

Range-Wide Management Considerations

Habitat Management Area (HMA) Alignments

- Review new information and consider adjustment or confirmation of HMA boundaries.
- Consider criteria for addressing non-habitat within HMAs.
- Review ACEC nominations as required.

Mitigation Process

- Identify mitigation standard and strategies needed to support conservation and restoration of resilient habitats.

Habitat Objectives

- Provide consistent application of habitat objectives while allowing for site variability across the range and flexibility to account for new information.

Disturbance Caps

- Minimize disturbance to habitats consistent with impacts to local populations and lessons learned during implementation.

Fluid Mineral Development and Leasing Objective

- Improve clarity and consistency of fluid mineral objective in greater sage-grouse HMAs.

Oil and Gas Waivers, Exceptions, and Modifications (WEMs)

- Improve the clarity and consistency for circumstances when BLM managers could consider granting WEMs in HMAs.

Renewable Energy Development and Transmission

- Review and consider updates to management for these uses that are increasing in importance and prevalence range-wide.

Livestock Grazing

- Simplify and focus RMP-level livestock grazing management actions that guide implementation-level authorizations to maintain land health.

Wild Horses and Burros

- Clarify RMP-level management actions guiding implementation-level activities to maintain land health and meet habitat objectives.

Threats from Predation

- Provide management and guidance within BLM's jurisdiction for addressing threats from predation

Adaptive Management

- Consider management responses to population and habitat changes unrelated to climate factors regardless of state boundaries.

State-Specific Circumstances

- Address unique specific circumstances that need to be addressed at the RMP level.
