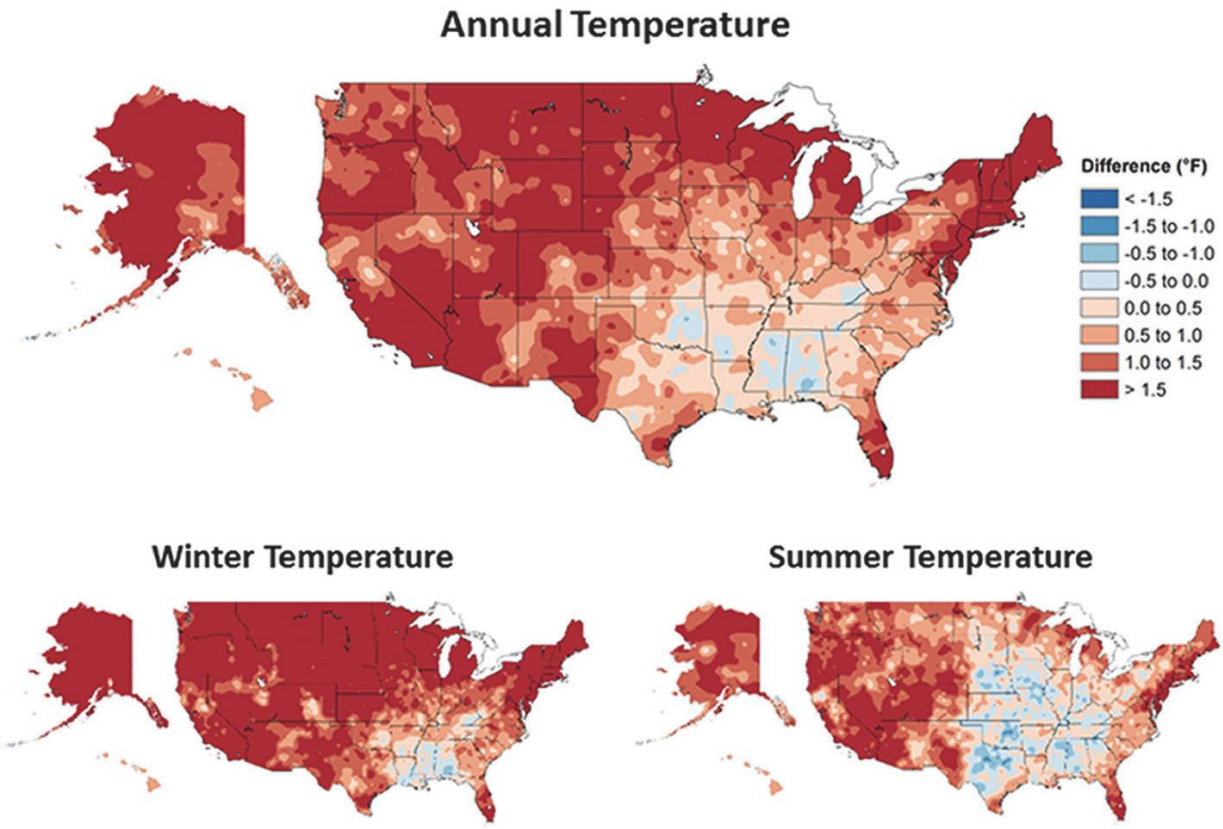
**Figure P-1. Rock Springs Wind Rose**



Future predicted climate maps include the following:

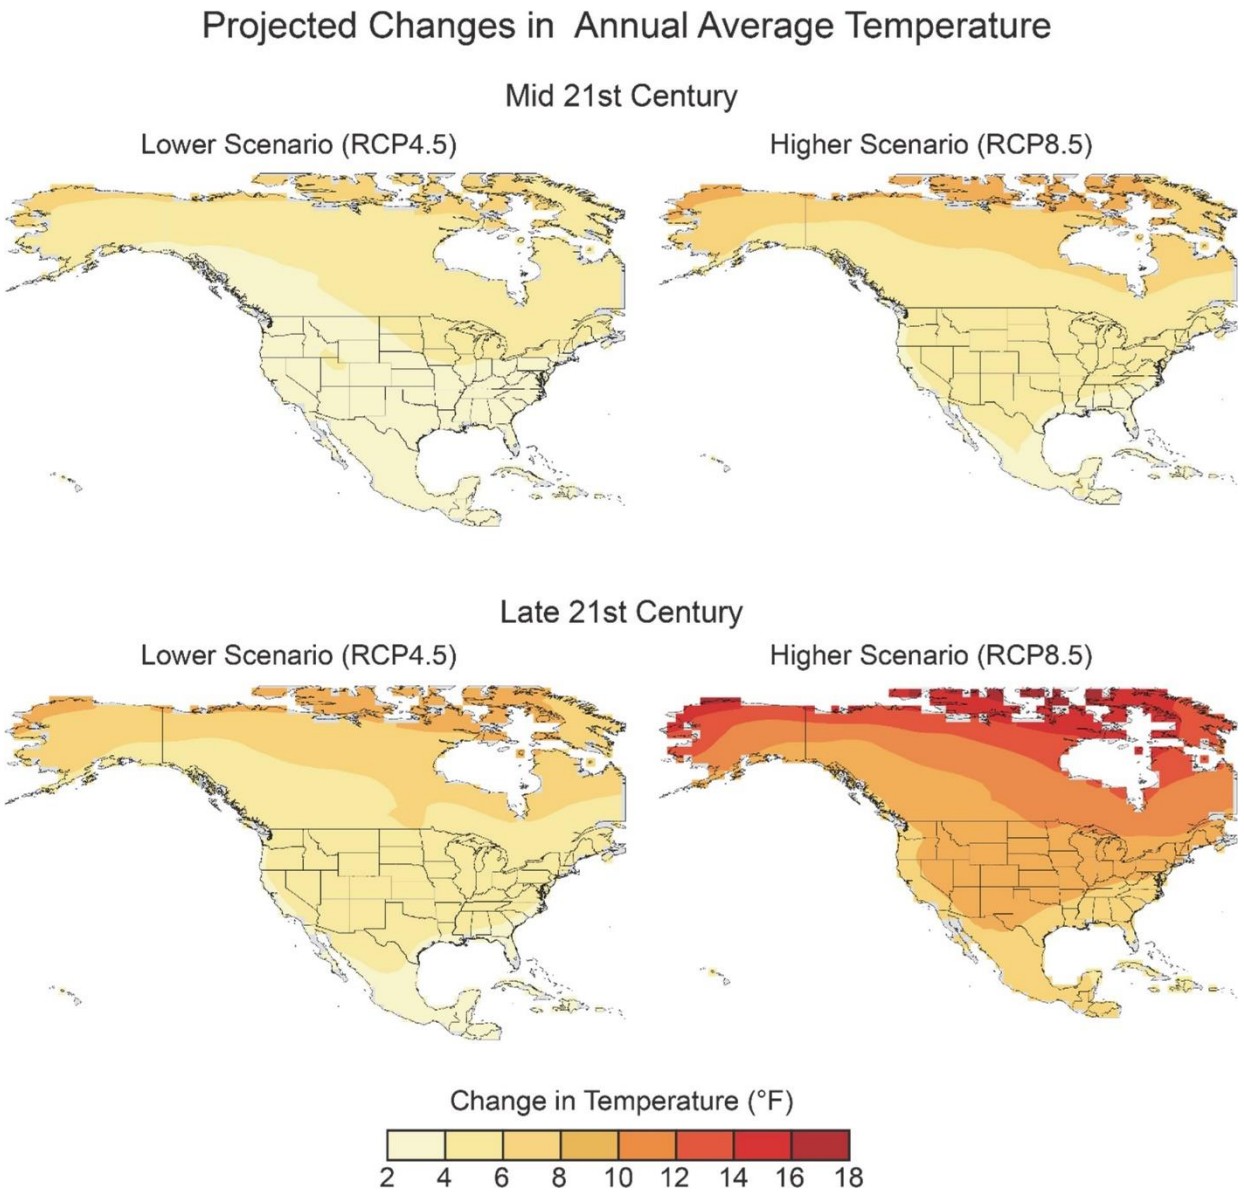
- Figure P-2. Observed Changes in Annual, Winter and Summer Temperatures (degrees Fahrenheit)
- Figure P-3. Projected Changes in Annual Average Temperature in North America (degrees Fahrenheit)
- Figure P-4. Projected Changes in the Number of Days Per Year with a Maximum Temperature Above 90°F and a Minimum Temperature Below 32°F in the Contiguous United States.

**Figure P-2. Observed Changes in Annual, Winter and Summer Temperatures (degrees Fahrenheit)**



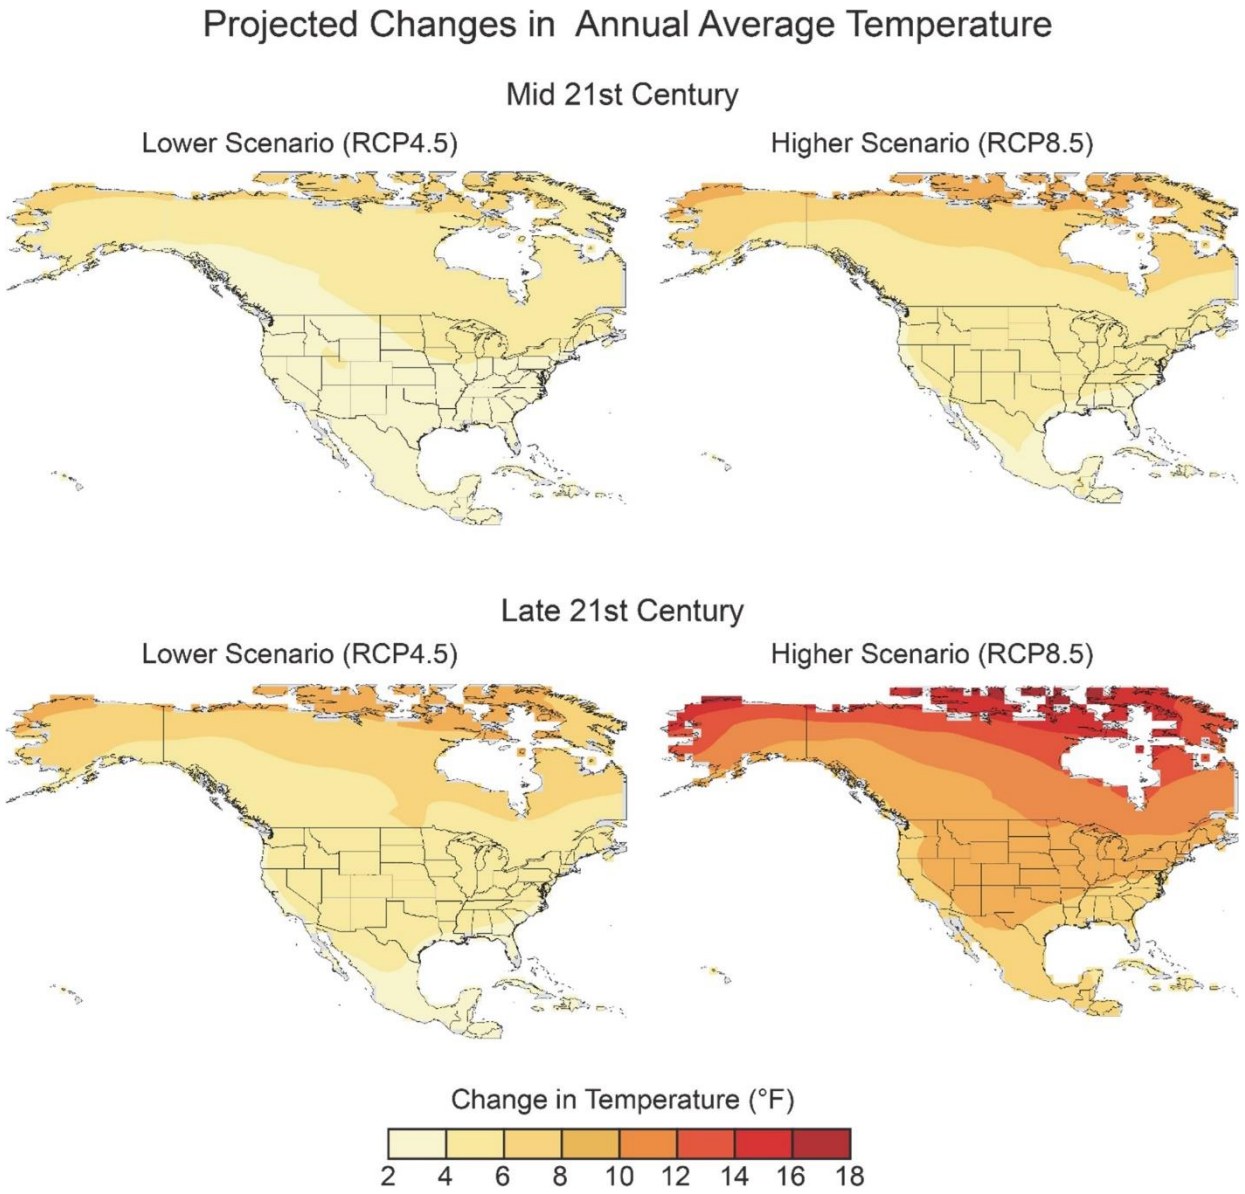
"Changes are the difference between the average for present-day (1986–2016) and the average for the first half of the last century (1901–1960 for the contiguous United States, 1925–1960 for Alaska and Hawaii). Estimates are derived from the ClimDiv dataset (Figure source: NOAA/NCEI)." (USGCRP, 2018)

**Figure P-3. Projected Changes in Annual Average Temperature in North America (degrees Fahrenheit)**



"Changes are the difference between the average for mid-century (2036–2065; top) or late-century (2070-2099, bottom) and the average for near-present (1976–2005). Each map depicts the weighted multimodel mean. Increases are statistically significant in all areas (that is, more than 50% of the models show a statistically significant change, and more than 67% agree on the sign of the change). (Figure source: CICS-NC and NOAA NCEI)." (USGCRP, 2018)

**Figure P-4. Projected Changes in the Number of Days Per Year with a Maximum Temperature Above 90°F and a Minimum Temperature Below 32°F in the Contiguous United States**



"Changes are the difference between the average for mid-century (2036–2065) and the average for near-present (1976–2005) under the higher scenario (RCP8.5). Maps in the top row depict the weighted multimodel mean whereas maps on the bottom row depict the mean of the three warmest models (that is, the models with the largest temperature increase). Maps are derived from 32 climate model projections that were statistically downscaled using the Localized Constructed Analogs technique. Changes are statistically significant in all areas (that is, more than 50% of the models show a statistically significant change, and more than 67% agree on the sign of the change). (Figure source: CICS-NC and NOAA NCEI)." (USGCRP, 2018)

# P.3 REGULATORY FRAMEWORK

For quantitative analysis, the air quality criteria in Section P.4 apply. Although the criteria listed below do not apply to the qualitative analysis presented in this final environmental impact statement (EIS), they are identified here for reference purposes. The basic framework for controlling air pollutants in the United States is mandated by the 1970 Clean Air Act (CAA) and its amendments, Environmental Protection Agency (EPA) regulations, including the 1999 Regional Haze Regulations, and state and local regulations. The CAA addresses criteria air pollutants, federal standards, and the Prevention of Significant Deterioration (PSD) program. The Regional Haze Regulations address visibility impairment. EPA regulations address ambient air quality standards for criteria pollutants, emission control technology, air quality monitoring, and State Implementation Plan (SIP) development (which may include air quality modeling and regulations), and air quality related value (AQRV) analyses related to regional haze.

## P.3.1 Ambient Air Quality Constituents

Air pollutants addressed in this study include criteria pollutants, hazardous air pollutants (HAP), which could cause visibility impairment (regional haze) or atmospheric deposition impacts, and greenhouse gases.

## P.3.2 Criteria Pollutants

Criteria pollutants are those for which national standards of concentration have been established. Ambient air concentrations of these constituents greater than the standards represent a risk to human health. Criteria pollutants include carbon monoxide (CO), nitrogen dioxide ($NO_2$), sulfur dioxide ($SO_2$), ozone ($O_3$), particulate matter ($PM_{10}$ and $PM_{2.5}$), and lead (Pb).

- **Carbon Monoxide.** CO is an odorless, colorless gas formed during any combustion process, such as operation of engines, fireplaces, and furnaces. High concentrations of CO affect the oxygen-carrying capacity of the blood and can lead to unconsciousness and asphyxiation. Wildfires are a natural source of CO.
- **Nitrogen Dioxide.** $NO_2$ is a red-brown gas formed during operation of internal combustion engines. Engines emit a mixture of nitrogen gases, collectively called nitrogen oxides ($NO_x$). $NO_x$ can contribute to brown cloud conditions and can convert to ammonium nitrate particles and nitric acid, which can cause visibility impairment and acid rain. Bacterial action in soil can be a natural source of nitrogen compounds.
- **Sulfur Dioxide.** $SO_2$ forms during combustion from trace levels of sulfur in coal or diesel fuel. It can convert to ammonium sulfate ($(NH_4)_2SO_4$) and sulfuric acid ($H_2SO_4$), which can cause visibility impairment and acid rain. Volcanoes are natural sources of $SO_2$. Anthropogenic sources include refineries and power plants.
- **Ozone.** $O_3$ is a faint blue gas that is generally not emitted directly into the atmosphere but is formed from the reaction of $NO_x$ and volatile reactive organic compound (VOC) emissions in the presence of sunlight. Internal combustion engines are the main source of $NO_x$. Volatile organic compounds, like terpenes, are very reactive. Sources of VOCs include, but are not limited to, paint, varnish, and some types of vegetation. The faint acrid smell common after thunderstorms is caused by ozone formation by lightning. $O_3$ is a strong oxidizing chemical that can burn lungs and eyes, and damage plants.
- **Particulate Matter.** Particulate matter (e.g., soil particles, hair, pollen) is essentially small particles suspended in the air that settle to the ground slowly and may be resuspended if disturbed. Separate allowable concentration levels for particulate matter are based on the relative size of the particle:
  - $PM_{10}$ particles with diameters smaller than 10 micrometers are small enough to be inhaled and can cause adverse health effects.

  - $PM_{2.5}$ particles with diameters smaller than 2.5 micrometers are so small that they can be drawn deeply into the lungs and cause serious health problems. Particles in this size range are also the main cause of visibility impairment.

- **Lead.** Before the wide use of unleaded fuel for automobiles, lead particles were emitted from tailpipes. Lead is not considered in this EIS because no proposed projects are expected to emit lead. The lead standard is not addressed in this Technical Support Document because proposed projects will have no lead emission sources.

## Hazardous Air Pollutants

There are a wide variety of HAPs, including N-hexane, ethylbenzene, toluene, xylene, formaldehyde, and benzene. Although HAPs do not have ambient air quality standards associated with them, the EPA has issued reference concentrations (RfC) to evaluate the inhalation risk for cancerous and noncancerous health effects.

Although this EIS is a National Environmental Policy Act (NEPA) document and not a regulatory document, there are regulatory issues that should be taken into account in preparing this EIS and ensuing project-specific EISs. Actual regulation of HAPs is achieved through compliance with applicable maximum achievable control technology (MACT) standards and not through ambient air quality standards. Regulatory agencies implement control through section 112 programs, specifically section 112(g) case-by-case MACT determinations according to 40 Code of Federal Regulations (CFR) part 63, subpart B and section 112(d) MACT emission standards.

Any source that emits or has the potential to emit 10 tons per year or more of any HAP or 25 tons per year or more of any combination of HAPs is considered a major source and would require a Title V, part 70, operating permit review and permit. This may include either compliance with an applicable MACT emission standard or a case-by-case 112(g) MACT determination if the source is new or is the result of major modifications and no applicable MACT emission standard has been promulgated. Specific regulations that would apply in the planning area in 2018 include 40 CFR part 63 subpart HH National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities; 40 CFR part 63 subpart HHH, National Emission Standards for Hazardous Air Pollutants from Natural Gas Transmission and Storage Facilities; and 40 CFR Part 63 Subpart ZZZZ, National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines. This last regulation affects source categories using reciprocating engines for gas compression.

## Atmospheric Deposition Constituents

Sulfur and nitrogen compounds that can be deposited on terrestrial and aquatic ecosystems include nitric acid ($HNO_3$), nitrate ($NO_3^-$), ammonium ($NH_4^+$), and sulfate ($SO_4^{--}$). $HNO_3$ and $NO_3^-$ are not emitted directly into the air but form in the atmosphere from industrial and automotive emissions $NO_x$. $SO_4^{--}$ is formed in the atmosphere from industrial emission of $SO_2$. Deposition of $HNO_3$, $NO_3^-$, and $SO_4^{--}$ can adversely affect plant growth, soil chemistry, lichens, aquatic environments, and petroglyphs. $NH_4^+$ is primarily associated with feedlots and agricultural fertilization. Deposition of $NH_4^+$ can affect terrestrial and aquatic vegetation. While deposition may be beneficial as a fertilizer, it can adversely affect the timing of plant growth and dormancy.

## Greenhouse Gas Constituents

Greenhouse gases (GHG) are pollutants that are effective in preventing heat from escaping the earth's atmosphere and have been attributed to altering components of the earth's climate. These include carbon dioxide ($CO_2$), methane ($CH_4$), and nitrous oxide ($N_2O$). Other identified GHGs, including hydroflourocarbons, perflourocarbons, and sulfur hexafluoride were not included in the analysis because

proposed activities are not sources of these pollutants and emissions are expected to be insignificant or zero. Major sources of GHG are from stationary and mobile fossil fuel combustion sources (i.e., transportation, consumption of coal and natural gas).

# P.4 THRESHOLDS OF SIGNIFICANCE

## P.4.1 Criteria Pollutants

The National Ambient Air Quality Standards (NAAQS) are health-based standards for the maximum concentration of air pollutants at all locations to which the public has access. The NAAQS are legally enforceable standards. Concentrations above the NAAQS represent a risk to human health. The EPA has developed standards for each pollutant for a specific averaging time. Short averaging times (1, 8, and 24 hours) address short-term exposure, while the annual standards address long-term exposure. Wyoming has also established its own State standards, the Wyoming Ambient Air Quality Standards (WAAQS).

Chapter 3 of the resource management plan (RMP) and EIS presents the National Primary Air Quality Standards (NAAQS) and the Wyoming Primary Air Quality Standards (WAAQS). Analyses of proposed alternatives for project-specific EISs compare cumulative concentrations of air pollutants to the NAAQS and WAAQS. The Bureau of Land Management (BLM) requires that all authorized activities comply with applicable local, state, tribal, and federal air quality laws, regulations, and standards. Analyses of proposed alternatives for project-specific EISs compare cumulative concentrations of air pollutants to the NAAQS and WAAQS. The BLM requires that all authorized activities comply with applicable local, state, tribal, and federal air quality laws, regulations, and standards.

## P.4.2 Prevention of Significant Deterioration

The goal of the Prevention of Significant Deterioration (PSD) program is to ensure that air quality in areas with clean air does not significantly deteriorate while maintaining a margin for future industrial growth. Under the PSD program, each area in the United States is classified by the air quality in that region according to the following system:

- PSD Class I Areas: Congressional mandated PSD Class I Areas with pristine air quality, such as wilderness areas, national parks, and some Native American reservations, are accorded the strictest protection. Only very small incremental increases in concentration are allowed in order to maintain the air quality in these areas.
- PSD Class II Areas: Essentially all areas that are not designated Class I are designated Class II. Moderate incremental increases in concentration are allowed, although the concentrations are not allowed to reach the concentrations set by Wyoming and federal standards (i.e., WAAQS and NAAQS).
- PSD Class III Areas: No areas have yet been designated Class III. Concentrations would be allowed to increase up to the WAAQS and NAAQS.

The incremental increases allowed for specific pollutants in Class I and Class II areas can be found in the Wyoming Air Quality Standards and Regulations (Wyoming Department of Environmental Quality [WDEQ] 2016). Comparisons of potential $PM_{10}$, $NO_2$, and $SO_2$ concentrations in NEPA air quality analyses with PSD concentrations are intended only to evaluate a threshold of concern and do not represent a regulatory PSD Increment Consumption analysis. Regulatory PSD Increment Consumption analyses are solely the responsibility of the State of Wyoming, which has been granted primacy (with EPA oversight).

In project-specific EISs, the BLM does not perform a regulatory PSD analysis. The PSD increments are used only as a reference to give the public a better understanding of the level of potential impact.

### Hazardous Air Pollutants

Section 112 of the CAA lists more than 180 chemicals as HAPs. In addition, Sections 112 (d) and 112(g) require regulatory agencies to establish MACT standards for sources that emit HAPs. Any source that emits or has the potential to emit 10 tons per year or more of any HAP or 25 tons per year or more of any combination of HAPs is considered a major source and will require a Title V, Part 70, operating permit review and permit. In addition to MACT standards, EPA has listed (on its Air Toxics Database) Reference Exposure Levels (REL) for many of the HAPs.

## P.4.3 Regional Haze Regulations

Visibility impairment in the form of regional haze obscures the clarity, color, texture, and form of what one sees. Haze-causing pollutants (mostly fine particles) are directly emitted into the atmosphere or are formed when gases emitted into the air form particles as they are carried downwind. Emissions from human-caused and natural sources can be carried great distances, contributing to regional haze. The Wyoming Department of Environmental Quality–Air Quality Division (WDEQ-AQD) submitted its Regional Haze State Implementation Plan (SIP), in accordance with 40 CFR Part 51.308 and Part 57.309, in January 2011 and approved by EPA March 2014.

Visual range, one of several ways to express visibility, is the greatest distance at which a person can distinguish a dark landscape feature from a light background like the sky. Without human-caused visibility impairment, natural visual range is estimated to average about 110–115 miles in the western United States and 60–80 miles in the eastern United States (Malm 1999). Visibility can also be expressed in terms of deciview (dv), a measure for describing perceived changes in visibility. One dv is defined as a change in visibility that is just perceptible to an average person.

The Regional Haze Regulations were developed by the EPA in response to the CAA Amendments of 1977 and 1990. They are intended to maintain visibility on the least impaired days and improve visibility on the most impaired days in mandatory Federal Class I areas across the United States, so that visibility in these areas is returned to natural conditions by 2064. These regulations require states to submit a regional haze SIP and progress reports to demonstrate reasonable progress toward the 2064 goal.

## P.4.4 Applicability to the Rock Springs Planning Area

Air pollution impacts are limited by local, state, tribal, and federal air quality regulations, standards, and implementation plans established under the CAA and administered by the WDEQ-AQD with oversight from the EPA. Air quality regulations require proposed new, or modified existing, air pollutant emission stationary sources (including oil and gas compression facilities) to undergo a permitting review before their construction can begin. Therefore, the WDEQ-AQD has the primary authority and responsibility to review permit applications and to require emission permits, fees, and control devices, before construction and/or operation.

Fugitive dust and exhaust from construction activities (road and well pad construction; oil or gas well drilling and completion), along with air pollutants emitted during operation (e.g., well operations, booster [field] and pipeline [sales] compressor engines), are potential causes of air quality impacts. These issues are more likely to generate public concern where natural gas development activities occur near residential areas or near PSD Class I and sensitive Class II areas. As described in Chapter 3, there are seven Class I areas in Wyoming, however there are no Class I areas located within the planning area. The planning area does intersect the 100-kilometer buffer with two Class I areas, see Chapter 3 for detailed information.

The U.S. Forest Service, National Park Service, and the U.S. Fish and Wildlife Service have also expressed concerns regarding potential atmospheric deposition (i.e., acid rain) and visibility impacts within downwind PSD Class I and sensitive Class II areas under their administration throughout Wyoming.

As explained in Chapter 3, the NAAQS and WAAQS are health-based standards for the maximum acceptable concentrations of air pollutants at locations to which the public has access. The analysis of the proposed alternatives must demonstrate continued compliance with all applicable local, state, tribal, and federal air quality standards. Existing air quality throughout the planning area is in compliance with most ambient air quality standards, as demonstrated by the relatively low concentration levels presented in the Analysis of the Management Situation. Currently, portions of Sweetwater County are still in nonattainment for the NAAQS and the WAAQS standards for 2008 Ozone. The U.S. Congress (through the CAA section 116) authorized local, state, and tribal air quality regulatory agencies to establish air pollution control requirements more (but not less) stringent than federal requirements. Also, under both the Federal Land Policy and Management Act (FLPMA) and the CAA, the BLM cannot authorize any activity that would not conform to all applicable local, state, tribal, and federal air quality laws, regulations, standards, and implementation plans.

Given the planning area's current air quality standards attainment status, future development projects that have the potential to emit more than 250 tons per year of any criteria pollutant (or certain listed sources that have the potential to emit more than 100 tons per year) would be required to undergo a site-specific regulatory PSD Increment Consumption analysis under the federal New Source Review permitting regulations. Development projects that require PSD permits may also be required by the applicable air quality regulatory agencies to incorporate additional emission control measures (including a best available control technology analysis and determination) to ensure protection of air quality resources, and to demonstrate that the combined impacts of all PSD sources will not exceed the allowable incremental air quality impacts for $NO_2$, $PM_{10}$, and $SO_2$. Minor sources with emissions below the cutoff rates mentioned above do not require PSD permits; nevertheless, their emissions contribute to increment consumption.

A regulatory PSD Increment Consumption analysis may be conducted as part of a New Source Review, or independently. The determination of PSD increment consumption is a legal responsibility of the applicable air quality regulatory agencies, with EPA oversight. In addition, an analysis of cumulative impacts resulting from all existing sources and the permit applicant's sources is also required during New Source Review to demonstrate that applicable ambient air quality standards will be met during the operational lifetime of the permit applicant's operations.

Sources subject to the PSD permit review procedure are also required to demonstrate potential impacts on AQRV. These include visibility impacts, degradation of mountain lakes from atmospheric deposition (i.e., acid rain), and effects on sensitive flora and fauna in PSD Class I and Class II areas. The CAA also provides specific visibility protection procedures for the mandatory federal PSD Class I areas designated by the U.S. Congress on August 7, 1977, which included wilderness areas greater than 5,000 acres in size, as well as national parks and national memorial parks greater than 6,000 acres in size as of that date.

## P.5 AIR QUALITY IMPACT ASSESSMENT

As described in Chapter 4, Environmental Consequences (Air Quality), the BLM used a qualitative emission comparison approach this assessment. A qualitative method was selected because of a lack of specific project information on location, types, and magnitude of potential projects. Emissions calculations (see Section P.6, Emission Calculations) were based on the best available engineering data and assumptions, emission inventory procedures, and professional and scientific judgment. However, when specific data or procedures were not available, assumptions were applied (see emission assumptions, Section P.6.1). For any future projects, significance criteria for potential air quality impacts will include local, state, tribal, and federally enforced legal requirements to ensure that air pollutant concentrations remain within specific allowable levels.

It is important to note that before actual development could occur, the applicable air quality regulatory agencies (including the state, tribe, or the EPA) would need to review specific air pollutant emissions preconstruction permit applications that examine potential project-specific air quality impacts. As part of

these permit reviews (depending on source size), the air quality regulatory agencies could require additional quantitative air quality impact analyses or mitigation measures. Thus, before development occurred, additional site-specific air quality analyses may need to be performed to ensure protection of air quality. Federal land managers may require a demonstration that potential impacts from proposed projects would not adversely affect AQRV (including visibility) in sensitive Class I and Class II areas.

# P.6 EMISSION CALCULATIONS

For this analysis, emissions of $PM_{10}$, $PM_{2.5}$, NOx, $SO_2$, CO, VOC, HAPs, and GHG were estimated for a 20-year period starting in 2012, beginning with 2013 as the short year (year 1), 2021 as the mid-year (year 10), and 2031 as the long year (year 20). Emissions were estimated for the four alternatives: Alternative A (Current Management), Alternative B (Emphasizes Conservation), Alternative C (Emphasizes Resource Use), and Alternative D (Emphasizes Less Conservation than Alternative B and Less Use than Alternative C). Emissions of the Proposed RMP were assessed by comparing the proposed actions of the Proposed RMP with those of Alternative A through Alternative D. The BLM's Excel spreadsheet-based emissions calculators were adapted for the analysis to estimate emissions for the planning area. Trona mining emissions were calculated separately using emissions factors and methodology from a Wyoming trona mining permit application (see Section P.6.3 for additional information for trona mining calculations). Emission factors used in the BLM calculators to estimate proposed emissions were obtained from: (1) the EPA NONROAD2008a Emissions Model, (2) EPA's AP-42 Guidance, and (3) EPA MOVES 2010a for mobile emissions factor model for non-road motor vehicles. Information regarding equipment types, numbers, activity, etc., for the various emission categories/activities was provided by specialists in the BLM Rock Springs Field Office.

When reviewing the resulting emissions inventory shown in Section P.6.4, it is important to understand that assumptions were made regarding development. For example, there is uncertainty regarding ultimate development of energy resources (e.g., number of wells, equipment used, specific locations of wells, etc.). In general, the assumptions that were made would tend to result in a conservatively high estimate of emissions. For instance, given the number of sources included in this analysis, the likelihood that all emission sources would actually operate at their reasonable, foreseeable maximum emission rates over an entire year (or even 24 hours) is small. A summary of total emissions for each pollutant species from all BLM activities is presented in Chapter 4, in the Air Quality Section. Detailed emission totals for each alternative/planning year are presented in Table P-3 through Table P-15.

## P.6.1 Emission Development Assumptions

For the qualitative emission comparison approach, the following assumptions were used:

- All emission sources are assumed to operate at their reasonably foreseeable maximum emission rates (as identified in the other resource sections of this document) simultaneously throughout the area. Given the number of sources included in this analysis, the co-probability of such a scenario actually occurring over an entire year (or even 24 hours) is small.
- In developing the emissions inventory, there is uncertainty regarding ultimate development (i.e., number of wells, equipment to be used, specific locations, etc.). Only 75% of the proposed oil and gas wells were assumed to be fully operational and remain operating, with normal well closures throughout the area at a rate of 12 wells per year. For coalbed natural gas (CBNG) wells, it was assumed that 80% of the wells drilled annually are fully operational and remain operating, with normal well closures throughout the area at a rate of one well per year. The BLM field office provided the well numbers used in this analysis.
- Mitigation measures are included in the emissions inventory that may not be achievable in all circumstances. However, actual mitigation decided upon by the developers and local and state authorities may be greater or lesser than those assumed in the analysis. For example, maintaining

a construction road speed limit of 15 miles per hour (mph) may be reasonable in a construction zone but difficult to enforce elsewhere. Full (100%) mitigation of fugitive dust from disturbed lands may not be achievable. Further, 50% reduction in fugitive emissions is assumed based on construction road wetting on the unimproved access road to the pad and at the pad, but this level of effectiveness is characterized as the maximum possible. Wetting of haul roads was assumed for maintenance traffic.

- Induced or secondary growth related to increases in vehicle miles traveled (VMT) is not included in the emissions inventory. Only activities directly related to BLM actions are considered. (An example of 'secondary' development is where an increase of workers causes an increase of more people to support them, such as shopping centers. Growth of air emissions would occur to secondary activities, such as workers traveling to the store or to recreational activities.)

The major assumptions used in developing the emissions calculations are:

- EPA-recommended emission factors (i.e., *AP-42*) are appropriate for all activities.
- Activity factors (or the quantification of activity for each resource program as provided by the Rock Springs Field Office) are appropriate for the short year (year 1) and all future time frames. Activity factors, such as production wells, and well abandonment, are taken into account for each year. The rates of well closures and successful wells (i.e. producing wells) remains constant throughout each year (see the second bullet for details).
- For the qualitative analysis, only emissions from Rock Springs Field Office BLM-administered activities are included.
- For the cumulative impacts analysis, emissions calculated for oil and gas taking place within the Rock Springs Field Office (including for federal and non-federal actions), statewide, and county emissions are included. Statewide and county emissions were obtained from the most recent National Emissions Inventory from 2014.

Emissions were calculated for the following activities: oil development and production, natural gas development and production, CBNG development and production, coal mining, trona mining, sand and gravel mining, BLM travel, lands and realty actions, trails and roads, livestock grazing, vegetation management, and fire management.

A qualitative emission comparison approach was selected for this RMP air quality analysis. This approach was used because: (1) the uncertainty of the data and future demand for fluid and solid minerals development impacting the accuracy of the estimated emissions and (2) as projects are defined, quantitative analysis will be required. There are limitations associated with this approach. However, given the uncertainties with the number, nature, and specific location of future sources and activities, the emission comparison approach is defensible and provides a sound basis to compare alternatives.

It is important to note that before actual development could occur, the applicable air quality regulatory agencies (including the state, Tribal, or EPA) would review specific air pollutant emissions preconstruction permit applications that examine potential project-specific air quality impacts. As part of these permit reviews (depending on source size), the air quality regulatory agencies could require additional air quality impact analyses or mitigation measures. Thus, before development occurs, additional site-specific air quality analyses would be performed to ensure protection of air quality. Per the FLPMA, the BLM would need to demonstrate that potential impacts from proposed projects will not adversely affect AQRVs (including visibility) in PSD Class I and sensitive Class II areas.

## P.6.2 Emissions Estimation Criteria

Emissions from BLM-associated activities were calculated based on data provided by the Rock Springs Field Office and best available information, AP-42, and the emission analysis results from previous BLM studies. The BLM used the BLM calculators to estimate emissions from the proposed scenarios. Because oil and gas field activities comprise many phases (i.e., exploration, development, production, and closure), the components that need to be included in emission calculations are complex. The text below provides details on the emissions estimated from the various sources analyzed as part of this RMP.

Estimated emissions from oil, gas, and CBNG wells include the following:

- Fugitive dust, combustive, and GHG emissions from well pad construction activities
- Fugitive dust, combustive, and GHG emissions from road traffic
- Fugitive dust, combustive, and GHG emissions from construction and drilling support vehicles
- Combustive emissions from natural gas-fired compressors (CBNG well only)
- Fugitive dust, combustive, and GHG emissions from separators, dehydrators, and water-tank heater operations
- Fugitive dust, combustive, and GHG emissions from compressor station visits
- Fugitive dust, combustive, and GHG emissions from well workover operations
- Fugitive dust, combustive, and GHG emissions from well and pipeline visits for inspection and repair
- HAPs and VOC emissions from tank condensate, venting (for natural gas wells only) and truck loadout (for natural gas wells only)
- Fugitive dust, combustive, and GHG emissions from road-maintenance activities
- Fugitive dust, combustive, and GHG emissions from road and well reclamation activities
- VOC and GHG from wellhead fugitives and venting.

Estimated emissions from coal mining include the following:

- Fugitive dust, combustive, and GHG emissions from extraction and processing activities, road traffic, and reclamation activities.

Estimated emissions from sand and gravel mining include the following:

- Fugitive dust, combustive, and GHG emissions from extraction and processing activities, road traffic, and reclamation activities.

Estimated emissions from BLM trails and roads include the following:

- Fugitive dust, combustive, and GHG emissions from road traffic
- Fugitive dust, combustive, and GHG emissions from maintenance activities (trails and travel only).

Estimated emissions from fire management include the following:

- Fugitive dust and smoke from fires
- Fugitive dust, combustive, and GHG emissions from road traffic and heavy equipment operations.

Estimated emissions from vegetation management and rights-of-way (ROW) include the following:

- Fugitive dust, combustive, and GHG emissions from road traffic and heavy equipment operations.

Estimated emissions from livestock grazing include the following:

- Fugitive dust, combustive, and GHG emissions from road traffic and heavy equipment operations
- Methane emissions from enteric fermentation and manure management operations.

Summaries of emission inventories for each of the BLM activities for the short-year (year 1), mid-year (year 10), and long-year (year 20) scenarios are provided in Section P.6.4 for all of the alternatives. These emissions were calculated from data provided by the Rock Springs Field Office and used the best available information, AP-42, and the emission studies from other BLM documents.

The assumed numbers of oil and gas wells are provided by the Rock Springs Field Office and are shown in Table P-2. This table accounts for new wells to be drilled in the planning area.

**Table P-2. Total Producing Wells for BLM and Non-BLM Activities Per Alternative***

| Activity | Scenario | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Alternative A | | Alternative B | | Alternative C | | Alternative D | |
| | Fed | Non-Fed | Fed | Non-Fed | Fed | Non-Fed | Fed | Non-Fed |
| **Short Year (Year 1)** | | | | | | | | |
| Producing Oil Wells | 171 | 76 | 158 | 76 | 172 | 76 | 171 | 76 |
| Producing Natural Gas Wells | 1,539 | 687 | 1,424 | 687 | 1,544 | 688 | 1,538 | 688 |
| Producing CBNG Wells | 33 | 27 | 30 | 27 | 34 | 27 | 33 | 27 |
| **Mid-Year (Year 10)** | | | | | | | | |
| Producing Oil Wells | 316 | 108 | 188 | 108 | 321 | 108 | 314 | 108 |
| Producing Natural Gas Wells | 2,843 | 973 | 1,690 | 972 | 2,886 | 976 | 2,828 | 976 |
| Producing CBNG Wells | 68 | 34 | 42 | 33 | 75 | 36 | 72 | 36 |
| **Long Year (Year 20)** | | | | | | | | |
| Producing Oil Wells | 478 | 144 | 222 | 144 | 488 | 145 | 475 | 145 |
| Producing Natural Gas Wells | 4,304 | 1,294 | 1,997 | 1,293 | 4,390 | 1,302 | 4,273 | 1,302 |
| Producing CBNG Wells | 100 | 59 | 49 | 58 | 114 | 64 | 107 | 64 |

*As per the RFD it is assumed that 75% of all new oil and gas wells drilled and 80% of all CBNG wells drilled become producing.

Estimated emissions from oil and gas development for all alternatives were calculated using a reasonably foreseeable development rate based on historical development rates for federal wells within the planning area over the last 20 years. Estimated emissions from oil and gas activities were based on a rate of 75% of all new oil and gas wells being producing wells. It was also assumed that a rate of 12 oil and gas wells would be abandoned annually.

Estimated emissions from CBNG development for all alternatives were calculated using a reasonably foreseeable development rate based on historical development rates for federal wells within the planning area over the last 20 years. Estimated emissions from CBNG activities were based on a rate of 80% of all new oil and gas wells being producing wells. It was also assumed that a rate of one CBNG well would be abandoned annually.

## P.6.3 Trona Mining Emissions Estimation

The BLM calculators do not account for trona mining; therefore, the BLM developed a separate calculator to estimate trona mining emissions. The BLM based the trona mine emissions calculator on a permit application analysis prepared by the WDEQ-AQD for the Ciner Wyoming, LLC, Big Island Mine and Refinery. The BLM used this analysis to develop emission factors based on tons of trona produced per year. The Ciner facility emissions estimate included soda ash dryers, coolers, and calciner; vents for the mines and processing equipment; heavy machinery used around the facility; and both gasoline and diesel industrial engines. The BLM included these sources in its trona mining emissions calculator.

The BLM also accounted for employee commute emissions and the transfer of trona off-site via train to two locations outside of Wyoming. For consistency, the BLM used the same emission factors for employee commuting emissions and emissions from the transfer of trona by locomotive that were used for the BLM calculators. The BLM calculator emission factors were obtained from (1) the EPA NONROAD2008a Emissions Model, (2) EPA's AP-42 Guidance, and (3) EPA Emission Factors for Locomotives. The BLM used the Union Pacific Website to obtain information on fuel consumed (ton-miles/gallon) during trona shipping using the locomotives.

The 2012 Soil Mineral Occurrence and Development Potential Report for the Rock Springs Field Office (BLM 2012) was used to calculate the trona numbers. The numbers are as follows:

- The total annual tons of trona produced in the Rock Springs planning area is 2,641,105 tons/year.
  - The 2012 Mineral Potential Report states the total amount mined in year 2010 was 16,506,904 tons. The 16.5-million-ton estimate is for all production from the Green River Basin (KSLA). For estimating the emissions from activity on BLM managed lands, the checkerboard land ownership pattern is factored in. Therefore, the factor would be 3,653,566 mineral estate acres per 5,700,195 total acres or 64.1% (BLM, 2012). This factor is multiplied by 25% to account for the checkerboard land ownership, resulting in BLM trona emission equaling 16% (2,641,105 tons/year) of the total KSLA mined material.
- The total number of commuting employees in the Rock Springs planning area is 716.
  - The number of employees was calculated in the same manner as tons mined per year. The number of employee commuters is based on 33% (716) of the total workers in the KSLA (2,151 employees), as identified in the Mineral Potential Report for the Rock Springs Field Office.

## P.6.4 Summary of the Rock Springs Planning Area BLM Emissions for All Activities

Table P-3 through Table P-14 summarize the projected total annual emissions by alternative from the short-year (year 1), mid-year (year 10), and long-year (year 20) and Table P-15 summarizes the projected total annual emissions for trona mining for all alternatives.

Air quality impacts would primarily result from minerals development and production and oil and natural gas development activities; emissions associated with these actions would outweigh those produced from other proposed activities.

The alternatives were compared to each other and the results show that Alternative B would result in the lowest levels of emissions in the short year (year 1), mid-year (year 10), and long year (year 20) for all pollutants, while Alternative C would result in the highest levels of emissions for all years. In general, all emissions are likely to be greatest under Alternative C, followed by Alternative A, Alternative D, and Alternative B, respectively. However, since Alternative D has a higher RFD prediction for CBNG wells than Alternative A, the Mid- and Long-Year emissions exceed that of Alternative A. Specifically, for the

Mid-Year, PM10, PM2.5, VOC, and CH4 Alternative D has the second highest emissions, while all other pollutants were second highest for Alternative A. For the Long-Year, PM10, PM2.5 Alternative D has the second highest emissions, while all other pollutants were second highest for Alternative A. This is due primarily to the higher RFD rate predicted for fluid and solid mineral activities for Alternatives A over D with exception of CBNG Wells, where Alternative D is higher. As stated previously, emissions of the Proposed RMP were assessed by comparing the proposed actions of the Proposed RMP with those of Alternative A through Alternative D.

For each alternative, Figure P-5, Figure P-6, and Figure P-7 present a visual summary of the regulated pollutant emissions for short-year (year 1), mid-year (year 10), and long-year (year 20), respectively. Figure P-8, Figure P-9, and Figure P-10 present a visual summary of the GHG pollutant emissions for short-year (year 1), mid-year (year 10), and long-year (year 20), respectively.

**Figure P-5. Emissions Estimates for Short Year from BLM Activities in the Rock Springs Planning Area - Criteria Pollutants**

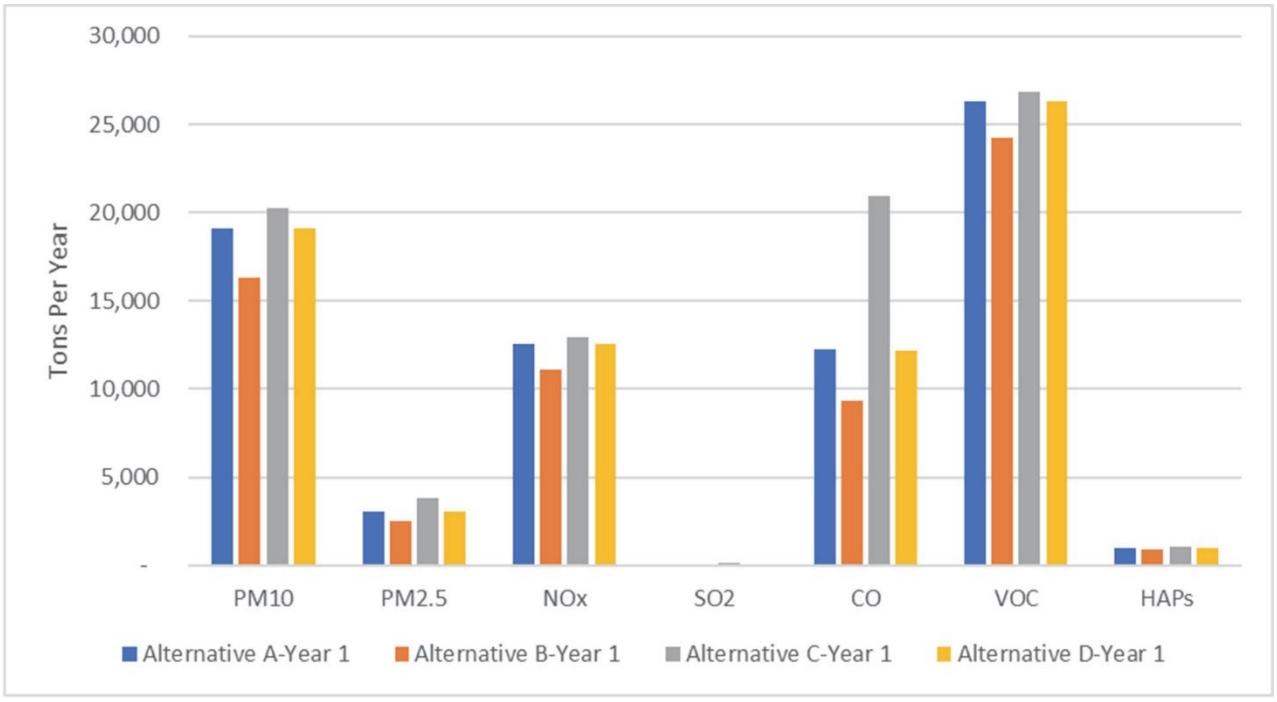


**Figure P-6. Emissions Estimates for Mid-Year from BLM Activities in the Rock Springs Planning Area - Criteria Pollutants**

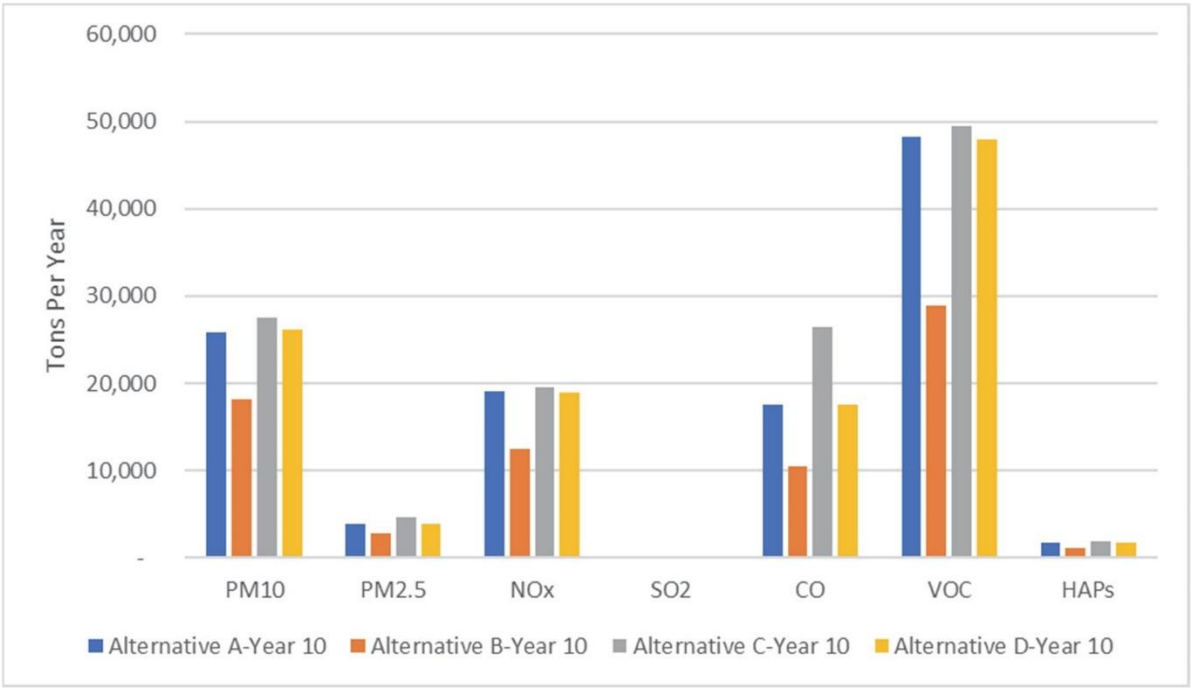

**Figure P-7. Emissions Estimates for Long Year from BLM Activities in the Rock Springs Planning Area - Criteria Pollutants**

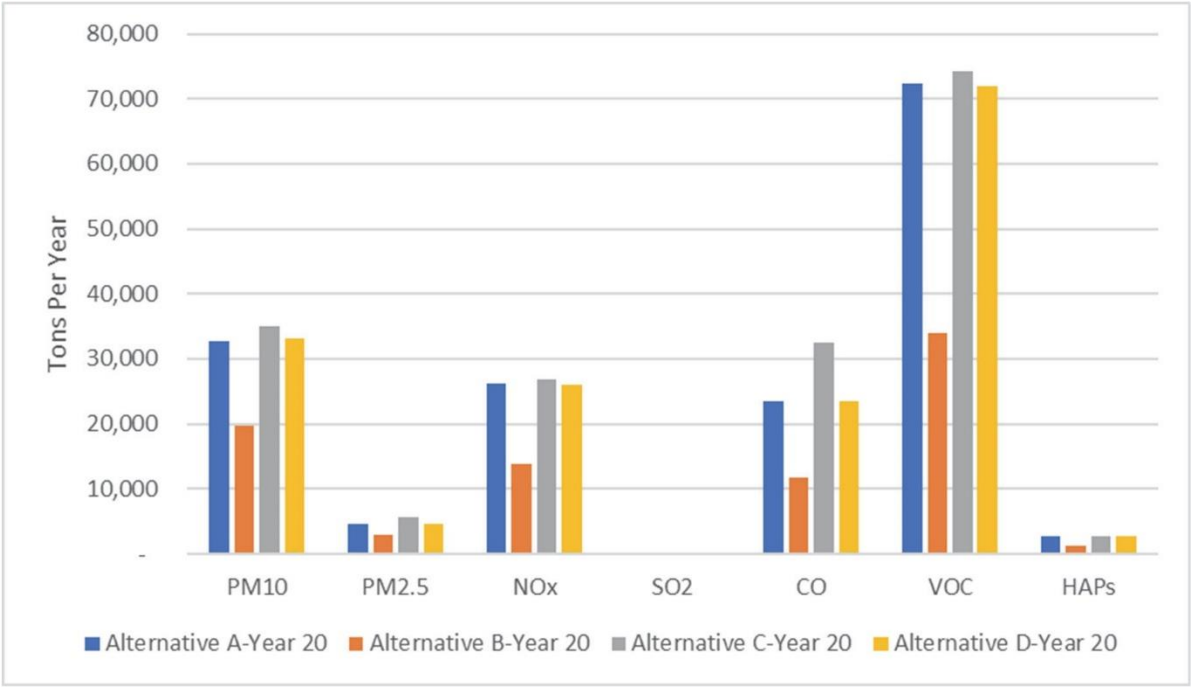

**Figure P-8. Emissions Estimates for Short Year from BLM Activities in the Rock Springs Planning Area – GHG**

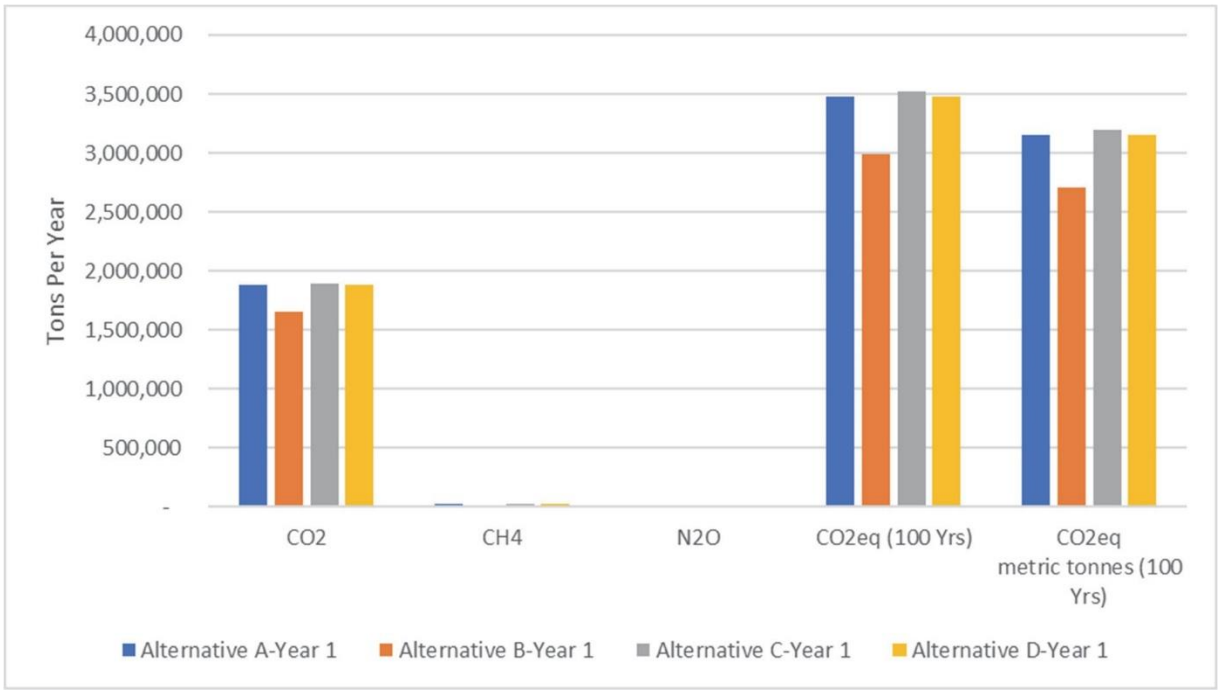

**Figure P-9. Emissions Estimates for Mid-Year from BLM Activities in the Rock Springs Planning Area – GHG**

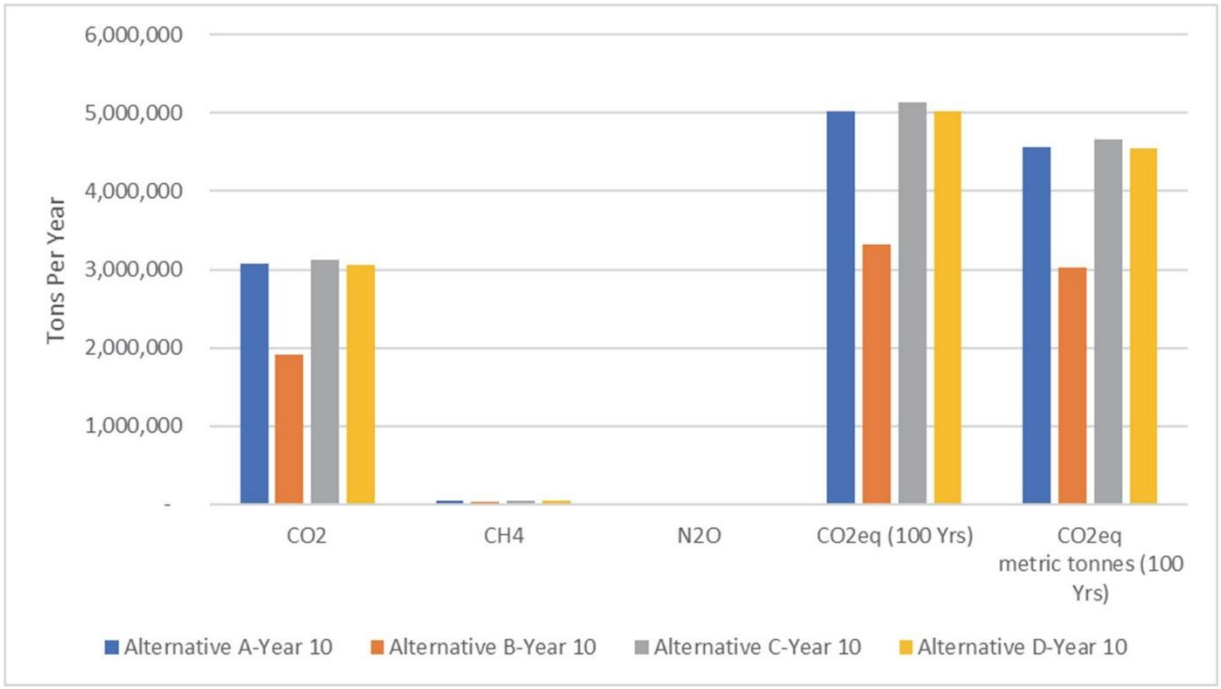

**Figure P-10. Emissions Estimates for Long Year from BLM Activities in the Rock Springs Planning Area – GHG**

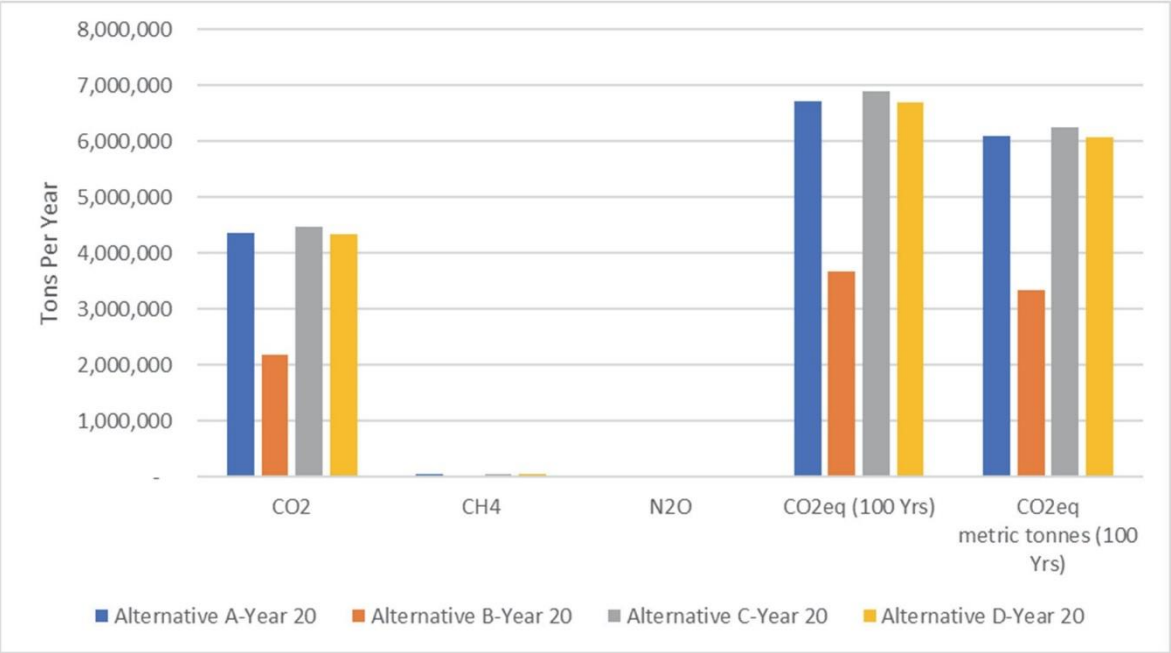

Table P-16 through Table P-28 summarize the inputs used to obtain annual emissions. Additional detail on specific inputs can be found in the BLM Excel calculation documents.

Table P-29 and Table P-30 summarize the data used to develop the GHG emissions and cumulative impacts.

## Table P-3. Alternative A—Short-Year Air Emissions Summary, Total Annual Emissions, All Project Resources (Tons)

| Activity | Criteria Pollutants | | | | | Organics | | Greenhouse Gases | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | $PM_{10}$ | $PM_{2.5}$ | $NO_x$ | $SO_2$ | CO | VOC | HAPs | $CO_2$ | $CH_4$ | $N_2O$ | $CO_{2eq}$ | $CO_{2eq}$ metric tonnes |

## Table P-15. Trona Mining Activities, Annual Emissions Summary (Tons)

| Activity | Criteria Pollutants | | | | | Organics | | Greenhouse Gases | |
|---|---|---|---|---|---|---|---|---|---|
| | $PM_{10}$ | $PM_{2.5}$ | $NO_x$ | $SO_2$ | CO | VOC | $HAPs_a$ | $CO_{2eq}$ tons | $CO_{2eq}$ metric tonnes |
| Mobile Source Emissions | 50 | 50** | 1,047 | 1 | 462 | 84 | 8 | 94,646 | 85,870 |
| Trona Mine Operation Activities | 664 | 455 | 466 | 4 | 1,666 | 415 | 41 | 850,045 | 771,148 |
| **Total** | **713** | **505** | **1,513** | **5** | **2,129** | **499** | **50** | **944,701** | **857,018** |

[a] HAPs = Hazardous Air Pollutants; assumed = VOCs * <1.1

**$PM_{2.5}$ was calculated at the same emissions rate as $PM_{10}$ for Locomotives to have consistency with the BLM's Excel spreadsheet-based emissions calculators. Typically, $PM_{2.5}$ would be a percentage of $PM_{10}$.

## Table P-16. General Overall Inputs for Oil Production – Alternative A

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Maximum Number of Wells Drilled Annually - Federal | 23.0 | 23.0 | 23.0 |
| Maximum Number of Wells Drilled Annually - Non-Federal | 5.0 | 5.0 | 5.0 |
| Average Number of Wells per Well Pad - Federal | 1.0 | 1.0 | 1.0 |

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Average Number of Wells per Well Pad - Non-Federal | 1.0 | 1.0 | 1.0 |
| Maximum Number of Wells Producing Annually - Federal | 171.0 | 316.0 | 478.0 |
| Maximum Number of Wells Producing Annually - Non-Federal | 76.0 | 108.0 | 144.0 |
| Average Number of Field Compressor Stations Developed Annually - Federal | 2.0 | 2.0 | 2.0 |
| Average Number of Field Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Sales Compressor Stations Developed Annually - Federal | 0.0 | 0.0 | 0.0 |
| Average Number of Sales Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Barrels of Oil Production per Well per Day - Federal | 16 | 44.0 | 44.0 |
| Average Barrels of Oil Production per Well per Day - Non-Federal | 16 | 44.0 | 44.0 |
| Average Gas Production per Well per Day -Federal (thousand standard cubic feet [MSCF]/day) | 8.0 | 22.0 | 22.0 |
| Average Gas Production per Well per Day - Non-Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |

## Table P-17. General Overall Inputs for Oil Production – Alternative B

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Maximum Number of Wells Drilled Annually - Federal | 6.0 | 6.0 | 6.0 |
| Maximum Number of Wells Drilled Annually - Non-Federal | 5.0 | 5.0 | 5.0 |
| Average Number of Wells per Well Pad - Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Wells per Well Pad - Non-Federal | 1.0 | 1.0 | 1.0 |
| Maximum Number of Wells Producing Annually - Federal | 158.0 | 188.0 | 222.0 |
| Maximum Number of Wells Producing Annually - Non-Federal | 76.0 | 108.0 | 144.0 |
| Average Number of Field Compressor Stations Developed Annually - Federal | 2.0 | 2.0 | 2.0 |
| Average Number of Field Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Sales Compressor Stations Developed Annually - Federal | 0.0 | 0.0 | 0.0 |
| Average Number of Sales Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Barrels of Oil Production per Well per Day - Federal | 16 | 44.0 | 44.0 |
| Average Barrels of Oil Production per Well per Day - Non-Federal | 16 | 44.0 | 44.0 |
| Average Gas Production per Well per Day -Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |
| Average Gas Production per Well per Day - Non-Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |

## Table P-18. General Overall Inputs for Oil Production – Alternative C

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Maximum Number of Wells Drilled Annually - Federal | 24.0 | 24.0 | 24.0 |
| Maximum Number of Wells Drilled Annually - Non-Federal | 5.0 | 5.0 | 5.0 |
| Average Number of Wells per Well Pad - Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Wells per Well Pad - Non-Federal | 1.0 | 1.0 | 1.0 |
| Maximum Number of Wells Producing Annually - Federal | 172.0 | 321.0 | 488.0 |
| Maximum Number of Wells Producing Annually - Non-Federal | 76.0 | 108.0 | 145.0 |
| Average Number of Field Compressor Stations Developed Annually - Federal | 2.0 | 2.0 | 2.0 |
| Average Number of Field Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Sales Compressor Stations Developed Annually - Federal | 0.0 | 0.0 | 0.0 |
| Average Number of Sales Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Barrels of Oil Production per Well per Day - Federal | 16 | 44.0 | 44.0 |
| Average Barrels of Oil Production per Well per Day - Non-Federal | 16 | 44.0 | 44.0 |
| Average Gas Production per Well per Day -Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |
| Average Gas Production per Well per Day - Non-Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |

## Table P-19. General Overall Inputs for Oil Production – Alternative D

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Maximum Number of Wells Drilled Annually - Federal | 23.0 | 23.0 | 23.0 |
| Maximum Number of Wells Drilled Annually - Non-Federal | 5.0 | 5.0 | 5.0 |
| Average Number of Wells per Well Pad - Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Wells per Well Pad - Non-Federal | 1.0 | 1.0 | 1.0 |
| Maximum Number of Wells Producing Annually - Federal | 171.0 | 314.0 | 475.0 |
| Maximum Number of Wells Producing Annually - Non-Federal | 76.0 | 108.0 | 145.0 |
| Average Number of Field Compressor Stations Developed Annually - Federal | 2.0 | 2.0 | 2.0 |
| Average Number of Field Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Sales Compressor Stations Developed Annually - Federal | 0.0 | 0.0 | 0.0 |
| Average Number of Sales Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Average Barrels of Oil Production per Well per Day - Federal | 16 | 44.0 | 44.0 |
| Average Barrels of Oil Production per Well per Day - Non-Federal | 16 | 44.0 | 44.0 |
| Average Gas Production per Well per Day -Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |
| Average Gas Production per Well per Day - Non-Federal (MSCF/day) | 8.0 | 22.0 | 22.0 |

## Table P-20. General Overall Inputs for Natural Gas Production – Alternative A

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|
| Maximum Number of Wells Drilled Annually - Federal | 209.0 | 209.0 | 209.0 |
| Maximum Number of Wells Drilled Annually - Non-Federal | 49.0 | 49.0 | 49.0 |
| Average Number of Wells per Well Pad - Federal | 2.0 | 3.0 | 3.0 |
| Average Number of Wells per Well Pad - Non-Federal | 2.0 | 3.0 | 3.0 |
| Maximum Number of Wells Producing Annually - Federal | 1,539.0 | 2,843.0 | 4,304.0 |
| Maximum Number of Wells Producing Annually - Non-Federal | 687.0 | 973.0 | 1,294.0 |
| Average Number of Field Compressor Stations Developed Annually - Federal | 7.0 | 7.0 | 7.0 |
| Average Number of Field Compressor Stations Developed Annually - Non-Federal | 2.0 | 2.0 | 2.0 |
| Average Number of Sales Compressor Stations Developed Annually - Federal | 1.0 | 1.0 | 1.0 |
| Average Number of Sales Compressor Stations Developed Annually - Non-Federal | 1.0 | 1.0 | 1.0 |
| Average Gas Production per Well per Day - Federal (MSCF/day) | 74.0 | 198.0 | 198.0 |
| Average Gas Production per Well per Day - Non-Federal (MSCF/day) | 74.0 | 198.0 | 198.0 |

## Table P-21. General Overall Inputs for Natural Gas Production – Alternative B

| -- | Short Year (Year 1) | Mid-Year (Year 10) | Long Year (Year 20) |
|---|---|---|---|

# APPENDIX Q—AIR QUALITY ADAPTIVE MANAGEMENT STRATEGY

## Q.1 PURPOSE

The Rock Springs Field Office Air Quality Adaptive Management Strategy (AQAMS) is intended to present the processes, procedures, and actions that support adaptive management principles for the protection of air resources and atmospheric values within the Rock Springs planning area. This AQAMS describes air resources management and outlines specific requirements for proponents of projects that have the potential to generate air emissions and impact air resources.

### Q.1.1 Nexus with the Resource Management Plan

The basis for development and inclusion of this AQAMS is supported by the specific goals and objectives outlined in Chapter 2 of the Rock Springs Resource Management Plan (RMP), specifically:

- **Management Goal PR 01:** Minimize the impact of management actions in the Planning Area on air quality by complying with all applicable air quality laws, rules, and regulations.
- **Management Goal PR 02:** Improve air quality in the Planning Area as practicable.
- **Management Objective PR 1-1:** Maintain concentrations of criteria pollutants in compliance with applicable state and federal Ambient Air Quality Standards within the scope of the Bureau of Land Management's (BLM) authority.
- **Management Objective 1-2:** Maintain concentrations of prevention of significant deterioration (PSD) pollutants associated with management actions in compliance with the applicable increment.
- **Management Objective 2.1:** Reduce visibility-impairing pollutants in accordance with the reasonable progress goals and time-frames established within the State of Wyoming's Regional Haze State Implementation Plan.
- **Management Objective 2.2:** Reduce atmospheric deposition pollutants to levels below generally accepted levels of concern and levels of acceptable change.

### Q.1.2 Characterization of Air Resources within the Rock Springs Planning Area

The air analysis included in the Rock Springs RMP identifies potential air resource impacts that could be affected by future BLM-authorized activities. An air emissions inventory was compiled for the planning area to determine the relative magnitude of air pollutant emissions associated with BLM actions and to compare emissions between alternatives. This emissions inventory is summarized in the Chapter 4, Air Quality section in the RMP/Environmental Impact Statement (EIS). Additional detail including methods and assumptions used in compiling the emissions inventory, are presented in the *Technical Support Document for Air Quality* (Appendix P). Emissions were calculated using assumptions about the likelihood of potential future activities occurring under each alternative. As a result, the compiled air emissions inventory represents a comparison of emissions of air pollutants based on best available information for future development projections. The emissions inventory is valuable for contrasting the impact of land use allocations on air resources among alternatives and useful for identifying activities that are likely to be major contributors of emissions. This AQAMS includes strategies that could be implemented by the BLM to address the following identified air quality issues:

- Air pollutant emissions – BLM-authorized activities within the planning area have the potential to emit criteria air pollutants, hazardous air pollutants (HAP), or greenhouse gases (GHG). Emissions of some pollutants may be emitted in quantities that could result in adverse impacts to air quality. Of the BLM authorized activities analyzed in the RMP, oil and gas development activities were shown to have the largest potential for increases in these pollutants.
- Ozone nonattainment – portions of the planning area are located within the Upper Green River Basin (UGRB) ozone (2008 standard) nonattainment area. BLM authorized activities, such as oil and gas and other mineral development, have the potential to emit ozone precursor emissions and may adversely impact ozone concentrations in the region. The BLM must comply with General Conformity requirements within the ozone nonattainment area.
- Visibility and atmospheric deposition – the planning area is surrounded by several Class 1 areas including Bridger, Fitzpatrick, and Mt. Zirkel Wilderness Areas. Emissions of nitrates, sulfates, and particulate matter from potential future oil and gas and other mineral development activities could cause decreases in scenic visual quality as well as changes to aquatic and soil chemistry, toxic effects in freshwater biota, and changes in plant community composition.

# Q.2 GENERAL CONDITIONS

## Q.2.1 BLM Responsibilities under the Federal Land Policy and Management Act, the Mineral Leasing Act, and the National Environmental Policy Act

Under the Federal Land Policy and Management Act (FLPMA), the BLM is required to manage public lands in a manner that will protect the quality of air and atmospheric values [FLPMA Sec. 102(a)(8)]. The FLPMA also provides that the public lands be managed in a manner which recognizes the Nation's need for domestic sources of minerals, food, timber, and fiber from the public lands and includes provisions for implementing the Mining and Minerals Policy Act of 1970 [FLPMA Sec. 102(a)(12)]. Further, the FLPMA provides that "In the development and revision of land use plans, the Secretary shall provide for compliance with applicable pollution control laws, including State and Federal air, water, noise, or other pollution standards or implementation plans;" [FLPMA Sec. 202(c)(8)]. In addition to its responsibilities under FLPMA, the BLM is required under the Mineral Leasing Act (MLA) to implement the decisions of an RMP in a manner that recognizes valid and existing mineral lease rights. In accordance with the National Environmental Policy Act of 1969 (NEPA), the BLM must take environmental factors into account when considering major federal actions. The BLM uses the NEPA process to analyze potential impacts of proposed actions on air resources and to consider appropriate measures to mitigate adverse impacts.

## Q.2.2 Adaptive Management for Air Resources

Adaptive management incorporates the principles of monitoring current conditions, predicting future impacts, and adapting management strategies to account for changing conditions. Components of this adaptive management strategy include 1) air monitoring; 2) emissions inventorying; 3) regional and project specific modeling; 4) annual analyses of air resources management data and strategies; 5) identification of mitigation measures; and 6) evaluation of the effectiveness of this AQAMS.

## Q.2.3 Review of Strategy Effectiveness

The BLM will periodically conduct a review of relevant air resources management data in order to implement and improve the adaptive management strategy. This review would be triggered by monitored exceedances of a measured National Ambient Air Quality Standards (NAAQS) at any air monitoring station within or adjacent to the planning area or at least every three years. The BLM will use the results of the

review to determine if this AQAMS is meeting the goals and objectives for air resources established in the Rock Springs RMP and if it should be updated or revised. The review may include one or more of the following tasks:

- Evaluation of current air monitoring data and trends from air monitoring sites located within and adjacent to the planning area to determine the status of current air quality conditions including measured concentrations approaching or exceeding any NAAQS or Wyoming Ambient Air Quality Standards (WAAQS) or including measured adverse impacts on air quality related values in Class I areas or sensitive Class II areas (as identified on a case-by-case basis by Wyoming Department of Environmental Quality [WDEQ] or a federal land management or tribal agency)
- Review of BLM authorized federal mineral development projects, or other potentially significant emission-generating projects authorized by the BLM within the planning area and comparison to the level of emissions analyzed in the Rock Springs RMP
- Evaluation of available reasonably foreseeable oil and gas development projections within the planning area for the upcoming three- to five-year period and comparison to the level of predicted future development analyzed in the Rock Springs RMP or other applicable regional or project-specific air impacts analysis
- Review of air quality modeling results from impact analyses conducted by the BLM, WDEQ, or other federal or tribal agencies within the previous 12 months that affect or are affected by BLM-authorized activities within the planning area.

### Q.2.4 Revision of the Air Quality Adaptive Management Strategy

The AQAMS is not a decision document, but rather an implementation strategy to address potential air quality concerns within the Rock Springs planning area. Therefore, the AQAMS may be modified as necessary to comply with changing laws, regulations, BLM policy, or to address new information and changing circumstances. Changes to the goals, objectives, or management actions set forth in the Rock Springs RMP would require maintenance or amendment of the Rock Springs RMP; however, changes to implementation, including modifying this AQAMS, may be made without maintaining or amending the RMP.

## Q.3 OZONE NONATTAINMENT AND GENERAL CONFORMITY

The UGRB was officially designated by the Environmental Protection Agency (EPA) as an ozone nonattainment area with a marginal classification in May 2012. The nonattainment area includes all of Sublette county and portions of Sweetwater and Lincoln counties. Section 176(c)(1) of the Clean Air Act (CAA) and the General Conformity regulations in 40 Code of Federal Regulations (CFR) 93 Subpart B and Chapter 8, Section 3 of the Wyoming Air Quality Standards and Regulations (WAQSR) require any entity of the federal government that authorizes, permits, licenses, conducts, or approves an activity that has the potential to emit the nonattainment pollutant (or precursors) to demonstrate that the action conforms to the applicable State Implementation Plan for achieving and maintaining the NAAQS and WAAQS before the action is otherwise approved.

The process to evaluate a proposed federal action within a nonattainment area involves the General Conformity applicability review and analysis, the General Conformity evaluation and determination process, and the General Conformity Determination. The applicability review process and analysis are required for any federal action (unless it is exempt) that would contribute pollutant emissions within the nonattainment area. A Conformity Determination is required for each nonattainment pollutant (and its precursors) where the total of direct and indirect net annual emissions in a nonattainment or maintenance area would equal or exceed the General Conformity de minimis thresholds. The de minimis thresholds are based on the severity of the nonattainment status. The UGRB was designated as marginal nonattainment

for ozone (2008 standard) by the EPA; thus, the applicable de minimis thresholds for the ozone precursors of nitrogen oxides (NOx) and volatile organic compounds (VOC) are 100 tons per year for any federal action.

The General Conformity regulations under WAQSR Chapter 8 Section 3(c) exempt specific actions from conformity determinations. Exempted activities include: actions where the total of direct and indirect emissions are below the de minimis levels; actions which would result in no emissions increase; routine maintenance, repair, and administrative activities; actions where the emissions are not reasonably foreseeable; the portion of an action that includes major or minor new or modified stationary sources that require a permit under the New Source Review program (WAQSR Chapter 6, Section 2).

# Q.4 INTERAGENCY AIR RESOURCES COLLABORATION

The CAA is the comprehensive federal law that provides for regulation of air emissions from stationary and mobile sources, the protection of public health and welfare through the NAAQS, and protection of visibility in designated Class I areas. The WDEQ has been delegated authority by EPA to implement the CAA within Wyoming. WDEQ has the primary responsibility for protecting air resources, regulating emissions sources, and maintaining air quality standards. The BLM has a responsibility to identify and address air quality issues attributable to our actions and within our authority while upholding our responsibility to manage public lands for multiple use. In addition, other federal, state, and tribal agencies also play an important role in air resource management. Interagency collaboration is key to comprehensive management of air quality, as no single agency has all the necessary tools to solve these complex issues alone. To that end, the BLM will work collaboratively with other agencies involved in the management of air resources to develop a comprehensive strategy to manage and protect air resources within the Rock Springs planning area from BLM authorized projects and activities.

## Q.4.1 Coordination with Wyoming Department of Environmental Quality

Since the late 1990s, the BLM has developed a cooperative working relationship with the WDEQ Air Quality Division (WDEQ-AQD) to address potential air quality and visibility impacts from its planning and authorizing actions through the NEPA process. The BLM and WDEQ staff have fostered a working relationship emphasizing coordination while respecting the State of Wyoming's regulatory authority. The BLM recognizes WDEQ's delegated authority under the CAA and primacy related to air quality issues. The WDEQ-AQD has developed air quality regulations and permitting requirements for the construction and operation of air pollution sources within both attainment and nonattainment areas. Regulations for permitting the construction, operation, and modification of air emissions sources are codified in WAQSR Chapter 6 Permitting Requirements. The WDEQ has also developed guidance on Best Available Control Technology (BACT) specific to the oil and gas industry that can be found in WDEQ's *Oil and Gas Production Facilities Chapter 6, Section 2 Permitting Guidance*, revised May 2016. Regulations pertaining to federal actions within a nonattainment area are codified in WAQSR Chapter 8 Nonattainment Area Regulations.

Before issuing any approval or Record of Decision (ROD) for federal mineral development projects or other proposed actions with the potential to generate significant emissions of regulated air pollutants within the planning area, the BLM will consult with WDEQ on strategies for analyzing and mitigating potential impacts to air quality from the proposed action. The BLM will keep WDEQ apprised of reasonably foreseeable development on public lands that may have the potential to impact air resources. Additionally, the BLM will collaborate with WDEQ on supporting regional air monitoring and modeling efforts.

### Q.4.2 Intermountain West Data Warehouse – Western Air Quality Study

The BLM Wyoming State Office has been an active participant in the Intermountain West Data Warehouse – Western air Quality Study (IWDW-WAQS); previously known as the Three-State Study, since 2010. The IWDW-WAQS provides high-quality tools for understanding and assessing the effects of current and future energy development and associated emissions on air quality in the Rocky Mountain west. The IWDW-WAQS is a cooperative venture between federal land management agencies, including the BLM, U.S. Forest Service (USFS), U.S. Fish and Wildlife Service (USFWS), and the National Park Service (NPS) as well as the EPA and state agencies from Wyoming, Colorado, Utah, and New Mexico. As part of this project, the BLM has provided significant funding for air monitoring, regional photochemical grid modeling, and oil and gas basin emissions inventories. As part of its adaptive management response to regional air quality issues within and surrounding the planning area, the BLM is committed to continued participation in the IWDW-WAQS and will continue to provide support for regional analyses, monitoring, and emission inventory development as funding allows. Additional information on the IWDW-WAQS project can be found at the IWDW website: http://views.cira.colostate.edu/TSDW/.

## Q.5 AIR RESOURCE MANAGEMENT

### Q.5.1 Air Analysis for Authorized Emissions Generating Activities

As part of the NEPA process and prior to authorization of any proposed federal mineral development activity or other proposed project with the potential to generate emissions of regulated air pollutants above levels of concern as identified during project scoping, the BLM will conduct an air analysis to determine the magnitude of potential impacts on air quality based on the estimated emissions from the activity being authorized.

The BLM will consider the following analysis criteria to identify pollutants of concern and inform decisions regarding the appropriate level of air analysis to be conducted for oil and gas development activities and may consider these criteria for other activities with the potential to generate emissions of regulated air pollutants:

- magnitude of potential air emissions from the proposed activity
- duration of proposed activity
- proximity to a federally mandated Class I area, sensitive Class II area (as identified on a case-by-case basis by WDEQ or a federal land management or tribal agency), population center, or other sensitive receptor
- location within or adjacent to a non-attainment or maintenance area
- meteorological and geographic conditions
- existing air quality conditions including measured exceedances of NAAQS or WAAQS and measured adverse impacts on air quality related values from BLM authorized projects and activities
- intensity of existing and projected development in the area
- issues identified during project scoping.

### Q.5.2 Emissions Inventory

The BLM may require the proponent of a federal mineral development activity (as proposed in a permit application, plan of development, or other application) to submit an emissions inventory of direct and

indirect emissions associated with the proposed project when determined necessary to complete an analysis in accordance with NEPA. The BLM may request submittal of an emissions inventory for other proposed activities that have the potential to generate emissions of regulated air pollutants based on the analysis criteria included in Q.5.1. When required, any submitted emissions inventory must include estimated emissions of regulated air pollutants from all sources related to the proposed activity, including fugitive emissions, HAPs, and GHG emissions, for each year or distinct phase over the life of the project. The BLM will review the emissions inventory to determine its completeness and accuracy. In many cases, the BLM will accept inventory data reported to other state or federal regulatory agencies. Emission control measures, in addition to regulatory requirements, included in the emissions inventory assumptions and relied upon to determine project impacts, will become Operator Committed Measures if/when the BLM authorizes an activity.

## Q.5.3 Emissions Reduction Strategies

The BLM may request the proponent of a federal mineral development project that has the potential to emit any regulated air pollutants at levels which may cause or contribute to a violation of a Federal or State air quality standard to provide emissions reduction strategies to reduce project related air pollutant emissions including GHGs, HAPs, and fugitive dust. The BLM may request submittal of emissions reduction strategies for other proposed activities that have the potential to generate emissions of regulated air pollutants based on the analysis criteria included in Q.5.1. Project proponents for oil and gas development projects should refer to Table Q-1. Best Management Practices for Oil and Gas Development as a reference for potential emission reduction technologies and strategies. The list is not intended to preclude the use of other effective air pollution control technologies that may be proposed. Details of operator committed measures submitted by the applicant will be included in and enforced as a condition of approval in the BLM-issued authorization.

## Q.5.4 Air Monitoring

The BLM recognizes that ambient air monitoring provides valuable data for determining current and background concentrations of air pollutants, describing long term trends in air pollutant concentrations, and evaluating the effectiveness of air control strategies. The BLM will cooperate with WDEQ to support a comprehensive air monitoring network within the planning area and areas potentially affected by BLM authorized activities within the planning area. The air monitoring network will include the WDEQ Rock Springs SLAMS monitoring station in the city of Rock Springs. The BLM will continue to support its Wyoming Air Resource Monitoring System (WARMS) air monitoring network, contingent upon available funding. Additional information on this network can be found at https://www.blmwarms.net/index.html. The BLM will also work collaboratively with the USFS, NPS, USFWS, or other entities to support the collection of air quality data in an effort to better understand the impacts of atmospheric deposition and visibility impairment within the planning area. This collaboration may be facilitated through interagency partnerships including the Greater Yellowstone Coordinating Committee, Western Regional Air Partnership, and National Atmospheric Deposition Program.

## Q.5.5 Project Specific Air Monitoring

The BLM may require as part of the air analysis (Section Q.5.1) that project proponents provide new and/or existing air monitoring data from a site within, adjacent to, or representative of the proposed development area. The purpose of this air monitoring is to establish baseline air quality conditions prior to development at the site. The requirement for providing air monitoring data will be based on the analysis criteria listed in Section Q.5.1 and the availability or absence of existing representative air monitoring data.

The project proponent will be responsible for funding, siting, installing, operating, and maintaining any air monitoring equipment if monitoring is required in the absence of existing representative air monitoring

data. Project-specific monitoring data may be used by the BLM in subsequent NEPA analyses required for project approvals. Air monitoring data used to inform an authorization decision will be disclosed through the NEPA process. Additionally, the BLM will ensure that ambient air monitoring data collected as a Condition of Approval for any BLM authorized activity will be made publicly available.

## Q.5.6 Modeling

Air dispersion and photochemical grid models are useful tools for predicting project-specific impacts on air quality, predicting the potential effectiveness of control measures and strategies, and forecasting trends in regional concentrations of air pollutants. The BLM will use regional air modeling and project-specific modeling, in conjunction with other air analysis tools, to develop air resource protection strategies consistent with its responsibilities under FLPMA. Further, the BLM will use modeling of projected air emissions to evaluate the direct, indirect, and cumulative impacts of proposed actions as part of an analysis in accordance with NEPA. The BLM will support and participate in regional modeling efforts through multi-state and/or multi-agency organizations, such as the IWDW and the Western Regional Air Partnership. In addition, the BLM will conduct or facilitate regional air modeling as outlined in Section Q.4.2 or other regional study, contingent upon available funding.

## Q.5.7 Project-Specific Modeling

The BLM may require project-specific air quality modeling to analyze potential impacts from a proposed federal mineral development project or other proposed activity that has the potential to emit regulated air pollutants in order to evaluate the effectiveness of any air emission control measures. The BLM will determine the parameters required for a project-specific modeling analysis through the development of a modeling protocol for each analysis. Project proponents may submit results from other modeling analyses that include the proposed action or activities similar to the proposed project for the BLM's review and approval. The decision to require air quality modeling will be based on the analysis criteria listed in Section Q.5.1. The BLM may not require an air modeling analysis when it can be demonstrated that the project will not cause a substantial increase in emissions of the pollutants of concern.

## Q.5.8 Air Resources Mitigation Measures

Many activities the BLM authorizes, permits, or allows, may generate air pollutant emissions that have the potential to adversely impact air quality. The primary mechanism to reduce air quality impacts is to reduce emissions via project design features and mitigation. Appropriate emission reduction measures are best identified and required at the project authorization stage, when the temporal and spatial characteristics and technological specifications of the proposed action have been defined. The project-specific information available at that stage allows for the development of an emissions inventory and impact analysis that can be used to identify effective mitigation options for predicted adverse impacts.

The BLM will ensure implementation of reasonable air emissions control measures, design features, operator committed measures, or mitigation within its regulatory authority if an air quality impact analysis shows that future impacts are predicted to exceed a NAAQS or WAAQS or levels of concern for air quality related values in a Class I area, or if a BLM authorized source caused or contributed to a monitored exceedance of a NAAQS or WAAQS as determined by WDEQ in consultation with the BLM. Control measures would be implemented through appropriate mechanisms as provided for by law and consistent with lease rights and obligations. In the absence of, or in addition to effective control technologies, the BLM may manage the pace, place, density, and intensity of development to meet air quality standards. Project proponents for oil and gas development projects should refer to Table Q-1. Best Management Practices for Oil and Gas Development, as a reference for potential emission reduction technologies and strategies. The list is not intended to preclude the use of other effective air pollution control technologies that may be proposed.

## Q.5.9 Lease Notice for Oil and Gas Development within the Upper Green River Basin Ozone Nonattainment Area

The BLM will attach the following lease notice to all offered lease parcels located within the Rock Springs planning area that lie within the UGRB Ozone (2008 standard) nonattainment area.

> ***Lease Notice:*** *Prior to project-specific approval, additional air resource analyses will be required in order to comply with General Conformity requirements under the Clean Air Act. The lessee/operator will be required to provide a complete emissions inventory, and may be required to provide air monitoring data, and/or modeling results for an analysis of impacts to air quality or air quality related ozone levels. Interagency consultation may be initiated with affected land managers and air quality regulators to determine potential mitigation options for any predicted impacts from the proposed development. The analysis and consultation may result in the imposition of additional project-specific best management practices to minimize emissions of ozone-precursors if the proposed operation would not comply with the General Conformity regulations.*

**Table Q-1. Best Management Practices for Oil and Gas Development**

| Recommended Emission Reduction Measure | Potential Environmental Benefits | Potential Environmental Liabilities |
|---|---|---|
| **Control Strategies for Drilling and Compression** | | |
| Multi-well pad directional or horizontal drilling. | When compared to single pad vertical drilling, reduces construction related emissions, decreases surface disturbance, reduces trip frequencies, and reduces habitat fragmentation. | Could result in higher air impacts in one area with longer sustained drilling times. Depends on geological strata, topography, and other physical constraints. |
| Improved engine technology (Tier 4) for diesel drill rig engines. | Reduced NOx, PM, CO, and VOC emissions. | Dependent on availability of technology from engine manufacturers and, potentially differentials in cost for small operators. |
| Selective Catalytic Reduction (SCR) for drill rig engines and/or compressors. | NOx emissions reduction, potential decreased formation of visibility impairing compounds and ozone. NOx control efficiency of 95% achieved on drill rig engines. NOx emission rate of 0.1 g/hp-hr achieved for compressors. | Potential NH3 emissions and formation of visibility impairing ammonium nitrate.<br>Regeneration/disposal of catalyst can produce hazardous waste. |
| Non-selective catalytic reduction (NSCR) for drill rig engines and/or compressors. | NOx emissions reduction, potential decreased formation of visibility impairing compounds, and ozone. NOx control efficiency of 80-90% achieved for drill rig engines. NOx emission rate of 0.7 g/hp-hr achieved for compressor engines greater than 100 hp. | Regeneration/disposal of catalysts can produce hazardous waste. Not applicable to lean burn or 2-stroke engines. |
| Natural Gas fired drill rig engines. | NOx emissions reduction, potential decreased formation of visibility impairing compounds, and ozone. | May require construction of infrastructure (pipelines and/or gas treatment equipment). May require onsite gas storage. May require additional engines to supplement needed torque. |
| Electrification of drill rig engines and/or compressors. | Decreased emissions at the source. Transfers emissions to more efficiently controlled source (EGU). | Displaces emissions to EGU. May require construction of power lines. |

| Recommended Emission Reduction Measure | Potential Environmental Benefits | Potential Environmental Liabilities |
|---|---|---|
| Improved engine technology (Tier 2, 3 or 4) for all mobile and non-road diesel engines. | Reduced $NO_X$, PM, CO, and VOC emissions. | Dependent on availability of technology from engine manufacturers. |
| Reduced emission (a.k.a. "green") completions. | Reduction in VOC and $CH_4$ emissions. Reduces or eliminates flaring and venting and associated emissions. Reduces or eliminates flowing back into open pits and associated evaporative emissions. Increased recovery of gas to pipeline rather than atmosphere. | May result in temporary increase in truck traffic and associated emissions due to delivery of onsite equipment or due to construction of infrastructure. |
| Flaring of completion emissions. | Reduces methane, VOC, and some HAP emissions. Converts $CH_4$ to $CO_2$. | Some emissions from combustion of flaring gas. |
| Minimize/eliminate venting and/or use closed loop process where possible during "blow downs." | Reduces methane, VOC, and some HAP emissions. | Depends on frequency and pressure. May require onsite equipment. |
| Eliminate evaporation pits for drilling fluids. | Reduces VOC and GHG emissions. Reduces potential for soil and water contamination. Reduces odors and potentially surface disturbance. | May increase truck traffic and associated emissions. Requires tank and/or pipeline infrastructure. |
| Electrification of wellhead compression/ pumping. | Reduces local emissions of fossil fuel combustion and transfers to more easily controlled source. | Displaces emissions to EGU. Depends on availability of power lines. |
| Wind (or other renewable) generated power for compressors. | Low or no emissions. | May require construction of infrastructure. Visual impacts. Potential wildlife impacts. |
| Compressor seals – replace wet with dry or use mechanical seal. | Reduce gas venting (VOC and GHG emissions). | May not be mechanically feasible. May be costly. |
| Compressor rod packing system – use monitoring and replacement system. | Reduce gas leaks (VOC and GHG emissions). | Requires establishing a monitoring system and doing replacements. |
| **Control Strategies Utilizing Centralized Systems** | | |
| Centralization (or consolidation) of gas processing facilities (e.g., separation, dehydration, sweetening). | Reduces vehicle miles traveled (truck traffic) and associated emissions. Reduced VOC and GHG emissions from individual dehydration/ separator units. | Temporary increase in construction associated emissions. Higher potential for pipe leaks. |
| Liquids Gathering systems (for condensate, gas, and produced water). | Reduces vehicle miles traveled and associated emissions. Reduced VOC and GHG emissions from tanks, truck loading/unloading, and multiple production facilities. | Temporary increase in construction associated emissions. Higher potential for pipe leaks. Requires pipeline infrastructure. |
| Water and/or fracturing liquids delivery system. | Reduced long term truck traffic and associated emissions. | Temporary increase in construction associated emissions. Higher potential for pipe leaks. Requires pipeline infrastructure. |
| **Control Strategies for Tanks, Separators, and Dehydrators** | | |
| Eliminate use of open top tanks. | Reduced VOC and GHG emissions. | -- |
| Capture and control of flashing emissions from all storage tanks and separation vessels with vapor recovery and/or thermal combustion units. | Reduces VOC and GHG emissions. | Pressure buildup on older tanks can lead to tank rupture and release. |

| Recommended Emission Reduction Measure | Potential Environmental Benefits | Potential Environmental Liabilities |
|---|---|---|
| Capture and control of produced water, crude oil, and condensate tank emissions. | Reduces VOC and GHG emissions. | -- |
| Capture and control of dehydration equipment emissions with condensers, vapor recovery, and/or thermal combustion. | Reduces VOC, HAP, and GHG emissions. | May create emissions from combustion of gas used for heating. |
| Use zero emissions dehydrators or use desiccants dehydrators. | Reduces VOC, HAP, and GHG emissions. Can be as effective as Triethylene Glycol dehydration. | Requires desiccants (salt tablets). Process results in the formation of a brine solution that must be disposed of. |
| **Control Strategies for Miscellaneous Fugitive VOC Emissions** | | |
| Install plunger lift systems to reduce well blow downs. | Reduces VOC and GHG emissions. Can be more efficient at fluids removal than other methods. | Must have adequate pressure. |
| Install and maintain low VOC emitting seals, valves, hatches on production equipment. | Reduces VOC and GHG emissions. | -- |
| Initiate equipment leak detection and repair program (e.g., including use of forward-looking infrared cameras, grab samples, organic vapor detection devices, and/or visual inspection). | Reduction in VOC and GHG emissions. | -- |
| Install or convert gas operated pneumatic devices to electric, solar, or instrument (or compressed) air driven devices/controllers. | Reduces VOC and GHG emissions. | Electric or compressed air driven operations can displace or increase combustion emissions. |
| Use "low" or "no bleed" gas operated pneumatic devices/controllers. | Reduces VOC and GHG emissions. | -- |
| Use closed loop system or thermal combustion for gas operated pneumatic pump emissions. | Reduces VOC and GHG emissions. | -- |
| Install or convert gas operated pneumatic pumps to electric, solar, or instrument (or compressed) air driven pumps. | Reduces VOC and GHG emissions. | Electric or compressed air driven operations can displace or increase combustion emissions. |
| Install vapor recovery on truck loading/unloading operations at tanks. | Reduces emissions of VOC and GHG emissions. | Pressure build up on older tanks can lead to uncontrolled rupture. |
| **Control Strategies for Fugitive Dust and Vehicle Emissions** | | |
| Unpaved surface treatments including watering, chemical suppressants, and gravel. | 20% - 80% control of fugitive dust (particulates) from vehicle traffic. | Potential impacts to water and vegetation from runoff of suppressants. |
| Use remote telemetry and automation of wellhead equipment. | Reduces vehicle traffic and associated emissions. | Not possible in some terrain or conditions. |
| Speed limit restrictions on unpaved roads. | Reduction of fugitive dust emissions. | -- |

| Recommended Emission Reduction Measure | Potential Environmental Benefits | Potential Environmental Liabilities |
|---|---|---|
| Reduce commuter vehicle trips through car pools, commuter vans or buses, innovative work schedules, or work camps. | Reduced combustion emissions, reduced fugitive dust emissions, reduced ozone formation, reduced impacts to visibility. | -- |
| **Miscellaneous Control Strategies** | | |
| Use of ultra-low sulfur diesel (e.g., in engines, compressors, construction equipment). | Reduces emissions of particulates and sulfates. | Dependent up on availability of ultra-low sulfur diesel. |
| Reduce unnecessary vehicle idling. | Reduced combustion emissions, reduced ozone formation, reduced impacts to visibility, reduced fuel consumption. | -- |
| Reduced pace or phased development. | Peak emissions of all pollutants reduced. | Emissions generated at a lower rate but for a longer period. Life of project, duration of impacts is longer but of a lesser intensity. |

# APPENDIX R—APPROPRIATE MANAGEMENT LEVELS FOR HERD MANAGEMENT AREAS

As part of the process to revise the Rock Springs Resource Management Plan (RMP), the Bureau of Land Management (BLM) Rock Springs Field Office (RSFO) is evaluating the Appropriate Management Level (AML) for the Little Colorado Herd Management Area (HMA). The purpose of this appendix is to demonstrate the analysis of AML for the HMA in the planning area.

AML establishes the number of wild horses to be managed within an HMA. AML is expressed as a population range with an upper and lower limit. The AML upper limit is the number of wild horses which results in a Thriving Natural Ecological Balance (TNEB) and avoids a deterioration of the range. The AML lower limit is normally set at a number that allows the population to grow to the upper limit over a 4- to 5-year period, without any interim gathers to remove excess wild horses.

An evaluation of the AML for the White Mountain HMA in provided in Appendix A of the Proposed Resource Management Plan Amendment and Final Environmental Impact Statement for Wild Horse Management for the BLM Rock Springs and Rawlins Field Offices (https://eplanning.blm.gov/eplanning-ui/project/2009946/510).

## R.1 LITTLE COLORADO

**Table R-1. Wild Horse Management in the Little Colorado HMA**

| -- | Existing Management Alternative A |
|---|---|
| **AML** | 69-100 |
| **Acres within the HMA** | 630,759 |
| **Acres per wild horse at High AML** | 6,307 |
| **Annual AUMs needed to Support Wild Horses at High AML** | 1,200 |

The *Wild Horses and Burros Management Handbook* (H-4700-1) provides an outline of a three-tiered analysis for establishing and adjusting the AML:

- The Tier 1 analysis determines whether the four essential habitat components (forage, water, cover, and space) are present in sufficient amounts to sustain healthy wild horse populations and healthy rangelands over the long-term.
- The Tier 2 analysis determines the amount of sustainable forage available for wild horse use.
- The Tier 3 analysis determines whether or not the projected wild horse herd size is sufficient to maintain genetically diverse wild horse populations (i.e., avoid inbreeding depression).

This document follows this three-tiered analysis approach for assessing AML for the Little Colorado HMA.

## R.1.1 Tier 1 Analysis: Sufficient Forage, Water, Cover and Space

**Table R-2. Summary of the Adequacy of Wild Horse Habitat within the Little Colorado Herd Management Area**

| HMA Name | Forage | | Water | | Cover | | Space | |
|---|---|---|---|---|---|---|---|---|
| | Sufficient | Insufficient | Sufficient | Insufficient | Sufficient | Insufficient | Sufficient | Insufficient |
| Little Colorado | X | -- | X | -- | X | -- | X | -- |

The Little Colorado HMA was established in August 1997, with the approval of the Green River RMP. The AML for the Little Colorado HMA is currently set at a range of 69 to 100 wild horses. This HMA contains approximately 630,759 acres. The Little Colorado HMA consists mostly of BLM and Bureau of Reclamation lands managed by the RSFO. Elevation ranges from 6,250 feet along the Big Sandy River to over 7,489 feet in the Figure Four Canyon area. Summers are hot, and winters can range from mild to bitterly cold. Annual precipitation ranges from less than seven to more than 12 inches per year. About half of the precipitation falls during the growing season from April through June, with the remainder coming in high intensity summer thunderstorms and winter snowfall. Much of the precipitation from summer thunderstorms runs off in numerous drainages. Some of this water is captured in reservoirs or pits. Flowing wells, springs, and creeks are the primary sources of water for wild horses, livestock, and wildlife. The Little Colorado HMA contains approximately 89 wells/reservoirs and approximately 26 miles of stream, providing plenty of water sources for wild horses to utilize distributed throughout the HMA.

The vegetation communities in the Little Colorado HMA are very diverse in this large area, reflecting the diversity in soils, topography, and geology found there. The high-elevation, cold-desert vegetation of the project area is composed predominantly of Wyoming big sagebrush/grass and Gardner saltbush vegetation communities. Other plant communities present include desert shrub, grassland, mountain shrub, juniper woodlands, and a very few aspen woodlands. Needle-and-thread, Indian ricegrass, bluebunch wheatgrass, western wheatgrass, junegrass, basin wildrye, sandhill muhly, Canby and little bluegrass, and threadleaf sedge are the predominant grasses and grass-like species. Wyoming big sagebrush, black sagebrush, bud sage, birdsfoot sage, Gardner's saltbush, spiny hopsage, four-wing saltbush, greasewood, bitterbrush, winterfat, horsebrush, Douglas and rubber rabbitbrush, and true mountain mahogany are important shrub species. Forbs are common and variable depending on the ecological site and precipitation zone.

Wild horses generally prefer perennial grass species as forage when available. Shrubs are more important during the fall and winter, and in drought years. The species of grasses preferred depends on the season of the year. Needle-and-thread and Indian ricegrass are most important during the winter and spring and wheatgrasses during the summer and fall.

Overall, the habitat within the Little Colorado HMA provides adequate forage, water, cover, and space to sustain a viable and healthy wild horse population, while maintaining TNEB.

## R.1.2 Tier 2 Analysis: Sustainable Forage

**Table R-3. Summary of Wild Horse Populations, Utilization and Precipitation from 2008 – 2015**

| Year | Wild Horse Population | Wild Horse Animal Unit Months Utilized | Average % Utilization Monitored | Annual Precipitation (inches) (30-Year Average = 6.45 in) Big Piney |
|---|---|---|---|---|
| 2008 | 69 | 828 | 20% | 5.77 |
| 2009 | 83 | 996 | 18% | 9.0 |
| 2010 | 152 | 1,824 | 25% | 4.78 |
| 2011 | 256 | 3,072 | 20% | 3.67 |
| 2012 | 70 | 840 | 19% | 2.53 |
| 2013 | 88 | 1,056 | 22% | 4.64 |
| 2014 | 104 | 1,248 | 2% | 4.79 |
| 2015 | 259 | 3,108 | 21% | 6.87 |
| Average | 135 | 1,621 | 18% | 5.2 |

The data in Table R-3 provides historical information on wild horses, climate and forage utilization under Existing Management. Data is provided from 2008-2015 as this was the period when utilization monitoring data was available for this area.

Overall, the eight-year evaluation period occurred during a drought. The 30-year average annual precipitation for this area is 6.45 inches. During the eight-year period shown in Table R-3, average precipitation was 5.2 inches, with only two years being above average and six years below average.

Within these climatic conditions, and with an average wild horse population of 135, average utilization levels were at 18% for the assessment period. Utilization standards for this area seek to ensure utilization levels are below 50% in the uplands. It is important to note that utilization levels take into account all potential sources of defoliation such as livestock, wildlife, wild horses, etc.

**Table R-4. Summary of Land Health Standards for Allotments within the Little Colorado Herd Management Area**

| Allotment | Year of Land Health Assessment | Standard 1 Soils | Standard 2 Riparian | Standard 3 Upland Vegetation | Standard 4 Plant and Animal Habitat | Standard 5 Water Quality | Standard 6 Air Quality |
|---|---|---|---|---|---|---|---|
| Big Sandy | 2013 | -- | -- | -- | -- | -- | -- |
| Lombard | 2013 | -- | X | -- | -- | -- | -- |
| Eighteen Mile | 2013 | -- | X | -- | -- | -- | -- |
| Figure Four | 2002 | -- | -- | -- | -- | -- | -- |
| Sublette | 2002 | -- | -- | -- | -- | -- | -- |
| Boundary | 2002 | -- | -- | -- | -- | -- | -- |

"--" indicates the land health standard is being met.
X – Indicates that the land health standard is not being met.

Table R-4 summarizes the results of the most recent land health standards for allotments within the Little Colorado HMA. As shown, the primary concern with land health conditions within the HMA are riparian areas. While wild horses can utilize riparian areas, they have not been identified as a primary causal factor to these riparian areas not meeting land health standards. The main reason that Standard #2 is not being met is due to the dam on the Big Sandy River. The water levels on the Big Sandy River are maintained and the water levels do not fluctuate as needed for woody vegetation to be established and maintained.

At high AML (100 wild horses) in the Little Colorado HMA, there would be approximately 6,307 acres per wild horse and these wild horses would utilize 1,200 AUMs per year. Historic utilization levels show that even when wild horse populations were significantly over their high AML, utilization levels were still substantially below the 50% use objective.

## R.1.3 Tier 3 Analysis: Genetic Diversity

Current genetic diversity is generally good within the Little Colorado HMA, but needs to be monitored closely.

RECOMMENDATIONS: Current variability levels are high enough that no action is needed at this point but the herd should be monitored closely due to the high proportion of rare alleles. This is especially true if it is known that the herd size has seen a recent decline.

The *Wild Horses and Burros Management Handbook* (H-4700-1) states, "To avoid inbreeding depression in wild horse populations, a minimum herd size of 50 effective breeding animals (a total population size of about 150-200 animals) is recommended."

High AML for the Little Colorado HMA is below this recommended level; however, wild horses in this HMA have maintained healthy genetics over the past few decades at this AML. Therefore, it is expected that a high AML of 100 wild horses will continue to maintain adequate genetic diversity.

# APPENDIX S—RECREATION REPORT

## S.1 RECREATION MANAGEMENT

Over the years, definitions of recreation have differed in their particular emphasis but have shared a common core; recreation is a behavior that individuals choose to engage in for the purpose of realizing experiences and personal benefits, such as renewal or refreshment. The individual attains experiences and benefits by participating in preferred recreation activities in preferred recreation settings.

Public lands can provide visitors a wide array of satisfying recreation experiences. The goal of the public land manager is to provide opportunities for visitors to obtain desired experiences and beneficial outcomes while protecting resources. The manager accomplishes this goal by planning for and managing the physical, social, and operational settings and the activities that occur within them.

Recreation resources and uses are allocated through the land use planning process. During land use planning, an interdisciplinary team considers various management scenarios for all resources that are present within a geographic area to achieve management goals and objectives. Some form of recreation use and associated recreation resources are typically present on the lands and waters managed by Bureau of Land Management (BLM) field offices and are consequently allocated through the land use planning process.

In the last several decades, there has been a growing recognition of how much recreation contributes to the quality of life, economy, society, and environment. Changing public values and expectations of land management agencies to meet the demand for diverse recreation uses has created the need for changes in managing recreation and visitor services.

These changes and resulting advances in recreation management knowledge and practices have been responsible for the evolution from activity-based management to experience-based management and, recently, benefits-based management. Each transition built on the management framework of the previous. Within the BLM, benefits-based management has further transitioned to outcomes-focused management.

### S.1.1 Outcome Focused Management

Outcomes-focused management is defined as an approach to recreation management that focuses on the positive outcomes gained from engaging in recreational experiences.

### S.1.2 Recreation Management Area Designation

To help effectively manage recreation and visitor services, the BLM designates recreation management areas (RMA), and the areas are classified as either a special recreation management area (SRMA) or an extensive recreation management area (ERMA). Both types of areas are recognized as producing high-quality recreation opportunities and offering beneficial outcomes for recreation participants, recreation-tourism partners, visitor service providers, and communities. Recreation and visitor service objectives in RMAs are recognized as a primary resource management consideration, and specific management is required to protect the recreation opportunities. The RMA designation is based on recreation demands and issues, recreation setting characteristics, resolving use/user conflicts, compatibility with other resource uses, and resource protection needs. There is no requirement to designate all lands as RMAs.

## Special Recreation Management Areas

A SRMA is an administrative unit where existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness, especially as compared to other areas used for recreation.

### Management Focus

A SRMA is managed to protect and enhance a targeted set of activities, experiences, benefits, and desired recreation setting characteristics. The land use plan may subdivide an SRMA into recreation management zones (RMZ) to further delineate specific recreation opportunities. Within an SRMA, recreation and visitor services management is recognized as the predominant land use plan focus, where specific recreation opportunities and recreation setting characteristics are managed and protected on a long-term basis.

## Extensive Recreation Management Areas

An ERMA is an administrative unit that requires specific management consideration in order to address recreation use, demand, or recreation and visitor services program investments.

### Management Focus

An ERMA is managed to support and sustain principal recreation activities and associated qualities and conditions. Management of ERMAs is commensurate with the management of other resources and resource uses. While generally unnecessary, ERMAs may be subdivided into RMZs to ensure recreation and visitor services are managed commensurate with other resources and resource uses.

The existing Green River Resource Management Plan (RMP) and the Jack Morrow Hills Coordinated Activity Plan identified six special recreation management areas. They are the following:

- Wind River Front
- Green River
- Killpecker Sand Dunes Open Play Area
- Continental Divide National Scenic Trail
- Continental Divide Snow Machine Trail
- Oregon and Mormon Pioneer National Historic Trail.

Additional public scoping identified two additional areas where recreation management for beneficial outcomes may be considered. They are the following:

- Red Creek Badlands
- Little Mountain.

These SRMAs accommodate national visitor demand for destination-oriented recreational opportunities in the Rock Springs Field Office (RSFO). This demand has been identified by onsite customers and community involvement. These areas contain a high diversity of vegetation, wildlife, scenic, historic, and cultural resources providing additional opportunities for outdoor recreation. SRMA management will sustain and enhance these resources as well as accommodate visitor demand. Special Recreation Permits will be allowed in these areas so long as the resource conditions and outcome objectives can be maintained.

# S.2 RECREATION MANAGEMENT AREA PRESCRIPTIONS

## S.2.1 Wind River Front

Supporting information: The west slope of the Wind River Mountains attracts visitors from the surrounding communities and from outside the region due to the spectacular scenery, abundant wildlife, and exposed geologic formations. Nearby attractions which also draw visitors to the area include the Big Sandy Recreation Area and the Prospect Mountains. Also, some visitors traveling to or from Yellowstone National Park spend time in the area. The SRMA includes the Sweetwater Guard Station, Sweetwater Bridge, Dutch Joe, and Blucher Creek campgrounds, which are BLM managed campgrounds referred to as the Sweetwater Campgrounds. The SRMA also includes the Sweetwater River, which meets national requirements for designation as a Wild and Scenic River. The area also includes the Lander Cutoff of the Oregon Trail. The west slope of the Wind River Mountains provides important wildlife habitat and access into the Bridger Teton National Forest. These resources provide for excellent semi-primitive, and non- motorized recreation as well as motorized (touring) recreation.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes developed campgrounds and dispersed recreation and camping areas. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Class II. All motorized use would be limited to designated roads and trails. The area is a right-of-way (ROW) avoidance area.

Information and Education – Signage and other visitor controls are installed in this area and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

### Recreation Setting Characteristics:

#### Physical Setting

Level of:

Remoteness – Within 0.5 mile of four-wheel drive two track routes.

Naturalness – Character of the natural landscape retained. A few of the modifications contrast with the character of the landscape.

Facilities – Maintained and marked trails, simple trailhead developments, basic developed fire pits and toilets.

#### Social Setting

Level of:

Contacts – Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes.

Group Size – 4-6 people per group.

Evidence of Use – Areas of alteration uncommon. Little surface vegetation wear observed, sounds of people infrequent.

#### Administrative Setting

Level of:

Mechanized Use – Middle Country: Four-wheel drive vehicles, all-terrain vehicles (ATV), dirt bikes, or snowmobiles in addition to non-motorized mechanized use. Back Country: Mountain bikes and other mechanized use, but all is non-motorized.

Visitor Services – Signs present at key access points, but limited. Interpretive signs at trailheads, campgrounds, and parking areas.

Management Controls – Some regulatory and ethics signs. Moderate use restrictions including barriers.

Recreation Activity Opportunities – Hunting, fishing, photography, sightseeing, driving for pleasure, wildlife viewing, horse riding and packing, and hiking.

## Outcomes (Experience and Benefits):

Experiences –

- Savoring the total sensory sight, sound, and smell experience of a natural landscape.
- Developing skills and abilities.
- Enjoying exploring on my/our own.
- Enjoying the closeness of family.
- Enjoying the areas wildlife, scenery, views, and aesthetics.

Personal Benefits –

- Improved mental well-being, physical fitness and health maintenance.
- Personal appreciation and satisfaction, a more outdoor-oriented lifestyle.

Community Benefits –

- Maintenance of community's distinctive recreation/tourism market niche or character.
- Increased desirability as a place to live or retire.
- Heightened sense of satisfaction with our community.

Environmental Benefits –

- Greater sensitivity to/awareness of outdoor aesthetics, nature's art and its elegance.
- Increased appreciation of area's cultural history.

Economic Benefits –

- Positive contributions to local/regional economic stability.
- More positive contributions to local/regional economy.

## S.2.2 Green River

Supporting information: The Green River SRMA is made up of BLM and Bureau of Reclamation managed public lands. The river is very popular for fishing, floating, sightseeing, and hunting and is used by local residents as well as visitors from throughout the nation and from foreign countries. Many visitors traveling to or from Yellowstone National Park spend time in the area. The Green River is listed as a blue-ribbon fishery with semi-developed and primitive put-in and take-outs. The river contains islands, as well as other scattered tracts of public land that provide for river access.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes dispersed recreation areas. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Classes II and III. All motorized use would be limited to designated roads and trails. All river access routes will be preserved. The area is a ROW avoidance area.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

### Recreation Setting Characteristics:

#### Physical Setting

Level of:

Remoteness – Within 0.5 mile of low-clearance or passenger vehicle routes.

Naturalness – Character of the natural landscape partially modified, but modifications do not overpower natural landscapes.

Facilities – Facilities such as campsites, restrooms, river access, and trailheads.

#### Social Setting

Level of:

Contacts – Usually 30 encounters/day on travel routes. Group Size – 4-6 people/group.

Evidence of Use – Front Country: Small areas of alteration prevalent. Surface vegetation gone with compacted soils observed. Sounds of people regularly heard. Middle Country: Small areas of alteration. Surface vegetation showing wear with some bare soils. Occasional sounds of people.

#### Administrative Setting

Level of:

Motorized Use – The majority of the river tracts are a Front Country setting where two-wheel drive vehicles are predominant, but also four-wheel drive vehicles and non-motorized mechanized use occurs.

Visitor Services – On site controls and services are present but harmonize with the natural environment.

Management Controls – Continue to provide for experiences and associated facilities with an emphasis on maintaining Rural to Front Country recreation settings.

Recreation Activity Opportunities – Fishing, hunting, floating, photography, and sightseeing.

### Outcomes (Experience and Benefits):

Experiences –

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Personal Benefits –

- Improved mental well-being.
- Closer relationship with the natural world.
- Enhanced sense of personal freedom.

Community Benefits –

- Heightened sense of satisfaction with our area as a place to live.
- Greater community involvement in recreation and other land use decisions.

Environmental Benefits –

- Maintenance of distinctive recreation character.
- Greater retention of distinctive natural landscape features.

Economic Benefits –

- Increased local job opportunities.
- Increased local tourism revenue.
- Improved local economic stability.

## S.2.3 Killpecker Sand Dunes Open Play Area

Supporting information: This area is located 23 miles north and east of the city of Rock Springs, Wyoming. This area is currently being used for cross country and off-road motor vehicle use by both off-highway vehicles (OHV) and motorcycles as well as other specialty designed vehicles such as sand rails and utility terrain vehicles (UTV). Visitors are from within the local communities, as well as from outside the area. The area is composed of sand dunes and mostly devoid of vegetation.

The Killpecker Sand Dunes area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. Local communities have identified this area as highly desired for motorized recreational opportunities.

## Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes developed campgrounds and dispersed camping and recreation areas. In areas where overnight camping is allowed, there is a 14-day camping limit. Only the shifting sand portion of the sand dunes is available for off road use.

Administration – The area would be managed as Visual Resource Management Class III. Mineral material sales and/or free use permits will be prohibited.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

## Recreation Setting Characteristics:

### Physical Setting

Level of:

Remoteness – Within 0.5 mile of primary roads.

Naturalness – Character of the natural landscape considerably modified.

Facilities – Modern facilities such as campgrounds and occasional exhibits.

### Social Setting

Level of:

Contacts – Usually 40 encounters/day on travel routes.

Group Size – 15-25 people/group.

Evidence of Use – A few large areas of alteration. Surface vegetation absent with hardened soils. Sounds of people frequently heard.

### Administrative Setting

Level of:

Motorized Use – Ordinary vehicle traffic is characteristic.

Visitor Services – Information materials plus experience and benefit descriptions.

Management Controls – Regulations strict on speed limits and use in campground and ethics signage prominent.

Recreation Activity Opportunities – Driving for pleasure, OHV hill climbing and driving.

### Outcomes (Experience and Benefits):

Experiences –

- Developing skills and abilities.
- Enjoying risk-taking adventure.
- Being around people I know and enjoy.

Personal Benefits –

- Improved physical fitness and health maintenance.
- More competitive spirit.
- Improved skills for outdoor enjoyment.

Community Benefits –

- Heightened sense of satisfaction with our community.
- More informed citizenry about where to go for different kinds of recreation experiences and benefits.

Environmental Benefits –

- Greater community ownership and stewardship of recreation and natural resources.
- Maintenance of distinctive recreation setting character.

Economic Benefits –

- Improved local economic stability.
- Increased local tourism.
- Greater value-added local services and industry.

## S.2.4 Continental Divide National Scenic Trail

Supporting information: The Continental Divide National Scenic Trail (CDNST) SRMA is made up of BLM-managed public lands in the northeast corner of the RSFO near the Continental Divide. Nine miles of the CDNST are located in the RSFO entering from the Lander Field Office and exiting into the Bridger Teton National Forest. A spur route is located between county road 4-74 along the north boundary of the Honeycomb Buttes Wilderness Study Area.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes dispersed recreation and camping areas. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Class II within three miles or the visual horizon, whichever is closest. All motorized use would be limited to designated roads and trails. The area within one mile of the trail is a ROW avoidance area.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

## Recreation Setting Characteristics:

### Physical Setting

Level of:

Remoteness – Within 0.5 mile of two track routes.

Naturalness – Natural landscape with modifications in harmony with surroundings and not visually obvious.

Facilities – Developed trails made mostly of native materials, structures are rare and isolated.

### Social Setting

Level of:

Contacts – 7-15 encounters/day on travel routes.

Group Size – 4-6 people per group.

Evidence of Use – Areas of alteration uncommon. Little surface vegetation wear observed. Sounds of people infrequent.

### Administrative Setting

Level of:

Motorized Use – Four-wheel drive vehicles, ATVs, and dirt bikes along the two track routes. Non-motorized mechanized use as well as pedestrian use along the 0.5 mile single track trail.

Visitor Services – Basic maps, staff infrequently present to provide onsite assistance.

Management Controls – Basic user regulations at key access points. Minimum use restrictions.

Recreation Activity Opportunities – Hiking, mountain biking, photography, and nature viewing.

## Outcomes (Experience and Benefits):

Experiences -

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Personal Benefits –

- Improved mental well-being.

- Enhanced sense of personal freedom.
- Improved physical fitness and health maintenance.

Community Benefits –

- Greater household awareness of, and appreciation for our natural and cultural heritage.
- More informed citizenry about where to go for different kinds of recreation experiences and benefits.

Environmental Benefits –

- Greater community ownership and stewardship of recreation and natural resources.
- Increased awareness and protection of natural landscapes.

Economic Benefits –

- Enhanced ability for visitors to find areas providing wanted recreation experiences and benefits.
- Increased local tourism revenue.
- Improved local economic stability.

## S.2.5 Continental Divide Snow Machine Trail

Supporting information: The Continental Divide Snow Machine Trail (CDSMT) SRMA is made up of BLM-managed public lands in the northeast corner of the RSFO near the Continental Divide. Seven miles of the CDSMT is located in the RSFO entering from the Lander Field Office and exiting into the Bridger Teton National Forest.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes developed camping areas and dispersed camping uses. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Class II within three miles or the visual horizon, whichever is closest. All motorized use would be limited to designated roads and trails. Over the snow vehicle use is limited to areas where snow is a minimum of 8” deep. The area is a ROW avoidance area.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored once per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

### Recreation Setting Characteristics:

#### Physical Setting

Level of:

Remoteness – More than 0.5 mile from improved roads.

Naturalness – Natural landscapes with modifications in harmony with surroundings and not visually obvious.

Facilities – Developed trails mostly of native materials. Structures are rare and isolated.

#### Social Setting

Level of:

Contacts – 7-15 encounters/day.

Group Size – 4-6 people per group.

Evidence of Use – Areas of alteration uncommon. Little surface vegetation wear observed. Sounds of people infrequent.

#### Administrative Setting

Level of:

Motorized Use – Primary use is snow machines.

Visitor Services – Area brochures and maps, staff present only occasionally to provide onsite assistance.

Management Controls – Some regulatory and ethics signs. Moderate use restrictions.

Recreation Activity Opportunities – Hiking, snow machining, nature viewing, and skiing.

## Outcomes (Experience and Benefits)

Experiences –

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Personal Benefits –

- Improved mental well-being.
- Enhanced sense of personal freedom.
- Improved physical fitness and health maintenance.
- Greater family bonding.

Community Benefits –

- Heightened sense of satisfaction with our community.
- Greater community involvement in recreation and other land use decisions.

Environmental Benefits –

- Increased awareness and protection of natural landscapes.
- Greater retention of distinctive natural landscape features.

Economic Benefits –

- Greater value-added local services.
- Increased local job opportunities.
- Increased local tourism revenue.
- Improved local economic stability.

## S.2.6 Oregon and Mormon Pioneer National Historic Trail

Supporting information: The Oregon and Mormon Pioneer National Historic Trails SRMA is made up of BLM-managed public lands in the RSFO following four congressionally designated Historic Trails. These four trails cross through the RSFO in the area north of Interstate 80, and are the Oregon, California, Mormon Pioneer and Pony Express Trails.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes the trails and a three-mile buffer on both sides. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Class II within three miles or the visual horizon, whichever is closer. All motorized use is limited to designated roads and trails. The area within one mile of the trail is a ROW avoidance area.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

### Recreation Setting Characteristics:

#### Physical Setting

Level of:

Remoteness – Within 0.5 mile of four-wheel drive two track routes.

Naturalness – Character of the natural landscape retained. A few modifications contrast with the character of the landscape.

Facilities – Maintained and marked trails, simple trailhead developments.

#### Social Setting

Level of:

Contacts – 15-29 encounters on travel routes.

Group Size – 7-12 people/group.

Evidence of Use – Small areas of alteration. Surface vegetation showing wear with some bare soils. Occasional sounds of people.

#### Administrative Setting

Level of:

Motorized Use – Four-wheel drive vehicles, ATVs and dirt bikes in addition to nonmotorized mechanized use.

Visitor Services – Area brochures and maps, staff occasionally present to provide onsite assistance. Management Controls – Some regulatory and ethics signs. Moderate use restrictions.

Recreation Activity Opportunities – Hiking, mountain biking, photography, heritage tourism including wagon train and hand cart reenactment.

## Outcomes (Experience and Benefits):

Experiences –

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Personal Benefits –

- Improved mental well-being.
- Enhanced sense of personal freedom.
- Improved physical fitness and health maintenance.
- Greater family bonding.

Community Benefits –

- Greater household awareness of and appreciation for our natural and cultural heritage.
- More informed citizenry about where to go for different kinds of recreation experiences and benefits.

Environmental Benefits –

- Greater protection of area historic structures and archaeological sites.
- Increased awareness and protection of natural landscapes.

Economic Benefits –

- More positive contributions to local-regional economy.
- Maintenance of community's distinctive recreation/tourism market niche or character.

## S.2.7 Red Creek Badlands

Supporting information: The Red Creek Badlands is rich in natural recreational resources with dramatic landscapes. Management objectives are to maintain the primitive to semi-primitive setting and wilderness characteristics, including the Red Creek Wilderness Study Area (WSA), wildlife, and wild horses which cater to primitive and semi-primitive recreational experiences.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes dispersed camping and recreation areas. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as Visual Resource Management Class I in the Red Creek WSA and Classes II and III in all other areas. All motorized use would be limited to designated roads and trails. The area is a ROW avoidance area.

Information and Education – Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

### Recreation Setting Characteristics:

#### Physical Setting

Level of:

Remoteness – More than 0.5 mile from motorized routes.

Naturalness – Undisturbed natural landscapes.

Facilities – No structures.

#### Social Setting

Level of:

Contacts – Fewer than 3-6 encounters/day in area and on travel routes.

Group Size – Fewer than or equal to 3 people/group.

Evidence of Use – No alterations of the natural terrain. Sounds of people are rare.

#### Administrative Setting

Level of:

Motorized Use – Four-wheel drive vehicles, ATVs, and dirt bikes in addition to nonmotorized mechanized use.

Visitor Services – No maps or brochures available onsite, and staff are rarely available.

Management controls – On site controls and services present at key access points, but subtle.

Recreation Activity Opportunities – Hiking, hunting, camping, mountain biking, and photography.

### Outcomes (Experience and Benefits):

Experiences –

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Personal Benefits –

- Improved mental well-being.
- Closer relationship with the natural world.
- Enhanced sense of personal freedom.
- Improved physical fitness and health maintenance.
- Greater family bonding.

Community Benefits –

- Greater community involvement in recreation and other land use decisions.
- Heightened sense of satisfaction with our community.

Environmental Benefits –

- Maintenance of distinctive recreation setting character.
- Greater community ownership and stewardship of recreation and natural resources.

Economic Benefits –

- More positive contributions to local-regional economy.
- Enhanced ability for visitors to find areas providing wanted recreation experiences and benefits.

## S.2.8 Little Mountain

Supporting information: Little Mountain is located south of Rock Springs, Wyoming. The Little Mountain area is a very popular destination for both local residents and out-of-region visitors. The area is abundant with a wide variety of wildlife and dramatic scenery. This SRMA is necessary to accommodate semi-primitive to middle country recreational experiences in a recreational resource rich environment.

### Land Use Plan Management Actions/Allowable Uses and Implementation Actions:

Management – The area includes dispersed recreation and camping areas. In areas where overnight camping is allowed, there is a 14-day camping limit.

Administration – The area would be managed as a Visual Resource Management Class II. All motorized use would be limited to designated roads and trails. The area is a ROW avoidance area. A withdrawal from appropriation under the mining laws will be pursued.

Information and Education –Signage and other visitor controls are installed and more would be added if needed to meet management objectives.

Monitoring – Sites and facilities would be monitored twice per month for each month the area is accessible by the public. Monitoring would include visitor use, recreation caused resource effects or impacts, and visitor satisfaction.

## Recreation Setting Characteristics:

### Physical Setting

Level of:

Remoteness – Within 0.5 mile of mechanized trails/routes.

Naturalness – Natural landscape with modification in harmony with surroundings and not visually obvious.

Facilities – Structures are rare and isolated.

### Social Setting

Level of:

Contacts – 7-15 encounters/day on travel routes.

Group Size – 4-6 people/group.

Evidence of Use – Areas of alteration uncommon. Little surface vegetation wear observed, sounds of people infrequent.

### Administrative Setting

Level of:

Motorized Use – Four-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.

Visitor Services – Basic maps, staff infrequently present to provide onsite assistance.

Management Controls – Basic user regulations at key access points. Minimum use restrictions.

Recreation Activity Opportunities – Hiking, hunting, wildlife photography, and sightseeing.

## Outcomes (Experience and Benefits):

Experiences –

- Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.
- Feeling good about solitude.

- Being isolated and independent.
- Enjoy having easy access to natural landscapes.

Personal Benefits –

- Closer relationship with the natural world.
- Improved mental well-being.

Community Benefits –

- Heightened sense of satisfaction with our community.
- Greater community involvement in recreation and other land use decisions.

Environmental Benefits –

- Maintenance of distinctive recreation setting character.
- Greater community ownership and stewardship of recreation and natural resources.

Economic Benefits –

- Enhanced ability for visitors to find areas providing wanted recreation experiences and benefits.
- Increased desirability as a place to live or retire.

This page intentionally left blank.

# APPENDIX T–CUMULATIVE AND OTHER IMPACTS

## T.1 CUMULATIVE IMPACTS

This section defines cumulative impacts, describes the methodology used for assessing these impacts, describes projects and activities considered in this assessment, and presents the results organized by resource topic.

Cumulative impacts are the effects on the environment that result from implementing any of the alternatives in combination with other actions outside the scope of the plan revision, either within the planning area or outside it. The Council on Environmental Quality (CEQ) regulations for implementing the National Environmental Policy Act (NEPA) define cumulative impacts as:

> *"The impacts on the environment which result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or nonfederal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." (40 Code of Federal Regulations [CFR] §1508.7).*

The real effect of any single action cannot be determined by considering that action in isolation but must be determined by considering the likely result of that action in conjunction with many others. The cumulative impact analysis for the Proposed Resource Management Plan (RMP) and final Environmental Impact Statement (EIS) evaluates the potential impacts associated with the management alternatives in combination with the potential impacts associated with other relevant activities that have occurred, are occurring, or are likely to occur in the vicinity of the planning area.

### T.1.1 Cumulative Analysis Methodology

Land use planning is the Bureau of Land Management's (BLM) broadest level of decision making. BLM planning-level decisions are programmatic decisions that allocate resources or specify allowable uses in all or portions of the planning area to emphasize certain management direction. Site-specific actions are rarely addressed in an RMP. As a result, the cumulative impact analysis is also broad and general in nature. It will present ranges and qualitative conclusions as opposed to bounded quantified details. These cumulative impacts will then be considered in subsequent NEPA documents that analyze specific projects or programs. Examples include oil and gas field development plans, livestock grazing allotment management plans (AMP), and individual authorizations such as rights-of-way (ROW) or special recreation permits.

Analysis and description of the identifiable effects of past actions are required to the extent they are relevant and useful in analyzing whether the reasonably foreseeable effects of the alternatives may have a continuing, additive, and significant relationship to those present effects. Based on scoping, agencies have discretion on what is useful concerning past action for the agency's analysis of the effects of present action and its reasonable alternatives. Effects of past actions and activities on resources are manifested in the current condition of the resource, which is described in Chapter 3 (Affected Environment) for resources on lands administered by the BLM within the planning area. Specific information presented in Chapter 3 is not repeated here.

Effects of past actions and activities on resources are manifested in the current condition of the resource, which is described in Chapter 3 (Affected Environment) for resources on lands administered by the BLM within the planning area. The cumulative impact analysis is based on numerous assumptions and projections about future actions and their effects. Detailed information about specific future actions may be unavailable.

General terms such as low, moderate, and high are used to describe the intensity of effects. The cumulative impact analysis also compares the relative intensity of effects between alternatives.

This analysis focuses on RMP actions that, when combined with other past, present, and reasonably foreseeable future actions, would collectively be significant. Not all issues identified for direct or indirect impact assessment in the RMP are analyzed for cumulative effects. Because of the wide geographic scope of a cumulative impact assessment and the variety of activities assessed, cumulative impacts are commonly examined at a more qualitative and less detailed level than are direct and indirect impacts.

Public documents prepared by federal, state, and local government agencies are the primary sources of information regarding past, present, and future actions considered in the cumulative effects analysis. Actions undertaken by private persons and entities are assumed to be captured in the information made available by such agencies. Speculative or uncommitted projects are not included in the projections. These projections are not planning decisions. Using them in this analysis does not constitute approval by the BLM, or any authorizing agency. These projections do not set a limit or cap on future BLM actions. Unforeseen changes in such factors as economics; public demand; and federal, state, and local laws and policies could result in different outcomes than those projected for this analysis.

Potential cumulative impacts are described for each affected resource within a defined cumulative impact analysis area (CIAA). The CIAA covers different geographic areas depending on the specific resource being evaluated. The CIAAs are described in each of the resource sections below. CIAAs that extend beyond the planning area are largely for resources that are mobile or migrate, compared to resources that are stationary. For example, the air quality CIAA is large because it is based on the complex interaction between climatic factors, terrain, and the potential for significant impacts to occur in sensitive areas within the airshed. Smaller CIAAs were established for resources that are stationary such as cultural resources, minerals, and visual resources. In some cases, these CIAAs might be the same as the planning area boundary. Activities and development that occur within or outside the CIAAs have the potential to create cumulative impacts on the specific resource being analyzed.

The BLM considered the following factors in this cumulative impact assessment:

- Federal, nonfederal, and private actions
- The potential for effects to cross political and administrative boundaries
- Other spatial and temporal characteristics of each affected resource
- The comparative scale of cumulative impacts across alternatives
- Scoping comments.

Temporal and spatial boundaries used in the cumulative analysis are developed on the basis of resources of concern and actions that might contribute to an impact. The baseline date for the cumulative impacts analysis is 2017. The temporal scope of this analysis is a 20-year planning horizon. Land use planning documents are generally evaluated on a 5-year cycle.

Spatial boundaries vary and are larger for resources that are mobile or migrate (e.g., migratory birds) compared with stationary resources. Occasionally, spatial boundaries could be contained within the planning area boundaries or an area within the planning area. Spatial boundaries were developed to facilitate the analysis and are included under the appropriate resource section heading. The cumulative effects analysis for all topics included an analysis of cumulative effects at the planning area level.

## T.1.2 Projects and Activities Considered

The following activities were identified as having the greatest likelihood to generate potential cumulative impacts when added to activities associated with the Rock Springs RMP alternatives:

- BLM and Forest Service land management plans and activities in adjacent planning areas
- Regional oil and gas development activities (e.g., exploration, production, and pipeline development)
- Regional recreation activities (e.g., hunting, off-highway vehicle (OHV) use, dispersed recreation)
- Economic development activities in Lincoln, Sweetwater, Uinta, Sublette, and Fremont Counties.

Activities and development that occur within the CIAAs have the potential to create cumulative impacts on the specific resource being analyzed. Oil and gas development presents the highest likelihood for impacts within the planning area and in southwest Wyoming as a whole. Anticipated oil and gas projects within the planning area are encompassed by the oil and gas reasonable foreseeable development (RFD) for the planning area. Mineral development and other actions that would create the potential for cumulative impacts are listed in Table T-1 and Table T-2. The projects listed in Table T-2 are not presented as an exhaustive list of actions, but every effort has been made to present a representative list of actions that could contribute to cumulative impacts.

**Table T-1. Summary of Oil and Gas Reasonable Foreseeable Development for Public Lands and Mineral Estate in Southwestern Wyoming**

| Planning Area | Existing Wells | Public Land and Mineral Estate RFD | Private and State Lands RFD | Total Oil and Gas RFD | Total Potential Wells (existing plus RFD) |
|---|---|---|---|---|---|
| Kemmerer Field Office | 1,562 | 1,221 | 1,459 | 2,680 | 4,242 |
| Pinedale Field Office | 2,970 | 7,804 | 1,247 | 9,051 | 12,021 |
| Rawlins Field Office | 3,450 | 4,087 | 5,111 | 9,198 | 12,648 |
| Rock Springs Field Office | 6,095 | 4,648 | 1,087 | 5,735 | 11,830 |
| Total | 14,077 | 17,760 | 8,904 | 26,664 | 40,741 |

**Table T-2. Summary of Other Activities Considered**

| Project Title | Project Description |
|---|---|
| Big Sandy Rock Sill | Provides artificial habitat for increasing fish populations in the Big Sandy River. On-ground project activity ongoing. |
| Bird Canyon Field Natural Gas Development (EIS) | Crown Energy and Koch Exploration Company are proposing new development in the existing Bird Canyon Field. Development consists of up to 371 new wells (234-Crown, 137-Koch) over 6-12 years with associated road development. The proposal is currently on hold. |
| Bitter Creek Shallow Oil and Gas Project | The project proposes to drill a maximum of 61 wells with an estimated 326 acres of total surface disturbance. The total project area encompasses approximately 17,961 acres: 11,768 acres are federal surface and minerals and 6,193 acres are private surface and minerals. The environmental assessment (EA) was completed in 2005. On-ground project activity ongoing. |

| Project Title | Project Description |
|---|---|
| Black Butte Coal Lease Modification | Project proposed to expand surface mining operations by about 450 acres of federal coal lands. NEPA complete. On-ground project activity ongoing. |
| BLM Wild Horse Gathers | BLM wild horse gathers from herd management areas (HMA) within the five HMAs in the Rock Springs Field Office (RSFO) and adjacent BLM offices. |
| Big Firehole Canyon Fuel Treatment Project | The project proposes to conduct fuel treatments on 400 acres. On-ground project activity ongoing. |
| Browns Spring Fuel Treatment Project | The project conducted fuel treatments on 250 acres in 2011. |
| Copper Ridge Shallow Gas Exploration and Development Pilot Project | The proposal involves drilling, completing, and operating a maximum of 89 shallow gas wells and related production and water disposal facilities in the Copper Ridge Project Area. The project area includes a total of 24,953 acres. The Copper Ridge Project Area overlies an area already developed by two existing oil and gas projects; the Brady and the Jackknife Springs Fields. The EA was completed in 2003. On-ground project activity ongoing. |
| Desolation Road Unit Development | The project includes gas resource exploration and development to include development of up to 17 wells from five well pads in two phases. Phase 1 would be to drill two exploratory gas wells from two well pads. If successful, Phase 2 would be to drill up to 15 wells from those two pads, add three more well pads and construct the associated access roads and pipelines. Project withdrawn 2021. |
| FMC Grange Optimization Project | Enhance solution mining capabilities at FMC Granger. NEPA in progress. |
| Green River RMP | Comprehensive land use plan (LUP) focuses on similar resource issues and management to the south of the planning area. Green River RMP manages portions of the Pinedale planning area CIAAs for air, cultural, forestry, recreation, vegetation, visual resource management (VRM), watersheds, and wildlife habitat management. On-ground project activity ongoing. |
| Henry's Fork Colorado River Salinity Project | The Natural Resources Conservation Service (NRCS) has developed this plan and EIS to reduce 6,540 tons of annual salt loading to the Colorado River system by implementing conservation practices in the upper Henrys Fork project area. NEPA complete. On-ground project activity ongoing. |
| Hiawatha EIS | The Operators propose to drill as many as 4,208 new wells within the project area, which represents a full development scenario. Project withdrawn 2019. |
| Industrial Plant shut downs and overhauls | On a yearly basis, many of the Industrial Plants shut down a portion of their operations for overhauls. These shuts downs collectively can bring annually hundreds of workers into the County. |
| Jim Bridger Coal Lease | Leases modified in July 2011 and May 2013, totaling 2,562.54 acres. NEPA documents complete. On-ground project activity ongoing. |
| Jim Bridger Power Plant | Retrofits to power plant units to accommodate Environmental Protection Agency (EPA) haze rules. |
| Jim Bridger South Wind Project | Wind project; Type II status in 2011. Project closed 2015. |
| Kinney Rim Wind Project | Wind project; Type II status in 2011. Project closed 2016. |
| LaBarge Platform Exploration and Development (EIS) | The Pinedale and Rock Springs Field Offices developing an EIS for the La Barge Platform Project for 838 new natural gas and oil wells from 463 new well pads (vertical and horizontal) over a 40-year project lifespan. Drilling expected to occur over a 10-year period in the Upper Green River Basin, in Sublette and Lincoln counties in western Wyoming. The project area consists of 218,000 acres of federal, state, and private lands. The area is one of the oldest oil and gas fields in the region, dating back roughly 100 years. Project withdrawn in 2015. |
| Little Monument Natural Gas Project | Burlington proposes to drill, complete, and produce approximately 31 additional wells at eight or more wells per section within the Little Monument project area over the next three years. The EA was completed in 2004. On-ground project activity ongoing. |

| Project Title | Project Description |
|---|---|
| Little Red Creek Fuel Treatment Project | The project conducted 400 acres of fuel treatments in 2010. On-ground project activity ongoing. |
| Luman Rim EA | The proposed action is to drill 58 additional natural gas wells in the Luman Rim area of north central Sweetwater County, Wyoming. The EA was completed in 12/2010. On-ground project activity ongoing. |
| Monell Arch Development EA | Proposal submitted by Anadarko Petroleum Corporation to infill drill additional oil and gas wells in the Monell and Arch Units to facilitate product extraction, maximize the economic recovery of the resource, and extend the production life of the units. The Monell Arch area is located in southwestern Wyoming, and is comprised of 22,657 acres of mixed federal, state and private surface lands and 22,658 acres of mixed federal and state mineral lands in Sweetwater County. The operator has proposed approximately 105 new oil wells, 18 $CO_2$ injector wells and two water injection wells that would be drilled within the project area. On-ground project activity ongoing. |
| Monell Enhanced Oil Recovery Project | Anadarko proposes to drill a maximum of 126 wells. The EA was completed in 2005. Drilling began in 2006 and was planned for approximately three to six years. On-ground project activity ongoing. |
| North Dutch John Unit #1 Well | A new oil or gas well proposal inside the North Dutch John Unit in Sweetwater County, Wyoming. An associated access road, two-track upgrade and well pad is also included in with this analysis, with a total proposed disturbance of 10.4 acres. Project withdrawn 2020. |
| NPL (Normally Pressured Lance) Project | The NPL Project Area, located about 68 miles northwest of Rock Springs, Wyoming, covers approximately 141,000 acres administered by the BLM Pinedale Field Office and RSFO. For all project components, the estimated total initial surface disturbance is estimated to be about 6,625 acres, or 4.7% of the NPL surface acreage. Up to 3,500 new wells would be drilled over a ten-year period starting in March 2013 at an average rate of up to 350 wells per year.<br>Outside of the sage-grouse core area, drilling would occur on an average of four centralized, multi-well pads per section. Inside the sage-grouse core area, drilling would take place from one multi-well pad per 640-acre area (not section). Each multi-well drilling and completion pad would encompass up to approximately 18 acres per location and would support between 1 and 64 wells. Record of Decision issued August 2018. |
| Pacific Rim Shallow Gas Exploration and Development Project | Project proposes to drill a maximum of 120 wells. The EA was completed in 2004. On-ground project activity ongoing. |
| Pit 14 Coal Lease | 1,399 acres leased for coal development. The EIS was completed in 2007. On-ground project activity ongoing. |
| Puma Deep Prospect Area Gas Development Project | Davis Petroleum Corporation proposes to construct, drill, and complete 10 wells in addition to the five already existing wells on the 8,800-acre federally administered minerals. The EA was completed in 2009. On-ground project activity ongoing. |
| Riley Ridge to Natrona Pipeline | The Riley Ridge to Natrona proposal is to construct pipelines of various sizes along a 243-mile linear ROW through Fremont, Sublette, Sweetwater and Natrona counties. Other construction activities include the Riley Ridge Sweetening Plant, access roads, power lines, injection wells, and power line. Project completed 2019. |
| Rock Springs RMP Revision (EIS) | Revise Green River RMP. |
| Simplot - Reliability Project | Expansion to increase plant capacity. |
| Sweeney Ranch Wind Project | The project involves constructing a wind development project with a maximum of 119 wind turbine generators within the RSFO boundary. Wildlife surveys were initiated in 2010/2011. Project closed 2015. |

| Project Title | Project Description |
|---|---|
| Sweetwater Solar Energy Project | The project proposes construction of a solar generation project approximately 11 miles northwest of the City of Green River: Photovoltaic collecting arrays, perimeter roads, buried electrical collection lines, an operation and maintenance facility and overhead electrical power line. The Project encompasses approximately 703 acres of which 640 acres are managed by the BLM. Project completed 2018. |
| Ten Mile Rim Coal Lease | Coal lease on the Ten Mile Rim Tract (WYW-154595); includes 2,242.18 acres of federal coal lands. The EA was completed in 2004. Coal production ongoing. |
| Vermillion Basin Natural Gas Exploratory and Development Project | Proposal to drill up to 56 natural gas wells in and around three existing, producing oil and gas units (Trail, Kinney Rim, and Canyon Creek). The EA was completed in 2002. On-ground project activity ongoing. |

## T.1.3 Cumulative Impacts by Resource

### Air Quality

#### Greenhouse Gases and Climate Change

Concentrations of certain gases in the earth's atmosphere have been identified as being effective at trapping heat reflected off the earth's surface thereby creating a "greenhouse effect." As concentrations of these greenhouse gases increase, the earth's surface warms, the composition of the atmosphere changes, and global climate is affected. Concentrations of greenhouse gases have increased dramatically in the earth's atmosphere in the past century. Anthropogenic (man-made) sources and human activities have been attributed to these increases particularly for $CO_2$, $CH_4$, $N_2O$, and fluorinated gases (EPA 2018).

This Air Quality Technical Support Document is presented in Appendix P and describes the processes used to conduct the air quality impact assessment and provides summaries of relevant analysis data. Table T-3 shows the total federal direct and indirect GHG emissions across all alternatives for oil and gas over the 20-year analysis period. As mentioned in Section 4.3.4, Alternative C has the potential to emit the most direct GHG emissions while Alternative B direct GHG emissions are the least of all alternatives. Alternative B most closely aligns with the DOI's climate change priorities among all alternatives. Emissions under the Proposed RMP are anticipated to be between Alternatives B and D, but more similar to Alternative D.

**Table T-3. Total Federal Direct and Indirect Oil and Gas GHG Emissions (MT)**

| Alternative | End-Use/Indirect Oil and Gas Emissions | | | Sum of Direct and Indirect Oil and Gas Emissions | | |
|---|---|---|---|---|---|---|
| | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2$ | $CH_4$ | $N_2O$ |
| A | 310,991,900 | 11,569 | 892 | 366,901,300 | 578,495 | 1,657 |
| B | 181,625,860 | 6,719 | 519 | 213,133,065 | 336,806 | 955 |
| C | 315,829,639 | 11,678 | 902 | 372,645,808 | 588,054 | 1,680 |
| D | 308,401,354 | 11,520 | 887 | 363,863,661 | 573,587 | 1,645 |

Table T-4 presents not only all non-oil and gas direct and indirect GHG emissions but also the grand total of all direct and indirect GHG emissions from BLM-authorized activities over the 20-year analysis period. Appendix R-Air Quality Adaptive Management Strategy Section R.5.9 provides a list of best management practices for oil and gas development (which constitute the largest proportion of total anticipated emissions) that address both air quality and GHG emissions reductions. Emissions under the Proposed RMP are anticipated to be between Alternatives B and D, but more similar to Alternative D.

## Table T-4. Non-Oil and Gas Direct and Indirect Emissions and Sum of All Direct and Indirect GHG Emissions from BLM-Authorized Activities (MT)

| Alternative | Sum of Direct and Indirect Emissions from Non-Oil and Gas Activities | | | Grand Total for Direct and Indirect GHG Emissions from All BLM-Authorized Activities | | |
|---|---|---|---|---|---|---|
| | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2$ | $CH_4$ | $N_2O$ |
| A | 24,298,362 | 226,717 | 378 | 391,199,662 | 805,213 | 2,035 |
| B | 24,264,316 | 64,548 | 47 | 237,397,380 | 401,354 | 1,002 |
| C | 24,373,117 | 235,863 | 1,704 | 397,018,926 | 823,917 | 3,383 |
| D | 24,298,362 | 226,717 | 378 | 388,162,022 | 800,305 | 2,024 |

The EPA has determined that six greenhouse gases are air pollutants and subject to regulation under The Clean Air Act (CAA): $CO_2$, $CH_4$, $N_2O$, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Of these greenhouse gases, $CO_2$, $CH_4$, and $N_2O$ are commonly emitted by the types of activities included in this analysis, while the remaining three greenhouse gases are emitted in extremely small quantities or are not emitted at all. Greenhouse gas emissions from management actions and activities were estimated for each alternative in this analysis for $CO_2$, $CH_4$, and $N_2O$.

A greenhouse gases' ability to contribute to global warming is based on its longevity in the atmosphere and its heat-trapping capacity. In order to aggregate greenhouse gas emissions and assess their contribution to climate change, the EPA has assigned each greenhouse gas a global warming potential (GWP) that is used to calculate $CO_2$ equivalents. Under all of the alternatives, a variety of activities in the planning area would generate greenhouse gas emissions, including $CO_2$, $CH_4$, and $N_2O$. These activities include oil and gas and other minerals development (primarily coal and trona mining), fire events, motorized vehicle use, livestock grazing, facilities development, and other surface-disturbing activities. Since the Industrial Revolution, atmospheric concentrations of $CO_2$ have risen more than 40% and continues to rise at a rate about 0.4% per year (IPCC 2013), principally due to the combustion of fossil fuels. Fossil fuel combustion accounted for 93.5% of national $CO_2$ emissions in 2016 (EPA 2018). $CH_4$ is more than 28 times as effective as $CO_2$ at trapping heat in the atmosphere and accounts for 28 times more greenhouse gas for the GWP over 100 years and 84 in greenhouse gas for the GWP for 20 years (IPCC 2014) and accounted for about 10% of greenhouse gas emissions in 2016 (EPA 2018). $N_2O$ is 265 times as effective as $CO_2$ at trapping heat in the atmosphere and accounts for 265 times more greenhouse gas for the GWP over 100 years and 264 in greenhouse gas for the GWP for 20 years (IPCC 2014) and accounted for about 6% of greenhouse gas emissions in 2016 (EPA 2018). $CO_2$ equivalent is a measurement that allows an aggregate comparison of multiple greenhouse gases (e.g., $CO_2$, $CH_4$, and $N_2O$), created by multiplying the actual or anticipated emissions of each gas by its relative GWP. Therefore, the GWPs used for greenhouse gas emission calculations and reporting for the Rock Springs planning area for 100 years are $CO_2$ = 1, $CH_4$ = 28, and $N_2O$ = 265 and for 20 years are $CO_2$ = 1, $CH_4$ = 84, and $N_2O$ = 264. Table T-5 shows the estimated annual emissions of the greenhouse gases for each alternative in year 1, year 10, and year 20.

## Table T-5. Total Estimated Greenhouse Gas Emissions Summary for Bureau of Land Management Activities in the Rock Springs Planning Area (Tons or Metric Tonnes)

| Scenario | $CO_2$ (tons) | $CH_4$ (tons) | $N_2O$ (tons) | $CO_2$eq tons (100 Year) | $CO_2$eq metric tonnes (100 Year)* | $CO_2$eq tons (20 Year)** |
|---|---|---|---|---|---|---|
| Alternative A - Year 1 | 1,792,764 | 26,021 | 39 | 3,476,501 | 3,153,829 | 4,083,849 |
| Alternative B - Year 1 | 1,564,352 | 16,782 | 20 | 2,984,314 | 2,707,325 | 3,074,262 |

| Scenario | $CO_2$ (tons) | $CH_4$ (tons) | $N_2O$ (tons) | $CO_2$eq tons (100 Year) | $CO_2$eq metric tonnes (100 Year)* | $CO_2$eq tons (20 Year)** |
|---|---|---|---|---|---|---|
| Alternative C - Year 1 | 1,807,623 | 26,560 | 106 | 3,524,047 | 3,196,962 | 4,161,517 |
| Alternative D - Year 1 | 1,790,750 | 26,013 | 39 | 3,474,249 | 3,151,786 | 4,081,131 |
| Alternative A - Year 10 | 2,981,005 | 38,933 | 56 | 5,030,699 | 3,706,757 | 6,361,095 |
| Alternative B - Year 10 | 1,824,372 | 19,671 | 24 | 3,326,211 | 3,017,488 | 3,577,975 |
| Alternative C - Year 10 | 3,036,206 | 40,017 | 123 | 5,133,982 | 4,657,471 | 6,525,008 |
| Alternative D - Year 10 | 2,971,247 | 38,937 | 56 | 5,020,997 | 4,554,973 | 6,351,589 |
| Alternative A - Year 20 | 4,279,554 | 52,984 | 74 | 6,727,520 | 6,103,105 | 8,844,778 |
| Alternative B - Year 20 | 2,097,511 | 22,633 | 28 | 3,683,300 | 3,341,435 | 4,100,930 |
| Alternative C - Year 20 | 4,380,881 | 54,693 | 142 | 6,894,592 | 6,254,671 | 9,107,486 |
| Alternative D - Year 20 | 4,260,853 | 52,955 | 74 | 6,707,907 | 6,085,313 | 8,823,508 |

*GWP-100 yr $CH_4$ = 28, $N_2O$ = 265
** GWP-20 yr $CH_4$ = 84, $N_2O$ = 264

According to the Intergovernmental Panel on Climate Change (IPCC), "*Emission metrics facilitate multi-component climate policies by allowing emissions of different greenhouse gases and other climate forcing agents to be expressed in a common unit (so-called 'CO2-equivalent emissions'). The GWP was introduced in the IPCC First Assessment Report, where it was also used to illustrate the difficulties in comparing components with differing physical properties using a single metric. The 100-year GWP (GWP100) was adopted by the United Nations Framework Convention on Climate Change and its Kyoto Protocol and is now used widely as the default metric. It is only one of several possible emission metrics and time horizons. {WGI 8.7, WGIII 3.9} The choice of emission metric and time horizon depends on type of application and policy context; hence, no single metric is optimal for all policy goals. All metrics have shortcomings, and choices contain value judgments, such as the climate effect considered and the weighting of effects over time (which explicitly or implicitly discounts impacts over time), the climate policy goal and the degree to which metrics incorporate economic or only physical considerations. There are significant uncertainties related to metrics, and the magnitudes of the uncertainties differ across metric type and time horizon. In general, the uncertainty increases for metrics along the cause–effect chain from emission to effects. {WGI 8.7, WGIII 3.9}."* (IPCC 2014)

Typical sources contributing to potential cumulative impacts on air quality would include emissions from conventional oil and gas development, vehicle operations associated with mining activities, and general vehicular activity. Overall, air quality in the Rock Springs planning area is good. In 2012, EPA designated the Upper Green River Basin Area (UGRB) as a nonattainment area for the 2008 ozone NAAQS. The UGRB 2008 ozone nonattainment area includes a portion of Sweetwater County. See 40 CFR § 81.351. In 2016, the EPA determined that the UGRB 2008 ozone marginal nonattainment area had attained the 2008 ozone NAAQS. See 40 CFR §52.2623. However, the EPA has not yet formally re-designated the UGRB from nonattainment to maintenance status for the 2008 ozone NAAQS. In 2018, the EPA designated all areas within Wyoming, including all areas within the Rock Springs planning area, as attainment/unclassifiable for the 2015 ozone NAAQS. Some concentrated emission sources may have health impacts to certain local residents due to the potential levels of pollutants, such as a large plant or mine. Increases in population would likely bring more development and the potential for more emission sources that could degrade air quality in the planning area.

BLM and non-BLM reasonably foreseeable actions are anticipated to increase emissions in the planning area over the life of the plan. For the planning area, the cumulative air quality impacts (as measured against NAAQS and WAAQS) are anticipated to have the same intensity on BLM and non-BLM administered

lands because it is assumed the density of activities are the same in both areas. This conclusion also assumes that cumulative impacts to air quality are equally distributed across the planning area. Because of proposed development restrictions on BLM administered land, the potential for adverse cumulative impacts to air quality are anticipated to be the least under Alternative B, which places the greatest restrictions on resource uses and management actions that contribute emissions, followed by Alternatives D, A, and C. Cumulative emissions are projected to be highest under Alternative C due to fewer proposed development restrictions on BLM administered land. Cumulative emissions within the Planning Area are not anticipated to result in air quality impacts that exceed NAAQS or WAAQS given the rather small amount of emissions from the BLM and other activities.

Estimated future BLM and non-BLM emissions are accounted for in the air quality cumulative emissions analysis. The 2014 Wyoming statewide emissions, which were obtained from the 2014 National Emissions Inventory (NEI) Data (EPA, 2014), were used in this analysis as a comparison. The long-year (year 20) has the largest impact to air quality emissions and therefore was used for the cumulative analysis, as all other years (year 1 and year 10) would have less impact. For each Alternative BLM activities and non-BLM activities (from oil, gas, and coal mining) which occur within the RSFO planning area were reviewed and compared to the 2014 Wyoming statewide estimated emissions (obtained from the 2014 NEI). Specific assumptions include:

- The cumulative impacts from non-BLM mineral actions (oil, gas, and coalbed natural gas [CBNG]) are based on the percent BLM vs. non-BLM mineral estate in the planning area.
- For cumulative impacts associated with other activities (i.e., non-oil and gas), the amount and density of activities is assumed to be the same for both BLM and non-BLM actions.
- Statewide emissions were obtained from the most recent EPA NEI data available from 2014.

Table T-6 shows criteria pollutant and hazardous air pollutants (HAP) emissions from BLM and non-BLM sources. Figure T-1, Figure T-2, Figure T-3, and Figure T-4 show the long year emissions from BLM and non-BLM sources in the planning area under Alternatives A, B, C, and D, respectively. Emissions under the Proposed RMP are anticipated to be between Alternatives B and D, but more similar to Alternative D.

**Table T-6. Comparison of Emissions from Bureau of Land Management and Non-Bureau of Land Management Activities in the Rock Springs Planning Area to Cumulative Annual Statewide Emissions for 2014**

| Pollutant | Estimated BLM Emissions in the Rock Springs Planning Area (tons per year) | Estimated Non-BLM Emissions in the Rock Springs Planning Area (tons per year) | 2014 Wyoming Statewide Emissions (tons per year) | Total Tons per year | % Contribution of Actions within the Rock Springs Planning Area Emission to Statewide Emissions |
|---|---|---|---|---|---|
| **Alternative A - Long Year (Year 20)** | | | | | |
| PM10 | 32,759 | 9,135 | 195,603 | 237,498 | 17.64% |
| PM2.5 | 4,663 | 1,077 | 38,495 | 45,415 | 12.98% |
| NOX | 26,126 | 6,779 | 177,330 | 210,235 | 15.65% |
| SO2 | 50 | 7 | 56,772 | 56,830 | 0.10% |
| CO | 23,454 | 5,609 | 411,274 | 440,337 | 6.60% |
| VOC | 72,334 | 21,782 | 814,311 | 908,427 | 10.36% |
| HAPs | 2,659 | 812 | 81,431 | 84,902 | 4.09% |

| Pollutant | Estimated BLM Emissions in the Rock Springs Planning Area (tons per year) | Estimated Non-BLM Emissions in the Rock Springs Planning Area (tons per year) | 2014 Wyoming Statewide Emissions (tons per year) | Total Tons per year | % Contribution of Actions within the Rock Springs Planning Area Emission to Statewide Emissions |

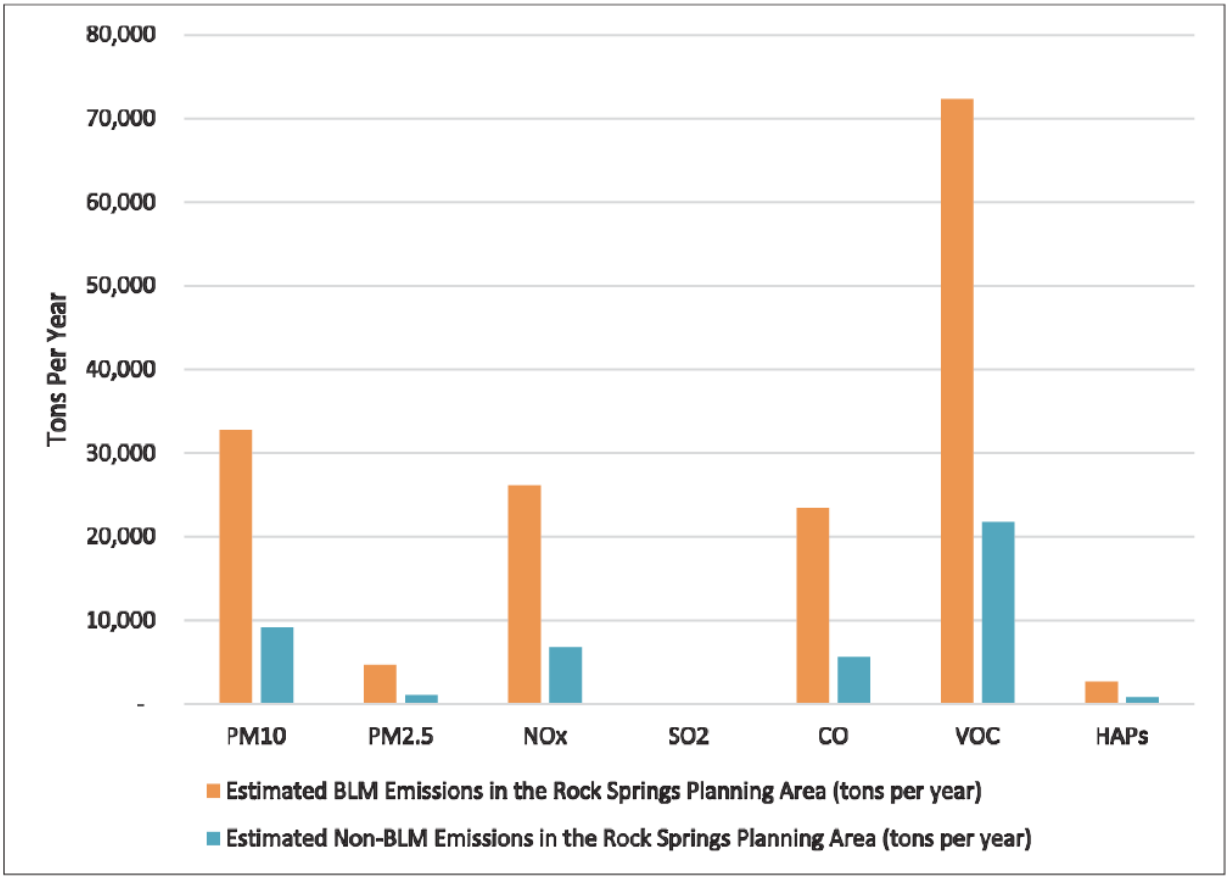
| HAPs | 2,652 | 824 | 81,431 | 84,908 | 4.09% |

### Alternative A

Criteria air pollutant and HAPs, emissions from BLM managed source emissions would be more than non-BLM managed source emissions, however would be less than the 2014 Wyoming statewide emissions in the planning area. Table T-6 shows criteria pollutant and HAP emissions from estimated BLM and non-BLM sources against the Wyoming statewide emissions inventory. $PM_{10}$ is the largest percentage of emissions contribution within the Rock Springs planning area with 17% of the total emissions contributed by activities on BLM land, whereas $SO_2$ is the lowest percentage at 0.1%. Figure T-1 shows the long-year emissions from BLM and non-BLM sources in the planning area under Alternative A.

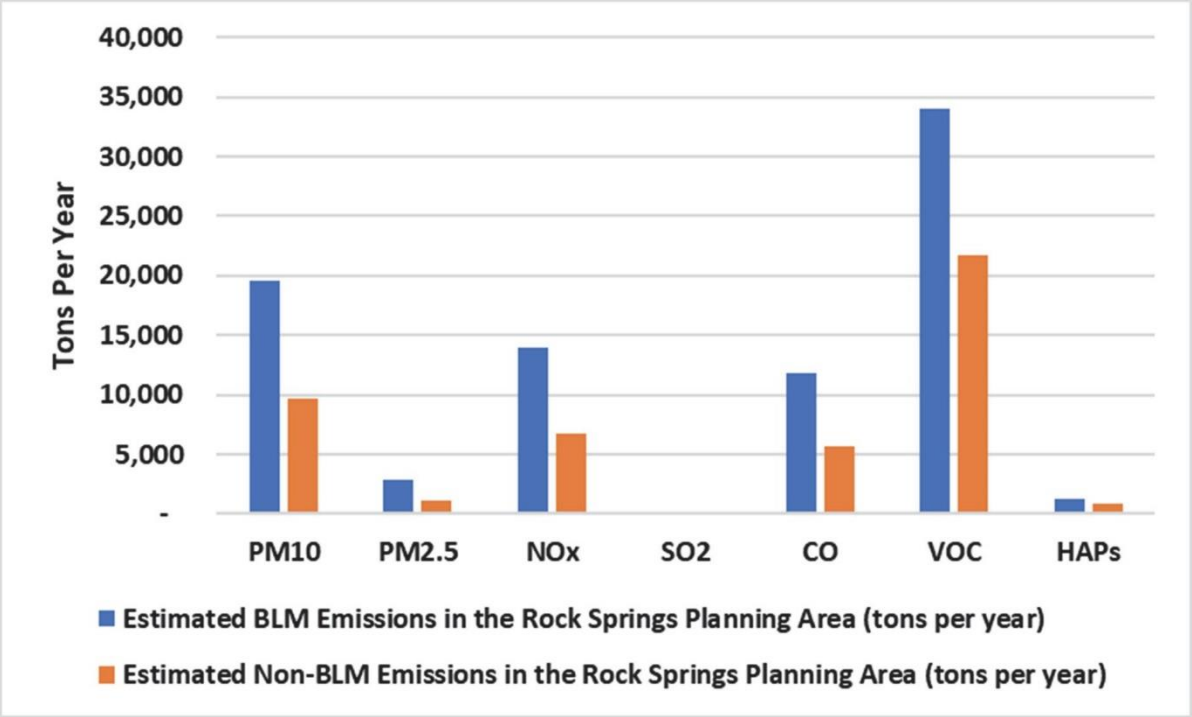
**Figure T-1. Long Year Emissions from Bureau of Land Management and Non-Bureau of Land Management Sources in the Planning Area under Alternative A**



### Alternative B

Alternative B has the smallest cumulative impact with emissions from BLM managed source emissions would be more than non-BLM managed source emissions, however would be less than the 2014 Wyoming statewide emissions in the planning area. Table T-6 shows criteria pollutant and HAP emissions from estimated BLM and non-BLM sources against the Wyoming statewide emissions inventory. $PM_{10}$ is the largest percentage of emissions contribution within the Rock Springs planning area with 13% of the total emissions contributed by activities on BLM land, whereas $SO_2$ is the lowest percentage at 0.05%. Figure T-2 shows the long-year emissions from BLM and non-BLM sources in the planning area under Alternative B.

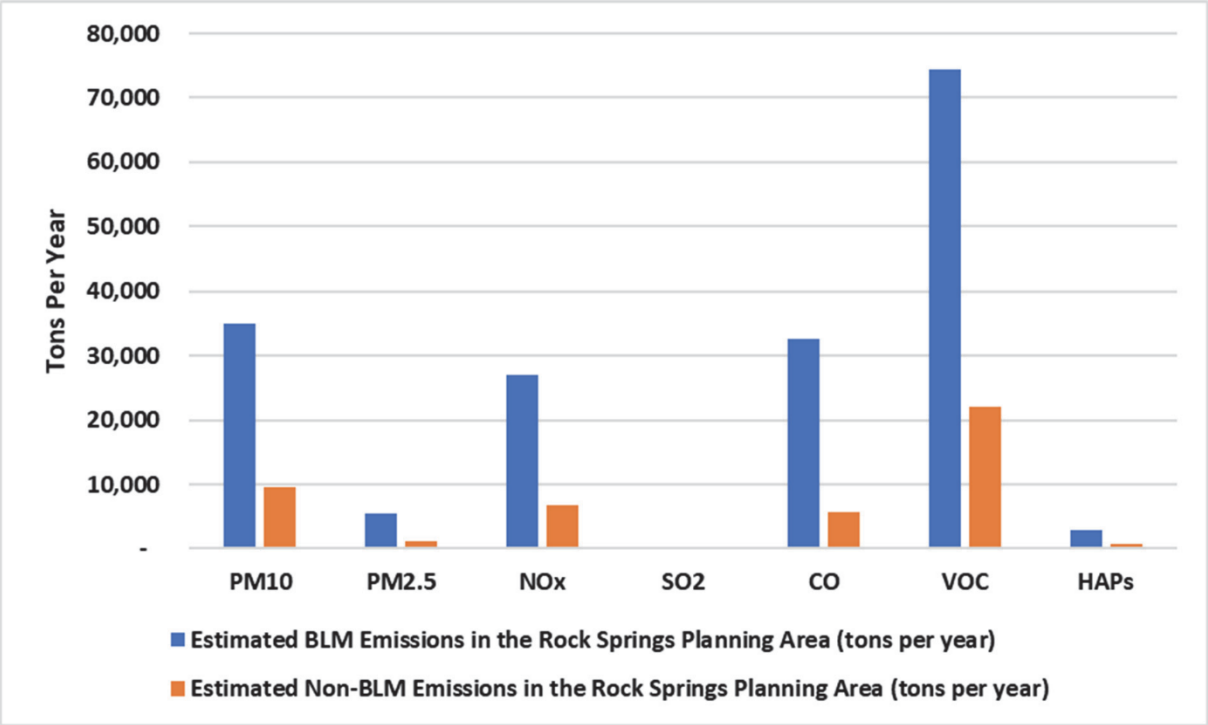
**Figure T-2. Long Year Emissions from Bureau of Land Management and Non-Bureau of Land Management Sources in the Planning Area under Alternative B**



### Alternative C

Alternative C has the largest cumulative impact with emissions from BLM managed source emissions would be more than non-BLM managed source emissions, however would be less than the 2014 Wyoming statewide emissions in the planning area. Table T-6 shows criteria pollutant and HAP emissions from estimated BLM and non-BLM sources against the Wyoming statewide emissions inventory. $PM_{10}$ is the largest percentage of emissions contribution within the Rock Springs planning area with 23% of the total emissions contributed by activities on BLM land, whereas $SO_2$ is the lowest percentage at 0.2%. Figure T-3 shows the long-year emissions from BLM and non-BLM sources in the planning area under Alternative C.

**Figure T-3. Long Year Emissions from Bureau of Land Management and Non-Bureau of Land Management Sources in the Planning Area under Alternative C**

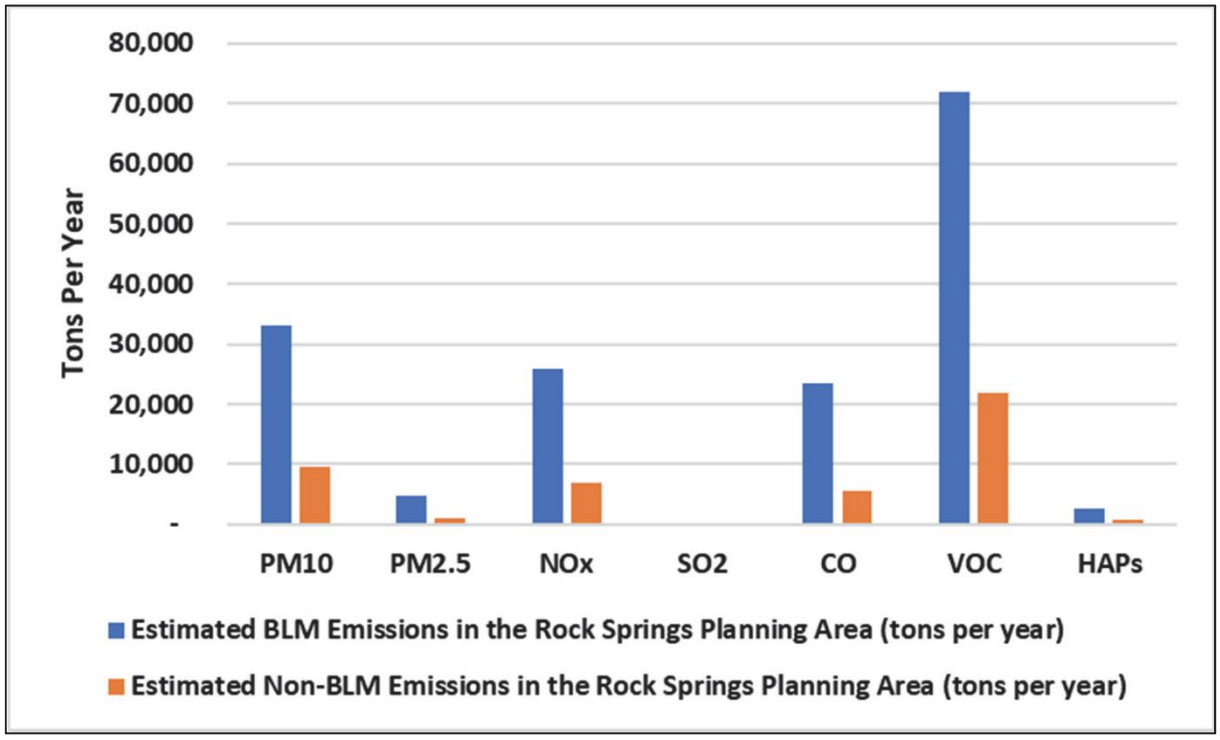


### Alternative D

Alternative D has similar cumulative impact as Alternative A, as emissions from BLM managed source emissions would be more than non-BLM managed source emissions, however would be less than the 2014 Wyoming statewide emissions in the planning area. Table T-6 shows criteria pollutant and HAP emissions from estimated BLM and non-BLM sources against the Wyoming statewide emissions inventory. $PM_{10}$ is the largest percentage of emissions contribution within the Rock Springs planning area with 22% of the total emissions contributed by activities on BLM land, whereas $SO_2$ is the lowest percentage at 0.1%. Figure T-4 shows the long-year emissions from BLM and non-BLM sources in the planning area under Alternative D.

Air resources were evaluated within the planning area to determine how air quality could be affected by future federal actions implemented under this RMP. Actions that initiate or increase emissions of air pollutants can result in negative effects on air resources, including increased concentrations of air pollutants, decreased visibility, increased atmospheric deposition on soils and vegetation, and acidification of sensitive water bodies. Actions that reduce or control emissions of air pollutants can be very effective at improving air quality and preventing degradation.

**Figure T-4. Long Year Emissions from Bureau of Land Management and Non-Bureau of Land Management Sources in the Planning Area under Alternative D**



### Proposed RMP

Estimated emissions under the Proposed RMP are predicted to be between the estimated emissions of Alternative B and Alternative D. However, the land use restrictions and allocations shown in Table ES-1 for the Proposed RMP are generally closer to Alternative D compared to Alternative B. Therefore, the emissions associated with the Proposed RMP are predicted to be closer to Alternative D compared to Alternative B. Refer to Figure T-2 and Figure T-4, above, for the emissions of Alternative B and Alternative D, respectively.

## Greenhouse Gas Emissions

On January 2, 2011, the EPA began covering greenhouse gas emissions under the CAA from mobile and stationary sources of air pollution through prevention of significant deterioration (PSD) and Title V Operating Permit Programs, because of their contribution to global climate change. While leasing actions would not generate any direct or indirect greenhouse gas emissions, the BLM recognizes that the reasonably foreseeable consequence of leasing may be oil and gas development, and that such development could result in an increase in greenhouse gas emissions due to the post production or "downstream" uses of the petroleum products produced from these parcels. The BLM used readily available scientific information and reasonable assumptions about product end use to estimate potential downstream emissions attributable to this lease sale. It should be noted at the outset that the BLM does not exercise control over the specific end use of the oil and gas produced from any individual federal lease and has no authority to direct or regulate the end use of the produced products. As a result, the BLM can only provide an estimate of potential greenhouse gas emissions by assuming that all produced products would eventually be combusted. The uncertainty about end uses is in addition to the uncertainty with regard to the actual levels of development and production that may occur at any given well.

Table T-7, Estimated Greenhouse Gas Emissions from BLM Actions Due to Fossil Fuel Combustion, shows the comparison of greenhouse gas emissions from BLM actions for Alternative C (largest impact alternative) to U.S. reported greenhouse gas emissions from 2018, statewide reported greenhouse gas emissions from 2018, and Sweetwater County reported greenhouse gas emissions from 2018 (EPA 2018). The inventory was obtained from the EPA's Facility Level Information on Greenhouse Gases Tool (FLIGHT) and was based on actual reported emissions for 2018. Greenhouse gas emissions estimated for the largest impact alternative (Alternative C) comprise a total of 64.56% of statewide greenhouse gas emissions. The largest impact of greenhouse gas emissions statewide is natural gas combustion, closely followed by coal combustion. The total estimated greenhouse gas emissions for Alternative C (largest impact alternative) of 36.87 million metric tonnes are approximately equal to 1.2% of the total U.S. 2018 greenhouse gas emissions of 2,987 million metric tonnes of $CO_2$ equivalents (EPA 2018). In this analysis it was assumed that 100% of oil and associated gas produced included in this EIS would be attributed to fossil fuel combustion within the U.S. for residential heating and electricity.

**Table T-7. Estimated Greenhouse Gas Emissions from Bureau of Land Management Actions Due to Fossil Fuel Combustion**

| BLM Alternative C - Long Year (year 20) | | TOTAL U.S. GHG Emission Reported in 2018 | | TOTAL Wyoming GHG Emission Reported in 2018 | | TOTAL Sweetwater County GHG Emission Reported in 2018 | | Total Federal Lands GHG Emissions and Sequestration Reported in 2014 | |
|---|---|---|---|---|---|---|---|---|---|
| **Action** | **Estimated $CO_2eq$ (million metric tons)** | **$CO_2eq$ (million metric tons)** | **% BLM RSFO Contri-bution** | **$CO_2eq$ (million metric tons)** | **% BLM RSFO Contri-bution** | **$CO_2eq$ (million metric tons)** | **% BLM RSFO Contri-bution** | **$CO_2eq$ (million metric tons)** | **% BLM RSFO Contri-bution** |
| Coal Combustion Total | 15.85 | 2,987 | 0.53% | 59.46 | 26.66% | 16.88 | 88.09% | 1,279 | 1.24% |
| Oil Combustion Total | 3.38 | | 0.11% | | 5.69 % | | --* | | 8.99% |
| Natural Gas Combustion Total | 17.47 | | 0.58% | | 29.38% | | --* | | 1.37% |
| Trona Transport Total | 0.16 | | 0.01% | | 0.27% | | 0.90% | | 0.01% |
| **TOTAL Emissions** | **36.87** | | **1.23%** | | **64.56%** | | **88.99%** | | **11.61%** |

* The majority of oil and gas is not combusted in the county; therefore, greenhouse gas downstream emissions are not completed for Sweetwater County.

Several activities contribute to the phenomena of climate change, including emissions of greenhouse gases (especially $CO_2$ and $CH_4$) from fossil fuel development, large wildfires and activities using combustion engines; changes to the natural carbon cycle; and changes to radiative forces and reflectivity (albedo). It is important to note that greenhouse gases will have a sustained climatic impact over different temporal scales. For example, recent emissions of $CO_2$ can influence climate for 100 years.

At this time, the BLM is disclosing the likelihood and potential magnitude of downstream greenhouse gas emissions but is not able to disclose potential impacts to climate change from the estimated downstream greenhouse gas emissions related to mineral development and other activities. It may be difficult to discern whether global climate change is already affecting resources in the planning area (as opposed to on a global level). It is important to note that projected changes locally are likely to occur over several decades to a century. Therefore, many of the activities in the planning area associated with climate change may not be

measurably discernible within the reasonably foreseeable future. Existing climate prediction models are global or continental in scale; therefore, they are not appropriate to estimate potential impacts of climate change on the planning area. The current state of the science involves calculating potential quantities of greenhouse gases that may be added to the atmosphere from a particular activity. However, tools to analyze or predict how global or regional climate systems may be affected by a particular activity or activities within the planning area are not currently available. Assessing the impacts of greenhouse gas emissions on global climate change requires modeling on a global scale which is beyond the scope of this analysis. Potential impacts on climate change are influenced by greenhouse gas emission sources from around the globe and it is not possible to distinguish the impacts on global climate change from greenhouse gas emissions originating from the planning area.

The social cost of carbon (SCC) is an estimate of the monetized damages associated with a small increase in $CO_2$ emissions (typically one metric ton) in a particular year. This dollar figure also represents the value of damages avoided for a small emission reduction. SCC is meant to be a comprehensive estimate of climate change damages and includes changes in net agricultural productivity, human health, property damages from increased flood risk, and the value of ecosystem services due to climate change. Federal agencies use the SCC to incorporate the social benefits of reducing $CO_2$ emissions into the cost-benefit analyses of certain regulatory actions (Interagency Working Group on Social Cost of Carbon 2010).

Although the SCC can be a helpful tool to assess the benefits of $CO_2$ reductions, it does not include all damages given current modeling and data limitations. The models used to develop the SCC estimates do not include all of the important physical, ecological, and economic impacts of climate change because of a lack of precise data on the nature of potential damages and because the science used in the models lags behind the most recent research. The NEPA process does not require a cost-benefit analysis or a quantitative presentation of SCC cost estimates. Without the completion of a thorough cost-benefit analysis incorporating the social benefits of energy production, the inclusion of an SCC analysis would present only part of the necessary data. Therefore, the SCC protocol was not used in this analysis. Greenhouse gas combustion emissions are quantified and compared to national and global greenhouse gas emissions above.

## Soil Resources

The CIAA used to analyze cumulative impacts on soils includes the entire planning area. Surface-disturbing activities occurring within the planning area are not expected to affect soil resources outside the planning area. However, watershed impacts (sediment delivery to stream systems, sedimentation, changes in frequency, duration, and volume runoff) could extend beyond the planning area.

Cumulative impacts on soils would result from all surface-disturbing activities, removal of vegetation cover, soil compaction, and the associated accelerated erosion. Mineral development activities, including oil and gas, coal, and other minerals, and related construction of roads, pipelines, and well pads would be the primary cause of such disturbances; although activities such as utility corridor and wind energy development would also contribute cumulatively to localized impacts on soils. Vegetation treatments and large range improvements, including prescribed fire, have and would continue to affect soils resources locally, but the actions would increase vegetation cover and soil health over the long term. All forms of recreational activities, particularly OHV use, can increase potential for erosion, sedimentation, gully creation, biologic soil crust damage, and riparian and upland vegetation damage. Grazing of wild horses and livestock could affect soil resources in some areas where animals congregate, increasing soil loss, erosion, or soil compaction in these areas. However, the significance of impacts varies with the nature and degree of disturbance as well as site specific environmental conditions.

The implementation of the BLM's mitigation guidelines, restrictions on surface use, continued implementation of land health standards, and monitoring efforts would provide protection to soils on federal lands and lands with federal subsurface minerals, which would help reduce cumulative effects.

The greatest surface disturbing activities could occur under Alternative C, followed by Alternatives A, D, and the Proposed RMP and Alternative B. Alternative B would have the most restrictions on surface disturbing activities among the action alternatives. Cumulative impacts on soil resources would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Watershed and Water Quality

The CIAA boundary for watershed resources and water quality includes watersheds that intersect the planning area (Map 3-1). While surface-disturbing activities within the planning area are not expected to affect watershed resources and water quality outside of the planning area, watershed impacts beyond the planning area are dependent on hydrograph alteration and the quality and quantity of water flowing from the planning area.

Degradation of the water resource can be a rapid process, whereas recovery is often much slower. The cumulative impacts on watersheds and water quality are dependent primarily on the health of the vegetative community, the amount of surface disturbance, the amount of pollutants, and the degree to which groundwater quality and quantity are degraded through human activity.

Cumulative impacts to water resources would occur as a result of surface disturbing activities from mineral and energy development, vehicle use, recreation, vegetation treatments, livestock grazing, and wildfire. These activities cause surface disturbances by removing vegetation cover, displacing and compacting soils, and altering soil structure and chemistry. The result is exposed surfaces that increase the potential for runoff and erosion, which delivers sediment and contaminants to nearby waterways. Sedimentation in waterways can cause changes in water chemistry as well as geomorphic adjustments that could have negative effects on stream function.

Accidental or direct inputs of nutrients, chemicals, or other pollutants may occur during development activities, recreation and vehicle use, wildfire, vegetation treatments, or from livestock or other grazing animals. Cumulative impacts from nutrients, chemicals, or other pollutants entering waterways could result in degraded or impaired water quality, including eutrophication of smaller streams or canals.

Best management practices (BMP), reclamation efforts, and monitoring of environmental conditions can minimize the impacts of development and the resulting disturbance to the hydrologic cycle, but they are not completely effective. Therefore, the greater the level of disturbance, through whatever source and means, to the vegetation, the land surface, and subsurface structure, the greater the disruption to the water resource.

The greatest surface disturbing activities could occur under Alternative C, followed by Alternatives A, D and Alternative B. Alternative B would have the most restrictions on surface disturbing activities. The Proposed RMP would generally result in similar impacts from surface disturbing activities on water resources as Alternatives B and D. Cumulative impacts to watersheds and water quality would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP, with Alternative B being the lowest.

## Vegetative Communities

The CIAA used to analyze cumulative impacts on vegetation extends outside the planning area, following fourth-order watershed (eight-digit hydrologic unit code [HUC]) boundaries (Map 3-1). The CIAA is composed of fourth-order watersheds that completely or partially overlap the planning area. Fourth-order watersheds were used as the basic unit of analysis because the scope of cumulative influence would be at the watershed scale and is not expected to extend beyond this scale.

Cumulative effects on vegetation within the CIAA would result primarily from surface-disturbing activities that directly remove vegetation, such as mineral development and associated infrastructure, road and ROW development, rangeland improvements, and dispersed recreation. This would also indirectly affect vegetation by reducing the forage base, thereby increasing wildlife and livestock grazing on existing vegetation resources. The displacement of wildlife associated with surface-disturbing and other disruptive activities would also serve to increase grazing on non-disturbed vegetation resources. Surface disturbance would increase the proliferation of noxious and invasive weeds, which would increase the need for weed-controlling activities. Vegetation treatments would cause short-term impacts on vegetation by decreasing vegetation production and increasing establishment of early successional species. Long-term effects could include increased production and diversity of vegetation communities.

Oil and gas development would cause the greatest amount of surface disturbance through construction of well pads, roads, pipelines, and other facilities. Cumulative impacts would likely be greater where mineral development is more intense, and on state and private lands because of greater protections afforded to natural resources on public lands compared to state and private lands.

The degree of impact on vegetation communities would depend on the timing of activities and whether the amount of activity within the CIAA outpaces successful reclamation and revegetation efforts in disturbed areas. The implementation of the BLM's mitigation guidelines, BMPs, and restrictions on surface use would help to reduce overall effects. However, given the level of anticipated mineral development and that most of the native shrub communities (e.g., sagebrush) require in excess of 20 years to reestablish to pre-disturbance conditions, surface disturbance impacts are expected under all alternatives.

The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts on vegetation resources would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Wildlife and Fisheries

The CIAAs used to analyze potential impacts on wildlife and fisheries vary by species. The CIAAs for pronghorn, mule deer, elk, and moose comprise the HMAs (for each species) that intersect the planning area (Map 3-3). The CIAA for all other wildlife comprises the planning area. The CIAA for fisheries covers the same area as the CIAA for water quality and watershed resources. It extends outside the planning area, following fourth-order watershed (eight-digit HUC) boundaries (Map 3-1).

Cumulative effects on wildlife and fisheries within the CIAAs would result primarily from surface-disturbing and other disruptive activities such as mineral and energy development and associated infrastructure, geophysical exploration, urban expansion and subdivision of private lands, ROWs, rangeland improvements, fences of all kinds, vegetation treatments, and dispersed recreation. These activities could result in short-term and long-term habitat fragmentation and animal displacement. Habitats could become unavailable to wildlife because of human disturbance factors (e.g., traffic, machinery, noise, livestock grazing activities) during sensitive time periods such as winter, birthing, nesting, and early rearing of young. Loss of vegetation from development activities would degrade habitat and increase forage competition among grazing animals. Livestock grazing practices could further increase cumulative impacts through direct competition for forage, water, and space, and by limiting the ability to manage vegetation for fish and wildlife needs. These impacts would also reduce the capability to maintain current population objectives.

Oil and gas development would cause the greatest amount of surface disturbance through construction of well pads, roads, pipelines, and other facilities. Reclamation and mitigation efforts would reduce impacts on wildlife habitat and fisheries; however, construction and maintenance of roads and well pads and the presence of humans would result in long-term or permanent impacts. Cumulative impacts would likely be

greater where mineral development is more intense, in areas where development overlaps with crucial and winter wildlife ranges, and on state and private lands because of the lack of protections afforded to natural resources in these areas. As development expands throughout southwestern Wyoming, the ability of big game and other wildlife species to disperse into habitats outside of the planning area could become limited. This may create isolated populations in areas where habitats remain intact. The degree of impact would depend on the timing of development activities and whether the amount of activity within each CIAA outpaces the successful reclamation and revegetation efforts in disturbed areas. Because of this pace of development (whether federal mineral, commercial, or private residence), more pressure would be put on habitats outside of the development (likely private lands) as wildlife is displaced from the disturbances.

Crucial winter range and birthing habitat are important areas to the viability of big game. Persistent disturbance in sensitive habitats would shift the areas of use and weaken the tendency of the animals to return to the disturbed area. If animals return to disturbed habitat, populations could be lower and use of the habitat could be unpredictable. Mineral development activities would likely cause displacement of animals and selection of alternative habitats and would likely inhibit big game movement between winter ranges and birthing areas. The displacement of big game, and specifically mule deer, from high-use to low-use areas has the potential to influence survival and reproduction (Sawyer et al. 2006). Should migration be disrupted and key habitats continue to be degraded over a short period of time, it is likely that long-term displacement of big game from these habitats would occur.

The health of fisheries within the CIAA is directly related to the overall health and functional capabilities of riparian resources, which are a reflection of watershed health. It is assumed that any substantial unmitigated disturbances to the soils or changes in vegetative cover would have an adverse effect on watershed health and water quality and would therefore have an adverse effect on associated fisheries. The degree of impact attributed to any one disturbance or series of disturbances is influenced by location within the watershed, time and degree of disturbance, existing vegetation, and precipitation. Surface disturbances would result in accelerated erosion and runoff, increasing stream flow and sediment and nutrient loads to local channels. Sedimentation of a stream channel could impact fisheries by reducing habitat complexity, which results in a lower diversity of prey organisms. Increased turbidity would result from increased sediment input, which decreases light penetration and inhibits visual predation by fish. Surface disturbance near streams that results in substantial removal of riparian vegetation could increase current velocity, which puts additional strain on fish and reduces nutrient cycling. In addition to increased sediment input, stream bank disturbance could impact fisheries by creating bank instability, which would alter flow regimes and destroy pool-riffle formations necessary for fish survival. Increased nutrient loading of streams can impact fisheries by increasing primary production above natural levels, which degrades habitat and decreases oxygen levels. Surface disturbance and timing restrictions and stipulations afforded all streams and riparian areas within the planning area would help to reduce impacts. Conventional oil and gas and CBNG development activities would be the primary cause of surface disturbance and related impacts on fisheries on public lands in the RSFO.

Because stream systems within the planning area are not entirely under BLM management and cross onto state and private ownerships, the connectivity of these streams is sometimes incomplete. Thus, the metapopulations for fish species are also disconnected. Often this occurs because of irrigation diversions or other such barriers that do not allow for migration between smaller headwater streams via the larger streams and rivers. Population objectives sometimes reflect these discontinuities, and re-establishment of connectivity is usually a major goal. Without this connectivity and with a continuation of additional fragmentation within the entire CIAA, populations of many fish species would continue to be threatened.

Impacts on wildlife would likely occur under all alternatives because of the loss of vital, high-value habitats and corridors between these habitats. The success of disturbed land reclamation, both short and long term, would determine the duration of impacts. The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities causing the least contribution to cumulative impacts to

wildlife and fisheries. Cumulative impacts on wildlife and fisheries habitat would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Special Status Species

The CIAA used to analyze potential impacts on Special Status Species vary by species and the habitat they inhabit or use for migration (for wildlife) both inside and adjacent to the planning area. The CIAA for special status fisheries covers the same area as the CIAA for water quality and watershed resources. It extends outside the planning area, following fourth-order watershed (eight-digit HUC) boundaries (Map 3-1).

Cumulative effects on Special Status Species plants and animals within the CIAA would result primarily from surface-disturbing and other disruptive activities such as mineral development and associated infrastructure, wind energy development, fences of all kinds, ROW and road development, prescribed and wildfire, introduction and spread of non-native, invasive plant species; urban expansion and subdivision of private lands, and dispersed recreation. These activities could result in short-term and long-term habitat loss, fragmentation, and animal displacement. Habitats could become unavailable to wildlife because of human disturbance factors (e.g., traffic, noise, energy development) during sensitive time periods such as winter, birthing, nesting, and early rearing of young. Loss of vegetation from development activities would degrade habitat and increase competition for food resources among special status and other wildlife species. Potential habitat for special status plants could be lost during development or other surface disturbing activities.

Depending on the extent and timing of activity (e.g., hiking, camping, or recreation), over time, casual use could cause slight to significant incremental changes to habitats that may be occupied by Special Status Species or provide necessary habitat components. Impacts could include trampling of special status plant species or damage to Special Status Species habitats, introducing noise or dust that can disturb species during sensitive periods, introducing invasive weeds or disease, degrading Special Status Species habitat, and causing direct or stress-related mortality. Stationary species such as plants would be particularly susceptible to cumulative effects from mineral development, recreation, wildfire, and livestock grazing. With the eventual increases of casual use resulting from increased populations or popularity of the area for recreation activity, incremental impacts could become significant for some species.

Permitted activities result in ground disturbance that could accumulate to affect large expanses of habitat. Surface disturbances could remove or degrade native vegetation, fragment habitats, introduce invasive weeds, displace species, cause abandonment of nesting and breeding areas, reduce availability of key habitat components, and reduce reproduction and survivability. However, all permitted activities, including reasonably foreseeable well development on federal minerals, proposed pipelines traversing the planning area, and mineral claims, would require BLM consultation to ensure projects would not adversely affect Special Status Species at a cumulative level. Additionally, BLM policy requires other Special Status Species of non-federal status (such as BLM sensitive and state-listed species) to receive the same protection and consideration as federally protected species.

Oil and gas development would cause the greatest amount of surface disturbance through construction of well pads, roads, pipelines, and other facilities. Reclamation and mitigation efforts would reduce impacts on special status wildlife; however, construction and maintenance of roads and well pads and the presence of humans would result in long-term or permanent impacts. Special Status Species, under the Endangered Species Act (ESA) and Wyoming BLM sensitive species guidance, would be protected on federal lands by site-specific mitigation, including exclusion or avoidance of all surface-disturbing activities; however, protection of non-federally listed species on private and state lands may not occur, resulting in potentially significant impacts on these species. The degree of impact would depend on the timing of development activities and whether the amount of activity outpaces the successful reclamation and revegetation efforts in disturbed areas. Because of this pace of development (whether federal mineral, commercial, or private

residence), more pressure would be put on habitats outside of the development (likely private lands) as wildlife is displaced from the disturbances.

Surface disturbance could increase the proliferation of noxious and invasive weeds, which could increase the need for weed-controlling activities. Vegetation treatments could cause short-term impacts on vegetation by decreasing vegetation production and increasing establishment of early successional species. Long-term effects could include increased production and diversity of vegetation communities. Untreated weeds on non-BLM lands that spread to adjacent BLM-administered lands would result in degradation of native habitat. Weed treatments on non-BLM lands which are intermingled with BLM-administered lands are the responsibility of the private landowner or lessee. Coordination with non-BLM landowners in the development and application of weed treatments would assure that weeds are identified and treated on all ownerships to maintain productivity of native vegetation, which comprises important wildlife habitats. Special status plant species, under the ESA and Wyoming BLM sensitive species guidance, would be protected on federal lands by site-specific mitigation, including exclusion or avoidance of all surface-disturbing activities; however, protection of these species on private and state lands may not occur, resulting in potentially significant impacts on these species.

The degree of impact on vegetation communities (habitat for special status wildlife) would depend on the timing of activities and whether the amount of activity within the CIAA outpaces successful reclamation and revegetation efforts in disturbed areas. The implementation of BLM mitigation guidelines, BMPs, and restrictions on surface use would help to reduce overall effects. However, given the level of anticipated mineral development and that most of the native shrub communities (e.g., sagebrush) require in excess of 20 years to reestablish to pre-disturbance conditions.

The greatest surface disturbing activities could occur under Alternative C, and the least would occur under Alternative B, then with Alternatives A, D, and the Proposed RMP ranging in the middle of these two alternatives. Cumulative impacts on Special Status Species habitat would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Wild Horses

The CIAA used to analyze cumulative impacts on wild horses includes the active HMAs within the planning area. Cumulative impacts would occur from a combination of activities and uses occurring within the HMAs. Past, present, and reasonably foreseeable future actions and conditions within the CIAA that have affected and will likely continue to affect wild horses are wildfires, surface-disturbing activities, the presence and abundance of grazing wildlife and livestock, increased recreational demands, and protections for sensitive resources.

Potential cumulative impacts on wild horses within the HMAs would result from a combination of activities and land uses occurring within the area. Such impacts would result primarily from surface-disturbing activities, human disturbance, and the presence of livestock that compete with wild horses for forage resources. These activities result in wild horse displacement and direct removal and indirect degradation of forage. Wild horses would directly benefit from actions to increase forage opportunities, to improve range conditions, to maintain or improve water sources, and to eliminate barriers to movement. Restrictions and prohibitions on surface disturbing activities, as well as reclamation efforts and vegetation treatments would reduce impacts on wild horses. A reduction in development and recreation activities would decrease soil disturbances and vegetation removal, increase available forage, and decrease the displacement of wild horses. Wild horses would indirectly benefit from restrictions on motorized travel or other potentials for disturbance from people and vehicles.

The greatest surface disturbing activities could occur under Alternative C, with Alternatives A and D having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to wild horses would be highest under Alternative C, followed by Alternatives A and D, with

Alternative B being the lowest. The Proposed RMP strikes a balance of impacts described, remaining consistent with Alternative A.

## Wildland Fire Ecology and Management

The CIAA used to analyze cumulative impacts on fire management includes the entire planning area. Because of noncontinuous fuels, low historic fire incidence, and significant fuel breaks (e.g., state and county roads), management activities occurring within the planning area would not be expected to affect fire management outside of the planning area for the majority of the planning area.

Cumulative impacts on wildland fire management would occur as a result of the increased or decreased surface disturbances from development, grazing, recreation activities, and fire management occurring within the planning area. As general use, recreation, mineral development, and grazing increase as a whole throughout the planning area, potential for impacts to fire management, would increase as greater human traffic and activities would increase potential ignition sources.

With increased development and attendant infrastructure (e.g., power lines, compressors, pipelines, and fuel tanks) comes a corresponding increase in the potential for fire suppression to occur within Wildland Urban Interface (WUI) areas. Suppression activities within WUI areas can be more dangerous, time-consuming, and expensive than suppression in undeveloped areas. Particularly critical would be the extra caution required for firefighter safety within an active gas field. This increased development would also impact the fuels management activities within the oil and gas fields. Increasing the amount of oil and gas development would require more WUI/industrial interface fuels treatment projects and would tax the BLM's ability to plan, fund, and implement these projects. The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to wildland fire management would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Cultural Resources

The CIAA for cultural resources includes the entire planning area and neighboring lands with a high potential for connected resources. Potential cumulative impacts on cultural resources would result from surface-disturbing activities that cause erosion or vibration from traffic and/or machinery, soil compaction, and landscape alteration. Oil and gas development would cause the greatest amount of cumulative effects on cultural resources from construction of well pads, roads, pipelines, and diverse ancillary facilities. These development actions could result in damage to or loss of cultural resources. Direct impacts on cultural resources can occur from unanticipated subsurface discoveries (cultural resources discovered during project construction activities). Post review discoveries generally result in the irretrievable loss of some or occasionally all of the cultural resource involved. Even when salvage excavations result in the retrieval of some or a substantial amount of data, the nature of archaeological discovery during surface-disturbing activities results in the partial loss of information (e.g., spatial data, associated materials that wind up in the spoil piles). Surface-disturbing activities (e.g., mineral development, livestock grazing improvements, dispersed recreation) on private, state, and other federal lands within the CIAA would substantially increase the level of cumulative impact on cultural resources.

Surface-disturbing activities that occur in close proximity to sensitive Native American sites and some historic sites would potentially introduce visual atmospheric or audible indirect intrusions to those sites where the setting contributes to their National Register of Historic Places (NRHP) eligibility. This would result in a cumulative loss of the integrity of the setting of sensitive Native American sites and the setting of historic trails. Projects implemented on land owned by the State of Wyoming and on private surface where the BLM's cultural resource process does not apply could result in substantial cumulative effects.

Potential impacts on cultural resources would be in part mitigated by Cultural Resource Management Plan actions; implementation of federal regulatory laws, actions, and guidelines designed to protect cultural resources; and through consultation processes with the State Historic Preservation Office and Native American tribal representatives. However, it is anticipated that such measures would not prevent many impacts from occurring. Severe impacts would be likely to occur in situations in which undocumented NRHP-eligible archaeological sites are impacted but not recognized.

Activities permitted through the BLM (such as leasing of federal minerals, and mining on federal minerals) would likely disturb cultural resources. Compliance with Section 106 of the National Historic Preservation Act would be required either through the State Protocol or the Section 106 regulations at 36 CFR 800 for these activities, which would require cultural surveys and avoidance or mitigation of identified sites. This could incrementally result in the identification of more cultural resources, and an increase in information concerning cultural resources within the planning area. However, cultural resources are best interpreted when studied on a landscape level, identifying regional similarities and variations. Continuing to identify and study cultural resources through project mitigation would preserve the cultural resources, but if not done with proper consideration and foresight could result in the loss of regional cultural context. Professional research, documentation, and preservation where necessary would mitigate incremental impacts by preserving the regional context and values associated with the individual and collective sites.

The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to cultural resources would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP, with Alternative B being the lowest.

## Paleontological Resources

The CIAA used to analyze cumulative impacts on paleontological resources includes the entire planning area. Management activities occurring within the planning area are not expected to affect paleontological resources outside of the planning area.

Potential cumulative impacts on paleontological resources would result primarily from surface-disturbing activities that cause erosion or vibration from traffic and/or machinery, soil compaction, and landscape alteration. These types of activity could result in exposure, damage, and/or destruction of paleontological resources. The policies associated with the paleontological resource management program, which require identification and mitigation of paleontological resources prior to surface-disturbing activities, would help to reduce potential impacts. Implementation of these requirements would also increase the potential for identification, recordation, and collection of paleontological resources. However, even with identification and mitigation requirements, the potential exists for damage or destruction of previously unknown paleontological resources discovered during construction. In addition, OHV use, dispersed recreation, and other surface-disturbing activities not subject to a permitting process could result in exposure, damage, or destruction of paleontological resources.

Surface-disturbing and recreational activities that occur on private and state lands would result in substantial impacts on paleontological resources because of the lack of legal protections afforded to these resources on these lands. Approximately 1,450,000 acres of state and private land occurs within the CIAA, on which activities and development are expected to cause substantial damage to or destruction of paleontological resources or result in the improper collection of scientifically important paleontological resources. The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to paleontological resources would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP, with Alternative B being the lowest.

## Lands with Wilderness Characteristics

The CIAA used to analyze cumulative impacts on lands with wilderness characteristics includes the entire planning area. Cumulative impacts on lands with wilderness characteristics would primarily occur from human presence and surface disturbing activities associated with development, construction, and recreation activities. This would include activities related to fluid mineral well development, mining, OHV use, and construction of power lines, wind turbines, generators, substations, and other above-ground facilities. Such surface-disturbing and disruptive activities within and in the vicinity of the nine areas determined to contain wilderness characteristics would degrade those characteristics. These activities involve land clearing, grading, soil disturbance, the removal of vegetative cover, and the construction of roads, well pads and other support facilities. Such activities occurring on lands with wilderness characteristics would impact both the naturalness and opportunities for solitude and primitive recreation. Naturalness would be degraded or eliminated primarily from increases in human activity, modifications to the landscape, and visual intrusions caused by the construction of roads, well pads, development sites, and other facilities. Opportunities for solitude and primitive recreation would be reduced or eliminated by increases in noise and the presence of people, vehicles, and equipment associated with OHV use and exploration and development of mineral resources. Once mineral development activities are completed, opportunities for solitude and primitive recreation could return. However, productive wells would remain in place and would be substantially noticeable until the wells are decommissioned and disturbance is reclaimed, thereby eliminating naturalness for the life of the well. Restoration activities would reduce the loss of naturalness, especially on exploration wells that would be rehabilitated and revegetated over the short term.

As development of public, private, and state-owned lands continues, the importance of protecting lands with wilderness characteristics would increase and the values of these areas would increase as development proceeds on surrounding areas. As solitude and primitive recreation experiences become rarer, additional people would be drawn to lands with wilderness characteristics for their open space and undeveloped characteristics. The implementation of the BLM's mitigation guidelines, reclamation requirements, restrictions on surface use, rangeland guidelines, vegetation treatments, and monitoring efforts would provide protection to resource values, which would help reduce overall effects on lands with wilderness characteristics.

Cumulative impacts on lands with wilderness characteristics would be greatest under Alternative C because development activities are anticipated to be greatest under this alternative. Impacts would be the least intensive under Alternative B because of increased protections to sensitive resources and from prohibiting or limiting the amount of surface disturbance that would occur throughout the planning area. Under the Proposed RMP, most lands with wilderness characteristics fall within other management areas such as ACECs and would follow the other management direction. This could cumulatively add to impacts on lands with wilderness characteristics.

## Visual Resources

The CIAA used to analyze cumulative impacts on visual resources includes the entire planning area. Potential impacts on VRM would result primarily from surface disturbance activities that cause visual intrusions and degrade the visual quality of the CIAA. Activities related to oil and gas development, wind energy projects, pipeline projects, and communication towers would have the potential to degrade visual resources and result in inconsistencies with VRM Class objectives. Cumulative impacts would likely be greater in areas where mineral development is more intense, and near state and privately owned lands because of the BLM's lack of authority on these lands. Impacts would be lowest in areas managed for VRM Class I objectives such as wilderness study areas (WSA) and other special management areas.

Cumulative impacts on visual resources would be greatest under Alternative C because development activities are anticipated to be greatest under this alternative. Alternatives A and D and the Proposed RMP would have fewer visual impacts due to restrictions on development and surface disturbing activities.

Impacts would be the least intensive under Alternative B because of increased protections to sensitive resources and from prohibiting or limiting the amount of surface disturbance that would occur throughout the planning area.

## Minerals and Renewable Energy

The CIAA used to analyze cumulative impacts on minerals management and renewable energy development includes the entire planning area. Management activities occurring within the planning area are not expected to affect mineral resource and renewable energy development management outside of the planning area. Past, present and reasonably foreseeable future actions and conditions within the CIAA that have affected and will likely to continue to affect minerals and renewable energy are market forces, availability of resources for development, regulatory and prescriptive constraints, and reservoir/reserve depletion.

Cumulative impacts on mineral development would occur from restrictions that prohibit or restrict surface disturbance that ultimately decrease the number of oil and gas wells drilled during the planning period, as well as the acres of land open to solid mineral leasing, mineral material disposal, and the location of mining claims. Prohibiting surface disturbance would not allow for the development of solid, locatable, and saleable minerals and would prohibit the construction of some well pads, access roads, pipelines, and ancillary facilities. Offsite methods such as directional drilling would be required to access oil and gas resources. In some cases, an operator could place a well pad, access road, or production facility in a less-sensitive area and drill to the well directionally to recover reserves underlying the area prohibited from surface disturbing activities. The equipment and personnel required for directional drilling could increase the complexity of operations and slow the drilling process. Directional drilling increases the risk of drilling problems such as stuck casing and diminished well production. Prohibiting surface disturbance and applying extra lease stipulations and terms could also cause an operator to move to nearby private or state land with no such restrictions and drill wells that could lead to drainage of federal reserves and loss of federal revenue. However, the indirect and cumulative effects of consolidating infrastructure over the life of multiple oil and gas reserves could reduce the need for ancillary infrastructure over the larger region as infrastructure becomes more centralized, and less infrastructure would be necessary to deliver products downstream.

Restricting surface disturbance could lead to the relocation of well pads, access roads, pipelines, and ancillary facilities to areas with fewer restrictions. Relocation of these proposed facilities could cause temporary delays in developing oil and gas resources and other minerals and could limit mineral development activities in these areas. Oil and gas and other mineral development are expected to continue under all alternatives. Implementing Alternative C would result in the development of the greatest number of wells during the planning period. Alternative B would result in the least number wells because of surface disturbance restrictions. The Proposed RMP would result in more wells than Alternative B, but less than Alternative C.

Solid, saleable, and locatable mineral operations would continue under all alternatives. However, new development would be restricted from an increase in lands identified as unsuitable for coal leasing and closed to solid and saleable, mineral development and proposed for withdrawal for locatable mineral entry. The degree of impact would be lowest under Alternative C because of fewer land use restrictions for the protection of sensitive resources. Conversely, the implementation of increased restrictions to protect sensitive resources under Alternative B would result in the greatest level of impact on mineral development. The degree of impact under the Proposed RMP would be less than Alternative B, but more than Alternative C.

Similarly, prohibiting and restricting surface disturbing activities would limit the development of renewable energy, and could cause project proponents to relocate and/or move to nearby private or state land with no such restrictions. This could cause temporary delays in developing renewable energy. If suitable adjacent

sites are not available, renewable energy development could be prohibited. Renewable energy development is expected to continue under all alternatives. The degree of impact would be lowest under Alternative C because of fewer land use restrictions for the protection of sensitive resources. Conversely, the implementation of increased restrictions to protect sensitive resources under Alternative B would result in the greatest level of impact on renewable energy development. The Proposed RMP would have fewer cumulative impacts to renewable energy than Alternative B, but more than Alternative C.

## Livestock Grazing Management

The CIAA used to analyze cumulative impacts on livestock grazing includes all grazing allotments within the planning area (Map 3-11). Livestock are managed within the boundaries of these allotments and therefore could be affected by activities occurring in these areas.

Potential cumulative impacts on livestock grazing operations would result from a combination of activities and land uses occurring within the CIAA. Such impacts would result primarily from surface-disturbing activities, human disturbance, and the presence of wildlife that compete with livestock for rangeland resources. These activities result in livestock displacement, direct removal and indirect degradation of forage, and direct and indirect costs to the grazing permittee. Reclamation efforts and vegetation treatments would reduce impacts on livestock grazing; however, construction of roads and well pads and the constant presence of humans and wildlife would result in long-term impacts.

An increase in human population would create additional demands for recreational use of the public lands used for grazing and could result in livestock displacement, increases in noxious weed infestation, and costs to operators and public land management areas. Oil and gas development activities and related construction of roads, pipelines, and well pads would lead to a cumulative increase in soil disturbance, vegetation removal, noxious and invasive weed proliferation, and livestock displacement. Impacts would be greater in areas with high-density mineral development projects. These impacts could result in substantial rangeland degradation and thereby jeopardize compliance with the Wyoming Standards for Healthy Rangelands (USDI, BLM 1997) on some allotments. The implementation of the BLM's mitigation guidelines, reclamation requirements, restrictions on surface use, rangeland guidelines, vegetation treatments, and monitoring efforts would provide protection to forage resources on federal lands, which would help reduce overall effects on livestock grazing resources and operations.

The promotion of natural fire in the ecosystem, along with vegetation treatments to improve habitats, will place more of the vegetation communities in the lower seral stage. Generally, this improves and increases the forage resource, and from the standpoint of the CIAA, could offset forage losses that may occur from large-scale industrial development in some areas.

The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to livestock grazing management would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP, with Alternative B being the lowest. The Proposed RMP strikes a balance of the impacts identified, remaining consistent with Alternative D.

## Recreation

The CIAA used to analyze cumulative impacts on recreation resources includes the planning area, and big game herd units that intersect the planning area. Wildlife populations are managed within these boundaries and therefore could be impacted by activities occurring in these areas. Because hunting and wildlife viewing are recreation activities within the planning area, any activities that affect game populations would in turn impact recreation activities and reduce recreation benefits.

Cumulative impacts on recreation would potentially occur from a mixture of land uses that results in conflicts for unconfined, dispersed recreational opportunities. Impacts are a result of both increased recreational activity occurring within and outside of the planning area and user conflicts generated from planned actions. Surface-disturbing activities (primarily oil and gas development) would alter recreational settings and degrade some recreational experiences through increased visual intrusions, noise levels, traffic volumes, and concerns for public health and safety. In areas where development occurs, hunting opportunities would be diminished because of the displacement or loss of game animals. This would further increase cumulative effects to recreation by degrading a major recreation activity. Seasonal restrictions designed to protect sensitive resources could reduce recreational opportunities for some users by limiting access to certain areas; however, restrictions could also enhance the experience of other users who desire solitude, wildlife viewing, and primitive recreation opportunities. Cumulative impacts would likely be greater in all portions of the CIAA where mineral development is more intense, and near state and private lands because of the lack of protections afforded to natural resources in these areas. The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities; however, Alternative B would also remove all SRMAs, which would reduce the number of designated and developed recreation sites and the availability of recreation facilities for the public. Cumulative impacts to recreation would be highest under Alternative C, followed by Alternatives A and D, with Alternative B having the lowest impact on back and middle country recreation experiences. The Proposed RMP strikes a balance between the impacts identified, providing a range of recreation opportunities from developed recreation sites to remote wilderness experiences.

## Forestry and Woodlands

The CIAA used to analyze cumulative impacts on forest management extends outside the planning area, following fourth-order watershed (eight-digit HUC) boundaries (Map 3-1). The CIAA is composed of fourth-order watersheds that completely or partially overlap the planning area. The fourth-order watersheds were used as the basic unit of analysis because the scope of cumulative influence would be at the watershed scale and is not expected to extend beyond this scale.

Some of the cumulative impacts on forest management would result from surface-disturbing actions that remove forest cover. Because mineral development activities would take place mainly outside of forested areas, cumulative impacts would be minimal. However, woodland forest communities occur in areas that have a higher potential for oil and gas development, thus creating the potential for impacts on these areas. Impacts would include direct removal of forest cover to develop well sites, roads, and surface infrastructure. These areas would be taken out of timber harvest production for the life of the well or mining operations. Mineral resource development activity can also benefit forest management by providing opportunities for increased accessibility to potential harvest or management areas.

Management actions designed to protect sensitive resources would, in some cases, result in the exclusion of forestland from harvesting of forest products or other mechanical forest health treatments, limiting options available for forest stand restoration.

The greatest surface disturbing activities could occur under Alternative C, with Alternatives A, D, and the Proposed RMP having fewer, and Alternative B would have the most restrictions on surface disturbing activities. Cumulative impacts to forestry and woodland resources would be highest under Alternative C, followed by Alternatives A, D, and the Proposed RMP with Alternative B being the lowest.

## Lands and Realty

The CIAA used to analyze cumulative impacts on the uses administered by the lands and realty program includes the entire planning area.

Impacts on lands and realty management would result from actions that affect the location and design of proposed ROWs. These actions are primarily the result of implementing surface use restrictions (e.g., VRM designations, land use closures, NSO stipulations) and management prescriptions designed to protect natural resources. These actions would limit or restrict ROW project design and where ROWs would be permitted. The greatest impacts would occur in areas managed to meet VRM Class II objectives, as avoidance or exclusion areas for ROWs, and in areas managed with NSO stipulations.

The actions and activities considered in this analysis, including land use restrictions for the preservation of sensitive resources, would not prevent the BLM from accommodating major utility and transportation corridors. The degree of impact would be lowest under Alternative C because of fewer land use restrictions for the protection of sensitive resources. Conversely, the implementation of increased restrictions to protect sensitive resources under Alternative B would result in the greatest level of impact on lands and realty.

Under the Proposed RMP, cumulative impacts on lands and realty management would be greater than Alternatives A, C, and D, but less than Alternative B.

## Special Designations

The CIAA used to analyze cumulative impacts on special designations includes the entire planning area. Because management associated with special designations are intended to protect the resource values and uses for which they have been identified, it is not anticipated that any additional activities outside of the planning area would have a cumulative impact on special designations. Cumulative impacts on special designations would primarily occur from human presence and surface disturbing activities associated with development, construction and recreation activities. This would include activities related to fluid mineral well development, mining, OHV use, and construction of power lines, wind turbines, generators, substations, and other above-ground facilities.

Many of the resource values for which special designation areas were originally designated would be directly or indirectly impacted by surface disturbing activities. Examples of resource values that would be impacted by surface disturbance include cultural and paleontology, wildlife, vegetation, soils and watersheds, visual resources, and primitive and semi-primitive recreational opportunities. Increased levels of development and other surface disturbing activities could result in the loss or degradation of undiscovered cultural and paleontological resources. Modifications to the landscape caused by surface disturbance could impact vegetation communities and increase soil erosion and the overall integrity of the landscape which could also have a direct impact on wildlife habitat. Additionally, increased levels of surface disturbance and the associated increase use of heavy equipment, presence of humans, and increase noise levels could result in increased stress levels to wildlife and on their movement and migration patterns and natural habitat. Impacts to the integrity of the landscape caused from surface disturbance would result in the degradation of visual qualities and opportunities for primitive and semi-primitive recreational experiences.

As development of public, private, and state-owned lands continues, the importance of protecting special designations would increase and the values of these areas would increase as development proceeds on surrounding areas. As solitude and primitive recreation experiences become rarer, additional people would be drawn to the WSAs and other special designations for their open space and undeveloped characteristics. The implementation of the BLM's mitigation guidelines, reclamation requirements, restrictions on surface use, rangeland guidelines, vegetation treatments, and monitoring efforts would provide protection to resource values, which would help reduce overall effects on special designations.

Cumulative impacts on ACEC designations would be greatest under Alternative C because it does not propose any ACECs and because development activities are anticipated to be greatest under this alternative. Impacts would be the least intensive under Alternative B with 16 ACECs proposed and because of increased protections to sensitive resources and from prohibiting or limiting the amount of surface disturbance that

would occur throughout the planning area. The Proposed RMP would contribute to the next least intensive cumulative impacts to ACEC designations because it includes 12 ACECs that would protect their relevant and important values, which is more than Alternatives A, D, and C.

## Socioeconomics

The CIAA used to analyze cumulative impacts on socioeconomics extends beyond the planning area, to include the entire socioeconomic study area consisting of Fremont, Lincoln, Sublette, Sweetwater, and Uinta counties. Section 4.23 describes the socioeconomic impacts of BLM actions on the socioeconomic study area. These impacts take place in the context of social and economic impacts from resource uses on other lands in the socioeconomic study area, social and economic impacts driven by other activities in the socioeconomic study area (e.g., public infrastructure development), and broader social and economic trends (e.g., in- and out-migration, changes in social values, trends in energy prices, etc.). Thus, the socioeconomic impacts from BLM decisions in this planning action are just a part of the many contributing factors to the social and economic changes taking place in the socioeconomic study area.

Oil and gas activity development activity is expected to occur on both public and private lands throughout southwestern Wyoming during the planning period. BLM-administered land is just one contributor, albeit a large one, to the overall level of development. The intensity of development in the oil and gas sector reflects both public policy and market forces. Even though leasing and management of oil and gas resources are affected by BLM decisions, the timing and pace of development reflects market forces established by various factors beyond the management decisions of the BLM. These include national and international energy demand and prices, production factors within the CIAA, and business strategies of operators. These factors affect development on both BLM and non-BLM resources. As a result, it is difficult to estimate the pace of development, which means the actual cumulative impacts might vary if the rate of development changes during the study period.

During the planning period, it is likely that communities within the socioeconomic study area will be affected by the oil and gas development "boom and bust" cycle and the intensity or magnitude of this cycle would be a function of pace. It is likely that individuals from outside the area would fill many of the jobs created during the boom portion of the cycle. Temporary and permanent population increases in certain parts of the study area would be directly attributable to oil and gas development across BLM and non-BLM mineral resources. Moreover, it is anticipated that this phenomenon would likely cause hardships for areas that must improve or expand infrastructure and public services to accommodate increases in population. However, these hardships would be offset to some extent by the tax revenues generated by oil and gas activity. The larger impacted communities may be in a slightly better position to absorb increases in population relative to the smaller ones. This is probably also true during any downturns in oil and gas economic activities. A larger community typically has a more diverse economic base that is less dependent on a single industry. Population changes driven by total levels of oil and gas development may also cause changes in local social cohesion, customs, and culture. This would also vary by community, because some areas have a long-standing history of growth driven by minerals development, and some do not.

Levels of coal and trona production in the RSFO over the planning period will be determined largely by market conditions, including commodity prices and costs of production. It is possible that coal production and attendant economic activity could decline over time due to price competition from other energy sources or broader (non-BLM) regulatory factors. None of the alternatives or the Proposed RMP would impact coal and trona production in ways that significantly exacerbate or counter the larger forces acting on these industries.

Wind energy development in the socioeconomic study area is driven by favorable wind resources and demand for renewable energy. This market demand comes from population centers well beyond Wyoming's borders, and is likely to continue or increase during the planning period. Large-scale wind energy projects on non-BLM administered land in the socioeconomic study area may be proposed and built

during the planning period. A combination of large projects on both BLM and non-BLM land would create significant economic activity in the socioeconomic study area, but could also exacerbate pressures on the local economy, public services, and social systems from influxes of construction workers. This would be particularly true if this activity were to coincide with a "boom" period in oil and gas development, which is conceivable given that demand for both renewable energy and oil and gas development increase when the price of energy increases. It is also worth noting that the high acreage of ROW exclusion areas under Alternative B (2,480,876 acres versus 394,940 acres under Alternative A) could have a dampening effect on projects on both BLM and non-BLM land by making development of power transmission lines from wind development areas difficult. As the Proposed RMP is a combination of Alternatives D and B, some dampening effect of Alternative B would be expected to occur under the Proposed RMP.

Some changes to livestock grazing practices on BLM-administered lands would occur under any of the alternatives or the Proposed RMP. It is unlikely that any of the alternatives or the Proposed RMP would result in large changes in the number of animal unit months (AUM) available for livestock grazing. Marginal changes in available AUMs can probably be accommodated or made up for on other lands in the socioeconomic study area. However, broader factors in the region (e.g. changing availability and cost of private grazing lands) and market forces create economic stress for some livestock grazing operators. If changes in AUM availability disproportionately affect some operators, those changes in combination with other economic pressures could impact the viability of those particular operations.

Many recreation attractions besides BLM-administered land generate economic activity in the socioeconomic study area. Other attractions include Flaming Gorge National Recreation Area, National Forest lands, the Seedskadee National Wildlife Refuge, Scenic and Historic Byways, and state parks, wildlife habitat management areas, and public access areas. Management of all these areas, along with management of BLM-administered land, potentially affects the recreation economy. However, broader economic forces are typically much more important drivers than management actions, excepting outright closures of sites. Visitation levels are affected by economic factors such as gasoline prices (which affects local and regional travel), airfares and the value of the dollar (which affect foreign travel), and general consumer confidence in the economy, which affects willingness to spend money on travel and recreational activities. Nonetheless, cumulative loss of scenic open space due to oil and gas development on BLM-administered land and other public and private lands across the socioeconomic study area could impact some recreation-based economic activity by causing some people to move their recreation activities to other, less-impacted areas.

## T.2 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES

NEPA §102(2)C requires a discussion of any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. An irretrievable commitment of a resource is one in which the resource or its use is lost for a period of time (e.g., extraction of any locatable mineral ore or fluid mineral). An irreversible commitment of a resource is one that cannot be reversed (e.g., the extinction of a species or disturbance to protected cultural resources).

Implementation of the Rock Springs RMP would allow for surface disturbing activities, including mineral and energy development and infrastructure development that would result in irreversible or irretrievable commitments of resources. These surface disturbing activities would result in long-term or permanent alterations to soil, removal of vegetation cover, fragmentation of wildlife habitat, and damage to cultural and paleontological resources. Wildlife dependent on the affected habitats may be displaced and populations may be reduced as the carrying capacity of the range is reduced. Increases in sediment, salinity, and nonpoint source pollution that result from these activities could result in degradation of water quality and an irretrievable loss of water utility, aquatic habitats, and aquatic-dependent species. However, management prescriptions and mitigation prescribed under the alternatives are intended to reduce the

magnitude of these impacts by preventing habitat loss in some areas and reclaiming soil, vegetation, and habitat resources. Although reclamation of some disturbed sites would occur, the level of habitat diversity and quality that existed prior to disturbance would likely not be achieved for several decades and may never return to pre-disturbance conditions. This would likely result in permanent reductions in wildlife populations and impairment of water quality and vegetation communities in some areas.

An irretrievable commitment of nonrenewable fossil fuels (i.e., oil and gas) would occur from the development of wells and subsequent extraction of fluid minerals over the next 20 years. The number of additional wells proposed for development within the planning area ranges from fewer than baseline to 146 depending on the alternative.

## T.3 UNAVOIDABLE ADVERSE IMPACTS

NEPA §102(2)C requires disclosure of any adverse environmental effects that cannot be avoided should the RMP be implemented. Unavoidable adverse impacts are those that remain following the implementation of mitigation measures or impacts for which there are no mitigation measures. Some unavoidable adverse impacts would occur as a result of implementing the Rock Springs RMP.

Continuing to allow surface disturbing activities would result in unavoidable adverse impacts. Although these impacts would be mitigated to the extent possible, unavoidable damage is inevitable. Permanent conversion of vegetation resources to other uses, such as mineral and energy development reduces the quantity and quality of vegetation resources. Energy and mineral development activities on public lands create long-term visual intrusions, soil erosion and compaction, habitat degradation and fragmentation, and water quality impairment. Portions of the planning area with more intense recreational use would continue to experience scarring, increased soil erosion, loss of vegetation, and degradation of water and wildlife resources. Although these impacts are unavoidable, they are generally concentrated in areas that are already disturbed, which limits the spread of impacts on more remote or less frequented areas.

Development of the additional oil and gas wells would cause air quality related impacts. Under all alternatives, production and release into the atmosphere of HAPs, volatile organic compounds (VOC), CO, $SO_2$, $NO_X$, and $PM_{10}$ would increase. However, it is not anticipated that the concentrations of these substances would increase to the point where an exceedance of the NAAQS or WAAQS would occur. Although it is not anticipated that the concentrations of these substances would increase to the point where an exceedance of the NAAQS or WAAQS would occur, the increases over the low historical background concentrations would be noticeable and/or visible to the average person. Impacts would persist as long as development continued, unless improved methods for controlling and/or treating emissions were developed. These impacts would be apparent throughout the planning area and potentially throughout the CIAA for air quality.

Because large portions of the crucial big game habitats coincide with leased areas of oil and gas potential, impacts on wildlife habitat would be unavoidable. Although oil and gas well sites and their associated infrastructure would be mitigated to the extent possible (Appendix B) and BMPs would be employed (Appendix A), long-term and possibly permanent habitat degradation and displacement of wildlife populations would be unavoidable. In addition, competition is anticipated for forage resources among wildlife and livestock. The extent of these impacts would vary by location of development activities, season, and drought cycle.

Inadvertent damage and/or destruction of cultural and paleontological resources from increased visitation and surface-disturbing activities would be unavoidable. Although mitigation measures would include identification and mitigation of resources prior to surface disturbing activities, some unanticipated discoveries of unknown cultural and paleontological resources could occur. The number of sites anticipated to be inadvertently damaged is unknown.

Conflicts between user types such as recreationists who seek more primitive types of recreation and motorized users who share those recreational areas are unavoidable adverse impacts. As recreation demand increases, recreational use would disperse to other areas of the planning area, which could create conflicts with other existing uses of those areas. Recreation use would be displaced from areas of intense mineral development, which will increase the extent and frequency of conflict between these incompatible user groups in other areas.

Numerous land use restrictions imposed throughout the planning area to protect sensitive resources and other important values would impact the ability of operators, individuals, and groups to use the public lands without limitations and result in forgone opportunities to use resources within the planning area. Although attempts would be made to minimize these impacts by limiting the level of protection necessary to accomplish management objectives and by providing alternative use areas for impacted activities, unavoidable adverse impacts would occur.

## T.4 RELATIONSHIP BETWEEN LOCAL SHORT-TERM USES AND LONG-TERM PRODUCTIVITY

NEPA §102(C) requires discussion of the relationship between local, short-term uses of the human environment and the maintenance and enhancement of long-term productivity of resources.

Any use of the natural resources within the planning area is likely to adversely impact long-term productivity of these natural resources. The short-term uses that would result in the greatest impact on long-term productivity include mineral and energy development, dispersed recreation, forest harvest, livestock grazing, and infrastructure development. These uses result in surface-disturbing and other disruptive activities that remove vegetation, increase soil erosion and compaction, create visual intrusions and landscape alterations, increase noise, impair water quality, and degrade and fragment wildlife habitat. Although management actions, BMPs, surface use restrictions, and lease stipulations are intended to minimize the effect of short-term uses, some impact on long-term productivity of resources would occur regardless of management approach. Given this situation, the BLM will strive to achieve the most effective and practicable balance between short-term uses and long-term productivity through science-based and flexible management, application of mitigation measures and BMPs, monitoring, continuous evaluation of current management policies and practices, and revision of management prescriptions where necessary and feasible.

# APPENDIX U—COMPARATIVE ANALYSIS OF IMPACTS FROM ACTION ALTERNATIVES

Chapter 4 compares and summarizes the impacts of the actions proposed under each alternative. Impact descriptions that may occur as a result of management activities were primarily described under Alternative A in Chapter 4 and were referenced below for the other alternatives. A detailed discussion of the environmental consequences of the actions proposed under each action alternative is presented below and supports the summary of impacts in Chapter 4. The numbering of resources corresponds to the resource numbering in Chapter 4 to easily crosswalk the analyses.

## 4.3 AIR QUALITY

### 4.3.1 Summary of Impacts

The potential for BLM actions to contribute to future significant adverse impacts on air quality was analyzed in the context of existing air quality conditions within the planning area and predicted future growth in emission generating activities. Air pollutant emissions from future potential actions were estimated for several BLM management actions and activities likely to occur under each alternative that have the potential to generate quantifiable emissions of regulated air pollutants. The estimated emissions were compiled in an emissions inventory. Emissions calculations, assumptions, and methods are included in Appendix P, Air Quality Technical Support Document. Total estimated emissions and predicted increases in emissions were analyzed to develop air resource management goals, objectives, and actions that would be effective in minimizing future impacts on air quality. The resulting adaptive management strategy for the Rock Springs planning area is included in Appendix Q, Air Quality Adaptive Management Strategy.

Emissions were estimated for four criteria pollutants, volatile organic compounds (VOC), hazardous air pollutants (HAP), and greenhouse gases (GHG) for the Rock Springs Field Office (RSFO). Emissions were also estimated for three future years, a short-term year (year 1), a mid-term year (year 10) and a long-term year (year 20), as the basis to evaluate differences in management actions among alternatives and potential increases in emissions over the life of the plan. Potential emissions were also estimated for reasonably foreseeable future cumulative actions within the planning area and are discussed further in Appendix T. The following air pollutants were identified as being pollutants that could potentially be emitted by management actions and activities authorized, permitted, allowed, or performed under this Resource Management Plan (RMP). Emissions of each of these pollutants were estimated for each identified activity and addressed for each alternative in this analysis.

- Particulate matter (PM)—PM less than 10 microns in diameter ($PM_{10}$) and PM less than 2.5 microns in diameter ($PM_{2.5}$)
- Nitrogen oxides ($NO_X$)
- Sulfur dioxide ($SO_2$)
- Carbon monoxide (CO)
- VOC
- HAPs
- GHGs (carbon dioxide [$CO_2$], methane [$CH_4$], and nitrous oxide [$N_2O$]).

Estimated emissions from BLM actions under each alternative and estimated changes in emissions from BLM actions over the life of the plan vary by pollutant, management action, and year. In general, the major contributor

to total pollutant emissions over the life of the plan is predicted to be predominantly attributable to activities associated with oil and gas development. Activities associated with surface mining of coal and trona are predicted to be major contributors to particulate matter emissions. Activities associated with fire management, livestock grazing, and travel are predicted to contribute to some pollutant emissions as well. Table 4-34 and Table 4-35 summarize the estimated annual emissions for each alternative by pollutant.

**Table 4-34. Total Estimated Regulated Emissions Summary for Bureau of Land Management Activities in the Rock Springs Planning Area (Tons)**

| Scenario | $PM_{10}$ | $PM_{2.5}$ | $NO_X$ | $SO_2$ | CO | VOC | HAPs |
|---|---|---|---|---|---|---|---|
| Alternative A - Year 1 | 19,121 | 3,030 | 12,602 | 37 | 12,220 | 26,335 | 1,008 |
| Alternative B - Year 1 | 16,358 | 2,513 | 11,067 | 18 | 9,365 | 24,266 | 922 |
| Alternative C - Year 1 | 20,241 | 3,805 | 12,952 | 103 | 20,915 | 26,876 | 1,057 |
| Alternative D - Year 1 | 19,116 | 3,029 | 12,591 | 37 | 12,215 | 26,318 | 1,007 |
| Alternative A - Year 10 | 25,861 | 3,832 | 19,023 | 43 | 17,584 | 48,174 | 1,796 |
| Alternative B - Year 10 | 18,166 | 2,722 | 12,438 | 19 | 10,541 | 28,918 | 1,097 |
| Alternative C - Year 10 | 27,530 | 4,667 | 19,582 | 110 | 26,485 | 49,405 | 1,876 |
| Alternative D - Year 10 | 26,097 | 3,855 | 18,956 | 43 | 17,562 | 47,975 | 1,794 |
| Alternative A - Year 20 | 32,759 | 4,663 | 26,126 | 50 | 23,454 | 72,334 | 2,659 |
| Alternative B - Year 20 | 19,633 | 2,898 | 13,931 | 21 | 11,777 | 33,998 | 1,278 |
| Alternative C - Year 20 | 35,066 | 5,567 | 26,937 | 117 | 32,594 | 74,347 | 2,773 |
| Alternative D - Year 20 | 33,162 | 4,701 | 26,024 | 50 | 23,415 | 71,912 | 2,652 |

**Table 4-35. Total Estimated Greenhouse Gas Emissions Summary for Bureau of Land Management Activities in the Rock Springs Planning Area (Tons or Metric Tonnes)[1]**

| Scenario | $CO_2$ (tons) | $CH_4$ (tons) | $N_2O$ (tons) | $CO_2eq$ tons (100 Year) | $CO_2eq$ metric tonnes (100 Year)* | $CO_2eq$ tons (20 Year)** |
|---|---|---|---|---|---|---|
| Alternative A - Year 1 | 1,792,764 | 26,021 | 39 | 3,476,501 | 3,153,829 | 4,083,849 |
| Alternative B - Year 1 | 1,564,352 | 16,782 | 20 | 2,984,314 | 2,707,325 | 3,074,262 |
| Alternative C - Year 1 | 1,807,623 | 26,560 | 106 | 3,524,047 | 3,196,962 | 4,161,517 |
| Alternative D - Year 1 | 1,790,750 | 26,013 | 39 | 3,474,249 | 3,151,786 | 4,081,131 |
| Alternative A - Year 10 | 2,981,005 | 38,933 | 56 | 5,030,699 | 3,706,757 | 6,361,095 |
| Alternative B - Year 10 | 1,824,372 | 19,671 | 24 | 3,326,211 | 3,017,488 | 3,577,975 |
| Alternative C - Year 10 | 3,036,206 | 40,017 | 123 | 5,133,982 | 4,657,471 | 6,525,008 |
| Alternative D - Year 10 | 2,971,247 | 38,937 | 56 | 5,020,997 | 4,554,973 | 6,351,589 |
| Alternative A - Year 20 | 4,279,554 | 52,984 | 74 | 6,727,520 | 6,103,105 | 8,844,778 |
| Alternative B - Year 20 | 2,097,511 | 22,633 | 28 | 3,683,300 | 3,341,435 | 4,100,930 |

| Scenario | $CO_2$ (tons) | $CH_4$ (tons) | $N_2O$ (tons) | $CO_2eq$ tons (100 Year) | $CO_2eq$ metric tonnes (100 Year)* | $CO_2eq$ tons (20 Year)** |
|---|---|---|---|---|---|---|
| Alternative C - Year 20 | 4,380,881 | 54,693 | 142 | 6,894,592 | 6,254,671 | 9,107,486 |
| Alternative D - Year 20 | 4,260,853 | 52,955 | 74 | 6,707,907 | 6,085,313 | 8,823,508 |

[1]Emissions are gross for all activities and indirect and direct GHG's are not separated. Detailed descriptions of the emission calculations can be found in Appendix P, section T.6. Further information can be found in Appendix T, Cumulative Impact Analysis.
*Global Warming Potential (GWP)-100 yr $CH_4$ = 28, $N_2O$ = 265
** GWP-20 yr $CH_4$ = 84, $N_2O$ = 264

Existing air quality conditions, geographic characteristics, and estimated emissions for each alternative were evaluated to identify pollutants of concern and activities that emit significant quantities of pollutants of concern and to identify potential adverse impacts on air quality. The identification of the following pollutants, activities, and potential impacts under each alternative was used to design air quality management goals and objectives listed in Chapter 2 and the Air Quality Adaptive Management Strategy included in Appendix Q:

- The magnitude of estimated emissions of air pollutants from BLM authorized activities and management actions is predicted to be greatest under Alternative C which includes the highest level of energy development actions. Therefore, potential impacts to air quality under this alternative are expected to be greatest. Air quality impacts under Alternatives A and D are expected to be similar to current conditions at the proposed levels of development under these alternatives. Alternative B, with oil and gas development levels about half of Alternative C, would be expected to result in the least impacts to air quality. The estimated emissions and impacts on air quality associated with the Proposed RMP are the same as for Alternative B.
- The magnitude of estimated emissions from BLM authorized oil and gas activities at the level of development predicted in Alternatives A, C, and D over the life of the plan have the potential to contribute to increased ambient concentrations of ozone in the Rock Springs planning area and the Upper Green River Basin ozone (2008 standard) nonattainment area during the summer and winter ozone seasons. Estimated emissions from BLM authorized oil and gas activities under Alternative B and the Proposed RMP have the potential to contribute to ozone formation in the region but significantly less than the other alternatives due to the more restrictive oil and gas production rates in these alternatives. For example, Alternative B authorizes fewer wells for gas and oil development.
- The magnitude of and increases in estimated emissions from BLM authorized oil and gas activities at the level of development predicted in Alternatives A, C, and D have the potential to cause impacts related to visibility degradation and increased atmospheric deposition at sensitive areas such as the Fitzpatrick Wilderness Area to the north and the Mount Zirkel Wilderness Area to the south. Emissions predicted under Alternative B and the Proposed RMP also have the potential to impact visibility and deposition but significantly less than the other alternatives.
- The magnitude of and increases in estimated emissions from solid mineral development, including surface mining of coal and trona, at the level of development predicted for all alternatives over the life of the plan have the potential to cause impacts related to fugitive dust and increased ozone formation, visibility degradation, and atmospheric deposition.
- The estimated emissions of GHGs directly associated with solid mineral development and livestock grazing under all alternatives are not predicted to significantly change from current conditions during the life of the plan while direct emissions of GHGs associated with oil and gas development under all alternatives are predicted to increase, which is due to a larger estimated number of oil and gas wells being installed.

## 4.3.2 Alternative B

Alternative B emission estimates result in the lowest total air pollutant emissions in future project years and conserve the most land area for physical, biological, and cultural resources. This alternative emphasizes the improvement and protection of habitat for wildlife and sensitive plant and animal species, improvement of riparian areas, and implementation of management actions that improve water quality and enhance protection of cultural resources. This alternative would likely result in the least adverse impacts on air quality (Table 4-34 and Table 4-35). Tables of the estimated emissions calculations by source category and the key assumptions used in the calculations are provided in Appendix P.

### Fluid Minerals

Estimated emissions from oil and gas development for Alternative B were calculated using a reasonably foreseeable development (RFD) rate based on historical development rates for federal wells within the planning area over the last 20 years. Estimated emissions from oil and gas activities were based on installation of 1,231 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 75% of all new oil and gas wells being producing wells. Estimated emissions from 1,536 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of 12 oil and gas wells abandoned annually.

Estimated emissions from coalbed natural gas (CBNG) activities were based on installation of 61 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 80% of all new oil and gas wells being producing wells. Estimated emissions from 28 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of one CBNG well abandoned annually. Appendix P includes additional details on the assumptions used in calculating emissions from oil and gas activities for this alternative. The general assumptions used to estimate emissions for Alternative A are the same for Alternative B.

The reasonably foreseeable potential emissions for Alternative B, oil and gas development, is less than all other alternatives as Alternative B is the most restrictive alternative.

### Solid Minerals

Estimated emissions for solid mineral development activities for Alternative B include coal mining, trona mining, and sand and gravel mining. Solid mineral development and emissions estimates over the life of the plan for this alternative are the same as Alternative A except the assumption of a decrease in sales of sand and gravel (4,000 tons mined per year) for each year of the plan.

### Land Resources – Rights-Of-Way and Renewable Energy

Emissions generating activities associated with rights-of-way (ROW) include construction activities for wind energy projects, communication sites, transmission lines, and non-oil and gas pipelines. A total of 21 projects with an average of 107 acres of disturbance per project were assumed as the level of development for this category (note wind energy projects make up the majority of the acreage). This level of development is not expected to vary by alternative or increase over the life of the plan. Estimated emissions are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts.

### Livestock Grazing

Emissions generating activities associated with this category include primarily construction activities in support of grazing operations. Construction and maintenance of reservoirs, springs, wells, pipelines, and fences generate

fugitive dust and combustion emissions from construction equipment. Estimated emissions are based on animal unit months (AUM) from cattle grazing permits. Because Alternative B is a conservative approach, grazing activities are less than other alternatives. Estimated emissions from this category are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts.

### Trails and Travel Management

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

### Vegetation – Fire Management and Ecology and Mechanical Treatment

Emissions generating activities associated with the category included smoke (particulate matter and other products of combustion) from prescribed and wildfires and combustion emissions from mechanical equipment used to manage vegetation and wildlife habitat. Estimated emissions were calculated based on no acres burned and an increase in weed treatment in the planning area. The magnitude of emissions from prescribed fire has the potential to result in impacts on visibility, ozone formation, and human and wildlife health.

## 4.3.3 Alternative C

Alternative C emission estimates result in the greatest magnitude and increase in total air pollutant emissions. Alternative C proposes the least restrictive management actions for energy and commodity development and the least protective management actions for physical, biological, and cultural resources while maintaining protections required by laws and regulations. Under this alternative, development and use of resources within the planning area would occur with intensive management of surface disturbing and disruptive activities. This alternative has the highest potential for adverse impacts on air quality (Table 4-34 and Table 4-35). Tables of the estimated emissions calculations by source category and the key assumptions used in the calculations are provided in Appendix P.

### Fluid Minerals

Estimated emissions from oil and gas development for Alternative C were calculated using an RFD rate based on historical development rates for federal wells within the planning area over the last 20 years. Estimated emissions from oil and gas activities were based on installation of 4,776 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 75% of all new oil and gas wells being producing wells. Estimated emissions from 1,536 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of 12 oil and gas wells abandoned annually.

Estimated emissions from CBNG activities were based on installation of 143 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 80% of all new oil and gas wells being producing wells. Estimated emissions from 28 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of one CBNG well abandoned annually. Appendix P includes additional details on the assumptions used in calculating emissions from oil and gas activities for this alternative. The general assumptions used to estimate emissions for Alternative A are the same for Alternative C.

The reasonably foreseeable potential for oil and gas development for Alternative C is greater than Alternatives A, B, and D for oil and gas activities. The estimated emissions for oil and gas development under this alternative reflect this substantially higher level of development compared to Alternative B and slightly higher than that of Alternatives A and D. The magnitude of $NO_X$ and VOC emissions would likely contribute to increased

concentrations of ozone formation and has the potential to contribute to adverse impacts associated with ozone formation.

### Solid Minerals

Estimated emissions for solid mineral development activities for Alternative C include coal mining, trona mining, and sand and gravel mining. Solid mineral development and emissions estimates over the life of the plan for this alternative are the same as Alternative A except the assumption of an increase in sales of sand and gravel equivalent to the base year (6,500 tons mined per year) for each year of the plan.

### Land Resources – Rights-Of-Way and Renewable Energy

Emissions generating activities associated with ROWs include construction activities for wind energy projects, communication sites, transmission lines, and non-oil and gas pipelines. A total of 47 projects with an average of 113 acres of disturbance per project were assumed as the level of development for this category (note wind energy projects make up the majority of the acreage). Estimated emissions are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts.

### Livestock Grazing

Emissions generating activities associated with this category include primarily construction activities in support of grazing operations. Construction and maintenance of reservoirs, springs, wells, pipelines, and fences generate fugitive dust and combustion emissions from construction equipment. Estimated emissions are based on AUMs from cattle grazing permits. Because Alternative C is the least restrictive management approach, grazing activities are expected to be more than other alternatives. Estimated emissions from this category are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts.

### Trails and Travel Management

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

### Vegetation – Fire Management and Ecology and Mechanical Treatment

Emissions generating activities associated with the category included smoke (particulate matter and other products of combustion) from prescribed and wildfires and combustion emissions from mechanical equipment used to manage vegetation and wildlife habitat. Estimated emissions were calculated based on historical acres burned and treated in the planning area. An increase of current practices was assumed for this alternative. The magnitude of emissions from prescribed fire has the potential to result in impacts on visibility, ozone formation, and human and wildlife health.

## 4.3.4 Alternative D

Alternative D results in the next to lowest emissions of all alternatives for most emissions, including greenhouse gasses. Because the RFD predicted a larger number of CBNG wells for Alternative D than Alternative A, Alternative D has higher emissions than Alternative A for some pollutants (Table 4-34 and Table 4-35). Tables of the estimated emissions calculations by source category and the key assumptions used in the calculations are provided in Appendix P.

## Fluid Minerals

Estimated emissions from oil and gas development for Alternative D were calculated using an RFD rate based on historical development rates for federal wells within the planning area over the last 20 years. Estimated emissions from oil and gas activities were based on installation of 4,603 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 75% of all new oil and gas wells being producing wells. Estimated emissions from 1,536 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of 12 oil and gas wells abandoned annually.

Estimated emissions from CBNG activities were based on installation of 134 new BLM wells and associated drilling, completion, gas treatment, and compression activities over the life of the plan, with a rate of 80% of all new oil and gas wells being producing wells. Estimated emissions from 28 existing base year BLM wells and associated decline over a 20-year period were also included in the estimated emissions calculations at a rate of one CBNG well abandoned annually. Appendix P includes additional details on the assumptions used in calculating emissions from oil and gas activities for this alternative. The general assumptions used to estimate emissions for Alternative A are the same for Alternative D.

The reasonably foreseeable potential for oil and gas development for Alternative D is less than Alternatives A and C for most activities, with the exception of CBNG, where Alternative D is slightly higher than that of Alternative A. The estimated emissions for oil and gas development under this alternative reflect a lower level of development compared to Alternative A and C with exception to CBNG. The magnitude of $NO_X$ and VOC emissions would likely contribute to increased concentrations of ozone formation and have the potential to contribute to adverse impacts associated with ozone formation.

## Solid Minerals

Estimated emissions for solid mineral development activities for Alternative D include coal mining, trona mining, and sand and gravel mining. Solid mineral development and emissions estimates over the life of the plan for this alternative are the same as Alternative A.

## Land Resources – Rights-Of-Way and Renewable Energy

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

## Livestock Grazing

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

## Trails and Travel Management

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

## Vegetation – Fire Management and Ecology and Mechanical Treatment

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A for fire management. For vegetation management, Alternative D includes more weed treatment; however, this minor increase has little impact on the estimated emissions.

## 4.3.5 Proposed RMP

The estimated emissions and impacts on air quality for the Proposed RMP are predicted to fall between the levels proposed under Alternative B and Alternative D.

### Fluid Minerals

Estimated emissions and impacts on air quality from oil and gas development for the Proposed RMP are predicted to fall between Alternative B and Alternative D. Although the BLM did not complete an RFD scenario for the specific blend of management included in the Proposed RMP, all management in the Proposed RMP was analyzed under one or more of these other alternatives. The BLM notes that the acreage restrictions and closures for fluid mineral leasing would generally be between Alternative B and Alternative D, but closer to Alternative D. As a result, the BLM anticipates that the number of wells developed and fluid leasable mineral activity (and therefore the emissions related to oil and gas development) will be between those estimated for Alternative B and Alternative D, but closer to the numbers presented in Alternative D. Refer to Table 4-34 and Table 4-35, above, for the estimated emissions of Alternative B and Alternative D.

### Solid Minerals

Estimated emissions for solid mineral development activities for the Proposed RMP include coal mining, trona mining, and sand and gravel mining. Solid mineral development and emissions estimates over the life of the plan for this alternative are predicted to be in between Alternative B and Alternative D. The acreage restrictions and closures for solid mineral leasing would generally be between Alternative B and Alternative D, but closer to Alternative D. Therefore, the emissions related to solid mineral development activities are predicted to be closer to Alternative D, compared to Alternative B. As noted under Alternative D, solid mineral development and emissions estimates over the life of the plan for that alternative are the same as Alternative A, and the BLM anticipates that the Proposed RMP values would also be similar to Alternative A. Refer to Table 4-34 and Table 4-35, above, for the estimated emissions of Alternative B and Alternative D.

### Land Resources – Rights-of-Way and Renewable Energy

Estimated emissions and impacts on air quality associated with ROW management and renewable energy development for the Proposed RMP are predicted to be in between Alternative B and Alternative D. The acreage restrictions and closures for ROW management and renewable energy development would be between Alternative B and Alternative D, but closer to Alternative D. Therefore, the emissions related to ROW management and renewable energy development are predicted to be closer to Alternative D, compared to Alternative B. As noted under Alternative D, ROW management and renewable energy development and emissions estimates over the life of the plan for that alternative are the same as Alternative A, and the BLM anticipates that the Proposed RMP values would also be similar to Alternative A. Refer to Table 4-34 and Table 4-35, above, for the estimated emissions of Alternative B and Alternative D.

### Livestock Grazing

Estimated emissions and impacts on air quality associated with management of livestock grazing for the Proposed RMP are predicted to be in between Alternative B and Alternative D, and overall very similar to those under Alternative A. Refer to Table 4-34 and Table 4-35, above, for the estimated emissions. Estimated emissions from this category are predicted to be very low for all alternatives and are not expected to contribute to significant air quality impacts.

### Trails and Travel Management

Estimated emissions and impacts on air quality are predicted to be the same as Alternative A.

### Vegetation – Fire Management and Ecology and Mechanical Treatment

Estimated emissions and impacts on air quality associated with vegetation and fire management for the Proposed RMP are predicted to be in between Alternative B and Alternative D. The acreage restrictions and closures for vegetation and fire management would be between Alternative B and Alternative D, but closer to Alternative D. Therefore, the emissions related to vegetation and fire management are predicted to be closer to Alternative D, compared to Alternative B. Refer to Table 4-34 and Table 4-35, above, for the estimated emissions of Alternative B and Alternative D.

## 4.3.6 Air Quality Adaptive Management Strategy

The RSFO has developed an Air Quality Adaptive Management Strategy in lieu of emissions modeling. The Air Quality Adaptive Management Strategy is intended to present the processes, procedures, and actions that support adaptive management principles for the protection of air resources and atmospheric values within the Rock Springs planning area. This Air Quality Adaptive Management Strategy describes air resources management and outlines specific requirements for proponents of projects that have the potential to generate air emissions and impact air resources. The Air Quality Adaptive Management Strategy provides the flexibility to respond to changing conditions that could not have been predicted during RMP development and allows for the use of new technology and methods that may minimize or reduce impacts. The Air Quality Adaptive Management Strategy can be found in Appendix Q.

# 4.4 SOIL RESOURCES

## 4.4.1 Alternative B

Impacts on soil resources resulting from implementing actions associated with the management of air quality would be the same as those presented under Alternative A.

Prohibiting surface disturbing activities in areas with limited reclamation potential soils would provide greater protections to soils, compared to Alternative A, as these areas would be prohibited areas, rather than avoidance areas. They would also be managed as no surface occupancy (NSO) for fluid minerals, closed to mineral materials sales/disposals, and closed to all solid mineral leasing. Additional soils management actions would provide further protections to soils, including the use of photo point monitoring for all channel crossings and all surface disturbance greater than 0.5 acres, which would inform land managers when vegetation cover is removed, and soil erosion or excess sedimentation is occurring in these areas. The preparation of site-specific activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, and enhance water quality) would be required in all areas and more stringent requirements for activity and implementation planning and monitoring would be required, compared to Alternative A.

Impacts on soil resources resulting from implementing water management actions would be similar to those presented under Alternative A, except that the restrictions near surface water sources would be increased. Surface disturbing activities would be prohibited within ¼ mile of 100-year floodplains, wetlands, riparian areas, perennial streams, and within 500 feet of the edge of the inner gorge of large ephemeral drainages. This would eliminate surface disturbance and related soil impacts within these areas and provide increased protections to soil resources over a larger area compared to Alternative A.

Managing lands with wilderness characteristics specifically to preserve those characteristics would prevent surface disturbance and protect soils in these areas, as management actions would include closing these lands to fluid minerals, mineral material sales/disposal, all solid mineral leasing, mineral location, and designating exclusion areas for all new ROWs. These lands would also be managed for Visual Resource Management (VRM) Class II, and the state parcels and inholdings within these areas would be pursued for acquisition. However, allowing motorized travel for access to state/private parcels within these areas could result in localized surface disturbance and resulting overland water flow and sediment loading.

In areas open to fluid mineral leasing under standard terms and conditions, the impacts to soil resources would be similar to those described under Alternative A. Under Alternative B, 99,674 acres would be managed with controlled surface use (CSU) stipulations (approximately 86% reduction in acreage compared to Alternative A) and 713,837 acres would have seasonal timing limitation stipulations (TLS) (approximately 61% fewer acres than under Alternative A). However, 813,354 acres would be managed with NSO stipulations, an acreage increase of approximately 413% compared with Alternative A. This NSO designation, along with 2,186,218 acres that would be closed to fluid mineral leasing (an approximately 305% increase in acreage compared to Alternative A) would eliminate surface disturbance from fluid mineral development and therefore protect soil resources across a larger area compared with Alternative A.

In areas open to coal resource inventory and exploration, along with leasing and development, impacts to soils would be the same as discussed in Alternative A; and 3,535,546 acres would be closed to exploration and leasing for coal development (628% increase), which would provide greater protections to soil resources in these areas, compared to Alternative A, as the surface disturbing activities associated with exploration and leasing would not occur. Approximately 2,122,282 acres would be excluded or closed for oil shale development (192% increase), which would reduce the extent of impacts compared with Alternative A.

Approximately 1,993,908 acres would be pursued for withdrawal from locatable mineral entry. This would result in protections for soil resources similar to Alternative A, but to a larger extent as there would be approximately 258% more acres withdrawn.

Impacts to soils from saleable minerals management actions would be similar to Alternative A, but to a lesser extent. Under Alternative B, 2,581,741 acres would be closed to saleable mineral disposal (an approximately 210% increase compared to Alternative A). In these additional closed areas, impacts would be reduced as surface disturbing activities associated with mineral material disposal, and subsequent erosion and sedimentation would not occur.

Fire and fuels management actions would have impacts to soils similar to those discussed in Alternative A, except stricter stipulations on heavy equipment use could provide more localized protections to soils in these areas.

Management actions for forests and woodlands would also be similar to Alternative A, except logging operations on slopes steeper than 25% would be prohibited, which would provide more protections to soils, compared to Alternative A, by maintaining vegetative cover and soil stability.

Vegetation treatment actions would have similar impacts to soils as those discussed in Alternative A, but longer resting times for treated areas would likely provide greater protections to soils in these areas as vegetation and soil would have a longer timeframe to establish and stabilize. Requiring management plans to maintain, improve, or restore vegetation in all riparian areas within five growing seasons could provide greater long-term protections, compared to Alternative A, by defining a timeframe for implementation.

Habitat management actions for fish and wildlife would have similar impacts as discussed in Alternative A. Actions to maintain or improve habitat, such as reducing livestock grazing and requiring selective placement of water developments would reduce surface disturbance in the vicinity of streams and water bodies resulting in

improved riparian and soil conditions. Applying seasonal surface disturbance restrictions to wildlife habitat would provide protections to soil resources similar to Alternative A, but to a greater extent, as the restrictions would cover the entire planning area. Locations where stipulations, mitigations, and surface occupancy and/or disturbance restrictions for mineral activity apply would all provide protections to soil resources by minimizing vegetation removal, erosion, and excess sediment, salt, and nutrient loading to surface water.

Surface disturbing and disruptive activities would be prohibited to maintain aquatic and terrestrial habitat. These areas would be NSO for fluid minerals, closed to mineral material sales/disposal, and closed to all solid mineral leasing. These actions would provide protections to soil resources similar to Alternative A, but to a greater extent, as these activities would now be prohibited year-round, rather than seasonally. Similarly, closing big game crucial winter ranges and birthing areas from coal leasing and development would provide greater protections to soil resources, compared to Alternative A, as the soil compaction, vegetation removal, and subsequent erosion and sedimentation associated with these activities would not occur.

Applying NSO stipulations and closures in areas with special status plant species would result in the same protections to soil resources as discussed in Alternative A. Additional restrictions, such as designating ROW exclusion areas, would provide greater protections to soil resources, compared to Alternative A, as these areas would be exclusion areas, rather than avoidance areas. Prohibiting use of fire chemicals, salt or mineral supplements, and range improvements within ¼ mile of special status plant species could indirectly further protect soil quality in these areas.

Any management actions to protect special status species that result in surface disturbance (e.g., burying power lines) would have similar impacts to soil resources as discussed in Alternative A. Designating seasonal avoidance and limitations for surface disturbing activities in and near special status species' habitat would provide similar short-term protections to soil resources as discussed in Alternative A, but to a greater extent as there would also be seasonal surface disturbing and disruptive activities prohibitions and closures.

Protections to soils from management of specific cultural resource sites would be similar to Alternative A, but restrictions to mineral activities, including designating NSO and closed areas for fluid minerals, would be over a larger area compared to Alternative A, providing protections to a greater extent. Paleontological resource management activities would have the same impacts as discussed in Alternative A, but to a greater extent, as mitigation requirements and additional closures for mineral material sales would also be in place.

VRM actions would provide greater protections to soils resources compared to Alternative A. Alternative B would have fewer VRM Class IV areas, and more VRM Class II areas. Under Alternative B, 2,148,902 acres would be managed as VRM Class II, an approximate 269% increase of acres compared to Alternative A. Approximately 563,754 acres would be managed as VRM Class IV, which would be an approximately 74% reduction of acres compared to Alternative A, and thus the potential for impacts to soils would be reduced.

Lands and realty management actions would be similar to Alternative A, except where additional lands are retained. Retention of additional public lands would result in the continued level of protections for soils. Conversely, any potential disposal of lands would remove those protections from the affected lands.

Impacts to soils from ROW management would be similar to Alternative A in areas open for ROW actions. However, under this alternative, 2,480,876 acres would be designated as ROW exclusion areas, an approximately 481% increase in acres compared to Alternative A, and ROW avoidance acres would decrease by approximately 82%, to 133,903 acres. Although ROW avoidance acres would decrease, the larger increase in ROW exclusion areas would result in less likelihood for surface disturbing activities in these areas, and thus protections to soil resources would be greater under this alternative, compared to Alternative A. Additional measures to co-locate pipelines, power lines and other utilities adjacent to or within existing ROWs to reduce new surface disturbance would provide further protections to soils.

Livestock grazing management actions would be similar to Alternative A, except where areas open to grazing under Alternative A would be prohibited or closed to livestock grazing (exclosures and recreation areas). In these areas, reduced grazing pressure on vegetation would provide greater protections to soils, compared to Alternative A.

Recreation management actions would provide more protections to soils, compared to Alternative A. Camping would be prohibited in riparian areas, or within 200 feet of water, and surface disturbing activities would be prohibited within three miles or the visual horizon of developed recreation sites. Recreation site facilities would also be prohibited within 500 feet of riparian areas. These additional stipulations would result in less localized surface disturbance, providing greater protections to soils, compared to Alternative A. In addition, where surface disturbance is allowed, an approved plan would be required prior to site disturbance, which would likely reduce the extent of impacts.

Impacts to soils from off-highway vehicle (OHV) management actions would be similar to Alternative A, with 12,831 acres open, 225,537 acres closed, and 3,367,576 acres limited to designated roads and trails. In areas where OHVs are causing or will cause considerable adverse effects upon a range of resources, there would be less surface disturbance and reduced impacts to soils, compared to Alternative A, as these areas would be immediately closed until adverse effects are eliminated.

On National Historic Trails (NHT), a five-mile area on each side of the NHTs would be managed as closed to mineral leasing and mineral material sales, as an exclusion area for ROWs, and a withdrawal would be pursued. Additionally, within five to 15 miles on each side of the NHTs, the area would be managed as open to mineral leasing and mineral material sales with CSU restrictions, available to locatable mineral entry, and would be a ROW avoidance area with CSU restrictions. The areas within the five miles of the NHTs would have the most protections to soils from surface disturbing activities, as the stipulations would be more restrictive. However, soils within five to 15 miles of the NHTs would also receive protections from these stipulations. Both of these areas would receive more protections to soils, compared to Alternative A.

Wilderness Study Area (WSA) and Wild and Scenic River (WSR) management would provide the same protections to soils as discussed in Alternative A. Management actions for Areas of Critical Environmental Concern (ACEC) would be similar to Alternative A, but to a greater extent as 1,605,660 acres would be managed as ACECs under this alternative. Additional stipulations that close, exclude, restrict, or prohibit surface disturbance and surface disturbing activities would provide further protections, compared to Alternative A.

### 4.4.2 Alternative C

Impacts on soil resources resulting from implementing actions associated with the management of air quality would the same as those presented under Alternative A.

Surface disturbing activities would not be prohibited in areas with limited reclamation potential soils nor would these areas be designated avoidance areas for surface disturbing activities resulting in increased impacts on soil resources as compared to Alternatives A and B. Closure of Pilot Butte and Emmons Cone to mineral materials sales/disposals would provide greater protections to geological resources than Alternative A.

Impacts on soil resources resulting from implementing water management actions would increase compared to Alternative A, due to reduced restrictions on surface disturbing activities. Such activities would be considered within riparian areas, wetlands, and 100-year floodplains or adjacent to the inner gorge of large ephemeral drainages. This would increase the extent of potential vegetation removal and soil exposure, erosion, compaction, and loss compared with Alternative A. No limits to road density and surface occupancy would be designated in aquifer recharge areas resulting in impacts to groundwater quality and aquifer recharge greater than those presented under Alternative A.

Under this alternative, all lands identified as having wilderness characteristics would not be managed to protect those characteristics. This management could impact soil resources in areas where any surface disturbing activities were to occur, causing loss of vegetation, destabilized soils, and increased erosion.

Under Alternative C, 225,782 acres would be closed to new fluid mineral leasing (a decrease in acreage of approximately 58% compared to Alternative A), and 15,542 acres would be managed as NSO, also a decrease in acreage of approximately 90% compared to Alternative A. Approximately 215,890 acres would be managed as CSU (approximately 70% fewer acres than Alternative A) and 1,355,485 acres would have seasonal restrictions (an approximately 26% decrease in acres compared to Alternative A) (Map 2-8) (Table 2-4 in Appendix V). The decrease in acres designated as closed, NSO, CSU, and seasonally restricted would provide less protection to soils, compared to Alternative A. However, use of best management practices (BMP) and required mitigation measures could help to reduce the extent of these impacts.

Impacts to soils from coal leasing and development would be similar to those discussed in Alternative A, but to a greater extent as 226,219 acres would be closed, a 53% decrease compared to Alternative A. Impacts to soils from oil shale leasing and development would increase compared to those discussed under Alternative A, as 225,965 acres would be closed to leasing and development of oil shale, a 69% decrease.

Under this alternative, 234,961 acres would be pursued for withdrawal from locatable mineral entry. Impacts on soil resources could slightly increase, as approximately 321,597 fewer acres would be closed compared to Alternative A.

Saleable minerals management actions would have impacts similar to Alternative A, but likely to a greater extent, as 226,421 acres would be closed to mineral material sales/disposal, a decrease of 73% compared to Alternative A.

Fuels and fire management actions would have impacts to soils similar to those discussed in Alternative A, except stricter stipulations on heavy equipment use could provide more localized protections to soils in these areas.

Impacts to soils from forest and woodland management actions would likely be greater, compared to Alternative A, as woodlands would be managed to provide forest and woodland products to the public, rather than protections to resources. Clear-cutting and thinning would be allowed in more areas, which could result in greater impacts to soils in both the short-term and long-term, compared to Alternative A.

Vegetation treatment and habitat management actions would have similar impacts to soils as those discussed in Alternative A. Management actions that would maintain, improve, or restore riparian habitat, would provide similar protections to soils as discussed in Alternative A. Requiring management plans to achieve these objectives in all riparian areas, within ten years, could provide greater long-term protections, compared to Alternative A, by defining a time-frame for implementation.

Habitat management actions for fish and wildlife would have similar impacts as discussed in Alternative A, but likely to a greater extent, as allowing more grazing areas, water developments, structures, and energy production in habitat areas could result in greater surface disturbance, vegetation removal, soil compaction, and subsequent erosion. Vegetation treatments would have similar impacts as discussed in Alternative B. In habitats where surface disturbance restrictions are in place, these actions would provide protections to soils similar to Alternative B.

Surface disturbing activities would be allowed within specific cultural resource sites resulting in increased impacts to soils as compared to Alternative A. Paleontological resource management actions would have increased impacts to soils as compared to Alternative A.

Impacts to soil resources from managing visual resources would be similar to those described under Alternative A, except 395,683 acres would be managed as VRM Class III, a decrease of 219,809 acres, compared to Alternative A and 2,374,706 acres would be managed as VRM Class IV, an increase of 194,283 acres compared to Alternative A. This change in VRM designations could result in greater impacts to soils in these areas.

Lands and realty management actions would be similar to Alternative A. ROW exclusion areas would decrease by approximately 47% compared to Alternative A, to 225,784 acres. ROW avoidance areas would also decrease by approximately 96%, to 31,018 acres. Protections to soils would be reduced compared to Alternative A. ROW management actions that co-locate utilities and required mitigation measures would provide similar protections to soils as discussed in Alternative B, and withdrawal action impacts would be similar to those discussed in Alternative A.

Livestock grazing management actions differ from Alternative A, as 160,387 AUMs would be allocated for livestock, 158,260 (50%) fewer AUMs than Alternative A. Adjusting active use AUMs to facilitate proper grazing management or make significant progress toward rangeland standards and goals and objectives of the RMP could decrease localized impacts to soils.

Recreation management actions and impacts to soil resources would be similar to Alternative A but could be to a larger extent. The development of permanent recreation sites and facilities in undeveloped recreation use areas would be allowed, which would provide fewer protections to soils, compared to Alternative A, as there would not be an avoidance or prohibited area within 500 feet of riparian areas. Surface disturbing activities would be permitted within ¼ mile of developed recreation sites and trails if they are determined to be compatible with or are done for meeting recreation objectives for the area, which would provide fewer protections to soils compared to Alternative A.

OHV area designations would be managed similar to Alternative A, as 13,332 acres would be managed as open, 225,537 acres would be managed as closed, and 3,369,418 acres limited to designated roads and trails. Impacts to soil resources from these designations would be similar to Alternative A.

Impacts from special designation, WSAs, and WSR management actions would be similar to Alternative A. No ACECs would be designated or retained under this alternative, which would likely reduce protections to soils in these areas.

### 4.4.3 Alternative D

Impacts to soil resources resulting from implementing actions associated with the management of air quality, water, wildlife, and special status species, cultural resources, paleontological resources, and livestock grazing, fire and fuels, and forests and woodlands would the same as those presented under Alternative A.

Impacts to soils from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils (those with limited reclamation potential as per the Natural Resources Conservation Services (NRCS) soil rating) would be designated avoidance areas for surface disturbing activities, which would reduce the extent of surface disturbing activities in these areas and thereby reduce associated impacts to soil resources. However, under Alternative D, an operator must submit an approved mitigation plan before a proposed project on limited reclamation potential soils will be approved. This could provide a greater degree of protection to limited reclamation potential soils compared to Alternative A, as similar plans would be required under Alternative A only when deemed applicable. Closure of Pilot Butte and Emmons Cone to mineral materials sales/disposals and segregation and withdrawal of these areas would provide greater protections to geological resources than Alternative A.

Impacts on soil resources from managing lands with wilderness characteristics would be greatly increased compared to Alternative B. Under Alternative D, lands with wilderness characteristics would be managed for a variety of uses with only consideration of those characteristics. The management would help to reduce development activities within these areas, but to a far lesser degree than under Alternative B. These areas would not be closed to mineral development as they would be under Alternative B, which would increase the potential occurrence of surface disturbing activities within the nine areas of lands with wilderness characteristics. The activities would result in vegetation removal, the exposure of soils, wind and water erosion and subsequent soil loss, soil compaction, and loss of soil productivity.

Impacts to soil resources from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except stipulations that prohibit fluid mineral leasing would be applied to a smaller area. Under Alternative D, 768,989 acres would be closed to fluid mineral leasing (42% increase compared with Alternative A). Fewer areas would be managed with NSO stipulations (2,172 acres would be managed with NSO stipulations, which is a 99% decrease compared with Alternative A (Table 2-4 in Appendix V, Map 2-9). However, a larger area could be subject to CSU stipulations (1,238,899 acres, which is a 72% increase) and seasonal restrictions (1,911,167 acres which is a 54% increase) as compared with Alternative A. While prohibitions on fluid mineral leasing would reduce surface disturbance and thereby reduce related impacts to soil resources, managing more areas with NSO stipulations would result in decreased soil disturbance, compared with Alternative A.

Impacts on soil resources from solid leasable mineral development activities would be similar to those presented under Alternative A, except the area in which such mineral development is prohibited would be increased to 610,342 acres for coal (26% increase compared with Alternative A) and increased to 1,557,520 acres for oil shale (114% increase compared with Alternative A) (Table 2-7 in Appendix V, Map 2-14). This would increase the area in which soil resources could be impacted by coal development and decrease oil shale development activities on soil resources.

Impacts on soil resources from locatable and saleable mineral development activities would be similar to those presented under Alternative A. Under Alternative D, the lands closed to saleable minerals would be decreased to 362,009 acres, a 57% decrease compared with Alternative A (Table 2-8 in Appendix V, Map 2-19), which would increase the amount of land that could be subject to surface disturbance, vegetation removal, soil loss, and erosion. Lands withdrawn from locatable mineral development would decrease to 482,272 acres, a 13% decrease compared with Alternative A (Table 2-3 in Appendix V, Map 2-4). This management would increase the area in which soil resources could be impacted by locatable mineral development activities, which would decrease the potential for soil exposure to wind and water erosion and subsequent soil degradation and loss.

Impacts on soil resources from managing vegetation resources would be similar to those presented under Alternative A. Under Alternative D, prescribed fire would not be the preferred method for vegetation treatments as it is under Alternative A; however, because all vegetation treatment types are available under Alternative D, the impacts on soil resources would be essentially the same.

Impacts on soil resources resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be greatly increased to 1,178,718 acres (1202% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased soil erosion and loss. Increasing the area managed as VRM Class II would increase the area in which development is restricted in order to be consistent VRM Class II objectives. This could reduce the overall level and intensity of development and result in less soil exposure, erosion, and loss.

Impacts on soil resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be increased. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table

2-10 in Appendix V, Map 2-29), which would decrease the area in which ROW development activities are prohibited. This would increase impacts on soils from ROW development in these areas and could lead to an overall increase of such development across the planning area, thereby degrading soil health and productivity. Considering authorization of renewable energy ROWs within the Known Sodium Leasing Area (KSLA) would provide less protections to soil resources, compared to Alternative A, as surface disturbing activities could occur in these areas. Closing the utility window located in the Little Mountain ACEC would eliminate impacts on soils in that area.

Impacts on soil resources from managing recreation resources would be similar to those presented under Alternative B, except no surface occupancy restrictions would be placed on areas within ¼ miles of developed recreation sites, which would reduce the intensity and extent of surface disturbance in these areas and thereby result in fewer associated impacts to soil resources.

Impacts on soil resources from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as "limited to existing roads and trails" (2,398,839 acres) would be changed to "limited to designated roads and trails" and all routes within this area would be designated as open, closed, or limited.

Impacts on soil resources from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a larger area and thereby offer greater protections to important historic, cultural, wildlife, and scenic values in these areas. This management would reduce surface disturbing activities and indirectly help to protect and maintain soil resources. The acres designated as ACECs would decrease to 246,634 acres (14% decrease compared with Alternative A).

### 4.4.4 Proposed RMP

The Proposed RMP is a combination of management actions primarily from Alternative B and Alternative D and would have similar impacts as previously described under those alternatives. The Proposed RMP opens more areas for surface disturbance activities that may adversely affect soil resources compared to Alternative B, but fewer areas than under Alternative A. The implementation of BMPs should avoid or reduce soil impacts at the project level. In general, the Proposed RMP would increase protections for soils resources when compared to Alternatives A, C, and D, but decrease protections compared to Alternative B.

Impacts on soil resources resulting from implementing actions associated with the management of air quality would be the same as those under Alternative B, except that like Alternative D, dust abatement would be applied on a case-by-case basis using BMPs to protect air quality, which would also reduce soil impacts. Overall, impacts on soil resources from the management of air quality under the Proposed RMP would generally be the same as Alternatives A and B.

Impacts on soils from implementing soil-management actions would be similar to those identified under Alternatives A and D. Under the Proposed RMP, an operator must submit an approved mitigation plan before a proposed project on limited reclamation-potential soils can be approved. This would provide a greater degree of protection to, and mitigate loss of, limited reclamation potential soils compared to Alternative A, as similar plans would be required under Alternative A only when deemed applicable. The management of geological resources would be the same as Alternative A.

The impacts on soil resources from the management of vegetation resources would be similar to those presented under Alternative A and implemented in accordance with the guidelines in Appendix A, except where vegetation treatments can improve water quality and reduce erosion. The Proposed RMP would have similar vegetation management direction as Alternative B, but would allow more methods of treatments, such as chemical and

mechanical, to achieve vegetation goals. These types of treatments could have greater short-term surface disturbance impacts on soils, but may provide better soil stability after natural vegetation is re-established.

Under the Proposed RMP, impacts on soil resources resulting from implementing water management actions would be similar to those presented under Alternative A, except that restrictions near surface water sources would be specified as described under Alternative D, and permanent structures near water features would be allowed on a case-by-case basis. This would allow protection of soils near water features that align with BLM mitigation policies and the Wyoming BLM Mitigation Guidelines for Surface-Disturbing and Disruptive Activities, while providing flexibility to develop facilities and linear crossings on a case-by-case basis. Therefore, impacts from water management actions on soil resources under the Proposed RMP would be the same as Alternative D and would result in greater soil impacts near surface water sources than Alternative B, prohibiting surface disturbing activities and new structures and increasing restricted buffers near surface water sources.

Under the Proposed RMP, lands with wilderness characteristics would be managed for a variety of uses without specific management to protect wilderness characteristics. Lands with wilderness characteristics within the Salt Wells area may experience greater surface disturbance from multiple uses and, therefore, may have more impacts to soil than Alternatives A and B. Overall, not managing lands with wilderness characteristics would remove the potential beneficial impacts on soil resources described under Alternative B.

Impacts on soil resources from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, and the land use allocations would be the same as described under Alternative D. Under the Proposed RMP, more acres would be closed to fluid minerals (99% increase compared with Alternative A), and those that remain open would mostly be subject to NSO, CSU, and TLS stipulations to avoid or reduce impacts on soils. The Proposed RMP would result in additional acres available for fluid mineral leasing compared to Alternative B, with most acres subject to CSU and TLS. Therefore, the Proposed RMP would result in greater soil impacts from fluid mineral leasing and development than Alternative B.

Impacts on soil resources from locatable and saleable mineral development activities would be similar to those discussed under Alternatives A and D. The Proposed RMP would decrease the area in which soil resources could be affected by locatable mineral development activities and decrease the potential for soil exposure to wind and water erosion and subsequent soil degradation and loss, when compared to Alternatives A and D. However, the Proposed RMP would close fewer acres to salable mineral entry and provide fewer protections from indirect impacts on soil resources than Alternative A, but provide more protections than Alternatives B, C, and D.

Impacts on soil resources resulting from implementing VRM actions would be similar to those described under Alternative A, except that the number of acres designated as restrictive VRM Class II would increase by 71%. This more restrictive management would reduce surface disturbance under the Proposed RMP. Therefore, VRM actions would provide greater protections for soils resources compared to Alternative A.

Impacts on soil resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except that the extent of soil impacts from ROW activities would decrease, due primarily to a 68% increase in ROW exclusion areas compared to Alternative A. Similar to Alternative B, with the exception of “eligible but not designated” trails, the Proposed RMP alternative would only designate NHT corridors and remove all “eligible but not designated” trails within a 10-mile-wide buffer around designated trials from ROW exclusions. “Eligible but not designated” areas would be classified as ROW avoidance areas under the Proposed RMP and would provide more protection for soil resources from ROW authorizations when compared to management actions under Alternative A, but less than those under Alternative B.

The Proposed RMP would designate five Special Recreation Management Areas (SRMA) (138,605 acres), compared to six under Alternative A (298,110 acres) and none under Alternative B. As a result, the Proposed RMP would reduce the potential for recreation-related surface disturbances to impact soil resources when

compared to Alternative A, but would have a greater potential for impacts when compared to Alternative B. As under Alternative D, NSO restrictions would be placed on areas within ¼ mile of developed recreation sites, which would reduce the intensity and extent of surface disturbance in these areas and thereby result in fewer associated impacts on soil resources.

Impacts on soil resources from managing OHV use under the Proposed RMP would be the same as those presented under Alternative A, except the areas currently designated as "limited to existing roads and trails" (3,367,223 acres) would be "limited to designated roads and trails." This classification change would not yield a difference in impacts on soil conditions compared to Alternative A.

Impacts on soil resources from managing special-designation areas would be similar to those described under Alternative A, except that they would occur over more acres and thereby offer greater protections to important historic, cultural, wildlife, special status plants, and scenic values in these areas, as determined by the management area direction. The acreage designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase compared with 10 ACECs under Alternative A). Overall management of special designation areas under the Proposed RMP would limit surface disturbance to a greater extent than Alternative A by restricting the types of activities allowed in the areas and, therefore, providing indirect protection of soil resources. The Proposed RMP would have greater protection of soil resources through management of ACECs compared to Alternatives A, C, and D, but fewer protections than Alternative B.

# 4.5 WATER RESOURCES

## 4.5.1 Alternative B

Under Alternative B, water-related resources would have the least potential impacts on a broad scale, in comparison to the other alternatives.

Impacts to water resources from air quality management would be similar to those described under Alternative A. Under Alternative B, additional management for dust abatement could reduce sediment runoff and erosion, which could support water quality to a greater degree than Alternative A.

Under Alternative B, prohibiting surface disturbing activities in areas with limited reclamation potential soils would provide greater protections to water resources compared to Alternative A. These areas would be managed with NSO stipulations for fluid minerals, closed to mineral materials sales/disposals, and closed to all solid mineral leasing, which would provide additional protection to water resources. Additional soils management actions would provide further protections to water resources and could reduce soil loss, erosion, runoff, and the deposition of sediment, salts, pollutants, or excess nutrients into water bodies compared to Alternative A.

Under Alternative B, management for water resources, such as preventing or reducing surface disturbing activities, would provide greater protections to water when compared to Alternative A. Prohibiting the use of fire suppression chemicals within ¼ mile of surface water would provide protections to surface water resources by minimizing the amount of potential runoff of these chemicals into nearby water bodies, supporting water quality. Prohibitions for herbicide and pesticide loading, maintenance, and refueling areas would provide greater protections to water resources, as the prohibited area would be greater (¼ mile around water resources, floodplains, riparian areas, and special status plant locations, instead of 500 feet in Alternative A).

Water management actions that require hydrogeologic investigations to protect groundwater quality and prevent commingling of aquifers and obtaining legal protection of both consumptive and nonconsumptive water uses would help to maintain both surface and groundwater quality.

Managing lands with wilderness characteristics could prevent surface disturbance and protect water resources in these areas. Management would include closing these areas to fluid minerals, mineral material sales/disposal, all solid mineral leasing, mineral location, designating exclusion areas for all new ROWs, and VRM Class II. The management would provide greater protections to water resources by preventing associated surface disturbing activities and subsequent vegetation removal, soil erosion, and overland transport of excess sediment, salts, and nutrients into water bodies.

In areas open to fluid mineral leasing, impacts to water resources from allowing development of oil and gas within these lands with standard terms and conditions would be similar to those described under Alternative A. Under Alternative B, 2,186,218 acres would be closed to new fluid mineral leasing, an approximately 305% increase in acreage compared to Alternative A, and 813,354 acres would be managed as NSO, an increase of approximately 413% acres, compared to Alternative A. 99,674 acres would be managed as CSU (approximately 86% fewer acres than Alternative A) and 713,837 acres would have seasonal restrictions (approximately 61% fewer acres than Alternative A) (Map 2-7). The increased amount of land managed as closed or with NSO stipulations could provide greater protections to surface and groundwater resources in these areas, compared to Alternative A.

Under this alternative, 3,535,546 acres would be closed to coal leasing, exploration and development, and 2,122,282 acres would be closed to oil shale. This management would provide greater protections to water resources compared to Alternative A by reducing the amount of land that could be vulnerable to surface disturbance, vegetation removal, soil loss, erosion, and runoff of excess sediment, salts, pollutants, and nutrients into water bodies.

Under Alternative B, 1,993,908 acres would be pursued for withdrawal from locatable mineral entry. Impacts to water resources would be similar to those described under Alternative A, but would provide greater protection to water resources, as approximately 258% more acres would be withdrawn compared to Alternative A.

Impacts to water resources from saleable minerals management would be similar in kind, but less in extent, to those described under Alternative A. Under Alternative B, 2,581,741 acres would be closed to mineral material sales/disposals, an approximately 210% increase compared to Alternative A. Impacts would be reduced as surface disturbing activities associated with mineral material disposal, and subsequent erosion, sediment, nutrient, and salt transport to surface water bodies would occur in fewer acres of land compared to Alternative A.

Impacts to water resources from fuels and fire management would be similar to those discussed in Alternative A, except stricter stipulations on heavy equipment use and use of chemical fire suppressants could provide greater protections to water quality in these areas.

Impacts to water resources from forest and woodland resource management would be similar to Alternative A, except that additional management to reduce forestry on steep slopes, and reduced surface disturbance would provide more protections to water resources by maintaining vegetative cover and soil stability, thereby limiting excess sediment and nutrient transport to nearby surface water.

Vegetation treatment actions would have similar impacts as those discussed in Alternative A, but longer resting times for treated areas would likely provide greater protections to water resources in these areas as vegetation and soil would have a longer timeframe to establish and stabilize, thereby minimizing excess salt, sediment, and nutrient flow to water bodies. Prohibiting chemical applications, including herbicide and pesticide loading within ¼ mile, aerial application of chemicals within 2,640 feet, and vehicle and hand application of chemicals within 1,320 feet of wetlands, riparian areas, aquatic habitats and special status plants would provide greater protections to water resources in these areas by minimizing surface disturbance, chemical exposure, and maintaining water quality.

Impacts to water resources from fish and wildlife habitat management would be similar to those described under Alternative A. Management that would maintain or improve habitat, such as selective placement of water developments, would reduce surface disturbance in the vicinity of streams and water bodies resulting in improved riparian and soil conditions, and thus, more protections for water resources. However, surface disturbing activities such as vegetation treatments, removing and building fences, and water developments would result in short-term vegetation loss, which could cause localized erosion and sediment transport to nearby surface water. Applying seasonal surface disturbance restrictions would provide protections to water resources similar to Alternative A, but to a greater extent as the restrictions would cover the entire planning area.

Impacts to water resources from the management of special status plant species by applying NSO and closures would be similar to those described under Alternative A. Additional restrictions such as designating ROW exclusion areas would provide greater protections to water resources compared to Alternative A. Prohibiting use of fire chemicals, salt or mineral supplements, and range improvements within ¼ mile of special status plant species could indirectly protect water quality in these areas. Designating seasonal avoidance and limitations for surface disturbing activities in and near special status species' habitat would provide similar short-term protections to water resources as discussed in Alternative A. Under Alternative B, additional management such as closures and seasonal prohibitions of surface disturbing and disruptive activities could reduce the levels of vegetation removal, erosion, and excess sediment, salt, pollutant, and nutrient loading to surface water.

Protections to water resources from management of specific cultural resource sites would be similar to Alternative A, but to a greater extent as restrictions to mineral activities, including designating NSO and closed areas, would be over a larger area. Cultural resource management actions would include applying a CSU for fluid minerals, which would provide fewer protections to water resources for the specific areas, compared to Alternative A, as surface disturbing activities could still occur. Paleontological resource management activities would have the same impacts as discussed in Alternative A, but to a greater extent as mitigation requirements and additional NSO and closures for mineral sales and leasing would provide greater protections to water resources.

Impacts to water resources from VRM would be similar to those described in Alternative A, except that additional management would provide greater protections to water resources. Alternative B would have fewer VRM Class IV areas, and more VRM Class II areas. Approximately 2,148,902 acres would be managed as VRM Class II, a 269% increase of acres compared to Alternative A. Approximately 563,754 acres would be managed as VRM Class IV, which would be an approximately 74% reduction of acres compared to Alternative A, and thus the potential for impacts to water resources would be reduced.

Lands and realty management actions would be similar to Alternative A, except where additional lands are retained. Retention of public lands would result in the continued level of protections for water resources. Conversely, any potential disposal of lands would remove those protections from the affected lands.

ROW and corridor action impacts would be similar to Alternative A in areas open for ROW actions. Under this alternative, 2,480,876 acres would be designated as ROW exclusion areas, an approximately 481% increase in acres compared to Alternative A, and ROW avoidance acres would decrease by approximately 82%, to 133,903 acres. Exclusion areas would have less likelihood for surface disturbing activities than avoidance areas, and thus protections to water resources would be greater under this alternative, compared to Alternative A. Additional measures to co-locate pipelines, power lines, and other utilities adjacent to or within existing ROWs to reduce new surface disturbance would provide further protections to water resources.

Impacts to water resources from livestock grazing management would be similar to Alternative A. Under Alternative B, some areas would be prohibited or closed to livestock grazing. In these areas, reduced grazing pressure on vegetation would provide greater protections to water resources when compared to Alternative A.

Impacts to water resources from recreation management would be similar to those described under Alternative A; however, Alternative B would provide additional management which would protect water resources. The additional management would result in less surface disturbance, providing greater protections to water resources.

Impacts to water resources from OHV management would be similar to Alternative A, with 12,831 acres open, 225,537 acres closed (including in WSAs), and 3,367,576 acres limited to designated roads and trails. In areas where OHVs could cause considerable impacts upon soil, vegetation, or other resources, there would be less surface disturbance and reduced impacts to water resources, compared to Alternative A, as these areas would be immediately closed until adverse effects are eliminated.

Impacts to water resources from the management of NHTs, WSAs, and WSRs would be the same as those described under Alternative A. Impacts to water resources from the management for ACECs would be similar to Alternative A, but 1,605,660 acres would be managed as ACECs under Alternative B. Additional stipulations that close, exclude, restrict, or prohibit surface disturbance and surface disturbing activities would provide further protections to water resources compared to Alternative A.

### 4.5.2 Alternative C

Impacts to water resources from the management of soil resources would be similar in type to those described under Alternative A. The management would provide greater protections to water resources compared to Alternative A by reducing surface disturbing activities associated with mineral activities in these areas. The preparation of site-specific activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, enhance water quality) would provide similar protections to water quality resources as described in Alternative A, where implemented. These plans would not be required in all areas, and where not required, water quality resources could receive lesser protections, compared to Alternative A.

The emphasis on development of mineral resources under Alternative C would result in larger amounts of surface disturbance and related potential impacts to water resources than the other alternatives. State and federal water quality standards would still apply.

Water quality management actions would have impacts similar to those discussed in Alternative A. Prohibiting salt or mineral supplements near surface water would provide protections to water resources similar to those discussed in Alternative B, but to a lesser extent as the prohibited area is smaller (100 feet of surface water, compared to 2,640 feet in Alternative B). Prohibiting the use of fire suppression chemicals would provide similar protections to surface water compared to Alternative B, but to a lesser extent as the prohibited area would be smaller (within 100 feet from surface water, compared to 1,320 feet in Alternative B).

Under Alternative C, all lands identified as having wilderness characteristics would not be managed to protect those characteristics. This management could result in more surface disturbing activities compared to Alternative B. Not managing lands with wilderness characteristics could result in a loss of vegetation, destabilized soils, and additional flow of salt, sediment, pollutants, and nutrients to water bodies.

Under Alternative C, 225,782 acres would be closed to new fluid mineral leasing (a decrease in acreage of approximately 58% compared to Alternative A), and 15,542 acres would be managed as NSO, also a decrease in acreage of approximately 90% compared to Alternative A. Approximately 215,890 acres would be managed as CSU (approximately 70% fewer acres than Alternative A) and 1,355,485 acres would have seasonal restrictions (an approximately 26% decrease in acres compared to Alternative A) (Map 2-8). The decrease in acres designated as closed, NSO, CSU, and seasonally restricted would provide less protection to soils, compared to Alternative A. However, use of BMPs and required mitigation measures could help to reduce the extent of these impacts to water resources.

Impacts to water resources from coal and oil shale leasing and development would be very similar to those described in Alternative A. Under Alternative C, 226,219 acres would be closed to coal leasing, 259,745 fewer acres than Alternative A, and 225,965 acres would be closed to oil shale leasing, 501,840 fewer acres than Alternative A. The smaller areas that would be closed to coal and oil shale leasing could result in increased impacts to water resources from surface disturbance, vegetation removal, soil erosion, and runoff of sediment, salts, pollutants, or nutrients into surface water, which could degrade water quality to a greater degree than Alternative A.

Impacts to water resources from locatable and saleable mineral development would be similar to those described under Alternative A. Under Alternative C, locatable minerals would be proposed for withdrawal on 234,961 acres (approximately 58% fewer acres than Alternative A), resulting in greater potential for impacts to water resources in these areas from related surface disturbing activities. Saleable minerals would be closed within 226,421 acres, 607,298 fewer acres and a 73% decrease compared to Alternative A. The smaller areas available for mineral development could result in increased impacts to water resources from surface disturbance; vegetation removal; soil erosion; and runoff of sediment, salts, pollutants, or nutrients into surface water, which could degrade water quality to a greater degree than Alternative A.

Impacts to water resources from fuels and fire management would be similar to those discussed in Alternative A, except stricter stipulations on heavy equipment use could provide more localized protections to water resources in these areas.

Overall, impacts to water resources from forest and woodland management actions would likely increase compared to Alternative A, as woodlands would be managed to provide forest and woodland products to the public, rather than protections to resources. Clear-cutting and thinning would be allowed in more areas which could result in greater impacts to water resources in both the short-term and long-term, compared to Alternative A.

Impacts to water resources from the management of vegetation resources, including management actions that would maintain, improve, or restore riparian habitat, including achieving proper functioning condition (PFC), and removing or reducing livestock grazing in riparian areas, would have similar impacts as those discussed in Alternative A. Prohibitions to pesticide and herbicide applications would have similar impacts as those discussed in Alternative B, but to a lesser extent, as the prohibited areas would be smaller (100 feet instead of 2,640 feet for aerial application, and 25 feet by vehicle or 10 feet by hand application, compared to 1,320 feet under Alternative B) and water resources could be more vulnerable to contamination.

Impacts to water resources from habitat management actions for fish and wildlife would be similar to those discussed in Alternative A. Under Alternative C, fewer restrictions for habitat protection would likely result in greater surface disturbance, vegetation removal, and subsequent erosion and sediment transport to nearby water bodies.

Impacts to water resources from special status species management would be similar to Alternative A. Avoidance areas for surface disturbing activities in areas with special status plant species could provide protections to water resources, but not to the extent described Alternative A. Under this alternative, some areas restricted in Alternative A would have no restrictions in place; these areas would likely have greater impacts to water resources from more surface disturbing activities, compared to Alternative A. Prohibiting use of fire suppression chemicals, including foaming agents and surfactants, salt and mineral supplements, and range improvements within 100 feet of special status plant species populations would provide protections similar to Alternative B, but to a lesser extent as the prohibited area would be smaller (100 feet instead of ¼ mile).

Management actions for cultural resource sites that restrict or prohibit surface disturbing activities would provide similar protections to water resources as discussed in Alternative A. However, designation of additional ROW

exclusion areas could provide greater protections to water resources, compared to Alternative A. Impacts to water resources from paleontological resource management would be the same as those discussed in Alternative A.

Under Alternative C, 607,899 acres would be managed as VRM Class II, which would be 25,227 more acres than under Alternative A. This increase in VRM Class II acreage would be approximately 4%, which could result in greater protections to water resources. Approximately 395,683 acres would be managed as VRM Class III, a decrease of 219,809 acres compared to Alternative A; and 2,374,706 acres would be managed as VRM Class IV, an increase of 194,283 acres compared to Alternative A. The increase of VRM Class IV could result in greater impacts to water resources from surface disturbance; vegetation loss; erosion; and runoff of sediment, salts, pollutants, or excess nutrients.

Impacts to water resources from lands and realty management would be similar to those described in Alternative A, except retention of public lands would result in the continued level of protections for water resources. ROW exclusion areas would decrease by approximately 47% compared to Alternative A, to 225,784 acres, and ROW avoidance areas would decrease by approximately 96%, to 31,018 acres. These reductions in exclusion and avoidance areas would provide fewer protections to water resources, compared to Alternative A. ROW management actions that co-locate utilities and required mitigation measures would provide similar protections to water resources as discussed in Alternative B.

Impacts to water resources from livestock grazing management would be similar to Alternative A, except larger areas of land would be open to livestock grazing, compared to Alternative A. Areas that would be open to grazing under this alternative could experience increased localized impacts to water resources. Soil compaction and loss of vegetative cover from increased grazing could result in reduced soil infiltration, increased runoff, and sedimentation of surface waters.

Impacts to water resources from recreation management would be similar to Alternative A, but to a larger extent. The development of permanent recreation sites and facilities in undeveloped recreation use areas would be allowed, which would provide fewer protections to water resources, compared to Alternative A. Surface disturbing activities would be permitted within ¼ mile of developed recreation sites and trails, which would provide fewer protections to water resources compared to Alternative A.

Impacts to water resources from OHV area designations would be similar to Alternative A, as 13,332 acres would be managed as open, 225,537 acres would be managed as closed, and 3,365,374 acres limited to designated roads and trails. Of these designated routes, 16,256 miles would be open, 427 miles would be closed, 93 miles would be limited, and 165 miles would be designated as transportation linear disturbance. Impacts to water resources from route designations would be similar to those described under Alternative B, but many more miles of routes would be open to OHV use which would result in increased erosion, vegetation loss, soil compaction, and sediment, salt, pollutant, or nutrient runoff into nearby waterbodies when compared to Alternative B.

Impacts to water resources from special designations, WSAs, and WSR management would be similar to Alternative A, except the wild portion of the Sweetwater River would be revoked, which would reduce protections to water resources in this area compared to Alternative A. No ACECs would be designated or retained under this alternative, which would likely reduce protections to water resources in these areas. Under Alternative C, localized surface disturbance could occur, which could lead to increased erosion and sediment to flow to nearby surface water.

### 4.5.3 Alternative D

The impacts on water resources resulting from implementing actions associated with the management for air quality, fire and fuels, forests and woodlands, fish and wildlife, special status species, cultural resources, paleontological resources, and livestock grazing would be similar to those presented under Alternative A.

Impacts to water resources from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils (those with limited reclamation potential as per the NRCS soil rating) would be designated avoidance areas for surface disturbing activities, which would reduce the extent of surface disturbing activities in these areas and thereby reduce associated impacts to water resources. However, an operator must submit an approved mitigation plan before a proposed project on limited reclamation potential soils will be approved. This could provide a greater degree of protection to water resources compared to Alternative A, as similar plans would be required under Alternative A only when deemed applicable.

The impacts on water resources resulting from implementing water management actions would be similar to those presented under Alternative A, except two additional provisions under Alternative D would provide greater protection to water resources. Impoundment ponds, reserve pits, and evaporation ponds that could result in the contamination of sensitive water resources would be avoided or mitigated. This would serve to ensure that such ponds/pits do not pose a threat to surface and groundwater resources, which would further help to maintain or improve water quality. The second additional provision would require hydrogeologic investigations where there is a reasonable expectation that surface water features are connected with aquifers and geologic formations that are potentially impacted by BLM authorized activities. This would help to protect groundwater resources by informing surface users of the connection to groundwater sources and would provide additional protections compared with Alternative A because this requirement would be applied across the entire planning area (versus only the Jack Morrow Hills [JMH] Area).

The impacts to water resources from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except stipulations that prohibit fluid mineral leasing and surface occupancy would be applied to a smaller area. Under Alternative D, 768,989 acres would be closed to fluid mineral leasing (42% increase compared with Alternative A) and 2,172 acres would be managed with NSO stipulations (99% decrease compared with Alternative A) (Table 2-4 in Appendix V, Map 2-9). Managing more areas that are closed to fluid mineral leasing or fewer areas with NSO stipulations would result in increased surface disturbance and related impacts to water resources.

The impacts on water resources from solid leasable mineral development activities would be similar to those presented under Alternative A, except the area in which coal and oil shale development are prohibited would be increased to 610,342 acres (26% increase compared with Alternative A) and 1,557,520 acres (114% increase compared with Alternative A), respectively (Table 2-7 in Appendix V, Map 2-14). This would decrease the area in which water resources could be impacted by coal and oil shale development activities.

The impacts on water resources from locatable and saleable mineral development activities would be similar to those presented under Alternative A. Under Alternative D, the lands closed to saleable mineral development would be decreased to 362,009 acres (57% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-19) and lands proposed for withdrawal from locatable mineral entry would be decreased to 482,272 acres (13% decrease compared with Alternative A) (Table 2-3 in Appendix V, Map 2-4). This would increase the potential for surface disturbance and related vegetation removal, soil erosion, and sedimentation and degradation of water resources.

The impacts on water resources from managing vegetation resources would be similar to those presented under Alternative A. Under Alternative D, prescribed fire would not be the preferred method for vegetation treatments as it is under Alternative A. However, because all the vegetation treatment types are available under Alternative D, the impacts on water resources would be essentially the same.

The impacts on water resources resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be increased to 1,178,718 acres (103% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased surface disturbances and related impacts on water quality. Increasing the area managed as VRM Class

II would increase the area in which development is restricted in order to be consistent VRM Class II objectives. This, in turn, could reduce the overall level and intensity of development and decrease the potential for surface disturbance and related vegetation removal, soil erosion, and sedimentation and degradation of water resources.

The impacts on water resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be increased. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table 2-10 in Appendix V, Map 2-29), which would decrease the area in which ROW development activities are prohibited. This would increase impacts on water resources from ROW development in these areas and could lead to an overall increase of such development across the planning area, thereby increasing the potential for degradation of water quality.

The impacts on water resources from managing recreation resources would be similar to those presented under Alternative A, except the areas designated as SRMAs would be decreased to 135,549 acres (55% decreased compared to Alternative A) (Table 2-12 in Appendix V, Map 2-39), which could decrease intensive recreational activities in the former SRMAs and thereby decrease associated impacts to water resources.

The impacts on water resources from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as "limited to existing roads and trails" (2,398,839 acres) would be changed to "limited to designated roads and trails" and all routes within this area would be designated as open, closed or limited.

The impacts on water resources from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a smaller area and thereby offer fewer protections to important historic, cultural, wildlife, and scenic values in areas that were formerly special designations. This, in turn, could increase surface disturbing activities and related impacts on water resources. The acres designated as ACECs would be decreased to 246,634 acres (14% decrease compared with Alternative A).

### 4.5.4 Proposed RMP

The Proposed RMP is a combination of management actions, primarily from Alternatives B and D, that would place emphasis on minimizing surface disturbing activities with potential to impact water resources. As a result, the Proposed RMP would generally result in impacts to water resources at levels similar to those previously described under Alternatives B and D.

Impacts on water resources from actions associated with the management for air quality, fish and wildlife, special status species, cultural resources, paleontological resources, fire and fuels, solid leasable minerals, and livestock grazing would generally be the same as those presented under Alternative A. Impacts on water resources from actions associated with the management for recreation and visual resources would be the same as those presented under Alternative D.

Similar to Alternative D, soil management actions under the Proposed RMP are generally designed to reduce erosion, improve water quality, improve bank stability, and restore wetland and riparian areas. Impacts on water resources from soil management actions would be similar to those identified under Alternative A, except for surface-disturbing activities and salinity control measures, which would be the same as Alternative D and offer more protection to water resources when compared to Alternative A. Within the JMH planning area, the BLM would continue to participate with federal, state, and local governmental agencies to develop and implement salinity control plans for the Colorado River Basin and maintain existing and future applicable water quality plans, which is the same as Alternative B and would result in a reduced potential for water quality impacts when compared to Alternative A. Similar to Alternative D, the Proposed RMP would also implement plans that are site

specific on a case-by-case basis, incorporate BMPs, and enhance water quality actions, further protecting water resources.

Impacts on water resources from management of vegetation resources would be similar to those presented under Alternative A and would be implemented in accordance with the guidelines in Appendix A, except where vegetation treatments can improve water quality and reduce erosion. Under the Proposed RMP, the use of mechanical, chemical, and biological control methods (including prescribed fire and livestock grazing) would result in the same potential for indirect impacts on water resources as Alternatives A and D, and greater impacts than actions proposed under Alternative B. The prohibitions to pesticide and herbicide applications under the Proposed RMP would have similar impacts as those discussed in Alternative C.

Like Alternative D, the Proposed RMP would implement restrictions on the placement of permanent facilities and linear crossings within floodplains, wetlands, riparian areas, and perennial streams but would result in fewer protections than Alternative B, which would prohibit any new surface-disturbing activities within the areas. The Proposed RMP would allow for linear crossings on a case-by-case basis if a site-specific analysis were conducted by a BLM Authorized Officer (AO) and if there were a determination of no adverse impact.

Impacts on water resources from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except that stipulations prohibiting fluid mineral leasing and surface occupancy would be applied to a larger area. Under the Proposed RMP, 1,076,039 acres would be closed to fluid mineral leasing (99% increase, compared with Alternative A), and 215,437 acres would be managed with NSO stipulations (36% increase, compared with Alternative A) (Table 2-4 in Appendix V). Similar to Alternative D, the Proposed RMP would avoid subsurface mineral activity in identified aquifer-recharge areas in the towns of Superior and McKinnon, designating these locations as ROW avoidance areas. Additionally, the Proposed RMP would allow for increased CSU restrictions for fluid minerals (1,116,266 acres) to reduce impacts on these important local water resources.

Impacts on water resources from locatable minerals and saleable minerals would be similar to those under Alternative A, except that the Proposed RMP would close slightly more acres to salable mineral entry (51,187 more acres than Alternative A) and pursue additional acres for withdrawal for locatable minerals (343,646 more acres than Alternative A). Compared to Alternative A, this would decrease the potential for surface disturbance and related vegetation removal, soil erosion, and sedimentation and degradation of water resources, although not to the extent as the more-restrictive management actions under Alternative B. Similar to Alternative D, saleable mineral pits that are no longer in use would be reclaimed, which would have a long-term positive impact on water resources.

Unlike Alternatives A, B, and D, the Proposed RMP would not require hydrogeologic investigations in areas where surface water features are expected to be connected to aquifers that could be impacted by BLM-authorized activities, potentially reducing surface and groundwater quality by collecting less information that could otherwise inform mitigation measures. Other activities and related impacts within aquifer recharge areas would be the same as those described under Alternative D, which are aimed at protecting groundwater quality and maintaining a healthy aquifer recharge area.

The impacts on water resources resulting from most forest management actions would be similar to Alternative D and would improve vegetative health across the forest landscape, reduce erosion potential, and improve water quality. Similar to Alternative B, the Proposed RMP would prohibit clear-cut harvesting and limit logging operations on slopes steeper than 25% (unless technological, environmental, and economic methods are available and approved), which would result in further increases to soil stability and greater protection of water resources than Alternatives A and D.

Under the Proposed RMP, impacts on water resources resulting from lands and realty actions to protect fish and wildlife habitats would be the same as those of Alternative D, and would allow for greater flexibility of land exchanges of equal or greater value along aquatic and riparian habitats, when compared to Alternative A.

Impacts on water resources from implementing ROW management would be similar to those presented under Alternative A, except that the extent of the impacts would be decreased. Under the Proposed RMP, 921,059 acres would be designated as ROW exclusion areas, an approximate 116% increase compared to Alternative A, but a 63% decrease compared to Alternative B. ROW avoidance areas (1,047,929 acres) would increase by approximately 42% and 683%, when compared to Alternatives A and B, respectively. As described under Alternative B, exclusion areas would have less likelihood for surface-disturbing activities than avoidance areas; thus, protections for water resources would be greater under the Proposed RMP compared to Alternative A and reduced compared to Alternative B.

The impacts on water resources from managing special designation areas would be similar to those presented under Alternative B, except that approximately 648,665 fewer acres would be designated as ACECs under the Proposed RMP. Similar to Alternative D, allowances would be made for the installation of structures designed to reduce sediment, siltation, or erosion. Overall, the Proposed RMP would provide greater protection for water resources through the management of ACECs than Alternatives A, C, and D, but provide fewer protections than Alternative B.

Like Alternative B, the Proposed RMP would give further consideration or inclusion in the WSR system to the seven BLM-administered public land parcels along the Sweetwater River (involving about 9.7 miles of the river), which would offer greater protection for water resources in this area and positively impact the river and riparian ecosystems.

# 4.6 VEGETATIVE COMMUNITIES

## 4.6.1 Alternative B

Impacts to vegetation from watershed management would be the same as those under Alternative A. In addition, increased restrictions on surface disturbing activities and larger buffer zones around riparian areas and floodplains would provide greater protections to riparian vegetation. Water developments for diversion from springs or seep sources could reduce surface disturbances from grazing and wildlife around springs and seeps by redistributing them around the diversions. Prohibiting the use of fire suppression chemicals within 1,320 feet (¼ mile) of surface water would protect vegetation and water quality from these chemicals within wetland and riparian habitat. Prohibiting salt blocks and other nutritional supplements within 2,640 feet (½ mile) of surface water sources, riparian areas, and wetlands could distribute livestock use of vegetation and reduce impacts on vegetation along water sources.

Impacts to vegetation from managing lands identified as having wilderness characteristics would provide increased protection to vegetation resources in these areas. Lands would be pursued for withdrawal from locatable mineral entry or closed to mineral material sales and solid mineral leasing which would prevent or reduce surface disturbing activities. Vegetation resources could remain intact, soils would remain stable, and the introduction and spread of invasive, non-native plant species would be less likely to occur.

Impacts to vegetation from oil and gas leasing would be similar to those described under Alternative A, but under Alternative B, more acres of habitat would be protected from surface disturbance due to fluid mineral leasing (Table 2-4 in Appendix V). Based on Table 4-7 in Chapter 4, Alternative B would close approximately 71,766 acres (46%) of grasslands to oil and gas leasing and apply NSO stipulations to 22,665 acres (15%) of grasslands. Alternative B would close approximately 1,296,074 acres of sagebrush to oil and gas leasing (59%) and apply

NSO stipulations to 282,094 acres (13%) of sagebrush. The management under Alternative B would close approximately 73,144 acres of riparian vegetation to oil and gas leasing (50%) and apply NSO stipulations to 16,810 acres of riparian vegetation (11%); and would close approximately 28,488 acres of aspen/conifer to oil and gas leasing (69%) and apply NSO stipulations to 1,341 acres of aspen/conifer vegetation (3%).

Withdrawing 1,993,908 acres to locatable mineral entry and closing 2,581,741 acres to saleable mineral development could benefit vegetation. The decreased levels of mineral development proposed under Alternative B would result in reduced vegetation disturbance and a lower potential for weed invasion compared to Alternative A.

Impacts to vegetation resources from wildland fire and fuels management would be similar to Alternative A, except wildfires could be allowed to persist in lands that would benefit from fire. This alternative would require less fire line construction and other surface disturbance, which would reduce disturbance and removal of vegetation and limit areas where invasive non-native plant species could occur.

Impacts to vegetation from forest and woodland management would be similar to those described under Alternative A; however, Alternative B emphasizes the use of natural processes for forestry management in addition to not allowing clearcutting. The management in Alternative B would support forest and woodland habitat by encouraging natural habitat conditions, native vegetation, cover, forage, and functional ecosystems.

Vegetation management under Alternative B would support vegetation resources to a greater degree than under Alternative A. The additional management would result in riparian vegetation that consists of mid- to late-seral-stage communities with a mixture of herbaceous and multi-aged woody species. Other effects would include increased vegetation production, increased diversity, and a more stable riparian plant growth medium. Vegetation treatments would be designed to re-establish the natural role of fire in the ecosystem. This would result in lower-seral plant communities with less woody species. Impacts of noxious weed infestations on vegetation resources would be less than under Alternative A because of an anticipated decrease in access and activities that would introduce or aid in spreading the species in the planning area.

Impacts to vegetation from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control would protect vegetation and surrounding soils from damage from more invasive control methods, such as chemicals or fire. However, less invasive techniques may not be as effective in controlling large infestations of noxious weeds as would chemicals or fire. Under Alternative B, additional management for preventing and controlling the infestation of aquatic invasive species could support wetland and riparian vegetation. The management would help prevent the infestation of riparian and aquatic habitat from non-native species, which would help maintain and protect native ecosystems.

Impacts to vegetation from the management of wildlife, fish, and special status species habitat would be similar to Alternative A. Additional management under Alternative B could help maintain or improve conditions for plants by preventing soil compaction, erosion, sedimentation, and the influx of nutrients into riparian areas, wetlands, or streambeds which could support the health and vitality of vegetation resources in these areas. Wildlife and fisheries objectives would be addressed during reclamation activities, which would influence the plant seed mix selection used in reclaimed areas. Impacts on vegetation from surface-disturbing activities would not occur within certain wildlife buffers, which would help to retain a native vegetation composition. Managing important waterfowl areas for preferred waterfowl habitat would benefit riparian and wetland vegetation.

Under Alternative B, 225,736 acres would be managed as VRM Class I, 2,148,902 acres would be managed as VRM Class II, 666,522 acres would be managed as VRM Class III, and 563,754 acres would be managed as VRM Class IV. This management would protect larger areas of land from surface disturbance and vegetation loss to a greater degree when compared with Alternative A.

The increased restrictions placed on livestock grazing activities under this alternative would likely support vegetation resources to a greater degree when compared to Alternative A. Closing all exclosures within the planning area to livestock grazing and suspend AUMs currently authorized in these exclosures would allow the forage in the exclosure area a chance to regrow.

Impacts from OHV management would be similar to Alternative A; however, a reduced amount of the area would be open to OHV use, so the likelihood of impacts would be less than Alternative A. Opening 12,831 acres to OHV use could result in the introduction or spread of invasive, non-native plant species, which could alter or destroy native vegetation and ecosystems. Closing routes to OHV use (225,537 acres) would help prevent these impacts to vegetation. Restricting vehicular travel would prevent damage to vegetation from vehicles; prevent soil loss, erosion, and runoff to riparian habitat. Under this Alternative, 3,367,576 acres of OHV use would be limited to designated roads and trails. Alternative B is only limited to designated roads and trails while Alternative A has areas limited to existing roads and trails.

Management of 2,480,876 acres of ROW exclusion and 133,903 acres of avoidance areas could prevent or reduce surface disturbance and vegetation loss through an increase of lands managed as exclusion areas compared to Alternative A.

Alternative B would apply greater protection for vegetation resources within Special Designations/Management Areas (SD/MA). Impacts to vegetation resources would be similar to those described under Alternative A; however additional management would protect vegetation from disturbance associated with roads, oil and gas activity, locatable mineral activity, logging, and OHV use.

River segments that have been identified as eligible for WSR designation (9.7 miles) would have greater restrictions relating to stream impoundments, vehicle crossings, diversions, channelization, or rip-rapping compared to Alternative A. These would limit projects in these river segments and thereby protect upland and riparian vegetation from surface disturbing activities.

Under Alternative B, WSAs (Map 2-37, 227,960 acres) would be managed to maintain suitability for preservation as wilderness. This would maintain or improve soil and water resources by limiting surface disturbance that could contribute to erosion and non-point sources of sediment and other pollutants. The BLM Manual 6330 for WSAs prohibits or restricts motorized equipment use, which would limit vegetation and weed treatment options in these areas. Dispersed hiking and equestrian use could increase the potential for the introduction or spread of noxious and invasive weeds.

SRMAs would not be retained, instead some areas will be managed as ACECs.

Actions related to special management areas (1,605,660 acres of ACECs) could have a greater beneficial impact on vegetation resources under this alternative. Management actions associated with the addition of the paleosol deposition area to the Greater Sand Dunes ACEC, the face of Steamboat Mountain, and the area where elk crucial habitat and birthing areas overlap to Steamboat Mountain ACEC, would benefit rare and sensitive plant communities through further restrictions on activities within these sensitive areas. Management actions associated with designating special status plant species habitat and the cushion plant community as ACECs, and designation of the new Pinnacles ACEC, would also benefit and protect these communities from disturbance.

## 4.6.2 Alternative C

Impacts to vegetation from the management of riparian and wetland resources would be the same as those described under Alternative A. Impacts resulting from management of air quality, soils and geology, cultural resources, fire and fuels management, vegetation, and lands and realty would be similar to Alternative A. In

general, this alternative would result in the greatest level of surface disturbance and vegetation loss due to less restrictive management actions.

The effects of watershed management actions would be the same as those of Alternative A, except these beneficial impacts would be reduced because of fewer restrictions on surface disturbing activities and smaller buffer zones around riparian areas and floodplains.

Under Alternative C, a larger portion of the planning area would be open to surface disturbing activities, including locatable mineral exploration and development and mineral material sales compared to Alternative A. Impacts to vegetation communities are expected to be greater than under Alternative A because of the increased amount of area available to development.

Impacts from oil and gas leasing and development would be similar to those described under Alternative A; however, smaller areas of habitat would be closed or have NSO stipulations, which could allow for greater loss of vegetation from development activities (Table 4-7 in Chapter 4). The management under Alternative C would close approximately 8,105 acres (5%) of grasslands to oil and gas leasing and apply NSO stipulations to 1,877 acres (1%) of grasslands; close approximately 48,968 acres of sagebrush to oil and gas leasing (2%) and apply NSO stipulations to 61,505 acres (3%) of sagebrush; close approximately 10,081 acres of riparian vegetation to oil and gas leasing (7%) and apply NSO stipulations to 2,230 acres of riparian vegetation (2%); and close approximately 499 acres of aspen/conifer to oil and gas leasing (1%) and apply NSO stipulations to 166 acres (0.4%) of aspen/conifer vegetation.

Impacts to vegetation from closing 226,421 acres to saleable mineral development and withdrawing 234,961 acres of lands from mineral location, 72% and 58% fewer acres respectively compared to Alternative A, could increase vegetation loss or damage to habitat. The management under Alternative C would allow more surface disturbance, damage, or removal of vegetation, soil loss, and the introduction or spread of invasive, non-native plant species.

Impacts to vegetation from wildland fire management and forest and woodland management would be the same as those described under Alternative A. Under Alternative C, allowing the harvest of cottonwood trees could remove critical components of riparian vegetation and degrade the overall ecosystem. The removal of large trees could lead to erosion and streambank degradation, which could continue in harvest areas until new vegetation was established.

Impacts to vegetation resources from the management of grassland and shrubland communities would be very similar to those described under Alternative A. Use of non-native species could help stabilize soils and prevent erosion in the short-term, and over the long-term could provide stable land for native species to re-establish. However, some non-native plants may out compete native species and alter the composition of the ecosystem, which could degrade overall vegetation health. The use of non-native plants could increase the risk of spread and possible degradation of native habitat values.

Impacts to vegetation resources from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control through various methods, including chemicals, the use of BMPs, and buffer distances for chemical use could reduce the infestation and spread of invasive species to a greater degree than Alternative A. The management would help prevent the infestation of non-native species, which would help maintain native vegetation and ecosystems. Management to protect special status plants, wetlands, riparian areas, and aquatic habitats through buffers for chemical use would prevent accidental application or spills and protect vegetation from accidental contact with herbicides.

Impacts to vegetation from the management of wildlife, fish, and special status species would be similar to Alternative A, and impacts would be similar to those described under Alternative A. Additional management under Alternative C by prioritizing livestock and allowing more areas to be open to livestock could increase

competition for forage and habitat resources. Increased use by livestock could cause loss of vegetation, soil compaction, erosion, trampling of vegetation, and the spread of invasive, non-native plant species.

Impacts to vegetation resources from the management of visual resources would be very similar to those described under Alternative A. Management for VRM Class I would be 226,629 acres, 912 more acres than Alternative A; VRM Class II would be 607,899 acres, 25,227 more acres than Alternative A; VRM Class III would be 395,68 acres, 219,809 fewer acres than Alternative A; and VRM Class IV would be 2,374,706 acres, 194,283 more acres than Alternative A. There would be slightly more acres protected by VRM Classes I and II, but nearly 200,000 more acres subjected to surface disturbing and disruptive activities within VRM Class IV compared to Alternative A.

Impacts to vegetation from the management of 225,784 acres as ROW exclusion areas would be similar to those described under Alternative A. Under Alternative C, approximately 200,925 fewer acres would be managed as ROW exclusion areas, which could allow more vegetation loss and surface disturbance from the development of ROWs. Additionally, under Alternative C only 31,018 acres would be managed as ROW avoidance area, 705,120 fewer acres than under Alternative A. This management would further allow for vegetation loss and surface disturbance from the development of ROWs than the management activities proposed under Alternative A.

Livestock grazing management actions under this alternative could have greater impacts on vegetation resources than described under Alternative A. Together with forage use by big game species; this would further increase grazing pressure on vegetation resources, potentially affecting long-term productivity of vegetation. Less restrictive measures for range improvements, water developments, and salt and mineral placement could limit protections on vegetation resources. Full implementation of these management actions could cause difficulty in allotments meeting the Wyoming Land Health Standards. Reducing total authorized use to highest level of billed use over the last 10 years could provide increased vegetation resources for big game and other wildlife species. Reducing livestock use to 160,387 AUMs could reduce vegetation loss from livestock use, potentially increasing long-term productivity of vegetation. However, because management of livestock under this alternative would be very similar to the levels of actual use that have historically occurred in the planning area, it is likely that few changes would occur beyond those described under Alternative A.

Under Alternative C, the management of SRMAs (592,800 acres) could help protect, maintain, or enhance vegetation resources. Visitor use and access is promoted in SRMAs, which could increase popularity and visitation, resulting in increased vegetation disturbance from trampling and increased potential for weed introduction and spread of non-native, invasive plant species.

The effects of OHV use and other recreational activities would be greater and occur over more of the area under this alternative than compared to Alternative A. A larger area of land open to OHV use could allow for increased vehicle and associated human activity.

Under this alternative, no areas would be designated as ACECs and special management areas would not be retained. This would allow more surface disturbance, potentially reducing protection of vegetation resources.

### 4.6.3 Alternative D

Impacts on vegetation resulting from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, and livestock grazing would the same as those presented under Alternative A. The impacts on vegetation from managing fire and fuels and forests and woodlands would be the same as those presented under Alternative B.

Impacts on vegetation from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils (those with limited reclamation potential as per the

NRCS soil rating) would be designated avoidance areas for surface disturbing activities, which would reduce the extent of surface disturbing activities in these areas and thereby reduce the intensity and extent of vegetation removal and degradation of vegetation communities. However, an operator must submit an approved mitigation plan before a proposed project on limited reclamation potential soils will be approved. This could provide a greater degree of protection to vegetation resources compared to Alternative A, as similar plans would be required under Alternative A only when deemed applicable.

Impacts on vegetation from managing lands with wilderness characteristics could be increased compared to Alternative B. Under Alternative D, lands with wilderness characteristics would be managed for a variety of uses with only consideration of those characteristics. Such management could allow some development activities within these areas. These areas would not be closed to mineral development as they would be under Alternative B, which would increase the potential occurrence of surface disturbing activities within the nine lands with wilderness characteristics. Such activities would result in removal and damage to vegetation resources, which would degrade the overall health of vegetative communities.

Impacts on vegetation from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except stipulations that prohibit fluid mineral leasing would be applied to fewer acres (Table 2-4 in Appendix V). Based on Table 4-7 in Chapter 4, under Alternative D approximately 31,240 acres (20%) of grasslands would be closed to oil and gas leasing and 1,961 acres (1%) would be managed with NSO stipulations; 189,122 acres (8%) of sagebrush would be closed to oil and gas leasing and 53,718 acres (2%) would be managed with NSO stipulations; 36,084 acres (22%) of riparian vegetation would be closed to oil and gas leasing and 983 acres (1%) would be managed with NSO stipulations; and 21,586 acres (22%) of aspen/conifer vegetation would be closed to oil and gas leasing and 57 acres (1%) would be managed with NSO stipulations.

Under Alternative D, withdrawing 482,272 acres to locatable mineral entry would apply to 13% fewer acres compared to Alternative A, resulting in impacts very similar to those described under Alternative A but more acres would be affected. Impacts to vegetation resources from closing 362,009 acres to saleable mineral development would be similar to those described under Alternative A; however, a 57% reduction in closed areas could allow for larger areas of vegetation damage or removal when compared to Alternative A.

Impacts on vegetation from managing vegetation resources would be similar to those presented under Alternative A. Under Alternative D, prescribed fire would not be the preferred method for vegetation treatments as it is under Alternative A. However, because the vegetation treatment types are available under Alternative D, the impacts on vegetation resources would be essentially the same.

Impacts on vegetation resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be increased to 1,178,718 acres (102% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased vegetation removal and degradation when compared to Alternative A.

Impacts on vegetation resulting from implementing lands and realty actions would be similar to those presented under Alternative A. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table 2-10 in Appendix V, Map 2-29). More acres would be managed under ROW avoidance areas, 1,388,618 acres, compared to 736,138 acres under Alternative A. ROW avoidance areas could provide some additional protection to vegetation resources compared to lands that are open to ROW development.

Impacts on vegetation from managing recreation resources would be similar to those presented under Alternative A. Fewer SRMAs would be retained under Alternative D which could reduce the level of protection to vegetation resources from protective management within the SRMAs not carried forward from Alternative A.

Impacts on vegetation from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as "limited to existing roads and trails" (3,367,576 acres) would be changed to "limited to designated roads and trails" and all routes within this area would be designated as open, closed, or limited.

Impacts on vegetation from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a smaller area and thereby offer fewer protections to these areas. The management would reduce surface disturbing activities and indirectly help to protect and maintain healthy vegetative communities. The acres designated as ACECs would decrease to 246,634 acres (14% decrease compared with Alternative A).

### 4.6.4 Proposed RMP

The Proposed RMP is a combination of management actions, primarily from Alternative B and Alternative and D, and would have similar impacts as previously described under these alternatives. In general, the Proposed RMP would have increased protections for vegetation communities, compared to Alternatives A and D, but fewer than Alternative B.

Impacts on vegetation resulting from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, wild horses, and livestock grazing would the same as those presented under Alternative A. The impacts on vegetation from managing fire and fuels, invasive species and pest management, and forest and woodland management would be the same as those presented under Alternative B.

Impacts on vegetation from implementing soil management actions would be similar to those identified under Alternative A, except that restrictions in areas with limited reclamation potential soils, consistent with Alternative D, would reduce the extent of surface-disturbing activities in these areas, thereby reduce the intensity and extent of vegetation removal, and degradation of vegetation communities.

Impacts on vegetation from not managing lands with wilderness characteristics specifically to preserve their wilderness characteristics would be the same as those described under Alternative D.

Impacts on vegetation from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except that stipulations that limit surface disturbance from fluid mineral leasing would be applied to more acres (Table 2-4 in Appendix V). As shown in Table 4-7 in Chapter 4, under the Proposed RMP approximately 42,351 acres (38% more acres than under Alternative A) of grasslands would be closed to oil and gas leasing and 5,286 acres (64% fewer acres than under Alternative A) would be managed with NSO stipulations; 99,596 acres (49% fewer acres than under Alternative A) of sagebrush would be closed to oil and gas leasing and 23,010 acres (90% fewer acres than under Alternative A) would be managed with NSO stipulations; 43,055 acres (71% more acres than under Alternative A) of riparian vegetation would be closed to oil and gas leasing and 3,020 acres (90% fewer acres than under Alternative A) would be managed with NSO stipulations; and 11,535 acres (39% fewer acres than under Alternative A) of aspen/conifer vegetation would be closed to oil and gas leasing and 322 acres (96% fewer acres than under Alternative A) would be managed with NSO stipulations.

Under the Proposed RMP, pursuing withdrawal for locatable minerals on 900,204 acres (62% more acres than under Alternative A) and closing 884,906 acres to mineral material sales (6% more acres than under Alternative A), would result in impacts similar to those described under Alternative A, but over a larger area. Closing additional areas to mineral development may reduce additional vegetation damage or removal when compared to Alternative A, but to lesser extent than management under Alternative B.

Impacts on vegetation from managing vegetation resources would be similar to those presented under Alternative A, except that a full range of naturally occurring wildfires, prescribed fire, chemical treatments, biological treatments, mechanical methods, and livestock grazing would be used to meet vegetation management objectives. As noted under Alternative D, the BLM anticipates that the impacts on vegetation resources from expanding the range of treatment options would be essentially the same as under Alternative A. The Proposed RMP would also allow vegetation manipulation projects to reach multiple-use objectives, with similar effects anticipated as under that alternative.

Impacts on vegetation resulting from implementing VRM actions would be similar to those presented under Alternative A, except that the number of acres designated as VRM Class II would be increased to 1,301,004 acres (123% increase compared with Alternative A) (Table 2-9 in Appendix V), which could result in decreased vegetation removal and degradation when compared to Alternative A, but to a lesser extent than under Alternative B.

Impacts on vegetation resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except that acres of ROW exclusion and ROW avoidance areas would be increase to 921,059 acres (116% increase compared with Alternative A), and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). ROW exclusion, and, to a lesser extent, avoidance, areas would limit new linear and renewable energy facilities that could damage or remove vegetation.

Impacts on vegetation from managing special designations and management areas would be similar to those presented under Alternative A, except that they would occur over a larger area and thereby offer additional protections to vegetation in these areas. The management attached to these designations would reduce surface-disturbing activities/direct removal of vegetation and indirectly help to protect and maintain healthy vegetative communities. The acres designated as ACECs would increase to 935,135 acres (226% increase compared with Alternative A). However, compared to Alternative B, acres designated as ACECs would decrease by 42%, resulting in fewer beneficial effects on vegetation resources.

## 4.7 WILDLIFE AND FISHERIES

### 4.7.1 Alternative B

Impacts to wildlife and fisheries habitat from geophysical, land withdrawals, land disposals, land acquisitions, renewable energy, and WSR management would be the same as those described under Alternative A.

Impacts from air quality management would be the same as those described under Alternative A; however, measures to control dust could protect wildlife and fisheries habitat to a greater degree than compared to Alternative A.

Impacts to wildlife and fisheries from the management of soil resources would be similar to those described under Alternative A; however, additional management protection to soil resources could support wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Impacts to wildlife and fisheries from the management of water resources would be similar to those described under Alternative A. However, applying buffers to the prohibition of surface disturbing activities and new permanent structures within aquatic systems, applying mineral stipulations, and avoiding linear crossings would support wildlife habitat and aquatic systems. The additional management for aquifers and water quality could protect wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Managing all lands with wilderness characteristics for their wilderness characteristics would prevent damage or loss of wildlife habitat from development activities, reduce disturbance to wildlife from the presence of humans,

vehicles, or machinery, prevent erosion or runoff, and protect an intact ecosystem. The closed acres that are adjacent to riparian habitat or stream channels would protect important habitat for fish species, such as avian species, big game, and other wetland and riparian wildlife species, and would support water quality within stream and river corridors. The lands with wilderness characteristics would be directly protected from damage and disturbance by oil and gas development. Precluding oil and gas development would prevent the introduction and spread of invasive, non-native plant species from machinery and vehicles, further supporting desired forage, cover, and contiguous habitat.

Under Alternative B, approximately 1,292 oil, gas, and CBNG wells would be developed within the planning area, 3,481 fewer wells as compared to Alternative A. There would be 8,892 acres of initial surface disturbance and 2,566 acres of long-term disturbance from oil and gas development. There would be 23,939 fewer acres of initial surface disturbance and 6,900 fewer acres of long-term disturbance compared with Alternative A.

Closing 2,186,218 acres to fluid mineral leasing would reduce habitat loss for wildlife and would close 1,646,197 more acres than under Alternative A. Closing land to new oil and gas development would protect larger areas of habitat for deer, elk, and pronghorn as compared to Alternative A (Table 4-9 in Chapter 4). This management would allow for contiguous, uninterrupted habitat, for wildlife to migrate, breed, hunt, and forage. Over one million more acres of sagebrush habitat would be closed to oil and gas leasing as compared to Alternative A. Wildlife that rely on sagebrush would have larger areas of undisturbed habitat free from disturbance and mineral development activity.

Under Alternative B, 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. The NSO stipulation would protect larger areas of habitat for deer, elk, pronghorn, and moose as compared to Alternative A (Table 4-9 in Chapter 4). Larger areas of grassland and sagebrush would be protected from surface disturbance and disruptive activity under Alternative B, which could support greater habitat connectivity for numerous wildlife species.

Applying CSU stipulations to oil and gas leases could reduce damage or loss of vegetation and habitat for wildlife (99,674 acres of CSU). Impacts to wildlife and fisheries from the application of CSU stipulations would be similar to those described under Alternative A, but smaller areas of habitat could receive some reduced impacts from oil and gas development and production activities (Table 4-9 in Chapter 4).

Approximately 1,993,908 acres of the planning area would be proposed for withdrawal from locatable mineral entry, 1,437,350 acres more than Alternative A (Table 4-10 in Chapter 4), and 2,186,218 acres would be closed to geothermal leasing, 1,646,197 acres more than under Alternative A. The remaining acres in the planning area would be available for locatable mineral entry and geothermal leasing. Impacts to wildlife and fisheries would be similar to those under Alternative A; however, a much larger area of land would be unavailable for locatable mineral development and geothermal leasing compared to Alternative A.

Impacts to wildlife and fisheries habitat from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The protections to lands closed to solid mineral development would be applied to 3,049,582 more acres of land closed to coal, 1,394,477 more acres of lands closed to oil shale, and 1,665,326 more acres of land closed to trona leasing and development compared to Alternative A. The larger areas of closures would prevent damage or loss of wildlife habitat from development activities when compared to Alternative A (Table 4-10 in Chapter 4).

Closing 2,581,741 acres of lands to saleable mineral development would prevent damage or loss of wildlife habitat from mineral excavation on 1,748,022 more acres compared to Alternative A. Impacts to big game, wildlife, and fish habitat would be similar to those described under Alternative A, but a much greater area of land would be closed to surface disturbing activities (Table 4-10 in Chapter 4).

Impacts from wildland fire management would be similar to those described under Alternative A. Additional management to protect sagebrush and other sensitive resources could protect habitat and wildlife within these areas from damage or loss from unplanned fires to a greater degree compared to Alternative A.

Under Alternative B, forest and woodland management would be similar to the management and impacts described under Alternative A; however, Alternative B emphasizes the use of natural processes for forestry management in addition to not allowing clearcutting. The management in Alternative B would support forest and woodland habitat for wildlife by encouraging natural habitat conditions, native vegetation, cover, forage, and functional ecosystems.

Impacts to wildlife and fish habitat from management of grassland and shrubland communities would be very similar to those described under Alternative A. Resting lands from livestock grazing a minimum of five growing seasons after treatments would allow treated areas to revegetate, soils to stabilize, and vegetation to mature to the point of withstanding livestock grazing pressure. Rested areas could provide wildlife with new vegetation for cover and forage without competition with livestock during the rest period.

Impacts to wildlife and fish habitat from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control through only mechanical or biological methods, would protect vegetation and wildlife habitat from damage from the use of more invasive control methods, such as chemicals or fire. However, less invasive techniques may not be as effective in controlling large infestations of noxious weeds as chemicals or fire. Under Alternative B, additional management for preventing and controlling the infestation of aquatic invasive species could support wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems.

Impacts to wildlife and fish habitat from the management of riparian and wetland resources would be similar to those described under Alternative A. Additional management for achieving PFC would maintain or improve wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The management could help reduce soil runoff into aquatic systems, reducing siltation of spawning habitat, improving water quality, and preventing erosion of streambanks.

Management for wildlife and fish would be similar to Alternative A and impacts would be similar to those described under Alternative A. Additional management under Alternative B such as adjustments to livestock and wild horse management could help maintain or improve habitat by preventing vegetation loss, removing competition for forage, or reducing the introduction or spread of invasive, non-native plant species. The management could reduce soil compaction, erosion, sedimentation, and the influx of nutrients into riparian areas, wetlands, or streambeds. Maintaining and improving habitat for migratory bird species of conservation concern could support habitat for Neotropical migrants. The management could support existing nesting, feeding, or breeding habitat, or could allow for mitigation to restore areas of habitat if losses were suffered elsewhere in the planning area. Alternative B would apply greater stipulations to protect important seasonal and sensitive habitat for fish and wildlife species. Stipulations for no net loss of habitat and prohibiting renewable energy projects in sensitive habitats would prevent the loss or damage of important habitat areas for forage, hunting, nesting, breeding, young rearing, and migration of wildlife species. The management could also protect wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems.

Impacts to wildlife and fish habitat from the management for big game of would be similar to those described under Alternative A. Additional management to protect big game parturition habitat, crucial winter range, and migration corridors could ensure reproductive success and survival of young, reduce winter mortality associated with increased stress caused by human-induced disturbance, and provide migration corridors that link crucial habitats (winter range) and parturition areas.

Impacts to wildlife and fish habitat from the management of raptors would be similar to those described under Alternative A. Under Alternative B, additional management would protect raptors through seasonal closures, greater buffer distances, preventing surface disturbance or occupancy within one mile of active and historic nests, and locating infrastructure away from high avian-use areas. The management would provide greater protection by reducing disturbance to raptors during critical life phases, preventing the risk of collisions with wires or structures, and protecting important habitat for nesting, breeding, or hunting as compared to Alternative A.

Impacts to wildlife and fish habitat from the management of fish would be similar to those described under Alternative A. Under Alternative B, additional management would provide specific timeframes for seasonal restrictions and buffer distances (¼ mile), which could provide greater protection for fish and important habitat for fish reproduction to a greater degree than compared to Alternative A. Closing fish bearing streams to solid mineral leasing would support fisheries and stream health, and protect wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The restrictions could help prevent sediment runoff into aquatic systems, reduce siltation of spawning habitat, improve water quality, and prevent erosion of streambanks.

Impacts to wildlife and fish habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative B, additional management could provide greater habitat protection and fewer disruptive activities, supporting wildlife and their habitat.

Impacts to wildlife and fish habitat from the management of special status wildlife species would be similar to those described under Alternative A. Under Alternative B, additional management to protect habitat and reintroduce species would provide greater habitat protection for wildlife and fish, and reintroduction of species could fill key niches in ecosystems.

Impacts to wildlife and fish habitat from the management of cultural resources would be similar to those described under Alternative A. Under Alternative B, additional management such as buffer distances, NSO stipulations, and closures to mineral sales to prevent surface disturbing activities would reduce damage or removal of wildlife cover and forage, reduce fragmentation of habitat, and prevent disturbance of wildlife to a greater degree than Alternative A.

Impacts to wildlife and fisheries from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,785 acres, 68 acres more than Alternative A), VRM Class III (666,522 acres, 51,030 acres more than Alternative A), and for the Gateway West Pipeline. Under Alternative B, 2,148,902 acres would be managed as VRM Class II, 1,566,230 more acres than Alternative A. The management for VRM Class II would retain the character of the landscape, which could allow for some surface disturbance, as described under Alternative A, but the classification of 2,148,902 acres would provide greater protection overall for wildlife and fisheries. Under Alternative B, 563,754 acres would be managed as VRM Class IV, 1,616,669 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification.

Impacts to wildlife and fisheries from ROW management would be the same as those described under Alternative A; however, under Alternative B, 2,480,876 acres would be managed as ROW exclusion areas. The management would protect fish and wildlife habitat from linear disturbances, surface disturbing activities, and habitat loss on 2,130,936 more acres as compared to Alternative A. Fewer acres would be managed as avoidance areas, 133,903 acres under Alternative B, 602,235 fewer acres than Alternative A. Although a smaller amount of land would be protected as avoidance areas, the difference is far offset by the over two million additional acres of land managed as exclusion areas.

Impacts to wildlife and fisheries from livestock grazing management would be similar to those described under Alternative A. In addition, application of monitoring, greater protection of riparian areas and springs, and additional range improvements would provide greater protection of fish and wildlife habitat as compared to Alternative A. The additional management could help maintain or improve habitat by reducing congregation of animals in sensitive areas and prevent or reduce damage to forage and cover. Removal of fences reduces threats of injury or death from collisions or entanglement with fences, enhances migration corridors, and could allow access to additional forage and cover.

Impacts to wildlife and fisheries from recreation management would be similar to those described under Alternative A. Additional management to consider other resource values, buffer distances, and mineral lease stipulations and closures could help maintain or improve habitat for fish and wildlife to a greater degree than Alternative A.

Under Alternative B, the Wind River Front SRMA (257,680 acres) would not be retained.. This could reduce vegetation damage, surface disturbance, and disruption of wildlife from human or vehicle presence caused by recreation use to a greater degree than Alternative A. Other management within the Wind River Front area would have similar impacts to wildlife and fisheries compared to Alternative A, but with greater protection to lands from mineral stipulation and other surface disturbance prohibitions.

Impacts to wildlife and fisheries from managing OHV open and closed areas would be the same as those described under Alternative A. Under Alternative B, there would be no category called "limited to existing roads and trails." While the routes would be moved under the "limited to designated roads and trails" for a total of 3,367,576 acres (the sum of limited to designated and limited to existing acres in Alternative A) impacts to wildlife and fish habitat would be similar to those described under both categories under Alternative A. Additional management to prohibit and limit OHV use could provide greater protection to wildlife and fisheries from damage to fish and wildlife habitat and help to prevent soil loss, erosion, and runoff to riparian habitat, and the introduction or spread of invasive, non-native plant species as compared to Alternative A.

Impacts to wildlife and fisheries from the management of congressionally designated trails would be similar to those described under Alternative A. Under Alternative B, management of eligible and congressionally designated trails could reduce or prevent disturbance or loss of habitat for wildlife to a greater degree when compared to Alternative A.

Impacts to wildlife and fisheries from the management of WSAs would be similar to those described under Alternative A. Additional management under Alternative B for visual resources could provide greater habitat protection beyond the perimeter of the WSAs by preventing or reducing surface disturbing activities within viewsheds.

Under Alternative B, the Red Desert Watershed Management Area would be divided into a management area (164,140 acres) and the remainder added to the Steamboat Mountain ACEC (439,330 total acres). Impacts to fish and wildlife from the management of the area would be similar to those described in Alternative A, but additional management could further reduce surface disturbance, human and vehicle presence, and a reduction in predation of smaller wildlife species. Where protective management is applied, it would support forage, habitat, migration corridors, and other important areas for big game, raptors, and other wildlife species. The management could reduce soil runoff into aquatic habitat, support water quality, and protect riparian areas from sedimentation and erosion. The remaining management areas listed in Alternative A would be managed as ACECs under Alternative B.

The Greater Red Creek ACEC would be expanded from 131,600 acres in Alternative A to 468,170 acres, and the Monument Valley ACEC (69,960 acres), and Big Sandy Openings ACEC (2,020 acres) would be designated in Alternative B. The expansion and designations would allow for greater protection of habitat for wildlife and

fisheries through management such as ROW exclusion, closed to mineral leasing, limited vehicle use, vegetation management, and protective management for wildlife.

Designating the Pinnacles ACEC (1,340 acres) would protect habitat for wildlife and fisheries through management such as ROW exclusion, closed to mineral sales, and limiting surface disturbing activities. The management would support forage, habitat, migration corridors, and other important areas for big game, raptors, and other wildlife species. The management could reduce soil runoff into aquatic habitat, support water quality, and protect riparian areas from sedimentation and erosion.

Impacts to wildlife and fisheries from retaining the designation of the Cedar Canyon ACEC (2,540 acres) would be similar to Alternative A, but additional management would allow for greater habitat protection under Alternative B.

Impacts to wildlife and fisheries from retaining the designation of the Greater Sand Dunes ACEC (including the Crookston Ranch and Boar's Tusk Portions, 39,290 acres) and the Oregon Buttes ACEC would be the same as those described under Alternative A.

Impacts to wildlife and fisheries from the management of the Eastern Portion of the Greater Sand Dunes ACEC would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to wildlife and fisheries from the management of the Natural Corrals ACEC (1,110 acres) would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to wildlife and fisheries from the management of the Pine Springs ACEC (6,480 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 430 acres under Alternative B. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to wildlife and fisheries from the management of the Special Status Plant Species ACEC (3,610 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 2,510 acres under Alternative B. The inclusion of additional land and protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to wildlife and fisheries from the management of the Steamboat Mountain ACEC (439,330 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 392,050 acres under Alternative B. The inclusion of additional land and protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to wildlife and fisheries from the management of the White Mountain Petroglyphs ACEC (20 acres) would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Designating and managing the South Wind River ACEC (374,710 acres) for watershed, sensitive big game habitat, wildlife, and other values could improve, enhance, or maintain fisheries and wildlife habitat. Protective

management to prevent or reduce surface disturbance, ROW exclusion, and closures to mineral leasing could provide protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence. Preventing or reducing surface disturbing activities in the ACEC would maintain contiguous habitat for forage, cover, migration, and important life cycles of big game, raptors, and other wildlife. The management could reduce the introduction or spread of invasive, non-native plant species, which would protect native habitat. Habitat for fish, macroinvertebrates, waterfowl, and other aquatic species could be protected by reducing soil loss, erosion, and runoff to riparian habitat. Reducing erosion would support water quality, stream channel integrity, and prevent cementation of spawning gravel. Managing lands as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Wildlife such as elk, prairie dogs, and northern harrier could benefit from the low, early seral areas of vegetation.

Designating and managing the Big Game Migration Corridors ACEC (226,335 acres) to prohibit surface disturbing activities or facilities and other actions to restrict development and habitat fragmentation would support and protect big game and other species which use the area for habitat or migration. Management for no-net-loss of sensitive habitat would allow uninterrupted expanses of habitat for big game and other wildlife to use for forage, cover, or movement across the landscape. Providing protected corridors for big game and other wildlife species allows for passage from critical ranges such as winter habitat or parturition areas to summer habitat with reduced stress from human presence, danger of vehicle collisions, or disturbance from machinery within the ACEC. Because limited disturbing activities would be allowed, fewer activities that could force wildlife to flee or abandon habitat could occur, lowering stress levels and allowing big game, raptors, and other wildlife to remain in desired habitat. Managing lands as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Wildlife such as elk, prairie dogs, and northern harrier could benefit from the low, early seral areas of vegetation within the mitigation area.

Impacts to wildlife from reducing or minimizing risk to humans and the environment from hazardous materials would be similar to Alternative A. In addition, restoration of contaminated lands could reduce runoff of contaminants into riparian and aquatic systems and provide additional habitat for wildlife species.

## 4.7.2 Alternative C

Impacts to wildlife and fisheries habitat from geophysical, riparian and wetland, raptors, cultural resources, pursuing land withdrawals, land disposals, land acquisitions, and renewable energy management would be the same as those described under Alternative A.

Impacts to wildlife and fisheries from air quality management would be the same as those described under Alternative B, with the exception of dust abatement measures, which would be the same as Alternative A.

Impacts to wildlife and fisheries from the management of soil resources would be similar to those described under Alternative A. Fewer protections to highly erodible soils under Alternative C could result in the potential for increased soil erosion, soil loss, and sediment runoff to a greater degree when compared to Alternative A.

Lands with wilderness characteristics would not be managed for wilderness characteristics under Alternative C. These lands would be managed for other resource uses or resource values. Protective management applied under Alternative B would not be applied in Alternative C and could allow surface disturbing or disruptive activities to occur on these lands. Surface disturbance or disruptive activities could result in damage or removal of cover and forage, fragmentation of habitat, and disturbance that could force wildlife to abandon habitat within these areas. Development could result in runoff into aquatic systems, causing siltation of spawning habitat, reduced water quality, and erosion of streambanks, diminishing stream function and health. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, making habitat less desirable to native wildlife. Disturbed areas could attract predatory species of wildlife which could reduce populations of small wildlife.

Approximately 4,919 oil, gas, and CBNG wells would be developed under Alternative C within the planning area, 146 more than under Alternative A. There would be 33,840 acres of initial surface disturbance and 9,758 acres of long-term disturbance from fluid mineral development. This would be 1,009 more acres of initial surface disturbance and 292 more acres of long-term disturbance compared with Alternative A.

Closing 225,782 acres to fluid mineral leasing would reduce habitat loss for wildlife and would allow for contiguous, uninterrupted habitat, and 314,239 fewer acres would be closed than under Alternative A. Impacts to wildlife and fisheries would be similar to those described under Alternative A; however, surface disturbance, habitat damage, and forage loss could occur over more acres under Alternative C. Closing fewer acres of land to new oil and gas development would reduce habitat protection for deer, elk, pronghorn, and moose as compared to Alternative A (Table 4-9 in Chapter 4). All vegetation types that provide habitat for big game as well as other wildlife species would have smaller areas of protection within closed areas.

Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than Alternative A. Outside of areas with NSO stipulations, impacts to wildlife and fisheries would be similar to those described under Alternative A, however, surface disturbance and disruptive activities could occur over 143,069 more acres under Alternative C. The NSO stipulation would reduce habitat protection for deer, elk, pronghorn, and moose from surface disturbance as compared to Alternative A (Table 4-9 in Chapter 4). Vegetation types that provide habitat for big game as well as other wildlife species would have smaller areas of protection under the NSO stipulation, which could lead to habitat fragmentation and lower quality forage or cover for wildlife.

Applying CSU stipulations to 215,890 acres could reduce damage or loss of vegetation and habitat for wildlife, 505,242 fewer acres compared to Alternative A (Table 4-9 in Chapter 4). Impacts to wildlife and fisheries from the application of CSU stipulations would be similar to those described under Alternative A, but overall, less habitat would receive reduced impacts from oil and gas development and production activities.

Approximately 234,961 acres of the planning area would be pursued for withdrawal from locatable mineral entry, 321,597 fewer acres compared to Alternative A. Approximately 225,782 acres of the planning area would be closed to geothermal leasing, 314,239 fewer acres compared to Alternative A. Impacts to wildlife and fisheries would be the same as those described under Alternative A; however, surface disturbance and disruptive activities could occur over more acres under Alternative C (Table 4-10 in Chapter 4).

Impacts to wildlife and fisheries habitat from the development of coal resources would be similar to those described under Alternative A. Under Alternative C, 226,219 acres would be closed to coal, 225,965 acres would be closed to oil shale, and 225,965 acres would be closed to trona leasing and development. The smaller areas of closures, 407,618 acres fewer for coal, 501,840 for oil shale, and 228,629 fewer for trona, could result in increased damage or loss of wildlife habitat from development activities and increased disturbance to wildlife from the presence of humans when compared to Alternative A (Table 4-10 in Chapter 4).

Approximately 226,421 acres of the planning area would be closed to saleable mineral development, 607,298 fewer acres compared to Alternative A. Impacts to wildlife and fisheries would be the same as those described under Alternative A, however, surface disturbance and disruptive activities could occur over more acres under Alternative C.

Impacts to wildlife and fisheries from wildland fire management and forest and woodland management would be the same as those described under Alternative A. Under Alternative C, allowing the harvest of cottonwood trees could remove nesting habitat for birds and bats, disturb nearby wildlife from human presence, machinery and vehicles, and cause surface disturbance which could remove vegetation and cause erosion.

Impacts to wildlife and fish habitat from management of grassland and shrubland communities would be very similar to those described under Alternative A. Use of non-native species could help stabilize soils and prevent

erosion in the short term, and over the long term could provide stable land for native species to re-establish. Some non-native plants may not provide appropriate cover or forage values for wildlife, and the use of non-native plants could increase the risk of spread and eventual degradation of native habitat values.

Impacts to wildlife and fish habitat from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control through various methods, including chemicals, the use of BMPs, and buffer distances for chemical use could reduce the infestation and spread of invasive species to a greater degree than Alternative A. Additional management for preventing and controlling the infestation of aquatic invasive species could support wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl and other species dependent on these ecosystems. The management would help prevent the infestation of riparian and aquatic habitat from non-native species, which would help maintain native ecosystems for forage and cover for wildlife and could support water quality and quantity.

Management for wildlife and fish would be similar to Alternative A, and impacts would be similar to those described under Alternative A. Additional management under Alternative C by prioritizing livestock and raising grazing levels could increase competition for forage resources between livestock and wildlife, especially for big game species. Increased use by livestock could cause loss of vegetation for forage and cover, soil compaction, erosion, trampling of vegetation and habitat, and the spread of invasive, non-native plant species. Retaining fences could impact wildlife by creating travel barriers, altering distribution patterns, increasing stress and energy loss, and could cause injury or death from entanglement or collisions.

Management to allow renewable energy projects in sensitive wildlife habitats could result in habitat damage or loss of big game crucial winter range and parturition habitat, raptor concentration areas (high-use/high-density raptor nesting/roosting/perching areas), and unique habitats (e.g., aspen and mountain shrub). Renewable energy development could result in displacement of some wildlife and raptor species from breeding and foraging habitat within the construction area. Construction of wind turbines throughout the planning area may create collision hazards for raptors, bats, and multiple avian species. Studies have documented deaths of avian and bat species from wind turbines, although the levels of collision and death vary in the scientific research (Madders and Whitfield 2006). Collision levels fluctuate based on habitat, terrain, elevation and even weather conditions (Madders and Whitfield 2006). Prediction of accurate bird or bat losses from wind development is currently not available; however, it can be assumed that some losses of these species will occur. Physical or psychological barriers could lead to fragmentation of habitats, further limiting the availability of effective habitat. An area of intensive activity or construction becomes a barrier when animals cannot or will not cross it to access otherwise suitable habitat. These impacts are especially problematic when they occur within limiting habitat components such as crucial winter ranges and reproductive habitats. Development of solar projects would result in the entire loss of all habitat within the project footprint. Studies have shown avian mortalities associated with solar farms, where birds may mistakenly see solar panels as the reflective surface of a lake or water body (Kagan et al. 2014).

Impacts to wildlife and fish habitat from the management for big game of would be the same as those described under Alternative A. Slightly more protections to seasonal habitat could be applied under Alternative C, which could reduce disruptive activities within sensitive big game habitat.

Under Alternative C, seasonal restrictions for surface disturbance near spawning fish populations would not be applied. Allowing surface disturbing activities along fish bearing streams near spawning, incubation, and fry rearing habitat could lead to sediment runoff and accumulation of fine silts in stream channels, which could cause cementation of spawning gravel for fish species. Increased sediment could affect water quality for and aquatic habitat for fish, waterfowl, macroinvertebrates, and other species dependent on these ecosystems.

Impacts to wildlife and fish habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative C, allowing more opportunities for surface disturbing activities

near special status plant species could force big game, raptors, or other wildlife to abandon habitat within these areas.

Impacts to wildlife and fisheries from the management of visual resources would be very similar to those described under Alternative A. Management for VRM Class I would be 226,629 acres, 912 acres more than Alternative A; VRM Class II would be 607,899 acres, 25,227 acres more than Alternative A; VRM Class III would be 395,683 acres, 219,809 fewer acres than Alternative A; and VRM Class IV, 2,374,706 acres, 194,283 acres more than Alternative A.

Impacts to wildlife and fisheries from ROW management would be similar to those described under Alternative A. Under Alternative C, 225,784 acres would be managed as ROW exclusion areas, 200,925 fewer acres compared to Alternative A. Under Alternative C, 31,018 acres would be managed as ROW avoidance areas, 705,120 fewer acres compared to Alternative A. Surface disturbing and disruptive activities from ROW development could damage or remove forage and habitat for wildlife species to a greater degree than under Alternative A.

Impacts to wildlife and fisheries from livestock grazing management would be similar to those described under Alternative A. Additional management under Alternative C by allowing livestock in riparian areas could increase competition for forage resources between livestock and wildlife, especially big game species. Increased use by livestock could cause loss of vegetation for forage and cover, soil compaction, erosion, trampling of vegetation and habitat, and the spread of invasive, non-native plant species. Use of riparian areas by livestock could increase runoff and accumulation of fine silts in stream channels which could cause cementation of spawning gravel for fish species. Increased sediment could affect water quality and aquatic habitat for fish, waterfowl, macroinvertebrates, and other species dependent on these ecosystems. Water developments, particularly in winter and parturition ranges, could lead to reductions in forage due to distribution of animals; however, implementation of the Wyoming Land Health Standards could ensure that habitat for wildlife is not degraded by over-use of livestock.

Under Alternative C, reducing total authorized use to highest level of billed use over the last 10 years could provide increased forage and habitat resources for big game and other wildlife species. Reducing use to 160,387 AUMs could reduce habitat degradation from livestock, which could support water quality and availability, and allow a more natural grazing pattern from wildlife use. However, because management of livestock under this alternative would be very similar to the levels of actual use that have historically occurred in the planning area, it is likely that few changes would occur beyond those described under Alternative A.

Impacts to wildlife and fisheries from recreation management would be similar to those described under Alternative A; however, the emphasis of recreation use over other resources could result in more surface disturbing or disruptive activities to occur from recreation use.

Impacts to wildlife and fisheries from the management of the Wind River Front SRMA (257,680 acres) would be similar to those under Alternative A for recreation and the management of the SRMA. The emphasis of the SRMA management for recreation use, including increased use of motorized vehicles, allowing increased surface disturbing activities and mineral leasing would lead to habitat loss and abandonment of habitat to a greater degree when compared to Alternative A.

Impacts to wildlife and fisheries from managing OHV areas would be the same as those described under Alternative A; however, managing transportation routes as open, closed, and limited to designated roads and trails would protect fish and wildlife habitat to a greater degree than described under Alternative A.

Impacts to wildlife and fisheries from the management of eligible and congressionally designated trails would be similar to those described under Alternative A. Under Alternative C, allowing surface disturbing activities, mineral development, and other disruptive activities could result in more habitat damage or loss.

WSAs would be managed for multiple use, and WSRs, ACECs, and other management areas would not be retained under Alternative C. This management would result in fewer protections to wildlife and fisheries habitat as compared to Alternative A and could allow surface disturbing or disruptive activities to occur on these lands.

Impacts to wildlife and fisheries from public safety management would be the same as those described under Alternative B.

### 4.7.3 Alternative D

Impacts to wildlife and fisheries habitat from geophysical activities, wildland fire, grassland and shrubland, raptors, special status wildlife species, cultural, paleontological, pursuing land withdrawals, land disposals, land acquisitions, renewable energy, livestock grazing, and WSR management would be the same as those described under Alternative A.

Impacts to wildlife and fisheries from air quality management would be the same as those described under Alternative B, with the exception of dust abatement measures, which would not be required under Alternative D. Applying dust abatement measures on a case-by-case basis could reduce dust accumulation on forage for wildlife that could diminish the quality of forage and make it less palatable. Dust control could reduce sediment runoff and accumulation of fine silt in stream channels which would prevent cementation of spawning gravel for fish species. Reduced sediment would support water quality and aquatic habitat for fish, waterfowl, macroinvertebrates, and other species dependent on these ecosystems.

Impacts to wildlife and fisheries from the management of soil resources would be similar to those described under Alternative A. However, additional management protection to soil resources could support wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Impacts to wildlife and fisheries from the management of water resources would be similar to those described under Alternative A. Applying buffers and the avoidance of surface disturbing activities and construction within aquatic systems, applying mineral stipulations, and avoiding linear crossings could support wildlife habitat and aquatic systems. The management would protect streams and water resources lesser degree than Alternative A, due to the avoidance stipulation for development within stream buffers. Additional management for aquifers and water quality could protect wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Impacts to wildlife and fisheries from the management of lands with wilderness characteristics would be similar to those described under Alternative B. Fewer areas would be managed specifically for those characteristics and fewer restrictions on surface disturbance would be applied, providing fewer protections of wildlife habitat under this alternative.

Under Alternative D, approximately 4,737 oil, gas, and CBNG wells would be developed within the planning area, 36 fewer wells as compared to Alternative A. There would be 32,587 acres of initial surface disturbance and 9,397 acres of long-term disturbance from oil and gas development. There would be 244 fewer acres of initial surface disturbance and 69 fewer acres of long-term disturbance compared with Alternative A.

Closing 768,989 acres to fluid mineral leasing would reduce habitat loss for wildlife and would close 228,968 more acres than under Alternative A. Impacts to wildlife and fisheries would be similar to those described under Alternative A; however, surface disturbance, habitat damage, and forage loss could occur over more acres under Alternative C. Closing fewer acres of land to new oil and gas development would reduce habitat protection for deer, elk, pronghorn, and moose as compared to Alternative A (Table 4-9 in Chapter 4). All vegetation types that provide habitat for big game as well as other wildlife species would have smaller areas of protection within closed areas.

Under Alternative D, 2,172 acres would be managed with NSO stipulations, which is 156,439 fewer acres than under Alternative A. Fewer acres managed with NSO stipulations would protect smaller areas of habitat for deer, elk, pronghorn, and moose as compared to Alternative A (Table 4-9 in Chapter 4). The management could allow an increase disturbance within riparian, grassland, and aspen/conifer habitat from surface disturbance, vegetation loss, or migration corridors when compared with Alternative A.

Applying CSU stipulations to oil and gas leases could reduce damage or loss of vegetation and habitat for wildlife (1,238,899 acres of CSU). Impacts to wildlife and fisheries from the application of CSU would be similar to those described under Alternative A. About 517,767 more acres of habitat could receive some reduced impacts from oil and gas development and production activities from CSU stipulations as compared to Alternative A (Table 4-9 in Chapter 4).

Approximately 482,272 acres of the planning area would be pursued for withdrawal from locatable mineral entry, 74,286 fewer acres than Alternative A, and 768,989 acres would be closed to geothermal leasing, 228,968 more acres than under Alternative A. The remaining acres in the planning area would be available for development of locatable minerals and geothermal leasing. Impacts to wildlife and fisheries would be similar to those under Alternative A; however, fewer acres of land would be pursued for withdrawal from locatable mineral entry and closed to geothermal leasing compared to Alternative A. Lands within those areas would not have surface disturbance from geothermal development, and habitat for big game, wildlife, and fish would not be damaged from those activities (Table 4-10 in Chapter 4).

Impacts to wildlife and fisheries habitat from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative D, 610,342 acres would be closed to coal leasing, 124,378 more acres than under Alternative A, 1,557,520 acres would be closed to oil shale leasing, 829,715 more acres than Alternative A, and 389,552 acres would be closed to trona leasing, 34,081 fewer acres than Alternative A. The smaller areas of coal, oil shale, and trona closed to leasing could result in increased damage or loss of wildlife habitat from development activities and increased disturbance to wildlife from the presence of humans when compared to Alternative A.

Closing 362,009 acres of lands to saleable mineral development would prevent damage or loss of wildlife habitat from mineral excavation on 471,710 fewer acres compared to Alternative A. Impacts to big game, wildlife, and fish habitat would be similar to those described under Alternative A, but a smaller area of land would be closed to surface disturbing activities (Table 4-10 in Chapter 4).

Impacts to wildlife and fisheries from forest and woodland management would be similar to those described under Alternative A. In addition, Alternative D would limit logging operations on slopes steeper than 25%, which could help prevent or reduce soil loss and erosion from logging operations. Reducing or preventing soil loss and erosion could reduce sediment build up in streams, which could protect water quality and spawning gravel for fisheries. Under Alternative D, allowing the harvest of cottonwood trees could remove nesting habitat for birds and bats. Harvest could disturb nearby wildlife from human presence, machinery, and vehicles, and cause surface disturbance which could remove vegetation and cause erosion. Surface disturbance could result in runoff into aquatic systems, causing siltation of spawning habitat, diminished water quality, and erosion of streambanks. Erosion and increased runoff could continue in harvest areas until new vegetation is established.

Impacts to wildlife and fish habitat from management of riparian and wetland resources would be similar to those described under Alternative A. Additional management for achieving Wyoming Rangeland Standards and PFC would maintain or improve wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems.

Management for wildlife and fish would be similar to Alternative A and impacts would be similar to those described under Alternative A. Additional management to maintain or improve habitat for migratory birds on a

case-by-case basis would support bird species to a greater degree compared to Alternative A. Alternative D would apply greater stipulations to protect important seasonal and sensitive habitat for fish and wildlife species compared to Alternative A.

Impacts to wildlife and fish habitat from the management for big game of would be the same as those described under Alternative A. Impacts to wildlife from additional management in Alternative D to protect big game parturition habitat, crucial winter range, and migration corridors would be similar to those described under Alternative A, but would not provide as much protection as Alternative D. The CSU management for migration corridors under Alternative D would provide greater protection for big game and could provide uninterrupted pathways for wildlife movement.

Impacts to wildlife and fish habitat from the management of fish would be similar to those described under Alternative A. Under Alternative D, additional management including avoiding surface disturbance within 100-year floodplains and fish-bearing streams would provide similar protection for fish and important habitat for fish reproduction than compared to Alternative A.

Impacts to wildlife and fish habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative D, additional management could provide greater habitat protection and fewer disruptive activities, supporting wildlife and their habitat.

Impacts to wildlife and fisheries from the management of visual resources would be similar to those described for VRM Class I under Alternative A (225,703 acres). Under Alternative D, 1,178,718 acres would be managed as VRM Class II, 569,046 acres more than Alternative A; 738,311 acres would be managed as VRM Class III, 122,819 more acres than Alternative A; and 1,455,234 acres would be managed as VRM Class IV, 725,189 acres fewer than Alternative A. There would be more acres protected by VRM Class II, and less managed under VRM Class IV, which could support overall habitat health and habitat connectivity.

Impacts to wildlife and fisheries from ROW management would be the same as those described under Alternative A; however, under Alternative D, 286,289 acres would be managed as ROW exclusion areas. The management would protect fish and wildlife habitat from linear disturbances, surface disturbing activities, and habitat loss on 117,493 fewer acres as compared to Alternative A. Larger areas would be managed as avoidance areas, 1,388,618 acres under Alternative D, 652,480 more acres than Alternative A.

Impacts to wildlife and fisheries from recreation management would be similar to those described under Alternative A. Management of SRMAs would be similar to Alternative A, however fewer SRMAs and management for those SRMAs could reduce or prevent surface disturbing activities in some areas but to a lesser degree when compared to Alternative A.

Impacts to wildlife and fisheries from managing OHV areas would be the same as those described under Alternative A; however, managing transportation routes as open, closed, and limited to designated roads and trails would protect fish and wildlife habitat to a greater degree than described under Alternative A.

Impacts to wildlife and fisheries from the management of congressionally designated trails would be similar to those described under Alternative A. Under Alternative D, additional management of eligible and congressionally designated trails could reduce or prevent disturbance or loss of habitat for wildlife to a greater degree when compared to Alternative A.

Impacts to wildlife and fisheries from the management of WSAs would be similar to those described under Alternative B. Under Alternative D, if WSAs were not designated as wilderness, most of the areas would be managed as ACECs. Impacts to wildlife and fisheries from the management of ACECs are described further below.

Impacts to wildlife and fisheries from the management of the Red Desert Management Area (162,980 acres), Pine Mountain Management Area (62,760 acres), and Sugarloaf Basin Management Area (87,240 acres) would be very similar to Alternative A, although fewer management areas would be retained under Alternative D. Where protective management is applied, it would support forage, habitat, migration corridors, and other important areas for big game, raptors, and other wildlife species. The management could help prevent sediment runoff into aquatic habitat, support water quality, and protect riparian areas from sedimentation and erosion.

Impacts to wildlife and fisheries from the management of South Pass Historic Landscape ACEC, Little Mountain ACEC, Steamboat Mountain ACEC, and Special Status Plants ACEC would be the same as those described under Alternative A.

Impacts to wildlife and fisheries from not retaining the ACEC designations for Cedar Canyon, Greater Sand Dunes, Natural Corrals, Oregon Buttes, Pinnacles, and Pine Springs ACECs would be the same as those described under Alternative C.

Impacts to wildlife and fisheries from the management of National Historic Landmarks would be the same as those described under Alternative B.

Impacts to wildlife from reducing or minimizing risk to humans and the environment from hazardous materials would be the same as Alternative B.

### 4.7.4 Proposed RMP

The Proposed RMP is a combination of management actions primarily from Alternatives B and D and would have similar impacts as previously described under those alternatives. In general, the Proposed RMP would have increased protections for wildlife and fisheries compared to Alternatives A, C, and D, but fewer than Alternative B.

Impacts on wildlife and fisheries habitat from air quality management, geophysical activities, soil management, cultural resources, paleontological resources, wildland fire management, forest and woodland management, grassland and shrublands management, invasive species, riparian and wetland resources, pursuing land withdrawals, land disposals, land acquisitions, livestock grazing, OHV management, WSA management, and WSR management would be similar to those described under Alternative A and would not provide substantial differences in environmental consequences for wildlife and fisheries.

Impacts on wildlife and fisheries from the management of water resources would be similar to those described under Alternative A. Additionally, under the Proposed RMP, impacts on wildlife and fisheries from the management of water resources would generally be more restrictive for surface-disturbing activities than under Alternative D, but less restrictive than under Alternative B. Applying buffers and avoiding surface-disturbing activities and construction within aquatic systems, applying mineral stipulations, and only allowing linear crossings with site-specific analyses could support beneficial impacts on wildlife habitat and aquatic systems. The avoidance stipulation would protect streams and water resources to a lesser degree than Alternatives A and B, which prohibit permanent facilities. Under the Proposed RMP, additional management for aquifers and water quality could protect wildlife habitat and fishery resources to a greater degree than under Alternative A.

Under the Proposed RMP, lands with wilderness characteristics would not be specifically managed to protect their wilderness character, and beneficial impacts on wildlife and fisheries from management of these areas described under Alternative B would not occur. However, lands with wilderness characteristics generally overlap other special management areas, for example ACECs, and management of those other designations would have beneficial impacts on wildlife and fisheries (e.g., protections to limit surface-disturbing activities), similar to the effect described under Alternative A.

Impacts on wildlife and fisheries from mineral development would be similar to those described under Alternatives A and B. Under the Proposed RMP, closing 1,076,039 acres to fluid mineral leasing would reduce habitat loss for wildlife and would close 536,018 more acres than under Alternative A. In addition, most open acres would have NSO, CSU, and TLS that would provide some protections for wildlife and fisheries and avoid disturbance during sensitive periods. However, impacts on wildlife and fisheries from the management of fluid minerals under the Proposed RMP would be greater than under Alternative B, which has 1,110,179 more acres closed and 597,917 more acres with NSO stipulations than the Proposed RMP (Appendix V; Table 2-4). Compared to Alternative B, the Proposed RMP removes the NSO restriction within crucial winter range and reduces restrictions surrounding identified raptor nests to a CSU. With fewer NSO restrictions, more areas would be open to fluid mineral extraction under the Proposed RMP, which would have greater impacts on wildlife and fisheries compared to Alternative B. Under the Proposed RMP, there would be more areas closed to solid leasable minerals (coal, oil shale, and trona), which would reduce solid mineral–associated impacts on wildlife compared to Alternatives A, C, and D (see Appendix V; Table 2-7).

Impacts from locatable minerals on wildlife and fisheries would be similar to those described under Alternative A. Under the Proposed RMP, 510,207 fewer acres would be open to locatable minerals compared with Alternative A, and 927,080 more acres than Alternative B. In addition, the Proposed RMP would propose to withdraw 343,646 more acres from locatable mineral development than Alternative A, which would provide greater protections for wildlife and fisheries.

Impacts on wildlife and fisheries from saleable minerals would be as described under Alternative A, but with slightly larger area open for salable mineral disposal (81,531 more acres). Therefore, the Proposed RMP would have greater impacts on wildlife and fisheries over a larger area than Alternatives A and B, but fewer than Alternatives C and D.

Impacts on wildlife and fisheries from renewable energy development would be similar to those described under Alternative A, but impacts would be reduced because 821,898 fewer acres would be open for renewable energy development. Compared with Alternative B, the Proposed RMP allows for 648,576 more acres to be open without restrictions to renewable energy development (see Appendix V). This is similar to, but 303,625 acres less than, the area that would be open under Alternative D. The Proposed RMP removes the big game parturition and raptor concentration area restrictions. Therefore, the Proposed RMP would have greater impacts on big game and raptor concentration areas due to potential development impacts, compared to Alternative B. The Proposed RMP also removes “eligible but not designated” trails from the NHT corridor. With a reduced corridor, more area would be open for development, which could affect wildlife and fisheries, as described above under Alternative A.

Impacts on wildlife and fish habitat from the management of riparian and wetland resources would be similar to those described under Alternative A. Under the Proposed RMP, additional management for achieving Wyoming Rangeland Standards and PFC would maintain or improve wetland, riparian, and aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The Proposed RMP would also pursue acquisitions, where possible, to enhance riparian area management and therefore would benefit aquatic wildlife and fisheries to a greater extent than Alternative A.

Management for wildlife and fish would be similar to that of Alternative A, and impacts would be similar to those described under Alternative A. Additional management under the Proposed RMP, such as developing habitat management plans and evaluating grazing conflicts during permit renewals, would support wildlife and fisheries management. However, like Alternative D, the Proposed RMP would allow more development activities in big game migration corridors, big game crucial winter ranges and parturition areas, and raptor nest buffers than Alternatives A and B. This could result in greater impacts on wildlife and fisheries and would be evaluated more closely on a case-by-case basis and subject to adequate mitigation.

Impacts on wildlife and fisheries from management of special status species would be as described under Alternative A and primarily follow the management direction of Alternative B, except for management of special status plant species. The Proposed RMP would follow the management actions for special status plants proposed under Alternative D and would allow surface-disturbing activities within special status plant species habitat subject to adequate mitigation. This could result in increased impacts on wildlife and fisheries compared to management actions under Alternatives A and B, where there are more prohibited activities.

Impacts on wildlife and fisheries from the management of visual resources would be similar to those described under Alternative A, except more acres would be designated as VRM Class I (19 more acres than under Alternative A) and VRM Class II (718,332 more acres than under Alternative A). The management for VRM Class I and VRM Class II would retain the character of the landscape, which could allow for some surface disturbance as described under Alternative A, but would provide greater protection overall for wildlife and fisheries than VRM Class III and VRM Class IV designations.

Impacts on wildlife and fisheries from ROW management would be the same as those described under Alternative A except that, under the Proposed RMP, 821,989 fewer acres would be open, and a total of 921,059 acres would be managed as ROW exclusion areas (494,350 more acres than Alternative A). The decrease in acres open to ROW authorization and increased acreage designated as ROW exclusion areas under the Proposed RMP would result in increased protections for fish and wildlife habitat from linear disturbances, surface-disturbing activities, and habitat loss to a greater extent than Alternative A.

Impacts on wildlife and fisheries from the Proposed RMP designation of 12 ACECs would be greater than under Alternative B (16 designated ACECs), but less than under Alternatives A and D (10 ACECs). The Proposed RMP removes the Big Game Migration ACEC, which could result in increased constraint on the migration of big game by allowing multiple uses. Such uses could constrain the extent and suitability of migration habitat for big game, resulting in greater impacts on big game species. However, the Proposed RMP would require the development of a specific habitat management plan (HMP) to address big game migration corridors.

The Proposed RMP would designate a 10-mile-wide corridor around certain existing NHTs as the National Trail Management Corridor. The restrictions associated with these NHT corridors would protect wildlife and fisheries habitat in those locations. The extent of NHT corridors would be less under the Proposed RMP than under Alternative B, primarily because of the removal of the "eligible but not designated" trails. Designated NHTs within the NHT corridors would be changed to ROW avoidance areas that would provide some protection for wildlife and fisheries compared with Alternative A, but less than Alternative B.

Impacts from grazing on wildlife and fisheries would be the same as those described under Alternative A. The Proposed RMP allocates 3,596,265 acres as available for grazing, which is 4,861 acres more than allocated under Alternative A and 12,467 acres more than allocated under Alternative B.

Impacts on wildlife and fisheries from recreation management would be similar to those described under Alternative A. The Proposed RMP would have 159,505 fewer acres designated as SRMAs when compared to Alternative A, which would reduce recreation-related impacts on wildlife and fisheries to a greater extent than Alternative A.

# 4.8 SPECIAL STATUS SPECIES

## 4.8.1 Alternative B

Impacts to special status species from geophysical activities, pursuing land withdrawals, land disposals, land acquisitions, renewable energy, and WSR management would be the same as those described under Alternative A.

Impacts from air quality management would be the same as those described under Alternative A; however, measures to control dust could protect special status wildlife and fisheries habitat to a greater degree than compared to Alternative A.

Impacts to special status species from the management of soil resources would be similar to those described under Alternative A. However, additional management protection to soil resources could support special status wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Impacts to special status species from the management of water resources would be similar to those described under Alternative A. However, applying buffers to the prohibition of surface disturbing activities and new permanent structures within aquatic systems, applying mineral stipulations, and avoiding linear crossings would support wildlife habitat and aquatic systems. The management would support special status fish, macroinvertebrates, and other aquatic species' habitat by reducing erosion and nutrient inputs. Reducing erosion and nutrient inputs would support water quality, stream channel integrity, and prevent cementation of spawning gravel. The management could protect a larger area of riparian and wetland habitat that could support Ute ladies' tresses and meadow pussytoes. The additional management for aquifers and water quality could protect special status wildlife habitat and fisheries resources to a greater degree compared to Alternative A.

Managing all lands with wilderness characteristics to preserve those characteristics would prevent damage or loss of special status wildlife habitat from development activities, reduce disturbance to special status species from the presence of humans, vehicles or machinery, prevent erosion or runoff, and protect an intact ecosystem. The closed acres that are adjacent to riparian habitat or stream channels would protect important habitat for special status fish species such as flannelmouth sucker, bluehead sucker, and roundtail chub; avian species such as trumpeter swan, yellow-billed cuckoo, and bald eagle, amphibians, and other wetland and riparian wildlife species; and would support water quality within stream and river corridors. Precluding oil and gas development would prevent the introduction and spread of invasive, non-native plant species from machinery and vehicles, further supporting desired forage, cover, and contiguous habitat.

Under Alternative B, approximately 1,292 oil, gas, and CBNG wells would be developed within the planning area, 3,481 fewer wells as compared to Alternative A. There would be 8,892 acres of initial surface disturbance and 2,566 acres of long-term disturbance from oil and gas development, which is 23,939 fewer acres of initial surface disturbance and 6,900 fewer acres of long-term disturbance compared with Alternative A.

Closing 2,186,218 acres to fluid mineral leasing would reduce habitat loss for special status species. The closures would allow for contiguous, uninterrupted habitat, and would prevent oil and gas development on 1,646,197 more acres than under Alternative A. Closed lands that are adjacent to riparian habitat or stream channels (295,614 acres) could protect important habitat for special status fish, amphibians, birds, plant species, and would help support water quality. Special status plant species within the closed areas (319 acres) would be protected from surface disturbance, soil loss, and damage of surrounding habitat. Sage-grouse leks (86,447 acres) would be protected from surface disturbance or disruptive activity from oil and gas development within the closed areas.

Under Alternative B, 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Lands that are adjacent to riparian habitat or stream channels (77,487 acres) could protect important habitat for fish, amphibians, birds, plant species, and would help support water quality. Special status plant species within the NSO stipulated areas (197 acres) would be protected from surface disturbance, soil loss, and damage of surrounding habitat.

Applying CSU and TLS to oil and gas leases could reduce damage or loss of vegetation and habitat for special status species (99,674 acres of CSU stipulations and 713,837 acres of TLS). Impacts to special status species from the application of CSU and TLS would be similar to those described under Alternative A, but smaller areas of habitat could receive some reduced impacts from oil and gas development and production activities, but much larger areas are managed as closed and NSO, providing greater habitat protection.

Approximately 1,993,908 acres of the planning area would be pursued for withdrawal from locatable mineral entry, 1,437,350 more acres than Alternative A, and 2,186,218 acres would be closed to geothermal leasing, 1,646,197 acres more than under Alternative A. The remaining acres in the planning area would be available for the development of locatable minerals and geothermal leasing. Impacts to special status wildlife and fisheries would be similar to those under Alternative A; however, a much larger area of land would be closed to geothermal leasing compared to Alternative A. Lands within the closed areas would not have surface disturbing activities from geothermal development, and special status wildlife and fish habitat would not be damaged from those activities.

Impacts to special status wildlife and fisheries habitat from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The protections to lands closed to solid mineral development would be applied to 2,741,709 more acres of land closed to coal, 1,394,477 more acres of land closed to oil shale, and 1,665,326 more acres of land closed to trona compared to Alternative A.

Closing 2,581,741 acres of lands to saleable mineral development would prevent damage or loss of special status species habitat from mineral excavation on 1,748,022 more acres compared to Alternative A. Impacts to special status species habitat would be similar to those described under Alternative A, but a much greater area of land would be closed to surface disturbing activities, protecting vegetation, preventing erosion and runoff, and ensuring greater habitat connectivity.

Impacts to special status species from wildland fire management would be similar to those described under Alternative A. Additional management to protect water quality would support special status fish, wetland birds, and amphibians to a greater degree compared to Alternative A.

Under Alternative B, forest and woodland management would be similar to the management and impacts described under Alternative A; however, Alternative B emphasizes the use of natural processes for forestry management in addition to not allowing clearcutting. The management in Alternative B would support forest and woodland habitat for special status species by encouraging natural habitat conditions, native vegetation, cover, forage, and functional ecosystems.

Impacts to special status species habitat from management of grassland and shrubland communities would be very similar to those described under Alternative A. Resting lands from livestock grazing for a minimum of five growing seasons after treatments would allow treated areas to revegetate, soils to stabilize, and vegetation to mature to the point of withstanding livestock grazing pressure. Rested areas could provide wildlife with new vegetation for cover habitat and forage without competition with livestock during the rest period.

Impacts to special status species habitat from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control through only mechanical or biological methods would protect vegetation and special status species habitat from damage from more invasive control methods, such as chemicals or fire. However, less invasive techniques may not be as effective in controlling large infestations of noxious weeds as chemicals or fire. Under Alternative B, additional management for preventing and controlling the infestation of aquatic invasive species could support wetland, riparian, and aquatic habitat for special status fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The management would help prevent the infestation of riparian and aquatic habitat from non-native species, which would help maintain native ecosystems for forage and cover for special status wildlife and could support water quality and quantity for special status fish and amphibians.

Impacts to special status species habitat from management of riparian and wetland resources would be similar to those described under Alternative A. Additional management for achieving PFC would maintain or improve wetland, riparian, and aquatic habitat for special status fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The management could help reduce sediment runoff into aquatic systems, reducing siltation of spawning habitat for special status fish, improving water quality, and preventing erosion of streambanks.

Impacts to special status species from the management for wildlife and fish would be similar to Alternative A. Additional management under Alternative B such as adjustments to livestock and wild horse management could help maintain or improve habitat by preventing vegetation loss, removing competition for forage, and reducing the introduction or spread of invasive, non-native plant species. Maintaining and improving habitat for migratory bird species of conservation concern could support habitat for avian species such as the ferruginous hawk, Northern goshawk, and trumpeter swan. The management could support existing nesting, feeding, or breeding habitat, or could allow for mitigation to restore areas of habitat if losses were suffered elsewhere in the planning area. Alternative B would apply greater stipulations to protect important seasonal and sensitive habitat for special status fish and wildlife species. Stipulations for no net loss of habitat and prohibiting renewable energy projects in sensitive habitats would prevent the loss or damage of important habitat areas for forage, hunting, nesting, breeding, young rearing, and migration of special status wildlife species. The management could also protect wetland, riparian, and aquatic habitat for special status fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems.

Impacts to special status species habitat from the management for big game of would be similar to those described under Alternative A. Additional management to protect big game parturition habitat, crucial winter range, and migration corridors could support special status species that use seasonal habitat. The management could ensure reproductive success and survival of young, reduce winter mortality associated with increased stress caused by human-induced disturbance, and provide migration corridors that link crucial habitats (winter range) and breeding, nesting, and brood rearing areas.

Impacts to special status species habitat from the management of raptors would be similar to those described under Alternative A. Under Alternative B, additional management would protect raptors through seasonal closures, greater buffer distances, preventing surface disturbance or occupancy within one mile of active and historic nests, and locating infrastructure away from high avian-use areas. The management would provide greater protection by reducing disturbance to raptors during critical life phases, preventing the risk of collisions with wires or structures, and protecting important habitat for nesting, breeding, or hunting as compared to Alternative A.

Impacts to special status species habitat from the management of fish would be similar to those described under Alternative A. Under Alternative B, additional management would provide specific timeframes for seasonal restrictions and buffer distances (¼ mile), which could provide greater protection for special status fish and important habitat for fish reproduction to a greater degree than compared to Alternative A. Closing fish bearing streams to solid mineral leasing would support fisheries and stream health, and protect wetland, riparian, and

aquatic habitat for fish, macroinvertebrates, waterfowl, and other species dependent on these ecosystems. The restrictions could help prevent sediment runoff into aquatic systems, preventing siltation of spawning habitat, improving water quality, and preventing erosion of streambanks. The management could also provide additional protection to special status plants that inhabit riparian areas, such as Ute ladies' tresses.

Impacts to special status species habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative B, additional management could provide greater habitat protection and fewer disruptive activities, supporting special status plant and wildlife species and their habitat. The additional management could help prevent sediment runoff into aquatic systems, preventing siltation of spawning habitat, improving water quality, and preventing erosion of streambanks. Protecting some basin big sagebrush/lemon scurfpea areas along the base of Steamboat Mountain would protect these ecosystems from damage or disturbance and protect the special status wildlife that inhabit these areas.

Impacts to special status species habitat from the management of special status wildlife species would be similar to those described under Alternative A. Under Alternative B, additional management to protect habitat and reintroduce species would provide greater habitat protection for special status wildlife and fish, and reintroduction of species could fill key niches in ecosystems.

Impacts to special status species habitat from the management of cultural resources would be similar to those described under Alternative A. Under Alternative B, additional management such as buffer distances, NSO stipulations, and closures to mineral sales to prevent surface disturbing activities would prevent damage or removal of special status species cover and forage, reduce fragmentation of habitat, and prevent disturbance of wildlife.

Impacts to special status species from the management of visual resources would be similar to those described under Alternative A for VRM Class I (225,785 acres, 68 acres more than Alternative A), VRM Class III (666,522 acres, 51,030 acres more than Alternative A), and for the Gateway West Pipeline. Approximately 14,081 acres of rivers or navigable waters would be protected from surface disturbance within the VRM Class I areas. Approximately 11,675 acres of sage-grouse leks, 374 acres of special status plants, and 57,171 acres of rivers or navigable waters could be vulnerable to surface disturbing activities within the VRM Class III areas. Under Alternative B, 2,148,902 acres would be managed as VRM Class II, 1,566,230 more acres than Alternative A. The management for VRM Class II would retain the character of the landscape, which could allow for some surface disturbance, as described under Alternative A, but the classification of 2,148,902 acres would provide greater protection overall for special status species. Approximately 19 acres of special status plants, and 211,579 acres of rivers or navigable waters could be protected from surface disturbance within the VRM Class II areas. Under Alternative B, 563,754 acres would be managed as VRM Class IV, 1,616,669 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification. Approximately 12,524 acres of sage-grouse leks, 94 acres of special status plants, and 48,946 acres of rivers or navigable waters could be affected by surface disturbing activities within the VRM Class IV areas.

Impacts to special status species from ROW management would be the same as those described under Alternative A; however, under Alternative B, 2,480,876 acres would be managed as ROW exclusion areas. The management would protect special status species habitat from linear disturbances, surface disturbing activities, and habitat loss on 2,130,936 more acres as compared to Alternative A. Approximately 486 acres of special status plants, and 270,305 acres of rivers or navigable waters would be protected from disruptive activities within the exclusion areas. Larger areas would be managed as avoidance areas, 133,903 acres under Alternative B, 602,235 more acres than Alternative A. Approximately 24,033 acres of rivers or navigable waters would be less likely to be subject to disruptive activities within the avoidance areas.

Impacts to special status species from livestock grazing management would be similar to those described under Alternative A. In addition, application of monitoring, greater protection of riparian areas and springs, and additional range improvements would provide greater protection of special status fish and wildlife habitat as compared to Alternative A. The additional management could help maintain or improve habitat by reducing congregation of livestock in sensitive areas and prevent or reduce damage to forage and cover. The management could prevent or reduce compaction or erosion of soils, and reduce the influx of nutrients into riparian areas, wetlands, or streambeds, which could support water quality and riparian vegetation within these areas. Removal of fences reduces threats of injury or death from impacts with fences, enhances migration corridors, and could allow access to additional forage and cover.

Impacts to special status species from recreation management would be similar to those described under Alternative A. Additional management to consider other resource values, buffer distances, and mineral lease stipulations and closures could help maintain or improve habitat for special status fish and wildlife to a greater degree than Alternative A.

Under Alternative B, the Wind River Front SRMA (257,680 acres) would not be retained. This could reduce vegetation damage, surface disturbance, and disruption of special status wildlife from human or vehicle presence caused by recreation use to a greater degree than Alternative A. Other management within the Wind River Front area would have similar impacts to special status wildlife and fisheries compared to Alternative A, but with greater protection to lands from mineral stipulations and other surface disturbance prohibitions.

Impacts to special status species from managing OHV open and closed areas would be the same as those described under Alternative A. Under Alternative B, there would be no category called "limited to existing roads and trails." While the routes would be moved under the "limited to designated roads and trails" for a total of 3,367,576 acres impacts to wildlife and fish habitat would be similar to those described under both categories under Alternative A. Additional management to prohibit and limit OHV use could provide greater protection to special status species from damage to habitat and help to prevent soil loss, erosion, and runoff to riparian habitat, and the introduction or spread of invasive, non-native plant species as compared to Alternative A. Within the open areas, there are 377 acres of land adjacent to rivers which could be subject to noise, dust, possible habitat damage, and sediment runoff that could degrade water quality and spawning habitat for special status fish species. Within the designated areas, there are 85,407 acres of sage-grouse leks, 318,113 acres of land adjacent to rivers, and 487 acres of special status plant habitat which could be subject to noise, dust, and some sediment runoff. Within the closed areas, there are 136 acres of special status plant habitat, and 13,908 acres of land adjacent to rivers which would have reduced surface disturbance, less noise from vehicles, and less runoff into streams.

Impacts to special status species from recreation management would be similar to those described under Alternative A. Under Alternative B, management of eligible and congressionally designated trails could reduce or prevent disturbance or loss of habitat for special status species to a greater degree when compared to Alternative A. Managing historic trail segments under Alternative B could prevent or reduce surface disturbance, damage, or removal of wildlife cover and forage, reduce fragmentation of habitat, and reduce disturbance of special status species.

Impacts to special status species from the management of WSAs would be similar to those described under Alternative A. Additional management under Alternative B for visual resources could provide greater habitat protection beyond the perimeter of the WSAs by preventing or reducing surface disturbing activities within viewsheds. Preventing or reducing surface disturbing activities from VRM Class I and II areas would maintain contiguous habitat for forage, cover, migration, and important life cycles of special status Species.

Under Alternative B, the Red Desert Watershed Management Area would be divided into a management area (164,140 acres) and the remainder added to the Steamboat Mountain ACEC (439,330 acres). Impacts to special status species from the management of the area would be similar to those described in Alternative A, but additional

management could further reduce surface disturbance, human and vehicle presence, and a reduction in predation of smaller special status wildlife species. The remaining management areas listed in Alternative A would be managed as ACECs under Alternative B.

The Greater Red Creek ACEC would be expanded from 131,600 acres in Alternative A to 468,170 acres, and the Monument Valley ACEC (69,960 acres), and Big Sandy Openings ACEC (2,020 acres) would be designated in Alternative B. The expansion and designations would allow for greater protection of habitat for special status Species through management such as ROW exclusion, closed to mineral leasing, limited vehicle use, vegetation management, and protective management for wildlife. The management would support forage, habitat, migration corridors, and other important areas for special status species, especially sagebrush obligate species. Closed areas would result in less disturbance or stress to wildlife from vehicles and human presence, which would support the overall health of special status species. Management to protect special status plant species could help prevent disturbance or damage to special status plants and could help maintain the integrity of surrounding soils and vegetation.

Designating the Pinnacles ACEC (1,340 acres) would protect habitat for special status species through management such as ROW exclusion, closed to mineral sales, and limiting surface disturbing activities. The management would support forage, habitat, migration corridors, and other important areas for special status wildlife species.

Impacts to wildlife and fisheries from retaining the designation of the Cedar Canyon ACEC (2,550 acres) would be similar to Alternative A, but additional management would allow for greater habitat protection under Alternative B. Closing the area to mineral development, prohibiting motorized and non-motorized use, preparing reclamation plans, and other resource protection could reduce or prevent loss of habitat for special status wildlife in that area. Vegetation management and habitat enhancement for special status raptors and other wildlife could maintain or improve overall habitat for special status species and could provide nesting habitat and hunting perches for raptors and other avian species.

Impacts to special status species from retaining the designation of the Greater Sand Dunes ACEC (including the Crookston Ranch and Boar's Tusk Portions, 39,290 acres) and the Oregon Buttes ACEC would be the same as those described under Alternative A.

Impacts to special status species from the management of the Eastern Portion of the Greater Sand Dunes ACEC would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to wildlife from vehicles, machinery, or human presence.

Impacts to special status species from the management of the Natural Corrals ACEC (1,110 acres) would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to special status wildlife from vehicles, machinery, or human presence. Preventing or reducing surface disturbing activities in the ACEC would maintain contiguous habitat for forage, cover, migration, and important life cycles of special status species.

Impacts to special status species from the management of the Pine Springs ACEC (6,480 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 430 acres under Alternative B. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to special status species from vehicles, machinery, or human presence.

Impacts to special status species from the management of the Special Status Plant Species ACEC (3,610 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 2,510 acres under Alternative B and additional protective management for special status plants would be applied. The

additional acres and management would provide greater protection for suitable plant habitat, which would support continued existence and regeneration of small rock cress, precocious milkvetch, Wyoming tansymustard, and hairy greenthread.

Impacts to special status species from the management of the Steamboat Mountain ACEC (439,330 acres) would be similar to those described under Alternative A. The ACEC would be expanded an additional 392,050 acres under Alternative B. The inclusion of additional land and protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to special status species from vehicles, machinery, or human presence. Management to protect special status plant species would prevent disturbance or damage to special status plants and could help maintain the integrity of surrounding soils and vegetation.

Impacts to special status species from the management of the White Mountain Petroglyphs ACEC (20 acres) would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could provide greater protection of habitat and reduce disturbance to special status species from vehicles, machinery, or human presence.

Designating and managing the South Wind River ACEC (374,710 acres) for visual, crucial habitat, special status plants, and other values could improve, enhance, or maintain special status species habitat. Protective management to prevent or reduce surface disturbance, ROW exclusion, and closures to mineral leasing could provide protection of habitat and reduce disturbance to special status wildlife from vehicles, machinery, or human presence. Preventing or reducing surface disturbing activities in the ACEC would maintain contiguous habitat for forage, cover, migration, and important life cycles of special status species.

The management could reduce the introduction or spread of invasive, non-native plant species, which would protect native habitat. Managing land as a separate offsite mitigation area could provide new seral stages of vegetation as new habitat regenerates. Special status wildlife such as mountain plover, white-tailed prairie dogs, and swift fox could benefit from the low, early seral areas of vegetation.

Impacts to special status species from reducing or minimizing risk to humans and the environment from hazardous materials would be similar to Alternative A. In addition, restoration of contaminated lands could reduce damage to wildlife habitat, help reduce runoff of contaminants into riparian and aquatic systems, and provide additional habitat for special status species.

## 4.8.2 Alternative C

Impacts to special status species from the management of water, geophysical, riparian and wetland, raptors, cultural, pursuing land withdrawals, land disposals, land acquisitions, and renewable energy resources would be the same as those described under Alternative A.

Impacts to special status species from air quality management would be the same as those described under Alternative B, with the exception of dust abatement measures, which would be the same as Alternative A.

Impacts to special status species from the management of soil and water resources would be similar to those described under Alternative A. Fewer protections to highly erodible soils under Alternative C could result in the potential for increased soil erosion, soil loss, and sediment runoff to a greater degree when compared to Alternative A.

Lands with wilderness characteristics would not be managed for wilderness characteristics under Alternative C. These lands would be managed for other resource uses or resource values. Protective management applied under

Alternative B would not be applied in Alternative C and could allow surface disturbing or disruptive activities to occur on these lands.

Approximately 4,919 oil, gas, and CBNG wells would be developed under Alternative C within the planning area, 146 more wells compared to Alternative A. There would be 33,840 acres of initial surface disturbance and 9,758 acres of long-term disturbance from oil and gas development, with 1,009 more acres of initial surface disturbance and 292 more acres of long-term disturbance compared with Alternative A.

Closing 225,782 acres to fluid mineral leasing would reduce habitat loss, would allow for contiguous, uninterrupted habitat, and would close 314,239 fewer acres than under Alternative A. Impacts to special status wildlife and fisheries would be the same as those described under Alternative A, however, surface disturbance and disruptive activities could occur over larger areas under Alternative C. No river or navigable waters and habitat for special status plant species would be included within the closed areas under Alternative C.

Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than Alternative A. Impacts to special status wildlife and fisheries would be the same as those described under Alternative A; however, surface disturbance and disruptive activities could occur over larger areas under Alternative C. No river or navigable waters and habitat for special status plant species would be included within the NSO stipulated areas under Alternative C.

Applying CSU stipulations to 215,890 acres could reduce damage or loss of vegetation and habitat for wildlife, 505,242 fewer acres compared to Alternative A. Applying TLS to 1,355,485 acres could seasonally reduce surface disturbance or disruptive activities in sensitive habitat for raptors, or other special status species, 485,482 less acres compared to Alternative A. Impacts to special status wildlife and fisheries from the application of CSU and TLS would be similar to those described under Alternative A, but overall, less habitat would receive reduced impacts from oil and gas development and production activities.

Approximately 234,961 acres of the planning area would be pursued for withdrawal from locatable mineral entry, 321,597 fewer acres compared to Alternative A. Approximately 225,782 acres of the planning area would be closed to geothermal leasing, 314,239 fewer acres compared to Alternative A. Impacts to special status species would be the same as those described under Alternative A, however, surface disturbance and disruptive activities could occur over more acres under Alternative C.

Impacts to special status species from the development of coal, oil shale, and trona resources would be similar to those described under Alternative A. Under Alternative C, 226,219 acres would be closed to coal, which would be a 259,745 acre reduction compared with Alternative A. Approximately 225,965 acres would be closed to both oil shale and trona leasing and development, which would be a 501,840 acre reduction for oil shale and a 228,629 acre reduction for trona. The smaller areas of closures could result in increased damage or loss of habitat from development activities and increased disturbance to special status species from the presence of humans when compared to Alternative A.

Approximately 226,421 acres of the planning area would be closed to saleable mineral development, 607,298 fewer acres compared to Alternative A. Impacts to special status species would be the same as those described under Alternative A, however, surface disturbance and disruptive activities could occur over larger areas of land under Alternative C.

Impacts to special status species from wildland fire management and forest and woodland management would be the same as those described under Alternative A. Under Alternative C, allowing the harvest of cottonwood trees could remove nesting habitat for bald eagle and long-eared myotis. Harvest activities could disturb nearby wildlife from human presence, machinery, and vehicles, and cause surface disturbance, which could remove vegetation and cause erosion. Surface disturbance could result in runoff into aquatic systems, causing siltation of spawning

habitat, diminished water quality, and erosion of streambanks. Erosion and increased runoff could continue in harvest areas until new vegetation was established.

Impacts to special status species habitat from the management of grassland and shrubland communities would be very similar to those described under Alternative A. Use of non-native species could help stabilize soils and prevent erosion in the short-term, and over the long-term could provide stable land for native species to re-establish. Some non-native plants may not provide appropriate cover or forage values for special status wildlife, and the use of non-native plants increases the risk of spread and eventual degradation of native habitat values.

Impacts to special status species habitat from invasive species and pest management would be similar to those described under Alternative A. Additional management for invasive plant species control through various methods, including chemicals, the use of BMPs, and buffer distances for chemical use could reduce the infestation and spread of invasive species to a greater degree than Alternative A. The management would help prevent the infestation of riparian and aquatic habitat from non-native species, which would help maintain native ecosystems for forage and cover for special status wildlife and could support water quality and quantity. Management to protect special status plants, wetlands, riparian areas, and aquatic habitats through buffers for chemical use would prevent accidental application or spills and protect special status plants from accidental contact with herbicides.

Impacts to special status species habitat from the management for wildlife and fish would be similar to Alternative A, and impacts would be similar to those described under Alternative A. Additional management under Alternative C by prioritizing livestock and raising grazing levels could increase competition for forage and habitat resources between livestock and special status wildlife. Increased use by livestock could cause loss of vegetation for forage and cover, soil compaction, erosion, trampling of vegetation and habitat, and the spread of invasive, non-native plant species. Retaining fences could impact special status wildlife by creating travel barriers, altering distribution patterns, increasing stress and energy loss, and could cause injury or death from entanglement.

Management to allow renewable energy projects in sensitive wildlife habitats could result in habitat damage or loss of raptor concentration areas (high-use/high-density raptor nesting/roosting/perching areas), and unique habitats (e.g., aspen and mountain shrub). Renewable energy development could result in displacement of some special status wildlife and raptor species from breeding and foraging habitat within the construction area. Construction of wind turbines throughout the planning area may create collision hazards for raptors, bats, and multiple avian species. Studies have documented deaths of avian and bat species from wind turbines, although the levels of collision and death vary in the scientific research (Madders and Whitfield 2006). Collision levels fluctuate based on habitat, terrain, elevation, and even weather conditions (Madders and Whitfield 2006). Prediction of accurate bird or bat losses from wind development is currently not available; however, it could be assumed that some losses of these species will occur.

Impacts to special status species habitat from the management for big game of would be the same as those described under Alternative A. Impacts to special status species from additional management in Alternative C would protect big game parturition habitat, crucial winter range, and migration corridors.

Under Alternative C, seasonal restrictions for surface disturbance near spawning fish populations would not be applied. Allowing surface disturbing activities along fish bearing streams near spawning, incubation, and fry rearing habitat could lead to sediment runoff and accumulation of fine silts in stream channels which could cause cementation of spawning gravel for special status fish species. Increased sediment could affect water quality for and aquatic habitat for special status fish, waterfowl, macroinvertebrates, and other species dependent on these ecosystems.

Impacts to special status species habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative C, allowing more opportunities for surface disturbing activities near special status plant species could degrade habitat in surrounding areas or allow for the introduction

and spread of invasive, non-native plant species. Invasive plants could compete with special status plants and reduce available habitat for special status plants to reproduce. Eventually, non-natives could out-compete some special status plant species if monitoring did not identify the threat in time.

Impacts to special status species from the management of visual resources would be very similar to those described under Alternative A. Management for VRM Class I would be 226,629 acres, 912 acres more than Alternative A; VRM Class II would be 607,899 acres, 25,227 acres more than Alternative A; VRM Class III would be 395,683 acres, 219,809 fewer acres than Alternative A; and VRM Class IV, 2,374,706 acres, 194,283 acres more than Alternative A. There would be slightly more acres protected by VRM Classes I and II, but nearly 200,000 more acres subjected to surface disturbing and disruptive activities within VRM Class IV compared to Alternative A.

Impacts to special status species from ROW management would be similar to those described under Alternative A. Under Alternative C, 225,784 acres would be managed as ROW exclusion areas, 200,925 fewer acres compared to Alternative A. Under Alternative C, 31,018 acres would be managed as ROW avoidance areas, 705,120 fewer acres compared to Alternative A. Surface disturbing and disruptive activities from ROW development could damage or remove forage and habitat for wildlife species to a greater degree than under Alternative A.

Impacts to special status species from livestock grazing management would be similar to those described under Alternative A. Additional management under Alternative C by allowing livestock in riparian areas could increase competition for forage and habitat resources between livestock and special status species. Increased use by livestock could cause loss of vegetation for forage and cover, soil compaction, erosion, trampling of vegetation and habitat, and the spread of invasive, non-native plant species. Use of riparian areas by livestock could increase runoff and accumulation of fine silts in stream channels which could cause cementation of spawning gravel for special status fish species. Increased sediment could affect water quality and aquatic habitat for special status fish, amphibians, macroinvertebrates, and other species dependent on these ecosystems. Implementation of the Wyoming Land Health Standards could ensure that habitat for wildlife is not degraded by over-use of livestock.

Under Alternative C, reducing total authorized use to highest level of billed use over the last 10 years could provide increased forage and habitat resources for special status species. Reducing use to 160,387 AUMs could reduce habitat degradation from livestock, which could support water quality and availability, and allow a more natural grazing pattern from wildlife use. However, because management of livestock under this alternative would be very similar to the levels of actual use that have historically occurred in the planning area, it is likely that few changes would occur beyond those described under Alternative A.

Impacts to special status species from recreation management would be similar to those described under Alternative A; however, the emphasis of recreation use over other resources could result in more surface disturbing or disruptive activities to occur.

Impacts to special status species from the management of the Wind River Front SRMA (257,680 acres) would be similar to those under Alternative A for recreation and the management of the SRMA. The emphasis of the SRMA management for recreation use, including increased use of motorized vehicles, and allowing increased surface disturbing activities and mineral leasing would lead to habitat loss and abandonment of habitat to a greater degree when compared to Alternative A.

Impacts to special status species from managing OHV areas would be the same as those described under Alternative A. Under Alternative B, there would be no category called “limited to existing roads and trails.” While the routes would be moved under the “limited to designated roads and trails” for a total of 3,367,576 acres, impacts to special status species habitat would be similar to those described under both limited to designated and existing categories under Alternative A.

Impacts to special status species from the management of eligible and congressionally designated trails would be similar to those described under Alternative A. Under Alternative C, allowing surface disturbing activities, mineral development, and other disruptive activities could result in more habitat damage or loss.

WSAs would be managed for multiple use and WSRs, ACECs, and other management areas would not be retained under Alternative C. This management would result in fewer protections to special status species fish, wildlife, and plants as compared to Alternative A.

Impacts to special status species from public safety management would be the same as those described under Alternative B.

### 4.8.3 Alternative D

Impacts to special status species habitat from geophysical activities, wildland fire, raptors, special status wildlife species, cultural, paleontological, pursuing land withdrawals, land disposals, land acquisitions, renewable energy, and WSR management would be the same as those described under Alternative A.

Impacts to special status species from air quality management would be the same as those described under Alternative B, with the exception of dust abatement measures, which would not be required under Alternative D. Applying dust abatement measures on a case-by-case basis could reduce dust accumulation.

Impacts to special status species from the management of soil resources would be similar to those described under Alternative A. However, additional management to protect soil resources could support special status wildlife, fisheries, or plants a greater degree compared to Alternative A.

Impacts to special status species from the management of water resources would be similar to those described under Alternative A. Applying buffers and the avoidance of surface disturbing activities and construction within aquatic systems, applying mineral stipulations, and avoiding linear crossings could support special status species habitat and aquatic systems, but to a lesser degree compared to Alternative A.

Impacts to special status species from the management of lands with wilderness characteristics would be similar to those described under Alternative B; however, fewer areas would be managed specifically for those characteristics and fewer restrictions on surface disturbance would be applied. Managing lands for a variety of uses could reduce some damage or loss of special status species habitat from development activities, reduce disturbance to special status wildlife from the presence of humans, vehicles, or machinery, or reduce erosion or runoff.

Under Alternative D, approximately 4,737 oil, gas, and CBNG wells would be developed within the planning area, 36 fewer wells as compared to Alternative A. There would be 32,587 acres of initial surface disturbance and 9,397 acres of long-term disturbance from fluid mineral development; which is 244 fewer acres of initial surface disturbance and 69 fewer acres of long-term disturbance compared with Alternative A.

Closing 768,989 acres to fluid mineral leasing would close 228,968 more acres than under Alternative A. Closing land to new oil and gas development would protect smaller areas of habitat compared to Alternative A. Riparian areas and stream habitat (67,224), and special status plants (170 acres) would be protected from surface disturbance or disruptive activity from oil and gas development within the closed areas to a lesser degree compared to Alternative A.

Under Alternative D, 2,172 acres would be managed with NSO stipulations, which is 156,439 fewer acres than under Alternative A. Smaller areas of grassland and sagebrush would be protected from surface disturbance and disruptive activity under Alternative D, which could reduce habitat connectivity for swift fox, ferruginous hawk,

burrowing owl, and pygmy rabbit. Lands that are adjacent to riparian habitat or stream channels (35,384 acres) could protect important habitat for fish, amphibians, birds, and plant species, and would help support water quality within a smaller area compared to Alternative A. Special status plant species within the NSO stipulated areas (177 acres) would be protected from surface disturbance, soil loss, and damage of surrounding habitat within about 321 fewer acres compared to Alternative A.

Applying CSU and TLS to oil and gas leases could reduce damage or loss of vegetation and habitat for special status wildlife species (1,238,899 acres of CSU stipulations and 1,911,167 acres of TLS). Impacts to special status species from the application of CSU and TLS would be similar to those described under Alternative A, but slightly larger areas of habitat could receive some reduced impacts from CSU and TLS for oil and gas development and production activities.

Approximately 482,272 acres of the planning area would be pursued for withdrawal from locatable mineral entry, 74,286 fewer acres than Alternative A, and 768,989 acres would be closed to geothermal leasing, 228,968 more acres than under Alternative A. The remaining acres in the planning area would be available for the development of locatable minerals and geothermal leasing. Impacts to special status species would be similar to those described under Alternative A. Lands within the closed and withdrawn areas would be affected by surface disturbing activities from excavation of locatable minerals and geothermal development, and habitat for special status species would not be damaged from those activities.

Impacts to special status species habitat from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative D, 610,342 acres would be closed to coal leasing, 124,378 more acres than under Alternative A, 1,557,520 acres would be closed to oil shale leasing, 829,715 more acres than Alternative A, and 389,552 acres would be closed to trona leasing, 34,081 fewer acres than Alternative A. The smaller areas of coal, and trona closures could result in increased damage or loss of habitat from development activities and increased disturbance to special status species from the presence of humans when compared to Alternative A.

Closing 362,009 acres of lands to saleable mineral development would prevent damage or loss of special status species habitat from mineral excavation on 471,710 fewer acres compared to Alternative A. Impacts to special status species habitat would be similar to those described under Alternative A, but smaller areas of land would be closed to surface disturbing activities, allowing for surface disturbance, erosion, vegetation loss, and habitat fragmentation.

Impacts to special status species from forest and woodland management would be similar to those described under Alternative A. In addition, Alternative D would limit logging operations on slopes steeper than 25%, which could help prevent or reduce soil loss and erosion from logging operations. Reducing or preventing soil loss and erosion could reduce sediment build up in streams, which could protect water quality and spawning gravel for fisheries. Under Alternative D, allowing the harvest of cottonwood trees could remove nesting habitat for birds and bats, disturb nearby wildlife from human presence, machinery and vehicles, and cause surface disturbance which could remove vegetation and cause erosion. Surface disturbance could result in runoff into aquatic systems, causing siltation of spawning habitat, diminished water quality, and erosion of streambanks. Erosion and increased runoff could continue in harvest areas until new vegetation is established.

Impacts to special status species habitat from management of grassland and shrubland communities would be the same as those described under Alternative C.

Impacts to special status species habitat from management of riparian and wetland resources would be similar to those described under Alternative A. Additional management for achieving Wyoming Rangeland Standards and PFC would maintain or improve wetland, riparian, and aquatic habitat for special status fish, macroinvertebrates,

waterfowl, and other species dependent on these ecosystems. The management could reduce runoff into aquatic systems, reducing siltation of spawning habitat, improving water quality, and preventing erosion of streambanks.

Management for special status species would be similar to Alternative A and impacts would be similar to those described under Alternative A. Additional management to maintain or improve habitat for migratory birds on a case-by-case basis would support special status bird species to a greater degree compared to Alternative A. Alternative D would apply greater stipulations to protect important seasonal and sensitive habitat for special status species compared to Alternative A.

Impacts to special status species habitat from the management for big game would be the same as those described under Alternative A. Impacts to wildlife from additional management in Alternative D to protect big game parturition habitat, crucial winter range, and migration corridors would be similar to those described under Alternative B, but would not provide as much protection as Alternative B.

Impacts to special status species habitat from the management of fish would be similar to those described under Alternative A. Under Alternative D, additional management including avoiding surface disturbance within 100-year flood plains and fish-bearing streams could provide greater protection for special status fish and important habitat for fish reproduction than compared to Alternative A.

Impacts to special status species habitat from the management of special status plant species would be similar to those described under Alternative A. Under Alternative D, additional management could prevent surface disturbance, soil loss, and direct damage or mortality of special status plants within the planning area.

Impacts to special status species from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,703 acres, 14 acres fewer than Alternative A), and for the Gateway West Pipeline. Under Alternative D, 1,178,718 acres would be managed as VRM Class II, 569,046 more acres than Alternative A. The management for VRM Class II would retain the character of the landscape, which could allow for some surface disturbance, as described under Alternative A, but the classification of 1,178,718 acres would provide greater protection overall for special status species. Approximately 147,976 acres of streams and riparian habitat could be protected from surface disturbance within the VRM Class II areas. Under Alternative D, 738,311 acres would be managed as VRM Class III, 122,819 more acres than Alternative A, and 1,455,234 acres would be managed as VRM Class IV, 725,189 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class III and IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification. Approximately 98,271 acres of streams and riparian habitat could be vulnerable to surface disturbing activities within the VRM Class III areas. Approximately 70,276 acres of streams and riparian habitat could be affected by surface disturbing activities within the VRM Class IV areas.

Impacts to special status species from ROW management would be the same as those described under Alternative A; however, under Alternative D, 286,289 acres would be managed as ROW exclusion areas. The management would protect special status species habitat from linear disturbances, surface disturbing activities, and habitat loss on 117,493 fewer acres as compared to Alternative A. Approximately 238 acres of special status plant habitat, and 17,650 acres of streams and riparian habitat would be protected from disruptive activities within the exclusion areas. However, more acres would be managed as avoidance areas, 1,388,618 acres under Alternative D, 652,480 more acres than Alternative A. Approximately 244,969 acres of stream and riparian habitat could be protected from disruptive activities within the avoidance areas, which is more acres when compared to Alternative A.

Impacts to special status species from livestock grazing management would be very similar to those described under Alternative A. In addition, the Pine Creek Special Status Plant exclosure would protect the only known population of small rockcress (*Arabis pusilla*) from livestock grazing and OHV use. The McKinnon Special Status Plant Exclosure is designed to protect precocious milkvetch (*Astragalus proimanthus*), which is only known to

occur within 10 square miles near McKinnon. The exclosure would also protect this species from livestock grazing and OHV use.

Impacts to special status species from recreation management would be the same as those described under Alternative A. Management of SRMAs would be similar to Alternative A, however fewer SRMAs but to a lesser degree compared to Alternative A.

Impacts to special status species from managing OHV areas would be the same as those described under Alternatives A and B. Within the areas closed to OHV use under Alternative D there are 932 acres of sage-grouse leks which would be subject to reduced surface disturbance, less noise from vehicles, and reduced habitat fragmentation. Within the designated areas, there are 487 acres of special status species habitat which could be subject to noise, dust, possible habitat damage, and disturbance from vehicles and human presence.

Impacts to special status species from the management of congressionally designated trails would be similar to those described under Alternative A. Under Alternative D, additional management of eligible and congressionally designated trails could reduce or prevent disturbance or loss of habitat for special status species to a greater degree when compared to Alternative A.

Impacts to special status species from the management of WSAs would be similar to those described under Alternative B. Under Alternative D, if WSAs were not designated as wilderness, most of the areas would be managed as ACECs. Impacts to special status species from the management of ACECs are described in detail under Alternative A.

Impacts to special status species from the management of the Red Desert Management Area (162,980 acres), Pine Mountain Management Area (62,760 acres), and the Sugarloaf Basin Management Area (87,240 acres) would be very similar to Alternative A although fewer management areas would be retained under Alternative D. Where protective management is applied, it would support forage, habitat, migration corridors, and other important areas for raptors and other special status species.

Impacts to special status species from the management of South Pass Historic Landscape, Little Mountain, Special Status Plants, and Steamboat Mountain ACECs would be the same as those described under Alternative A.

Impacts to special status species from not retaining the ACEC designations for Cedar Canyon, Greater Sand Dunes, Natural Corrals, Oregon Buttes, Pinnacles, and Pine Springs ACECs would be the same as those described under Alternative C.

Impacts to special status species from the management of National Historic Landmarks would be the same as those described under Alternative B.

Impacts to special status species from reducing or minimizing risk to humans and the environment from hazardous materials would be the same as Alternative B.

## 4.8.4 Proposed RMP

The Proposed RMP is a combination of management actions, primarily from Alternative B and Alternative D and would have similar impacts as previously described under these alternatives. In general, the Proposed RMP would have increased protections for special status species compared to Alternatives A, C, and D, but fewer than Alternative B. In general, impacts on special status species and their habitats would be similar to those described above for wildlife and fisheries. The BLM is in consultation with the U.S. Fish and Wildlife Service (USFWS) to fulfill requirements under the Endangered Species Act of 1973 (ESA) and is developing a Biological Assessment for evaluating the Proposed RMP (Appendix H). Section 7 consultation with USFWS is ongoing. The Biological

Assessment and Biological Opinion will be posted to the ePlanning site (https://eplanning.blm.gov/eplanning-ui/project/13853/510) prior to issuance of the Record of Decision.

Although impacts on special status species may differ because of the amount of area open to and management direction for mineral development, SRMAs, ACECs, and lands with wilderness characteristics, all the action alternatives, including the Proposed RMP, require special status plant and wildlife surveys in suitable habitat before any surface-disturbing activities occur. If any special status species were found, then the BLM would coordinate with USFWS or Wyoming Fish and Game Department (WGFD), or both, to protect special status species. This would protect special status species at the implementation level across the planning area.

Impacts on special status species from mineral development would be similar to those described under Alternatives A and B. Under the Proposed RMP, closing 1,076,039 acres to fluid mineral leasing would protect special status species from oil and gas development and would close 536,018 more acres than under Alternative A. In addition, most open acres would have NSO, CSU, and TLS that would provide some protection for special status species and avoid disturbances during sensitive periods. Impacts on special status species from the management of fluid minerals from the Proposed RMP would be greater than under Alternative B, which has more acres closed, and with more NSO stipulations. The Proposed RMP is similar to Alternative D, but with some adjustments for special management changes (Appendix V; Table 2-4). Areas that would be open include "eligible but designated" NHT trails, the big game migration corridor, Monument Valley, and portions of the Little Mountain ACEC. If development were to occur in these open areas, impacts on special status species and their habitats may be greater than those of Alternative B, but less than those of the other alternatives. Under the Proposed RMP, there would be more acres closed to solid leasable minerals (coal, oil shale, and trona), which would reduce solid mineral associated impacts on special status species compared to Alternatives A, C, and D (Appendix V; Table 2-7).

Impacts from recreation on special status species would be similar to those described under Alternative A, but the Proposed RMP would have fewer potential impacts from recreation on special status species because there would be 159,505 fewer acres designated as SRMAs compared with Alternative A. However, recreation impacts would be greater than those under Alternative B, which does not propose any SRMAs and instead focuses on primitive recreation experiences.

Unlike Alternative B, the Proposed RMP would manage lands with wilderness characteristics for multiple uses and as determined by other management area direction, instead of for wilderness characteristics (see Appendix V), and impacts would be similar to those of Alternatives A and D. Under the Proposed RMP, management for lands with wilderness characteristics specifically to preserve those characteristics would not occur, and the beneficial impacts on special status species from their management described under Alternative B would not be realized. For example, lands with wilderness characteristics would not be closed to mineral or other development, which would increase the potential occurrence of surface-disturbing activities in special status species habitat. Other overlapping special designations would still help limit development effects on special status species in these areas.

The Proposed RMP would designate 12 ACECs and increase the acreage in ACECs by about 648,665 acres compared with Alternative A, but would decrease areas designated as ACECs by approximately 670,525 acres compared to Alternative B. ACEC management direction would indirectly protect special status species that may occur within ACECs by limiting the types of activities that could occur and focusing management on protecting the critical values for which the ACEC was designated. However, the Proposed RMP allows for more multiple uses in ACECs than Alternatives A and B. For example, under the Proposed RMP, some ACECs may be open to certain types of mineral development (see Appendix V). As such, the ACECs designated under the Proposed RMP may not provide as much protection for special status species compared with the alternatives (in particular Alternative B) that more fully restrict development in ACECs.

Impacts on special status species from the management of the Special Status Plant Species ACEC would be similar to those described under Alternative A. Under the Proposed RMP, the ACEC would be expanded to 4,469 acres to protect newly identified special status plant populations. The inclusion of additional land and protective measures to prevent or reduce surface disturbance could provide greater protection for special status plants than the other alternatives.

Livestock grazing has the potential to affect sensitive Colorado River and Platte River species. Impacts from grazing on special status species would be the same as those described under Alternative A. The Proposed RMP allocates 3,596,265 acres as available for grazing, which is 4,861 acres more than allocated under Alternative A and 12,467 acres more than allocated under Alternative B.

# 4.9 WILD HORSES

## 4.9.1 Alternative B

Impacts to wild horses from air quality management would be similar to those described under Alternative A. Under Alternative B, additional management to reduce dust and emissions could support forage quality by reducing accumulation of dust particles on vegetation to a greater degree compared to Alternative A.

Under Alternative B, soil, water quality, and watershed management activities would benefit wild horses through enhancement of vegetation resources aimed at reducing erosion and improving water quality. Prohibiting the use of fire suppression chemicals within 1,320 feet (¼ mile) of surface water would protect forage for horses and water quality from these chemicals to a greater degree compared to Alternative A. Prohibiting salt blocks and other nutritional supplements within 2,640 feet (½ mile) of surface water sources, riparian areas, and wetlands could distribute forage use and reduce impacts on water sources from overuse, or degraded water quality.

Managing lands with wilderness characteristics could protect forage from surface disturbing activities and prevent the removal or damage of forage, prevent soil loss, erosion, or removal of habitat for plant species, and prevent the introduction or spread of invasive, non-native plant species. Closing all lands with wilderness characteristics to mineral leasing and development, and management as exclusion areas for ROWs could protect these areas from surface disturbing activities and could benefit wild horses. Increased restrictions on surface disturbing activities would protect forage and water quality and would reduce human activity, thereby reducing potential stress to animals.

Impacts to wild horses from the management of mineral resources would be similar to those described under Alternative A. Under Alternative B, increased restrictions on surface disturbing activities from mineral development would support forage and water resources to a greater degree. Applying lease stipulations and closing lands to mineral leasing and development within this alternative would decrease the amount of surface disturbing activities, thereby maintaining vegetation for wild horses. Management actions that restrict surface disturbing activities include TLSs (for all herd management areas [HMA]) (713,837 acres), CSU stipulations (99,674 acres), and NSO stipulations (813,354 acres). Closing HMA lands to oil and gas leasing (2,186,218 acres, a 305% increase over Alternative A), mineral material sales (2,581,741 acres), and proposed for withdrawal from locatable mineral entry (1,993,908 acres) would protect larger areas of forage and habitat compared to Alternative A.

Impacts from fire and fuels management would be similar to Alternative A, except wildfire for resource benefit would be emphasized to improve forage condition in HMAs when they occur. As a result, more vegetation could be burned during the life of the plan, thereby increasing the likelihood of maintaining vegetation in an early seral stage and improving the condition of the forage. Where wildfire for resource benefit occurs, short-term impacts would be loss of vegetation and localized increased competition for forage; and long-term impacts would result in possible concentration on burned areas and associated delays in vegetation community responses.

Impacts to wild horses from vegetation management would be similar to those described under Alternative A. Management, such as riparian management exclosures under Alternative B would provide additional benefits for wild horses and their habitat compared to Alternative A. Short-term, horses could be excluded from water and forage; long term, exclosures could benefit wild horses by improving water quality and riparian forage conditions. However, the provision under this alternative that allows exclosures to be removed could partially offset these impacts.

Impacts to wild horses from wildlife and fisheries management would be similar to Alternative A; however, additional measures for wildlife protection would be implemented under this alternative. Impacts to wild horses from the management to improve habitat for wildlife, prevent habitat fragmentation, and provide protection from human activity would benefit wild horses and their habitat by maintaining and improving forage production to a greater degree when compared to Alternative A. Surface disturbing and disruptive activities in sensitive species habitat, as well as migration and transitional ranges, would be managed and could decrease disturbance during sensitive periods, such as foaling.

Impacts to wild horses from VRM would be similar to Alternative A, except 2,148,902 acres would be designated as VRM Class II. The VRM Class II designation, in some cases, could preclude surface disturbing activities or preclude facility placement, which could protect forage available to wild horses.

Impacts to wild horses from the management of renewable energy and ROWs would be similar to those described under Alternative A. Under Alternative B, 2,480,876 acres of ROW exclusion and 133,903 acres of avoidance areas could prevent or reduce surface disturbance, removal of vegetation, and prevent the introduction or spread of invasive, non-native plant species to a greater degree when compared to Alternative A. The management could support more forage and undisturbed habitat for wild horses than Alternative A.

Impacts to wild horses from livestock grazing management would be very similar to those described under Alternative A. Under Alternative B, the construction and maintenance of livestock range improvements and water developments would maintain healthy forage conditions, prevent overuse of vegetation resources, and ultimately benefit wild horses.

Impacts to wild horses from recreation management would be similar to Alternative A; however, additional management to protect natural resources could support vegetation health and water quality for horses to a greater degree than Alternative A.

Impacts to wild horses from OHV use would be the same as those described under Alternative A. Routes would only be managed as limited to designated road and trails within 3,367,576 acres which could focus vehicle use to only well used routes, preventing further vegetation loss or disruption of animals from vehicle use on ‘existing’ routes.

Management for special designations would protect wild horses to a greater degree than Alternative A. Management aimed at conserving sensitive vegetation communities, and limitations on mineral development and other surface disturbing activities, would benefit wild horses by enhancing overall vegetation conditions and subsequently increasing forage production.

### 4.9.2 Alternative C

Impacts to wild horses would not occur from forests and woodlands, cultural, paleontological, and lands and realty management. Impacts to wild horses from VRM, ROWs, and back country byways would be the same as those described under Alternative A.

Impacts to wild horses from soils, water quality, and watershed management actions would be similar to those described under Alternative A. Less protective management, such as considering the avoidance area around riparian zones and floodplains on a case-by-case basis would provide less protection to vegetation resources from surface disturbing activities and possibly result in degraded forage conditions in these areas when compared to Alternative A.

Under this alternative, lands with wilderness characteristics would not be managed to protect the characteristics, which could allow for surface disturbing or disruptive activities to occur within these areas. This could result in damage or loss of forage, soil compaction, and degradation of water quality. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species that could alter native vegetation, which could degrade forage for wild horses.

Impacts to wild horses from the management of mineral resources would be the same as those described under Alternative A. Under Alternative C, management actions that restrict surface disturbing activities include TLSs (for all HMAs) (1,355,485 acres), CSU stipulations (215,890 acres), and management of areas as NSO (15,542 acres). Closing areas to oil and gas leasing (225,782 acres, a 58% decrease compared to Alternative A), closing areas to mineral material sales (226,421 acres), and proposing areas for withdrawal from locatable mineral entry (234,961 acres) would protect habitat for wild horses to a lesser degree when compared to Alternative A.

Impacts to wild horses from fire and fuels management are similar to Alternative A. In addition, additional fire suppression efforts would possibly maintain existing forage in HMAs that would otherwise burn in wildfires.

Impacts to wild horses from vegetation, wildlife and fisheries, and special status species would be the same as those described under Alternative A. However, benefits from wildlife habitat management would be less extensive than under the other alternatives because of less restrictive actions to protect wildlife habitat. This management could reduce availability of vegetation resources for wild horses when compared to Alternative A.

Impacts to wild horses from livestock grazing management would be the same as those described under Alternative A, except more water development actions would occur, which would increase the availability of water for wild horses.

Impacts from recreation management would be similar to Alternative A; however, increased recreation opportunities could reduce the wild and free-roaming nature of the horses.

The effects on wild horses resulting from the development of ROWs would be similar to those identified for Alternative A. The difference is that 225,784 acres would be excluded from ROW development (200,925-acre decrease), increasing areas of disturbance and vegetation removal that would be vulnerable to the introduction and spread of invasive, non-native plant species, which could alter native vegetation for wild horses.

Increasing open OHV use within approximately 500 additional acres would result in impacts similar to those described under Alternative A, but additional habitat for wild horses could be affected.

Under this alternative, no areas would be designated as ACECs and special management areas would not be retained. Removing the restrictions could increase surface disturbance which could increase the short-term displacement of wild horses and decrease available forage, leading to a greater loss in the wild and free-roaming nature of wild horses than any other alternative.

### 4.9.3 Alternative D

Impacts to wild horses would not occur from forests and woodlands, cultural, paleontological, and lands and realty management.

Impacts on wild horses resulting from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, recreation, and livestock grazing would the same as those presented under Alternative A.

Impacts on wild horses from soils, water quality, and watershed management would be similar to those identified under Alternative A. However, less restrictive management in floodplains and riparian areas would allow increased vegetation removal within these areas, possibly leading to forage reduction for wild horses to a greater degree when compared to Alternative A.

Under Alternative D, lands with wilderness characteristics would be managed for multiple use which could reduce development activities within these areas, but to a far lesser degree than under Alternative B. Surface disturbing activities could result in removal and damage to vegetation resources, which would reduce available forage for wild horses.

Impacts on wild horses from managing fluid mineral leasing and development would be similar to those presented under Alternative A. Under Alternative D, management actions that restrict surface-disturbing activities include TLSs (for all HMAs) (1,911,167 acres), CSU stipulations (1,238,899 acres), and NSO stipulations (2,172 acres). Closing HMA lands to oil and gas leasing (768,989 acres, a 42% increase over Alternative A) would protect larger areas of forage and habitat compared to Alternative A. Reducing areas closed to mineral material sales (362,009 acres) and proposed for withdrawal from locatable mineral entry (482,272 acres) could allow for more vegetation resources to be damaged or removed by fluid mineral leasing activities when compared to Alternative A.

Impacts on wild horses from locatable and saleable mineral development activities would be similar to those presented under Alternative A, except the area in which such mineral development is prohibited across HMAs would be reduced to 61,153 acres for locatable minerals (87% decrease compared with Alternative A) (Table 2-3 in Appendix V, Map 2-4) and to 82,471 acres for saleable minerals (44% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-19). This would increase the area in which vegetation resources could be impacted by locatable and saleable mineral development activities, which would increase the potential for vegetation removal and thereby decrease forage levels for wild horses.

Impacts on wild horses from managing fire and fuels would be the same as those presented under Alternative B.

Impacts on wild horses from managing vegetation resources would be similar to those presented under Alternative A. Under Alternative D, prescribed fire would not be the preferred method for vegetation treatments as it is under Alternative A. However, because all vegetation treatment types are available under Alternative D, the impacts on forage resources would be essentially the same.

Impacts on wild horses resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be greatly increased to 1,178,718 acres (102% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased degradation and removal of forage.

Impacts on wild horses resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be reduced. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table 2-10 in Appendix V, Map 2-29), which would decrease the area in which ROW development activities are prohibited compared to Alternative A.

Impacts on wild horses from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as “limited to existing roads and trails” (3,367,576 acres) would be changed to

"limited to designated roads and trails" and all routes within this area would be designated as open, closed, or limited.

Impacts on wild horses from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a smaller area (246,634 acres of ACEC designations) and thereby offer fewer protections to important values in these areas. This would increase surface disturbing activities and indirectly help to protect and maintain healthy forage resources.

### 4.9.4 Proposed RMP

Impacts on wild horses resulting from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, and livestock grazing would the same as those presented under Alternative A.

Impacts on wild horses from soils, water quality, and watershed management would be similar to those identified under Alternatives A and D. Under the Proposed RMP, requirements for an operator to submit a mitigation plan prior to surface-disturbing activities will provide a greater degree of protection to and mitigate loss of limited reclamation potential soils compared to Alternative A. Like Alternative D, the Proposed RMP would implement some restrictions on the placement of permanent facilities and linear crossings within floodplains, wetlands, riparian areas, and perennial streams but would result in fewer protections than Alternative B, which would prohibit any new surface-disturbing activities in these areas. Under the proposed RMP, the levels of protection for soil and watershed resources would have greater protective effect on wild horses than Alternative A but less than Alternative B.

Under the Proposed RMP, impacts from management of lands with wilderness characteristics would be similar to those described under Alternative D. Similar to Alternative D, under the Proposed RMP, lands with wilderness characteristics would be managed for a variety of uses with only consideration of those characteristics. Such management could allow some development activities within these areas, but to a lesser extent, resulting in fewer impacts on wild horses than those under Alternatives A and C.

Impacts on wild horses from managing fluid mineral leasing and development would be less than those presented under Alternative A and greater than those presented under Alternative B. Under the Proposed RMP, approximately 1,076,039 acres would be closed to fluid mineral leasing, 215,437 acres would be managed with NSO stipulations, 1,116,266 acres would be managed as CSU areas, and 526,067 acres would be managed with TLS. Increased closures and protective measures around fluid mineral leasing would reduce habitat and forage disturbance and disruption of individual wild horses compared to Alternative A.

Impacts on wild horses from locatable and saleable mineral development activities would be less than those presented under Alternative A, due to an overall increase in areas closed or withdrawn from locatable and salable mineral extraction. Under the Proposed RMP, 900,204 acres of locatable minerals would be proposed for withdrawal (62% increase compared with Alternative A) (Table 2-3 in Appendix V, Map 2-5) and 884,906 acres would be closed to development of saleable minerals (6% increase compared with Alternative A) (Table 2-8 in Appendix V, Map 2-20). This would decrease the area in which vegetation resources could be impacted by locatable and saleable mineral development activities, which would minimize the potential for vegetation removal and thereby increase forage levels for wild horses.

Impacts on wild horses from managing fire and fuels would be similar to those presented under Alternative A. However, similar to Alternatives B and D, the Proposed RMP incorporates greater restrictions on the use of fire suppression agents; therefore, it could be more difficult to suppress and control wildfires. These restrictions could both reduce and increase impacts on wild horses, reducing environmental toxins but increasing impacts if fires burn more forage and habitat areas.

Impacts on wild horses from managing vegetation resources would be similar to those presented under Alternative A, and include a combination of management actions from Alternatives B and D. The Proposed RMP would have increased protections for vegetative communities compared to Alternatives A and D, but fewer than Alternative B.

Impacts on wild horses resulting from implementing VRM actions would be similar to those presented under Alternative A, except 718,332 more acres would be designated as VRM Class II under the Proposed RMP. Increased management of lands as VRM Class II would result in impacts similar to those described under Alternatives B and D. As such, impacts on wild horse habitat and forage resources would decrease compared to Alternative A, but would increase compared to Alternative B, which manages the majority of the planning area as VRM Class II.

Impacts on wild horses resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except there would be an increase in ROW exclusion and avoidance areas, which could reduce effects on wild horses. The Proposed RMP designates 921,059 acres as ROW exclusion areas (116% increase compared with Alternative A) and 1,047,929 acres as ROW avoidance areas (42% increase compared with Alternative A) (Table 2-10 in Appendix V, Map 2-30). This would protect more habitat and reduce impacts on wild horses compared to Alternative A by increasing the area in which ROW development activities are prohibited. However, the Proposed RMP would result in more impacts compared to management under Alternative B.

Impacts on wild horses from managing OHV use would be the same as those presented under Alternative D.

Impacts on wild horses from managing special recreation areas would be the same as those presented under Alternative D. The Proposed RMP designates 138,605 acres as special recreation areas, which is similar to Alternative D (135,549 acres) but approximately 54% less than Alternative A.

Impacts on wild horses from managing special designation areas would be similar to those presented under Alternative A, except more land would be managed as ACECs as opposed to Management Areas. Under the Proposed RMP, 935,135 acres as ACEC, 648,665 more acres (226%) than Alternative A. This would increase surface disturbing activities and indirectly help to protect and maintain healthy forage resources.

# 4.10 WILDLAND FIRE ECOLOGY AND MANAGEMENT

## 4.10.1 Alternative B

Impacts to wildland fire ecology and management from the management of air resources, Greater Sage-Grouse, and livestock grazing would be the same as those discussed under Alternative A.

Impacts to wildland fire ecology and management from the management of soil and geologic resources would be similar to those discussed under Alternative A, except that surface disturbing activities in areas that are highly erodible or difficult to reclaim would be managed as NSO for fluid minerals, closed to mineral material sales/disposals, and closed to all solid mineral leasing. This could help to promote healthy, diverse vegetation communities that contain mosaic patterns and natural fuel breaks and generally fuel low-intensity fires.

Impacts to wildland fire ecology and management from the management of water resources would be similar to those discussed under Alternative A, except that greater surface disturbing protections would be in place. These restrictions could help to promote healthy, diverse vegetation communities that contain mosaic patterns and natural fuel breaks and generally fuel low-intensity fires; which could help to reduce fire frequency and intensity. Use of fire suppression chemicals (including foaming agents and surfactants) would be prohibited within 1,320 feet (¼ mile) of surface water. Fire control/suppression could be impacted by those restrictions.

Managing all lands identified as having wilderness characteristics specifically to preserve those characteristics would provide additional restrictions on wildland fire management in the planning area. Management actions to limit surface disturbing activities, surface occupancy, and degradation of viewshed or setting impacts, and help preserve wilderness characteristics would restrict surface disturbing activities and transportation routes. These management actions would help to promote healthy, diverse vegetation communities that contain mosaic patterns and natural fuel breaks and generally fuel low-intensity fires; which helps to reduce fire frequency and intensity.

Under this alternative, 2,186,218 acres in the planning area are closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (1,646,197 more acres than Alternative A); 1,993,908 acres are proposed for withdrawal from locatable mineral entry (1,437,350 more acres than Alternative A); and 2,581,741 acres are closed to saleable mineral development and/or disposals (1,748,022 more acres than Alternative A) (Tables 2-3, 2-4, and 2-8 in Appendix V, and Maps 2-2, 2-7, and 2-17). Compared to Alternative A, more acres would be unavailable to the exploration, leasing, and/or development of fluid minerals, unavailable for saleable mineral disposal, and withdrawn from locatable mineral entry. This management would reduce surface disturbing activities and occupancy which help to promote healthy, diverse vegetation communities that contain mosaic patterns and natural fuel breaks.

Wildland fire and ecology management actions would be similar to Alternative A, except more emphasis would be placed on allowing wildfire to function as a natural management tool for improving diversity of plant species and age classes. Wildfire response would vary from full suppression in areas where fire is undesirable, to monitoring fire behavior in areas where fire can be used as a management tool in achieving resource objectives. The use of heavy equipment would be restricted to uses that are necessary to protect life or property. The prohibitions on the use of chemical fire suppression agents within ¼ mile of rock art sites, lands with special designations, and where it could adversely affect other resources is more restrictive than Alternative A. These restrictions could limit certain fire control or suppression techniques.

Similar to Alternative A, emphasis would be on forest and woodland management that improves vegetative health and benefits other resources, except that the use of natural processes like decay, succession, and wildfire would be allowed and utilized to the greatest extent possible. This priority directly impacts the ability to utilize prescribed burns and fire control techniques to accomplish resource management objectives and/or improve habitats. Managing wildfire to most benefit the forest and woodland ecology of the planning area requires actions to limit high-intensity fires that can directly damage or destroy commercially valuable timber stands, other non-commercial forest products, wildlife habitats, recreation areas, and manmade structures and development. Clear cut harvests create fire breaks and fire equipment access avenues that could be effective in preventing the spread of wildfires; prohibiting them under this alternative would reduce that benefit to fire control/suppression efforts. Limiting logging operations on slopes steeper than 25% (compared to 45%, under Alternative A) would reduce lands where commercial harvests could be conducted, thereby increasing fuel loading that support high-intensity fires.

Impacts to wildland fire ecology and management from the management of invasive species and pests is similar to Alternative A. Additional BMPs would be applied to protect vegetation communities from threats from noxious weed infestations. This alternative prohibit aerial application of chemicals within 2,640 feet (½ mile) of wetlands, riparian areas, aquatic habitats, and special status plants; and prohibiting vehicle and hand application of chemicals within 1,320 feet (¼ mile) would impact applications of fire retardants and suppression chemicals. The management could make fire suppression efforts more difficult or expensive due to the inability to use retardant or suppression chemicals.

Impacts to wildland fire ecology and management from the management of fish and wildlife resources and special status species are similar to Alternative A. Surface use restrictions would be utilized to accomplish no-net-loss of sensitive terrestrial and aquatic wildlife habitats. NSO and TLS for fluid minerals, closures to solid mineral leasing and mineral material sales/disposals, ROW avoidance or exclusions, and vehicle access and travel limitations

would also be applied at various sites to reduce surface disturbances and occupancy. These restrictions would help to promote healthy vegetation communities and reduce wildfire occurrence and intensity. Prohibiting the use of fire suppression chemicals within 1,320 feet (¼ mile) of special status plant species populations would limit fire control/suppression actions.

Impacts to wildland fire ecology and management from the management of cultural and paleontological resources would be similar to Alternative A, except this alternative applies more protective measures such as NSOs and CSUs for fluid minerals; closures to mineral material sales/disposal, mineral location, and all solid mineral leasing; and ROW exclusions. These restrictions would help to reduce wildfire occurrence and intensity and the resultant need for fire suppression activities.

VRM impacts would be similar to Alternative A, except that approximately 225,785 acres would be classified as VRM Class I (68 more acres than Alternative A), 2,148,902 acres as VRM Class II (1,566,230 more acres than Alternative A), 666,522 acres as VRM Class III (51,030 more acres than Alternative A) and 563,754 acres as VRM Class IV (1,616,669 fewer acres than Alternative A). This would likely lead to less surface disturbance and thereby a reduction in impacts to fire management.

Land resource management actions related to the real estate transactions of acquisition, disposal, and/or pursuing withdrawals would have similar impacts to wildland fire ecology and management as Alternative A. Impacts on wildland fire ecology from the management of ROWs and transportation corridors would be similar to Alternative A, except no new corridors would be designated. In total, 2,480,876 acres would be designated as exclusion for ROWs (2,054,167 more than Alternative A) and 133,903 acres would be designated as ROW avoidance areas (602,235 fewer than Alternative A). This would likely lead to less surface disturbance and thereby a reduction in impacts to fire management. Impacts to wildland fire ecology from the management of renewable energy projects would be similar to Alternative A, except an increase in ROW exclusion areas would result in fewer renewable energy projects and thereby fewer related impacts on fire management.

Impacts to wildland fire ecology from the management of recreation would be similar to Alternative A. The Continental Divide National Scenic Trail, Continental Divide Snowmobile Trail, the Green River, Killpecker Sand Dunes, Oregon and Mormon Pioneer National Historic Trails, and the Wind River Front SRMAs would not be retained. Not retaining the SRMAs, releasing lands from an emphasis on recreation resource development, and applying a greater zone of restriction against surface disturbing activities and visual disturbances on land surrounding developed recreation sites, certain designated trails, and the Wind River Front SRMA could potentially reduce human and vehicle access to those areas; thereby decreasing potential ignition sources (and wildfire occurrence) and the need for fire control/suppression actions. Not retaining SRMAs could allow more opportunities to utilize fire fuel treatments to manipulate vegetation in those areas. Greater buffer zones against surface and visual disturbances could limit fuel treatments and suppression techniques.

The actions to manage OHV travel in the planning area would be similar to Alternative A, except OHV use is limited to the roads and trails designated for OHV use (these designations are applied to 3,367,576 acres, which is 2,398,617 more acres than Alternative A). Limiting new OHV areas could decrease the extent of surface disturbances that could result in damage or removal of vegetation and thereby reduce related impacts to wildland fire.

Impacts to wildland fire ecology from the management to protect congressionally designated and/or eligible trails, and NHTs are similar to Alternative A, except there are greater protective measures proposed such as larger buffer zones (“setbacks”) and specific closures and restrictions. The greater restrictions on surface disturbing activities, vehicle travel, and stricter VRM classifications under this Alternative could potentially place limitations on wildland fire fuel treatments and fire control/suppression actions. Any land protection measures or reduction of surface disturbances would prevent or reduce vegetation loss or damage, and could reduce the introduction and

spread of invasive, non-native plant species. Reducing human and vehicle access could also reduce ignition sources in the area, which would decrease the probability of wildfire occurrence.

Impacts to wildland fire ecology from the management of WSAs and WSRs would be similar to Alternative A, but there would be a greater emphasis on protecting wilderness setting and viewshed values. The greater restrictions on surface disturbing activities, stricter VRM classifications, and restricted vehicle travel under this alternative could place limitations on the use of prescribed fire for fuel treatments and fire control or suppression actions. This would also reduce the potential for degraded landscapes that increase fire occurrence and intensity.

Impacts to wildland fire ecology from the management of ACECs would be similar to those described under Alternative A, except 1,605,660 acres (1,319,210 more than Alternative A) would be designated as ACECs. This alternative emphasizes managing important habitats for no-net-loss of habitat, retaining habitat health and function by applying surface use restrictions, and addressing human access and activities that could degrade or destroy resources. Additional stipulations to individual ACECs (e.g., eliminating ROW windows, excluding ROWs, and limiting road development) would provide greater restrictions on surface disturbances. The greater restrictions on surface disturbing activities, additional ACEC stipulations, and stricter VRM classifications under this alternative could potentially place limitations on fuel treatments using prescribed fire and fire control/suppression actions. This would also reduce the potential for degraded landscapes that increase fire occurrence and intensity.

## 4.10.2 Alternative C

Impacts to wildland fire ecology and management from the management of air resources, soil resources, riparian and wetland resources would be the same as those presented under Alternative A.

Impacts to wildland fire ecology from the management of water resources would be similar to Alternative A, except surface disturbing activities occurring in or near the 100-year flood plains, wetlands, riparian areas, and gorges would each be considered on a case-by-case basis (rather than be protected by a full closure stipulation). The less restrictive stipulations under this alternative could increase the allowance of surface disturbances, occupancy, human presence, and vehicle access. Those activities can contribute to soil and vegetation damage that can lead to more fire-prone habitat and increase wildfire ignition sources. The use of fire suppression chemicals, including foaming agents and surfactants, would be prohibited within 100 feet of surface water (as compared to 1,320 feet under Alternative A). This smaller buffer distance would allow greater use of this fire control/suppression technique and the improved ability to suppress wildfires.

The management measures proposed under Alternative B to protect lands with wilderness characteristics would not be implemented under this alternative. The impacts of not managing to protect wilderness characteristics could allow for surface disturbing activities to occur within these areas which could result in increased ignition sources and damage to vegetation, thereby increasing the potential for wildfire occurrence and intensity. Fewer prohibitions could also improve the ability and increase the flexibility to utilize fuel treatments and fire control/suppression techniques.

Under this alternative, 225,782 acres in the planning area are closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (314,239 fewer acres than under Alternative A, Table 2-4 in Appendix V and Map 2-8). Approximately 234,961 acres are proposed for withdrawal from locatable mineral entry (321,597 fewer than Alternative A) and 226,421 acres are unavailable for saleable mineral development and/or disposals (607,298 fewer acres than Alternative A) (Tables 2-3 and 2-8 in Appendix V, and Maps 2-3 and 2-17). Impacts to wildland fire ecology and management would be similar to those described under Alternative A, except fewer acres would be closed to the exploration, leasing, and/or development of fluid minerals and fewer acres would be available for development of locatable and salable minerals. More land available for mineral development allows more surface disturbing activities and human access, which would increase the potential for wildfire occurrence

and intensity. In addition, the ability and flexibility to utilize fuel treatments and fire control/suppression techniques could be greater where there are fewer restrictions.

The management of wildland fire would be similar to Alternative A, except that full wildfire suppression would be used on all unplanned ignitions to limit the total number of acres burned. Planned ignitions would be managed the same as Alternative B to maintain or improve biological diversity and the overall health of the public lands. The use of heavy equipment could be utilized outside of a 100-foot buffer zone around special management areas; and chemical fire suppression agents could be used within 300 feet of rock art site and special designations. These are both less restrictive than Alternative A. These allowances could allow greater use of fire control or suppression techniques, which would reduce the threat of large wildfires. However, full suppression of wildfire in the long-term disrupts the natural fire regime and can eventually result in in larger, more intense and destructive wildfires.

Compared to Alternative A, forest and woodland management would emphasize actions that maintain and enhance forest and woodland health across the landscape to provide forest and woodland products to the public. This could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase harvest volumes. Clear-cuts of any size would be allowed (compared to a 25-acre size limit for individual clear-cut units in Alternative A). Any slope greater than 45% could be logged with cable systems or by helicopter. Pre-commercial thinning would also be allowed to reduce overstocked areas and decrease fire loads. All of these types of harvests would reduce fuel loads, which could decrease the intensity and size of wildfires, allow fires to be more easily controlled, and thereby reduce fire-fighting costs and efforts.

Impacts to wildland fire ecology from the management of invasive species and pests would be similar to those described under Alternative A. Allowing chemical treatments would result in an additional method that supports fire fuel reduction. Prohibiting aerial application of chemicals within 100 feet (compared to 2,640 feet under Alternative B) of wetlands, riparian areas, aquatic habitats, and special status plants; and prohibiting vehicle and hand application of chemicals within 25 feet (by vehicle) and 10 feet (by hand) as compared to 1,320 feet under Alternative B, would allow the application of fire retardants and suppression chemicals. This smaller buffer distance would allow greater use of this fire control/suppression technique and the improved ability to suppress wildfires.

Impacts to wildland fire ecology and management from the management of fish and wildlife resources and special status species is similar to Alternative A, except that smaller surface disturbing and/or surface use distance buffer zones would be applied around developments and operations. Allowing project development and greater surface disturbances could result in damage or removal of plant communities. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel high-intensity fires. Allowing these activities could also increase ignition sources in the area, which would increase the probability of wildfire occurrence. Avoiding surface disturbance near special status plants could protect vegetation in these areas and help to promote healthy, diverse vegetation communities, which would reduce the potential for wildfire occurrence and intensity.

Impacts to wildland fire ecology and management from the management of cultural and paleontological resources is similar to Alternative A, except that smaller surface disturbing/setting buffer distances would be applied around known cultural and paleontological sites. Smaller sized buffer distances under this alternative could open areas in the planning area to more surface disturbing activities and human access. Surface disturbing activities could result in damage or removal of vegetation and an increased potential for wildfire occurrence and intensity. The ability and flexibility to utilize fuel treatments and fire control/suppression techniques could be greater where there are fewer restrictions. The use of fire retardant chemicals would be allowed within 300 feet of the rock art sites as compared to ¼ mile of them under Alternative B; allowing greater use of fire control or suppression techniques.

Impacts to wildland fire ecology and management from VRM would be similar to Alternative A, except that approximately 226,629 acres would be classified as VRM Class I (912 more than Alternative A), 607,899 acres

VRM Class II (25,229 more than Alternative A), 395,683 acres VRM Class III (219,809 fewer than Alternative A), and 2,374,706 acres as VRM Class IV (194,283 more than Alternative A). More acreage managed under VRM Class I and II could potentially limit the ability and flexibility to utilize fuel treatments and fire control/suppression techniques. More acres under VRM Class IV, and a smaller VRM buffer distances along the Continental Divide National Scenic Trail would place fewer overall prohibitions on surface disturbing activities. The management could open areas in the planning area to more surface disturbing activities and human access, thereby increasing the potential for wildfire occurrence and intensity.

Impacts to wildland fire ecology and management from management of lands and realty would be similar to those described under Alternative A, except acres of ROW exclusion and avoidance areas would be fewer (225,784 acres excluded, and 31,018 acres avoided; 200,925 and 705,120 fewer acres than Alternative A, respectively). Fewer exclusions and avoidance areas could open lands to more surface disturbing activities and human access. Surface disturbing activities could result in damage or removal of vegetation. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel high-intensity fires. Human presence and construction, operations, and vehicular activities would increase potential ignition sources (and wildfire occurrence) in the planning area; thereby increasing the need for fire suppression actions.

Impacts to wildland fire ecology and management from ROWs and transportation corridors would be similar to those described under Alternative A, except preferred energy corridors would be retained; new corridors could be designated; and there would be no preferred location of ROWs within ROW concentration areas and corridors. Retaining and/or designating new corridors, reducing restrictions on the placement of ROWs, and fewer ROW exclusion and avoidance areas, could open areas in the planning area to more surface disturbing activities and human access. Surface disturbing activities could result in damage or removal of vegetation. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel high-intensity fires. Human presence, construction, and vehicular activities would increase potential ignition sources (and wildfire occurrence) in the planning area; thereby increasing the need for fire suppression actions. ROW corridors could provide fire breaks that could aid in fire control/suppression efforts.

Impacts to wildland fire ecology and management from the management to designate and manage travel would be similar to Alternative A, except five back country byways would not be retained (Tri-Territory Loop, the Lander Road, Red Desert, Fort LaClede Loop, and the Firehole-Little Mountain Loop), and additional travel routes that meet the criteria for designation as back country byways would not be considered. The actions of not retaining existing back country byways or designating new ones under this alternative would reduce public visitation to these areas, which would decrease potential ignition sources; thereby decreasing the probability of wildfire occurrences.

Impacts to wildland fire ecology and management from livestock grazing management would have similar impacts as those described under Alternative A except that more planning area acreage would be open to livestock grazing. Properly managed grazing can serve as a vegetation treatment that supports soil and vegetation health, and the reduction of hazardous fuel loads. Livestock grazing that is not managed correctly can result in excessive vegetation loss and surface disturbances, and cause the introduction or spread of invasive, non-native plant species. Those conditions could result in the eventual development of vegetation communities that could load fuels and increase potentials for wildfire occurrences.

Impacts to wildland fire ecology and management from recreation management would be similar to Alternative A, except that undeveloped recreation would be managed with a priority consideration for recreation use. Allowing and encouraging recreational use attracts increasing numbers of visitors, which increases the probability of unintentional ignitions and the need for wildfire suppression activities. Surface disturbances from recreational activities could result in damage or removal of vegetation that can result in conditions that favor ignitions and fuel

wildfires. Overall, the fewer restrictions under this alternative, could open areas in the planning area to more surface disturbing activities and human access and thereby increase the potential for wildland fire occurrence and intensity.

Impacts on wildland fire ecology and management from OHV travel would be similar to Alternative A, except that this alternative allows cross country OHV use in 13,332 acres (501 more acres than Alternative A). OHV use could increase the extent of surface disturbances that could result in damage or removal of vegetation. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel high-intensity fires.

Impacts to wildland fire ecology and management from management to protect congressionally designated and/or eligible trails, and NHTs are similar to Alternative A, except that fewer restrictions on surface disturbing activities and vehicle travel could place fewer limitations on fuel treatments and fire control/suppression actions. Any land management that allow surface disturbance could result in increased vegetation loss or damage and resultant increases in the potential for wildfire occurrence and intensity. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel wildfires. Increasing human and vehicle access could also increase ignition sources in the area, which would increase the probability of wildfire occurrence.

Impacts to wildland fire ecology and management from the management of WSAs and WSRs would be similar to Alternative A, but there would be a greater emphasis on managing designated areas for multiple use. Under this alternative, the Sweetwater River designation would not be retained, so no WSR management actions would be developed or applied. No management for WSRs could potentially increase access, travel, and surface disturbances to these sites, which could increase potentials for wildfire occurrence.

Under this alternative, no ACECs would be retained (as compared to all being retained under Alternative A). Removing all the ACEC-specific land use and relaxing surface disturbing restrictions under this alternative could result in increased vegetation loss or damage. Areas of disturbance would be vulnerable to the introduction and spread of invasive, non-native plant species which could alter native vegetation, creating vegetation communities that fuel wildfires. Increased human and vehicle access could also increase ignition sources in the area, which would increase the probability of wildfire occurrence.

### 4.10.3 Alternative D

Impacts to wildland fire ecology and management from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, and livestock grazing would be the same as those presented under Alternative A. The impacts on wildland fire ecology and management from managing forests and woodlands would be the same as those presented under Alternative B.

Impacts to wildland fire management from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils (those with limited reclamation potential as per the NRCS soil rating) would be designated avoidance areas for surface disturbing activities, which would reduce the extent of surface disturbing activities in these areas and thereby reduce the number of ignition sources (e.g., people, vehicles) and consequently the probability of wildfire occurrence. Heavy equipment use is allowable only after the AO has determined that such surface disturbance is necessary. Reductions in surface disturbing activities would also reduce the intensity and extent of vegetation removal and degradation, which would reduce the potential for wildfire occurrence and intensity.

Under Alternative D, lands with wilderness characteristics would be managed for multiple use, which could reduce development activities within these areas, but to a far lesser degree than under Alternative B. These areas would not be closed to mineral development as they would be under Alternative B, which would increase surface

disturbing activities within the nine lands with wilderness characteristics. Such activities could increase the number of ignition sources (e.g., people, vehicles) and consequently the probability of wildfire occurrence.

Impacts on wildland fire ecology and management from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except stipulations that prohibit fluid mineral leasing or prohibit surface occupancy would be applied to a smaller area. Under Alternative D, 768,989 acres would be closed to fluid mineral leasing (228,968 acres more than Alternative A). These stipulations would decrease surface disturbance from fluid mineral development and thereby decrease related impacts on wildfire across a larger area compared with Alternative A.

Impacts on wildland fire ecology and management from locatable mineral development activities would be similar to those presented under Alternative A, except the area in which such mineral development is prohibited would be increased to 482,272 acres (13% decrease compared with Alternative A) (Table 2-3 in Appendix V, Map 2-4). This would greatly decrease the area in which vegetation could be impacted by locatable mineral development activities, which would decrease the number of potential ignition sources and degradation of vegetation communities and thereby make them less susceptible to fire.

Impacts on wildland fire ecology and management from saleable mineral development activities would be similar to those presented under Alternative A, except the area in which such mineral development is prohibited would be decreased to 362,009 acres (57% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-19). This would greatly increase the area in which vegetation could be impacted by saleable mineral development activities, which would increase the number of potential ignition sources and degradation of vegetation communities and thereby make them more susceptible to fire.

Impacts on wildland fire ecology and management from implementing actions designed to manage fire within the planning area would be similar to those presented under Alternative A, except greater restrictions on the use of fire suppression agents could make it more difficult to suppress and control wildfires. This could result in more intense wildfires that burn more acres and cause extreme damage to vegetation resources, which in turn could lead to further degradation of vegetation resources. Under this alternative, the use of aerial and ground fire suppression agents would be prohibited within ¼ mile and 300 feet, respectively, of rock art sites, special status species, surface water sources, and riparian areas. Compared with Alternative A, which prohibits such use only directly on rock art sites, this would create a greater degree of impact on wildfire management.

Impacts on wildland fire ecology and management from managing vegetation resources would be similar to those presented under Alternative A, except the use of prescribed fire to treat vegetation communities would be reduced given that prescribed fire would not the preferred method for such treatments. However, because all vegetation treatment types are available under Alternative D, the impacts on the occurrence and intensity of wildfire would be the same as those presented under Alternative A.

Impacts on wildland fire ecology and management resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be greatly increased to 1,178,718 acres (102% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased vegetation removal and degradation. Increasing the area managed as VRM Class II would increase the area in which development is restricted in order to be consistent with VRM Class II objectives. This, in turn, could reduce the overall level and intensity of development and help to reduce wildfire occurrence and intensity.

Impacts on wildland fire ecology and management resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be reduced. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table 2-10 in Appendix V, Map 2-29), which would greatly decrease the area in which ROW

development activities are prohibited. This would cause impacts on wildland fire from ROW development in these areas and could lead to an overall increase of such development across the planning area, thereby helping to maintain healthy vegetative communities that are less susceptible to fire.

Impacts on wildland fire ecology and management from managing recreation resources would be similar to those presented under Alternative A, except additional surface use restrictions would be placed on many of the SRMAs. Mineral and ROW development activities would be limited or precluded in the Killpecker Sand Dunes, Oregon and Mormon Pioneer National Historic Trail, and Little Mountain, SRMAs, which would reduce the intensity and extent of surface disturbance in these areas and thereby reduce wildfire intensity and the probability of fire occurrence.

Impacts on wildland fire ecology and management from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as "limited to existing roads and trails" would be changed to "limited to designated roads and trails" (3,367,576 acres) and all routes within this area would be designated as open, closed or limited.

Impacts on wildland fire ecology and management from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a larger area and thereby offer greater protections to important historic, cultural, wildlife, and scenic values in these areas. This, in turn, would reduce surface disturbing activities and indirectly help to protect and maintain healthy vegetative communities, which would reduce the potential wildfire occurrence and intensity. The acres designated as ACECs would decrease to 246,634 acres (39,816 acres less than Alternative A).

## 4.10.4 Proposed RMP

Impacts on wildland fire ecology and management from implementing management actions for air quality, water resources, fish and wildlife, special status species, cultural resources, paleontological resources, and livestock grazing would be the same as those presented under Alternative A. The impacts on wildland fire ecology and management from managing forests and woodlands would be the same as those presented under Alternative B.

Impacts on wildland fire ecology and management from implementing actions designed to manage fire within the planning area would be similar to those presented under Alternative A. However, as under Alternatives B and D, greater restrictions on the use of fire suppression agents could make it more difficult to suppress and control wildfires.

Impacts on wildland fire management from implementing soil management actions would be similar to those identified under Alternative A, except restrictions on surface disturbing activities in areas of limited reclamation potential and related beneficial effects to vegetation health and retention would be the same as those proposed under Alternative D.

Impacts from managing lands with wilderness characteristics for multiple use would increase surface disturbing activities within these areas and increase the number of ignition sources and potential for wildfire occurrence similar to Alternative D, and to a greater degree than Alternative B (which includes resource use restrictions to preserve wilderness character in these areas).

Impacts on wildland fire ecology and management from managing fluid mineral leasing and development, locatable mineral development, and saleable mineral disposals would be similar to those discussed under Alternative A, except stipulations and prohibitions under the Proposed RMP could change the location and size of potential development. Under the Proposed RMP, 1,076,039 acres would be closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (536,018 more acres than under Alternative A) (Table 2-4 in Appendix V). Approximately 900,204 acres are proposed for withdrawal from locatable mineral entry

(343,646 more acres than under Alternative A) and 884,906 acres are unavailable for saleable mineral development and/or disposals (51,372 more acres than Alternative A) (Tables 2-3 and 2-8 in Appendix V). Generally, the Proposed RMP would manage fewer areas as available for mineral development than Alternative A, reducing the number of potential ignition sources and degradation of vegetation communities that could make them more susceptible to fire to greater extent than under that alternative. Conversely, the Proposed RMP would restrict mineral development far less than under Alternative B, providing a greater potential for new ignition sources and vegetation degradation compared to that alternative.

Impacts on wildland fire ecology and management from the management of water resources, and special status species would be similar to those discussed under Alternative B, except that greater surface-disturbing protections would be in place. Under the Proposed RMP, it would prohibit the use of fire suppression chemicals, including foaming agents and surfactants, within 300 feet.

Impacts on wildland fire ecology and management from the management of special designations, cultural resources, paleontological resources, soil, wildlife and fisheries, and rock art sites would be similar to those discussed under Alternative B, except that greater surface-disturbing protections would be in place. Under the Proposed RMP, it would prohibit the use of fire suppression chemicals, including foaming agents and surfactants, within 300 feet.

Impacts on wildland fire ecology and management from management of vegetation resources would be similar to those presented under Alternative A, except that the use of prescribed fire to treat vegetation communities and related effects would be the same as under Alternative D. As noted under Alternative D, because all vegetation treatment types are available under the Proposed RMP, the impacts on the occurrence and intensity of wildfire would be the same as those presented under Alternative A.

Impacts on wildland fire ecology and management resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be greatly increased to 1,301,004 acres (123% increase compared with Alternative A) (Table 2-9 in Appendix V), resulting in decreased potential for vegetation removal and degradation. Increasing the area managed as VRM Class II would increase the area in which development is restricted in order to be consistent with VRM Class II objectives. This, in turn, could reduce the overall level and intensity of development and help to reduce wildfire occurrence and intensity, which is consistent with impacts under Alternative D.

Impacts on wildland fire ecology and management resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be reduced due to the larger area of exclusion areas under the Proposed RMP. In total, 921,059 acres would be designated as exclusion for ROWs (494,350 more acres than under Alternative A) and 1,047,929 acres would be designated as ROW avoidance areas (311,791 more acres than under Alternative A). Similar to Alternative B, additional avoidance areas could decrease ROW and renewable energy development activities, and therefore help maintain healthy vegetative communities that are less susceptible to fire and reduce potential new ignition sources to a greater degree than under Alternative A.

Impacts on wildland fire ecology and management from managing recreation resources would be similar to those presented under Alternative A, except additional surface use restrictions would be placed on many of the SRMAs similar to under Alternative D. As described under Alternative D, additional surface use restrictions would reduce the intensity and extent of surface disturbance in these areas and thereby reduce wildfire intensity and the probability of fire occurrence.

Impacts on wildland fire ecology and management from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as “limited to existing roads and trails” would be changed to “limited to designated roads and trails” (3,367,223 acres), similar to the management actions under

Alternative D. If road and trail designation removes or limits access on certain routes during travel management planning, the potential for ignition sources from human use of those routes could be reduced compared to Alternative A.

Impacts on wildland fire ecology and management from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a larger area that would include use restrictions to protect important historic, cultural, wildlife, and scenic values. This, in turn, would reduce surface disturbing activities and indirectly help to protect and maintain healthy vegetative communities, which would reduce the potential wildfire occurrence and intensity. The acres designated as ACECs would increase to 935,135 acres (648,665 acres more than Alternative A), which would constitute more acreage than ACECs designated under Alternative D, but substantially less acreage than the ACECs designated under Alternative B.

# 4.11 ENERGY AND MINERALS

## 4.11.1 Alternative B

Under this alternative, 1,993,908 acres would be pursued for withdrawal from mineral location (Table 2-3 in Appendix V, Map 2-2). This represents a 258% increase in acres compared to Alternative A, and therefore impacts to locatable minerals would be increased compared to Alternative A, as fewer areas would be available for such mineral development.

Under Alternative B, it is projected that a total of 1,292 federal wells would be drilled during the next 20 years (73% decrease compared to Alternative A). The decrease in the number of wells drilled is due to an increase in areas that are closed to fluid mineral leasing and managed with NSO stipulations. Approximately 2,186,218 acres would be closed to new fluid mineral leasing (305% increase compared with Alternative A) and 813,354 acres would be managed as NSO areas (413% increase compared with Alternative A) (Table 2-4 in Appendix V, Map 2-7). Although fewer acres would be managed with CSU and seasonal restrictions, there would be far more acres managed as NSO or closed to new fluid mineral leasing, compared to Alternative A, which would result in greater impacts to fluid mineral leasing exploration, development, and operations in these areas.

Impacts to oil shale leasing and development would be similar to those presented under Alternative A, except the areas closed to oil shale leasing would increase to 2,122,282 acres (192% increase compared to Alternative A) (Table 2-7 in Appendix V, Map 2-12), which would preclude oil shale development in these areas and result in significantly less production from activities within the planning area.

Under Alternative B, 3,535,546 acres would be closed to coal exploration and development activities (628% increase compared to Alternative A) (Table 2-7 in Appendix V, Map 2-12), including areas outside the coal occurrence and development potential area.

Impacts to trona development would be similar to those described under Alternative A, except more areas would be closed to trona leasing and development. Under Alternative B, 49,224 acres would be closed to trona leasing and development within the KSLA (Table 2-7 in Appendix V, Map 2-12), which represents a 101% increase compared to Alternative A. This would increase the level of impacts to trona development and could result in further reduction of trona extracted via mining activities.

Under Alternative B, 2,581,741 acres would be closed to mineral material sales/disposals (Table 2-8 in Appendix V, Map 2-17). This would be an approximately 210% increase in acreage compared to Alternative A. Additionally, no new community pits, localized common use areas, or new mineral material sites would be established.

These management actions would cause greater impacts to saleable minerals by further precluding saleable mineral development and exploration, compared to Alternative A.

Approximately 2,480,876 acres would be designated as ROW exclusion areas, an approximately 481% increase in acres compared to Alternative A, and ROW avoidance acres would decrease by approximately 82%, to 133,903 acres (Table 2-10 in Appendix V, Map 2-27). Although ROW avoidance acres would decrease, the larger increase in ROW exclusion areas would result in greater impacts to mineral resources, by likely limiting future access to mineral exploration and development sites and could restrict the placement of facilities associated with mineral exploration, development, and operations, including pipelines, transmission lines, communication facilities, and roads.

Impacts to mineral development activities resulting from management of visual resources would be similar to those described under Alternative A, except more acres would be managed as VRM Class I, II, and III and fewer acres would be managed as VRM Class IV. Under Alternative B, 225,785 acres would be managed as VRM Class I (0.03% increase compared to Alternative A), 2,148,902 acres would be managed as VRM Class II (269% increase compared to Alternative A), 666,522 acres would be managed as VRM Class III (8% increase compared to Alternative A), and 563,754 acres would be managed as VRM Class IV (74% decrease compared to Alternative A) (Table 2-9 in Appendix V, Map 2-22). The large increase in VRM Class II acreage and large decrease in VRM Class IV acreage would greatly increase the impacts of visual resource management on mineral development activities.

## 4.11.2 Alternative C

Under this alternative, 234,961 acres would be pursued for withdrawal from mineral location (Table 2-3 in Appendix V, Map 2-3). Compared to Alternative A, impacts on mineral location would be reduced, as approximately 60% fewer acres would be pursued for withdrawal. Locatable mineral development activities would be precluded, sites would be relocated, and additional development costs could be incurred, but to a lesser degree than under Alternative A.

Under Alternative C, it is projected that a total of 4,919 federal fluid mineral wells would be drilled during the next 20 years (3% increase compared with Alternative A) (BLM RFD 2016). The increase in the number of wells drilled is due to a decrease in areas closed to fluid mineral development and managed with NSO stipulations. Approximately 225,782 acres would be closed to new fluid mineral leasing (58% decrease compared with Alternative A) and 15,542 acres would be managed as NSO areas (90% decrease compared to Alternative A) (Table 2-4 in Appendix V, Map 2-8). Although slightly more acres would have seasonal restrictions, there would be fewer acres designated as closed, NSO, and CSU, which would reduce impacts to fluid mineral leasing compared to Alternative A.

Impacts to oil shale leasing and development would be less than those discussed under Alternative A. The areas closed to oil shale leasing would decrease to 225,965 acres (Table 2-7 in Appendix V, Map 2-13), which represents a 70% decrease in such closures.

Impacts to coal leasing and development would be similar to those presented under Alternative A, except 226,219 acres would be closed to coal exploration and development activities (64% decrease compared to Alternative A) (Table 2-7 in Appendix V, Map 2-13). This would increase the area in which coal leasing is allowed and thereby could result in increased coal development and production and reduce the need to relocate facilities.

Impacts to trona development would be similar to those described under Alternative A, except fewer areas would be closed to trona leasing and development. Under Alternative C, 21,412 acres would be closed to trona leasing and development within the KSLA (Table 2-7 in Appendix V, Map 2-13), which represents a 12% decrease compared to Alternative A. This would reduce related impacts to trona mining activities, as more areas would be available for such mining.

Impacts to saleable mineral development would be similar to those presented under Alternative A, except the areas closed to mineral material sales would decrease to 226,421 acres (72% decrease compared with Alternative A). This would increase the area in which saleable mineral development is allowed and thereby could result in increased production of such mineral resources.

Under this alternative, ROW exclusion areas would decrease by approximately 47% compared to Alternative A, to 225,784 acres (Table 2-10 in Appendix V, Map 2-28). ROW avoidance areas would also decrease by approximately 96%, to 31,018 acres. These designations would likely reduce potential impacts to mineral resources by allowing increased future access to mineral exploration and development sites, and placement of facilities associated with mineral exploration and development, including pipelines, transmission lines, communication facilities, and roads.

Approximately 226,629 acres would be managed as VRM Class I, an increase of 912 acres (Table 2-9 in Appendix V, Map 2-23). Approximately 607,899 acres would be managed as VRM Class II, which represents an increase of 25,227 acres compared with Alternative A. This increase in VRM Class I and II acreage would be approximately 3%, which could result in greater impacts to mineral resources, compared to Alternative A, and could increase the cost of energy, renewable energy, and mineral development proposed in these areas. In areas with high mineral potential and topographical challenges, energy and mineral resources could be challenging or infeasible to recover and meet VRM Class II objectives. Under Alternative C, 395,683 acres would be managed as VRM Class III, a decrease of 219,809 acres compared to Alternative A. 2,374,706 acres would be managed as VRM Class IV, an increase of 194,283 acres compared to Alternative A; this would likely result in reduced impacts to mineral resources in these areas.

### 4.11.3 Alternative D

Under this alternative, 482,272 acres would be pursued for withdrawal from mineral location (Table 2-3 in Appendix V, Map 2-4). Compared to Alternative A, impacts on mineral location would be decreased, as approximately 40% fewer acres would be pursued for withdrawal.

Under Alternative D, it is projected that a total of 4,737 federal fluid mineral wells would be drilled during the next 20 years (1% decrease compared to Alternative A). The decrease in the number of wells drilled is due to an increase in areas that are closed to fluid mineral leasing. Approximately 768,989 acres would be closed to new fluid mineral leasing (42% increase compared with Alternative A) and 2,172 acres would be managed with NSO stipulations (99% decrease compared with Alternative A) (Table 2-4 in Appendix V; Map 2-9). Although more acres would be managed with seasonal restrictions and CSU stipulations, there would be significantly more acres managed as closed and with NSO stipulations compared to Alternative A, which would result in a reduced level of impact to fluid mineral leasing and development.

Impacts to oil shale leasing and development would be similar to those presented under Alternative A, except the areas closed to oil shale leasing would increase to 1,557,520 acres (114% increase compared to Alternative A) (Table 2-7 in Appendix V, Map 2-14), which would increase impacts on oil shale development and could result in decreased production of oil from shale resources.

Under Alternative D, 610,342 acres would be closed to coal exploration and development activities (26% increase compared to Alternative A) (Table 2-7 in Appendix V, Map 2-14).

Impacts to trona development would be the same as those described under Alternative A. Under Alternative D, 24,290 acres would be closed to trona leasing and development within the KSLA, which represents a <1% decrease compared to Alternative A (Table 2-7 in Appendix V, Map 2-14).

Impacts to saleable mineral development would be similar to those presented under Alternative A, except the areas closed to mineral material sales would decrease to 362,009 acres (57% decrease compared with Alternative A). This would increase the area in which saleable mineral development is allowed and thereby could result in increased production of such mineral resources.

Approximately 286,289 acres would be designated as ROW exclusion areas, an approximately 33% decrease in acres compared to Alternative A, and ROW avoidance acres would increase by approximately 88% to 1,388,618 acres. The significant decrease in ROW exclusion areas would likely reduce potential impacts to mineral resources by allowing increased future access to mineral exploration and development sites, and placement of facilities associated with mineral exploration, development, and operations, including pipelines, transmission lines, communication facilities, and roads.

Compared to Alternative A, this alternative would have fewer VRM Class IV areas and more VRM Class II and VRM Class III areas. Approximately 1,178,718 acres would be managed as VRM Class II, which represents a 102% increase in acres compared to Alternative A. Approximately 1,455,234 acres would be managed as VRM Class IV, which would be an approximately 44% reduction of acres compared to Alternative A. The large increase in VRM Class II acreage and large decrease in VRM Class IV acreage would greatly increase the impacts of visual resource management on mineral development activities.

## 4.11.4 Proposed RMP

Under this alternative, 900,204 acres would be pursued for withdrawal from mineral location (Table 2-3 in Appendix V). Compared to Alternative A, impacts on mineral location would be increased because approximately 62% more acres would be pursued for withdrawal. Conversely, compared to Alternative B, impacts on mineral location would be decreased because approximately 55% fewer acres would be pursued for withdrawal.

Although the BLM did not include the specific range of management for oil and gas leasing carried forward in the Proposed RMP in its RFD scenarios (BLM RFD 2016), the BLM anticipates that, based on the management of fluid leasable minerals under this alternative, the number of wells drilled would be greater than under Alternative B, but fewer than Alternatives A or D. Of the alternatives analyzed in the RFD, the effects on wells drilled would be most like those presented for Alternative D. The decrease in the number of wells drilled compared to Alternative A would be due to an increase in areas that are closed to fluid mineral leasing. Approximately 1,076,039 acres would be closed to new fluid mineral leasing, and 215,437 acres would be managed with NSO stipulations (Table 2-4 in Appendix V). Notably, the Proposed RMP includes a closure to fluid minerals within the KSLA for the protection of trona miners that are at risk when fluid mineral wells are drilled into active trona mining areas. Because there would be substantially more acres managed as closed and with NSO stipulations when compared to Alternative A, a reduced level of fluid mineral leasing and development would likely occur. Conversely, compared to Alternative B, there would be substantially fewer acres managed as closed and with NSO stipulations, thus decreasing effects on fluid mineral leasing compared to that alternative.

Impacts on oil shale leasing and development would be similar to Alternative A, except that the areas closed to oil shale leasing would increase to 1,115,490 acres or around 53% (Table 2-7 in Appendix V), which would increase impacts on oil shale development and could result in decreased production of oil from shale resources. Conversely, the Proposed RMP includes substantially fewer acres of oil shale closures than Alternative B, and adverse effects on development of this resource would be less than under that alternative.

Under the Proposed RMP, 766,880 acres are closed to coal development; therefore, effects from closures on coal exploration and development activities would be similar to those under Alternatives D, and substantially less than under Alternative B (Table 2-7 in Appendix V). The acres closed to coal exploration and development activities are approximately 58% more than under Alternative A.

Impacts on trona development would be similar to, but greater than, those described under Alternative A. Under the Proposed RMP, 569,554 acres would be closed to trona leasing and development, which represents an approximate 34% increase compared to Alternative A (Table 2-7 in Appendix V).

Impacts on saleable mineral development would be similar to those presented under Alternative A, except that the areas closed to mineral material sales would slightly increase to 884,906 acres (a 6% increase, compared with Alternative A). This would slightly decrease the area in which saleable mineral development is allowed and thereby could result in limited increased production of such mineral resources. Impacts on saleable mineral development would be substantially less than under Alternative B, which closes the majority of the planning area to mineral material sales.

Approximately 921,059 acres would be designated as ROW exclusion areas, an approximately 116% increase compared to Alternative A. The substantial increase in ROW exclusion areas would likely increase potential impacts on mineral resources by limiting future access to mineral exploration and development sites and placement of facilities associated with mineral exploration, development, and operations, including pipelines, transmission lines, communication facilities, and roads. Conversely, compared to Alternative B, which manages the majority of the planning area as ROW exclusion, effects would be reduced under the Proposed RMP.

Compared to Alternative A, this alternative includes fewer VRM Class IV and Class III areas, and more areas managed VRM Class II. Approximately 1,301,004 acres would be managed as VRM Class II, which represents a 123% increase in acres, compared to Alternative A. Approximately 1,929,258 acres would be managed as VRM Class IV, which would be a limited reduction of approximately 12%, compared to Alternative A. The large increase in VRM Class II acreage would greatly increase the impacts of visual resource management on mineral development activities compared to Alternative A. Conversely, substantially fewer acres are managed as VRM Class II compared to Alternative B, thereby reducing impacts of visual resource management on mineral development activities compared to that alternative.

# 4.12 CULTURAL RESOURCES

## 4.12.1 Alternative B

Impacts to cultural resources from wild horses would be the same as those described under Alternative A. Under this alternative, impacts on cultural resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to cultural resources from the management of soil and geologic resources would be similar to those discussed under Alternative A, except there would be more measures to protect soil and maintain or improve soil health. Under this alternative, prohibiting surface disturbing activities and management for soil health, cover, and stability could provide greater protections to unknown and known cultural resources by reducing the potential for detrimental erosion impacts to a greater degree compared to Alternative A.

Water resource management would have similar impacts to cultural resources compared to Alternative A. Alternative B offers greater protections to unknown and known cultural resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Managing all lands identified as having wilderness characteristics specifically to preserve those characteristics would reduce surface disturbing activities that could directly or indirectly expose, damage, or destroy known and unknown cultural resources. Limiting human access and activities could reduce the potential for structure and artifact vandalism. Under Alternative B, closing lands with wilderness characteristics to fluid minerals

development, mineral material sales/disposal, solid mineral leasing, and management as an exclusion area for ROWs would offer additional protections from surface occupancy and surface disturbing activities.

Impacts to cultural and historic resources from fluid mineral management would be similar to those described under Alternative A; however, larger areas of land would be closed to fluid mineral development and managed with NSO stipulations. Compared to Alternative A, opportunities to explore, locate, and develop fluid minerals in the planning area would be reduced overall. Under Alternative B, approximately 1,292 oil, gas, and CBNG wells would be developed within the planning area (Map 2-7), which would be 3,481 fewer wells as compared to Alternative A. There would be 8,892 acres of initial surface disturbance and 2,566 acres of long-term disturbance from fluid mineral development, 23,939 fewer acres of initial surface disturbance, and 6,900 fewer acres of long-term disturbance compared with Alternative A. Under this alternative, 2,186,218 acres in the planning area are closed to fluid mineral exploration, leasing, and development (1,646,197 more acres than Alternative A). Under Alternative B, 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Applying CSU stipulations to 99,674 acres, which is 621,458 fewer acres than Alternative A, and applying TLS to 713,837 acres, which is 1,127,130 fewer acres than Alternative A, would offer greater protections than Alternative A by reducing the amount of land available for oil and gas development potentially impacted by surface disturbing activities.

Approximately 2,186,218 acres would be closed to geothermal resource development, 1,646,197 more acres than Alternative A. Limiting human access and activities could reduce the potential for structure and artifact vandalism. The discovery of previously unknown cultural resources would be less likely to occur in areas where surface disturbing activities are low. In the areas where geothermal resources could be developed, lease stipulations could provide greater protections to cultural resources by reducing the impacts of surface disturbing activities and human presence in the planning area.

Impacts from locatable and saleable mineral exploration, developments, and operations would be similar to those under Alternative A. Approximately 1,993,908 acres would be proposed for withdrawal from locatable mineral entry (1,437,350 more than Alternative A) and 2,581,741 acres would be unavailable for mineral material sales and disposals, 1,748,022 acres more than Alternative A (Maps 2-2 and 2-17).

Impacts to cultural resources from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The protections to lands closed to solid mineral development would be applied to 2,741,709 more acres of land closed to coal, 1,394,477 more acres of lands closed to oil shale, and 1,665,326 more acres closed to trona compared to Alternative A. The management could provide greater protections to cultural resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Wildland fire and ecology management actions would have similar impacts to cultural resources compared to Alternative A. The prohibition on the use of chemical fire suppression agents within ¼ mile of rock art sites and special designations could protect cultural and historic resources to a greater degree compared to Alternative A. The management would generally provide greater protections to soil stability and thereby reduce the potential for detrimental erosion that could impact unknown and known cultural resources and sites.

Management actions to maintain, restore, and enhance forests and woodlands would have similar impacts to cultural and historic resources as Alternative A, although there would be an emphasis on using natural processes to improve vegetative health and to benefit other resources. The management could benefit known and unknown cultural resources by reducing the potential for amplified erosion and setting degradation to a greater degree compared to Alternative A.

Management actions to maintain, restore, and enhance grassland, shrubland, riparian, and wetland habitats would have similar impacts to cultural resources when compared to Alternative A. Under Alternative B, the management could benefit known and unknown cultural resources by reducing damage or destruction of resources, indirect impacts from erosional forces, and setting degradation to a slightly greater degree when compared to Alternative A.

Impacts to cultural resources from the management of fish and wildlife resources and special status species are similar to those described under Alternative A. In addition, surface use restrictions, NSO and TLS for fluid minerals, closures to solid mineral leasing and mineral material sales/disposals, ROW avoidance or exclusions, and vehicle access and travel limitations would also be applied at various sites to reduce surface disturbance. The management under Alternative B could provide greater protection to cultural resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Management actions designed to protect the cultural resources focus largely on human activities that cause surface disturbances which have the potential to impact soil stability, amplify erosion, inflict direct damage or destruction, cause indirect loss of scientific information, and degrade setting. Compared to Alternative A, actions emphasizing avoidance of development activities at National Register-eligible properties offers greater protections to cultural resources by reducing potentials for detrimental surface disturbing activities. The conservation and preservation of cultural resources would support accomplishing the recovery of scientific data; site stewardship programs and public education opportunities for NHTs and other sites would help to protect sites from visitor actions that could harm or destroy resources. The management under Alternative B could provide greater protection to known and unknown cultural resources by reducing the potential for direct damage or destruction of resources, indirect impacts from erosional forces, and setting degradation. Less human presence could reduce the potential for vandalism and unauthorized removal of artifacts. The discovery of previously unknown cultural resources would be less likely to occur in areas where surface disturbing activities are low.

Management actions to minimize impacts to areas of tribal importance (sacred, spiritual, respected, and/or traditional cultural settings, properties, or resources) within the planning area would be have similar impacts on cultural resources as described under Alternative A. Additional management to reduce surface disturbing activities and human presence in areas of tribal importance could lower the potential for direct damage or destruction to cultural and historic resources, indirect impacts from erosional forces, and setting degradation.

Paleontological resource management actions would have similar impacts on cultural resources as those described under Alternative A. The prohibition of surface disturbing activities in Adobe Town and Desolation Flat/Desolation Point areas could provide additional protections to known and unknown cultural resources that exist in those areas.

Impacts to cultural resources from VRM would be similar to Alternative A, except that the VRM Class II acreage is greater under this alternative. Approximately 225,785 acres would be classified as VRM Class I (68 acres more than Alternative A), 2,148,902 acres VRM Class II (1,566,230 more acres than Alternative A), 666,522 acres VRM Class III (51,030 acres more than Alternative A) and 563,754 acres as VRM Class IV (1,616,669 fewer acres than Alternative A). More acreage managed under VRM Class II would provide greater protections to known and unknown cultural resources by minimizing surface disturbing activities, human presence, and occupancy which could lower the potential for direct damage or destruction, indirect impacts from erosional forces, and setting degradation.

Land resource management actions related to the real estate transactions of acquisition, disposal, and/or pursuing withdrawal would have similar impacts to cultural resources as described under Alternative A, depending on the lands withdrawn or acquired.

Impacts to cultural resources from the management of renewable energy projects are similar to Alternative A, except additional measures and BMPs to protect resources and resource uses would be applied. These stipulations could provide greater protections to cultural resources by reducing the extent of human-caused surface disturbing activities and human presence.

Impacts to cultural resources from the management of ROWs would be similar to those described under Alternative A. In total, 2,480,876 acres would be designated as exclusion areas for ROWs (2,130,936 more than Alternative A) and 133,903 acres would be designated as ROW avoidance areas (602,235 fewer than Alternative A). Alternative B would provide greater protections to cultural resources by reducing the extent of human-caused surface disturbing activities and human presence.

Impacts to cultural resources from the management to designate and manage back country byways would be similar to Alternative A, except additional back country byways would be considered. Byways could provide opportunities for enhancing visitor knowledge and understanding of the significant natural and cultural resources located in their vicinity, which could improve appreciation and protection. Additional byways could increase the presence of visitors, which could increase the potential for surface disturbing activities and damages to cultural resources through unauthorized removal of artifacts or intentional acts of vandalism.

Impacts to cultural resources from the management of livestock grazing would be similar to those described under Alternative A. The management under Alternative B could provide greater protections to cultural resources by reducing surface disturbance. The management could reduce the opportunities for livestock making direct physical contact to cultural or historic structures or artifacts which could prevent damage or destruction of the resources to a greater degree compared to Alternative A.

Impacts to cultural resources from the management of recreation would be similar to Alternative A. The Continental Divide National Scenic Trail, Continental Divide Snowmobile Trail, the Green River, Killpecker Sand Dunes, Oregon and Mormon Pioneer National Historic Trails, and the Wind River Front SRMAs would not be retained. Not retaining the SRMAs and greater restriction for surface disturbing activities and visual disturbances could potentially reduce human and vehicle access to those areas. The management could provide greater protections to cultural resources by reducing the extent of surface disturbing activities and human presence. Reducing surface disturbing activities would lower potentials for direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation. Reduced human presence could lower the potential for vandalism and unauthorized removal of artifacts. The discovery of previously unknown cultural resources would be less likely to occur in areas where surface disturbing activities are low.

Management to protect congressionally designated and/or eligible trails, and NHTs would have similar impacts to cultural resources compared to Alternative A, except there would be greater protective measures proposed such as larger buffer zones and specific closures and restrictions.

Management of WSAs and WSRs would impact cultural resources similar to those described under Alternative A, but there would be a greater emphasis on protecting wilderness setting and viewshed values. The management would reduce the potential for surface disturbing activity. Reducing surface disturbing activities would lower the potential for direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation of cultural resources.

Impacts to cultural resources from the management of ACECs would be similar to those described under Alternative A. Under Alternative B, 1,605,660 acres of lands would be managed as ACECs, 1,319,210 more acres compared to Alternative A. The additional management for ACECs would provide greater protections against surface disturbance. Managing all the ACECs consistent with VRM Class II objectives would provide greater protection of the viewsheds and would maintain the cultural and historic settings surrounding protected sites. The

management could provide greater protection to known and unknown cultural resources by reducing the potential for direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation.

## 4.12.2 Alternative C

Impacts to cultural resources from the management of soil, geologic, water, grassland and shrubland, areas of tribal importance, lands and realty, and renewable energy resources would be the same as those described under Alternative A. Under Alternative C, impacts on cultural resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to cultural resources from managing lands with wilderness characteristics to not protect those characteristics would result in greater surface disturbing activities and increased presence of humans. This could potentially increase impacts on known and unknown cultural resources through direct resource damage or destruction, amplification of erosional forces, degradation of setting, and vandalism.

Impacts to cultural resources from the management of leasable minerals would be the same as those described under Alternative A. Under this alternative, approximately 4,919 oil, gas, and CBNG wells would be developed within the planning area (Map 2-8), which would be 146 more wells as compared to Alternative A. There would be 33,840 acres of initial surface disturbance and 9,758 acres of long-term disturbance from fluid mineral development; 1,009 additional acres of initial surface disturbance and 292 more acres of long-term disturbance compared with Alternative A.

Approximately 225,782 acres in the planning area would be closed to fluid mineral exploration, leasing, and development (314,239 fewer acres than under Alternative A). Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than under Alternative A. Applying CSU stipulations (215,890 acres; which is 505,242 fewer than Alternative A) and TLS (1,355,485 acres; which is 485,482 less than Alternative A) would overall offer fewer protections than Alternative A due to total fewer acres with lease stipulations (Map 2-8).

Impacts to cultural resources from the development of solid leasable minerals would be similar to those described under Alternative A. Under Alternative C, 226,219 acres would be closed to coal and 225,965 acres would be closed to oil shale and trona. Approximately 259,745 fewer acres would be closed to coal leasing, 501,840 fewer acres would be closed to oil shale leasing, and 228,629 fewer acres would be closed to trona leasing compared with Alternative A. The smaller areas of closures could result in increased surface disturbance, possibly increasing the potential for damage to cultural resources.

Impacts from locatable and saleable mineral management on cultural resources would be similar to those described under Alternative A. Under Alternative C, 234,961 acres would be proposed for withdrawal from locatable mineral entry (321,597 fewer than Alternative A) and 226,421 acres would be closed to mineral material sales and disposals (607,298 fewer than Alternative A) (Maps 2-3 and 2-18). The management would provide fewer protections to cultural resources by increasing the potential extent of surface disturbing activities and human presence in the planning area compared to Alternative A.

Impacts from wildland fire management on cultural resources would be similar to those described under Alternative A. Management such as wildfire suppression and a smaller buffer distance for the use of chemical fire suppression agents could lead to fewer protections for cultural resources from fire suppression activities and possible damage to rock art sites from suppression chemicals. The management under Alternative C could decrease the potential for direct fire damage to known cultural resources, but if suppression activities involved significant land surface disturbances, direct and indirect impacts to cultural resources could occur compared to Alternative A.

Impacts to cultural resources from forest and woodland management would be similar to those described under Alternative A. The management could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase the extent of surface disturbing activities compared to Alternative A.

Impacts to cultural and historic resources from the management of riparian, wetland, fish, wildlife, and special status species habitats would be similar to those described under Alternative A, except that smaller surface disturbing and/or surface use distance buffer zones would be applied around developments and operations. The management could increase the potential for direct destruction or damage to known and unknown cultural resources through surface disturbance, impacts to soil/rock stability, and amplified detrimental erosion.

Impacts from the management of cultural and paleontological resources would be similar to those described under Alternative A, except that smaller surface disturbance and setting buffer distances would be applied around known cultural and paleontological sites. Smaller sized buffer zones under this alternative could open land in the planning area to more surface disturbing activities and human access. Protections applied to paleontological sites would generally provide similar protections to any known or unknown cultural sites in those same locations.

Impacts to cultural resources from VRM would be the same as those described under Alternative A. Under Alternative C, 226,629 acres would be managed as VRM Class I (912 more than Alternative A), 607,899 acres VRM Class II (25,227 more than Alternative A), 395,683 acres VRM Class III (219,809 fewer than Alternative A), and 2,374,706 acres as VRM Class IV (194,283 more than Alternative A).

Under Alternative C, 225,784 acres would be managed as ROW exclusion areas and 31,081 acres would be managed as ROW avoidance areas (200,925 and 715,120 fewer acres than Alternative A, respectively). Fewer acres of ROW exclusion and avoidance areas could open areas in the planning area to more surface disturbing activities and human access compared to Alternative A. These actions could increase the potential for direct destruction or damage to known and unknown cultural resources through surface disturbance and occupancy, impacts to soil or rock stability, and amplified detrimental erosion.

Under Alternative C, the management of not retaining back country byways could reduce public visitation to these areas, which could decrease the potential for damage to cultural resources through unauthorized removal of cultural artifacts or intentional acts of vandalism. However, opportunities for public education or enjoyment of cultural resources would be reduced or lost under Alternative C by not retaining or designating byways.

Impacts to cultural resources from the management of livestock grazing would be similar to Alternative A. Additional management under Alternative C allowing livestock in riparian areas could result in vegetation loss, surface disturbance and amplified erosion, which could inflict direct damage or destruction to cultural resources, and/or degrade their settings. Reducing total authorized use for grazing could reduce contact from livestock on cultural resources; however, because management is continuing actual livestock use, it is likely that further impacts would occur beyond those described under Alternative A.

Impacts to cultural resources from recreation management would be similar to Alternative A. Fewer restrictions under Alternative C could open areas in the planning area to more surface disturbing activities and allow more access into areas with fewer recreational management controls. The management could increase the potential for direct destruction or damage to known and unknown cultural resources through surface disturbance, impacts to soil/rock stability, and amplified erosion. Surface disturbing activity or occupancy could cause degradation of the setting in which the cultural resource exists. Increased presence of humans could result in artifact vandalism or removal.

Impacts to cultural resources from the management to protect congressionally designated and/or eligible trails, and NHTs would be similar to those described under Alternative A. Fewer restrictions on surface disturbing

activities, vehicle travel, and more relaxed VRM classifications under this alternative could impact known and unknown cultural resources through an increase in surface disturbing activity and human presence compared to Alternative A.

Impacts to cultural resources from the management of WSAs would be to the same as those described under Alternative A. No management for WSRs could potentially increase access, travel, and surface disturbance along the Sweetwater River, which could increase the potential for impacts to known and unknown cultural resources in those locations. An increase in surface disturbing activities could result in direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation.

Under this alternative, no ACECs would be retained. The management would provide fewer protections to known and unknown cultural resources in these areas by increasing the potential for surface disturbing activities or occupancy, and an increase in the presence of humans. Surface disturbing activity or occupancy has the potential to degrade or destroy cultural resources through impacts to soil stability, amplified erosion, direct damage or destruction to resources, and diminished viewshed or setting. An increased presence of humans could raise the potential for vandalism and the unauthorized removal of artifacts. The discovery of previously unknown cultural resources would be more likely to occur in areas where surface disturbing and occupancy activities are high.

### 4.12.3 Alternative D

Impacts to cultural resources from soil, geologic, water, fire and fuels, woodlands, vegetation, riparian and wetland, fish and wildlife, special status species, paleontology, back country byways, and livestock grazing management would be the same as those described under Alternative A. Under Alternative D, impacts on cultural resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to cultural resources from the management of lands with wilderness characteristics would be very similar to those described under Alternative B. Fewer areas would have management specifically for preservation of wilderness characteristics, which could allow for more surface disturbing activities compared to Alternative B.

Under Alternative D, approximately 4,737 oil, gas, and CBNG wells would be developed within the planning area (Map 2-9), which would be 36 fewer wells as compared to Alternative A. There would be 32,587 acres of initial surface disturbance and 9,397 acres of long-term disturbance from oil and gas development, 244 fewer acres of initial surface disturbance, and 69 fewer acres of long-term disturbance compared with Alternative A. Under this alternative, 768,989 acres in the planning area are closed to fluid mineral exploration, leasing, and development (228,968 more acres than Alternative A). Under Alternative D, 2,172 acres would be managed with NSO stipulations, which is 156,439 fewer acres than Alternative A. Applying CSU stipulations on 1,238,899 acres (517,767 more acres than Alternative A) would offer similar protections to cultural resources within these areas as described under Alternative A.

Impacts to cultural resources from geophysical exploration would be the same as those described under Alternative B.

Impacts from locatable mineral exploration, development, and operations would be very similar to those described under Alternative A. Under Alternative D, 482,272 acres of land would be proposed for withdrawal from locatable mineral entry, 74,286 fewer acres compared to Alternative A. Managing less land available for locatable mineral development activities could provide fewer protections to cultural resources from human-caused surface disturbing activities and human presence in the planning area.

Impacts from saleable mineral development would be similar to those described under Alternative A. Under Alternative D, 362,009 acres would be closed to saleable mineral disposal, 471,710 more acres compared to

Alternative A. Cultural resources could be vulnerable to surface disturbance and human activities to a greater degree compared to Alternative A.

Impacts to cultural resources from solid mineral leasing would be similar to those described under Alternative A. Under Alternative D, 610,342 acres of land would be closed to coal leasing, 124,478 more acres compared to Alternative A; 2,401,135 acres would be closed to oil shale leasing, 829,715 fewer acres compared to Alternative A; and 389,552 acres would be closed to trona leasing, 34,081 fewer acres compared to Alternative A. The smaller areas of land closed to coal, oil shale, and trona leasing could result in increased surface disturbance and thereby increase the potential for damage to cultural resources.

Under Alternative D, management of cultural resources would be similar to Alternative A, however additional management to protect resources from surface disturbance or disruptive activities would be applied. Minimizing surface disturbing activities and human presence in areas of cultural resources and of tribal importance would lower the potential for direct damage or destruction to known and unknown cultural resources that exist in those same areas; as well as indirect impacts from erosional forces and setting degradation.

Impacts to cultural resources from the management of visual resources would be similar to those described under Alternative A. Approximately 225,703 acres would be classified as VRM Class I (14 acres fewer than Alternative A), 1,178,718 acres as VRM Class II (596,046 acres more than Alternative A), 738,311 acres as VRM Class III (122,819 acres more than Alternative A) and 1,455,234 acres as VRM Class IV (725,189 acres less than Alternative A). More acreage managed under VRM Class II and less acreage under VRM Class IV would provide greater protections to known and unknown cultural resources compared to Alternative A.

Impacts on cultural resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres, 140,420 fewer acres compared with Alternative A and 1,388,618 acres would be managed as ROW avoidance areas, 652,480 more acres compared with Alternative A (Table 2-10 in Appendix V, Map 2-29). Exclusion and avoidance areas could reduce potential impacts on cultural resources from ROW development, thereby helping to maintain the integrity of cultural resources in the planning area.

Impacts to cultural resources from recreation management would be similar to those described under Alternative A. SRMA management could reduce surface disturbance in some areas and protect cultural resources from damage or exposure from excavation or erosion. However, increased use in the remaining SRMAs could lead to vegetation loss or erosion, which could expose unknown cultural resources, but could put the resources at risk from vandalism, damage, or illegal collection.

Impacts to cultural resources from the management to protect congressionally designated and/or eligible trails, and NHTs would be similar to those described under Alternative A. Under Alternative D, additional protective measures proposed such as larger buffer distances, specific closures, and restrictions would be applied to these areas to a greater degree when compared to Alternative A.

Impacts to cultural resources from the management of WSAs would be very similar to those described under Alternative B. Fewer protections for surface disturbance within these areas could increase the potential for direct or indirect damage or destruction to cultural resources as compared to Alternative B. However, the discovery of previously unknown cultural resources could increase in areas where surface disturbing activities occur.

Impacts to cultural resources from the management of WSRs would be the same as those described under Alternative B.

Impacts to cultural resources from the management of ACECs and special management areas would be similar to those described under Alternative A. Under Alternative D, 246,634 acres would be managed as ACECs, 39,816

fewer acres compared to Alternative A. Approximately 312,980 acres would be special management areas, 267,030 fewer acres compared to Alternative A.

## 4.12.4 Proposed RMP

The Proposed RMP would mostly consist of a mix of management actions from Alternative B and Alternative D. In general, the Proposed RMP would have greater protections for cultural resources than Alternatives A, C, and D, but fewer than Alternative B. Under the Proposed RMP, impacts on cultural resources from water resource management, geophysical exploration, fire and fuels, forests and woodlands, vegetation, riparian and wetland, fish and wildlife, special status species, paleontological resources, back country byways, and livestock grazing management would be the same as those described under Alternative A. Under the Proposed RMP, impacts on cultural resources would not be anticipated, or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts on cultural resources from the management of soil and geological resources would be similar to those discussed under Alternative A, except that, similar to Alternatives B and D, there would be more measures to protect soil properties and maintain or improve soil health. Management for soil health, cover, and stability could provide greater protections to unknown and known cultural resources by reducing the potential of erosion.

Management actions related to the preservation of land with wilderness characteristics under the Proposed RMP are mostly the same as those described under Alternative D. No areas under the Proposed RMP would have management specifically for the preservation of lands with wilderness characteristics, allowing for a greater potential for ground-disturbing activities, which could affect known and unknown cultural resources.

Impacts from locatable, leasable, and saleable mineral exploration, development, and operations would be similar to those described under Alternative A, except that generally more of the planning area would be closed/withdrawn or managed for surface use restrictions. Under the Proposed RMP 1,076,039 acres in the planning area are closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (536,018 more acres than Alternative A); 900,204 acres are proposed for withdrawal from locatable mineral entry (343,646 more acres than Alternative A); and 884,906 acres are closed to saleable mineral development and/or disposals (51,187 more acres than Alternative A) (Tables 2-3, 2-4, and 2-8 in Appendix V). Activities related to shaling and other methods of resource extraction could affect cultural resources through potential soil exposure to wind and water erosion and subsequent soil degradation and loss. The impact would be mitigated by following Wyoming State Protocol, National Historic Preservation Act (NHPA) Section 106, and BLM guidelines, wherever applicable, which could add additional costs to project development and management. Under the Proposed RMP, more acres would be closed to fluid minerals (99% increase compared with Alternative A), and many areas that remain open would be subject to NSO and CSU stipulations, which would avoid or reduce potential impacts on cultural resources from surface-disturbing activities, compared to Alternative A. However, compared to Alternative B, management of mineral resources under the Proposed RMP would allow substantially more development, which would increase the potential for effects on known and unknown cultural resources, compared to that alternative.

Management actions designed to protect cultural resources under the Proposed RMP would be similar to those described under Alternative B, with a few actions included from Alternative D. Management actions for precontact steatite/soapstone quarry sites under the Proposed RMP would be the same as Alternative D. The Proposed RMP would allow for the potential of ROW expansion in these areas, as well as CSUs for fluid mineral development, and would require tribal consultation for all activities that could impact steatite outcrops. Management actions under the Proposed RMP for rock art sites, which would be designated under VRM Class II, would be the same as Alternative D. Rather than the 3-mile protective buffer zone proposed in Alternative B, the Proposed RMP would adopt a 0.5-mile buffer within which ground-disturbing activities would be permitted only if site-specific analysis determines no adverse effects will occur. Within 0.25 mile of a designated rock art site, activities would only be permitted if they do not adversely affect Native American, cultural, or historical values, as outlined in

Alternative D. Regions of the Playa Lake area with high cultural resource density would not be designated as new historic districts under the Proposed RMP, following Alternative D, rather than Alternative B. Similarly, specific cultural sites would largely be managed in accordance with Alternative D, allowing ground-disturbing activities in their vicinity, provided that site-specific analysis determines no adverse effects would occur on nearby cultural resources. Pine Springs would be designated a VRM Class II, with management actions prohibiting ground-disturbing activities within the site boundary. The West Sand Dunes Archaeological District would be managed under the Proposed RMP according to the protocol outlined in Alternative D. It would not be designated as a special management area and would be renamed the West Sand Dunes Paleosol Deposition Area. The Proposed RMP follows the same management action as Alternative D regarding potential ground-disturbing activities within the JMH planning area. The buffer zone to avoid ground-disturbing activities, including geophysical survey, in the vicinity of sites eligible for inclusion in the NRHP under Criterion D would be adjusted to 100 feet, as opposed to the 500 feet buffer proposed in Alternative B.

Impacts on cultural resources from VRM would be similar to Alternative A, except that more acres would be managed VRM Class II, and fewer acres would be managed as VRM Class IV. Approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A) and 1,929,258 acres as VRM Class IV (251,165 fewer acres than Alternative A). More acreage managed under VRM Class II and less acreage under VRM Class IV would provide greater protections to cultural resources by minimizing surface-disturbing activities, human presence, and occupancy, which could lower the potential for direct damage or destruction and indirect impacts from erosional forces. Impacts on cultural resources from VRM under the Proposed RMP would be most similar to those described under Alternative D.

Impacts on cultural resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). ROW exclusion and (to a lesser extent) avoidance areas could reduce potential impacts on cultural resources from ROW development.

Impacts on cultural resources from recreation management under the Proposed RMP would be similar to those described under Alternative A, except that, similar to Alternative D, the Proposed RMP would have fewer potential impacts from recreation on cultural resources. Under the Proposed RMP, 159,505 fewer acres are designated as SRMAs compared with Alternative A. SRMA management could reduce surface disturbance in some areas and protect cultural resources from damage or exposure from excavation or erosion. However, increased use in the remaining SRMAs could lead to vegetation loss or erosion, which could expose unknown cultural resources and put the resources at risk from vandalism, damage, or illegal collection.

Impacts on cultural resources from managing special designation areas would be similar to those described under Alternative A, except that they would occur over more acres and thereby offer greater protections to important historic, cultural, wildlife, special status plants, and scenic values in these areas, as determined by the management area direction. The acres designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase compared with 10 ACECs under Alternative A). Overall management of special designation areas under the Proposed RMP would limit surface disturbance to a greater extent than Alternative A by restricting the types of activities allowed in the areas, thus decreasing the potential for impacts on cultural resources. The Proposed RMP would have greater protection of cultural resources through management of ACECs when compared to Alternatives A, C, and D, but fewer than Alternative B.

NHT management and beneficial impacts on cultural resources due to restrictions on surface-disturbing activities would be the same as under Alternative D, but substantially less than under Alternative B. Projects involving ground disturbance may affect known and unknown cultural resources throughout the planning area.

Impacts on cultural resources from WSA management would be the same as those described under Alternative D.

Impacts on cultural resources from the management of WSRs would be the same as those described under Alternative B.

# 4.13 PALEONTOLOGICAL RESOURCES

## 4.13.1 Alternative B

Impacts to paleontological resources from areas of tribal importance, lands and realty, and renewable energy management would be the same as those presented under Alternative A. Under this alternative, impacts on paleontological resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to paleontological resources from the management of soil and geologic resources would be similar to those discussed under Alternative A, except there would be more measures to protect soil properties and maintain or improve soil health. This alternative could provide greater protections to unknown and known paleontological resources by reducing the potential for detrimental erosion impacts as compared to Alternative A.

Impacts to paleontological resources from the management of water resources would be similar to those discussed under Alternative A except that greater surface disturbing protections would be applied. Alternative B offers greater protections to unknown and known paleontological resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Managing all lands identified as having wilderness characteristics specifically to preserve those characteristics would provide additional protections to soil health and stability, and from surface disturbing activities that could directly or indirectly expose, damage, or destroy known and unknown paleontological resources. Surface disturbing activities and occupancy could cause degradation of the setting in which the paleontological resource exists. Limiting human access and activities could reduce the potential for fossil vandalism. Under Alternative B, closing lands with wilderness characteristics to fluid minerals development, mineral material sales/disposal, solid mineral leasing, and management as an exclusion area for ROWs would offer additional protections from surface occupancy and surface disturbing activities. The discovery of previously unknown paleontological resources would be less likely to occur in areas where surface disturbing and occupancy activities are low.

Impacts to paleontological resources from fluid mineral management would be similar to those described under Alternative A. Under Alternative B, approximately 1,292 oil, gas, and CBNG wells would be developed within the planning area (Map 2-7), which would be 3,481 fewer wells as compared to Alternative A. There would be 8,892 acres of initial surface disturbance and 2,566 acres of long-term disturbance from fluid mineral development, 23,939 fewer acres of initial surface disturbance, and 6,900 fewer acres of long-term disturbance compared with Alternative A. Under this alternative, 2,186,218 acres in the planning area are closed to fluid mineral exploration, leasing, and development, 1,646,197 more acres than Alternative A. Under Alternative B, 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Applying CSU stipulations (within 99,674 acres, 621,458 fewer than Alternative A) and TLS (within 713,837 acres, 1,127,130 fewer than Alternative A) would offer greater protections than Alternative A due to fewer acres in the Alternative B scenario being potentially impacted by surface disturbing activities.

Impacts from locatable, leasable, and saleable mineral exploration, development, and operations would be similar to those under Alternative A. Approximately 1,993,908 acres would be withdrawn from locatable mineral entry (1,437,350 more than Alternative A) and 2,581,741 acres would be closed to mineral material sales (1,748,022 more than Alternative A) (Maps 2-2, 2-7, and 2-12). Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The protections to lands unavailable to solid mineral development would be applied to 2,741,709

more acres of land closed to coal, 1,394,477 more acres of lands closed to oil shale, and 1,665,326 more acres of land closed to trona compared to Alternative A. The management could provide greater protections to paleontological resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Impacts to paleontological resources from wildland fire and ecology management would be similar to those described under Alternative A. The prohibition on the use of chemical fire suppression agents within ¼ mile of rock art sites and other sensitive areas is more restrictive than under Alternative A. These actions could provide greater protections to soil stability and thereby reduce the potential for detrimental erosion that could impact unknown and known paleontological resources and sites.

Management actions to maintain, restore, and enhance forests and woodlands would have similar impacts to paleontological resources as Alternative A. The management could benefit known and unknown paleontological resources by reducing the potential for amplified erosion and setting degradation. Prohibiting pre-commercial thinning would reduce surface disturbing activities. Management to leave timber harvest areas to revegetate naturally could potentially result in a lengthier period of soil instability, which could amplify detrimental erosion and lead to damage to paleontological resources. However, increased erosion could expose unknown resources to discovery and study.

Management to maintain, restore, and enhance grassland, shrubland, riparian, and wetland habitats would have similar impacts to paleontological resources when compared to Alternative A. All plans and projects applied to these habitats would be designed to reduce surface disturbing/occupancy activities. The management could benefit known and unknown paleontological resources by reducing direct damage or destruction, indirect impacts from erosional forces, and setting degradation.

Impacts to paleontological resources from the management of fish and wildlife resources and special status species are similar to those described under Alternative A. In addition, surface use restrictions would be applied at various sites to reduce surface disturbance. The management under Alternative B could provide greater protection to paleontological resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Cultural resource management actions would have similar impacts to paleontological resources as those described under Alternative A, except decreasing the setting to be protected surrounding significant rock art sites would provide fewer protections to the setting of paleontological resources that exist in those same areas. Additional management under Alternative B could decrease the potential for direct destruction or damage to known and unknown paleontological resources through surface disturbance and occupancy, impacts on soil or rock stability, amplified detrimental erosion, degradation of setting, and vandalism.

Impacts from paleontological resource management would be similar to Alternative A, except that site-specific analysis and potential adverse effect mitigation would occur prior to considering surface disturbing activities at known significant paleontological resource localities. Additionally, surface disturbing activities would be prohibited in Adobe Town and Desolation Flat/Desolation Point areas. This management would provide additional protections to known and unknown paleontological resources. The conservation and preservation of paleontological sites supports accomplishing the recovery of scientific data. Site stewardship programs and public education opportunities for these sites would help to protect sites from visitor actions that could harm or destroy these resources.

Impacts to paleontological resources from VRM would be similar to Alternative A, except that the VRM Class II acreage is greater under this alternative. Approximately 225,785 acres would be managed as VRM Class I (68 more acres than Alternative A), 2,148,902 acres as VRM Class II (1,566,230 more acres than Alternative A), 666,522 acres VRM Class III (51,030 more acres than Alternative A), and 563,754 acres as VRM Class IV

(1,616,669 fewer acres than Alternative A). More acreage managed under VRM Class II would provide greater protection to paleontological resources by minimizing surface disturbing activities and human presence in these areas, which could lower the potential for direct damage or destruction, indirect impacts from erosional forces, and setting degradation.

Impacts to paleontological resources from the management of ROWs would be similar to those described under Alternative A, except no new corridors would be designated under Alternative B. In total, 2,480,876 acres would be managed as ROW exclusion areas, 2,130,936 more than Alternative A, and 133,903 acres would be managed as ROW avoidance areas, 602,235 fewer acres than Alternative A. Fewer acres of ROWs would provide greater protections to paleontological resources by reducing the extent of human-caused surface disturbing activities and human presence in the planning area.

Impacts to paleontological resources from the management of back country byways would be similar to Alternative A, except additional back country byways would be considered. Byways could provide opportunities for enhancing visitor knowledge and understanding of the significant natural and paleontological resources located in their vicinity, which could improve appreciation and protection. Back country byways could increase the presence of visitors, which could increase the potential for surface disturbing activities and damage to paleontological resources through unauthorized removal of fossils or intentional acts of vandalism.

Impacts to paleontological resources from the management of livestock grazing would be similar to those described under Alternative A. The management could provide greater protections to paleontological resources by reducing surface disturbance. The management could reduce the opportunities for livestock to make direct physical contact to fossil sites which could prevent damage or destruction to the resource.

Impacts to paleontological resources from the management of recreation in the planning area would be similar to Alternative A, except that the entire planning area would not be managed as an Extensive Recreation Management Area (ERMA) and SRMAs would not be retained. Under Alternative B, more emphasis would be placed on management for resource values instead of recreation values. The management could provide greater protections to paleontological resources by reducing the extent of surface disturbing activities and human presence. Reducing surface disturbing activities could prevent direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation.

Impacts to paleontological resources from OHV management would be similar to Alternative A, except more acres are limited to existing roads and trails. There are no acres designated to “existing roads and trails” for Alternative B. Managing OHV use to minimize adverse effects on resources would provide similar protections to the unknown and known paleontological resources in the planning area by reducing the extent of human-caused surface disturbing activities and human presence when compared to Alternative A.

Management to protect congressionally designated and/or eligible trails, and NHTs would have similar impacts on paleontological resources as Alternative A, except there are greater protective measures proposed such as larger buffers and specific closures and restrictions. Reducing surface disturbing activities would lower the potential for direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation at paleontological sites.

Management of WSAs and WSRs would impact paleontological resources similar to those described under Alternative A, but there would be a slightly greater emphasis on protecting wilderness setting and viewshed values over recreational values. The management would reduce the potential for surface disturbing activity which could protect known and unknown paleontological resources.

Impacts to paleontological resources from the management of ACECs would be very similar to those described under Alternative A; however, 1,605,660 acres of lands would be managed as ACECs under Alternative B,

1,319,210 more acres compared to Alternative A. Additional stipulations to individual ACECs could reduce surface disturbance, which could provide greater protections to known and unknown paleontological resources by reducing the potential for direct resource damage or destruction, indirect impacts from erosional forces, and setting degradation. Reduced human presence could decrease the potential for vandalism and unauthorized removal of fossils.

## 4.13.2 Alternative C

Impacts to paleontological resources from soil and geologic resources, water, geothermal, geophysical, forests and woodlands, grassland and shrubland, areas of tribal importance (sacred, spiritual, respected, and traditional cultural settings, properties, or resources), lands and realty, and renewable energy management would be the same as those described under Alternative A. Under this alternative, impacts on paleontological resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to paleontological resources from managing lands with wilderness characteristics to not protect those characteristics would result in fewer protections for soil health and stability and could allow more surface disturbing activities and occupancy. This could potentially increase impacts on known and unknown paleontological resources through direct resource damage or destruction, amplification of erosional forces, degradation of setting, or vandalism.

Compared to Alternative A, opportunities to explore, locate, and develop fluid minerals in the planning area would increase under Alternative C. Mineral development activities could cause direct destruction or damage to known and unknown paleontological resources through surface disturbances and occupancies, adverse impacts on soil and rock stability that amplify detrimental erosion. Surface disturbing activities or surface occupancy could cause degradation of the setting in which the paleontological resources exist. Humans could cause unintentional damage to both known and unknown resources through their surface disturbing activities; as well as intentional destruction through vandalism, including the unauthorized removal of fossils.

Under Alternative C, approximately 4,919 oil, gas, and CBNG wells would be developed within the planning area (Map 2-8), which would be 146 more wells as compared to Alternative A. There would be 33,840 acres of initial surface disturbance and 9,758 acres of long-term disturbance from oil and gas development; 1,009 more acres of initial surface disturbance and 292 more acres of long-term disturbance compared with Alternative A. Approximately 225,782 acres in the planning area would be closed to fluid mineral exploration, leasing, and development; 314,239 fewer acres than under Alternative A. Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than under Alternative A. Applying CSU stipulations to 215,890 acres, 505,242 fewer than Alternative A and applying TLS to 1,355,485 acres, 47,258 fewer acres than Alternative A, would overall offer fewer protections than Alternative A due to total fewer acres of land protected by closures or lease stipulations.

Impacts from locatable, leasable, and saleable mineral exploration, development, and operations on paleontological resources would be similar to those under Alternative A. Under Alternative C, 234,961 acres would be withdrawn from locatable mineral entry, 321,597 fewer than Alternative A, and 226,421 acres would be closed to mineral material sales and disposals, 607,298 fewer than Alternative A (Map 2-3, 2-13, and 2-18). Approximately 226,219 acres would be closed to coal leasing, 407,617 fewer acres than Alternative A, 225,965 acres would be closed to oil shale leasing, 501,840 fewer acres than Alternative A, and 225,965 acres would be closed to trona leasing, 228,629 fewer acres than Alternative A. The management would provide fewer protections to paleontological resources by increasing the potential extent of surface disturbing activities and human presence in the planning area compared to Alternative A.

Impacts to paleontological resources from wildland fire management would be similar to Alternative A. Additional management such as wildfire suppression, heavy equipment usage, and prohibitions for using chemical fire suppression agents in special designations and rock art sites would not be as restrictive. The management under Alternative C could decrease the potential for direct fire damage to known paleontological resources in those areas, but if suppression activities involved significant land surface disturbances, direct and indirect impacts to paleontological resources could occur.

Impacts to paleontological resources from the management of riparian, wetland, fish, wildlife, and special status species habitats would be similar to those described under Alternative A, except that smaller surface disturbing and/or surface use distance buffer zones would be applied around developments and operations. The management could increase the potential for direct destruction or damage to known and unknown paleontological resources through surface disturbance, impacts to soil/rock stability, and amplified detrimental erosion when compared to Alternative A.

Impacts from the management of cultural resources would have similar impacts on paleontological resources as those described under Alternative A, except that only imposing minimum required restrictions would provide fewer protections against surface occupancy or disturbances that could lead to detrimental erosion, paleontological site or fossil damage, or degradation of scenic views.

Paleontological resource management actions under this alternative are the same as Alternative A. Impacts from this management are the same as those described under Alternative A.

Impacts to paleontological resources from the management of visual resources would be the same as those described under Alternative A. Under Alternative C, approximately 226,629 acres would be classified as VRM Class I (912 more than Alternative A), 607,899 acres VRM Class II (25,227 more than Alternative A), 395,683 acres VRM Class III (219,809 fewer than Alternative A), and 2,374,706 acres as VRM Class IV (194,283 more than Alternative A).

Impacts to paleontological resources from the management of ROWs is similar to Alternative A, except 225,784 acres would be designated as exclusion for ROWs, 200,925 fewer than Alternative A, and 31,018 acres would be designated as ROW avoidance areas, 705,120 fewer than Alternative A. This management could increase the potential for direct destruction or damage to known and unknown paleontological resources through surface disturbance, impacts to soil or rock stability, and amplified erosion.

Impacts to paleontological resources from the management of back country byways could reduce public visitation areas along these routes, which could decrease the potential for damage to paleontological resources through unauthorized removal of fossils or intentional acts of vandalism.

Impacts to paleontological resources from the management of livestock grazing would be similar to Alternative A. Properly managed grazing could serve as a vegetation treatment that supports soil and vegetation health. Livestock grazing that is not managed correctly could result in excessive vegetation loss and surface disturbances that degrade soil health and stability and amplify erosion which could inflict direct damage or destruction to paleontological resources. Reducing total authorized use for grazing could reduce damage to paleontological resources from livestock; however, because management is continuing actual livestock use, it is likely that few changes would occur beyond those described under Alternative A.

Impacts to paleontological resources from recreation management would be similar to those described under Alternative A. Under this alternative, the management could open areas in the planning area to more surface disturbing activities from recreation use and allow greater access by humans into areas with fewer recreational management controls. The management could increase the potential for direct damage to known and unknown paleontological resources through surface disturbance, impacts to soil and rock stability, and amplified detrimental

erosion. Increased presence of humans could result in fossil vandalism or removal. However, the discovery of previously unknown paleontological resources would be more likely to occur in areas where surface disturbing activities and human presence are high.

Impacts to paleontological resources from OHV management would be similar to those described under Alternative A, except that this alternative would allow approximately 500 more acres of open areas within 13,332 acres compared to Alternative A. Under Alternative C, 225,537 acres would be closed to vehicle use, and 3,365,374 acres would be limited to designated roads and trails.

Impacts to paleontological resources from the management to protect congressionally designated and/or eligible trails, and NHTs would be similar to those described under Alternative A. Alternative C would include less restrictive management for surface disturbing activities which could increase human-caused surface disturbing activities and human presence compared to Alternative A.

Impacts to paleontological resources from the management of WSAs and WSRs would result in fewer protections to fossil resources within the 9.7 miles of rivers described under Alternative A.

Under this alternative, no ACECs would be retained and the management would provide fewer protections to known and unknown paleontological resources in these areas by increasing the potential for surface disturbing activity and occupancy.

### 4.13.3 Alternative D

Impacts to paleontological resources from water resource management, geophysical exploration, fire and fuels, forests and woodlands, vegetation, riparian and wetland, fish and wildlife, special status species, cultural resource, back country byways, and livestock grazing management would be the same as those described under Alternative A. Under this alternative, impacts on paleontological resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts to paleontological resources from the management of soil and geologic resources would be similar to those discussed under Alternative A, except there would be more measures to protect soil properties and maintain or improve soil health. Management for soil health, cover, and stability could provide greater protections to unknown and known paleontological resources by reducing the potential of erosion.

Under Alternative D, lands with wilderness characteristics would be managed for multiple use or existing management, which could allow for more surface disturbing activities compared to Alternative B.

Under Alternative D, approximately 4,737 oil, gas, and CBNG wells would be developed within the planning area (Map 2-9), which would be 36 fewer wells as compared to Alternative A. There would be 32,587 acres of initial surface disturbance and 9,397 acres of long-term disturbance from oil and gas development; 244 fewer acres of initial surface disturbance and 69 fewer acres of long-term disturbance compared with Alternative A. Under this alternative, 768,989 acres in the planning area are closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development, 228,968 more acres than Alternative A. Under Alternative D, 2,172 acres would be managed with NSO stipulations, which is 156,439 fewer acres than Alternative A. Applying CSU stipulations on 1,238,899 acres, 517,767 acres more than Alternative A, and TLS on 1,911,167 acres, 70,200 acres more than Alternative A, would offer similar protections as Alternative A.

Impacts from locatable, leasable, and saleable mineral exploration, development, and operations would be similar to those described under Alternative A, although smaller areas of land are closed to solid mineral leasing. Approximately 482,272 acres would be proposed for withdrawal from locatable mineral entry, 74,286 fewer acres

than Alternative A, and 362,009 acres would be closed to mineral material sales and disposals, 471,710 fewer acres than Alternative A. Under Alternative D, 610,342 acres would be closed to coal leasing, 124,378 more acres than Alternative A, 1,557,520 acres would be closed to oil shale leasing, 829,715 more acres than Alternative A, and 389,552 acres would be closed to trona leasing, 34,081 fewer acres than Alternative A.

Under Alternative D, management of paleontological resources would have impacts similar to Alternative A; however, additional management for the Farson Fossil Fish Beds could protect the paleontological site.

Impacts to paleontological resources from VRM would be similar to Alternative A except that more acres would be managed as VRM Class II and III, and fewer acres as Class IV compared to Alternative A. Approximately 225,703 acres would be classified as VRM Class I, which is nearly the same as Alternative A, 1,178,718 acres as VRM Class II, 596,046 acres more than Alternative A, 738,311 acres as VRM Class III, 122,819 acres more than Alternative A, and 1,455,234 acres as VRM Class IV 725,189 acres less than Alternative A. More acreage managed under VRM Class II would provide greater protections to known and unknown paleontological resources by minimizing surface disturbing activities, human presence, and occupancy which could lower the potential for direct damage or destruction, indirect impacts from erosional forces, and setting degradation.

Impacts on paleontological resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be reduced. The number of acres designated as ROW exclusion areas would be increased to 286,289 acres, 140,420 fewer acres compared with Alternative A (Table 2-10 in Appendix V, Map 2-29), which could reduce the area in which ROW development activities are prohibited. This could increase potential impacts on paleontological resources from ROW development from surface disturbing activities.

Impacts to paleontological resources from recreation management would be similar to those described under Alternative A. SRMA management could reduce surface disturbance in some areas and protect paleontological resources from damage or exposure from excavation or erosion. However, increased use in the remaining SRMAs could lead to vegetation loss or erosion, which could expose unknown paleontological resources, but could put the resources at risk from vandalism, damage, or illegal collection.

Impacts to paleontological resources from OHV management would be similar to those described under Alternative A. The same number of acres would be managed as OHV open and closed areas (12,831 and 225,537 acres). Impacts from 3,367,576 acres managed as open to designated roads and trails would be the same as those described under Alternative A although all roads would be managed as ‘designated’ rather than for ‘existing’ roads and trails.

Impacts to paleontological resources from the management to protect congressionally designated and/or eligible trails, and NHTs would be similar to those described under Alternative A. Under Alternative D, additional protective measures proposed such as larger buffer zones and specific closures and restrictions would be applied to these areas to a greater degree when compared to Alternative A.

Impacts to paleontological resources from the management of WSAs would be very similar to those described under Alternative B. Slightly fewer protections for surface disturbance within these areas could increase the potential for direct or indirect damage or destruction to paleontological resources as compared to Alternative B.

Impacts to paleontological resources from the management of WSRs would be the same as those described under Alternative B.

Impacts to paleontological resources from the management of ACECs and special management areas would be similar to those described under Alternative A. Under Alternative D, 246,634 acres would be managed as ACECs,

39,816 fewer acres compared to Alternative A. Approximately 312,980 acres would be special management areas, 267,030 fewer acres compared to Alternative A.

## 4.13.4 Proposed RMP

Under the Proposed RMP, impacts on paleontological resources from management of water resources, geophysical exploration, fire and fuels, forests and woodlands, vegetation, riparian and wetland, fish and wildlife, special status species, cultural resources, back country byways, and livestock grazing resources would be the same as those described under Alternative A. Under this alternative, impacts on paleontological resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for air quality, invasive species and pest management, and public safety.

Impacts on paleontological resources from the management of soil and geologic resources would be similar to those discussed under Alternative A, except that, similar to Alternatives B and D, there would be more measures to protect soil properties and maintain or improve soil health. Management for soil health, cover, and stability could provide greater protections to unknown and known paleontological resources by reducing the potential of erosion.

Management actions related to the preservation of land with wilderness characteristics under the Proposed RMP are mostly the same as those described under Alternative D. No areas under the Proposed RMP would have management specifically for the preservation of land with wilderness characteristics, allowing for a greater potential for ground-disturbing activities, which could affect paleontological resources.

Impacts from locatable, leasable, and saleable mineral exploration, development, and operations would be similar to those described under Alternative A, except that generally more of the planning area would be closed/withdrawn or managed for surface use restrictions. Under the Proposed RMP 1,076,039 acres in the planning area are closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (536,018 more acres than Alternative A); 900,204 acres are proposed for withdrawal from locatable mineral entry (343,646 more acres than Alternative A); and 884,906 acres are closed to saleable mineral development and/or disposals (51,187 more acres than Alternative A) (Tables 2-3, 2-4, and 2-8 in Appendix V). Activities related to shaling and other methods of resource extraction could affect paleontological resources through potential soil exposure to wind and water erosion and subsequent soil degradation and loss. The impact would be mitigated by following Wyoming State Protocol, BLM guidelines, and the Paleontological Resources Preservation Act wherever applicable, which could add additional costs to project development and management. Under the Proposed RMP, more acres would be closed to fluid minerals (99% increase compared with Alternative A) and many areas that remain open would be subject to NSO and CSU stipulations, which would avoid or reduce potential impacts on paleontological resources from surface-disturbing activities compared to Alternative A. However, compared to Alternative B, management of mineral resources under the Proposed RMP would allow substantially more development, which would increase the potential for effects to known and unknown paleontological resources compared to that alternative.

The Proposed RMP includes paleontological resources management actions from Alternative D that are generally less restrictive to surface-disturbing activities. Specifically, Adobe Town and Desolation Flats/Point will not be designated as a new management area and no new restrictions would be placed on mineral extraction from the surroundings. The Farson Fossil Fish Beds (199 acres) would be designated as a ROW avoidance area and surface-disturbing activities could occur on a case-by-case basis. Such activities would proceed following BLM mitigation policies in addition to the Paleontological Resources Preservation Act.

Impacts on paleontological resources from VRM would be similar to Alternative A except that more acres would be managed as VRM Class II, and fewer acres would be managed as VRM Class IV. Approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A) and 1,929,258 acres as VRM Class IV (251,165 fewer acres than Alternative A). More acreage managed under VRM Class II and less acreage

under VRM Class IV would provide greater protections to paleontological resources by minimizing surface-disturbing activities, human presence, and occupancy, which could lower the potential for direct damage or destruction and indirect impacts from erosional forces. Impacts on paleontological resources from VRM under the Proposed RMP would be most similar to those described under Alternative D.

Impacts on paleontological resources resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). ROW exclusion and (to a lesser extent) avoidance areas could reduce potential impacts on paleontological resources from ROW development.

Impacts on paleontological resources from recreation management would be similar to those described under Alternative A, except that, similar to Alternative D, the Proposed RMP would have fewer potential impacts from recreation on cultural resources. Under the Proposed RMP, 159,505 fewer acres are designated as SRMAs compared with Alternative A. SRMA management could reduce surface disturbance in some areas and protect paleontological resources from damage or exposure from excavation or erosion. However, increased use in the remaining SRMAs could lead to vegetation loss or erosion, which could expose unknown paleontological resources and could put the resources at risk from vandalism, damage, or illegal collection.

Impacts on paleontological resources from managing special designation areas would be similar to those described under Alternative A, except they would occur over more acres and thereby offer greater protections to important historic, cultural, wildlife, special status plants, and scenic values in these areas as determined by the management area direction. The acres designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase compared with 10 ACECs under Alternative A). Overall management of special designation areas under the Proposed RMP would limit surface disturbance to a greater extent than Alternative A by restricting the types of activities allowed in the areas and thus decreasing the potential for impacts on paleontological resources. The Proposed RMP would have greater protection of paleontological resources through management of ACECs compared to Alternatives A, C, and D but less than Alternative B.

NHT management and beneficial impacts on paleontological resources due to restrictions on surface-disturbing activities would be the same as under Alternative D, but substantially less than under Alternative B. Projects involving ground disturbance may affect known and unknown paleontological resources throughout the planning area.

Impacts on paleontological resources from WSA management would be the same as those described under Alternative D.

Impacts on paleontological resources from the management of WSRs would be the same as those described under Alternative B.

# 4.14 LANDS WITH WILDERNESS CHARACTERISTICS

## 4.14.1 Alternative B

Under Alternative B, nearly all of the resource uses that could potentially impact lands with wilderness characteristics would be prohibited in these areas, which would eliminate nearly all of the impacts described under Alternative A. All nine areas determined to contain wilderness characteristics would be managed as closed to the leasing, exploration and/or development of fluid and solid minerals, unavailable for saleable mineral disposal, withdrawn from locatable mineral entry, and managed as ROW exclusion areas. In addition, motorized travel

would be allowed only to access state and private land parcels. The impacts resulting from managing livestock grazing and developing range improvements would be the same as those described under Alternative A.

## 4.14.2 Alternative C

Impacts on lands with wilderness characteristics resulting from the leasing and development of mineral resources would be similar to those presented under Alternative A, except the impacts would be increased because the nine areas with wilderness characteristics would not be managed to protect those characteristics. Implementing fewer restrictions on mineral development designed to protect sensitive natural and cultural resources would decrease the areas in which mineral development is limited or prohibited. Under this alternative, 0.2 acres would be closed to fluid mineral leasing (99.9% decrease compared with Alternative A) (Table 2-4 in Appendix V, Map 2-8), 0.2 acres would be closed to coal leasing (99.9% decrease compared with Alternative A), 0.2 acres closed to oil shale (a 99.9% decrease compared with Alternative A) (Table 2-7 in Appendix V, Map 2-13), 0.2 acres would be proposed for withdrawal from locatable mineral development (99.9% decrease compared with Alternative A) (Table 2-3 in Appendix V, Map 2-3), 2,835 acres would be closed to saleable mineral development (95% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-18) and 2,835 acres would be managed as NSO areas (82% decrease compared with Alternative A) across the nine areas with wilderness characteristics. This decrease in such restrictions could result in increased mineral development activity in these areas and thereby an increase in related surface disturbances, visual intrusions, noise, and the presence of people, vehicles and facilities, all of which would further degrade naturalness and reduce opportunities for solitude and primitive recreation compared with Alternative A.

Impacts on lands with wilderness characteristics resulting from managing the lands and realty program would be similar to those presented under Alternative A, except the impacts would be increased. Implementing fewer restrictions on the development of ROWs to protect natural and cultural resources would decrease the areas in which ROW development is limited or prohibited. Under this alternative, 0.2 acres would be managed as ROW exclusion areas (99.9% decrease compared with Alternative A) and 39,762 acres would be managed as ROW avoidance areas (32% decrease compared with Alternative A) across the nine areas with wilderness characteristics (Table 2-10 in Appendix V, Map 2-28). This decrease in areas in which ROWs are excluded or avoided could increase the development of ROWs, which would increase related surface disturbances, visual intrusions, noise, and the presence of people, vehicles, and facilities. This, in turn, would further degrade naturalness and reduce opportunities for solitude and primitive recreation compared with Alternative A.

Impacts on lands with wilderness characteristics resulting from managing OHV use would be similar to those presented under Alternative A, except the impacts would be slightly reduced. The portions of the lands with wilderness characteristics that are managed as limited to existing roads and trails under Alternative A (35,483 acres) would be re-designated as limited to designated roads and trails. Because specific routes in these areas would be closed as part of the comprehensive trails and travel management planning process, the number of roads on which OHVs and other vehicles could travel would be reduced. This, in turn, would decrease the presence of vehicles and related impacts on opportunities for solitude and primitive recreation.

Impacts resulting from managing livestock grazing and developing range improvements would be the same as those described under Alternative A.

## 4.14.3 Alternative D

Impacts on lands with wilderness characteristics resulting from the leasing and development of saleable minerals and coal resources would be similar to those presented under Alternative A, except the impacts would be increased. Under this alternative, across the nine areas with wilderness characteristics, 23,603 acres would be closed to saleable mineral development (57% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-19) and 0.22 acres would be closed to the development of coal resources (99.9% decrease compared with

Alternative A) (Table 2-7 in Appendix V, Map 2-14). This decrease in such restrictions could result in increased mineral development activity in these areas and thereby an increase in related surface disturbances, visual intrusions, noise, and the presence of people, vehicles and facilities, which would degrade naturalness and opportunities for solitude compared with Alternative A.

Impacts on lands with wilderness characteristics resulting from the leasing and development of fluid minerals and oil shale resources would be similar to those presented under Alternative A, except the impacts would be decreased. Implementing greater restrictions on the development of fluid minerals and oil shale resources designed to protect sensitive natural and cultural resources would increase the areas in which mineral development is limited or prohibited. Under this alternative, across the nine areas with wilderness characteristics, 20,779 acres would be closed to fluid mineral leasing (17% increase compared with Alternative A) (Table 2-3 in Appendix V, Map 2-9) and 20,783 acres would be closed to oil shale leasing (75% increase compared with Alternative A) (Table 2-7 in Appendix V, Map 2-14). This increase in such restrictions could result in decreased mineral development activity in these areas and thereby a decrease in related surface disturbances, visual intrusions, noise, and the presence of people, vehicles and facilities, all of which would help to maintain naturalness and opportunities for solitude and primitive recreation compared with Alternative A.

Impacts on lands with wilderness characteristics resulting from managing the lands and realty program would be similar to those presented under Alternative A, except the impacts would be increased. Implementing fewer restrictions on the development of ROWs to protect natural and cultural resources would decrease the areas in which ROW development is prohibited. Under this alternative, across the nine areas with wilderness characteristics, 0.22 acres would be managed as ROW exclusion areas (99.9% decrease compared with Alternative A). This decrease in areas in which ROWs are excluded could increase the development of ROWs, which would increase related surface disturbances, visual intrusions, noise, and the presence of people, vehicles, and facilities, which would degrade naturalness and opportunities for solitude compared with Alternative A.

Impacts on lands with wilderness characteristics resulting from managing OHV use would be similar to those presented under Alternative A, except the impacts would be slightly reduced. The portions of the lands with wilderness characteristics that are managed as limited to existing roads and trails under Alternative A (35,483 acres) would be re-designated as limited to designated roads and trails. Because specific routes in these areas would be closed as part of the comprehensive trails and travel management planning process, the number of roads on which OHVs and other vehicles could travel would be reduced. This, in turn, would decrease the presence of vehicles and related impacts on opportunities for solitude and primitive recreation.

Impacts resulting from managing livestock grazing and developing range improvements would be the same as those described under Alternative A.

## 4.14.4 Proposed RMP

Impacts on lands with wilderness characteristics resulting from proposed management actions would be similar to those presented under Alternative A and Alternative D, except the impacts would be reduced. Impacts from managing lands with wilderness characteristics would be increased compared to Alternative B, because that alternative would manage lands with wilderness characteristics to preserve those characteristics as well as pursue acquisitions of state parcels to expand lands with wilderness characteristics. Like under Alternatives A and D, lands with wilderness characteristics would not be managed for wilderness characteristic values, and instead would follow other management direction including more emphasis on multiple uses. Under the Proposed RMP alternative, five lands with wilderness characteristics are within ACECs proposed for the Red Desert area and would be managed as part of the South Wind River ACEC and expanded Steamboat Mountain ACEC, two lands with wilderness characteristics are within the Little Mountain ACEC and would be managed for that ACEC's values, and two lands with wilderness characteristics are within the Salt Wells area and would be managed for multiple-use consistent with that area. These overlapping special designations would limit development activities

in these areas, reducing potential effects on their wilderness characteristics to a greater degree than if these designations were not in place. The lands with wilderness characteristics that now occur in the Salt Wells area may experience potential impacts from multiple uses but management in this area is designed to reduce adverse impacts. The Proposed RMP would not pursue land acquisitions in support of preserving wilderness characteristics.

Impacts on lands with wilderness characteristics resulting from the leasing and development of saleable minerals and coal resources would be similar to those presented under Alternative D, except the impacts would be decreased with more areas closed to salable minerals (Appendix V; Table 2-7).

# 4.15 VISUAL RESOURCES

## 4.15.1 Alternative B

Impacts to visual resources from the management of air quality, geophysical exploration, and Greater sage-grouse would be the same as those described under Alternative A.

Impacts to visual resources from the management of physical resources would be similar to those described under Alternative A. Additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements, would provide even greater protection to visual resources as compared to Alternative A. The management would prevent or reduce possible changes to scenic elements of the landscape, preserve scenic quality, and reduce changes in line, form, color, and texture of the visual environment.

Impacts to visual resources from locatable mineral development would be similar to those described under Alternative A. Under Alternative B, 1,993,908 acres would be pursued for withdrawal from locatable mineral entry, 1,437,350 more acres compared to Alternative A. Approximately 2,186,218 acres would be closed to geothermal leasing, 1,646,197 more acres when compared to Alternative A. These lands could retain their scenic integrity, have fewer changes to scenic elements of the landscape, and prevent changes in line, form, color, and texture of the visual environment.

Impacts to visual resources from oil and gas development would be similar to those described under Alternative A. Alternative B would apply greater restrictions on development through closures and NSO stipulations, which would retain their scenic integrity, have fewer changes to scenic elements of the landscape, and prevent changes in line, form, color, and texture of the visual environment (Table 4-19 in Chapter 4). Under Alternative B, 2,186,218 acres would be closed to fluid mineral leasing, 1,646,197 more acres than under Alternative A, and 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Impacts to visual resources from applying CSU and TLS would be similar to those described under Alternative A, but with 99,674 acres with CSU stipulations and 713,837 acres with TLS.

Impacts to visual resources from solid leasable and saleable minerals would be similar to those described under Alternative A. Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The larger areas of closures would protect the visual resources to a greater degree than Alternative A by retaining the natural character and preventing disruption of the line, form, color, and texture of the landscape.

Impacts to visual resources from the management of biological resources would be similar to those described under Alternative A. Additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements would provide even greater protection to visual resources as compared to Alternative A.

Impacts to visual resources from cultural, recreation, and special designation management would be similar to those described under Alternative A. Additional protective management to prevent surface disturbance or development activities, along with management to protect scenic resources would provide even greater protection to visual resources as compared to Alternative A.

Under Alternative B, the impacts from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,785 acres, 68 acres more than Alternative A), and VRM Class III (666,522 acres, 51,030 acres more than Alternative A) (Table 4-20 in Chapter 4). Under Alternative B, 2,148,902 acres would be managed as VRM Class II, 1,566,230 more acres than Alternative A. Under Alternative B, 563,754 acres would be managed as VRM Class IV, 1,616,669 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification.

Impacts to visual resources from ROW management would be the same as those described under Alternative A; however, under Alternative B, 2,480,876 acres would be managed as ROW exclusion areas. The management would retain the visual character and naturalness of these areas within 2,130,936 more acres as compared to Alternative A. Fewer acres would be managed as avoidance areas, 133,903 acres under Alternative B, 602,235 fewer acres than Alternative A (Table 2-10 in Appendix V).

Impacts to visual resources from OHV management would be the same as those described under Alternative A. Under Alternative B, there would be no category called “limited to existing roads and trails.” While the routes would be moved under the “limited to designated roads and trails” for a total of 3,367,576 acres impacts to visual resources would be similar to those described under both categories under Alternative A.

## 4.15.2 Alternative C

Impacts to visual resources from the management of physical resources, with the exception of lands with wilderness characteristics, would be the same as those described under Alternative A. Impacts to visual resources from geophysical exploration, biological resources, cultural and recreation management would be the same as those described under Alternative A.

Under Alternative C, not managing lands with wilderness characteristics for their wilderness characteristics could allow for surface disturbance and would remove the VRM Class II management for these areas. This removal of protections could result in soil and vegetation disturbance, construction of roads and pipelines, and the presence of permanent structures that would create noticeable visual contrast to the landscape.

Impacts to visual resources from locatable mineral development would be similar to those described under Alternative A. Under Alternative C, 234,961 acres would be pursued for withdrawal from locatable mineral entry, 321,597 fewer acres compared to Alternative A. Visual resources could be affected by increased mining activity from surface disturbance, mining equipment, or increased vegetation loss near mining claims.

Impacts to visual resources from geothermal leasing would be the same those described under Alternative A. Approximately 225,782 acres of the planning area would be closed to geothermal leasing, 314,239 fewer acres compared to Alternative A.

Impacts to visual resources from oil and gas development would be similar to those described under Alternative A. Closing 225,782 acres to fluid mineral leasing would close 314,239 fewer acres than under Alternative A. Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than Alternative A. CSU stipulations would be applied to 215,890 acres, 505,242 fewer acres compared to Alternative A, and TLSs would be applied to 1,355,485 acres, 485,482 less acres compared to Alternative A.

Impacts to visual resources from solid leasable and saleable minerals would be similar to those described under Alternative A. Under Alternative C, 226,219 acres would be closed to coal leasing, 259,745 fewer acres compared to Alternative A, 225,965 acres would be closed to oil shale leasing, 501,840 fewer acres than Alternative A, 225,965 acres would be closed to trona leasing, 226,219 fewer acres than Alternative A, and 226,421 acres of lands would be closed to saleable mineral development, 607,298 fewer acres compared to Alternative A. Areas of lands available to mineral development could result in damage to the natural landscape and disruption of the line, form, color, and texture of the visual environment.

Management for VRM Class I would be 226,629 acres, 912 acres more than Alternative A; VRM Class II would be 607,899 acres, 25,227 acres more than Alternative A; VRM Class III would be 395,683 acres, 219,809 fewer acres than Alternative A; and VRM Class IV, 2,374,706 acres, 194,283 acres more than Alternative A. There would be slightly more acres protected by VRM Classes I and II, but nearly 195,000 more acres subjected to surface disturbing and disruptive activities allowed under VRM Class IV compared to Alternative A.

Impacts to visual resources from ROW management would be similar to those described under Alternative A. Under Alternative C, 225,784 acres would be managed as ROW exclusion areas, 200,925 fewer acres compared to Alternative A. Under Alternative C, 31,018 acres would be managed as ROW avoidance areas, 705,120 fewer acres compared to Alternative A.

Impacts to visual resources from OHV use would be the same as those described under Alternative B.

## 4.15.3 Alternative D

Impacts to visual resources from air quality, and geophysical exploration would be the same as those described under Alternative A.

Impacts to visual resources from the management of physical resources would be similar to those described under Alternative A. Additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements would provide even greater protection to visual resources compared to Alternative A.

Impacts to visual resources from locatable mineral development would be similar to those described under Alternative A. Under Alternative D, 482,272 acres would be pursued for withdrawal from locatable mineral entry, 556,558 fewer acres compared to Alternative A. These areas could allow less surface disturbance as compared to Alternative A, and visual resources could experience less degradation from vegetation loss, soil disturbance, and disruption of the line, form, color, and texture of the landscape. Approximately 768,989 acres would be closed to geothermal leasing, 228,968 more acres compared to Alternative A.

Impacts to visual resources from oil and gas development would be similar to those described under Alternative A. Alternative D would apply fewer restrictions on development through closures and NSO stipulations (Table 2-4 in Appendix V). Under Alternative D, 768,989 acres would be closed to mineral leasing, 228,968 more acres than under Alternative A. Impacts to visual resources from applying NSO, CSU, and TLS would be similar to those described under Alternative A, but with 2,172 acres of NSO, 1,238,899 acres of CSU and 1,911,167 acres of TLS. The smaller areas of NSO (156,439 fewer acres than Alternative A), and larger areas of CSU (517,767 more acres than Alternative A), and TLS (70,200 more acres than Alternative A) could allow for more surface disturbing or disruptive activities compared to Alternative A.

Impacts to visual resources from solid leasable and saleable minerals would be similar to those described under Alternative A. Under Alternative D, 610,342 acres would be closed to coal leasing, 124,378 more acres than Alternative A, 1,557,520 acres would be closed to oil shale leasing, 829,715 more acres than Alternative A, and 389,552 acres would be closed to trona leasing, 34,081 fewer acres compared to Alternative A. Approximately

362,009 acres of lands would be closed to saleable mineral development, 471,710 fewer acres compared to Alternative A.

Impacts to visual resources from the management of biological resources would be similar to those described under Alternative A. Additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements would provide even greater protection to visual resources as compared to Alternative A.

Impacts to visual resources from cultural, recreation, and special designation management would be similar to those described under Alternative A. Under Alternative A, 246,634 acres would be ACECs, 39,816 fewer acres than Alternative A, 312,980 acres would be management areas and other features, 267,030 fewer acres than Alternative A, and 135,549 acres would be SRMAs, 162,561 fewer acres as compared to Alternative A. Additional protective management to prevent surface disturbance or development activities, along with management to protect scenic resources would provide even greater protection to visual resources as compared to Alternative A. The management would preserve the scenic settings and retain the visual resources within the protected areas and the surrounding landscapes.

Under Alternative D, the impacts from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,703 acres, 14 fewer acres than Alternative A). Impacts overall would be similar to Alternative A for VRM, although larger areas of land would be managed as VRM Class II, 1,178,718 acres, 596,046 more acres than Alternative A. Under Alternative D, 738,311 acres would be managed as VRM Class III, 122,819 more acres than Alternative A, and 1,455,234 acres would be managed as VRM Class IV, 725,189 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification.

Impacts to visual resources from ROW management would be the same as those described under Alternative A; however, under Alternative D, 286,289 acres would be managed as ROW exclusion areas. The management would retain the visual character and naturalness of these areas within 140,420 fewer acres as compared to Alternative A. More acres would be managed as avoidance areas, 1,388,618 acres under Alternative D, 652,480 more acres than Alternative A.

Impacts to visual resources from OHV management would be the same as those described under Alternative A. Under Alternative D, there would be no category called “limited to existing roads and trails.” While the routes would be moved under the “limited to designated roads and trails” for a total of 3,367,576 acres impacts to visual resources would be similar to those described under both categories under Alternative A.

## 4.15.4 Proposed RMP

Impacts on visual resources from air quality, geology, geophysical exploration, vegetation communities, wild horses, wildland fire ecology, cultural and paleontological resources, livestock grazing, forest and woodland management, lands and realty, WSAs, WSRs, and public safety would be the same as those described under Alternative A.

Impacts on visual resources from the management of physical resources would be similar to those described under Alternative A. Consistent with Alternative D, additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements, would provide greater protection to visual resources compared to Alternative A. The management would prevent or reduce possible changes to scenic elements of the landscape, preserve scenic quality, and reduce changes in line, form, color, and texture of the visual environment.

Impacts on visual resources from locatable mineral development would be similar to those described under Alternative A. Under the Proposed RMP, 900,204 acres would be pursued for withdrawal from locatable mineral entry, 343,646 more acres compared to Alternative A. Approximately 1,076,039 acres would be closed to geothermal leasing, 536,018 more acres when compared to Alternative A. Compared to Alternative A, a larger area is proposed for withdrawal from locatable mineral entry and similar acreages of closures for solid mineral leasing and mineral materials disposals. Additional withdrawals would reduce visual impacts associated with soil and vegetation disturbance, construction of roads and infrastructure, and the presence of permanent structures associated with mineral development by retaining their scenic integrity and resulting in fewer changes to scenic elements of the landscape and changes in line, form, color, and texture of the visual environment. Compared to Alternative B, substantially smaller closures for solid mineral leasing and mineral materials disposals under the Proposed RMP would increase visual impacts compared to that alternative.

Impacts on visual resources from fluid leasable mineral development would be similar to those described under Alternative A. The Proposed RMP would apply additional restrictions on development through closures (1,076,039 acres) and NSO stipulations (215,437 acres) compared to Alternative A (536,018 and 56,826 additional acres, respectively). Additionally, the Proposed RMP would have fewer restrictions for fluid leasable mineral development compared to Alternative B, resulting in increased potential for impacts on visual resources compared to that alternative.

Impacts on visual resources from solid leasable and saleable minerals would be similar to those described under Alternative A, except over a larger area. Under the Proposed RMP, 766,880 acres would be closed to coal, 1,115,490 acres would be closed to oil shale, and 569,554 acres would be closed to trona leasing and development. Increased areas of closures would protect the visual resources to a greater degree than Alternative A by retaining the natural character and preventing disruption of the line, form, color, and texture of the landscape.

Impacts on visual resources from the management of wildlife and fisheries resources would be similar to those described under Alternative A. Consistent with Alternative D, additional protective management to prevent surface disturbance or development activities, along with mitigation and revegetation requirements, would provide greater protection to visual resources as compared to Alternative A.

Impacts on visual resources from the management of lands with wilderness characteristics would be similar to those under Alternative D. Under the Proposed RMP, lands with wilderness characteristics would not be managed specifically to preserve wilderness characteristic values and instead follow other management direction including more emphasis on multiple uses in areas not covered by overlapping special designations. The Proposed RMP would not pursue land acquisitions of state parcels to expand lands with wilderness characteristics. Under the Proposed RMP, lands with wilderness characteristics would not be closed to mineral or other development, which would increase the potential occurrence of surface-disturbing activities and visual impacts.

Impacts on visual resources from management of land for recreation would be similar to those described under Alternative A. Application of a 0.25-mile NHT corridor and restrictions on ROW and mineral development in the corridor would reduce introduction of visual contrast in the area, although to a substantially lesser degree than the 5-mile NHT corridor applied under Alternative B. In addition, historic roads and trails that are eligible, but not congressionally designated, will be managed according to their historic context and the setting will be analyzed out to 1 mile on either side; this would allow for protections and eliminate conflicts with corridor development. The visual resource impacts from these exceptions are the same as those described for Alternative D.

Impacts on visual resources from special designation management would be similar to those described under Alternative A, but to a greater degree due to a larger area of special designations and management areas under the Proposed RMP. Additional protective management from these special designations and management areas would prevent surface disturbance or development activities, along with management to protect scenic resources that would provide more protection to visual resources as compared to Alternative A, but less than under Alternative

B, which includes substantially more special designations. The management would preserve the scenic settings and retain the visual resources within the protected areas and the surrounding landscapes. The Proposed RMP does, however, include fewer SRMAs than under Alternative A, potentially decreasing attention on managing recreation in these areas and reducing the incidental protection of visual resources.

Impacts from VRM management overall would be similar to those described for Alternative A, although larger areas of land would be managed as VRM Class II. Under the Proposed RMP, impacts from the management of visual resources would be the same as those described under Alternative A for VRM Class I. Management and impacts from VRM Class II would be similar to those described for Alternative D (1,301,004 acres, or 122,286 acres more than Alternative D and 718,332 acres more than Alternative A). Compared to Alternative B, the Proposed RMP manages a substantially smaller area in VRM Class I and II categories, in large part because the Proposed RMP does not include a 15-mile-wide VRM Class II designation for NHTs and surrounding landscapes. Impacts related to managing the majority of the lands in the planning area under the VRM Class III (149,413 acres) and Class IV (1,929,258) designations would be similar to those described under Alternative A, with a slightly smaller area managed to permit the level of surface disturbance allowed within the VRM Class III and IV classifications.

Impacts on visual resources from ROW management would be the same as those described under Alternative A; however, under the Proposed RMP, 921,059 acres would be managed as ROW exclusion areas. Impacts on visual resources from the ROW and renewable energy management would result from the creation of new contrasting visual elements from linear ROWs and renewable energy facilities. Generally, the Proposed RMP ROW restrictions and anticipated level of anticipated impacts fall between those anticipated under Alternatives B and D. The creation of new special management areas, along with buffer zones around sensitive resources, would help limit adverse visual impacts of renewable energy and ROW development.

Impacts on visual resources from OHV management would be the same as those described under Alternative A. Under the Proposed RMP, there would be no category called “limited to existing roads and trails.” While the routes would be moved under the “limited to designated roads and trails” for a total of 3,367,576 acres, impacts on visual resources would be similar to those described under both categories under Alternative A.

# 4.16 LIVESTOCK GRAZING MANAGEMENT

## 4.16.1 Alternative B

Impacts resulting from management of the air quality, fire, cultural resources, recreation, vegetation, and hazardous materials management would be the same as the Alternative A.

Watershed management actions would be more restrictive under this alternative. Increasing the avoidance area around riparian areas and floodplains to 1,320 feet (¼ mile) for fire suppression chemicals and 2,640 feet (½ mile) for salt blocks and other nutritional supplements would provide more protection to forage resources from surface disturbing activities but would allow for less flexibility in constructing water developments and range improvements.

Managing lands with wilderness characteristics specifically to preserve those characteristics would prevent surface disturbance and protect forage resources in these areas, as management actions would include closing these lands to fluid minerals, mineral material sales/disposal, all solid mineral leasing, mineral location, and designating exclusion areas for all new ROWs. These lands would also be managed for VRM Class II, and the state parcels and inholdings within these areas would be pursued for acquisition. However, allowing motorized travel for access to state/private parcels within these areas could result in localized surface disturbance and resulting forage removal and degradation.

Under this alternative, a greater number of acres of land is closed to disturbance than have restrictions compared to Alternatives A. Management actions that restrict surface disturbing activities include continuing to manage livestock grazing areas with site-specific seasonal restrictions, implementing CSU stipulations (99,674 acres), closing areas to oil and gas leasing (2,186,218 acres), and implementing NSO stipulations (813,354 acres). Under this alternative, 2,581,741 acres would be closed to mineral material sales and 1,993,908 acres could be pursued for withdrawal from locatable mineral entry. Restrictions on mineral development and other surface disturbing activities would help prevent the removal of forage resources.

Reclamation of surface disturbances would help mitigate long-term forage loss related to vegetation removal. Effects from most mineral development would be temporary, as the vegetation conditions on most sites ultimately would be reclaimed. Forage resources could be reduced if development outpaces reclamation and replacement of forage.

Impacts from fire and fuels management would be similar to those under Alternative A, except that more acres of wildfire would be allowed to burn for resource benefit. This would result in additional areas requiring rest from livestock grazing to allow recovery of vegetation following a wildfire, which would reduce the flexibility of livestock operations in the short term.

Management actions associated with the fire management program would likely reduce the use of fire suppression, which would reduce the related effects on vegetation communities and the potential for high-intensity fires that lead to extensive forage loss compared to Alternative A.

Forest management actions would result in a mature forest and would reduce forage production and quality for livestock use. Lack of commercial timber harvest would reduce disturbance from roads and maintain vegetation for forage, although distribution of livestock and vehicle access to check, doctor, and move livestock could be reduced compared to Alternative A.

Vegetation would be managed to meet desired plant community (DPC) objectives, which would require livestock operations to incur additional management complexity. Examples include adjustments in season or duration of use, rest from livestock use, additional herding, offsite water developments, and pasture fencing. In most cases, there would be improved forage production that would result in increased weight gains or other benefits to the livestock operation.

Effects from wildlife habitat management on livestock grazing would be similar to Alternative A. More restrictive actions to improve wildlife habitat could benefit livestock grazing.

The increase in VRM Class II acres (to 2,148,902 total acres) would affect construction activities from other resource programs, which would potentially result in a reduction in forage lost as compared with Alternative A.

Under Alternative B, 3,583,798 acres would be available for livestock grazing and 8,576 acres would be unavailable for grazing use. Livestock grazing management actions under this alternative generally would restrict operators by allowing for decreased flexibility in managing livestock. More restrictive measures for range improvements, water developments, and salt and mineral placement would limit protections to forage and surface water resources. Impacts from livestock management actions would be similar to those in Alternative A, except that livestock operations would incur additional management complexity to meet DPC objectives. Construction of range improvements would be considered for the purpose of improving rangeland diversity, condition, and sustainability. This could affect the location, type, and number of range improvements, which could decrease livestock distribution and rangeland use.

Impacts from lands and realty management would be similar to those identified in Alternative A, except that lands would not be considered for disposal. Thus, the loss of AUMs for livestock grazing from the possible disposal of lands would not occur.

The effects on livestock grazing resulting from the development of ROWs would be similar to those identified for Alternative A, except 2,480,876 acres would be excluded from ROW development (481% increase), which would decrease the extent of related forage removal, but could decrease opportunities for access to remote locations within allotments.

Impacts on livestock grazing from managing OHV use would be similar to those presented under Alternative A, except the area currently designated as "limited to existing roads and trails" (2,398,839 acres) would be changed to "limited to designated roads and trails" (3,367,576 acres) and all routes would be designated as open, closed or limited.

Impacts to livestock grazing from special designations/management areas would be similar to those described under Alternative A. Additional protective management for these areas could help reduce forage loss from development or surface disturbing activities.

Actions related to special management areas under this alternative could have a greater effect on livestock grazing. Management actions associated with expansion of existing ACECs and historic settings, and designation of new ACECs, and WSAs would increase the amount of area subject to surface disturbance restrictions and limitations and thus would increase protections to forage resources. However, such expansions and designations could limit construction of water developments and range improvements, potentially affecting livestock operations.

## 4.16.2 Alternative C

Impacts resulting from management of air quality, soils, forests and woodlands, wildlife, cultural resources, VRM, recreation, vegetation, and hazardous materials would be the same as Alternative A.

Watershed management actions would be less restrictive under this alternative. Reducing the avoidance area around riparian areas and floodplains to 250 feet would provide less protection to forage resources from surface disturbing activities but would allow for greater flexibility in constructing water developments and range improvements. In addition, the removal of riparian exclosures would increase available forage for livestock.

All lands identified as having wilderness characteristics would not be managed to protect those characteristics, which would allow for surface disturbing activities in the areas and potential loss of forage resources.

Impacts to livestock grazing would be similar to those described under Alternative A; however, Alternative C provides the greatest opportunity for mineral development and production. This could result in greater surface disturbance that could affect livestock grazing by removing available forage. Management actions that restrict surface disturbing activities include closing areas to oil and gas leasing (225,782 acres) and managing areas with NSO (15,542 acres) and CSU (215,890 acres) stipulations. In addition, 226,421 acres would be closed to mineral material sales and 234,961 acres would be pursued for withdrawal from locatable mineral entry.

Vegetation communities would be managed to prevent the spread of noxious weeds and achieve DPC objectives that emphasize wildlife habitat, livestock grazing, watershed, and biodiversity values which would support forage resources.

Impacts from wildland fire and fuels management would be the same as Alternative A, except for the increased emphasis on fire suppression and decreased use of natural fire. Suppression activities would result in smaller size of fires, which would reduce forage loss, damaged fences, changes in grazing management, and the need for

temporary fencing (to allow for recovery of plants). This would reduce management costs and maintain the flexibility of livestock operations. Reduced use of natural fire in the long term could result in decreased forage production and/or availability for livestock use.

Under Alternative C, reducing total authorized use to highest level of billed use over the last 10 years could reduce the future availability for ranchers to use public lands for livestock grazing. Compared to Alternative A, reducing use to 160,387 AUMs would not allow an increase of actual use and could affect grazing operations by reducing lands available for grazing use. The management could affect livestock operators' ability to increase heard size and subsequent financial growth. However, livestock operators would be able to continue to run livestock on public land in a similar fashion to what they have been doing over the past 10 years. Less restrictive measures for range improvements, water developments, and salt and mineral placement could create short-term benefits for livestock operators but could limit protections to forage and surface water resources. New fence construction would decrease management complexity and indirectly help increase pasture and forage productivity with improved distribution of livestock. This alternative would allow the largest amount of land available for grazing (3,592,374 acres), with no areas managed as unavailable for grazing use.

The effects on livestock grazing resulting from the development of ROWs would be similar to those identified for Alternative A. The difference is that 225,784 acres would be excluded from ROW development (47% decrease), thereby increasing the extent of potential forage removal, but also increasing opportunities for access to remote locations within allotments.

If Congress released the 13 existing WSAs from wilderness consideration, surface uses in the WSAs would be limited or prohibited similarly to the current situation and impacts on livestock grazing would not change.

Under this alternative, no areas would be designated as ACECs and special management areas would not be retained. Removing the restrictions would increase the amount of area subject to surface disturbance restrictions and limitations. Increased mineral development and a reduction in SD/MAs would increase the short-term displacement of livestock and decrease available forage.

## 4.16.3 Alternative D

Impacts on livestock grazing resulting from implementing management actions for air quality, water resources, vegetation, fish and wildlife, special status species, cultural resources, paleontological resources, and recreation would be the same as those presented under Alternative A.

Impacts on livestock grazing from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils would be designated avoidance areas for surface disturbing activities, which would reduce the extent of surface disturbing activities in these areas and thereby reduce the intensity and extent of forage removal and degradation.

Under Alternative D, lands with wilderness characteristics would be managed for multiple use, which could help to reduce development activities within these areas, but to a far lesser degree than under Alternative A. These areas would not be closed to mineral development as they would be under Alternative B, which would increase the potential occurrence of surface disturbing activities. Such activities could result in removal and damage to vegetation resources, which would reduce available forage for livestock.

Impacts on livestock grazing from managing fluid mineral leasing and development would be similar to those discussed under Alternative A, except stipulations that prohibit fluid mineral leasing or prohibit surface occupancy would be applied to a smaller area. Under Alternative D, 768,989 acres would be closed to fluid mineral leasing (42% increase compared with Alternative A) and 2,172 acres would be managed with NSO stipulations (99% decrease compared with Alternative A) (Table 2-4 in Appendix V, Map 2-9). These stipulations would eliminate

surface disturbance from fluid mineral development and thereby eliminate related impacts to forage resources in these areas; however, such impacts would occur across a smaller area compared with Alternative A. Similarly, areas pursued for withdrawal from locatable mineral development would be decreased to 482,272 acres (13% decrease compared with Alternative A), which would eliminate related impacts to forage resources across a smaller area compared with Alternative A.

Impacts on livestock grazing from saleable mineral development activities would be similar to those presented under Alternative A, except where mineral development is prohibited, which would be decreased to 362,009 acres (57% decrease compared with Alternative A) (Table 2-8 in Appendix V, Map 2-19). This would increase the area in which vegetation resources could be impacted by saleable mineral development activities, which would increase the potential for vegetation removal and thereby decrease forage levels for livestock.

Impacts on livestock grazing from managing fire and fuels and forests and woodlands would be the same as those presented under Alternative B.

Impacts on livestock grazing resulting from implementing VRM actions would be similar to those presented under Alternative A, except the number of acres designated as VRM Class II would be increased to 1,178,718 acres (102% increase compared with Alternative A) (Table 2-9 in Appendix V, Map 2-24), which could lead to decreased degradation and removal of forage.

Under Alternative D, 3,589,859 acres would be available for livestock grazing, with 2,515 managed as unavailable for grazing use, about 1,545 fewer acres available for grazing compared to Alternative A. Impacts on livestock grazing resulting from implementing livestock grazing management actions would be similar to those presented under Alternative A, except additional restrictions on the placement of salt and mineral supplements could reduce the level of flexibility regarding livestock grazing management. This would restrict the ability for livestock operators to provide salt and mineral supplements to livestock in these areas of the planning area and thereby reduce overall management flexibility. NEPA analysis considering rangeland suitability prior to authorizing livestock conversions could affect AUM availability for operators depending on the type of livestock being converted.

Impacts on livestock resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except the extent of the impacts would be increased. The number of acres designated as ROW exclusion areas would be decreased to 286,289 acres (33% decrease compared with Alternative A) (Table 2-10 in Appendix V, Map 2-29), which would decrease the area in which ROW development activities are prohibited. This would eliminate impacts on forage resources from ROW development in these areas; however, such impacts would occur across a smaller area compared with Alternative A.

Impacts on livestock grazing from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a smaller area and thereby offer fewer protections to important historic, cultural, wildlife, and scenic values in these areas. This, in turn, could increase surface disturbing activities and related impacts on forage resources. The acres designated as ACECs would be decreased to 246,634 acres (13.9% decrease compared with Alternative A). Management within a portion of the Little Mountain ACEC would require a grazing plan prior to approval of an annual grazing authorization. This management could lead to a delay when livestock use could occur once an operator identifies a desire to graze the within area (previously known as the Red Creek Portion of the Greater Red Creek ACEC, 55,880 acres).

## 4.16.4 Proposed RMP

Impacts on livestock grazing resulting from implementing management actions for air quality, water resources, vegetation, fish and wildlife, special status species, cultural resources, paleontological resources, and recreation would be the same as those presented in Alternative A, which are common to all alternatives.

Under the Proposed RMP, 3,596,265 acres would be available for livestock grazing, with 2,114 acres managed as unavailable for grazing use, which represents 12,467 more acres available for grazing compared to Alternative B and 6,406 more acres available for livestock grazing compared to Alternative D. Consistent with Alternatives A and D, livestock grazing would be authorized at current active use AUM levels. The seasonal big game closures applied under Alternative B are not incorporated into the Proposed RMP, removing effects to livestock permittees from these seasonal closures. Considering rangeland suitability prior to authorizing livestock conversions would affect AUM availability at the same levels as under Alternative D.

Management of vegetation and forage resources within rangeland allotments would be the same as those described under Alternative A.

Impacts on livestock grazing management flexibility from restrictions on placement of salt and mineral supplements around riparian areas and aquatic resources would be the same as those presented under Alternative A, and less than under the larger and more restrictive buffers applied under Alternatives B and D. Management of range improvements would be the same as described under Alternative B; therefore, impacts associated with range improvements would be the same as those described under that alternative.

Under the Proposed RMP, impacts on livestock grazing from implementing soil management actions would be less than those described in Alternatives C and D, but more than Alternatives A and B. The Proposed RMP is a combination of Alternatives B and D and would have similar impacts as previously described under these alternatives. The Proposed RMP opens more areas for surface disturbance activities than management under Alternative B, which may increase disturbance of vegetation resources and forage for livestock. However, implementation of BMPs should avoid or reduce soil impacts at the project level.

Under the Proposed RMP, lands with wilderness characteristics would be managed for multiple use as described in Alternative D. Unlike under Alternative B but similar to Alternative C, these areas would not be closed to mineral development specifically to preserve wilderness characteristics, which increases the potential occurrence of surface-disturbing activities, which could reduce available forage for livestock. Overlapping special designations and management areas would reduce the potential for surface-disturbing activities in some lands with wilderness characteristics.

Impacts on livestock grazing from managing fluid mineral leasing and development would be similar to those described for Alternatives A and D and greater than those described under Alternative B. Under the Proposed RMP, 1,076,039 acres would be closed to fluid mineral leasing, and 215,437 acres would be managed with NSO stipulations. These stipulations would eliminate surface disturbance from fluid mineral development and thereby eliminate related impacts to forage resources in these areas to a greater extent than the management actions described under Alternatives A and D, but less than those described under Alternative B. Similarly, areas closed to salable mineral materials disposals and proposed for withdrawal from locatable mineral entry (884,906 acres and 900,204 acres, respectively) would be greater than those described under Alternatives A and D, but less than those described under Alternative B. These closures would reduce effects on livestock grazing similar to closures for fluid minerals.

Impacts on livestock grazing from managing fire and fuels and forests and woodlands would be similar to those described under Alternative A. However, consistent with Alternatives B and D, greater restrictions on the use of fire suppression agents could make it more difficult to suppress and control wildfires. This could potentially lead to increased loss of forage resources in the event of wildfires.

Impacts on livestock grazing resulting from implementing VRM actions would be similar to those described under Alternatives A and D. Under the Proposed RMP, approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A) and 1,929,258 acres would be classified as VRM Class IV (251,165 fewer acres than Alternative A). This change in VRM classification compared to other alternatives could

allow a greater degree of degradation and removal of forage resources, particularly in VRM Class IV areas; however, it would improve opportunities to install range improvement projects that would benefit livestock grazing operations.

Impacts on livestock resulting from implementing lands and realty actions would be similar to those presented under Alternatives A and D, except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). The Proposed RMP would decrease where ROW development could damage forage resources when compared to Alternatives A and D, but increase the potential degradation of forage resources when compared to Alternative B.

Impacts on livestock grazing from managing special designation areas would be similar to those presented under Alternative A, except more land would be managed as ACECs as opposed to Management Areas and other designations. The acres designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase compared with 10 ACECs under Alternative A). Overall management of special designation areas under the Proposed RMP would limit surface disturbance to a greater extent than Alternative A by restricting the types of activities allowed in the areas and thereby decreasing the potential for impacts on paleontological resources. The typically more resource-protective management applied to ACECs would reduce impacts on livestock by further limiting the ability to disturb forage resources compared to current management. Opportunities for livestock grazing would also be improved compared to Alternative B, because livestock grazing would not be prohibited in the portions of the Greater Red Creek ACEC that prohibit grazing under that alternative.

# 4.17 RECREATION

## 4.17.1 Alternative B

Impacts to recreation resources from the management of air quality, geology, geophysical exploration, wildland fire, grassland and shrubland communities, riparian and wetland resources, lands and realty, back country byways, WSAs, WSRs, and public safety would be the same as those described under Alternative A.

Impacts to recreation resources from the management of soil and water would be similar those described under Alternative A. Alternative B could reduce noise, traffic and visual impacts of mineral development which could affect recreation and the qualities of solitude, vistas, and naturalness.

Management of lands with wilderness characteristics would prevent or reduce noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape. However, management for wilderness characteristics would prevent recreational opportunities related to developed sites, well-marked trails, motorized or mechanical use, and modern facilities. For recreationists seeking primitive or back country experiences, the management would enhance recreational values related to solitude and undisturbed natural environments. Areas with less surface disturbance or disruptive activities could provide more natural conditions to support recreational opportunities such as backpacking, hiking, wildlife viewing, horseback riding, and fishing.

Impacts to recreation resources from locatable mineral development would be similar to those described under Alternative A. Under Alternative B, 1,993,908 acres would be pursued for withdrawal from locatable mineral entry, 1,437,350 more acres compared to Alternative A.

Impacts to recreation resources from geothermal leasing would be the same as those described under Alternative A. Under Alternative B, 2,186,218 acres would be closed to geothermal leasing, 1,646,197 more acres than under Alternative A, supporting opportunities for solitude and primitive/unconfined recreation.

Impacts to recreation resources from mineral development would be similar to those described under Alternative A. Alternative B would apply greater restrictions on development through closures and NSO stipulations, which would prevent or reduce noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape (Table 4-24 in Chapter 4).

Under Alternative B, 2,186,218 acres would be closed to oil and gas leasing, 1,646,197 more acres than under Alternative A, and 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Impacts to recreation would be similar to those described under Alternative A for lands closed to oil and gas leasing and with NSO stipulations, but the management would apply to more acres of land. Under Alternative B, 23,703 acres surrounding campgrounds would be closed to oil and gas leasing, 23,521 more acres than Alternative A, and 12,935 acres would be within lands with NSO stipulations, 12,681 more acres compared to Alternative A.

Impacts to recreation resources from applying CSU and TLS would be similar to those described under Alternative A, but within 99,674 acres of CSU stipulations and 713,837 acres of TLS. These smaller areas of CSU and TLS could allow for some surface disturbing or disruptive activities, but the overall management would have fewer impacts from development activities, more quiet and solitude, and improved opportunities for hunting or viewing large game.

Impacts to recreation resources from solid leasable and saleable minerals would be similar to those described under Alternative A. Under Alternative B, 3,535,546 acres would be closed to coal, 2,122,282 acres would be closed to oil shale, and 2,119,920 acres would be closed to trona leasing and development. The protections to lands closed to solid mineral development would be applied to 2,741,709 fewer acres of land closed to coal, 1,394,477 more acres of lands closed to oil shale, and 1,665,326 more acres closed to trona compared to Alternative A. Approximately 2,581,741 acres of lands would be closed to saleable mineral development, 1,748,022 more acres compared to Alternative A. Recreation taking place in these areas would have fewer impacts from development activities, more quiet and solitude, and improved opportunities for hunting or viewing large game. Approximately 29,545 acres of lands surrounding campgrounds would be closed to saleable mineral development. This management would enhance the quality of recreation experiences, especially for recreationists seeking the opportunity for solitude and primitive/unconfined recreation.

Impacts to recreation resources from forest and woodland management would be similar to those described under Alternative A. Use of more natural processes and prohibiting clear cutting could prevent disruptions in the forest canopy, and would enhance the quality of recreation experiences, especially for recreationists seeking the opportunity for solitude and primitive or unconfined recreation. Forest areas would be less disturbed and could provide habitat for larger numbers of wildlife for viewing or big game for hunting.

Impacts to recreation resources from the management of wildlife, big game, raptors, fisheries and special status species would be similar to those described under Alternative A. Additional management to protect and improve wildlife habitat could support or improve recreational opportunities such as hunting, wildlife viewing, horseback riding, and fishing within the Planning Area.

Impacts to recreation resources from the management of cultural resources would be similar to those described under Alternative A. Additional protective management for reducing the impacts of mineral development and surface disturbing or disruptive activities would reduce visual impacts to recreation opportunities and enhance user experience where solitude and a pristine setting are part of the expectation.

Impacts to recreation from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,785 acres, 68 acres more than Alternative A), and VRM Class III (666,522 acres, 51,030 acres more than Alternative A). Under Alternative B, 2,148,902 acres would be managed as VRM Class II, 1,566,230 more acres than Alternative A. The management for VRM Class II would retain the character

of the landscape, but it could reduce recreational opportunities related to developed recreation sites, overall, it would enhance recreational values related to solitude and natural environments. Under Alternative B, 563,754 acres would be managed as VRM Class IV, 1,616,669 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class IV would be the same as those described under Alternative A, but fewer acres would be subjected to the level of surface disturbance allowed within the VRM Class IV classification.

Impacts to recreation from ROW management would be the same as those described under Alternative A; however, under Alternative B, 2,480,876 acres would be managed as ROW exclusion areas. The management would retain the visual character and naturalness of these areas within 2,130,936 more acres as compared to Alternative A. Fewer acres would be managed as avoidance areas, 133,903 acres under Alternative B, 602,235 fewer acres than Alternative A. This could reduce the extent of disturbed areas, which would reduce visual impacts to recreation opportunities and enhance user experience where solitude and a pristine setting are part of the expectation.

Impacts to recreation from livestock grazing management would be the same as those described under Alternative A. In addition, application of monitoring, greater protection of riparian areas and springs, and range improvements would be implemented to enhance wildlife, watershed, and riparian values. These management actions would improve the condition of these natural resources and consequently would enhance recreational values through improved water quality for water-based recreational activities and improved wildlife habitat for hunting, fishing, and wildlife observation.

Under Alternative B, management for recreation would have impacts similar to those described under Alternative A. Not retaining SRMAs may provide recreationists with a wide range of recreational opportunities, but user conflicts could occur if uses were not specified. Management within the two units of the Wind River Front SRMA (257,680 acres) would still apply, although the SRMA would not be designated. Impacts from the management would be the same as those described under Alternative A.

Impacts to recreation from OHV management would be the same as those described under Alternative A. Under Alternative B, there would be no category called “limited to existing roads and trails.” While the routes would be moved under the “limited to designated roads and trails” for a total of 3,367,576 acres (the sum of limited to designated and limited to existing acres in Alternative A) impacts to recreation would be similar to those described under both categories under Alternative A. Additional management to prohibit and limit OHV would limit vehicular recreation in some areas compared to Alternative A. Recreation taking place in these areas would have fewer impacts from development activities, more quiet and solitude, and improved opportunities for hunting game species or viewing wildlife.

Impacts to recreation from the management of National Historic Trails, the Dry Sandy Swales trail segment, the Overland Trail, the Cherokee Trail, and the Point of Rocks to South Pass Road would be the same as those described under Alternative A. In addition, greater restrictions on mineral development, surface disturbing activities, and construction of towers and other structures would reduce noise, traffic, and visual impacts of mineral or other development to a greater degree than under Alternative A.

Under Alternative B, the Red Desert Watershed Management Area would be divided into a management area (164,143 acres) and the remainder added to the Steamboat Mountain ACEC (176,881 acres). Impacts to recreation from the management of the areas would be similar to those described in Alternative A, but additional management could further reduce noise, traffic, and visual impacts of mineral or other development to a greater degree than under Alternative A.

The Greater Red Creek ACEC would be expanded from 131,600 acres in Alternative A to 468,170 acres, and the Monument Valley ACEC (69,960 acres), the Pinnacles ACEC (1,340 acres), and Big Sandy Openings ACEC (2,020 acres) would be designated in Alternative B. The management for the ACEC expansion and designations

would prevent or reduce noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape. If surface disturbing activities were permitted, the quality of recreation experiences could be diminished where roads, trails, dispersed camping, and other types of recreation occur nearby.

Impacts to recreation from retaining the designation of the Cedar Canyon ACEC (2,540 acres) would be similar to Alternative A, but additional management would allow for fewer surface disturbing or disruptive activities under Alternative B.

Impacts to recreation from retaining the designation of the Greater Sand Dunes ACEC (including the Crookston Ranch and Boar's Tusk Portions, 39,290 acres) and the Oregon Buttes ACEC would be the same as those described under Alternative A.

Impacts to recreation from the management of the Eastern Portion of the Greater Sand Dunes ACEC and the Natural Corrals ACEC (1,110 acres) would be similar to those described under Alternative A. Some additional protective measures to prevent or reduce surface disturbance could prevent or reduce noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape.

Impacts to recreation from the expansion and additional management of the Special Status Plant Species ACEC (3,610 acres), the Steamboat Mountain ACEC (439,330 acres), Pine Spring ACEC (6,480 acres) and White Mountain Petroglyphs ACEC (20 acres) would be similar to those described under Alternative A, but would apply over larger areas of land.

Designating and managing the South Wind River ACEC (374,710 acres) for watershed, sensitive big game habitat, wildlife, and other values could provide a range of recreational opportunities from back country to front country. The management would support recreational opportunities such as hunting, wildlife viewing, and fishing.

Management of National Historic Landmarks could enhance recreational experiences and provide benefits by protecting resources and educating the public about unique historic resources.

## 4.17.2 Alternative C

Impacts to recreation resources from the management of air quality, soils, geology, water, geophysical, wildland fire ecology, forest and woodland management, grassland and shrubland communities, riparian and wetland resources, wildlife, big game, raptors, fisheries, special status species, cultural resources, lands and realty management, land disposals, land acquisitions, renewable energy, and public safety would be the same as those described under Alternative A.

Under Alternative C, not managing lands with wilderness characteristics for their wilderness characteristics could allow for motorized use of the lands, providing greater access to the lands for recreational activities. However, greater access could reduce the natural conditions of the untrammeled, undeveloped landscape. Although more developed recreation activities could be allowed, the areas would continue to provide natural conditions to support recreational opportunities such as backpacking, hiking, wildlife viewing, and fishing.

Impacts to recreation resources from locatable mineral development would be greater than those described under Alternative A. Under Alternative C, 234,961 acres would be proposed for withdrawal from mineral location, 321,597 fewer acres compared to Alternative A. Recreation could be affected by increased mining activity from surface disturbance, mining equipment, or increased vehicle use near mining claims.

Impacts to recreation resources from geothermal leasing would be the same those described under Alternative A. Approximately 225,782 acres of the planning area would be closed to geothermal leasing, 314,239 fewer acres compared to Alternative A.

Impacts to recreation resources from mineral development would be similar to those described under Alternative A. Closing 225,782 acres to fluid mineral leasing would close 314,239 fewer acres than under Alternative A. Under Alternative C, 15,542 acres would be managed with NSO stipulations, which is 143,069 fewer acres than Alternative A. There would be no campgrounds within closed or NSO areas, 132 acres of campgrounds would be within CSU stipulations, TLSs would be applied to 326 acres of campgrounds. CSU stipulations would be applied to 215,890 acres, 505,242 fewer acres compared to Alternative A, and TLSs would be applied to 1,355,485 acres, 485,482 less acres compared to Alternative A.

Impacts to recreation resources from solid leasable and saleable minerals would be similar to those described under Alternative A. Under Alternative C, 226,219 acres of lands would be closed to coal leasing, 259,745 fewer acres compared to Alternative A. 225,965 acres would be closed to oil shale leasing, 501,840 fewer acres than Alternative A, 225,965 acres would be closed to trona leasing, 228,629 fewer acres than Alternative A, and 226,421 acres of lands would be closed to saleable mineral development, 607,298 fewer acres compared to Alternative A. Development could reduce populations of game species, which could reduce hunting success levels and the overall quality of hunting experiences, as well as wildlife viewing opportunities. Approximately 436 acres surrounding campgrounds would be open to saleable mineral development.

Impacts to recreation from the management of visual resources would be very similar to those described under Alternative A. Management for VRM Class I would be 226,629 acres, 912 acres more than Alternative A; VRM Class II would be 607,899 acres, 25,229 acres more than Alternative A; VRM Class III would be 395,683 acres, 255,807 fewer acres than Alternative A; and VRM Class IV, 2,374,706 acres, 194,283 acres more than Alternative A. There would be slightly more acres protected by VRM Classes I and II, but nearly 195,000 more acres subjected to surface disturbing and disruptive activities allowed under VRM Class IV compared to Alternative A.

Impacts to recreation from ROW management would be similar to those described under Alternative A. Under Alternative C, 225,784 acres would be managed as ROW exclusion areas, 200,925 fewer acres compared to Alternative A. Under Alternative C, 31,018 acres would be managed as ROW avoidance areas, 705,120 fewer acres compared to Alternative A. Surface disturbing and disruptive activities could diminish the visual quality and experience of primitive or back country landscapes to a greater degree than under Alternative A.

Not retaining back country byways could remove some recreation opportunities associated with sightseeing, driving for pleasure, and viewing wild horses.

Impacts to recreation from livestock grazing would be similar to those described under Alternative A, however, allowing livestock grazing in and around campgrounds could reduce the presence of vegetation, cause physical damage to facilities, increase visible waste, and possibly cause recreationists to relocate if large numbers of livestock were present. Some people enjoy seeing livestock when visiting the West, and the presence or evidence of livestock could contribute to the enjoyment of their experience.

Management for recreation would have impacts similar to those described under Alternative A. Under Alternative C, emphasis of management for recreation would provide greater opportunities for recreational experiences compared to Alternative A. Managing the Oregon Buttes, Honeycomb Buttes, Steamboat Mountain, Leucite Hills, Pine Mountain, and Cedar Canyon for their continuing value for recreational opportunities could give recreationists greater opportunities for motorized use, camping, developed recreation sites, or group activities.

Designating the Little Mountain Area as a SRMA and retaining the Green River and Wind River Front SRMAs for both motorized and non-motorized use would provide a range of recreational opportunities for those seeking a more natural back country experience, and those desiring a more developed or vehicle-oriented recreation experience. OHV use in these areas could increase conflicts between users and displace some non-motorized users and degrade the back country recreation experience in these areas.

Designating Red Creek Area as a SRMA and retaining the Continental Divide Snowmobile Trail SRMA would support a back country experience for recreationists. The management would prevent or reduce noise, OHV use, developed recreation sites, and support the natural character of the landscape. For recreationists seeking back country experiences, the management would enhance recreational values related to natural, unmodified environments. Areas with less development would provide more natural conditions to support recreational opportunities such as hunting, mountain biking, horseback riding, wildlife viewing, and fishing.

Retaining the Killpecker Sand Dunes SRMA designation for motorized recreationists to engage in OHV, motorbike, and other motorized hill climbing activities would provide motorized recreation enthusiasts open areas for riding and developed campgrounds, picnic areas, and other facilities for day use and overnight stays. The area would not have as much natural character as the outlying landscape, and the noise, dust, and exhaust may deter recreationists seeking more natural, undisturbed settings from the SRMA. The area could also have less natural character for recreationists in the 15,149 acre portion of the SRMA open to mineral material sales.

Retaining the Oregon and Mormon Pioneer National Historic Trails SRMA designation for historic tourism enhances recreational experiences and provides benefits by protecting historic resources. Impacts to recreation from managing the Green River, Sweetwater River, Big Sandy River, and the Bitter Creek segment between the towns of Rock Springs and Green River and the Wind River Front SRMA (257,680 acres) would be the same as Alternative A.

Impacts to recreation from managing OHV areas would be the same as those described under Alternative B.

Impacts to recreation from the management of National Historic Trails, the Dry Sandy Swales trail segment, the Overland Trail, the Cherokee Trail, and the Point of Rocks to South Pass Road or other historic roads and trails would be the same as those described under Alternative A.

If Congress does not designate WSAs as wilderness, and the areas were managed for multiple use, the opportunity for solitude and primitive or unconfined recreation would likely be affected by an increase in recreation opportunities that current management restricts, such as motorized recreation. An increase in recreation could also increase the potential for conflicts among users and displace some users thereby diminishing the recreation experience in these areas.

WSAs would be managed for multiple use and WSRs, ACECs, and other management areas would not be retained under Alternative C. This management would result in fewer restrictions to surface disturbance or disruptive activities as compared to Alternative A. Where mineral leasing and surface disturbing activities were permitted, the quality of recreation experiences could be diminished where roads, trails, dispersed camping, and other types of recreation occur nearby. Wells and associated facilities, pipelines, increased road traffic, noise, dust, and the visual impact of facilities in otherwise natural areas could reduce the quality of recreation experiences and possibly displace recreationists to other areas. Visual impacts of surface disturbance reduce the naturalness of back country recreation and reduce opportunities for solitude.

Impacts to recreation from the management of National Historic Landmarks would be the same as those described under Alternative B.

## 4.17.3 Alternative D

Impacts to recreation resources from the management of air quality, geology, geophysical exploration, wildland fire ecology, forest and woodland management, grassland and shrubland communities and riparian and wetland resources, lands and realty, WSAs, WSRs, and public safety would be the same as those described under Alternative A.

Impacts to recreation resources from the management of soil and water would be similar those described under Alternative A. Alternative D could reduce noise, traffic and visual impacts of mineral development which could affect recreation and the qualities of solitude, vistas, and naturalness. The management could result in some reduction of allowable motorized recreation activities; however, more restrictions to surface disturbance could support the quality of undeveloped, primitive recreation experiences.

Impacts to recreation from the management of lands with wilderness characteristics for multiple use or existing management could provide a range of recreational experiences in these areas. Management would allow multiple use in some areas, and other areas would continue other management, such as for ACECs. Where lands would be managed to conserve the landscape within ACECs or other protected areas, impacts would be the same as those described under Alternative B. Impacts to recreation from management for multiple use within lands with wilderness characteristics would be the same as those described under Alternative C.

Impacts to recreation resources from locatable mineral entry would be similar to those described under Alternative A. Under Alternative D, 482,272 acres would be pursued for withdrawal from locatable mineral entry, 74,286 fewer acres compared to Alternative A. Alternative D would pursue fewer acres of land from locatable mineral withdrawal, which could increase noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape.

Impacts to recreation resources from geothermal leasing would be similar to those described under Alternative A. Under Alternative D, 768,989 acres would be closed to geothermal leasing, 228,968 more acres compared to Alternative A.

Impacts to recreation resources from mineral development would be similar to those described under Alternative A. Alternative D would apply slightly fewer restrictions on development through closures, which would increase noise, traffic, and visual impacts of mineral or other development and detract from the natural character of the landscape.

Under Alternative D, 768,989 acres would be closed to fluid mineral leasing, 228,968 more acres than under Alternative A. Impacts to recreation would be similar to those described under Alternative A for lands closed to oil and gas leasing, but the management would apply to fewer acres of land. Impacts to recreation resources from applying NSO, CSU, and TLS would be similar to those described under Alternative A, but within 2,172 acres of NSO, 1,238,899 acres of CSU, and 1,911,167 acres of TLS. The smaller areas of closure and NSO with additional areas of CSU and TLS compared to Alternative A could allow for more surface disturbing or disruptive activities with increased impacts from development activities, less quiet and solitude, and degraded opportunities for hunting or viewing big game.

Impacts to recreation resources from solid leasable minerals would be greater than those described under Alternative A. Under Alternative D, 610,342 acres would be closed to coal leasing, 124,378 more acres than Alternative A, 1,557,520 acres would be closed to oil shale leasing, 829,715 more acres than Alternative A, and 389,552 acres would be closed to trona leasing, 34,081 fewer acres compared to Alternative A. Recreation could be affected by increased mining activity from surface disturbance, mining equipment, or increased vehicle use near mining claims. Development may also reduce populations of game species, which could reduce hunting success levels and the overall quality of hunting experiences, as well as wildlife viewing opportunities. This management would affect the quality of recreation experiences, especially for recreationists seeking the opportunity for solitude and primitive/unconfined recreation.

Under Alternative D, 362,009 acres of lands would be closed to saleable mineral development, 471,710 fewer acres compared to Alternative A. Where mining and surface-disturbing activities were permitted, the quality of recreation experiences could be diminished where roads, trails, dispersed camping, and other types of recreation occur nearby.

Impacts to recreation resources from the management of wildlife, big game, raptors, fisheries and special status species would be similar to those described under Alternative A. Additional management to protect and improve wildlife habitat could support or improve recreational opportunities such as hunting, wildlife viewing, horseback riding, and fishing within the Planning Area.

Impacts to recreation resources from the management of cultural resources would be similar to those described under Alternative A. Additional protective management for reducing the impacts of mineral development and surface disturbing or disruptive activities would reduce visual impacts to recreation opportunities and enhance user experience where solitude and a pristine setting are part of the expectation.

Impacts to recreation from the management of visual resources would be the same as those described under Alternative A for VRM Class I (225,733 acres, 14 acres less than Alternative A). Under Alternative D, 1,178,718 acres would be managed as VRM Class II, 596,046 more acres than Alternative A. The management for VRM Class II would retain the character of the landscape, but it could reduce recreational opportunities related to developed recreation sites, overall, it would enhance recreational values related to solitude and natural environments. Under Alternative D, 985,638 acres would be managed as VRM Class III, 370,146 more acres than Alternative A, and 1,455,234 acres would be managed as VRM Class IV, 725,189 fewer acres as compared to Alternative A. Impacts to lands managed as VRM Class III and IV would be the same as those described under Alternative A. Fewer acres managed as VRM Class IV could enhance the quality of solitude, primitive, or unconfined recreation.

Impacts to recreation from ROW management would be similar to those described under Alternative A. Under Alternative D, 286,289 acres would be managed as ROW exclusion areas, 140,420 fewer acres compared to Alternative A. More acres would be managed as avoidance areas, 1,388,618 acres under Alternative D, 652,480 more acres than Alternative A. This could increase the extent of disturbed areas, which would increase visual impacts to recreation opportunities and degrade user experience where solitude and a pristine setting are part of the expectation.

Impacts to recreation from back country byways management would be the same as those described under Alternative A. However, the Wild Horse Loop Tour would be renamed the Pilot Butte Loop Back Country byway.

Impacts to recreation from livestock grazing management would be the same as those described under Alternative A. In addition, application of monitoring, greater protection of riparian areas and springs, and range improvements would be implemented. These management actions would improve the condition of natural resources and consequently would enhance recreational values through improved water quality for water-based recreational activities and improved wildlife habitat for hunting and wildlife observation.

Under Alternative D, impacts to recreation from management of special designations would be greater than Alternative A. Managing the Little Mountain ACEC, South Pass Historic Landscape ACEC, Special Status Plant Species ACEC, Steamboat Mountain ACEC, Oregon Buttes ACEC, extended Pine Springs ACEC, western portion of the Greater Sand Dunes ACEC, Red Desert Management Area, Pine Mountain Management Area, Sugarloaf Basin Management Area, Killpecker Sand Dunes SRMA, Little Mountain SRMA, Continental Divide National Scenic Trail SRMA, and Wind River Front SRMA for recreational opportunities could provide recreationists opportunities for motorized use, camping, developed recreation sites, or group activities. Not retaining certain SRMAs, Management Areas and ACECs could increase user conflicts among recreationists or with other resource uses.

Impacts to recreation from SRMA management would increase as compared to Alternative A. Under Alternative D SRMA acreage would be reduced to 135,549 acres as compared to 298,110 acres under Alternative A, a 55% reduction. Not retaining the Continental Divide Snowmobile Trail SRMA (Community), Green River SRMA

(Community) and Oregon and Mormon Pioneer National Historic Trails SRMA (Destination) could increase user conflicts and decrease opportunities for motorized use, camping, developed recreation sites, or group activities.

Impacts to recreation from managing the Green River, Sweetwater River, Big Sandy River, and the Bitter Creek segment between the towns of Rock Springs and Green River would be the same as Alternative A.

Impacts to recreation from OHV management would be the same as those described under Alternative A. Under Alternative D, there would be no category called "limited to existing roads and trails." While the routes would be moved under the "limited to designated roads and trails" for a total of 3,367,576 acres impacts to recreation would be similar to those described under both categories under Alternative A. Additional management to prohibit and limit OHV use would limit vehicular recreation in some areas compared to Alternative A. Recreation taking place in these areas would have fewer impacts from development activities, more quiet and solitude, and improved opportunities for hunting game species or viewing wildlife.

Impacts to recreation from the management of National Historic Trails, the Dry Sandy Swales trail segment, the Overland Trail, the Cherokee Trail, and the Point of Rocks to South Pass Road would be the same as those described under Alternative A. In addition, greater restrictions on mineral development, surface disturbing activities, and construction of towers and other structures would reduce noise, traffic, and visual impacts of mineral or other development to a greater degree than under Alternative A.

Impacts to recreation from Management Area designations would increase as compared to Alternative A. Under Alternative D, total Management Area acreage would be reduced to 312,980 acres as compared to 580,010 acres under Alternative A, a 46% reduction. Reducing the size of the Red Desert Management Area and not retaining the Monument Valley Management Area, Big Sandy Openings Management Area or West Sand Dunes Archeological District would decrease opportunities for motorized use, camping, developed recreation sites, or group activities. Impacts from the management of the Pine Mountain Management Area (62,760 acres) and Sugarloaf Basin Management Area (87,240 acres) would be the same as those described under Alternative A.

Impacts to recreation from the management of ACECs would be greater than Alternative A. The Little Mountain ACEC (108,010 acres), South Pass Historic Landscape ACEC (53,940 acres), Steamboat Mountain ACEC (47,280 acres), and Greater Sand Dunes ACEC (26,364 acres) would be reduced in size as compared to Alternative A. The Oregon Buttes ACEC (3,440 acres) and Pine Springs ACEC (6,480 acres) would be retained with a minimal increase. The Cedar Canyon ACEC, Natural Corrals ACEC (630 acres), and Pinnacles ACEC would not be retained.

Impacts to recreation from management of the Special Status Plant Species ACEC (1,120 acres), Steamboat Mountain ACEC (47,280 acres) would be similar to those described under Alternative A.

Impacts to recreation from the management of National Historic Landmarks would be the same as those described under Alternative B.

## 4.17.4 Proposed RMP

Impacts on recreation resources from the management of air quality, geology, geophysical exploration, wildland fire ecology, grassland and shrubland communities, wildlife, big game, raptors, fisheries, lands and realty, wild horses, cultural resources, visual resources, livestock grazing, WSAs, WSRs, and public safety would be the same as those described under Alternatives A and D.

Impacts on recreation resources from the management of special status species, riparian and wetland resources, lands with wilderness characteristics, and travel management would be the same as those described under Alternative D.

Impacts on recreation resources from the management of soils would be similar to those described under Alternatives A, B, and D emphasizing available data, updated policy guidance, and case-by-case review to limit surface-disturbing activities. Management under the Proposed RMP could result in some reduction of allowable motorized recreation activities; however, modest restrictions to surface disturbance and targeted BMPs could support the quality of undeveloped, primitive recreation experiences.

Impacts on recreation resources from the management of water resources would be similar to those described under Alternatives A and D. Management for water resources from the avoidance of development in wetlands and floodplains could maintain or enhance the quality of recreation experiences, especially for recreationists seeking the opportunity for solitude and primitive recreation. However, the management could prevent some recreational access if stream crossings were prohibited. Additionally, overnight camping would be prohibited within 50 feet of riparian areas or surface water as described in Alternative D versus the 200-foot setback described in Alternative B. Camping areas would be closed if damage occurs but reopened following successful restoration. This action would maintain recreational values related to solitude and undisturbed natural environments. Furthermore, limiting or closing aquifer recharge areas to fluid minerals and coal development could reduce noise, traffic, and visual impacts of mineral development, which could affect recreation and the qualities of solitude, vistas, and naturalness.

Impacts on recreation resources from locatable mineral development would be similar to those described under Alternatives A and D. Under the Proposed RMP, 900,204 acres would be pursued for withdrawal from locatable mineral entry, a larger closure than proposed under Alternative A (62% more), but approximately 55% less than the acreage proposed under Alternative B. Locatable mineral withdrawals would reduce the potential for noise, traffic, and visual impacts of mineral development, which could affect recreation and the qualities of solitude, vistas, and naturalness.

Impacts on recreation resources from solid leasable and saleable minerals would be similar to those described under Alternative A. The Proposed RMP includes closures to solid leasable minerals and mineral materials consistent with Alternative A, but substantially less than under Alternative B, and would involve fewer restrictions. Development of solid leasable and saleable minerals could reduce hunting experiences and success levels, as well as wildlife viewing opportunities. This would also affect camping experiences where campgrounds are adjacent to solid leasable and saleable mineral development.

Under the Proposed RMP, 1,076,039 acres would be closed to fluid mineral leasing and 215,437 acres would be subject to NSO restrictions, which is a larger area than described under Alternative A but smaller than described under Alternative B. Impacts on recreation would be similar to those described under Alternative A for lands closed to oil and gas leasing, but the management would apply to more acres of land. This larger area of closures and NSO, compared to Alternative A, could limit surface-disturbing or disruptive activities. Minimizing surface-disturbing activities would limit impacts from fluid mineral development and improved preservation of quiet and solitude and opportunities for hunting or viewing wildlife.

Impacts on recreation resources from forest and woodland management would be similar to those described under Alternative B. Specific guidance for providing forest and woodland products to the public, as described in Alternative D, have been included in the Proposed RMP. The case-by-case basis of forest product collection (e.g., posts and poles, firewood, sawlogs, Christmas trees, burlwood, pre-commercial thinning, and cottonwood tree harvesting) could support recreation experiences and public engagement with, and connection to, the landscape for pleasure and hobby.

Impacts on recreational resources from management of back country byways is similar to Alternative D with the retention of Pilot Butte Loop Back Country Byway (renamed from Wild Horse Loop Tour). There is additional emphasis on a case-by-case basis and the Cherokee Trail and Tri-territory Short Loop would not be designated as back country byways for mountain bike use due to concerns for the integrity of cultural/historic values.

Impacts on recreation from the management of visual resources would be the same as those described under Alternative A except that more acres would be managed as VRM Class II and fewer acres would be managed as VRM Class IV. Approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A). The management for VRM Class II would retain the character of the landscape, but it could reduce recreational opportunities related to developed recreation sites; overall, it would enhance recreational values related to solitude and natural environments. Under the Proposed RMP, 1,929,258 acres would be managed as VRM Class IV (251,165 fewer acres than Alternative A). Fewer acres managed as VRM Class IV could enhance the quality of solitude, primitive, or unconfined recreation.

Impacts on recreation from ROW and renewable energy management are similar to those described under Alternative A except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). This could reduce the extent of disturbed areas, which would reduce visual impacts to recreation opportunities and enhance recreational user experience.

The recreation impacts from management of special recreation permits, undeveloped recreation, 14-Mile Recreation Area, firewood cutting, wild horse viewing, and recreational prospecting would be the same as described for Alternative B.

Under the Proposed RMP, surface-disturbing activities would be allowed within ¼ mile of developed recreation sites, on a case-by-case basis, only if they do not adversely affect recreational uses and objectives for the area. This is a reduction from the 3-mile buffer or the visual horizon, whichever is closer, presented in Alternative B. Impacts could be similar to those described under Alternative B but would involve fewer restrictions on development through closures and NSO stipulations, and therefore impacts would be more similar to those of Alternative D. This could reduce populations of game species, which could reduce hunting success levels and the overall quality of hunting experiences, as well as wildlife viewing opportunities. This management would affect the quality of recreation experiences, especially for recreationists seeking the opportunity for solitude and primitive/unconfined recreation.

The Proposed RMP includes five SRMAs, fewer than under Alternative A but more than included under Alternative B, which eliminates all SRMAs. Maintaining SRMAs could provide recreationists opportunities for motorized use, camping, developed recreation sites, or group activities. Not retaining certain SRMAs, management areas, and ACECs could increase user conflicts among recreationists or with other resource uses. Impacts on each SRMA are addressed in the following paragraphs.

Impacts on the Continental Divide National Scenic Trail SRMA in the Proposed RMP would be the same as described under Alternative D, and would have restrictions for ROW exclusions and mineral operations and closures along the trail than under Alternative B. As under Alternative D, where the BLM and State Historic Preservation Officer have agreed that the setting of the NHT in the western portion of the RSFO have been compromised by existing development, the corridor will be reduced to ¼ mile on either side of the NHT and closed to oil shale. The recreation impacts from these exceptions are the same as described for Alternative D and limits on surface-disturbing activities would reduce noise, traffic, and visual impacts of mineral or other development on trail use.

The Green River SRMA would not be retained under the Proposed RMP. Impacts from elimination of this designation are the same as described for Alternative B and could increase user conflicts and decrease opportunities for front and middle country recreation experiences including developed recreation sites, camping, and group activities.

Killpecker Sand Dunes SRMA would be reduced in area to only include the OHV Open Play Area (currently Alternative A is 39,290 acres and would be reduced to 12,802 acres). This reduction is similar to Alternative D

and would focus on OHV open play area and eliminate the WSA portion of the current SRMA, creating a more manageable recreation area without conflicting values (i.e., primitive recreation versus OHV use). Recreation impacts on management areas for Killpecker Sand Dunes SRMA align with those described for Alternative D.

Oregon and Mormon Pioneer NHT SRMA would not be retained. Impacts on recreation are the same as described for Alternative B and could increase user conflicts, reduce historic tourism recreation experiences, and reduce protection of historic resources.

Little Mountain Area would be designated as a new SRMA (40,455 acres) with a Class II VRM designation. Impacts on recreation are the same as described for Alternative D.

Under the Proposed RMP, the Wind River Front SRMA would be reduced in size to only include the eastern unit (Alternative A is 257,680 acres and the Proposed RMP is 85,335 acres). Recreation impacts would include decreased opportunities for middle and back country recreation experiences and an increase in potential user conflicts, similar to those described for Alternative D.

Impacts on recreation from management of special designation areas would be less than under Alternative A but greater than under Alternative B. The Proposed RMP designates 935,135 acres as ACECs, 648,665 more acres (226%) than Alternative A and 670,525 fewer acres compared to the area proposed in Alternative B. Overall management of special designation areas under the Proposed RMP could increase certain types of user conflicts while preventing or reducing noise, traffic, and visual impacts from development and supporting the natural character of the landscape.

Impacts on recreation from eliminating the designation of the Cedar Canyon ACEC (2,540 acres) would be similar to those described for Alternative C. Recreation experiences could be diminished and surface disturbance activities could possibly displace recreationists to other areas, reduce the naturalness of back country recreation, and reduce opportunities for solitude.

Impacts on recreation from reducing the size of the Greater Sand Dunes (Alternative A is 39,290 acres reduced to 26,746 acres) would be the same as described for Alternative D.

Impacts on recreation for Natural Corrals, Oregon Buttes, South Pass Historic Landscape, Special Status Plant Species, and White Mountain Petroglyphs ACECs would be the same as described for Alternative B.

Impacts on Pine Springs ACEC would also be the same as described for Alternative B with the exception that OHV use would not be prohibited (same as Alternative A). OHV and some non-motorized vehicle travel along the eastern edge would be limited to existing roads and trails. This action would maintain opportunities for trail-based OHV recreation within middle country settings and provide vehicle access to less-visited areas of the planning area. It would diminish the quality of primitive recreation and back country experience.

Impacts on recreation for designating South Wind River (281,104 acres) and Big Sandy Openings (1,994 acres) ACECs would be similar as described for Alternative B. The Red Desert Watershed Management Area would not be retained under the Proposed RMP because the area was not found to contain values that meet the relevance and importance criteria. The Steamboat Mountain Area would be expanded to include the Steamboat Mountain Management Area, western portion of the Red Desert Watershed Management Area, and other areas (from 47,280 acres to 439,081 acres; see Map 2-40). Designating and managing an expanded Steamboat Mountain ACEC for recreation, watershed, sensitive big game habitat, and wildlife values could support a range of recreational opportunities such as hunting, wildlife viewing, horseback riding, and fishing from back country to front country. This action could prevent or reduce noise, traffic, and visual impacts of mineral or other development and support the natural character of the landscape. Impacts from this additional and expanded management would be similar to those of Alternative A but over a broader area. Impacts on recreation for not designating East Sand Dunes –

Red Lake ACEC, because it is covered by WSAs, and Big Game Migration Corridor ACEC, due to precedent for all migration corridors, would be the same as described under Alternative D.

# 4.18 FORESTS AND WOODLANDS

## 4.18.1 Alternative B

Impacts on forests and woodlands would be minimal or not be anticipated as a result of implementing management actions for riparian and wetlands resources, livestock grazing, and OHV use.

Impacts to forests and woodlands from the management of soil and geologic resources, grassland and shrubland resources, cultural and paleontological resources, lands and realty, renewable energy, and recreation would be the same as those discussed under Alternative A.

Impacts to forests and woodlands from the management of air resources would be the same as those discussed under Alternative A, except dust abatement measures would be more restrictive. The dust abatement measures would require commercial timber harvest operations to perform additional emission control activities and could restrict available vehicle routes, which could reduce the profitability of the harvest operation.

Impacts to forests and woodlands from the management of water resources would be similar to those discussed under Alternative A, except there would be greater surface disturbing protections and erosion control requirements under Alternative B. This management would increase restrictions on forest and woodland management activities, and harvest volumes could be reduced by these restrictions.

Managing lands identified as having wilderness characteristics specifically to preserve those characteristics would provide additional restrictions on forest product harvesting in the planning area. Management to limit surface disturbing activities, surface occupancy, and degradation of viewshed or setting impacts, and help preserve wilderness characteristics would also be beneficial to habitat quality in forest and woodland communities. Harvest volumes could be reduced or precluded by these restrictions.

Under Alternative B, 2,186,218 acres in the planning area would be closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (1,646,197 more acres than Alternative A); 1,993,908 acres would be pursued for withdrawal from locatable mineral entry (1,437,350 more acres than Alternative A); and 2,581,741 acres would be closed to saleable mineral development and/or disposals (1,748,022 more acres than Alternative A) (Tables 2-3, 2-4, and 2-8 in Appendix V, and Maps 2-2, 2-7, and 2-17). Under Alternative B, 3,535,546 acres would be closed to coal and 2,122,282 acres would be closed to oil shale leasing and development. The protections to lands closed to solid mineral development would be applied to 2,741,709 more acres of land closed to coal and 1,394,477 more acres of lands closed to oil shale compared to Alternative A. Compared to Alternative A, more acres would be closed to the exploration and development of fluid and saleable minerals; and fewer acres would be pursued for withdrawal from locatable mineral entry. This would primarily impact forest and woodland resources by increasing competition for access to lands containing both mineable minerals and harvestable forest resources. Mineral resource development could preclude or restrict the harvesting of timber or woodland products at those development sites if harvesting activities were in conflict with mining activities.

Impacts to forests and woodlands from the management of wildland fire would be similar to Alternative A, except more emphasis would be placed on allowing wildfire to function as a natural management tool. This management could benefit forest and woodland communities by enhancing or improving the health of those resources through the removal of diseased trees, thinning of stands that are too dense to support good growth, initiating natural reforestation and reducing the potential direct destruction of forest products by a future wildfire. The management priorities and methods could impose additional closures or use restrictions on harvest sites and harvest methods

and could result in a decrease in harvest volumes. Prohibiting pre-commercial thinning could also result in stagnation of growth, and longer stand rotation lengths. Relying on natural processes, rather than utilization of logging or timbering to improve decadent stands, would decrease timber harvest volumes. Allowing harvested/denuded areas to revegetate naturally could result in slower regeneration of forest stands or forest stands with a lower proportion of commercially important species or conversion to non-forest or non-woodland. Forest stands that have been impacted by wildland fire sometimes result in removal of seed sources and seedbank of those commercially important forest stand species. This, in turn, could result in decreased harvest volumes.

Impacts to forests and woodlands from the management of invasive species and pests would be similar to those described under Alternative A. Additionally, restricting the use of chemicals could result in fewer methods to control invasive species that could harm harvestable forest products. Not allowing broad application of chemicals over a community of vegetation to kill invasive species would reduce any harmful impacts to native species and supporting resources that are sensitive to those chemicals.

Impacts to forests and woodlands from the management of fish and wildlife resources and special status species would be similar to Alternative A. The management could potentially restrict access to harvest sites by reducing vehicular routes, and could prohibit or limit the surface disturbance, structures, and equipment that are used in harvesting and reforestation activities. Harvest volumes could be reduced or precluded by these restrictions.

Impacts to forests and woodlands from VRM would be similar to Alternative A, except that larger areas of land would be managed as VRM Class II (1,566,230 acres more than Alternative A), and fewer acres of land would be managed as VRM Class IV (1,616,669 acres less than Alternative A). Management of larger acreages of land under VRM Class II could place greater limitations on forest product harvesting activities by controlling harvesting techniques, the size and shape of clear cuts and other forest management practices. Harvest volumes could be reduced or precluded by the management restrictions. Clear cuts could have the potential to impact VRM objectives in the planning area.

Impacts to forests and woodlands from the management of ROWs would be similar to Alternative A, except 2,480,876 acres would be designated as exclusion for ROWs (2,085,927 acres more than Alternative A) and 133,903 acres would be designated as ROW avoidance areas (602,235 acres fewer than Alternative A), which would reduce the extent of related impacts.

Impacts to forests and woodlands from the management to designate and manage travel in the planning area would be similar to Alternative A. Management that could be applied to byways and road developments could potentially restrict access to harvest sites, reduce vehicular routes, prohibit or limit surface disturbance and use of equipment for harvesting and reforestation activities. Harvest volumes could be reduced or precluded by these restrictions.

Impacts to forests and woodlands from the management to protect congressionally designated and/or eligible trails, and NHTs are similar to Alternative A, except there are greater protective measures proposed such as larger buffer zones and specific closures and restrictions. Projects or activities with large impacts to the viewsheds, such as clear cuts, would require larger setbacks to protect trails from visual setting impacts. Large, heavy vehicles would be prohibited from driving on contributing segments of the NHTs. The greater restrictions on surface disturbing activities, vehicle travel, and stricter VRM classifications under this alternative could potentially restrict access to harvest sites, reduce vehicular routes, prohibit or limit surface disturbance and equipment used for harvesting and reforestation activities. Harvest volumes could be reduced or precluded by these restrictions.

Impacts to forests and woodlands from the management of WSAs and WSRs would be similar to those described under Alternative A, but there would be a greater emphasis on protecting wilderness setting and viewshed values, which could reduce the opportunities for timber harvest activities in these areas.

Impacts to forests and woodlands from the management of ACECs would be similar to those described under Alternative A, except 1,605,660 acres (1,319,210 more acres than Alternative A) would be designated as ACECs. The management could provide additional protections to forest and woodland communities by reducing resource loss and maintaining or enhancing the health of those resources. Harvesting opportunities and volumes could be reduced, but resource health could be improved. The greater restrictions on surface disturbing activities, additional ACEC stipulations, and stricter VRM classifications under this alternative, could potentially restrict access to harvest sites prohibit or limit surface disturbance and equipment used in harvesting and reforestation activities. Harvest volumes could be reduced or precluded by these restrictions. Clear cuts could be prohibited or limited by more restrictive VRM classifications.

## 4.18.2 Alternative C

Impacts on forests and woodlands would not be anticipated as a result of implementing management actions for riparian and wetlands resources, livestock grazing, and OHV travel.

Impacts to forests and woodlands from the management of air resources, soil and geologic resources, grassland and shrubland resources, lands and realty, and renewable energy would be the same as those presented under Alternative A.

Impacts to forests and woodlands from the management water resources would be similar to Alternative A. The less restrictive management for surface disturbing activities under this alternative could potentially increase access to harvest sites and allow surface disturbances associated with harvesting and reforestation activities. Harvest volumes could therefore potentially increase in those areas.

The management measures proposed under Alternative B to protect lands with wilderness characteristics would not be implemented under this alternative. The impacts of not managing to protect wilderness characteristics would increase the available land and opportunities for forest product harvesting. Harvesting volumes could potentially increase in those areas where protective measures are not applied.

Under this alternative, 225,782 acres in the planning area would be closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (314,239 fewer acres than under Alternative A); 234,961 acres would be pursued for withdrawal from locatable mineral entry (321,597 fewer than Alternative A); 226,421 acres would be closed to saleable mineral development and/or disposals (607,298 fewer acres than Alternative A); 226,219 acres would be closed to coal leasing (259,745 fewer than Alternative A); and 225,965 acres would be closed to oil shale leasing (501,840 fewer acres than Alternative A) (Maps 2-3, 2-13, and 2-18). Compared to Alternative A, fewer acres would be unavailable for the exploration and/or development of locatable, fluid, solid, and saleable minerals. This could impact forests and woodlands by increasing competition for access to lands containing both mineable mineral and harvestable forest resources. Mineral resource development could preclude or restrict the harvesting of timber or woodland products at those development sites if harvesting activities were in conflict with mining activities.

Impacts to forests and woodlands from the management of wildland fire would be similar to Alternative A, except that full wildfire suppression would be used on all unplanned ignitions to limit the total number of acres burned. Suppressing wildfire could reduce the potential direct damage or destruction to existing forest products.

Compared to Alternative A, forest and woodland management emphasis would be on actions that maintain and enhance forest and woodland health across the landscape to provide forest and woodland products to the public. This could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase harvest volumes. Allowing clear-cuts could increase timber harvest volumes in the short term; over the long term, allowing clear-cuts could be a less sustainable forestry management practice, resulting in decreased harvest volumes. Pre-commercial thinning could prevent stagnation of growth, resulting in shortened

stand rotation lengths and increased timber harvest volumes. Logging or timbering would be used (over wildfire and other natural processes) to revitalize decadent stands, improve stand density, and increase canopy cover. After timber sales, vegetative treatment, or fire, forests and woodlands would be replanted as soon as possible, which would support future forest product production.

Impacts to forests and woodlands from the management of invasive species and pests would be similar to Alternative A. Control of noxious weeds and other invasive plant species could be achieved through chemical, mechanical, and biological methods. Allowing chemical treatments would result in more methods to control invasive species that can harm harvestable forest products. Allowing broad application of chemicals over a community of vegetation to kill invasive species could result in some harmful impacts to native species and supporting resources that could be sensitive to those chemicals.

Impacts to forests and woodlands from the management of fish and wildlife resources and special status species would be similar to Alternative A, except that smaller surface disturbing and/or surface use distance buffer zones would be applied around developments and operations. The management under Alternative C could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase harvest volumes.

Impacts to forests and woodlands from the management of cultural and paleontological resources are similar to those described under Alternative A, except that smaller surface disturbing/view shed buffer zone distances and less restrictive land use stipulations would be applied around known cultural and paleontological sites. Fewer land use prohibitions, restrictions, and smaller sized buffer zones under this alternative, could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase harvest volumes.

Impacts to forests and woodlands from VRM would be similar to those described under Alternative A, except that approximately 226,629 acres would be classified as VRM Class I (912 more than Alternative A), 607,899 acres VRM Class II (25,227 more than Alternative A), 395,683 acres VRM Class III (219,809 fewer than Alternative A), and 2,374,706 acres as VRM Class IV (194,283 more than Alternative A).

The actions to designate and manage ROWs and transportation corridors in the planning area would be the same as those described under Alternative A. Under Alternative C, 225,784 acres would be designated as exclusion for ROWs (200,925 fewer than Alternative A) and 31,018 acres would be designated as ROW avoidance areas (705,120 fewer than Alternative A).

Impacts to forests and woodlands from the management to designate and manage travel in the planning area would be similar to Alternative A. The management for not retaining existing back country byways or designating new ones under this alternative could potentially improve access to harvest sites, increase vehicular routes, and allow surface disturbance inherent in harvesting and reforestation activities. Harvest volumes could increase under these management actions.

Impacts to forests and woodlands from the management of recreation would be similar to Alternative A. Overall, fewer restrictions under this alternative, could potentially improve access to harvest sites, increase vehicular routes, and allow surface disturbance associated with harvesting and reforestation activities.

Impacts to forests and woodlands from the management to protect congressionally designated and/or eligible trails, and NHTs would be similar to Alternative A. The less restrictive management could potentially improve access to harvest sites and allow surface disturbance and equipment used harvesting and reforestation activities. Harvest volumes could be increased under those conditions.

Impacts to forests and woodlands from the management of WSAs and WSRs would be similar to Alternative A, but there would be a greater emphasis on managing designated areas for multiple use and no WSR management would be applied. The management under Alternative C could increase vehicular access to forested areas, and allow for additional surface disturbance, which could provide increased opportunities for timber harvest in these areas.

Under this Alternative, no ACECs would be retained. Removing all the ACEC-specific land use, VRM, and surface disturbing restrictions under this alternative could potentially improve access to harvest sites and allow for increased harvesting and reforestation activities. The application of surface use restrictions and seasonal limitations in sensitive wildlife habitats could limit some forest product harvesting.

## 4.18.3 Alternative D

Impacts on forests and woodlands would not be anticipated as a result of implementing management actions for riparian and wetlands resources, livestock grazing, and OHV travel.

Impacts to forests and woodlands from the management of air resources, soil and geologic resources, wildland fire, grassland and shrubland resources, travel and transportation, cultural and paleontological, lands and realty, and renewable energy would be the same as those presented under Alternative A.

Under Alternative D, lands would be managed for a variety of uses or with other existing management, such as ACECs. In these areas, use and harvest of forests and woodlands could increase depending on management of these areas. Access to forests and woodlands could increase, making harvest activities possible in these areas.

Under Alternative D, 768,989 acres in the planning area would be closed to fluid mineral (oil, gas, and geothermal) exploration, leasing, and development (228,968 more acres than Alternative A); 362,009 acres would be closed to saleable mineral development and/or disposals (471,710 fewer acres than Alternative A); 610,342 acres would be closed to coal leasing, 124,378 more acres than Alternative A, and 1,557,520 would be closed to oil shale leasing, 829,715 more acres than Alternative A. Compared to Alternative A, fewer acres would be closed to fluid and solid minerals and saleable minerals. This would primarily impact forests and woodlands where competition for access to lands containing both mineable minerals and harvestable forest resources occurs. Mineral resource development could preclude or restrict the harvesting of timber or woodland products at those development sites if harvesting activities were in conflict with mining activities.

Under Alternative D, impacts from forest and woodland resources would be similar to those described under Alternative A. There would be no timber compartments under Alternative D. This could open areas to harvests, allow greater flexibility in harvest methods and timber treatments, and thereby potentially increase harvest volumes. Allowing cottonwood tree harvest on a case-by case basis could potentially increase limited harvest of cottonwood.

Impacts to forests and woodlands from the management of fish and wildlife resources and special status species would be similar to those described Alternative A, except that additional surface use restrictions would be applied. The management could potentially restrict access to harvest sites by reducing vehicular routes, and could prohibit or limit the surface disturbance, and equipment that are used in harvesting and reforestation activities. Harvest volumes could be reduced or precluded by these restrictions.

Impacts to forests and woodlands from VRM would be similar to Alternative A, except that larger areas of land would be managed as VRM Class II (596,046 acres more than Alternative A) and VRM Class III (122,819 acres more than Alternative A), and fewer acres of land would be managed as VRM Class IV (725,189 acres less than Alternative A). Management of larger acreages of land under VRM Class II and III would place greater limitations to forest product harvesting activities, by potentially prohibiting or limiting surface and viewshed disturbance

associated with timber harvesting and reforestation activities. Harvest volumes could be reduced or precluded by the management restrictions. Clear cuts could have the potential to impact VRM objectives in the planning area. Requirements for visual simulation and VRM classification analyses prior to commercial timbering projects could incur additional delays and costs.

Impacts to forests and woodlands from ROWs and transportation corridors in the planning area would be similar to Alternative A. Under Alternative D, 286,289 acres would be designated as exclusion areas for ROWs (140,420 acres less than Alternative A) and 1,388,618 acres would be designated as ROW avoidance areas (652,480 more than Alternative A). Some ROW developments such as powerlines and pipelines require a large-scale removal of trees and woodlands along a swath of land to accommodate those structures. Larger exclusion areas under this alternative could increase the need for forest clearings to accommodate ROWs. Harvest volumes could be reduced or prohibited by greater restrictions.

Impacts to forests and woodlands from National Historic and Scenic Trails and National Historic and Scenic Trails-related resources, WSAs, WSRs, special management areas, and ACEC management would be the same as those described under Alternative A.

## 4.18.4 Proposed RMP

The Proposed RMP is a combination of management actions primarily from Alternatives B and D with additional management actions common to all alternatives and would have similar impacts as previously described under those alternatives. In general, the Proposed RMP would have increased management for forests and woodlands than Alternatives A, C, and D, but less than Alternative B. Under the Proposed RMP, harvesting of timber would focus on mature, decadent, and diseased trees with limitations on habitat fragmentation and ecological effects to natural regeneration.

Impacts on forests and woodlands would not be anticipated as a result of implementing management actions for riparian and wetlands resources, livestock grazing, and OHV travel.

Impacts on forests and woodlands from the management of air resources, soil and geologic resources, wildland fire, grassland and shrubland resources, travel and transportation, cultural and paleontological resources, lands and realty, and renewable energy would be similar to those presented under Alternative B.

Impacts on forests and woodlands from forest and woodland resource management would be similar to those discussed under Alternatives A and B. However, under the Proposed RMP forests and woodlands would be managed for a variety of uses while providing the public with access to forest and woodland products across the landscape. Additionally, forest and woodland management will use all available treatment methods, and natural processes would be allowed. Under the Proposed RMP, slash resulting from timber harvesting will be made available for biomass, piled or lopped and scattered, roller chopped, or burned to provide watershed protection, promote reforestation and reclamation, provide nutrient recycling, and improve wildlife habitat. Firewood cutting of dead standing or downed forest timber in designated cutting areas would be permitted. Management of conifer and aspen communities would be designed to promote forest and woodland health. Old, decadent trees could be left standing or downed to provide cover or other habitat for wildlife.

Impacts on forests and woodlands from the management of water resources would be similar to those discussed under Alternative A. Under the Proposed RMP, clearcutting is not allowed within 100 feet of drainages or standing and flowing water. Other logging activities are allowed if other resource values would not be adversely affected. Under the Proposed RMP, logging operations are limited on slopes steeper than 25% to technologically, environmentally, and economically acceptable methods.

Impacts on forests and woodlands from the management of fish and wildlife resources would be similar to those discussed under Alternative A. Under the Proposed RMP, timber harvesting activities would be restricted seasonally, as appropriate, to protect big game wintering and parturition activity, grouse (e.g., sage, sharptail) strutting and nesting, and raptor nesting activity. Approximately 1,436 acres of commercial timber within big game winter ranges are closed to logging activity, usually from November 15 to April 30. If the logging unit encompasses big game parturition habitats, the area is closed to timber harvest activities usually from May 1 through June 30. There would be no logging activity within grouse nesting sites and raptor nesting sites usually from February 1 to July 31 (see minerals management). Exceptions may be approved if conditions described in Appendix B apply.

Impacts to forests and woodlands from VRM would be similar to those of Alternative A, except that more acres would be managed as VRM Class II and fewer acres would be managed as VRM Class IV. Approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A) and 1,929,258 acres as VRM Class IV (251,165 fewer acres than Alternative A). Management of larger acreages of land under VRM Class II would place greater limitations on forest product harvesting activities by potentially prohibiting or limiting surface and viewshed disturbance associated with timber harvesting and reforestation activities. Harvest volumes could be reduced or precluded by the management restrictions. Clear cuts could have the potential to impact VRM objectives in the planning area. Requirements for visual simulation and VRM classification analyses prior to commercial timbering projects could incur additional delays and costs.

Impacts to forests and woodlands resulting from implementing lands and realty actions would be similar to those presented under Alternative A, except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). Some ROW developments such as powerlines and pipelines require a large-scale removal of trees and woodlands along a swath of land to accommodate those structures. Larger exclusion areas under this alternative could increase the need for forest clearings to accommodate ROWs. Harvest volumes could be reduced or prohibited by greater restrictions.

Impacts to forests and woodlands from National Historic and Scenic Trails and National Historic and Scenic Trails-related resources, WSAs, WSRs, special management areas, and ACEC management would be the same as those described under Alternative A.

Compared to Alternative B, forest and woodland management emphasis would be on actions that maintain and enhance forest and woodland health across the landscape to provide forest and woodland products to the public. Under the Proposed RMP, no timber compartments would be utilized and instead would be permitted, on a case-by-case basis, for collection and harvest of forest products. Pre-commercial thinning in overstocked areas and regenerated timber sale areas when trees in those areas reach the 10- to 30-year age class is allowable. Similarly, cottonwood tree harvest is allowable on a case-by-case basis. Revegetation inventory and monitoring data will be required following harvest, vegetation treatments, and fire, if natural regeneration does not occur within 5 years. Silvicultural BMPs and individual stand objectives for forest management would be followed including managing stand density, revitalizing decadent stands, and managing canopy cover. Forests and woodlands, under the Proposed RMP, would identify special management areas and incorporate appropriate management into activity plans. Examples of such special tree populations include the Douglas fir on Pine Butte, the northernmost extent of Colorado pinyon pine in Wild Horse Basin, old-growth juniper stands, and the isolated alpine woodland community on top of Black Mountain at Pine Springs.

# 4.19 LANDS AND REALTY

## 4.19.1 Alternative B

Impacts on lands and realty from management of cultural and paleontological resources, recreation, and travel and transportation would be the same as Alternative A.

Impacts on lands and realty resulting from implementing restrictions on ROWs would be similar to those presented under Alternative A, except impacts would be more extensive due to a large increase in areas managed as ROW exclusion areas.

Under this alternative, land use authorizations would benefit the overall management of public lands by making them available throughout the planning area for ROWs, permits, and leases, except in areas designated as exclusion or avoidance areas, as defined below. The impacts on land use authorizations would be more restricting than Alternative A, in that pipeline trenches would not be allowed to stay open longer than 10 days during the construction phase and would require mitigation measures for impacts to livestock, wildlife, and public safety. This would decrease both the amount of time allotted for construction as well as the time of year construction of ROWs would be available to occur. By imposing these types of restrictions, ROWs would only be implemented for a small duration and at certain times of the year for less impact to livestock and wildlife. These restrictions would result in the relocation or redesign of proposed ROWs and would increase management efforts and costs related to proposals submitted by ROW applicants, which are administered by the lands and realty program.

Under this alternative, areas managed as exclusion areas for ROWs would increase to 68% of the planning area (2,480,876 acres) and areas managed as avoidance areas for ROWs would decrease to 4% of the planning area (133,903 acres). This would increase the acres in which ROWs are precluded, which would potentially increase the number of ROW facilities precluded from development.

Impacts on lands and realty management resulting from processing land tenure/landownership adjustments would be similar to Alternative A, including that aquatic, wetland, and riparian habitat would not be suitable for disposal. This might reduce the ability to dispose of or acquire (through exchange) land parcels in an effort to reduce fragmented surface ownership and improve the manageability of public lands. Exceptions would be considered in cases of where land exchanges would allow for more contiguous federal ownership patterns. In addition, acquiring lands could result in further consolidation and improved manageability of public lands.

Impacts on lands and realty management resulting from oil and gas exploration and development within the planning area would be similar to those identified in Alternative A, except the projected level of ROW applications would decrease. Fewer areas would be available for leasing and development of oil and gas facilities because 2,186,218 acres would be unavailable to oil and gas leasing, 813,354 acres would be managed as NSO areas, and 99,674 acres would be managed as CSU areas. As a result, fewer acres are available for oil and gas development, which represents a 23% decrease compared to Alternative A.

Impacts on lands and realty management resulting from development of solid leasable minerals, locatable minerals, and mineral materials would be similar to those identified in Alternative A, except the level of development would likely decrease as more areas would be closed to such development. Because the number of ROW applications/authorizations and extent of related development would be commensurate with the level of anticipated mineral development, a decrease in ROW applications and authorizations would be realized. Under this alternative, 3,535,546 acres would be closed to coal development, 2,122,282 acres would be closed to oil shale leasing, 1,993,908 acres would be pursued for withdrawal from locatable mineral entry, and 2,581,741 acres would be closed to mineral material sales and permits.

Impacts from VRM would be similar to those under Alternative A, except VRM classifications would affect the location of new ROWs and facilities. ROW projects would be designed to meet the objectives of the VRM class established for the project area. Most ROWs and facilities would be compatible with VRM Class III (666,522 acres) and VRM Class IV (563,754 acres). In VRM Class II (2,148,902 acres) areas, ROW actions would be limited and would require mitigation to ensure that the project or surface disturbance did not attract the attention of the casual observer.

Similar to Alternative A, mitigation measures to protect wildlife resources, threatened and endangered species, and sensitive species' habitats would impact the potential disposal of lands. Seasonal closures would result in short-term impacts on lands and realty actions in sensitive areas such as the big game crucial winter range. Year-round restrictions and no surface-disturbing activities in areas such as sensitive aquatic and critical habitats would restrict the location of ROWs and land disposal actions over the long term.

Impacts to lands and realty from the management of SD/MAs would be similar to Alternative A, except ACECs would be managed as ROW avoidance or exclusion areas. These restrictions may result in the re-siting or redesign of proposed ROWs and would increase lands and realty management efforts and related costs.

## 4.19.2 Alternative C

Impacts on lands and realty from cultural and paleontological resources would be the same as those described under Alternative A.

Impacts on lands and realty resulting from implementing restrictions on ROWs would be similar to those presented under Alternative A, except impacts would be less extensive due to a large increase in areas managed as ROW avoidance areas.

Similar to Alternative A, land use authorizations would benefit the overall management of public lands by making them available throughout the planning area for ROWs, permits, and leases, except in areas designated as exclusion or avoidance areas, as defined below. The impacts on land use authorizations would be less restrictive than Alternative A; and similar to Alternative A, mitigation measures would be necessary for impacts to livestock, wildlife, and public safety due to the restriction to only allow pipeline trenches to be opened no longer than 10 days during the construction phase. This restriction would decrease both the amount of time allotted for construction as well as the time of year construction of ROWs would be available to occur. By imposing these types of restrictions, ROWs would only be implemented for a small duration and at certain times of the year for less impact to livestock and wildlife. These restrictions would result in the relocation or redesign of proposed ROWs and would increase management efforts and costs related to proposals submitted by ROW applicants, which are administered by the lands and realty program.

Under this alternative, areas managed as exclusion areas for ROWs would decrease to 6% of the planning area (225,784 acres) and areas managed as avoidance areas for ROWs would decrease to less than 1% of the planning area (31,018 acres), as compared with Alternative A. This would increase the potential areas for ROW designations and the requests for ROW authorizations, increasing the intensity, complexity, and costs of managing the lands and realty program.

Impacts on lands and realty management resulting from processing land tenure/landownership adjustments would be similar to Alternative A, except that aquatic, wetland, and riparian habitat would be suitable for disposal under this alternative. This may enhance the ability to dispose of or acquire (through exchange) land parcels in an effort to reduce fragmented surface ownership and improve the manageability of public lands.

Impacts on lands and realty management resulting from oil and gas exploration and development within the planning area would be similar to those identified in Alternative A, except more areas would be available for

leasing and development of oil and gas facilities. Under this alternative 225,782 acres would be unavailable to oil and gas leasing, 15,542 acres would be managed as NSO areas, and 215,890 acres would be managed as CSU areas. As a result, more acres are available for oil and gas development.

Impacts on lands and realty management resulting from development of solid leasable minerals, locatable minerals, and mineral materials would be similar to those identified in Alternative A, except the level of development would likely increase as areas closed to such development would be less under this alternative. Because the number of ROW applications/authorizations and extent of related development would be commensurate with the level of anticipated mineral development, an increase in ROW applications and authorizations would be realized. Under this alternative, 226,219 acres would be closed to coal leasing and development, 225,965 acres would be closed to oil shale leasing, 234,961 acres would be proposed for withdrawal from locatable mineral entry, and 226,421 acres would be closed to mineral material sales and permits. These impacts would be exacerbated by the anticipated increase in requests for ROW authorizations, which would increase the intensity, complexity, and costs of managing the lands and realty program.

Impacts on lands and realty from recreation management and transportation planning and access would be similar to those described under Alternative A, except that surface disturbing activities would be allowed within ¼ mile of developed recreation sites decreasing the intensity, complexity and costs of managing lands and realty program actions in these areas.

Impacts from VRM would be similar to those under Alternative A, except VRM classifications would affect the location of new ROWs and facilities. ROW projects would be designed to meet the objectives of the VRM class established for the project area. Most ROWs and facilities would be compatible with VRM Class III (395,683 acres) and VRM Class IV (2,374,706 acres). In VRM Class II (607,899 acres) areas, ROW actions would be limited and would require mitigation to ensure that the project or surface disturbance did not attract the attention of the casual observer. Compliance with VRM classifications in project areas would be less restrictive than Alternative A and increase the requests for ROW authorizations, impacting the intensity and costs to the lands and realty program.

Similar to Alternative A, mitigation measures to protect wildlife resources, threatened and endangered species, and sensitive species' habitats would impact the potential disposal of lands. Seasonal closures would result in short-term impacts on lands and realty actions in sensitive areas such as the big game crucial winter range. Year-round restrictions and no surface-disturbing activities in areas such as sensitive aquatic and critical habitats would restrict the location of ROWs and land disposal actions over the long term.

Impacts to lands and realty from the management of SD/MAs would be similar to Alternative A, except under this alternative, there would be no ACECs managed as ROW avoidance nor exclusion areas. Management of SD/MAs would therefore be less restrictive and would allow for an increase in requests for ROW authorizations, increasing the intensity, complexity, and costs of managing the lands and realty program.

## 4.19.3 Alternative D

Impacts on lands and realty from management of cultural and paleontological resources would be the same as Alternative A.

Impacts on lands and realty management from implementing actions for the lands and realty program would be similar to those presented under Alternative A, except decreases in ROW exclusion areas would enhance the ability to develop ROWs. Under Alternative D, 286,289 acres would be designated as ROW exclusion areas (Table 2-10 in Appendix V, Map 2-29), which represents a 33% decrease compared with Alternative A. In these areas, the development of ROW facilities would not be allowed. More acres would be managed under ROW avoidance areas, 1,388,618 acres, compared to 736,138 acres under Alternative A. ROW development would be allowed to

occur in these areas provided that site specific mitigation measures are followed. This would increase management efforts and costs related to proposals submitted by ROW applicants, which are administered by the lands and realty program but may be offset with the increased avoidance.

Impacts on lands and realty management resulting from oil and gas exploration and development within the planning area would be similar to those identified in Alternative A, except the projected level of ROW applications would increase. More areas would be available for leasing and development of oil and gas facilities because 768,989 acres would be unavailable to oil and gas leasing (42% increase compared with Alternative A) (Table 2-4 in Appendix V, Map 2-9). As a result, more acres are available for oil and gas development, which would commensurately increase the demand for ROW development.

Impacts on lands and realty management resulting from the development of solid leasable minerals would be similar to those identified in Alternative A, except the level of development would likely increase as fewer areas would be closed to such development. Because the number of ROW applications/authorizations and extent of related development would be commensurate with the level of anticipated mineral development, an increase in ROW applications and authorizations would be realized. Under this alternative, 610,342 acres would be closed to coal leasing (26% increase compared to Alternative A) and 1,557,520 acres would be closed to oil shale leasing (114% increase compared to Alternative A) (Table 2-7 in Appendix V, Map 2-14).

Impacts on lands and realty management resulting from the development of locatable and saleable minerals would be similar to those identified in Alternative A, except the level of ROW development would likely increase as more areas would be available to saleable mineral development. Because the number of ROW applications/authorizations and extent of related development would be commensurate with the level of anticipated mineral development, an increase in ROW applications and authorizations would be realized. Under this alternative, 362,009 acres would be closed to saleable mineral development (57% decrease compared to Alternative A) (Table 2-8 in Appendix V, Map 2-19).

Impacts on lands and realty from recreation management and transportation planning and access would be similar to those described under Alternative A, except that the Wind River Front SRMA would change from ROW exclusion to avoidance to accommodate recreation facilities and access.

Impacts from VRM would be similar to those under Alternative A, except changes in VRM classifications would affect the location of new ROWs and facilities. ROW projects would be designed to meet the objectives of the VRM class established for the project area. Most ROWs and facilities would be compatible with VRM Class III (738,311 acres) and VRM Class IV (1,455,234 acres) objectives. In VRM Class II (1,178,718 acres) areas, ROW actions would be limited and would require mitigation to ensure that the project or surface disturbance did not attract the attention of the casual observer.

Similar to Alternative A, mitigation measures to protect wildlife resources, threatened and endangered species, and sensitive species' habitats would impact the potential disposal of lands. Seasonal closures would result in short-term impacts on lands and realty actions in sensitive areas such as big game crucial winter range. Year-round restrictions and no surface disturbing activities in areas such as sensitive aquatic and critical habitats would restrict the location of ROWs and land disposal actions over the long term.

Impacts on lands and realty management from SD/MAs would be similar to Alternative A, except they would apply over a larger area, as the number of acres designated as ACECs would decrease. Because these areas are managed as ROW exclusion and avoidance areas, the reduction of ACEC designations would decrease the relocation or redesign of proposed ROWs and thereby decrease lands and realty management efforts and related costs. The acres designated as ACECs would decrease to 246,634 acres (14% decrease compared with Alternative A) (Table 2-12 in Appendix V, Map 2-39).

## 4.19.4 Proposed RMP

Under the Proposed RMP, impacts on lands and realty from management actions related to land tenure decisions would be similar to Alternative A. Impacts from the management of cultural and paleontological resources would be less than Alternative B, but more than Alternatives A, C, and D.

Impacts on lands and realty management from implementing actions for the lands and realty program would be similar to those presented under Alternative A, except that acres of ROW exclusion and ROW avoidance areas would be increased to 921,059 acres (116% increase compared with Alternative A) and 1,047,929 acres (42% increase compared with Alternative A), respectively (Table 2-10 in Appendix V). These limitations under the Proposed RMP would limit future ROW development within the planning area compared to the management actions described under Alternative A.

Impacts on lands and realty management resulting from oil and gas exploration and development within the planning area would be similar to those identified for Alternative A, except the projected level of ROW applications would likely decrease due to larger areas of closures and NSO restrictions under the Proposed RMP. Under the Proposed RMP, fewer areas would be available for leasing and development of oil and gas facilities because 1,076,039 acres would be unavailable to oil and gas leasing, 215,437 acres would be managed as NSO areas, and 1,116,266 acres would be managed as CSU areas. As a result, fewer acres are available for oil and gas development, which represents 987,978 fewer acres compared to Alternative A.

Impacts on lands and realty management resulting from the development of solid leasable minerals under the Proposed RMP would be similar to those identified for Alternative A, except the level of development would likely decrease, as more areas would be closed to such development. Because the number of ROW applications/authorizations and extent of related development would be commensurate with the level of anticipated mineral development, an increase in ROW applications and authorizations would be realized. Under this alternative, 766,880 acres would be closed to coal leasing (58% increase compared to Alternative A) and 1,115,490 acres would be closed to oil shale leasing (53% increase compared to Alternative A) (Table 2-7 in Appendix V).

Impacts on lands and realty management resulting from the development of locatable and saleable minerals with the Proposed RMP would be similar to those identified for Alternative A, except the level of ROW development would likely increase, as more areas would be available to saleable mineral development. Under the Proposed RMP, 884,906 acres would be closed to saleable mineral development (6% increase compared to Alternative A) (Table 2-8 in Appendix V, Map 2-20). Conversely, for locatable minerals, there would be a larger area of existing and proposed withdrawals compared to Alternative A, potentially reducing the level of ROW development associated with that type of development.

Impacts on lands and realty from recreation management and transportation planning and access under the Proposed RMP would be similar to those described under Alternatives A and D.

Impacts from VRM under the Proposed RMP would be similar to those under Alternative D, except changes in VRM classifications could affect the location of new ROWs and facilities. ROW projects would be designed to meet the objectives of the VRM class established for the project area. Most ROWs and facilities would be compatible with VRM Class III (149,413 acres) and VRM Class IV (1,929,258 acres) objectives. In VRM Class II (1,301,004 acres) areas, ROW actions would be limited and would require mitigation to ensure that the project or surface disturbance did not attract the attention of the casual observer.

Similar to Alternative A, under the Proposed RMP mitigation measures to protect wildlife resources, threatened and endangered species, and sensitive species' habitats would impact the potential disposal of lands. Seasonal closures would result in short-term impacts on lands and realty actions in sensitive areas such as big game crucial

winter range. Year-round restrictions and no surface-disturbing activities in areas such as sensitive aquatic and critical habitats would restrict the location of ROWs and land disposal actions over the long term.

Impacts on lands and realty management from special designation areas under the Proposed RMP would be similar to those described for Alternative A and B, except the number of acres designated as these areas would vary. Notably, the acres designated as ACECs under the Proposed RMP would be 935,135 acres (a 42% decrease compared with Alternative B). Because these areas are typically managed as ROW exclusion and avoidance areas, the reduction of special designation areas would decrease the relocation or redesign of proposed ROWs and thereby decrease lands and realty management efforts and related costs (Table 2-12 in Appendix V, Map 2-40).

# 4.20 RENEWABLE ENERGY

## 4.20.1 Alternative B

Under this alternative, impacts on renewable energy resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for riparian and wetland resources, livestock grazing, and OHV travel, locatable minerals, solid leasable minerals, and saleable minerals.

Impacts to renewable energy development from the management of wildland fire, grassland and shrubland resources, invasive species and pests would be the same as Alternative A.

Impacts to renewable energy resources from the management of air resources would be the same as those discussed under Alternative A, except dust abatement measures would be more restrictive. They would be required for all BLM authorized activities, and BMPs would have to be applied in coordination with local and state agencies to control dust on roads. These dust abatement measures would require renewable energy development sites to perform additional control activities and could restrict available vehicle routes.

Impacts to renewable energy resources from the management of soil and geologic resources would be similar to those discussed under Alternative A, except surface disturbing activities where soils are highly erodible or that are difficult to reclaim would be prohibited. Those areas would also be managed as NSO for fluid minerals (e.g., oil and gas leasing/development). Exploration and development of geothermal resources are subject to application of mitigation requirements for surface disturbing activities and NSO designations in the same manner as they are applied to oil and gas exploration and development activities. Actions to prohibit or limit surface disturbing activities to maintain soil stability, could impose the same restrictions to renewable energy development sites in the planning area. These restrictions could potentially impact access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and the site preparation and construction activities associated with renewable energy development.

Impacts to renewable energy resources from the management of water resources would be similar to those discussed under Alternative A, except that greater surface disturbing protections are provided by the requirement for site-specific activity and implementation plans. This alternative also expands the boundaries in the JMH planning area for prohibited surface disturbing activities, avoidance of linear crossings, required management as NSO for fluid minerals (e.g., oil and gas leasing/development) and applying a CSU for fluid minerals stipulation on the area's aquifer recharge areas. An NSO for fluid minerals stipulation for the Town of Superior aquifer recharge area is also provided by this alternative. Activity and implementation plans designed for water quality enhancement could be imposed on renewable energy development sites in the planning area. These restrictions could potentially impact access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and the site preparation and construction activities associated with renewable energy development.

Managing all lands identified as having wilderness characteristics specifically to preserve those characteristics would provide additional restrictions on renewable energy development in the planning area. Management actions to limit surface disturbing activities, surface occupancy, and degradation of view shed or setting impacts, help preserve wilderness characteristics (e.g., habitat quality) and help maintain the designation of lands with wilderness characteristics. Under Alternative B, closing lands identified with wilderness characteristics to fluid minerals (e.g., oil and gas) development, and management as an exclusion area for all new ROWs, would further restrict surface occupancy and surface disturbing activities. These areas would also be managed consistent with VRM Class II objectives. Wind and solar energy developments have high potentials to impact VRM objectives in the planning area due to the size and extent of the structures associated with them. Geothermal resource exploration, development, and leasing activities are not allowed in areas that are closed to oil and gas leasing consideration; and are also subject to application of mitigation requirements for surface disturbing activities and other stipulations in the same manner as they are applied to oil and gas exploration and development activities. Management actions to preserve and protect lands with wilderness characteristics could potentially impact access to renewable energy development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and the site preparation and construction activities associated with renewable energy development.

Impacts to renewable energy development from the management of fluid mineral (oil and gas) leasing and development would be similar to those described under Alternative A; however, closing 2,186,218 acres (1,646,197 more acres than under Alternative A) to fluid mineral leasing would greatly reduce the availability of potential development sites. Geothermal resource exploration, development, and leasing activities are not allowed in areas that are closed to oil and gas leasing consideration; and are also subject to application of restrictions on surface disturbing activities, NSOs, and other stipulations in the same manner as they are applied to oil and gas exploration and development activities. Under Alternative B, 813,354 acres would be managed with NSO stipulations, which is 654,743 more acres than under Alternative A. Applying CSU stipulations (within 99,674 acres, which is 621,458 less than Alternative A) and TLSs (within 713,837 acres, which is 1,127,130 less than Alternative A) with no exceptions, could influence the placement of facilities and, as a result, increase the cost of developing geothermal resources. More NSOs applied under this alternative, would place greater limitations on surface occupancy and further restrict geothermal development that quantify and visually define these management areas). The requirement to use BMPs in the exploration, development, production, and abandonment of oil and gas resources, and mitigation requirements for surface disturbing activities also could place additional restrictions on geothermal energy developments. Development restrictions for WSA, ACECs, Special Designation Areas, and other resource program restrictions for sites within this analysis area would prohibit or restrict geothermal energy developments.

Impacts to renewable energy development from the management of forests and woodlands is the same as Alternative A, except that slash resulting from timber harvesting would be made available for biomass. Woody biomass is a potential fuel for bioenergy developments. Resources adequate for sustained commercial production, transportation distances to biofuel energy generation plants and/or markets and consumers are key factors in determining feasibility for biomass utilization. There are not currently any applications for biomass energy development projects being processed by the BLM for the planning area but making biomass available from this forest management action supports the consideration of this type of alternative energy development.

Impacts to renewable energy development from the management of fish and wildlife resources and special status species is similar to Alternative A, except this alternative applies more surface use prohibitions or restrictions, seasonal and distance limitations, and rehabilitation standards on fluid mineral (oil, gas, and geothermal), renewable energy, and ROW developments in its management actions. Surface use restrictions would be utilized to accomplish no-net-loss of sensitive terrestrial and aquatic wildlife habitats (e.g., crucial winter range, parturition areas, migration corridor, and special status species nesting and brood rearing habitat). The land use, time and distance, and travel prohibitions and restrictions under this alternative could potentially limit access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and site

preparation and construction activities associated with renewable energy development. There is also a potential for operational restrictions. Structural design changes and incorporation of additional protective measures (e.g., wildlife collision avoidance enhancements) require additional costs. Future renewable energy projects could require additional impact minimization measures as impacts become known and better understood. Prohibiting renewable energy projects in big game crucial winter range and parturition habitat, raptor concentration areas, currently mapped unique habitats, or new areas identified as part of site-specific investigations would preclude renewable energy development.

Impacts to renewable energy development from the management of cultural and paleontological resources is similar to Alternative A, except this alternative applies more protective measures. The land use prohibitions and restrictions and larger sized buffer zones under this alternative, could potentially limit access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development. Wind turbine structures could be especially intrusive in certain view sheds that contribute to cultural, historical, or paleontological setting.

Impacts to renewable energy development from the management of areas of tribal importance (sacred, spiritual, respected, and/or traditional cultural settings, properties, or resources) would be similar to Alternative A, except in the JMH planning area, the zone of disturbance protection is more specific than Alternative A because the mitigation stipulations are triggered when an activity is proposed within three miles of a site (rather than as within the "vicinity" of a site). Mitigation requirements can result in additional efforts, delays, and costs to renewable energy development projects.

VRM impacts would be similar to Alternative A, except that the VRM acreage offering the most protected status to scenic value quality and preservation of public land in its natural condition is greater under this alternative. Approximately 225,785 acres would be classified as VRM Class I (68 more acres than Alternative A), 2,148,902 acres VRM Class II (1,566,230 more acres than Alternative A), 666,522 acres VRM Class III (51,030 more acres than Alternative A) and 563,754 acres as VRM Class IV (1,616,669 fewer acres than Alternative A). More acreage managed under the lower VRM classifications, potential prohibitions on surface disturbing activities associated with wind energy development, and larger VRM buffer distances along the Continental Divide National Scenic Trail would place greater limitations to renewable energy development projects, by restricting the availability and access of development sites and the site clearing/preparation/construction activities (roads, facilities, structures, and transmission/pipelines) necessary for the generation, collection, and transport of the energy. Wind and solar energy developments also have high potentials to impact VRM objectives in the planning area due to visual intrusions inherent in the size and extent of the structures associated with those types of developments. Requirements for visual simulation and VRM classification analyses prior to site developments could incur additional delays and costs to proposed renewable energy developments.

Applying greater restrictions (e.g., more ROW exclusion areas, restricting NHT utility crossings) and utilization of BMPs (e.g., locating pipelines, power lines and other utilities adjacent to or co-located within existing ROWs) as part of lands and realty management would place additional restrictions on renewable energy developments. This Alternative provides for maximum protection of crucial habitats and sensitive resources in ROWs and corridors. The greater restrictions, prohibitions, and protection stipulations under this Alternative, could potentially limit access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development.

The management actions for renewable energy development under this alternative are similar to Alternative A, except ROW exclusion areas would be greater (2,480,876 acres excluded, which is 2,054,167 more acres than Alternative A); and additional measures and BMPs could be identified and required to protect resources and resource uses. The greater restrictions, prohibitions, and protection stipulations under this Alternative, could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines,

and site preparation and construction activities associated with renewable energy development. ROW exclusion areas would preclude renewable energy development. Additional development and operations costs could result from added BMPs/measures.

The actions to designate and manage travel in the planning area would be similar to Alternative A, except additional back country byways would be considered. The land use and VRM restrictions and mitigation requirements that could be applied to byway road developments could impact the placement of facilities, structures, and transmission/pipelines associated with renewable energy developments. These actions could restrict renewable energy development.

The actions to manage recreation would be similar to Alternative A, except the Continental Divide National Scenic Trail, Continental Divide Snowmobile Trail, the Green River, Killpecker Sand Dunes, Oregon and Mormon Pioneer National Historic Trails, and the Wind River Front SRMAs would not be retained and a greater zone of restriction against surface disturbing activities and visual intrusions would be implemented. The greater restrictions on surface disturbing activities, and stricter VRM classifications, under this Alternative, could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development. Not retaining the SRMAs and releasing lands from an emphasis on recreation resource development could potentially facilitate renewable energy development in those areas.

Management actions to protect congressionally designated and/or eligible trails, and NHTs are similar to Alternative A, except there are greater protective measures proposed such as larger buffer zones ("setbacks") and specific closures and restrictions. The greater restrictions on surface disturbing activities, and stricter VRM classifications, under this Alternative, could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development.

Management of WSAs and WSR public lands would have actions similar to Alternative A, but there would be a greater emphasis on protecting wilderness setting and view shed values. The greater restrictions, prohibitions, and protection stipulations under this Alternative, could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development. ROW exclusion areas would preclude renewable energy development. Prohibitions and limitations on motorized and non-motorized travel would also place greater impacts on renewable energy developments.

Impacts to renewable energy resources from the management of ACECs would be similar to those described in Alternative A, except 1,605,660 acres (1,319,210 more than Alternative A) would be designated as ACECs. This alternative emphasizes managing important habitats for no-net-loss of habitat, retaining habitat health and function by applying surface use restrictions, and addressing human access and activities that could degrade or destroy resources. Additional stipulations to individual ACECs (e.g., eliminating ROW windows, excluding ROWs, limiting road development, closing areas to mineral development, etc.) would provide greater restrictions on surface disturbances and occupancy. The greater restrictions on surface disturbing activities, additional ACEC stipulations, and stricter VRM classifications under this Alternative, could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development.

## 4.20.2 Alternative C

Under this alternative, impacts on renewable energy resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for riparian and wetland resources, livestock grazing, and OHV travel, locatable minerals, solid leasable minerals, and saleable minerals.

Impacts to renewable energy resources from the management of air resources, forests and woodlands, wildland fire, grassland and shrubland resources, invasive species and pests would be the same as those presented under Alternative A.

Soil and geologic resource management actions under this alternative would be the same as Alternative A, except that areas where soils are difficult to reclaim would be managed as avoidance areas for surface disturbing activities with no exceptions and with a CSU stipulation for fluid minerals (oil and gas) leasing. Exploration and development of geothermal resources are subject to application of mitigation requirements for surface disturbing activities and CSU designations in the same manner as they are applied to oil and gas exploration and development activities. These restrictions could limit renewable energy development at these limited reclamation potential soil sites.

Water resource management actions would be similar to Alternative A, except where surface disturbing activities (including linear crossings) in or near the 100-year floodplains, wetlands, riparian areas, and gorges would each be considered on a case-by-case basis (rather than be protected by a full closure stipulation). Relaxing full closure stipulations facilitates the allowance of some surface disturbing activities. Compared to Alternative B, considering closed loop drilling systems in areas of shallow unconfined aquifers would also potentially increase allowances for some surface disturbing and occupancy activities. The less restrictive stipulation on surface disturbing activities under this alternative, could improve renewable energy development potentials.

There are no actions proposed under Alternative A for managing lands with wilderness characteristics. The management measures proposed under Alternative B would not be implemented under this alternative. The impacts of not managing to protect wilderness characteristics would provide more opportunities for allowable surface disturbances and occupancy activities, which could benefit potential renewable energy developments.

Management of leasable oil and gas minerals includes geothermal fluids. Impacts to renewable energy development from the management of fluid mineral leasing and development would be similar to those described under Alternative A; however only closing 225,782 acres (314,239 fewer acres than under Alternative A) to fluid mineral leasing would increase the availability of potential renewable energy development sites. Under this alternative, 15,542 acres would be managed with NSO stipulations (143,069 fewer acres than under Alternative A) and 215,890 acres with CSU stipulations (505,242 fewer than Alternative A) which reduces these surface disturbance/occupancy limitations to development activities. Greater TLSs (1,355,485 acres, 485,482 less than Alternative A), could adversely impact renewable energy site development and operational schedules (Table 2-4 in Appendix V, Map 2-8). Mineral management actions that restrict fluid mineral developments (including geothermal energy developments) are those that prohibit or limit exploration, leasing, access to development sites, and the placement and construction of facilities or structures associated with the development. Under this Alternative, benefits could come from reducing the number of acres closed to development and/or managed under NSO and CSU stipulations.

Impacts to renewable energy development from the management of fish and wildlife resources and special status species is similar to Alternative A, except that smaller surface disturbing and/or surface use distance buffer zones would be applied around developments and operations. Those actions and allowing renewable energy projects in big game crucial winter range and parturition habitat, raptor concentration areas, and unique habitats under this Alternative could facilitate renewable energy developments in the planning area. Additionally, no limits on surface disturbing activities in potential habitat areas of special status plant species could also improve opportunities for renewable energy development in the planning area.

Impacts to renewable energy development from the management of cultural and paleontological resources is similar to Alternative A, except that smaller surface disturbing/view shed buffer zone distances and less restrictive land use stipulations would be applied around known cultural and paleontological sites. The view shed to be protected surrounding significant rock art sites at Cedar Canyon, LaBarge Bluffs, Sugarloaf, Tolar, and White

Mountain would be reduced to a ¼-mile distance (which is less than the ½ mile under Alternative A). Compared to Alternative A, significant rock art sites would also be an avoidance area rather than an exclusion area for new ROWs. The Blue Point, Blue Forest, Adobe Town Rim and Cedar Canyon areas of high cultural site density would be managed on an individual site level (rather than as historic districts under Alternative A); and closed to surface disturbing activities that could adversely affect the cultural resources unless they could be mitigated. Those sites would also be managed as NSO for fluid minerals, and the Tri-Territory Marker site (10 acres) would be managed as closed to fluid mineral leasing, which apply greater restrictions on development activities than Alternative A.

Renewable energy development requires the ability to utilize specific land sites that have adequate wind, sunshine, biomass, or geothermal resources to support energy generation. Land use and visual impact restrictions also must not prohibit or restrict the surface disturbances and occupancy requirements associated with vehicle access to the site, site clearing/preparation activities, or the construction of facilities, structures, and transmission lines (including pipelines) necessary for the generation, collection, and transport of the energy. Wind turbine structures could be especially intrusive in certain view sheds that contribute to cultural, historical, or paleontological setting. Management actions under this Alternative that facilitate renewable energy developments are smaller buffer zones, and avoidance areas rather than exclusion areas for ROWs. Closing areas to surface disturbing activities and fluid mineral leasing (gas, oil, and geothermal), and managing sites as NSO for fluid minerals and avoidance of ROWs would provide greater restrictions to renewable energy development in those areas.

Impacts to renewable energy development from the management of areas of tribal importance (sacred, spiritual, respected, and/or traditional cultural settings, properties, or resources) would be similar to Alternative A; except that in the JMH planning area, the zone of disturbance protection is more specific than Alternative A because the mitigation stipulations are triggered when an activity is proposed within ¼ mile of a site (rather than as within the "vicinity" of a site). Renewable energy development requires surface disturbances associated with vehicle access to the site and site clearing/preparation activities; as well as the construction of facilities, structures, and transmission lines (including pipelines) necessary for the generation, collection, and transport of the energy. Mitigation requirements can result in additional efforts, delays, and costs to renewable energy development projects.

VRM impacts would be similar to Alternative A, except that the VRM acreage offering the most protected status to scenic value quality and preservation of public land in its natural condition is greater under this alternative. Approximately 226,629 acres would be classified as VRM Class I (912 more acres than Alternative A), 607,899 acres VRM Class II (25,227 more acres than Alternative A), 395,683 acres VRM Class III (219,809 fewer acres than Alternative A), and 2,374,706 acres as VRM Class IV (194,283 more than Alternative A). Management actions under this alternative that have the potential to limit renewable energy development in the planning area have more acres designated as low VRM classifications (VRM Class III and IV) and fewer acres under higher VRM classifications (VRM Class I and II). Fewer restrictions on surface disturbing activities; no required visual simulation or additional needs to determine VRM classifications in certain areas; and smaller VRM buffer distances along the Continental Divide National Scenic Trail reduce potential limitations to renewable energy development projects in the planning area.

This alternative provides for minimum protection of crucial habitats and sensitive resources in ROWs and corridors Additionally, BLM-administered public lands within the planning area would be available for agricultural entry under Desert Land Entry (43 Code of Federal Regulations [CFR] 2520). Renewable energy development requires the ability to utilize specific land sites that have adequate wind, sunshine, biomass, or geothermal resources to support energy generation. Fewer restrictions, prohibitions, and protection stipulations under this Alternative, could potentially facilitate access to development sites, vehicular routes, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development. Opening the planning area to agricultural entry could increase competition for available lands for renewable energy development.

The management actions for renewable energy development under this Alternative are similar to Alternative A, except ROW exclusion and avoidance areas would be fewer (225,784 acres excluded and 31,018 acres avoided; 200,925 and 705,120 fewer acres than Alternative A, respectively). Same as Alternative B, additional measures and BMPs could be identified and required to protect resources and resource uses. Fewer ROW exclusion and avoidance areas under this alternative, could potentially improve access to development sites, where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur. ROW exclusion and avoidance areas could preclude renewable energy development. Additional development and operations costs could result from added BMPs/measures.

The actions to designate and manage ROWs and transportation corridors in the planning area would be similar to Alternative A, except designated energy corridors would be retained; new corridors could be designated; and there would be no preferred location of ROWs within existing ROW areas and corridors. In total, 225,784 acres would be designated as exclusion for ROWs (200,924 fewer acres than Alternative A) and 31,018 acres would be designated as ROW avoidance areas (705,120 fewer than Alternative A). Fewer ROW exclusion and avoidance areas under this alternative, could potentially improve access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development. Retaining and/or designating new corridors and reducing restrictions on the placement of ROWs supports the development of transmission/pipelines associated with renewable energy development. ROW exclusion areas would preclude renewable energy development.

The actions to designate and manage travel in the planning area would be similar to Alternative A, except five back country byways would not be retained and additional travel routes that meet the criteria for designation as back country byways would not be considered. The land use and VRM restrictions and mitigation requirements that could be applied to byway road developments could impact the placement of facilities, structures, and transmission/pipelines associated with renewable energy developments. The actions of not retaining existing back country byways or designating new ones under this alternative could potentially improve access to development sites where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur.

The actions to manage recreation would be similar to Alternative A, except fewer designated recreation areas would be retained, smaller restriction zones for surface disturbing activities would be implemented, and ROW development could occur in the 14 Mile Recreation Area. Overall, the fewer restrictions under this alternative, could potentially improve access to development sites where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur. The addition of VRM Class II management objectives to the western unit of the Wind River Front SRMA could add restrictions to renewable energy development projects by limiting surface disturbance activities and structures that impact view sheds and settings. A CSU for fluid minerals on the Continental Divide Snowmobile Trail would also place limitations on potential geothermal development sites.

Management actions to protect congressionally designated and/or eligible trails, and NHTs are similar to Alternative A, except that mineral leasing (with standard lease stipulations) and new ROWs could potentially be allowed along (not directly on) the intact road or trail segments of the Overland and Cherokee Trails, Point of Rocks to South Pass Road, and other Expansion Era roads and trails. The fewer restrictions on surface use and surface disturbing activities, and smaller visual impact zones under this alternative, could potentially improve access to development sites where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur. Same as Alternative B, contributing segments of NHTs would not be available for use as industrial access roads (e.g., fluid mineral drilling access roads, or as haul roads for heavy truck traffic); and the view shed in checkerboard areas of land ownership (federal and non-federal) would be managed to preserve the existing character of the landscape to the extent possible. These actions would impose some limitations on renewable energy developments.

Management of WSAs and WSR public lands would have actions similar to Alternative A, but there would be a greater emphasis on managing designated areas for multiple use. Under this alternative, the Sweetwater River designation would not be retained, so no WSR management actions would be developed or applied. No management actions on this resource could potentially improve access to development sites where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur.

Under this alternative, no ACECs would be retained (as compared to them all being retained under Alternative A).

Removing all the ACEC-specific land use, VRM, and surface disturbing restrictions under this alternative could potentially improve access to development sites where the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development could occur. Actions that could place some restrictions on renewable energy developments could be through the application of surface use restrictions and seasonal limitations in sensitive wildlife habitats (e.g., crucial winter range, parturition areas, migration corridor, and special status species nesting and brood rearing habitat).

### 4.20.3 Alternative D

Under this alternative, impacts on renewable energy resources would not be anticipated or would result in negligible impacts as a result of implementing management actions for locatable minerals, solid leasable minerals, saleable minerals, livestock grazing, and OHV travel.

Impacts on renewable energy development from managing water resources, wildland fire, forests and woodlands, vegetation, fish and wildlife, special status species, cultural and paleontological resources, travel and transportation resources, and recreation would be the same as Alternative A.

Impacts on renewable energy resources from implementing soil management actions would be similar to those identified under Alternative A. Areas with limited reclamation potential soils (those with limited reclamation potential as per the NRCS soil rating) would be designated avoidance areas for surface disturbing activities, which would restrict activities related to renewable energy development and maintenance. In addition, under this alternative, an operator must submit an approved mitigation plan before a proposed project on limited reclamation potential soils will be approved. Avoiding areas with limited reclamation potential soils and requiring mitigation plans could preclude renewable energy development in some areas, require that some projects be redesigned and reduced in size, and result in reduced development across the planning area.

Under Alternative D, lands with wilderness characteristics would be managed for multiple use or with existing management, such as ACECs. Similar to Alternative B, the management could reduce renewable energy development activities, but to a far lesser degree than under Alternative B. Renewable energy development activities could occur within these areas, but could preclude some development projects, result in project relocation, or cause projects to be scaled back to help protect wilderness characteristics.

Impacts on renewable energy development from the management of fluid mineral leasing and development would be similar to those described under Alternative A, except additional restrictions on fluid mineral leasing could result in reduced development of geothermal resources. Geothermal resource development activities are subject to the same restrictions applied to fluid mineral leasing and development. Under Alternative D, 768,989 acres would be closed to oil and gas leasing (228,968 more acres than under Alternative A), which would increase the availability of geothermal development activities and could result in more energy production from geothermal resources compared with Alternative A.

Impacts on renewable energy development from managing visual resources would be similar to those presented under Alternative A, except more restrictive VRM classifications would be applied to a larger area, which would restrict the ability to develop renewable energy resources. Approximately 1,178,718 acres would be classified as VRM Class II (596,046 more acres than under Alternative A) and 1,455,234 acres would be classified as VRM Class IV (725,189 fewer acres than under Alternative A). Managing development on the landscape to be consistent with increased VRM Class II areas and decreased VRM Class IV areas could result in decreased development or require that renewable energy projects be redesigned to maintain consistency with VRM class objectives, which could lead to additional project costs and delays. This would be especially true for wind and solar energy developments, as these projects have high potential to impact visual resources due to the visual intrusions associated with the structures used for such energy production.

Impacts to renewable energy development from implementing actions for lands and realty management would be similar to those presented under Alternative A, except a significant increase in ROW exclusion areas would prohibit renewable energy development across a larger area. Approximately 286,289 acres would be managed as ROW exclusion areas (140,420 fewer acres than under Alternative A) As a result, renewable energy development would be precluded within the exclusion areas, which would likely reduce overall renewable energy development across the planning area. ROW avoidance areas could potentially limit access to development sites, the placement of facilities, structures, and transmission/pipelines, and site preparation and construction activities associated with renewable energy development.

Impacts on renewable energy development from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a larger area and thereby further restrict the ability to develop renewable energy sources. Surface disturbance restrictions and ROW exclusion and avoidance areas designed to protect important historic, cultural, wildlife, and scenic values across additional and expanded ACECs would preclude or restrict the placement of facilities associated with renewable energy. The acres designated as ACECs would decrease to 246,634 acres, which represents a 14% decrease compared with Alternative A.

## 4.20.4 Proposed RMP

Impacts on renewable energy from management actions related to air quality, water resources, vegetative communities, wildlife and fisheries, special status species, wild horses, wildland fire ecology and management, cultural and paleontological resources, livestock grazing, OHV travel, and forests and woodlands would be the same as under Alternative A. As noted under Alternative A, management actions for locatable, geophysical, solid mineral leasing and saleable mineral exploration and development would not impact renewable energy development.

Impacts on renewable energy resources from implementing soil management actions would be similar to those identified under Alternative A, except that, consistent with Alternative D, areas with limited reclamation potential soils (i.e., as per the NRCS soil rating) would be designated avoidance areas for surface disturbing activities, which would restrict activities related to renewable energy development and maintenance.

Impacts from managing lands with wilderness characteristics would be similar to Alternative D, except that more of these areas would be managed in accordance with other overlapping special designations and management uses (36% increase compared to Alternative D), which could preclude some development projects, result in project relocation, or cause projects to be scaled back to a greater degree under the Proposed RMP.

Impacts on renewable energy development from the management of fluid mineral leasing and development would be similar to those described under Alternative A, except that additional restrictions on fluid mineral leasing could result in reduced development of geothermal resources. Under the Proposed RMP, 1,076,039 acres would be closed to fluid mineral leasing (99% increase compared to Alternative A), which would decrease the availability

of geothermal development activities and could result in more energy production from geothermal resources, compared with Alternative A.

Impacts on renewable energy development from managing visual resources would be similar to those presented under Alternative A; more acres would be managed as VRM Class II and fewer acres would be managed as VRM Class IV, which would restrict the ability to develop renewable energy resources. In general, impacts on renewable energy development from managing visual resources would be more restrictive than Alternatives A, C, and D, but less restrictive than Alternative B. Approximately 1,301,004 acres would be classified as VRM Class II (718,332 more acres than Alternative A) and 1,929,258 acres as VRM Class IV (251,165 fewer acres than Alternative A). Managing development on the landscape to be consistent with increased VRM Class II areas could result in decreased development or require that renewable energy projects be redesigned to maintain consistency with VRM class objectives, which could lead to additional project costs and delays.

Impacts on renewable energy development from implementing actions for lands and realty management would be similar to those presented under Alternative A, except that an increase in ROW exclusion areas would prohibit renewable energy development across a larger area. Under the Proposed RMP approximately 921,059 acres would be managed as ROW exclusion areas (116% increase compared to Alternative A). As a result, renewable energy development would be precluded within the exclusion areas, which would likely reduce overall renewable energy development across the planning area. Additionally, under the Proposed RMP, 1,047,929 acres would be managed as ROW avoidance areas (42% increase compared with Alternative A). Increased acreage of ROW avoidance areas could potentially limit access to development sites, the placement of facilities, structures, and transmission lines, and site preparation and construction activities associated with renewable energy development.

Impacts on renewable energy development from managing special designation areas would be similar to those presented under Alternative A, except they would occur over a larger area, and thereby further restrict the ability to develop renewable energy sources. The acres designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase compared with 10 ACECs under Alternative A). Surface disturbance restrictions and ROW exclusion and avoidance areas designed to protect important historic, cultural, wildlife, and scenic values across additional and expanded ACECs would preclude or restrict the placement of facilities associated with renewable energy.

## 4.21 SPECIAL DESIGNATIONS

Special designations are identified and managed to protect the important historic, cultural, wilderness, wildlife, vegetation, soil, or watershed values for which these areas were designated. Therefore, potential impacts on special designations within the planning area are analyzed throughout Chapter 4 under the sections that address impacts on these resource values. For analyses on these values, refer to those appropriate sections in this chapter and Appendix C. The analysis below in this section only addresses changes to the boundaries of special designations, as those would have a direct impact on the ability to protect the resource values for which these areas were designated.

National Scenic and Historic Trails special designations are also identified in the analysis below, in this section and throughout Chapter 4 alternatives.

### 4.21.1 Alternative B

The potential impacts to special designations would be the same as those presented under Alternative A, except they would occur over a larger area for ACECs and management areas and thereby offer greater protections to important historic, cultural, wildlife, and scenic values in these areas. The acres designated as ACECs would increase greatly to 1,605,660 acres (460% increase) and extend to 16 ACECs compared with Alternative A (Table

2-12 in Appendix V, Map 2-37). The areas designated as management areas would decrease to 183,938 acres (68% decrease), compared with Alternative A. This is because many of the existing management areas would be designated as ACECs under this alternative, which would increase the level of protection to important historic, cultural, wildlife, and scenic values in these areas. The potential impacts to WSAs and WSRs would be the same as those presented under Alternative A.

## 4.21.2 Alternative C

The potential impacts to WSAs would be the same as those presented under Alternative A. The impacts on all other special designations discussed under Alternative A above would not occur, as the designations for ACECs, management areas, and WSRs would be eliminated under Alternative C.

## 4.21.3 Alternative D

The potential impacts to special designations would be the same as those presented under Alternative A, except they would occur over a smaller area for ACECs and other management areas (Table 2-12 in Appendix V, Map 2-39) and thereby offer fewer protections to important historic, cultural, wildlife, and scenic values in these areas. The acres designated as ACECs would decrease to 246,634 acres, which represents a 14% decrease compared with Alternative A. The areas designated as management areas would decrease to 312,980 acres (46% decrease compared with Alternative A). The potential impacts to WSAs and WSRs would be the same as those presented under Alternative A.

## 4.21.4 Proposed RMP

The Proposed RMP is a combination of management actions primarily from Alternatives B and D and would have similar impacts as previously described under these alternatives. The potential impacts on special designations would be the same as those presented under Alternative A, except they would occur over a larger area for ACECs and with a reduction in management areas. Several existing management areas would be included in the expanded Steamboat ACEC under the Proposed RMP.

The acres designated in 12 ACECs under the Proposed RMP would increase to 935,135 acres (226% increase in acres compared with 10 ACECs under Alternative A). Conversely, the Proposed RMP would designate 670,525 fewer acres than Alternative B. The Monument Valley ACEC and Cedar Canyon ACEC would be removed due to their checkboard land ownership. However, the important rock sites within Cedar Canyon would still be protected through application of other management decisions. Under the Proposed RMP, the Greater Red Creek ACEC (renamed Little Mountain ACEC) would be the same as under Alternative A but greatly reduced from the proposed expansions under Alternative B. Under the Proposed RMP, the Special Status Plant Species ACEC would add 3,269 acres compared with Alternative A and an additional 859 acres compared with Alternative B to include newly discovered plant populations. The Big Game Migration ACEC would be removed, but this area would be managed within the expanded Steamboat ACEC with CSU stipulations for fluid minerals. A specific HMP will be developed for big game migration under the Proposed RMP to protect wildlife values while still providing for multiple uses. Under the Proposed RMP, the current Red Lake and East Sand Dunes ACECs would be maintained as WSAs.

Under the Proposed RMP, management areas would be reduced and subject to multiple-use management activities that could allow surface-disturbing activities subject to mitigation compared with Alternative A. The Red Desert Watershed Management Area would be removed; however, approximately half of this management area (western unit) would be incorporated into the expanded Steamboat ACEC along with the West Sand Dunes Archaeological District, Steamboat Mountain, and Pinnacles Geographic management areas and these areas would follow that ACEC's management direction to preserve relevance and importance values. The eastern portion of the Red Desert

Watershed Management Area would be open to multiple uses without special designation management. The Pine Mountain and Sugarloaf Basin Management Areas and their management of sensitive resources would be the same as described under Alternative A.

The potential impacts to WSAs and WSRs would be the same as those presented under Alternative A.

# 4.22 SOCIOECONOMICS

This analysis mainly addresses impacts in the socioeconomic study area. As explained in the Socioeconomic Baseline Report (BLM 2013), this is the area most strongly linked economically and socially to BLM-administered lands and resources in the RSFO. The study area consists of all of Fremont, Lincoln, Sublette, Sweetwater, and Uinta counties. Where appropriate, the analysis identifies impacts that would occur beyond the boundaries of the socioeconomic study area.

Note that in economic and social analyses, the term "impact" refers to a change in the social or economic environment and does not imply whether these changes are positive or negative outcomes. The "direction" of the impact should be clear from the context but may also vary depending on the perspective of the reader. For instance, generation of jobs and income within the study area is considered by most people who live in the area to be a positive effect. Social impacts may be judged differently by different stakeholders. For instance, stakeholders who tend to view natural resource development as essential to their communities may view rapid oil and gas development as aligned with their personal and community interests, while others who tend to favor conservation may feel it is contrary to their or their community's interests.

Some socioeconomic impacts are addressed quantitatively below. Many impacts, including both economic and social impacts, can only be addressed qualitatively given the available data and information.

## 4.22.1 Methods of Analysis

### Market Values Economic Impact Analysis

The socioeconomic analysis relies on quantitative and qualitative discussions to convey potential impacts of management actions under each alternative.

#### Quantitative Economic Impact Analysis

A quantitative economic analysis approach was used when possible given adequate available information and resources. In this EIS, adequate data was available for five resource uses: livestock grazing, oil and gas development and production, coal production, trona (soda ash) production, and recreation. The coal and trona ash analyses were conducted separately, based on available data for each industry, but the results were combined for presentation in this EIS to protect potentially proprietary data given the small number of operators in each industry. The economic analysis examines changes in economic activity and is not a cost-benefit analysis. Please reference the 2013 RSFO Socioeconomic Baseline Report for a comprehensive analysis of additional socioeconomic impacts associated with the management area that are not otherwise discussed in this section.

The basic strategy used was to first identify how management actions under the alternatives may affect resource use levels, and then to monetize the direct impacts associated with these changes. For instance, direct impacts include expenditures made by oil and gas companies to drill a well and to complete the well for production. Direct impacts also include the value of the oil and gas that is produced and sold. Direct impacts were estimated based on anticipated levels of resource use (e.g., number of wells drilled, number of recreation visits) for each alternative.

Next, direct impacts were run through a customized input-output model to estimate the total amount of economic activity that would be generated as the direct impact ripples through the regional economy. Total impacts include the indirect economic activity stimulated by directly affected industries purchasing goods and services that are necessary inputs to production, and as labor income generated from production is spent by the households that receive the income.

The total effects were estimated in this EIS through use of the IMPLAN (IMpact analysis for PLANning) model.[1] The IMPLAN model was originally developed by the Forest Service and is commonly used by the BLM and many other government and private sector organizations to estimate the total economic impacts of various activities, actions, and policies. The model tracks inter-industry and consumer spending in a local or regional economy, allowing estimation of "indirect" and "induced" economic impacts in the local economy that result from the original economic activity or a change in economic activity. Indirect impacts result from local inter-industry purchases caused by the direct impact. Induced impacts results from re-spending of labor income (i.e., local purchases by households of employees and proprietors of the affected industries). The re-spending represented by indirect and induced impacts is often referred to as the "multiplier effect."

Outputs of the IMPLAN model include employment, labor income, and gross regional economic output. It is important to note that IMPLAN, based on some of its data sources, does not distinguish between full-time and part-time jobs. Sectors with higher labor earnings per job are likely to reflect a high proportion of full-time jobs, while sectors with low labor earnings per job often reflect a significant number of part-time jobs.

The IMPLAN model uses data specific to the local economy wherever possible, but also uses some data based on national-level economic relationships. Therefore, the model benefits from "calibration" of some of its data to better reflect the local economy. For this study, IMPLAN was calibrated based on work the University of Wyoming has done with the model in Wyoming over many years, and with data specific to this study. The specific IMPLAN impact analysis methodology and assumptions for each resource use are described in general in subsections below, and in greater detail in Appendix N, Technical Report: Social and Economic Impact Analysis Methodology.

In addition to estimating employment, labor income, and gross regional economic output with the IMPLAN model, the quantitative economic impact analysis also estimated – using tax and royalty rates – the following public revenues that accrue to various governments:

- Mineral severance taxes on oil, gas, coal, and trona collected by the State of Wyoming. The state redistributes some severance tax revenue to local governments.
- Ad valorem taxes on oil, gas, coal, and trona, collected by the counties based on state assessments of the value of mineral production.

Selected tables in this chapter report the federal share and the state share of federal mineral royalties separately and report the mineral severance taxes and ad valorem taxes. Gross revenues are reported; subsequent distributions of the revenues were not estimated.

**Outputs from Bureau of Land Management-Administered Land**

To develop the direct economic impacts of resource uses on BLM-administered land, the BLM first estimated the annual level of resource use under each alternative. These use levels, or outputs, are readily quantifiable values such as AUMs of forage use, number of oil and gas wells drilled, tons of coal produced, number of recreation visits, etc. Table 4-36 summarizes the estimated outputs by alternative. For livestock grazing, oil and gas

[1] *An additional analysis using the REMI model was also conducted. See the "REMI Model Analysis" section below for further information.*

development, coal and soda ash production, and recreation, the BLM assumed that the level of use would be the same across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production; the value in Table 4-36 is only for the first year of the study period, 2016. The following sections describe the basis for the annual estimates at a high level, and Appendix N, Technical Report: Social and Economic Impact Analysis Methodology, provides further detail.

## Table 4-36. Annual Activity / Outputs from Bureau of Land Management-Administered Land by Alternative

| -- | Alt. A | Alt. B | Alt. C | Alt. D |
|---|---|---|---|---|
| Livestock Grazing (AUMs – Billed Use)[1] | 147,631 | 147,631 | 147,631 | 147,631 |
| Livestock Grazing (AUMs – Total Authorized Use)[1,4] | 303,238 | 297,066 | 160,387 | 303,238 |
| Conventional Oil and Gas Wells Drilled[1] | 232.4 | 61.5 | 238.8 | 230.2 |
| CBNG Wells Drilled[1] | 6.2 | 3.0 | 7.2 | 6.7 |
| Crude Oil (bbls – 2016)[2] | 2,047,125 | 542,141 | 2,104,317 | 2,026,774 |
| Natural Gas (mcf – 2016)[2] | 82,824,048 | 21,947,512 | 85,144,702 | 82,005,381 |
| Coal and Soda Ash (short tons)[1,3] | 4,107,267 | 4,107,267 | 4,107,267 | 4,107,267 |
| Recreation (visits – Low Visitation)[1] | 426,439 | 426,439 | 426,439 | 426,439 |
| Recreation (visits – High Visitation)[1] | 847,318 | 847,318 | 847,318 | 847,318 |

[1] Based on the available data, the analysis assumes a constant annual activity level.
[2] Initial value; this would increase each year from 2016 due to increasing number of wells in production.
[3] Values combined to protect confidentiality of data from individual operators.
[4] The total number of permitted active AUMs per the Green River RMP is 318,647; however, this includes AUMs outside of the RSFO.

**Methods for Livestock Grazing**

The value of grazing in a specific area can be estimated based on the grazing use of the area in AUMs, and the value of an AUM. The direct value of production per AUM was estimated based on regional livestock production value data and ratios in the livestock economics literature. The figures for the value per AUM for cattle or sheep grazing were multiplied by the estimates of grazing use (number of AUMs) by livestock type under each alternative. The result was the total economic value of livestock production, which was used as the direct impact input to the IMPLAN model.

The estimates of grazing use were based on: a) the 10-year average (2006–2015) of billed AUMs, and b) total authorized AUMs of forage use for cattle, sheep, and other livestock for the RSFO. Billed forage use is the closest available proxy for actual forage use. Because billed use may exceed actual grazing use, the economic analyses may overstate the actual economic impacts of grazing to some degree. Estimates were also prepared for total authorized forage use in order to indicate the maximum possible economic impact of grazing on BLM-administered land; however, billed use was considerably below authorized use for every year of the 2006-2015 period. The sections below that focus on each alternative use the analysis based on historical billed AUMs. The section that summarizes the quantitative economic impact analysis results also provides the results for total authorized AUMs.

Total authorized AUMs are the same for Alternatives A and D. Total authorized AUMs are 6,202 less under Alternative B due to provisions of that management alternative (prohibition on grazing in certain allotments). Under Alternative C, total authorized AUMs are limited to the highest level of billed use over the last 10 years (2009 – 2018). That figure is 160,387 AUMs, which is 142,881 less than the authorized AUMs under Alternatives A and D.

The billed use estimates did not vary between the alternatives. While forage utilization and billed use could vary somewhat under these alternatives (e.g., due to differences in treatment of voluntary relinquishment of permits or grazing preference), the differences between the alternatives could not be quantified for billed use. Also, while total authorized AUMs decrease in Alternatives B and C, total authorized AUMs are still greater than or equal to historical total billed use in the RSFO; therefore, the BLM believes that billed use would not be affected by the reduction in authorized AUMs under Alternatives B and C.

In all cases, the AUMs used in the economic impact analysis were adjusted to limit the results to economic activity that accrues within the five-county socioeconomic study area. For each allotment, RSFO rangeland management staff familiar with the allotments and permittees identified probable locations of operator purchases for livestock supplies, services, and labor. This analysis estimated that 77.1% of the economic impact associated with RSFO AUMs accrues within the five-county socioeconomic study area. The remainder accrues outside the five counties, primarily in Idaho and Utah, and these impacts are not included in the results tables below.

The reader should note that the economic impact figures below only represent livestock grazing on BLM-administered land. They do not represent the total impact of livestock grazing on all land, public and private, in the RSFO.

**Methods for Oil and Gas Development and Production**

The analysis for oil and gas economic impacts was divided into two phases of oil and gas economic activity:

- Development (drilling and completion)
- Production.

This analysis focuses only on *new* oil and gas wells that would be drilled into federal mineral estate within the RSFO because the management decisions under consideration in the RMP would not apply to valid and existing mineral rights. The economic impact figures for the new oil and gas wells are a subset of the economic impacts of all oil and gas wells (new *and existing*) on federal mineral estate in the field office, which in turn are a subset of the economic impacts of all oil and gas wells on all federal *and non-federal* mineral estate in the field office and planning unit (i.e., including wells on privately and state-owned mineral estate). Put another way, the impact estimates do *not* include the economic impacts of any existing wells on federal mineral estate, nor of any wells (new and existing) on non-federal mineral estate.[2]

The analyses for development utilized the estimated well numbers from the RFD scenario. The RFD scenario estimated total wells drilled across the planning period. As shown by recent history, drilling activity can vary substantially from year to year. Therefore, the total estimated wells from the RFD were allocated equally to each year of the study period for the purposes of conducting the economic impact analysis. The success (completion) rate for new wells was assumed to be 85% for conventional wells and 95% for CBNG wells, based on recent experience as observed by the RSFO petroleum staff. Estimates of per well drilling and completion costs were based on data from industry and information from RSFO and High Desert District staff. The percentages of total well costs that are spent within the socioeconomic study area were based on data from industry, the U.S. Energy Information Administration, and previous BLM analyses in Wyoming. The combination of wells drilled, completion rates, costs, and percent local expenditures determined the direct impacts used in the IMPLAN model.

The analyses for production utilized the oil and gas production volumes by year from the RFD scenario. Production volumes were multiplied by projected annual oil and gas prices in the Dakotas/Rocky Mountain Region between 2016 and 2031, as reported by the U.S. Energy Information Administration and expressed in

[2] *A nuance here is that the figures for oil and gas production do include estimated production from the wells the RFD estimated would be placed into service from 2013-2015. In the RFD production estimates for each year from 2016 to 2031, it was not possible to separate out the production from the 2013-2015 wells from the total production.*

2014 dollars. These estimated revenues were then entered into the IMPLAN model to estimate the total economic impacts from production.

Ad valorem and severance tax revenues estimates were developed from per unit tax revenue rates from the Wyoming Department of Revenue's 2015 Annual Report. These estimated rates were applied to the forecasted market sales values, with the assumption that the Wyoming tax structure will remain constant over the analysis period. Estimates for Federal Mineral Royalties, both the Wyoming and federal shares, were based on the current Federal Government royalty rate of 12.5% royalty rate (Wyoming receives nearly half of this, or 6.0%). Royalties do not include bonus bids (a one-time additional revenue source for some leases). Royalties also do not include annual rental fees paid on federal mineral leases before they begin yielding production, which are a very small revenue stream.

**Methods for Coal and Trona (Soda Ash) Production**

For each of these industries, there is only one phase of economic activity – the production phase. There is no development phase equivalent to the drilling and completion activities in the oil and gas industry.

The economic analysis for each industry involved two major steps:

- Estimating the amounts of production on BLM-administered coal and trona in the planning area under each management alternative.
- Estimating the economic impacts based on the value of production.

Average production from BLM-administered coal within the RSFO from 2007–2015 was used as the estimate of future production. This period showed variations in production from year to year. Variations are also likely in the future, so the average value was used. In the RSFO, coal is produced from both surface and underground sources. These sources have different cost structures and tax and royalty rates. Future production from each source was based on the average surface to underground production ratio for 2013–2015, applied to the estimate of future production described above. The estimated production volumes were then multiplied by the price of coal, resulting in an estimate of the total annual sales value for coal production. The estimated future price was based on U.S. Energy Information Administration 2016–2031 reference case projections for western Wyoming minemouth prices, using the average of the price projections for all those years, which was $40.24 per short ton, expressed in 2014 dollars. The coal sales values were then entered into the IMPLAN model, Sector 22, Coal Mining, to estimate the total economic impact from coal production.

In the case of trona, there are two steps in production that are both encompassed in the analysis. First, trona is mined. Second, the vast majority of the trona ore is processed into soda ash, which is then sold and shipped to other industries. Some additional trona derivative products are also created and sold. These include purge liquor, sulfide, sodium bi-carbonate, and sodium sesquicarbonate. A small amount of trona ore is also sold separately. The value of these products is not included in the economic impact analysis. Together, they represent from 7.4% to 7.9% of the total sales value of all (federal, state, and private) trona-derived products from Sweetwater County according to data from the Office of Natural Resources Revenue.

Average soda ash production from BLM-administered trona from 2007–2014 was used as the estimate of future production. This period showed variations in production from year to year. Variations are also likely in the future, so the average value was used. The estimated soda ash production volume was then multiplied by the price of soda ash, resulting in an estimate of the total annual sales value for soda ash production. The 2014 Sweetwater County price of $133.91 per ton from the Wyoming Department of Revenue was used as the estimated future price. This assumes that soda ash prices will remain, on average, constant through the duration of the study period. The soda ash revenue was entered into the IMPLAN model to estimate the total economic impact of soda ash production. The total economic impact of trona mining was estimated separately by entering trona mining revenue

into a separate sector of the IMPLAN model, after removing the linkage between the soda ash and trona sectors to avoid double-counting the impacts from trona revenue.

Public revenues for coal and trona were estimated by multiplying the sales value by the current federal mineral royalty rates (portion retained by the Federal Government, and portion returned to the state) and current ad valorem and severance tax rates. Royalties do not include bonus bids and rents. The ad valorem and severance tax analysis was adjusted by the Wyoming Department of Revenue assessed to gross ratios.

The economic impacts of coal production are reported together with the impacts of trona production. Adding these results together was necessary in order to avoid potential disclosure of proprietary information due to the small number of operators in each industry.

**Methods for Recreation**

The direct economic effects of recreation on public lands administered by the RSFO can be estimated by multiplying annual recreational visitation as reported by BLM's Recreation Management Information System (RMIS), by average visitors' expenditure profiles. Table 4-37 shows the total visits in the RSFO in recent years.

**Table 4-37. Total Recreation Visits to the Rock Springs Field Office, 2011–2015**

| Fiscal Year | Visits |
|---|---|
| 2011 | 429,861 |
| 2012 | 426,439 |
| 2013 | 452,916 |
| 2014 | 518,082 |
| 2015 | 847,318 |
| Five-Year Average | 534,923 |
| Low Year Visits | 426,439 |
| High Year Visits | 847,318 |

Source: Recreation Management Information System data

While visitation in the RSFO has increased in recent years, it is unknown if this trend will continue. Therefore, the BLM conducted two economic analyses, for high and low visitation scenarios. The low scenario assumes that visitation over the 2016–2031 study period would average out as the low year visits number (426,439) and the high visitation scenario assumes that visitation would average out to the high year visits number (847,318).

While the alternatives differ in terms of recreation management actions, there is no basis for reliably estimating how the management actions will affect recreation visitation numbers. For instance, in Alternative C, a new open play area would be added. There is no basis for confidently predicting the amount of visitation the new play area would draw. Therefore, the total low and high scenario visitation numbers for Alternative C are the same as for Alternative A; however, it is likely there would be some additional visitation and economic contributions under Alternative C.

Due to the lack of recreation expenditure data for the RSFO, data from the National Visitor Use Monitoring (NVUM) program of the U.S. Forest Service (USFS) was used to provide proxy values for expenditures by recreationists in the RSFO. The NVUM program provides a robust data source that is widely used for recreation economic impact analysis for areas besides USFS-managed lands. This is done by identifying national forest units that are reasonably analogous to another recreation management area and applying the recreational expenditure data from NVUM to other area-specific recreation use data or estimates.

The USFS unit deemed most analogous to the RSFO in terms of recreation use was the Ashley National Forest. However, while the BLM used some of the NVUM data for the Ashley National Forest, the NVUM recreation "trip type" data for the national forest was replaced by analogous estimates for the RSFO developed by a RSFO recreation specialist. This is because the RSFO tends to get more non-local visitation than the Ashley National Forest. This is because the Flaming Gorge Reservoir, located on the National Forest and not part of the RSFO, sees significant local use, while the "brand" of recreation on the RSFO is more remote, which attracts a higher proportion of non-local visitors.

Expenditure values, also referred to as visitor spending profiles, from the NVUM for the Ashley National Forest were applied to the visitation data for the RSFO using a detailed procedure described in Appendix N, Technical Report: Social and Economic Impact Analysis Methodology. The estimated total direct expenditures were used in the IMPLAN model to estimate the indirect, induced, and total economic effects of recreation. The BLM acknowledges that certain recreation activities on BLM-administered land may generate visitor expenditure patterns that differ from the NVUM expenditure values. However, the BLM believes that in total—averaged across the many different recreation activities that take place in the RSFO— the per visit expenditure values from the NVUM are reasonably close to the per visit expenditures that occur in the socioeconomic study area due to recreation on BLM-administered land in the RSFO. Appendix N, Technical Report: Social and Economic Impact Analysis Methodology, discusses the use of NVUM data further, including its applicability for OHV recreation in particular.

The recreation economic analysis presents two views of the economic effects of recreation: economic impact and economic contribution. These views are in addition to the low and high visitation scenarios.

Economic impact measures only the effects of "new" income in the study area; in the case of recreation, economic impact is based on all spending of non-local residents on local recreation, and the spending by local residents that would be lost to other regions if the local BLM recreational opportunity did not exist (some spending by local residents would continue, using local substitute recreation opportunities). Economic contribution includes the effects of all expenditures made by local residents (roughly, individuals who live within the socioeconomic study area), as well as the role of spending from recreators from outside the study area. In other words, economic contribution is based on all spending of local residents on local recreation and all spending of non-local residents on local recreation. Economic impact is the measure used in the analyses above of oil and gas development and production, coal production, trona (soda ash) production, and livestock grazing. Local residents buy only a very small proportion of the total output of those industries, so a measure of economic contribution would be only slightly greater than the measure of economic impact. In the case of recreation, however, local residents make considerable recreation-related expenditures (gas, food, and so on while on local trips), so it is fair to include those expenditures in an analysis of the economic role of recreation. Put another way, expenditures by local and non-local recreationists alike help keep local businesses going.

**Base Year Dollars and Discounting**

All dollar figures throughout the economic analysis are in constant 2014 dollars. This is the base year used in the IMPLAN model.

Some of the results tables below summarize the economic impacts across the entire study period, 2016– 2031. This period reflects the analysis period of the RFD scenario, which extended to 2031.

In the summary tables for the entire study period, economic impacts in future years were *discounted* to adjust for the "time value of money." This is an economic concept that refers to the value of a given amount of money being less in the future. Most people, presented with a choice, would rather have a dollar now than a dollar 10 years from now, or even one year from now because the dollar can be put to productive use now. When monetary values of an action vary over time, economists adjust for the time value of money by applying an annual discount rate to

the amounts in future years. This is different than adjusting for inflation, which is a loss in money's value in the future due to a rise over time in prices for products and services across the economy. The result of adjusting for the time value of money is known as the "present value." Providing present values for 2016–2031 for all the economic impact analyses allows for comparison – based on a reasonably lengthy period – of the relative economic impacts of each resource use and alternative. The BLM used discounts rates of 3% and 7% to present different economic perspectives on the discount rate as recommended by the Office of Management and Budget. In simple terms, the lower rate reflects how consumers make consumption decisions, and the higher rate reflects how industry makes capital allocation decisions (OMB 1992, OMB 2003, OMB 2011).

**REMI Model Analysis**

The direct, indirect, induced, and total economic effects of the management alternatives were estimated in this study through use of the IMPLAN model as described above. An additional analysis using the same primary impact data and a different model – the REMI model developed by REMI, Inc. – was conducted by the State of Wyoming Economic Analysis Division in collaboration with the BLM and the Cooperating Agencies. Appendix O, REMI Model Application and Discussion, provides a detailed discussion of the REMI modeling process and a comparison of the results from the two models. Appendix O concludes that the differences in results between the IMPLAN and REMI models are not so great that they would lead to different management decisions (selection of a different preferred alternative) if REMI were used for the quantitative economic analysis instead of IMPLAN. The results of the two models do not tell decisively different economic stories about the nature of the local economy or the alternatives. Because the REMI and IMPLAN models were not decisively different during the comparison of management alternatives, the Proposed RMP was not modeled in REMI, as the existing results create lower and upper bounds for potential impacts. For NEPA purposes, all conclusions regarding the quantified economic effects of the alternatives are based on the IMPLAN model analysis, as presented in this section of Chapter 4.

### Qualitative Economic Impact Analysis

When direct impacts cannot be readily quantified, often the economic impacts can still be described qualitatively. In such cases, the analytical approach used in this EIS was to describe the type of impact in a base scenario (Alternative A, the No Action Alternative) and then assess the relative changes (qualitative indications of increases or decreases in economic values) that would be likely under other alternatives.

Some management decisions may result in increased costs to operators (the firms or individuals who undertake the activities) or to project proponents. The economic impacts of decisions that increase costs for operators and/or project proponents are many and can be complex. Several results can occur, sometimes simultaneously:

- *Reduced economic activity:* Cost increases may cut into profitability and drive delays to, reductions in, or cessation of operations or projects. In general, it is rare for cost increases to directly preclude projects or result in operators going out of business, as project proponents and operators will seek other approaches, such as reconfiguring or moving projects or operations. However, projects or operations may be scaled back, or if they are moved a great distance, the local economy may experience a loss.
- *Increased economic activity:* Where operations or projects are not delayed or reduced substantially, or terminated, increased costs may also generate additional economic activity in the form of income and jobs in the economic sectors receiving the increased expenditures. For instance, if restrictions under an alternative result in a new power line having to take a longer route, additional expenditures for materials, equipment, and labor would be made. These increased expenditures would support some amount of additional income and employment. However, increased costs may also represent opportunity costs; that is, the project proponent or society may have benefited more if the additional funds were used in another way.

- *The net effect:* In many cases it is not possible to identify which effect – increased or decreased economic activity – will predominate, without considerably more information.

In the analysis below, where management actions would potentially increase costs to operators or project proponents, these increased costs are pointed out and discussed qualitatively.

## Nonmarket Value Impact Analysis

The term nonmarket values refers to the benefits individuals attribute to experiences of the environment or uses of natural and cultural resources that do not involve market transactions and therefore lack prices. Because these values are not priced, they are difficult to estimate. Also, they are not directly comparable to estimates of income derived from market transactions such as commodity sales or purchases by recreationists. For example, a "consumer surplus" estimate of nonmarket value reflects the difference between total willingness to pay and transactions in market, while commodity and expenditure value estimates, like those generated by the IMPLAN model and presented in Section 4.23.3 and the alternative-specific annual impact and net present value tables, only reflect transactions in markets. Nonetheless, BLM guidance calls for the BLM to make effort to identify and assess impacts to nonmarket values in the planning process (BLM Instruction Memorandum No. 2013-131, Guidance on Estimating Nonmarket Environmental Values, May 31, 2013). The Socioeconomic Baseline Report provides background information on nonmarket values, including discussion of different types of nonmarket values.

For this RMP/EIS, the BLM estimates nonmarket values associated with recreation using a "benefits transfer" methodology described in the Impacts of Alternative A section below. Because of uncertainties inherent in quantification of nonmarket values, the analysis is conducted for low and high recreation visitation scenarios. Potential differences between the alternatives in the nonmarket values associated with recreation are described qualitatively. Additional types of nonmarket values, and how they may vary between alternatives, are described qualitatively.

### Social Impact Analysis

Some social impacts, especially those impacts related to certain demographic characteristics (such as population and age distribution), housing, and community services, are driven in large part by changes in economic activity. Other social impacts may arise with or without effects to economic activity including, for example, impacts on quality of life, recreation and amenity values, and traditional land uses and associated cultural values. Social impacts may be marginal or substantial, depending on the degree to which new and revised management actions alter the local social conditions.

Methods exist to quantify some social impacts; however, in this analysis social impacts are described qualitatively. This is because social impacts of BLM management decisions are typically not amenable to quantitative analysis. For instance, it is difficult to reliably translate potential for future resource development into population change estimates without having plans for their development. In other cases, the impacts are to values and attitudes and cannot readily be quantified. Social impacts also may vary considerably depending on the nature of the alternatives and of the communities involved. For a planning effort that covers as large a geographic area as this effort, analysis of social impacts must necessarily use a broad brush.

A key aspect of the social impacts analysis approach is to address impacts based on the varying points of view of key types of stakeholders. The Socioeconomic Baseline Report identifies several broad categories of stakeholders to BLM management decisions in the RSFO. These categories reflect different linkages people have to public lands. They also reflect distinct sets of attitudes, beliefs, values, opinions, and perceptions about public resources and the effects of various management policies and actions. Categorization of stakeholders is not meant to imply that all individuals and social groups fit neatly into a single category; many specific individuals or organizations may have multiple interests and would see themselves reflected in more than one stakeholder category. The point

of categorization is to allow differentiation of social impacts based on broad differences in points of view. The social impacts analyses below assess the alternatives against the different points of view in the broad stakeholder categories.

#### Environmental Justice Impact Analysis

Definitions and methods for analysis of potential environmental justice (EJ) issues are described in the Socioeconomic Baseline Report. In short, the socioeconomic study area was screened in the Socioeconomic Baseline Report to identify communities with minority and low-income populations that qualify as potential EJ populations based on guidance for EJ analysis from the Council on Environmental Quality (CEQ). These communities and their potential EJ populations, and assessment of the likelihood of impacts to these populations, are presented in Section 4.23.8 below.

## 4.22.2 Summary of the Quantitative Economic Impact Analysis Results

### IMPLAN Model Results

Appendix N presents multiple tables that allow for easy comparison of the quantitative economic impact results across the alternatives. The economic indicators presented in this section are:

- Total economic output
- Total labor earnings
- Total employment.

Certain estimated public revenues are presented in the sections below that address each alternative in detail.

Readers should keep in mind that the figures from the IMPLAN model and the revenue analysis *only* represent certain quantifiable economic effects of each alternative. Additional, non-modeled economic and social effects would occur under each alternative. These are addressed qualitatively in the sections focused on each alternative.

In the tables in Appendix N, annual estimates are for the first year of the study period, 2016. For livestock grazing, oil and gas development, coal and soda ash production, and recreation, the BLM assumed that the 2016 level of use would also be the average level of use across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production based on the RFD scenario. The net present value estimates in each table in Appendix N encompass the cumulative economic and fiscal impacts of each alternative across the entire study period, based on a discount rate of 3.0% or 7.0%. The net present value estimates take into account both the increasing level of oil and gas production in each year of the study period and the time value of money. Net present value is not an applicable concept for employment. The time value of money does not apply to future jobs versus present jobs. Therefore, the employment figures in the annual impact tables in Appendix N do not account for the projected growth in oil and gas production, and associated jobs, in each year of the study period. Instead, the net present value tables in in Appendix N that address each alternative in detail account for this growth in jobs by showing the average jobs in oil and gas production across the study period.

The BLM evaluated several analysis scenarios for grazing and recreation impacts. The first table in Appendix N for each economic indicator presents the analysis scenario for grazing economic impacts for estimated billed use of AUMs and recreation economic impacts for a high visitation scenario. A second table for each indicator presents results for each of the following additional scenarios:

- Grazing economic impact for full use of all authorized AUMS

- Recreation economic impact for a low visitation scenario
- Recreation economic contribution for a low visitation scenario
- Recreation economic contribution for a high visitation scenario.

The following general observations pertain to Tables N.7 through N.12 in Appendix N:

- The estimates for livestock grazing impacts do not vary across the alternatives when billed use is evaluated but do vary when total authorized use is evaluated. This is because, first, Alternative B reduces total authorized AUMs in some allotments, although by a small percentage of total AUMs across the entire RSFO. Second, Alternative C limits total authorized AUMs to the highest level of billed use over the last 10 years (2009 – 2018), which was 160,387 AUMs, considerably less than the 303,238 AUMs under Alternatives A and D. The total authorized AUMs under Alternatives B and C would still be greater than or equal to historical total billed use in the RSFO; therefore, the BLM believes that billed use would not be affected by the reduction in authorized AUMs under Alternatives B and C. The estimates for total authorized use are identical for Alternatives A and D because differences in management actions affecting livestock grazing under these two alternatives cannot be reliably quantified.
- The oil and gas development and production impact estimates vary across the alternatives according to differences in the RFD for each alternative.
- Although acres open or closed to coal and soda ash differ across alternatives, these acreage differences are not anticipated to have a measurable effect on future production amounts. This is based upon field office specialists' knowledge about coal and soda ash production in the area and their interactions with the companies.
- The recreation impact estimates for all alternatives are identical because differences in visitation based on management actions affecting recreation cannot be reliably quantified.

Table N.7 presents total economic output by BLM program by alternative. Important observations on these results include the following:

- The quantified economic output in the RSFO across all programs totals $1.734 billion annually in 2016 in Alternative A, $0.827 billion in Alternative B, $1.769 billion in Alternative C, and $1.723 billion in Alternative D.
- The impacts of oil and gas development and production, as well as coal and soda ash production, are considerably greater than the impacts of livestock grazing and recreation. For instance, total economic output from oil and gas development under Alternatives A, C, and D is over 50 times greater than that from livestock grazing and 19 to 20 times greater than that from recreation. Under Alternative B, the differences are about 14 and six times greater. However, these comparisons do not mean that economic activity attributable to livestock grazing and recreation on BLM-administered land is not valuable to the five-county socioeconomic study area economy, especially for the businesses and individuals who directly profit from that economic activity.
- Economic output from oil and gas production is less than output from oil and gas development on an annual basis in 2016 but is considerably greatly on a net present value basis across the entire study period, due to increasing production over time as more and more wells come into production each year.
- Total economic output from oil and gas development and production under Alternative C would be slightly higher than under Alternatives A and D. Output from these programs under Alternative B would be considerably lower – approximately 73% to 74% lower under Alternative B than Alternatives A, C, and D.

Table N.8 presents the total economic output results for additional livestock grazing and recreation analysis scenarios. These scenarios compare as follows to those presented in Table N.7:

- Total economic output from livestock grazing if all authorized AUMs were actually used (which has not occurred in recent history) would be almost twice as much as the output based on recent average billed use, except for Alternative C.
- Output from livestock grazing for use of all authorized AUMs under Alternative B would be slightly lower (just over 2% lower) than under Alternatives A and D.
- Output from livestock grazing for use of all authorized AUMs under Alternative C would be considerably lower (by almost half) than under Alternatives A, B, and D.
- The output from recreation under all alternatives in a low visitation scenario would be about half that of the output from a high visitation scenario, when viewed from either the economic impact or economic contribution perspective.
- From an economic contribution perspective, output from recreation is about 18% higher than output viewed from an economic impact perspective, for either the low or high visitation scenario. Economic contribution includes the effects of spending by recreationists who reside within the study area.

Readers should understand that economic output is a very gross level indicator of economic activity. Output is the value of all product and service purchases by intermediate and final consumers. Not all components of output actually accrue to the local economy. Much may leak out of the local study area[3] and move to the region where a product is produced (e.g., pipes and other material used in an oil or gas well) or to companies and individuals outside the study area (e.g., returns on capital that accrue to oil company corporate headquarters, stockholders, and lenders). As an example, the IMPLAN model shows that of the direct economic output for RSFO oil and gas production, only about 18% accrues in the socioeconomic study area: about 4% as local employee compensation, and about 14% as purchases of local goods and services that are inputs to production.

Earnings and employment are better indicators of the effects of BLM-administered land on the local (study area) economy. IMPLAN's estimates of earnings and employment are for the socioeconomic study area only. Direct jobs, and associated earnings, are for work taking place in the study area. The model adjusts for leakages out of the study area as some local businesses and workers buy products and services from outside the study area.[4] Thus, the total (direct, indirect, and induced) earnings and employment reported by IMPLAN all occur within the study area.

To summarize, while all economic output reported by IMPLAN is attributable to uses of BLM-administered land within the study area, only a portion of that economic activity actually accrues to the local economy (the study area). Earnings and employment reported by IMPLAN are attributable uses of BLM-administered land within the study area and occur within the study area.

Table N.9 presents total labor earnings by BLM program by alternative. Following are key observations regarding these results:

- Total labor earnings attributable to BLM-administered land in the RSFO total $379 million annually in 2016 in Alternative A, $168 million in Alternative B, $388 million in Alternative C, and $377 million in Alternative D.

[3] *The socioeconomic study area, consisting of following five counties: Fremont, Lincoln, Sublette, Sweetwater, and Uinta.*

[4] *IMPLAN assumes all direct earnings accrue within the study area. Therefore, temporary oil and gas workers are a special case. Much of their earnings from work in the study area accrues to their permanent location. Therefore, the induced impacts from respending of their earnings in the study area are manually adjusted, based on data from the Wyoming Wage Records Database maintained by the Wyoming Department of Workforce Services, to reflect the removal of that income from the local economy.*

- Oil and gas development provides, by far, the largest amount of total labor earnings on both an annual and net present value basis in Alternatives A, C, and D, but under Alternative B provides somewhat less earnings than coal and soda ash production.
- The net present value of total labor earnings from oil and gas production under all alternatives is considerably less than the net present value of oil and gas development. This result differs from that for total economic output from oil and gas production as shown in the total economic output table (Table N.7), in which the net present value of total economic output is greater for oil and gas production than for oil and gas development. The difference is because a smaller portion of oil and gas production earnings occur within the study area compared to oil and gas development earnings.
- As with total economic output, earnings would be considerably less for oil and gas development and production under Alternative B than Alternatives A, C, and D.

Table N.10 presents the total labor earnings results for additional livestock grazing and recreation analysis scenarios. The same observations made for output also apply for earnings for these scenarios. Specifically:

- Total labor earnings from livestock grazing if all authorized AUMs were actually used (which has not occurred in recent history) would be almost twice as much as earnings based on recent average billed use, except for Alternative C.
- Total labor earnings from livestock grazing for use of all authorized AUMs under Alternative B would be slightly lower (just over 2% lower) than under Alternatives A and D, and under Alternative C would be considerably lower (by almost half) than under Alternatives A, B, and D.
- The total labor earnings from recreation under all alternatives in a low visitation scenario would be about half that of the earnings from a high visitation scenario, when viewed from either the economic impact or economic contribution perspective.
- From an economic contribution perspective, total labor earnings from recreation are about 18% higher than total labor earnings viewed from an economic impact perspective, for either the low or high visitation scenario.

Table N.11 presents total employment by BLM program by alternative. IMPLAN's employment estimates include part-time, full-time, and overtime work, all expressed as annual average employment. Most of the observations made for earnings also apply for employment, except that net present value is not an applicable concept for employment. The key observations are as follows:

- Annual total employment attributable to BLM-administered land in the RSFO totals 5,435 jobs annually in 2016 in Alternative A, 2,515 jobs in Alternative B, 5,549 jobs in Alternative C, and 5,399 jobs in Alternative D.
- Oil and gas development provides, by far, the largest number of jobs in 2016 in Alternatives A, C, and D, but under Alternative B provides somewhat less jobs than coal and soda ash production.
- Total employment would be considerably less for oil and gas development and production under Alternative B than Alternatives A, C, and D.

Table N.12 presents the employment results for additional livestock grazing and recreation analysis scenarios. The same observations made for output also apply for employment for these scenarios. Specifically:

- Employment from livestock grazing if all authorized AUMs were actually used (which has not occurred in recent history) would be about twice as much as employment based on recent average billed use under Alternatives A, B, and D, but only slightly higher under Alternative C.

- Employment from livestock grazing for use of all authorized AUMs under Alternative B would be slightly lower (about 2% lower) than under Alternatives A, C, and D, and under Alternative C would be considerably lower (by almost half) than under Alternatives A, B, and D.
- The employment from recreation under all alternatives in a low visitation scenario would be about half that of the employment from a high visitation scenario, when viewed from either the economic impact or economic contribution perspective.
- From an economic contribution perspective, employment from recreation is 15% to 19% higher than employment viewed from an economic impact perspective, depending on the alternative and visitation scenario (high or low).

## 4.22.3 Alternative B

### Quantified Economic Impacts

Table N.16 in Appendix N summarizes the annual economic and fiscal impacts of Alternative B by program (resource use) and in total. These estimates are based on the first year of the study period, 2016. For livestock grazing, oil and gas development, coal and soda ash production, and recreation, the BLM assumed that the 2016 level of use would also be the average level of use across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production. The increasing production levels were based on the RFD scenario. Table N.17 presents the cumulative economic and fiscal impacts of Alternative B across the entire study period, based on a discount rate of 3%. Table N.18 presents the cumulative impacts of Alternative B based on a discount rate of 7%. These two tables take into account both the increasing level of oil and gas production in each year of the study period and the time value of money. In the case of employment, which is not subject to discounting for the time value of money, the growth in jobs in oil and gas production across the study period is reflected in the figure for average jobs per year in the net present value tables. These three tables in Appendix N all address the livestock grazing analysis scenario based on historical billed AUMs, and the recreation analysis scenario based the high visitation scenario and using the economic impact (versus economic contribution) perspective.[5] For other scenarios for grazing and recreation, see the earlier Section 4.22.3, Summary of the Quantitative Economic Impact Analysis Results.

Key high-level observations regarding the quantified economic impacts for Alternative B compared to Alternative A include:

- Total economic output attributable to BLM-administered land in the RSFO across all programs totals $827 million annually in 2016 in Alternative B. Earnings total $168 million annually. Employment totals 2,515 jobs annually. These values are approximately 56%, 52%, and 56% lower, respectively, than the comparable values for Alternative A.
- Total quantified public revenues in 2016 range from approximately 52% to 55% lower under Alternative B than Alternative A. The state redistributes a small portion of total severance taxes and federal mineral royalties directly to the local communities where the revenues are generated.
- When considered on a net present value basis, the percentage reductions are up to 5% greater for the economic indicators and up to 10% greater for the public revenue indicators compared to the 2016 percentage reductions noted above.

[5] *The rationales for these selections are as follows. For grazing, historical billed AUMs are the closest approximation possible for actual historical use, and future use is unlikely to differ dramatically, on average, from historical use. For recreation, the lower visitation scenario would probably under-represent future use given that some growth in recreation use over the study period is likely based on population and outdoor recreation trends, and economic impact is the most analogous analysis with the other resource uses.*

- The quantified impacts of livestock grazing, coal and soda ash production, and recreation are the same under Alternative B as Alternative A.
- All quantified economic and public revenue indicators for oil and gas development and production are approximately 74% lower under Alternative B than Alternative A. This is due to the substantially lower number of wells drilled under Alternative B and corresponding reductions in oil and gas production as projected by the RFD scenario.

It is possible that overall oil and gas development may not be as affected by BLM's actions under Alternative B as the large reduction in BLM-managed well counts would seem to indicate. Depending on oil/gas field configurations, well-drilling technology, and availability of non-federal mineral estate, in some areas oil and gas development may simply shift from federal mineral estate to non-federal mineral estate. Determining the degree of such shifts in activity requires considerably more information on the plans of and options available to oil and gas developers than is available for this planning level EIS. However, it should be noted that the RFD does not project a substantial difference in non-BLM managed wells between Alternatives A and B.

## Other Market-Based Economic Impacts

Alternative B would emphasize conservation of resource values through constraints on resource uses and through approaches to resource management that emphasize natural processes. Given this overall emphasis, Alternative B would result in reduced economic activity relative to Alternative A, as quantified above and as discussed below. It would also result in greater costs to the BLM and to operators. As noted earlier, increased costs may negatively impact operators and could reduce the economic activity supported by resource uses. However, individuals that appreciate the conservation emphasis of Alternative B may develop local economic activity around the conservation of the natural processes.

Alternative B would restrict certain management practices, which could increase costs. For instance, while Alternative A would allow clear cuts, Alternative B would prohibit them. Chemical treatments for vegetation management are specifically allowed under Alternative A, but not included as an option under Alternative B. Pre-commercial thinning would be prohibited under Alternative B except for fuels treatment.

Alternative B, besides cutting back substantially on oil and gas development activity through a wide range of prohibitions and restrictions, would cut back on other resource uses as well. For instance, the acreage restricted from saleable mineral disposals under Alternative B would be nearly three times greater than under Alternative A (2,581,741 acres vs. 833,719 acres). ROW exclusion areas under Alternative B would total 2,480,876 acres compared to 426,709 acres under Alternative A. These changes in part reflect an increased number of ACECs (with accompanying restrictions) under Alternative B, and much larger acreages for some of the ACECs common to both alternatives. ACECs under Alternative B total 1,605,660 acres, compared to 286,450 acres under Alternative A.

Alternative B would restrict access to resources in certain situations, potentially reducing economic activity. For instance, logging operations would be limited to slopes up to 25% under Alternative B, compared to 45% under Alternative A. In addition, while erosion control plans and rehabilitation plans would be prepared and implemented under Alternative A when areas where soils are highly erodible or difficult to reclaim cannot be avoided, in Alternative B surface-disturbing activities would be prohibited in such areas.

Setback distance requirements would be greater under Alternative B than Alternative A. These requirements could reduce certain activities and/or increase operational expenses. For instance:

- Surface disturbing activities and new permanent facilities (e.g., storage tanks, structure pits, etc.) would be prohibited not just within 100-year floodplains, wetlands, riparian areas, and perennial streams (as in Alternative A), but also within 1,320 feet (¼ mile) of such features.

- Herbicide and pesticide loading, maintenance, and refueling areas would be prohibited within ¼ mile of water sources, floodplains, riparian areas, and special status plant locations, compared to a 500-foot limitation in Alternative A.
- Surface disturbing activities would generally be prohibited within three miles of recreation sites, versus ¼ mile under Alternative A.
- Various restrictions would apply within a trail management corridor of five miles on either side of National Historic Trails, compared to a ¼ mile distance under Alternative A.

Many of the management restrictions that would occur under Alternative A as necessary or on a case-by-case basis would be applied on a broader basis under Alternative B. Exceptions, rather than application, would be decided on a case-by-case basis. For example, seasonal restrictions as necessary for surface disturbing activities to protect game fish and special status fish populations during spawning under Alternative A would be replaced in Alternative B by TLSs on surface disturbing activities within ¼ mile of riparian areas, with exceptions granted on a case-by-case basis.

The BLM and operators would incur additional expenses in Alternative B due to various activity planning requirements, including but not limited to the following:

- Alternative B would require best available modeling to quantify the amount of sediment, salinity, and associated nutrients that would be transported to water bodies from all surface disturbing activities.
- Site-specific activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, and enhance water quality) would be required in all cases in Alternative B, but only where needed in Alternative A.

A number of livestock grazing management actions under Alternative B could reduce the number of AUMs available for grazing, increase expenses, or alter management practices of operators. Examples include:

- If monitoring shows that the Wyoming Land Health Standards are not met and livestock grazing is shown to be among the contributing factors, Alternative B would implement a 20% reduction annually from the 10-year average of actual billed AUMs for each permit/lease up to three consecutive years (60%) in active AUMs until standards are met.
- Livestock and wild horse forage allocations would be adjusted as needed to meet site potential to support wildlife habitat requirements.
- Livestock grazing would be prohibited in wetland and riparian areas that are not meeting PFC.
- Multiple restrictions on placement of salt and mineral supplements (such as low moisture block supplements) would occur under Alternative B.

Alternative B de-emphasizes recreation, particularly developed recreation, relative to Alternative A. For instance, no SRMAs would be retained in Alternative B. Areas for OHV rallies, cross-country races, and other organized events would not be provided. Certain areas that would have recreation project plans developed under Alternative A would not have such plans under Alternative B. Certain areas that would be managed for recreation values under Alternative A would be managed for other values under Alternative B.

As in Alternative A, various management actions under Alternative B would generate economic activity due to the resulting expenditures made in the local and state economies by the BLM or by operators, although the level of economic activity from many of these actions would be small relative to the activity generated by resource uses.

## Impacts on Nonmarket Values

Nonmarket values associated with recreation may accrue differently across different types of recreationists. Consumer surplus values for activities associated with developed recreation could decrease because this alternative de-emphasizes such activities. For instance, SRMAs would not be retained in Alternative B. Consumer surplus values for OHV uses would decrease because areas for OHV rallies, cross-country races, and other organized events would not be provided, and areas could be immediately closed where OHVs are causing or will cause considerable adverse effects upon a wide range of resources, until the adverse effects are eliminated and measures implemented to prevent recurrence. Increases in consumer surplus may occur for some recreationists who would benefit from the increased protections in this alternative for the open spaces they value, because the lowest levels of resource development would occur in this alternative.

Nonmarket values associated with livestock grazing would differ from those Alternative A or the other alternatives. Potential reductions in AUMs associated with certain provisions of Alternative B and other actions that may affect operators' management practices could impact some grazing operations. To the extent that some ranchers cannot adjust their operations to make up for the losses of the forage on BLM-administered land, the nonmarket values associated with some of the ranches in the planning area, including provision of nonmarket lifestyle values to ranchers and open space amenity values to other residents and tourists, could be negatively impacted. However, as noted in the Alternative A nonmarket value discussion, the literature shows that changes in ranch profitability due to public land grazing policies may not directly translate to withdrawal from ranching. Another difference between Alternative A and the other alternatives is that adverse nonmarket value impacts some other people experience from livestock grazing due, for example, to reductions in native plant species and forage for wildlife, would decrease due to Alternative B's changes to the level of and practices in livestock grazing on BLM-administered land.

Use and non-use nonmarket values associated with wild horses would be greatest under Alternative B. This alternative would have the highest number and acres of wild horse HMAs, support the highest appropriate management level (AML) (1,040 to 1,796 wild horses) and allocate the largest number of AUMs (21,552) to wild horses. Water developments supporting wild horses would be provided. Provisions for public education and enjoyment of wild horses would greater than under other alternatives.

This alternative would also provide the greatest support to other non-use values. For instance, such values related to open space would be maintained through lower levels of extractive resource development, substantially higher acreage of ROW exclusion areas, and other actions.

Many nonmarket values associated with ecosystem services would be greater under this alternative than Alternative A and would be highest among the alternatives. This alternative's greater focus on habitat conservation and lower levels of resource development would be more likely to support higher levels of ecological and other natural functions that provide various ecosystem services. For example, under Alternative B, livestock grazing would be prohibited in wetland and riparian areas that are not meeting PFC. All riparian areas should, within growing seasons, have activity or other management plans in various states of implementation that would allow riparian areas to achieve PFC and be managed for late successional stage vegetation or potential natural community (PNC). This schedule and the PNC objective are more protective of riparian zone health than the schedule and objectives of the other alternatives. Therefore, benefits to ecosystem services associated with healthy riparian zones would be greatest under this alternative. Many other provisions of Alternative B would protect or enhance ecosystem service nonmarket values. For instance, prohibition of clear cuts, limitation of logging operations to slopes up to 25% (compared to 45% under Alternative A), and requirements for a site-specific activity and implementation plan in all cases would reduce erosion and sediment yield, promote ground cover, and enhance water quality, thereby providing greater ecosystem service values associated with water supplies.

## Social Impacts

Based on the analysis presented at the beginning of the Social Impacts subsection for Section 4.22.4, Impacts of Alternative A, social impacts driven by economic changes, such as stresses on community resources and community cohesiveness from high rates of resource development, would be reduced in Alternative B relative to Alternative A due to this alternative's much lower levels of oil and gas development. These impacts would be lowest in this alternative compared to any other alternative.

However, it is also possible that the low levels of oil and gas development under Alternative B could have negative community impacts. Many communities and residents in the planning area have experienced high rates of this development in the recent past, may expect such rates again in the future, and may have made plans or investments that depend on resumption of high rates of development. To the extent this is true for some of the communities and residents, the reduced rates of development under Alternative B could reduce their ability to achieve desired levels of community development and individual economic well-being.

Mineral Development and Production Stakeholders would see this alternative as much less favorable to their interests and values than Alternative A, and as the least favorable of all the alternatives. Based on the lower level of oil and gas development projected in this alternative, and additional operational and other restrictions, these stakeholders would see this alternative as providing the smallest economic contributions at the national, state, and local levels, and for their own businesses. They would also see it as providing the least support to long-standing mining customs and culture in the planning area. These stakeholders would also believe that this alternative fails to take adequate advantage of the planning area's mineral resources to reduce reliance on foreign energy sources.

Renewable Energy Stakeholders would view this alternative much less favorably than Alternative A. In particular, the very high acreage of this alternative that is in ROW exclusion areas (2,480,876 acres versus 426,709 acres under Alternative A) would make siting of wind energy projects and development of power transmission lines from areas with wind development difficult.

Livestock Grazing Stakeholders would find this alternative less favorable than Alternative A. Certain provisions of Alternative B could reduce the number of AUMs authorized for livestock grazing and be perceived as increasing their operating costs and requiring them to alter their management practices. These stakeholders would see this alternative as harmful to their abilities to maintain their livelihoods and the customs and culture of ranching, and they also would be concerned that this alternative would impact the long-term viability of maintaining livestock grazing as an important part of the traditions and economies of local communities.

Habitat and Resource Conservation Stakeholders would see this alternative as more favorable to their interests and values than Alternative A, and as the most favorable of all the alternatives. This alternative has the lowest levels of projected oil and gas development. It generally also would reduce other types of development, for instance, by substantially restricting ROWs. Developed recreation would be de-emphasized, with no SRMAs retained, and OHV routes would be substantially reduced. These stakeholders would find these reductions in development, additional operational constraints on commodity resource uses, and constraints on OHV use and new recreation developments to be consistent with their interests. In addition, these stakeholders would find resource protection designations (e.g., the area in ACECs would be expanded considerably compared to Alternative A) supportive of their values. Additional management actions would be consistent with these stakeholders' values, including prohibitions on clear-cuts, exclusive use of native plants to establish DPC objectives, and management of lands with wilderness characteristics and WSAs for wilderness values even if not designated as wilderness by Congress.

Recreation Stakeholders would have mixed views regarding Alternative B. Many recreational activities would be able to take place under this alternative as they would under Alternative A. However, OHV recreation would be constrained compared to Alternative A, through reductions in OHV routes and other actions. OHV recreationists

would find this alternative the least consistent with their interests. In addition, recreationists who prefer developed recreation facilities would have the lowest preference for this alternative, as it would not retain any SRMAs and would have other reductions in recreation development. However, some recreationists would favor the increased protections in this alternative for the open spaces they value, because the lowest levels of resource development would occur in this alternative. Recreationists who prefer quiet recreation experiences would also favor the reduction in areas and routes where OHV uses would take place.

## 4.22.4 Alternative C

### Quantified Economic Impacts

Table N.19 in Appendix N summarizes the annual economic and fiscal impacts of Alternative C by program (resource use) and in total. These estimates are based on the first year of the study period, 2016. For livestock grazing, oil and gas development, coal and soda ash production, and recreation, the BLM assumed that the 2016 level of use would also be the average level of use across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production. The increasing production levels were based on the RFD scenario. Table N.20 presents the cumulative economic and fiscal impacts of Alternative C across the entire study period, based on a discount rate of 3%. Table N.21 presents the cumulative impacts of Alternative C based on a discount rate of 7%. These two tables take into account both the increasing level of oil and gas production in each year of the study period and the time value of money. In the case of employment, which is not subject to discounting for the time value of money, the growth in jobs in oil and gas production across the study period is reflected in the figure for average jobs per year in the net present value tables. These three tables in Appendix N all address the livestock grazing analysis scenario based on historical billed AUMs, and the recreation analysis scenario based the high visitation scenario and using the economic impact (versus economic contribution) perspective.[6] For other scenarios for grazing and recreation, see the earlier Section 4.23.3, Summary of the Quantitative Economic Impact Analysis Results.

Key high-level observations regarding the quantified economic impacts for Alternative C compared to Alternative A include:

- Total economic output attributable to BLM-administered land in the RSFO across all programs totals $1.769 billion annually in 2016 in Alternative C. Earnings total $388 million annually. Employment totals 5,549 jobs annually. These values are 2.0% to 2.2% greater than the comparable values for Alternative A.
- Total quantified public revenues in 2016 are 2.0% to 2.1% greater under Alternative C than Alternative A. The state redistributes a small portion of total severance taxes and federal mineral royalties directly to the local communities where the revenues are generated.
- When considered on a net present value basis, the percentage increases for all economic and public revenue indicators are similar to the 2016 percentage increases noted above.
- The quantified economic impacts of livestock grazing, coal and soda ash production, and recreation are the same under Alternative C as Alternative A.

All quantified economic and public revenue indicators for oil and gas development and production are higher under Alternative C than Alternative A by slightly less than 3%. This is due to the slightly greater number of wells

[6] *The rationales for these selections are as follows. For grazing, historical billed AUMs are the closest approximation possible for actual historical use, and future use is unlikely to differ dramatically, on average, from historical use. For recreation, the lower visitation scenario would probably under-represent future use given that some growth in recreation use over the study period is likely based on population and outdoor recreation trends, and economic impact is the most analogous analysis with the other resource uses.*

drilled under Alternative C and corresponding increases in oil and gas production as projected by the RFD scenario.

## Other Market-Based Economic Impacts

Alternative C emphasizes resource uses (e.g., energy and mineral development and other commodity uses). Relative to the other alternatives, Alternative C proposes the least restrictive management actions for energy and commodity development and the least protective management actions for physical, biological, and cultural resources while maintaining protections required by laws and regulations. Given this overall emphasis, Alternative C would in most cases result in increased economic activity relative to Alternative A, as quantified above and as discussed below.

In contrast to all other alternatives, Alternative C would have no ACECs and no other management areas for purposes other than recreation (see below). It would have the same acreage in WSAs as all other alternatives.

Various activities (e.g., new permanent facilities) that would be prohibited in certain areas (e.g., 100-year floodplains) in Alternative A and larger areas under Alternative B would be considered on a case-by-case basis in Alternative C. Or they would be subject to certain restrictions (e.g., seasonal restrictions on surface disturbing and/or disruptive activities in big game crucial winter range) rather than prohibitions.

Alternative C's management practice limitations are generally much less restrictive than those of Alternative B; in most cases they are similar to or even more permissive than under Alternative A. Examples include:

- Allowing logging operations on slopes up to 45%;
- Allowing a full range of woodland management practices, including pre-commercial thinning;
- Not applying any TLSs to surface disturbing activities to protect fishery critical life stages;
- Avoiding known locations of special status plant species for surface disturbing activities, rather than prohibiting such activities in such locations;
- Treating actions to reduce raptor perches as discretionary rather than required for new structures in special status species habitat.

In addition, some activities that are the subject of restrictions in Alternative A and/or Alternative B would not be addressed or restricted in Alternative C, such as the placement of herbicide and pesticide loading, maintenance, and refueling areas relative to water sources, floodplains, riparian areas, and special status plant locations.

Considerably fewer acres would be closed to mineral material sales and disposal under Alternative C than Alternative A (226,421 vs. 833,719 acres). This could allow for increased commercial and local government uses, supporting local economic development.

Setback distances under Alternative C would be similar to or more permissive than those under Alternative A, and much less than under Alternative B. For instance, surface-disturbing activities under Alternative C would be allowed within the same ¼-mile distance of recreation sites as in Alternative A, compared to three miles under Alternative B.

Under Alternative C, site-specific activity and implementation plans (to reduce erosion and sediment yield, promote ground cover, and enhance water quality) may be prepared, but would not be required. In addition, there would be no requirement, as in Alternatives A and B, for hydrogeologic investigations where there is a reasonable expectation that surface water features are connected with geologic formations that are being dewatered.

Alternative C would generally have reduced mitigation requirements (and therefore costs) relative to Alternatives A and B.

Alternative C would limit total authorized AUMs to the highest level of billed use over the last 10 years (2009 – 2018). That figure is 160,387 AUMs, which is 142,881 less than the authorized AUMs under Alternative A. However, average historical billed use has been less than 160,387 AUMs, and the alternative allows use up to the highest use since 2009; therefore, the BLM believes that billed use would not be affected by the reduction in authorized AUMs under Alternative C.

Other management actions under Alternative C would generally treat livestock grazing similarly to or more favorably than Alternative A, and much more favorably than Alternative B. For instance, allotment stocking rates would be established to maximize utilization of forage in areas preferred by livestock. Alternative C would give priority to livestock forage needs when allocating vegetative resources regardless of site potential.

Alternative C generally manages recreation similarly to Alternative A but would favor developed recreation through designation of two additional SRMAs (Little Mountain and Red Creek Badlands). The SRMA acreage under Alternative C would total 592,800 acres, compared to 298,110 acres under Alternative A. Other resource uses would receive some preference over recreation under Alternative C. For instance, portions of the Wind River Front SRMA would be made available to mineral leasing. This could negatively impact recreational use of this area and its associated economic contributions. Similarly, oil and gas development would alter the visual experience and impact the historical experience value sought by users of the Oregon Trail and Overland Trail. These users would be likely to seek these experiences in other areas outside the RSFO.

Lands and realty actions—rights of way and corridors, land use authorizations, withdrawals, and land tenure adjustments—under Alternative C would generally be at least as favorable to economic development as under Alternative A. For instance, 225,784 acres would be identified as ROW exclusion areas under Alternative C, compared to 426,709 acres under Alternative A.

As in Alternative A, various management actions under Alternative C would generate economic activity due to the resulting expenditures made in the local and state economies by the BLM or by operators, although the level of economic activity from many of these actions would be small relative to the activity generated by resource uses.

## Impacts on Nonmarket Values

Nonmarket values associated with recreation would be similar to Alternative A under this alternative, with some potential for decreases in recreation consumer surplus values. In general, the recreation policies of the two alternatives are similar. However, Alternative C generally favors resource development values over recreation values. Some conflicts between these uses and values could occur, which could impact the quality of recreational experiences and thereby reduce the consumer surplus values for some recreationists. However, consumer surplus for some OHV users could increase, as Alternative C would include an additional open play area that is not part of Alternative A or other alternatives.

In this alternative, the nonmarket values associated with livestock grazing would be similar to Alternative A. With one major exception, most of this alternative's grazing provisions are similar to those of Alternative A, and some appear to be more favorable. The exception is the limitation of total authorized AUMs under Alternative C to the highest level of billed use over the last 10 years (2009 – 2018). The resulting figure of 160,387 AUMs is considerably less than the 231,484 AUMs authorized under Alternatives A and D. However, average historical billed use has been less than 160,387 AUMs, and the alternative allows use up to the highest use since 2009; therefore, the BLM believes that billed use would not be affected by the reduction in authorized AUMs under Alternative C. Therefore, on an overall basis, continuation of livestock grazing operations, and their attendant

nonmarket values such ranching lifestyle and culture values and open space preservation, would be expected. At the same time, adverse nonmarket value impacts from livestock grazing's effects on native/non-native plant dynamics and availability of forage for wildlife would continue.

Use and non-use nonmarket values associated with wild horses would be lowest under Alternative C. This alternative would eliminate all wild horse herds from the analysis area. There would be no public opportunity to view wild horses under this alternative.

Alternative C would result in the lowest levels of other non-use values. It would allow the highest levels of extractive resource development and have the least restrictive policies on locations of such development. As a result, large areas of undeveloped open space that to some people represent the essence of southwestern Wyoming would be reduced, resulting in lower non-use values for people who enjoy the existence of such areas.

Ecosystem service nonmarket values would be less under this alternative than Alternative A and would be less than under the other alternatives. This alternative's greater emphasis on resource development likely would result in impacts to ecological and other natural functions that provide various ecosystem services. For example, provisions under other alternatives that are protective of riparian zones and reduce upland erosion levels would be weaker or would not exist under Alternative C, resulting in lower levels of ecosystem services values associated with water supplies.

## Social Impacts

Based on the analysis presented at the beginning of the Social Impacts subsection for Section 4.23.4, Impacts of Alternative A, social impacts driven by economic changes, such as stresses on community resources and community cohesiveness from high rates of resource development, would be highest under Alternative C. This alternative has the highest projected levels of oil and gas development and production. These levels are only marginally (i.e., under 3%) greater than projected levels under Alternative A, but Alternative C has many provisions that would facilitate achievement of high levels of development activity.

Mineral Development and Production Stakeholders would find this alternative to be most favorable to their interests and values, and to maintenance of the mineral development economy and culture. This alternative has the highest level of projected oil and gas development of all the alternatives. In addition, it carries forward policies that these stakeholders are very familiar with and have largely incorporated into their costs of business. This alternative also has actions that would additionally facilitate resource development relative to Alternative A.

Renewable Energy Stakeholders would generally find this alternative to be most favorable to their interests. It carries forward policies that these stakeholders are very familiar with and have largely incorporated into their costs of business, and it would relax certain polices that could constrain renewable energy development. For instance, these stakeholders would favor the considerable reduction in ROW exclusion areas under this alternative.

Livestock Grazing Stakeholders would generally find this alternative to be most favorable to their interests. Alternative C would generally treat livestock grazing similarly to or more favorably than Alternative A, and much more favorably than Alternative B. Some management actions under Alternative C could allow for increased forage utilization.

Habitat and Resource Conservation Stakeholders would find this alternative unsatisfactory and the least favorable to their interests and values of all the alternatives. They would believe that long-term degradation of natural and cultural resources would result from the high levels of oil and gas development allowed under this alternative and from a range of management actions that ease operational constraints on oil and gas development. Additional actions that facilitate many types of development or remove resource protections relative to Alternative A and the

other alternatives, such as removal of most ROW exclusion areas and all ACEC designations, would be seen by these stakeholders as antithetical to maintenance of natural and cultural resource values.

Recreation Stakeholders would have mixed views on this alternative (as they would with Alternative B, but for different reasons). Many recreational activities would be able to take place under this alternative, much as they would under Alternative A. However, recreationists who prefer quiet recreation experiences and appreciate undeveloped areas and landscapes would have the lowest preference for this alternative, because it would allow more development of oil, gas, and other resources than other alternatives, and because it would place fewer constraints on OHV use than most alternatives, particularly compared to Alternative B. Recreationists who prefer developed recreation facilities would find Alternative C favorable as it has the highest acreage in SRMAs and facilitates recreation development. Recreationists who enjoy OHV use would find this alternative most preferable because it largely maintains access to OHV routes and would establish an additional OHV open play area.

## 4.22.5 Alternative D

### Quantified Economic Impacts

Table N.22 in Appendix N summarizes the annual economic and fiscal impacts of Alternative D by program (resource use) and in total. These estimates are based on the first year of the study period, 2016. For livestock grazing, oil and gas development, coal and soda ash production, and recreation, the BLM assumed that the 2016 level of use would also be the average level of use across every year of the study period, 2016–2031. This assumption was based on the available data. For oil and gas production, use levels and economic impact would increase in every year of the study period as additional wells come into production. The increasing production levels were based on the RFD scenario. Table N.23 presents the cumulative economic and fiscal impacts of Alternative D across the entire study period, based on a discount rate of 3%. Table N.24 presents the cumulative impacts of Alternative D based on a discount rate of 7%. These two tables take into account both the increasing level of oil and gas production in each year of the study period and the time value of money. In the case of employment, which is not subject to discounting for the time value of money, the growth in jobs in oil and gas production across the study period is reflected in the figure for average jobs per year in the net present value tables. These three tables in Appendix N all address the livestock grazing analysis scenario based on historical billed AUMs, and the recreation analysis scenario based the high visitation scenario and using the economic impact (versus economic contribution) perspective.[7] For other scenarios for grazing and recreation, see the earlier section, Summary of the Quantitative Economic Impact Analysis Results.

Key high-level observations regarding the quantified economic impacts for Alternative D compared to Alternative A include:

- Total economic output attributable to BLM-administered land in the RSFO across all programs totals $1.723 billion annually in 2016 in Alternative D. Earnings total $377 million annually. Employment totals 5,398 jobs annually. These values are about 0.7% less than the comparable values for Alternative A.
- Total quantified public revenues in 2016 are 0.7% less in Alternative D than in Alternative A. The state redistributes a small portion of total severance taxes and federal mineral royalties directly to the local communities where the revenues are generated.
- When considered on a net present value basis, the percentage reductions for all economic and public revenue indicators are similar to the 2016 percentage reductions noted above.

[7] *The rationales for these selections are as follows. For grazing, historical billed AUMs are the closest approximation possible for actual historical use, and future use is unlikely to differ dramatically, on average, from historical use. For recreation, the lower visitation scenario would probably under-represent future use given that some growth in recreation use over the study period is likely based on population and outdoor recreation trends, and economic impact is the most analogous analysis with the other resource uses.*

- The quantified impacts of livestock grazing, coal and soda ash production, and recreation are the same under Alternative D as Alternative A.

All quantified economic and public revenue indicators for oil and gas development and production are lower in Alternative D than Alternative A by 1.0%. This is due to the slightly lower number of wells drilled under Alternative D and corresponding reductions in oil and gas production as projected by the RFD scenario.

## Other Market-Based Economic Impacts

Alternative D provides a variety of opportunities to use and develop resources within the planning area while promoting environmental conservation. In general, this means that Alternative D's quantified economic effects are similar to or very slightly reduced relative to Alternative A (as shown above), and its additional economic effects generally are similar to Alternative A, with some aspects similar to Alternative B or C (as discussed below).

Alternative D would allow for a full range of current resource uses, and in some cases increased levels of use commensurate with current or future market conditions (e.g., renewable energy development). It does so while also protecting natural resource values in certain areas. For instance, Alternative D includes 246,634 acres of ACECs that would be managed for conservation, compared to 286,450 under Alternative A. In comparison to Alternative A, Alternative D adds an ACEC (Little Mountain ACEC, 108,010 acres) and does not include seven ACECs. Alternative D would have less land in other management areas than Alternative A (312,980 acres versus 580,010 acres); most notably the Red Desert Watershed Management Area would be reduced in size by about half and renamed the Red Desert Management Area.

Alternative D allows for a wide range of management practices, similar to Alternative A, but in some cases using a broader set of practices. This allows for cost effective management. For instance:

- It would allow use of all available treatment methods and natural processes to manage forest and woodland health.
- It would use best available methods to revitalize decadent forest stands—managing stand density and canopy cover according to silvicultural best practices and individual stand objectives.
- With respect to meeting vegetation management objectives, it would use naturally occurring wildfires, prescribed fire, chemical treatments, biological treatments, mechanical methods, and livestock grazing. This is as in Alternative C and is a broader set of practices than the preferred method of prescribed fire under Alternative A.
- It would use the techniques and BMPs of Integrated Pest Management (a comprehensive approach) to control and prevent the introduction, establishment, and spread of noxious weeds and other invasive species.

Alternative D's setback requirements would generally be greater than those under Alternative A, and similar to but in some cases less than distances under Alternative B. This would provide increase protection of natural values over Alternative A while not including some of the very large setbacks—with potential associated reductions in economic activity—of Alternative B.

Seasonal restrictions (and therefore associated costs) under Alternative D would be similar to or greater than under Alternative A, but generally less than under Alternative B.

Considerably fewer acres would be closed to mineral material sales and disposal under Alternative D than Alternative A (362,009 vs. 833,719 acres). This could allow for increased commercial and local government uses, supporting local economic development.

Activity and implementation plans would have to be prepared (and their costs incurred) in various situations, typically case-by-case, under Alternative D. This is a somewhat reduced requirement compared to Alternative A.

Alternative D would have various mitigation requirements, as do Alternatives A and B. Some of the specifics differ, but the overall effects in terms of mitigation would be similar across Alternatives A, B, and D, but greater than under Alternative C.

The economic effects of Alternative D (but not necessarily the exact management actions) with respect to livestock grazing would be similar to Alternative A. There could be some adjustments to livestock grazing use when land health evaluations, monitoring data or other acceptable scientific analysis demonstrate that changes in grazing management are needed and appropriate.

The economic effects of Alternative D with respect to recreation would be similar to Alternative A, although not all management actions would be the same. Alternative D would have less acreage in SRMAs (135,549 acres) than Alternative A (298,110 acres). It would also have fewer SRMAs: three compared to six under Alternative A.

Alternative D would have largely similar economic effects as Alternative A with respect to rights of way and corridors. It would have less acreage in ROW exclusion area status than Alternative A (286,289 acres versus 426,709 acres) but greater acreage in ROW avoidance areas (1,388,618 acres versus 736,138 acres).

Alternative D would be effectively the same as Alternative A regarding land use authorizations, withdrawals, and land tenure adjustments. Under Alternative D, the BLM would be able to take lands and realty actions to facilitate economic development in a similar way as Alternative A.

As in Alternative A, various management actions under Alternative D would generate economic activity due to the resulting expenditures made in the local and state economies by the BLM or by operators, although the level of economic activity from many of these actions would be small relative to the activity generated by resource uses.

## Impacts on Nonmarket Values

Nonmarket values associated with recreation would be similar to those in Alternative A. Consumer surplus values for non-motorized recreationists may increase relative to Alternative A, due to Alternative D's greater protection of the ecological resources that are valued by many of these recreationists. Consumer surplus values may decrease for some motorized recreationists due to somewhat greater controls on OHV use under Alternative D.

The nonmarket values associated with livestock grazing in this alternative would be similar to Alternative A. In general, the provisions of the two alternatives that affect grazing are similar, at least at the level of overall support to the viability of ranching operations and maintenance of the lifestyle and landscape amenity values associated with ranching. Similarly, adverse nonmarket value impacts from livestock grazing's effects on native/non-native plant dynamics and availability of forage for wildlife would continue.

Use and non-use nonmarket values associated with wild horses would be lower under Alternative D compared to Alternatives A and B, but greater than under Alternative C. This alternative would reduce the number of wild horse HMAs to three and reduce the overall number of wild horses (the AML) compared to Alternatives A and B.

Alternative D would provide variable levels of other non-use values compared to Alternative A and Alternative C, and lower levels than Alternative B. It includes 246,634 acres of ACECs that would be managed for conservation, compared to 286,450 acres under Alternative A, no acres under Alternative C, and 1,605,660 acres under Alternative B. Its setback distance requirements would generally be greater than those under Alternative A, and similar to but in some cases less than setback distances under Alternative A. It would also protect resources

by placing more total acres (2,363,716) in ROW exclusion or avoidance areas than Alternative A (2,282,260) or Alternative C (1,923,088). These and other provisions of Alternative D would help sustain non-use values for people who enjoy the existence of large areas of open space in southwestern Wyoming.

Ecosystem service nonmarket values under Alternative D generally would be similar to Alternative A and in some cases, may be greater. Alternative D, like Alternative A, allows for many resource development opportunities, but provides greater protection for conservation and ecological values generally, and sensitive resources in particular. For instance, Alternative D's setback requirements and seasonal restrictions are typically at least as protective – for instance, of ecosystem service values associated with healthy riparian zones role in supporting human water supplies – as those of Alternative A, and in some cases, are more protective. Alternative A would have somewhat greater acreages than Alternative D in ROW exclusion areas, in ACECs, in areas closed to oil and gas leasing, and in areas managed with NSO or CSU stipulations for oil and gas development. These provisions would tend to protect natural conditions that support water quality and other ecosystem service values.

## Social Impacts
