3. Distributions of livestock use 4. Intensity of use (utilization or stubble height objectives) 5. Kind of livestock (e.g., cattle, sheep, horse, llama, alpaca, and goat) 6. Class of livestock (e.g., yearlings versus cow/calf pairs) 7. Locations of bed grounds, sheep camps, trail routes, and the like	modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and • Grazing schedules (including rest or deferment). *Not in Priority Order **MD LG 8:** PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.	modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and • Grazing schedules (including rest or deferment). *Not in Priority Order **Dillon MD LG 8:** PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically. **Lewistown Action LG-1.1:** GRSG habitat objectives will be considered when evaluating an allotment's conformance with land health standards (see Appendix F in the Lewistown Field Office Proposed RMPA/Final EIS) prior to renewing a grazing authorization. **Lewistown Action LG-1.12**: In PHMA, implement management actions within or outside of the watershed planning/permit renewal process to modify grazing management and to meet seasonal GRSG habitat objectives. Consider singly, or in combination, for changes in: · Season or timing of use · Numbers of livestock (includes temporary non-use or livestock removal) · Distribution of livestock use · Intensity of use · Type of livestock	2018-023. Potential modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); • Grazing schedules (including rest or deferment); • Class of livestock; • Grazing schedules (including rest or deferment) • Making allotment unavailable to grazing *Not in priority order **MD LG 5:** If results from a land health assessment indicate that GRSG habitat objectives (Table 2-2) are not met in ~~SFA,~~ PHMAs or GHMAs and grazing is a causal factor, and until appropriate modifications (MD LG 1) are incorporated through the permit renewal process, then consistent with applicable laws and regulations, implement management strategies that may include, but are not limited to, the following: • Provide periods of rest or deferment during critical growth periods of key vegetation species • Limit grazing duration and intensity to allow plant growth sufficient to meet GRSG habitat objectives (Table 2-2) • Employ herd management techniques to minimize impacts of livestock on breeding, nesting, and brood-rearing habitat during the breeding season (March 1 to June 30; Lek—March 1 to	2. Numbers of livestock; 3. Distribution of livestock use; 4. Duration and/or level of use; 5. Locations of bed grounds, sheep camps, trail routes, and the like; 6. Extended rest or temporary closure from grazing through BLM administrative actions; 7. Make allotment unavailable to grazing; 8. Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and 9. Grazing schedules (including rest or deferment). *Not in Priority Order When SRH are being met no changes in current management or activity plans or permits/leases are required, but could occur to meet other resource management objectives.	changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats); and • Grazing schedules (including rest or deferment). *Not in priority order	2. Numbers of livestock (includes temporary nonuse or livestock removal) 3. Distribution of livestock use 4. Intensity of use 5. Kind of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats) 6. Class of livestock (e.g., yearlings versus cow calf pairs) 7. Range improvements. Refer to the document, "Grazing Influence, Management, and Objective Development in Wyoming's Greater Sage-Grouse Habitat" (Cagney et al. 2010) for guidance when considering appropriate management actions to achieve conformance.	"implement management strategies that may include" and both instances note that the list is inclusive of but not limited to a series of potential actions. It's just a list – like a toolbox of things the BLM could apply. 43 CFR 4180 directs BLM to take appropriate action if livestock are the causal factor for failing to achieve the land health standards. Handbook 4180 outlines the process and suggests available tools such as Ecological Site Descriptions to be used as a reference when assessing/evaluating the achievement of land health standards. Moved a consolidated version of this to the BMP appendix, as it's just a list of potential actions the BLM could consider during implementation.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
(See above.)	*(See above.)*	**HiLine MD-1**: If monitoring data demonstrate that livestock use on an allotment in a priority Greater Sage-Grouse area is adversely affecting Greater Sage-Grouse or their habitat, the terms and conditions of grazing permits may be modified, or changes in active use could be considered in order to meet the standards for rangeland health as described in 43 CFR, Part 4180 and the Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Appendix L) or to otherwise manage, maintain, or improve sage-grouse habitat. **HiLine MD-2:** Appropriate indicators and measurements specific to habitat for Greater Sage-Grouse, or any other wildlife species of concern, will be evaluated as part of standards and guidelines assessment and any necessary and appropriate habitat objectives specific to meeting the wildlife health standard for the site will be identified and incorporated into allotment management plans (AMPs) or the terms and conditions of livestock grazing permits. **North Dakota Management Direction LG-1.10**: In PHMA, implement management directions (grazing decisions, AMP/Conservation Plan development, or other agreements) to modify grazing management to meet State of North Dakota seasonal GRSG habitat requirements, where allotment evaluations indicate land health assessments are not being met due to livestock. Consider singly, or in combination, changes in:	May 15, and Nesting—April 1 to June 30) • Consider any temporary projects that can mitigate livestock impacts (e.g., temporary fencing or temporary water hauling locations; • Work with permittees to avoid concentrated turn-out locations for livestock within 4 miles of active and pending leks from March 1 to June 30 • Avoid domestic sheep use and bedding areas and herder camps within 2 miles of active and pending leks from March 1 to June 30 • Utilizing land features and roads on maps provided to the permittee to help delineate livestock use avoidance areas • Considering no grazing from May 15 – Sept. 15 in riparian areas and wet meadows. • Removing livestock within 3-7 days for the remainder of the grazing year once the allowable use levels are reached (BLM 1996, Burton et. al 2011, Cagney et. al, 2010, Connelly et. al 2000, France et. al 2008, Hagen et. al 2007, Holechek 1988, Platts 1990, and Tanaka et. al 2014): ▪ In riparian areas and wet meadows the allowable percent utilization is 35% woody species, and a minimum stubble height of 4-6 inches (10-15 cm) for herbaceous riparian vegetation based on site. ▪ In mountain big sage habitat, the allowable percent utilization is 40 % herbaceous key species and/or 35 % shrub key species.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
(See above.)	*(See above.)*	1. Season or timing of use; 2. Numbers of livestock (includes temporary non-use or livestock removal); 3. Distribution of livestock use; 4. Intensity of use; and 5. Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas, and goats).	▪ In Wyoming Basin big sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species. ▪ In black sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species. To the extent that the implementation of these strategies would be in conflict with the terms and conditions of any applicable livestock grazing permit or lease, then the BLM would complete a new decision-making process before implementing the strategies.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*
—	—	—	**MD LG 6:** Appropriate allowable utilization levels will be defined through the grazing permit renewal process. At least one alternative in the NEPA process will consider the utilization levels identified in MD LG 5.	—	—	—	Summary statement: • Include/Adjust terms and conditions to meet land health standards/GRSG objectives/needs Applicability for RMPs? Only from NV/CA. It's not an RMP decision, but "plan to plan" type of language along with direction for what future NEPA should consider in a range of alternatives, none of which are RMP decisions or BMPs.
—	—	—	**MD LG 7:** In pastures where post livestock removal use monitoring results in utilization levels that exceed allowable use levels and livestock are identified as a causal factor, reduce animal unit months (AUMs) grazed the following year ~~accordingly~~in accordance with 43 CFR 4160.1 and IM 2018-023. AUMs cannot be applied to another pasture that is already being used by livestock or is being purposefully rested.	—	—	—	Summary statement: • Include/Adjust terms and conditions to meet land health standards/GRSG objectives/needs Applicability for RMPs? Only from NV/CA. Not an RMP decision, but direction for implementation that is not directly linked to habitat conditions. Included as a BMP specific to NV/CA.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
—	—	—	**MD LG 10**: In any allotment where land health standards were not met and livestock grazing was found to be a significant causal factor, compliance monitoring will be conducted annually until GRSG habitat objectives (Table 2-2) are met. If compliance monitoring finds that the implemented management strategies identified in MD LG 5 are not achieving the desired results, a change in action will be required in compliance with 43 CFR 4160.1 and IM 2018-023.	—	—	—	Summary statement: • Monitoring commitment if not meeting LHS Applicability for RMPs? Monitoring is not an RMP decision but is based on available staff and budget. This is more appropriately addressed as a mix of 1) compliance with the grazing regulations and 2) implementation prioritization. Not carried forward as it's related to implementation prioritization, which is not an RMP action.
MD RM-8: (ADH) Develop drought contingency plans at the appropriate landscape unit that provide for a consistent/appropriate BLM response. Plans shall establish policy for addressing ongoing drought and post-drought recovery for GRSG habitat objectives.	**MD LG 14**: In response to weather conditions (i.e. drought) adjust grazing management (i.e., delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing) as appropriate to provide for adequate food and cover for GRSG.	**Dillon MD LG 14**: In response to weather conditions (i.e. drought) adjust grazing management (i.e., delay turnout, adjust pasture rotations, adjust the amount and/or duration of grazing) as appropriate to provide for adequate food and cover for GRSG. **Lewistown Action LG-1.13**: During drought periods, prioritize evaluating effects of the drought in PHMA, relative to their needs for food and cover. Drought management will continue to be in accordance with the Montana/Dakotas drought policy (see Appendix I, Drought Policy, in the Lewistown Field Office Proposed RMPA/Final EIS). Since there is a lag in vegetation recovery following drought, post-drought management will be implemented to allow for vegetation recovery that meets GRSG needs in PHMA. In accordance with BLM grazing regulation 43 CFR, Part 4130.3-3, consultation, cooperation, and coordination with owners or lessees having lands or	—	**MD LG 5:** During drought conditions use a recognized drought indicator, such as the Drought Monitor or Palmer Drought Severity Index, to determine when abnormally dry or drought conditions are developing, present, or easing. When such conditions are developing or present: 1. Conduct pre-season assessments prior to livestock turn out. 2. Monitor vegetation conditions during authorized livestock use periods to determine need for early removal or other changes to meet seasonal PHMA and GHMA objectives. If livestock grazing is deferred due to drought, reevaluate vegetation and Greater Sage-grouse habitat indicators that measure Greater Sage-grouse habitat prior to reauthorization of grazing.	~~**MA-LG-7:** In PHMA, during drought periods, prioritize evaluating effects of the drought relative to GRSG needs for food and cover.~~ ~~Initiate emergency management measures (e.g. delaying turnout, adjusting the amount and/or duration of livestock grazing, implement other terms of the permit) during times of drought to protect GRSG habitat, in accordance with Instruction Memorandum 2013-094 (Resource Management During Drought), or other agency policies.~~ ~~Implement post-drought management to allow for vegetation recovery that meets GRSG needs.~~	**MD LG 7:** When periods of drought occur, where appropriate, the AO will evaluate strategies to address drought through coordination with grazing permittee/lessee and annual billings processes. In cooperation with livestock grazing permittees/lessees, drought contingency plans will be developed at the appropriate landscape unit that provide for a consistent/appropriate BLM response. Contingency plans shall establish strategies for addressing ongoing drought and post-drought recovery.	Summary statement: • Drought response Applicability for RMPs? • Drought is not solely a livestock grazing issue. However, as drought directly effects vegetation that is used by both livestock grazing and GRSG, there is a connection. Consolidated grazing related management associated with drought to the BMP appendix, as the existing management to the left is more related to best practices than it is RMP-level decision-making or allocation changes. • Additionally, 43 CFR 4110.3-3(b) provides the ability of the authorized officer to determine that when resources on public lands require protection because of drought … that actions can be taken.

Field checks could include monitoring for actual use, utilization, and use supervision.	~~**MA LG 9:** In PHMA, assess livestock grazing in riparian and meadow complexes and ensure recovery or maintenance of appropriate vegetation and water quality. Where recovery or maintenance is not occurring and the causal factor is livestock grazing, reduce pressure on riparian or wet meadow vegetation used by GRSG in the summer by adjusting grazing management practices (e.g., use fencing/herding techniques, or changes in seasonal use or livestock distribution).~~ ~~Allotments within SFA, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.~~	**MD LG 5**: BLM monitoring would be used to evaluate progress toward achieving land health standards within PHMA and, where not achieved, to determine if existing grazing management practices or levels of grazing use on public lands are significant factors in failing to meet, maintain or make progress toward achieving the standards and conform with the guidelines, which through this process will identify appropriate actions to address nonachievement and nonconformance. ~~Allotments within SFAs, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks include monitoring for actual use, utilization, and use supervision.~~	Summary statement: • Monitoring to LHS/habitat objectives, including riparian monitoring and prioritizing "field checks" Applicability for RMPs? Prioritization of monitoring and "field checks" is not an RMP decision. It depends on staffing, budget, and the consideration of other resource issues that include, but are not limited to GRSG, other listed species, LHS, wildfire, or other resource concerns. The 2015 FWS listing determination cited the prioritization for reviewing grazing permits and conducting monitoring to determine if changes may be needed to meet GRSG habitat conditions – though it also noted that other criteria could be considered. 43 CFR 4180 directs BLM to take appropriate action if livestock are the causal factor for failing to achieve the land health standards. Handbook 4180 also provided guidance on assessing/evaluating Standard 2 which is the Riparian standard.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
MD RM-11: (ADH) Manage riparian areas and wet meadows for proper functioning condition within ADH. **MD RM-12:** (ADH) Within ADH, manage wet meadows to maintain diverse species richness, including a component of perennial forbs, relative to site potential (i.e., reference state). **MD RM-13:** (ADH) Establish permit/lease terms and conditions in conjunction with grazing strategies to ensure that the timing and level of utilization results in wet meadows with diverse species richness, including a component of perennial forbs, relative to site potential (i.e., reference state).	—	**Lewistown Action LG-1.18**: Within PHMA, reduce hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Use fencing/herding techniques or seasonal use or livestock distribution changes to reduce pressure on riparian or wet meadow vegetation used by GRSG in summer. Hot season use of riparian and wet meadow complexes may be authorized where consistent with overall GRSG habitat objectives and where use is currently resulting in vegetative conditions that are in conformance with land health standards. **HiLine (Same as Riparian MD-10):** Grazing techniques and practices detailed in Appendix I will be implemented to reduce hot season (summer) grazing on riparian and meadow complexes within the PHMA. Alternative water facilities will be installed to relieve grazing impacts on riparian areas inside of priority sage-grouse habitat.	**MD LG 12**: Grazing management strategies for riparian areas and wet meadows will, at a minimum, maintain or achieve proper functioning condition (PFC) and promote GRSG brood-rearing habitat objectives (Table 2-2) within PHMAs and GHMAs.	—	~~**MA-LG-8:** In PHMA, manage riparian areas and wet meadows for proper functioning condition.~~	**MD LG 10**: ~~Grazing between~~ In PHMA, for riparian habitats and/or wet meadow communities utilized by Greater Sage-Grouse, livestock grazing would be managed ~~and upland habitats will be balanced~~ to promote the production and availability of beneficial forbs ~~to GRSG~~ for use during ~~nesting and~~ brood-rearing~~, while maintaining upland conditions and functions. Grazing in meadows, mesic habitats, and riparian pastures also will be balanced to promote the production and availability of beneficial grasses and forbs for use during late brood-rearing within PHMA, while maintaining upland conditions and functions.~~	Summary statement: • Management of riparian areas/wet meadows Applicability for RMPs? Riparian management is not a solely livestock grazing issue. Managing for PFC is related to land health standards and vegetation management in an RMP. Including it in the livestock grazing section implies that grazing is the only affected or responsible resource use, which it is not. Desired conditions and associated management for riparian areas are a component of the "suitable habitat" action when it comes to GRSG, and/or are addressed in vegetation sections of the original RMP decisions. As this is a duplicative concept with language and concepts in the GRSG habitat objectives and land health standards it is being considered for removal from specific reference in the livestock grazing section under Alternatives 4, 5, 6 and the Proposed RMP Amendment.
MD RM-14: (ADH) Authorize new water development only after determining that the project will not adversely impact GRSG from habitat loss. Ensure that adequate long-term grazing management is in effect before authorizing water developments that may increase levels of use or change season of use. Give specific consideration to adjacent or downstream wetland habitat when a project entails a diversion from a spring or seep.	—	—	**MD LG 16:** Authorize new water developments for diversion from spring or seep source, in accordance with state water law and subject to valid existing rights when PHMAs and GHMAs will benefit from or not be negatively impacted by the new development. This includes developing new water sources for livestock as part of a grazing management plan to improve GRSG habitat.	—	**MA-LG-10:** In PHMA, manage existing and ~~limit authorization of~~ new water developments to ~~projects that~~ have a neutral ~~effect~~ or ~~are~~ beneficial effect to GRSG habitat~~ (such as by shifting livestock use away from critical areas). New developments that divert surface water must be designed to maintain riparian or wet meadow vegetation and hydrology to meet GRSG needs.~~	—	Summary statement: • Guidance/Management for new water developments Applicability for RMPs? Developed consolidated management in the alternative table above that combines management for any new grazing improvement project. See chapter 2 (and also Appendix 21, Section 21.1.10) Livestock Grazing decisions RM-3 and RM-4.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
MD RM-15: (ADH) Analyze springs, seeps and associated pipelines to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area. If necessary to maintain GRSG populations or reverse a downward population trend caused by habitat loss, modify the project as necessary to restore the applicable wetland habitat.	—	—	**MD LG 15:** In accordance with state water law and subject to valid existing rights, remove or modify water developments that are negatively impacting GRSG habitats. **MD LG 17:** Modify water development projects to ensure riparian habitats in PHMAs and GHMAs are being maintained or improved in compliance with valid existing rights and in accordance with state water law. **MD LG 19:** In PHMAs and GHMAs, remove livestock ponds built in perennial channels that are negatively impacting riparian habitats, either directly or indirectly, unless riparian access is able to be controlled and negative impacts effectively mitigated (e.g.; water gap fence to pond), and do not permit new ones to be built in these areas subject to valid existing rights. Prior to pond removal, offsite watering options will be examined and considered.	**MD LG 6:** Authorize new, relocate, or modify existing range improvements that use seeps or springs as a water source to enhance their year round functionality. Install or retrofit wildlife escape ramps in all livestock water troughs or water storage facilities (e.g., catchments, storage tanks). Maintain, enhance, or reestablish riparian areas in PHMA and GHMA **MD LG 7:** Identify playas, wetlands, and springs that have been modified for livestock watering within PHMA and GHMA. Identify those water improvements that have Greater Sage-grouse population limiting implications, and develop projects for rehabilitation. Further actions should be instigated for development of water off site; new water should be available before existing water is eliminated.	~~**MA-LG-11:** In PHMA, evaluate existing water developments (springs, seeps, etc., and their associated pipelines) to determine if modifications are necessary to maintain or improve riparian areas and GRSG habitat. Make modifications where necessary, considering impacts on other water uses when such considerations are neutral or beneficial to GRSG.~~	**MD LG 12**: Existing water developments associated with springs and seeps will be evaluated and associated pipelines/structures to those developments having a negative effect on PHMA will be modified.	Summary statement: • Guidance/Management of existing water developments (monitor, evaluate, maintain, adjust, and/or remove) Applicability for RMPs? Developed consolidated management in the alternative table above that combines management for any existing grazing improvement project. See chapter 2 (and also Appendix 21, Section 21.1.10) Livestock Grazing decisions RM-3 and RM-4.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
MD RM-16: (ADH) Manage for a habitat objective that is primarily sagebrush with a mosaic of seral stages and sagebrush in all age classes. On a site-by-site basis, do not allow treatments that would adversely affect GRSG populations. See Appendix H, Guidelines for Implementation and Adaptive Management.	—	**North Dakota Management Direction LG-1.16**: In PHMA, allow treatments that conserve, enhance or restore GRSG habitat as well as other priority species habitat (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve GRSG habitat).	—	—	~~**MA-LG-12:** In PHMA, ensure that vegetation treatments conserve, enhance or restore GRSG habitat (this includes treatments that benefit livestock).~~	—	Summary statement: • Direction for "treatments" that help GRSG Applicability for RMPs? Not a grazing specific action. Management actions for vegetation treatments are addressed in management actions in the vegetation section, which are not being changed by this amendment effort. As this is a duplicative concept with language and concepts in the GRSG habitat objectives and land health standards it is being considered for removal from specific reference in the livestock grazing section under Alternatives 4, 5, 6 and the Proposed RMP Amendment.
—	**MD LG 5**: When modifying grazing management, analyze indirect impacts on habitat, including changes in fuel loading and wildfire behavior.	**Dillon MD LG 5**: When modifying grazing management, analyze indirect impacts on habitat, including changes in fuel loading and wildfire behavior.	—	—	—	—	Summary statement: • Future NEPA guidance Applicability for RMPs? Identification of what to analyze in future NEPA actions is not an RMP decision. That's a NEPA policy implementation issue.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
MD RM-17: (PHMA) Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to GRSG PHMA to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of an Allotment Management Plan/Conservation Plan or if they provide value in conserving or enhancing the rest of PHMA, then no restoration would be necessary. Assess the compatibility of these seedings for GRSG habitat or as a component of a grazing system during the land health assessments (Davies et al. 2011). For example: Some introduced grass seedings are an integral part of a livestock management plan and reduce grazing pressure in important sagebrush habitats or serve as a strategic fuels management area.	—	**Lewistown Action LG-1.21**: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PHMA to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of a grazing management plan that is providing value in conserving or enhancing native rangelands in PHMA and other priority wildlife habitats, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat or as a component of a grazing system during the land health evaluation and determination process. **North Dakota Management Direction LG-1.17**: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PHMA to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of an AMP/Conservation Plan or if they provide value in conserving or enhancing the rest of the PHMA, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat or as a component of a grazing system during the land health assessments.	—	—	~~**MA LG-13**: In PHMA, evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If existing seedings provide value in conserving or enhancing GRSG habitats, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat during the land health assessments.~~	—	Summary statement: • Seedings (evaluate, restore, management) Applicability for RMPs? Not a grazing specific action. Management objectives for vegetation treatments are encapsulated by the GRSG habitat objective and are captured in management by the connection between LHS and habitat objectives. As this is a duplicative concept with language and concepts in the GRSG habitat objectives and land health standards it is being considered for removal from specific reference in the livestock grazing section under Alternatives 4, 5, 6 and the Proposed RMP Amendment.

(See above.)	*(See above.)*	evaluated and if necessary modified to conserve, enhance or restore sage-grouse habitat. **North Dakota Management Direction LG-1.20**: In PHMA, evaluate existing structural range improvements and location of supplements (salt or protein blocks) during grazing lease renewal process to make sure they conserve, enhance or restore GRSG habitat.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*
MD RM-21: (ADH) Mark fences in high risk areas (Christiansen 2009; Stevens 2011). (PHMA) Where marking fences does not reduce fence-related GRSG mortality, modify fences. Where modification does not reduce GRSG mortality and the fence-related mortality is sufficient to adversely affect GRSG populations, remove fences.	**MD LG 13**: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).	**Dillon MD LG 13**: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012). **Lewistown Action LG-1.27** Identify and mark fences in high and moderate risk areas, as identified by the use of "The Fence Collision Risk Tool" (http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/) within PHMA, based on proximity to lek, lek size, and topography (Stevens 2011, Stevens et al. 2013). **North Dakota Management Direction LG-1.20:** To reduce outright GRSG strikes and mortality, remove, modify or mark fences in high risk areas within PHMA based on proximity to lek, lek size, and topography.	**MD LG 14:** Build or modify livestock exclosures so that they are large enough to provide hiding cover to GRSG and other wildlife and to reduce the possibility of wildlife collisions with fences (Christiansen 2009; Stevens 2011; NRCS 2012). **MD LG 23:** Fences shall not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, and design).	**MD LG 9:** Remove, modify, or mark fences identified as high risk for collisions, generally within 1.2 miles of occupied or pending leks.	**MA-LG-16:** To reduce outright GRSG strikes and mortality, remove, modify or mark fences in high risk areas (Stevens et al. 2012) based on proximity to lek (e.g., within 1.2 miles of a lek), lek size, and topography, or as latest science indicates. ~~Prioritize actions in SFA first, then PHMA.~~ Employ NRCS fence collision risk tool (NRCS/CEAP Conservation Insight Publication "Applying the Sage Grouse Fence Collision Risk Tool to Reduce Bird Strikes").	—	Summary statement: • Fences – construction, reconstructions, marking, removal, modification, etc. Applicability for RMPs? Developed a consolidated management action specific to management of fences in GRSG HMAs. See chapter 2 (and also Appendix 21, Section 21.1.10) Livestock Grazing decision RM-5.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
MD RM-22: (ADH) Monitor for and treat invasive species associated with existing range improvements (Gelbard and Belnap 2003; Bergquist et al. 2007).	—	**Lewistown Action LG-1.27:** In PHMA and GHMA, monitor for and treat invasive and noxious weed species associated with existing range improvement projects. **North Dakota Management Direction LG-1.20:** Monitor for, and treat invasive species associated with existing range improvements.	—	—	~~**MA-LG-17:** In PHMA, monitor for and treat noxious weeds and treat invasive species where needed, associated with existing range improvements.~~	—	Summary statement: • Invasive species associated with range improvements Applicability for RMPs? Don't need a specific management action related to weeds in livestock grazing. The GRSG habitat objectives encapsulates the weed issue. The language in the management actions are not required to be an RMP decision to implement given language that is already captured in the habitat objective to manage for suitable GRSG habitat.
MD RM-23: (ADH) At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized shall remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3. When a permittee or lessee voluntarily relinquishes grazing preference, consider conversion of the allotment to a reserve common allotment that will remain available for use on a temporary, nonrenewable basis for the benefit of GRSG habitat. Authorize temporary nonrenewal permits in Reserve Common Allotments to meet resource objectives elsewhere such as rest or deferment due to fire or vegetation treatments. Temporary use of reserve common allotments would not be allowed due to drought or overuse of customary allotments.	**MD LG 18**: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	**Dillon MD LG 18, Billings Management Direction LG-17, Lewistown Action LG 1.5, HiLine LG-16, Miles City Management Decision 6, North Dakota Management Decision LG-1.7, South Dakota MD-23:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3. **Billings MD-LG-11:** All allotments wholly located in Greater Sage-Grouse PHMA will be considered for retirement, where the base property owner relinquishes their preference.	**MD LG 21:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized shall remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments and fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	**MD LG 15:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	~~**MA-LG-18:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.~~	**MD LG 6:** At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	Summary statement: • Relinquishment Applicability for RMPs? Retained this specific grazing management action in chapter 2 (see also Appendix 21, Section 21.1.10) as Management Action RM-6.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
—	**MD LG 10**: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts on seasonal habitats.	**Dillon MD LG 10**: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts on seasonal habitats.	—	**MD LG 3:** The timing and location of livestock turnout and trailing shall not contribute to livestock congregation on occupied or pending leks during the Greater Sage-grouse breeding season of March 1 through June 30.	—	**MD LG 9:** Livestock trailing that is authorized will include a trailing plan to utilize non-habitat to the extent possible, include specific routes and timeframes for trailing, utilize existing trails, and avoid stopovers on occupied leks, as appropriate.	Summary statement: • Management of trailing activities Applicability for RMPs? The existing language fits better as BMPs, not as RMP decisions. Included in the BMP appendix under Alternatives 4, 5, 6, and the Proposed RMP Amendment.
—	**MD LG 7**: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitat areas. A forage reserve is an area that is set aside for use as needed by various permittees who might be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit issued for grazing like a regular allotment.	**Dillon MD LG 7**: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in GRSG habitat areas. A forage reserve is an area that is set aside for use as needed by various permittees who might be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit issued for grazing like a regular allotment.	—	—	—	—	Summary statement: • Forage reserves Applicability for RMPs? Reserve Common Allotments are already included in Management Action RM-6. As such, a separate action is not needed as an RMP action. The area would still be available for livestock grazing, but authorizations would be applied to fill in for areas where authorized uses could not occur due to fire or vegetation treatments. Additional language is included in the BMP appendix for Alternatives 4, 5, 6 and the Proposed RMP Amendment.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
—	—	—	**MD LG 9:** When a transfer application is received for preference on an allotment within GRSG habitat: • Transfer of Preference: A transfer of preference will be approved unless the applicant does not meet qualifications (43 CFR, Part 4110.1 and 4110.2). A transfer will be approved to an unqualified applicant if 4110.2-3(e) applies. • Issuing the permit: In accordance with Section 402(c)(2) of FLPMA, a new permit will be issued to the new preference holder with the same terms and conditions as the terminated permit unless: – A NEPA analysis of alternative terms and conditions has been completed. If changes in terms and conditions are needed to meet sage-grouse habitat needs or otherwise make progress toward meeting land health standards, issue a decision offering a permit with the new terms and conditions – If a new permit is issued as required by Section 402(c)(2) of FLPMA, then determine priority for completing land health evaluations, habitat assessments and NEPA analysis as described in MD LG 1.	—	—	—	Summary statement: • Transfers Applicability for RMPs? Not needed as an RMP action; can consider this type of action without an RMP. Most of this action just cites to regulations or refers to policy. Considered for removal under Alternatives 4, 5, 6, and the Proposed RMP Amendment.

2015 RMP Amendment Livestock Grazing Management Direction with Updates from 2019 Amendment Identified							
Colorado	**Idaho**	**Montana/Dakotas**	**Nevada/California**	**Oregon**	**Utah**	**Wyoming**	**NOTES**
—	—	—	**MD LG 20:** In PHMA and GHMA, rest areas that have received vegetative treatments from livestock grazing until resource monitoring data verifies the treatment objectives are being met and an appropriate grazing regime has been developed. Any livestock grazing temporary suspended use or other management changes per 43 CFR, Part 4110.3-2a for the purpose of a vegetation treatment will be done through the grazing decision, prior to treatment. **MD LG 22:** After grazing rest associated with vegetation treatments in PHMAs and GHMAs, monitor annually for a minimum of 5 years to ensure project objectives are being maintained.	—	—	—	Summary statement: • Resting after vegetation treatments Applicability for RMPs? Don't need a specific RMP management action related to resting treated areas from livestock grazing. The GRSG habitat objectives encapsulates the need to adjust any of the land uses to meet GRSG habitat objectives. The action itself refers to regulations under which such changes would be considered. Beyond that, monitoring is not an RMP decision but is based on available staff and budget. Considered for removal under Alternatives 4, 5, 6 and the Proposed RMP Amendment.

Appendix 16

Montana/Dakotas Oil and Gas Lease Stipulations

This page intentionally left blank.

Appendix 16. Montana/Dakotas Oil and Gas Lease Stipulations

16.1 SUMMARY OF ALTERNATIVES

Alternatives 1 and 2	Alternative 3	Alternatives 4,5,6	Proposed RMP Amendment
Refer to Appendix 2, Section 2.10 for current Stipulations	Lease stipulations, waivers, exceptions and modifications are not applicable. Closed to leasing in PHMA. (CHMA would be NSO with No WEMS).	Refer to text below for Stipulations applicable to Alternatives 4, 5 and 6.	Refer to text below for Stipulations applicable to the Proposed RMP Amendment

16.2 OIL AND GAS LEASE STIPULATIONS ALTERNATIVES 4,5 AND 6: SUMMARY

No.	Area	Stip Type	Language
1.	PHMA/RHMA	NSO	GREATER SAGE-GROUSE PHMA/WEST DECKER RHMA To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in Priority Habitat Management Areas (PHMA) and West Decker RHMA.
2.	PHMA/RHMA	NSO	GREATER SAGE-GROUSE PHMA/WEST DECKER RHMA To protect high density Greater-Sage Grouse habitat, including all seasonal habitats, surface occupancy and use is prohibited within Priority Habitat Management Areas (PHMA) and West Decker RHMA.
3.	PHMA/RHMA	CSU	GREATER SAGE-GROUSE PHMA/WEST DECKER RHMA <u>Disturbance/Density Cap</u> Projects that exceed disturbance or density thresholds will need to be redesigned, relocated, or modified to avoid or minimize disturbance to sage grouse habitat or density of facilities near sage-grouse leks.
4.	GHMA/RHMA	NSO	GREATER SAGE-GROUSE LEKS IN GHMA/MUSSELSHELL RHMA To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in General Habitat Management Areas (GHMA) and Musselshell RHMA.
5.	GHMA/RHMA	NSO	GREATER SAGE-GROUSE CRUCIAL WINTER RANGE IN GHMA/MUSSELSHELL RHMA To protect Greater Sage-grouse winter concentration area, surface occupancy and use is prohibited for oil and gas exploration and development in crucial winter range in General Habitat Management Areas (GHMA) and Musselshell RHMA.

No.	Area	Stip Type	Language
6.	GHMA/RHMA	CSU	GREATER SAGE-GROUSE SEASONAL HABITATS IN GHMA/MUSSELSHELL RHMA Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts can be adequately addressed application of the mitigation hierarchy, including conservation actions, needed design features, and offsets. Prior to surface-disturbing or disruptive activities a plan to maintain functionality of breeding, nesting sage-grouse, brood rearing and/or winter habitats for Greater Sage-Grouse will be prepared by the proponent and implemented upon approval by the authorized officer. The plan shall address how short-term and long-term direct and indirect effects to seasonal habitats will be mitigated based on current science and research.
7.	RHMA Cedar Creek	CSU	GREATER SAGE-GROUSE CEDAR CREEK RHMA Surface occupancy and use would be allowed with design features to minimize disturbance to sage-grouse habitat within the Cedar Creek Greater Sage-Grouse Restoration Habitat Management Area.
8.	CHMA	CSU	GREATER SAGE-GROUSE CHMA Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts to potential stopover sites can be adequately mitigated. Prior to such activities a plan to mitigate impacts will be prepared by the proponent and implemented upon approval by the AO.
9.	ALL HMAs	TL	GREATER SAGE GROUSE HMAs To protect Greater Sage-grouse populations utilizing important seasonal habitats, no surface use is allowed from December 1 through March 15 in winter range, March 15 - July 15 in breeding and nesting habitats and during migratory periods for stopover sites. This stipulation does not apply to operation and maintenance of production facilities.

16.3 OIL AND GAS LEASE STIPULATIONS ALTERNATIVES 4, 5 AND 6: COMPLETE TEXT

16.3.1 No Surface Occupancy: Greater Sage-Grouse PHMA/West Decker RHMA

Stipulation: To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in Priority Habitat Management Areas (PHMA) and West Decker RHMA.

Objective: To maintain the integrity of Greater Sage-Grouse breeding activities in PHMA/West Decker RHMA and support sustainable Greater-Sage Grouse populations.

Waivers, Exceptions & Modifications: (See Range-wide Issues)

16.3.2 No Surface Occupancy: Greater Sage-Grouse PHMA/West Decker RHMA

Stipulation: To protect high density Greater-Sage Grouse habitat, including all seasonal habitats, surface occupancy and use is prohibited within Priority Habitat Management Areas (PHMA) and West Decker RHMA.

Objective: To maintain areas with the most important of habitats and highest densities of sage-grouse (e.g., core areas) by facilitating long-term sustainability by minimizing impacts to habitat through disturbance and disruption. Since GRSG utilize different seasonal habitats and require connectivity between these areas, oil and gas operations should avoid new surface disturbing and disruptive activities across GRSG breading areas (leks), nesting habitat, brood rearing areas, and winter concentration areas used in mild to severe winters (i.e., all winter range).

Waivers, Exceptions & Modifications: (See Range-wide Issues)

16.3.3 Controlled Surface Use for Disturbance Cap: Greater Sage-Grouse PHMA/West Decker RHMA

Stipulation: Projects that exceed disturbance or density thresholds will need to be redesigned, relocated or modified to avoid or minimize disturbance to sage grouse habitat or density of facilities near sage-grouse leks.

Objective: To reduce anthropogenic disturbance and habitat degradation within PHMA and West Decker RHMA.

Waivers, Exceptions and Modifications: (See Range-wide Issues)

16.3.4 No Surface Occupancy: Greater Sage-Grouse Leks in GHMA/Musselshell RHMA

Stipulation: To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in General Habitat Management Areas (GHMA) and Musselshell RHMA.

Objective: To maintain the integrity of Greater Sage-Grouse GHMA/Musselshell RHMA and support sustainable Greater-Sage Grouse populations.

Waivers, Exceptions & Modifications: (See Range-wide Issues)

16.3.5 No Surface Occupancy: Greater Sage-Grouse Crucial Winter Range GHMA/Musselshell RHMA

Stipulation: To protect Greater Sage-grouse winter concentration area, surface occupancy and use is prohibited for oil and gas exploration and development in crucial winter range in General Habitat Management Areas (GHMA) and Musselshell RHMA.

Objective: Maintain the integrity of crucial winter habitat to support sage-grouse populations during severe winters. Crucial winter range is where a high proportion of the species population is located during severe winter conditions (e.g., maximum snow depths in the deepest 2 of 20 years).

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the state wildlife agency to lack those attributes and if the area associated with the site proposed for the waiver is no longer in PHMA through the appropriate planning process (i.e., plan maintenance or amendment).

Prior to waiving the NSO stipulation for a given area, the potential waiver shall be subject to public review for at least a 30-day period.

Exception: The Authorized Officer may consider and grant an **exception** to the NSO stipulation associated within GHMA Crucial Winter Range if one of the following criteria apply – after documenting the review of available information associated with the site proposed for the exception – both internally compiled and as provided by state, local, or tribal governments, project proponents, other federal agencies, or interested stakeholders:

If it can be demonstrated that the proposed development and surface occupancy would not impair the function or utility of the site for current for subsequent use as seasonal habitat based on at least one of the following:

- The location of the proposed authorization is determined to be non-habitat/unsuitable (as determined by a biologist with GRSG experience using methods such as the Habitat Assessment Framework), and lacks the ecological potential to become marginal or suitable habitat, and does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function.
- Topography/areas of non-habitat create an effective barrier to impacts.
- By co-locating the proposed authorization with existing disturbance, no additional impacts would be realized above those already associated with the existing major infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function.
- The proposed location would be undertaken as an alternative to a similar action occurring on a nearby parcel (for example, due to landownership patterns), and development on the parcel in question would have less of an impact on GRSG or its habitat than on the nearby parcel; this exception must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts.

To approve this exception, the Authorized Officer must document, in coordination with the state wildlife agency, that the proposed action satisfies at least one of the criteria listed above.

Prior to granting an exception to an NSO stipulation the potential exception shall be subject to public review for at least a 30-day period.

If the area associated with the proposed exception has met one of the adaptive management triggers (hard or soft), no exceptions would be considered until the causal factor analysis is completed.

16.3.6 Controlled Surface Use: Greater Sage-Grouse Seasonal Habitats in GHMA/Musselshell RHMA

Stipulation: Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts can be adequately addressed through application of the mitigation hierarchy, including conservation actions, needed design features, and offsets. Prior to surface-disturbing or disruptive activities a plan to maintain functionality of breeding, nesting sage-grouse, brood rearing and/or winter habitats for Greater Sage-Grouse will be prepared by the proponent and implemented upon approval by the authorized officer. The plan shall address how short-term and long-term direct and indirect effects to seasonal habitats will be mitigated based on current science and research.

Objective: To protect the integrity of Greater Sage-grouse General Habitat Management Areas and Musselshell RHMA, promote movement and genetic diversity to, and maintain seasonal habitats to support sustainable populations. Plans to address impacts will in general:

- Utilize the Conservation Buffer distances (Appendix X, and other approved resources) and incorporate Required Design Features (Appendix Y, or other as applicable), such as:
  - The timing of construction (i.e., no surface use is allowed from December 1 through March 15 in winter range and March 15 - July 15 in breeding and nesting habitats)
  - The timing of operations and maintenance (e.g., limit early morning and evening visits to wells near leks during the breeding season)
  - Locate surface disturbing and disruptive activities, such as linear features, infrastructure related to energy development, tall structures (e.g., communication or transmission towers, transmission lines), and low structures (e.g., fences, rangeland structures), to avoid and minimize impacts to seasonal habitats and movement corridors
  - Mitigate noise and related disruptive activities including those that do not result in habitat loss near leks and winter concentration areas

Waiver: The AO may waive this stipulation if no portion of the leasehold is within a General Habitat Management Area.

Exception: The BLM determines that impacts to GRSG and its habitat are minimized such that the proposal will maintain the functionality of SG habitat, while meeting the General Habitat goals and objectives.

Modification: The AO may modify the area subject to the stipulation if an environmental analysis finds a portion of the GHMA is nonessential or no longer Greater Sage-Grouse habitat.

16.3.7 Controlled Surface Use: Greater Sage-Grouse Cedar Creek RHMA

Stipulation: Surface occupancy and use would be allowed with design features to minimize disturbance to sage-grouse habitat within the Cedar Creek Greater Sage-Grouse Restoration Habitat Management Area.

Objective: To minimize disturbance to sage-grouse habitat and maximize restoration efforts while allowing for the permitted uses, the project proponent will prepare a plan to maintain functionality of habitats for

Greater Sage-Grouse. The plan will be prepared prior to surface-disturbing or disruptive activities and implemented upon approval by the authorized officer. Plans to address impacts will in general:

- Utilize the buffer distances and analysis provided in Appendix X
- Incorporate Required Design Features (Appendix Y, or other as applicable)
- Timing of construction to avoid disruption to seasonal habitats
- Timing of operations and maintenance to minimize disruption to seasonal habitats
- Placing of linear features, related infrastructure, and surface disturbance in relation to leks.
- Noise and related disruptive activities including those that do not result in habitat loss

Exception: The AO may grant an **Exception** if the proposed action will meet the goals and objectives for sage-grouse habitat.

Modification: The AO, in coordination with MFWP, may modify the boundaries of the stipulated area if portions of the leasehold are no longer sage-grouse habitat and future use by sage-grouse is unlikely.

Waiver: This stipulation may be waived if:

- sage-grouse are no longer a BLM special status species,
- no reasonable alternative development scenario exists, or
- the habitat has been altered to the point sage-grouse no longer occupy the site and there is no reasonable likelihood of sage-grouse reoccupying the site.

Exception: The BLM may approve actions in RHMA that are within the applicable lek buffer distance identified above only if:

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations);
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain as outlined in the Mitigation Strategy (Appendix X).

Modification: The AO may modify the area subject to the stipulation if an environmental analysis finds a portion of the RHMA is nonessential or no longer Greater Sage-Grouse habitat after coordination with the state fish and wildlife entity.

Waiver: The AO may waive this stipulation if no portion of the leasehold is within a Restoration Habitat Management Area.

16.3.8 Controlled Surface Use: Greater Sage-Grouse CHMA

Stipulation: Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts to potential stopover sites can be adequately mitigated. Prior to such activities a plan to mitigate impacts will be prepared by the proponent and implemented upon approval by the AO.

Objective: To maintain the integrity of sage-grouse habitat and provide habitat for the movement and genetic diversity to support connected sage-grouse populations. Plans to address impacts will in general:

- Incorporate Required Design Features (Appendix Y, or other as applicable)
- Timing of construction to avoid disruption to movements between seasonal habitats

- Avoidance of placing of linear features, related infrastructure, and surface disturbance in existing or potential sagebrush ecosystems.
- Noise and related disruptive activities during spring and fall movement periods

Exception: The BLM may approve actions in CHMA if the BLM determines the proposed action will meet the objectives for sage-grouse stopover sites, through findings such as:

- The BLM determines that impacts to potential GRSG stopover sites are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing disturbance);
- Any residual impacts are addressed through compensatory mitigation measures as outlined in the Mitigation Strategy (Appendix X).

Modification: The AO, in coordination with the state Fish and Wildlife entity, may modify the boundaries of the stipulated area if portions of the leasehold are no longer sage-grouse habitat and future use by sage-grouse is unlikely.

Waiver: The AO, in coordination with the state Fish and Wildlife entity, may waive this stipulation if no portion of the leasehold is within a Connectivity Habitat Management Area.

16.3.9 Timing Limitation: Greater Sage-Grouse HMAs

Stipulation: To protect Greater Sage-grouse populations utilizing important seasonal habitats, no surface use is allowed from December 1 through March 15 in winter range, March 15 - July 15 in breeding and nesting habitats and during migratory periods for stopover sites. This stipulation does not apply to operation and maintenance of production facilities.

Objective: The protection of sage-grouse leks, breeding and nesting habitat (e.g., 3.1 miles from leks), winter range, and stopover sites necessary for the long term maintenance of sage-grouse populations.

Waivers, Exceptions & Modifications: (See Range-wide Issues)

16.4 MONTANA/DAKOTAS OIL & GAS LEASE STIPULATION SUMMARY: PROPOSED RMP AMENDMENT

No.	Area	Stip Type	Language
1.	PHMA/PHMA with limited exceptions/ LMHMA/SCHMA	NSO	GREATER SAGE-GROUSE PHMA, PHMA with limited exceptions, LMHMA, and SCHMA To protect high density Greater-Sage Grouse habitat, including all seasonal habitats, surface occupancy and use is prohibited within Priority Habitat Management Areas (PHMA and PHMA with limited exceptions), the Little Missouri HMA, and the South Carter HMA. This NSO only applies to the North Dakota portion of the Little Missouri HMA.
2.	PHMA/LMHMA	CSU	GREATER SAGE-GROUSE PHMA and LMHMA Projects that exceed disturbance or density thresholds will need to be redesigned, relocated, or modified to avoid or minimize disturbance to sage grouse habitat or density of facilities in PHMA and the Little Missouri HMA. This CSU only applies to the North Dakota portion of the Little Missouri HMA.

No.	Area	Stip Type	Language
3.	GHMA	NSO	GREATER SAGE-GROUSE LEKS IN GHMA To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in General Habitat Management Areas (GHMA).
4.	GHMA	NSO	GREATER SAGE-GROUSE CRUCIAL WINTER RANGE IN GHMA To protect Greater Sage-grouse winter concentration area, surface occupancy and use is prohibited for fluid mineral exploration and development in crucial winter range in General Habitat Management Areas (GHMA).
5.	GHMA	CSU	GREATER SAGE-GROUSE SEASONAL HABITATS IN GHMA Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts can be adequately addressed through application of the mitigation hierarchy, including conservation actions, needed design features, and offsets. Prior to surface-disturbing or disruptive activities a plan to maintain functionality of breeding, nesting sage-grouse, brood rearing and/or winter habitats for Greater Sage-Grouse will be prepared by the proponent and implemented upon approval by the authorized officer. The plan shall address how short-term and long-term direct and indirect effects to seasonal habitats will be mitigated based on current science and research.
6.	LMHMA	CSU	GREATER SAGE-GROUSE SEASONAL HABITATS IN LMHMA Surface occupancy and use would be allowed with design features to minimize disturbance to sage-grouse habitat in the Little Missouri Habitat Management Area. This CSU only applies within the Montana portion of the Little Missouri HMA (i.e., the Cedar Creek Anticline).
7.	CHMA	CSU	GREATER SAGE-GROUSE CHMA Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts to potential stopover sites can be adequately mitigated. Prior to such activities a plan to mitigate impacts will be prepared by the proponent and implemented upon approval by the AO.
8.	ALL HMAs	TL	GREATER SAGE GROUSE ALL HMA TYPES To protect Greater Sage-grouse populations utilizing important seasonal habitats, no surface use is allowed from December 1 through March 15 in winter range, March 15 - July 15 in breeding and nesting habitats and during migratory periods for stopover sites. This stipulation does not apply to operation and maintenance of production facilities.

16.5 MONTANA/DAKOTAS OIL & GAS LEASE STIPULATION COMPLETE TEXT: PROPOSED RMP AMENDMENT

16.5.1 No Surface Occupancy: Greater Sage-Grouse PHMA, PHMA with limited exceptions, LMHMA and SCHMA

Stipulation: To protect high density Greater-Sage Grouse habitat, including all seasonal habitats, surface occupancy and use is prohibited within Priority Habitat Management Areas (PHMA and PHMA with limited exceptions), the Little Missouri HMA and the South Carter HMA This NSO only applies to the North Dakota portion of the Little Missouri HMA.

Objective: To maintain areas with the most important habitats and highest densities of sage-grouse (e.g., core areas) by facilitating long-term sustainability by minimizing impacts to habitat through disturbance and disruption. Since GRSG utilize different seasonal habitats and require connectivity between these areas, oil and gas operations should avoid new surface disturbing and disruptive activities across GRSG breading areas (leks), nesting habitat, brood rearing areas, and winter concentration areas used in mild to severe winters (i.e., all winter range).

Waiver: No Waivers would be granted in PHMA with limited exceptions areas. See Range-wide Issues for waivers outside these areas.

Modification: No Modifications would be granted in PHMA with limited exceptions areas. See Range-wide Issues for modifications outside these areas.

Exceptions: The Authorized Officer may consider and grant an exception to the NSO stipulation for PHMA (and Little Missouri HMA in North Dakota, South Carter HMA) only for activities farther than 0.6m from a lek. No Exceptions would be granted within .6 miles of a lek or in PHMA with limited exceptions areas. Outside this boundary an exception may be considered if one of the following criteria apply:

- The project is proposed to be undertaken as an alternative to an off-BLM location in PHMA/LMHMA/SCHMA and will provide a clear conservation gain to GRSG.
- By co-locating the proposed authorization, and associated infrastructure, with existing disturbance, no additional impacts would be realized above those already associated with the existing infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function.

Granting the exception must be in conformance with the RMP GRSG goal and habitat objectives, and not result in direct, indirect, or cumulative effects on GRSG or its habitats after application of the Mitigation hierarchy (See Mitigation Section 2.6.3).

To approve this exception, the Authorized Officer must document the review of available information associated with the site proposed for the exception – both internally compiled and as provided by State, County and other local agencies, tribal governments, project proponents, other federal agencies, or interested stakeholders as appropriate - and determine that the proposed action satisfies at least one of the criteria listed above. If the appropriate State agency does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides.

Prior to granting an exception to an NSO stipulation the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).

If the area associated with the proposed development seeking the exception (e.g., well pad, compressor station, etc.) is in an area (neighborhood cluster) that has met one of the adaptive management thresholds (hard or soft) (refer to Section 2.5.13), no exceptions would be considered until the causal factor analysis is completed and the BLM has determined that allowing exceptions is still warranted.

16.5.2 Controlled Surface Use for Disturbance Cap: Greater Sage-Grouse PHMA/Little Missouri hMA in North Dakota and South Carter HMA

Stipulation: Projects that exceed disturbance or density thresholds will need to be redesigned, relocated, or modified to avoid or minimize disturbance to sage grouse habitat or density of facilities in PHMA and the Little Missouri HMA. This CSU only applies to the North Dakota portion of the Little Missouri HMA.

Objective: To limit anthropogenic disturbance and habitat degradation within PHMA, the Little Missouri HMA, and the South Carter HMA

Waivers, Exceptions and Modifications: (See Range-wide Issues)

16.5.3 No Surface Occupancy: Greater Sage-Grouse Leks in GHMA

Stipulation: To protect Greater Sage-grouse breeding activities, surface occupancy and use is prohibited within 0.6 mile of the perimeter of active leks and lek complexes in General Habitat Management Areas (GHMA).

Objective: To maintain the integrity of Greater Sage-Grouse GHMA and support sustainable Greater-Sage Grouse populations.

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the appropriate state agency to lack those attributes and if the area associated with the site proposed for the waiver is no longer in a GRSG HMA through the appropriate planning process (i.e., plan maintenance or amendment).

Prior to waiving the NSO stipulation for a given area, the potential waiver shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).

Exception: The AO may grant an **Exception** only where the proposed action:

(i) Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or
(ii) By co-locating the proposed authorization with existing disturbance, no additional impacts would be realized above those already associated with the existing infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function; or
(iii) The project is proposed to be undertaken as an alternative to an off-BLM location in PHMA and will provide a clear conservation gain to GRSG.

To approve this exception, the Authorized Officer must document the review of available information associated with the site proposed for the exception – both internally compiled and as provided by State, County and other local agencies, tribal governments, project proponents, other federal agencies, or interested stakeholders as appropriate - and determine that the proposed action satisfies at least one of the criteria listed above. The exception should be consistent with guidance and recommendations from the appropriate State agency. If the state does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides.

Prior to granting an exception to an NSO stipulation the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).

Modification: After documenting the review of available information the Authorized Officer documents, in coordination with the appropriate state authority, that a portion of the NSO area is nonessential, or it is identified through scientific research or monitoring that the existing area is inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the GRSG, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting.

The Authorized Officer may consider and grant a **modification** to the fluid mineral lease NSO stipulation where an exception is granted, as described under **Exception**, for the primary disturbance (e.g., well pad, compressor station), then a modification providing for surface occupancy of potential associated infrastructure related to the development that are not individually precluded by other GRSG actions (e.g., roads, pipelines, power lines). While the NSO stipulation could be modified for these additional developments, they must still comply with other GRSG management actions (e.g., mitigation, disturbance cap, minerals/energy density, seasonal restrictions, RDFs, etc.) if an exception to the NSO is granted.

Prior to modifying the area subject to the NSO stipulation, the potential modification shall be subject to public review for at least a 30-day period. If the area associated with the proposed exception has met one of the adaptive management triggers (hard or soft), no modifications would be considered until the causal factor analysis is completed.

16.5.4 No Surface Occupancy: Greater Sage-Grouse Crucial Winter Range GHMA

Stipulation: To protect Greater Sage-grouse winter concentration area, surface occupancy and use is prohibited for oil and gas exploration and development in crucial winter range in General Habitat Management Areas (GHMA)

Objective: Maintain the integrity of crucial winter habitat to support sage-grouse populations during severe winters. Crucial winter range is where a high proportion of the species population is located during severe winter conditions (e.g., maximum snow depths in the deepest 2 of 20 years).

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the appropriate state agency to lack those attributes and if the area associated with the site proposed for the waiver is no longer in a GRSG HMA through the appropriate planning process (i.e., plan maintenance or amendment).

Prior to waiving the NSO stipulation for a given area, the potential waiver shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).

Exception: The AO may grant an **Exception** in Crucial Winter Range only where the proposed action:

(i) Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or
(ii) By co-locating the proposed authorization with existing disturbance, no additional impacts would be realized above those already associated with the existing infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function; or
(iii) The project is proposed to be undertaken as an alternative to an off-BLM location in PHMA and will provide a clear conservation gain to GRSG.

To approve this exception, the Authorized Officer must document the review of available information associated with the site proposed for the exception – both internally compiled and as provided by State, County and other local agencies, tribal governments, project proponents, other federal agencies, or interested stakeholders as appropriate - and determine that the proposed action satisfies at least one of the criteria listed above. The exception should be consistent with guidance and recommendations from the appropriate State agency. If the state does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides.

Prior to granting an exception to an NSO stipulation the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).

If the area associated with the proposed exception has met one of the adaptive management triggers (hard or soft), no exceptions would be considered until the causal factor analysis is completed.

16.5.5 Controlled Surface Use: Greater Sage-Grouse Seasonal Habitats in GHMA

Stipulation: Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts can be adequately addressed through application of the mitigation hierarchy, including conservation actions, needed design features, and offsets. Prior to surface-disturbing or disruptive activities a plan to maintain functionality of breeding, nesting sage-grouse, brood rearing and/or winter habitats for Greater Sage-Grouse will be prepared by the proponent and implemented upon approval by the authorized officer. The plan shall address how short-term and long-term direct and indirect effects to seasonal habitats will be mitigated based on current science and research.

Objective: To protect the integrity of Greater Sage-grouse General Habitat Management Areas, promote movement and genetic diversity to, and maintain seasonal habitats to support sustainable populations. Plans to address impacts will in general:

- Consider conservation buffer distances (e.g Conservation buffer distance estimates for Greater Sage-Grouse—A review: U.S. Geological Survey Open-File Report 2014) and incorporate Required Design Features from the 2015 RMPAs and other applicable sources to include measures such as:
  - The timing of construction (i.e., no surface use is allowed from December 1 through March 15 in winter range and March 15 - July 15 in breeding and nesting habitats)
  - The timing of operations and maintenance (e.g., limit early morning and evening visits to wells near leks during the breeding season)
  - Locate surface disturbing and disruptive activities, such as linear features, infrastructure related to energy development, tall structures (e.g., communication or transmission towers, transmission lines), and low structures (e.g., fences, rangeland structures), to avoid and minimize impacts to seasonal habitats and movement corridors
  - Mitigate noise and related disruptive activities including those that do not result in habitat loss near leks and winter concentration areas

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the appropriate state agency to lack those attributes and if the area associated with the site proposed for the waiver is no longer in a GRSG HMA through the appropriate planning process (i.e., plan maintenance or amendment).

Exception: The BLM determines that impacts to GRSG and its habitat are minimized such that the proposal will maintain the functionality of SG habitat, while meeting the General Habitat goals and objectives.

Modification: The AO may modify the area subject to the stipulation if an environmental analysis finds a portion of the GHMA is nonessential or no longer Greater Sage-Grouse habitat.

16.5.6 Controlled Surface Use: Greater Sage-Grouse Little Missouri HMA in Montana

Stipulation: Surface occupancy and use would be allowed with design features to minimize disturbance to sage-grouse habitat in the Little Missouri Habitat Management Area. This CSU only applies within the Montana portion of the Little Missouri HMA (i.e., the Cedar Creek Anticline).

Objective: To minimize disturbance to sage-grouse habitat and maximize restoration efforts while allowing for the permitted uses, the project proponent will prepare a plan to maintain functionality of habitats for Greater Sage-Grouse. The plan will be prepared prior to surface-disturbing or disruptive activities and implemented upon approval by the authorized officer. Plans to address impacts will in general:

- Emphasize collocation and reduction of duplicative infrastructure
- Consider conservation buffer distances (e.g. Conservation buffer distance estimates for Greater Sage-Grouse—A review: U.S. Geological Survey Open-File Report 2014)
- Incorporate Required Design Features such as RDF/BMP appendices from 2015 RMPAs.
- Timing of construction to avoid disruption to seasonal habitats
- Timing of operations and maintenance to minimize disruption to seasonal habitats
- Placing of linear features, related infrastructure, and surface disturbance in relation to leks.
- Noise and related disruptive activities including those that do not result in habitat loss

Exception: The AO may grant an **Exception** if the proposed action will meet the goals and objectives for sage-grouse habitat.

The BLM may approve actions in the Little Missouri HMA that are within the applicable lek buffer distance identified above only if:

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations);
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain as outlined in the Mitigation approach.

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the appropriate state authority to lack those attributes and if the area associated with the site proposed for the waiver is no longer in a GRSG HMA through the appropriate planning process (i.e., plan maintenance or amendment).

Modification: The AO may modify the area subject to the stipulation if an environmental analysis finds a portion of the Little Missouri HMA is nonessential or no longer Greater Sage-Grouse habitat after coordination with the appropriate state authority.

16.5.7 Controlled Surface Use: Greater Sage-Grouse CHMA

Stipulation: Surface occupancy and use will be avoided unless the project proponent can clearly demonstrate that the impacts to potential stopover sites can be adequately mitigated. Prior to such activities a plan to mitigate impacts will be prepared by the proponent and implemented upon approval by the AO.

Objective: To maintain the integrity of sage-grouse habitat and provide habitat for the movement and genetic diversity to support connected sage-grouse populations. Plans to address impacts will in general:

- Consider conservation buffer distances (e.g. Conservation buffer distance estimates for Greater Sage-Grouse—A review: U.S. Geological Survey Open-File Report 2014)
- Incorporate Required Design Features (See RDF/BMP appendices).
- Timing of construction to avoid disruption to movements between seasonal habitats
- Avoidance of placing of linear features, related infrastructure, and surface disturbance in existing or potential sagebrush ecosystems.
- Noise and related disruptive activities during spring and fall movement periods

Exception: The BLM may approve actions in CHMA if the BLM determines the proposed action will meet the objectives for sage-grouse stopover sites, through findings such as:

- The BLM determines that impacts to potential GRSG stopover sites are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing disturbance);
- Any residual impacts are addressed through compensatory mitigation measures as outlined in the Mitigation approach.

Modification: The AO, in coordination with the appropriate state authority, may modify the boundaries of the stipulated area if portions of the leasehold are no longer sage-grouse habitat and future use by sage-grouse is unlikely.

Waiver: The Authorized Officer may consider and grant a waiver to if the area mapped as possessing the attributes protected by the stipulation is determined during coordination with the appropriate state authority to lack those attributes and if the area associated with the site proposed for the waiver is no longer in a GRSG HMA through the appropriate planning process (i.e., plan maintenance or amendment).

16.5.8 Timing Limitation: Greater Sage-Grouse HMAs

Stipulation: To protect Greater Sage-grouse populations utilizing important seasonal habitats, no surface use is allowed from December 1 through March 15 in winter range, March 15 - July 15 in breeding and nesting habitats and during migratory periods for stopover sites. This stipulation does not apply to operation and maintenance of production facilities.

Objective: The protection of sage-grouse leks, breeding and nesting habitat (e.g., 3.1 miles from leks), winter range, and stopover sites necessary for the long-term maintenance of sage-grouse populations.

Waivers, Exceptions & Modifications: (See Range-wide Issues)

Appendix 17. Proposed RMP Amendment and Analysis for Key Research Natural Areas in Oregon

17.1 Introduction and Background

This appendix provides excerpts and background information from the 2015 (and 2019) BLM Oregon Greater Sage-grouse (Greater Sage-grouse) final environmental impact statements (EIS) and plan amendment efforts, as well as newer information about the BLM Oregon key Research Natural Areas (RNA) needed to support the current planning and analysis process presented in the body of this EIS. This current effort is limited to RMP-level actions needed to provide guidance for subsequent implementation-level actions.

The 2015 Oregon Greater Sage-grouse ARMPA identified 15 existing RNAs as key RNAs and allocated all or portions of 13 key RNAs in Oregon as unavailable for livestock grazing. The 2019 RMPA reversed that decision and made all or portions of those 13 key RNAs available for livestock grazing. These decisions affected approximately 22,000 acres within 13 existing, district designated, RNAs. The 2019 RMPA was and remains enjoined by the United States District Court for the District of Idaho and the 2015 ARMPA decision for these 13 key RNAs remains in effect. None of the other BLM state Greater Sage-grouse ARMPAs, either in 2015 or in 2019, included the identification of key RNAs or changes in the availability of livestock grazing.

The two other existing RNAs identified as key RNAs in the 2015 planning process were previously excluded from livestock grazing and neither the 2015 nor 2019 RMP amendment processes proposed changing these underlying district-level land use plan decisions. Both the Foster Flat key RNA in the Burns District and Guano Creek-Sink Lakes key RNAs in the Lakeview District were, and will remain, allocated as unavailable for livestock grazing.

The BLM Oregon is addressing key RNAs in this current planning effort to update key RNA affected environment and clarify or modify existing Greater Sage-grouse management direction.

The following excerpts from the 2015 EIS provide background, context, and history regarding the intents and purposes of the RNAs.

17.2 2015 Final EIS Excerpts

The following excerpt from Chapter 3 of the 2015 Oregon Greater Sage-grouse Final EIS describes Research Natural Areas (from Special Designations 3.16.5 Areas of Critical Environmental Concern (ACEC); page 3-134 to 3-135).

RNAs are a unique type of ACEC created to: preserve examples of all significant natural ecosystems for comparison with those influenced by humans; provide educational and nondestructive research for ecological and environmental studies; and preserve gene pools of typical and endangered plants and animals. RNAs are areas that are part of a national network of reserved areas under various ownerships that contain important ecological and scientific values and are managed for minimum human disturbance. RNAs are intended to represent the full array of North American ecosystems with their biological communities, habitats, natural phenomena, and geological and hydrological formations. In RNAs, natural processes are allowed to

predominate and are primarily used for nonmanipulative research and baseline data gathering on relatively unaltered plant community types.

Under certain circumstances (refer to BLM, 1987, section .37B), deliberate manipulation may be used to maintain the unique features for which the RNA was established. Because natural processes are allowed to dominate, RNAs also make excellent controls for similar communities that are being managed and for long-term vegetation monitoring for shifts resulting from changes in precipitation and temperature (climate change). In addition, RNAs provide an essential network of diverse habitat types that will be preserved in their natural state for future generations.

RNAs have important biological or physical attributes that are identified and designated in cooperation with the Pacific Northwest RNA Committee (Forest Service, BLM, and Washington and Oregon) following the Oregon Natural Areas plan (Oregon Natural Heritage Advisory Council 2010).

These areas can be used for long-term baseline plant community monitoring; they are areas where few management activities have influenced the plant community for which the RNA was established. Management practices necessary to maintain or restore ecosystems can be allowed and perhaps are necessary to maintain the values, especially invasive plant control.

17.3 PROPOSED RMP AMENDMENT AND EIS ALTERNATIVES

17.3.1 Alternative 1

Under Alternative 1 all or portions of 13 key RNAs, approximately 21,922 acres total (**Table 17-1** below), would be allocated as unavailable for livestock grazing as described in the 2015 Greater Sage-grouse ARMPA (p. 2-18). Making these areas unavailable for livestock grazing would provide areas where natural processes will proceed for long-term monitoring and research (BLM 2015a, p. 4-24) of the plant communities present. Managing the key RNAs as unavailable for livestock grazing could increase the ecological protection in areas where livestock grazing is removed, although vulnerability to wildfire may increase as fine fuel loads build in the absence of livestock grazing (BLM 2015a, p. 4-100). The BLM would continue to manage ACECs, including key RNAs, to protect their relevant and important values (BLM 2015a, p. 4-272).

17.3.2 Alternative 2

Under Alternative 2, all of the following 13 key RNAs would be available for livestock grazing, subject to applicable laws, regulations, policies, and other BLM Oregon Resource Management Plan decisions: Black Canyon, Dry Creek Bench, East Fork Trout Creek, Fish Creek Rim, Foley Lake, Lake Ridge, Mahogany Ridge, North Ridge Bully Creek, Rahilly-Gravelly, South Bull Canyon, South Ridge Bully Creek, Spring Mountain, and Toppin Creek Butte (BLM 2018a, p. 2-9). Impacts to habitat would not change from the conditions present when these RNAs were identified as key. Opportunities for comparison of ungrazed to grazed areas would be fewer than under alternatives 1, 3, 4, 5, 6 or the Proposed RMP Amendment (BLM 2018a, p. ES-8). The BLM would continue to manage ACECs to protect their relevant and important values (BLM 2015a, p. 4-272). Livestock and other herbivores consume vegetation and affect soils through hoof action and possible compaction. When these impacts are kept at appropriate levels, natural processes such as plant growth and recovery, freeze-thaw periods, and microbial activity in the soil surface result in recovery from these impacts and maintain site stability and health. (BLM 2018a, p. 4-40). Natural processes will predominate on the key RNAs which remain available for research and data gathering on relatively unaltered plant communities.

Notes:
1 – Acreage estimates and AUM estimates/calculations have been updated from the 2015 ARMPA ROD.
2 – Black Canyon ACEC/RNA acres were reduced by 40 acres to reflect updated GIS data for the boundary.
3 – The Oregon 2015 ARMPA estimated that 47 AUMs may be removed based strictly on the change in acreage. The 2019 RMPA used the same estimate of 47 AUMs. Alternatives 1 and 2 reflect the numbers from the prior EISs. This key RNA has been excluded from the allotment and pasture through an administrative process; no change to permitted AUMs is necessary because the remaining pasture can support the estimated 47 AUMs associated with the key RNA made unavailable for livestock grazing.
4 – Estimated AUMs for Alternatives 5 and 6 associated with the area allocated as 'unavailable for livestock grazing' would be absorbed in portions of the associated pasture and/or allotment in which the Key RNA exists. Site-specific monitoring would inform if AUMs cannot be absorbed, with site-specific NEPA and grazing decisions to implement any reductions in AUMs as a result of implementing removal of livestock from those areas allocated as unavailable for livestock grazing as a result of this alternative.
5 – The 2015 and 2019 estimates of acres used the Guano Creek Wilderness Study Area boundary. The Guano Creek-Sink Lakes ACEC/RNA is much smaller and contained entirely within the larger WSA boundary. The corrected acres reflect just the ACEC/RNA portion that is, and would continue to be, unavailable for livestock grazing use under all alternatives.
6 – Lake Ridge key RNA would become available for livestock grazing, however a 13-acre area adjacent to the 2015 ARMPA-identified Lakeridge key RNA and within the ACEC/RNA would be unavailable for livestock grazing.
7 – Mahogany Ridge ACEC/RNA is divided into two "Parcels", totaling 622 acres. The southern parcel is 444 acres; the Key RNA is located solely in the southern parcel and totals 155 acres. In Alternatives 5 and 6, 140 acres would be allocated as unavailable for livestock grazing.
8 – South Bull Canyon data has been revised based on updated district site-specific information. The entire ACEC/RNA acreage is 770 of which 749 acres were designated in 2015 as a key RNA (and allocated as unavailable for livestock grazing). Under Alternatives 5 and 6, 492 of the 749 acres previously allocated as unavailable for livestock grazing would be reallocated as available for livestock grazing.
9 – Exception criteria would be have to be met for construction of exclosure fencing within WSA or increased management presence would be needed.
10 – Toppin Creek Butte acres were corrected to reflect updated GIS data for the area.

17.3.3 Alternatives 3, 4, 5, 6, and Proposed RMP Amendment

Alternatives 3, 4, 5, 6, and the Proposed RMP Amendment are based upon changed habitat management area boundaries. In 2022, ODFW informed BLM that they were going to update core and low density HMAs. Using ODFW's published methodology to estimate core and low density HMA, the BLM drafted maps of what would likely be considered core and low density HMAs. These maps were used for the draft EIS. For the final EIS, we have adopted ODFW's revised habitat designations.

Under Alternative 3, ODFW's revised core and low-density habitat would become PHMA and GHMA respectively. In addition, GHMA would include the modelled sagebrush habitat as in the 2015 ARMPA from Durtsche et al. (2010). Under Alternative 3, all proposed PHMA and GHMA would become PHMA and be allocated as unavailable for livestock grazing, including all of the 13 key RNAs.

Under Alternative 4, ODFW's revised core and low-density habitat would become PHMA and GHMA respectively. In addition, the GHMA includes the modelled sagebrush habitat as in the 2015 ARMPA from Durtsche et al. (2010). This alternative would retain the 2015 decision that makes all or portions of the 13 key RNAs unavailable for livestock grazing.

Under Alternatives 5, 6, and the Proposed RMP Amendment, ODFW's revised core would become PHMA and GHMA would be comprised of their low-density lek areas plus HAF mapped seasonal habitat. Under all three of these alternatives all, some, or none of specific key RNAs would be unavailable for livestock grazing as shown below and described in **Table 17-1** above. Under all three alternatives, the entirety of the key RNAs identified in 2015 are key RNAs and all of these key RNAs would be retained. All three alternatives would update management direction to reflect this interpretation. Special Designation (SD) 4 would be changed to: manage key RNAs as baseline reference areas for sagebrush plant communities they represent that are important to Greater Sage-grouse. Active or passive restoration actions, including removal of encroaching juniper, are allowed within key RNAs to support maintenance or improvement of identified vegetation communities and to meet Greater Sage-grouse habitat objectives.

The Proposed RMP Amendment is nearly the same as Alternative 5 with the following exceptions:

- the area allocated as unavailable for grazing in the Mahogany Ridge key RNA is reduced from 140 acres to 69 acres.
- A 5-acre or less exclosure is proposed that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the North Ridge Bully Creek key RNA or within close proximity to this key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse.
- A 5-acre or less exclosure is proposed that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the South Ridge Bully Creek key RNA or within close proximity to this key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse.
- A 5-acre or less exclosure is proposed that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the Spring Mountain key RNA or within close proximity to this key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse.

For purposes of this plan, a baseline reference area is one where ecological processes and current ecological condition are functioning within a normal range of variability and the plant community has adequate resistance to, and resiliency from, most disturbances. Ecological condition considers historical disturbance regimes, current authorized uses, climatic variability, and existing vegetation. The original designation of the Research Natural Areas that were later identified as key RNAs occurred because they possessed a typical representation of a common plant or animal association that is of scientific or other special interest. At the time of the RNA designation, livestock grazing and trailing on public, private, and state lands had occurred for decades; they were not undisturbed areas. Several of them, however, were topographically difficult for livestock to access or lacked nearby water sources and that remains true today. Preservation and protection of the natural attributes will predominate within the baseline reference areas. The baseline reference area is that area where grazing is restricted due to fences, topography, or active herd management.

17.3.4 Environmental Consequences

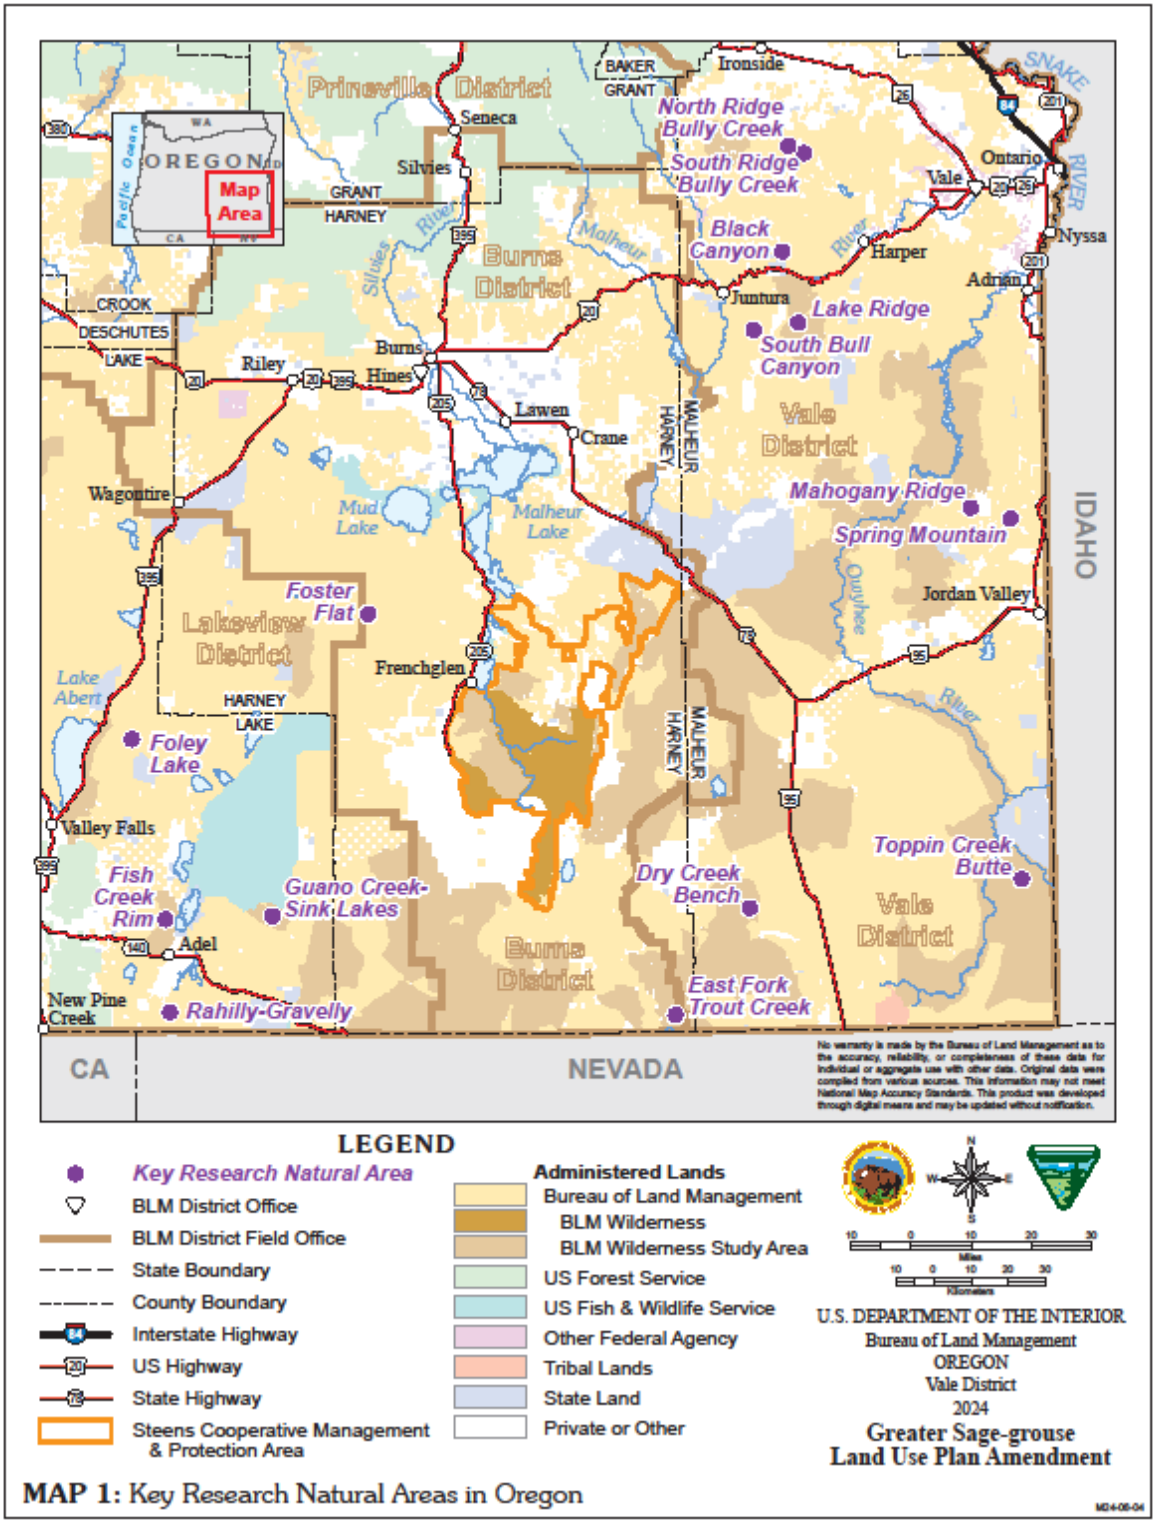
Under Alternatives 1 and 4 in 13 of the 15 key RNAs, 21,922 acres would be unavailable for livestock grazing, while under alternative 3, 46,484 acres would be unavailable for livestock grazing in the same areas; this would allow plant communities in these areas to be available for comparison with other areas that had more human influence for future research needs. Under these alternatives fencing might be present in and adjacent to key RNAs. These fences could affect livestock distribution. Modifications to existing water improvements and limitations on new water improvements may create additional limitations, however, livestock distribution outside of key RNAs should generally be maintained, and impacts should be limited from these actions (BLM 2015a, p. 4-203). Making portions of RNAs that contain plant communities important to Greater Sage-grouse unavailable for livestock grazing could provide the BLM with areas for baseline vegetation monitoring without the influence of livestock grazing. This could allow natural succession processes to proceed without the influence of livestock grazing, making these areas available for use as comparative controls to treated areas. Whether removal of livestock grazing would reduce the risk of invasive plant spread into the key RNAs is uncertain, as there are many vectors for invasive plants besides livestock, but reducing the physical disturbance from livestock grazing is likely to reduce one of those vectors (BLM 2018a, p. 4-4). OHV use would continue to be allowed or restricted as currently designated.

Under Alternative 2, livestock grazing management would be governed by the livestock grazing provisions in the 2019 ARMPA, which changed Objective Livestock Grazing 2 and deleted Management Direction Livestock 1 from the 2015 ARMPA to make all or portions of 13 key Research Natural Areas (key RNAs) available for livestock grazing. The key RNAs would continue to be required to meet rangeland health standards and other applicable BLM regulations and policies (BLM 2018a, p. 4-6). Impacts to habitat would not change from the conditions present when these RNAs were identified as key for Sage-grouse. Alternative 2 would result in 21,922 fewer undisturbed acres within Oregon available for research on the impact of livestock grazing on plant communities. However, these acres would remain available for long-term vegetation monitoring. Although the USFWS has determined improper livestock grazing can have adverse effects on Greater Sage-grouse habitat, properly managed livestock grazing may benefit the species (USFWS 2015, p. 59909). Under Alternative 2, the key RNAs would remain subject to management, including regulation of livestock grazing, to maintain and promote the key characteristics of the RNAs. Finally, making the key RNAs unavailable for livestock grazing would not address any threats to Greater Sage-grouse habitat identified in the COT report (USFWS 2013) that may exist within the boundaries of the RNAs. (BLM 2018a, p. 4-7).

Effects of Alternatives 5, 6, and the Proposed RMP Amendment are discussed below. The summarized impact analyses in Chapter 4 for the key RNAs in Oregon is supported by and based on the more detailed RNA

specific information presented in the following section. These alternatives are proposed to resolve or reduce specific conflicts and plan conformance issues.

Under all alternatives, the BLM would require changes to livestock grazing/management in the 13 key RNAs if a rangeland health evaluation finds that standard(s) are not being met and the determination document identifies existing livestock grazing as a causal factor in the failure to meet rangeland health standards. BLM may also require changes to livestock grazing/management for various reasons in accordance with its grazing regulations (43 CFR 4100 [2006]).



The BLM Assessment, Inventory and Monitoring (AIM) Strategy for Integrated Renewable Resources Management provides a framework for the BLM to quantitatively assess the condition, trend, amount, location, and spatial pattern of natural resources on the nation's public lands. The Landscape Monitoring Framework (LMF) is a component of the AIM strategy and is used to assess and monitor renewable resources on BLM-managed rangelands. We have identified the number of AIM and LMF plots, if any, within individual key RNAs. This information can be found in the description of the key RNAs.

17.4 KEY ACEC AND RNA DESCRIPTIONS

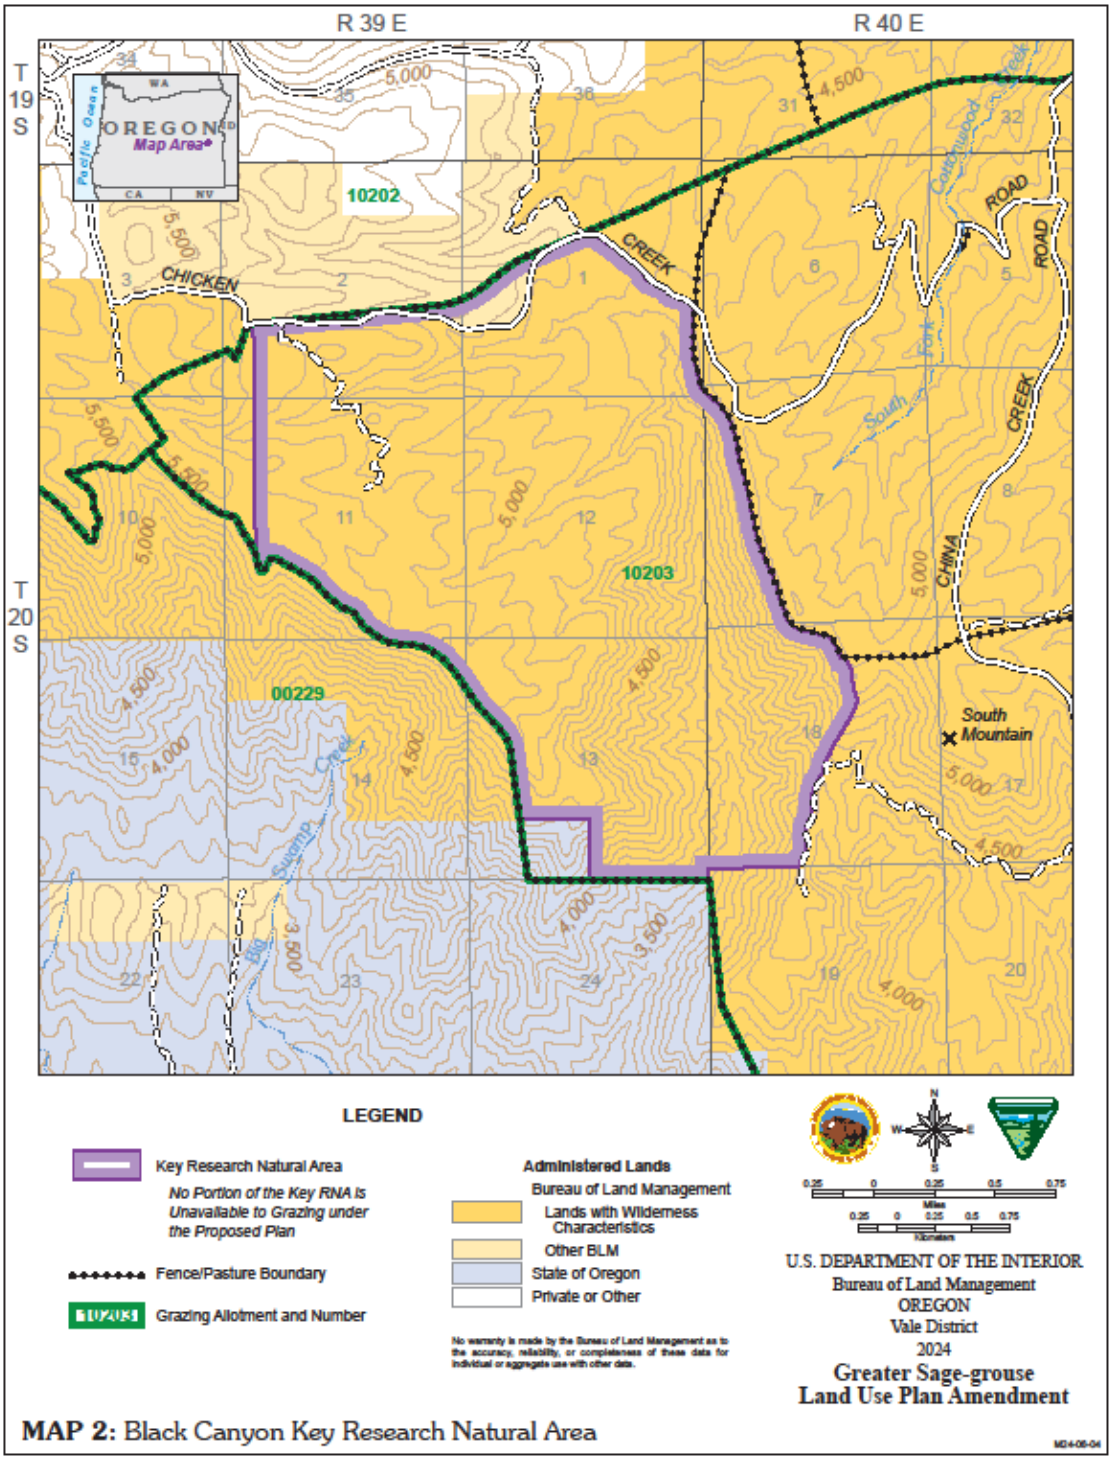
The key ACEC/RNAs in Oregon were identified as containing native sagebrush (*Artemisia* sp.) shrublands, grasslands, and other habitats that provide plant communities that sage-grouse use for breeding, nesting, brood rearing, foraging, and wintering. The plant community types that the RMPA/FEIS (BLM 2015a, p. 3-138 to 3-139) identified as important for sage-grouse are:

- Mountain big sagebrush (*Artemisia tridentata* spp. *vaseyana*)/grasslands
- Basin big sagebrush (*A. tridentata* spp. *tridentata*)/grasslands
- Wyoming big sagebrush (A. t. spp. *wyomingensis*)/grasslands
- Mountain mahogany (*Cercocarpus ledifolius*) and bitterbrush (*Purshia tridentata*) shrublands and grasslands
- Low sagebrush (*Artemisia arbuscula*)/grasslands
- Black sagebrush (*A. nova*)/grasslands
- Rigid sagebrush (*A. rigida*)/grasslands
- Silver sagebrush (*A. cana*)/grasslands
- Three-tip sagebrush (*A. tripartite*)/grasslands
- Shadscale, greasewood, and bud sagebrush *(A. canescens, A. confertifolia, Sarcobatus vermiculatus, Artemisia spinescens*)/desert scrub
- Vernal pools, playas, lake margins
- Black cottonwood (*Populus tricocarpa*), willow (*Salix* sp.) and aspen (*Populus tremuloides*) riparian areas, wet meadows, seeps, and springs

Map 1. Key Research Natural Areas in Oregon

17.4.1 Key ACECs

Three key ACECs were identified in the Proposed RMPA/Final EIS, all within the Lakeview Field Office: Abert Rim, High Lakes, and Red Knoll (BLM 2015a, p. 2-45). Current livestock grazing management would continue within all three key ACECs under all alternatives.



17.4.2 Key RNAs (District)

Black Canyon (Vale District)

Proposed RMP Amendment

Retain the area identified as a key RNA and reallocate the entire key RNA as available for livestock grazing.

Map 2. Black Canyon Key Research Natural Area

Affected Environment

The 2,600[1] acre Black Canyon ACEC/RNA, located north of the Malheur River above Jonesboro, Oregon, occupies the drainage of Black Canyon, a steep south-facing canyon that drains the uplands directly above the mainstem of the Malheur River. The drainage consists of an intermittent to perennial stream flowing just enough to develop riparian vegetation in the steep canyon. The uplands surrounding the drainage are sparsely vegetated due to the shallow soils and dry south-facing aspect. Elevations range from approximately 2,760 to 5,900 feet. There are two AIM plots within the area available for livestock grazing.

Livestock grazing and trailing on public, private, and state lands has occurred for decades in the area. Although there are flat benches conducive to livestock grazing in the upper elevations of the key RNA, the permittee does not currently push livestock to these areas, resulting in little to no use by livestock within the key RNA boundaries.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use will be limited to designated roads and trails. The ACEC/RNA is managed as VRM Classes II and III. Plant collecting requires a permit. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Where adverse impacts are identified, existing livestock use allocations will be adjusted using a variety of methods that could include fencing, reduction in livestock numbers, and changes in livestock grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 Southeastern Oregon RMP (SEORMP) ACEC/RNA Designation

The relevant and important values of the ACEC/RNA are the following vegetation cells identified by the Oregon Natural Heritage Program (ONHP): stiff sagebrush/Sandberg bluegrass, western juniper/big sagebrush/bluebunch wheatgrass, riparian community dominated by coyote willow with Pacific willow, and first to third order stream system in sagebrush zone.

2015 Greater Sage-grouse ARMPA

The Black Canyon ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities in the key RNA include old-growth western juniper/Wyoming big sagebrush/bluebunch wheatgrass, Wyoming big sagebrush/Idaho fescue (*Festuca idahoensis*), and stiff sagebrush/Sandberg bluegrass plant associations, as well as riparian community dominated by coyote willow and Pacific willow. Upland areas consist of shale rock outcroppings and steep canyons.

Vegetative communities in this key RNA that are important to Greater Sage-grouse habitat continue to be relatively unaltered. These are Wyoming big sagebrush/Idaho fescue (*Festuca idahoensis*), and stiff sagebrush/Sandberg bluegrass plant associations and the riparian community. These communities represent the Cool-Moist/Warm Dry sagebrush, Shallow-Dry Sagebrush, and Riparian communities important for

[1] Updated boundaries of some Key RNAs since publication of the 2015 Oregon ARMPA have resulted in minor change to acreages. No official boundary changes, however, have been made.

Greater Sage-grouse. Use by sage-grouse within the key RNA has not been documented, nor were signs of Greater Sage-grouse presence observed during site visits in 2022 (Fritts, Susan, McDaniel, Michele, and McGuire, Megan. Site visit. 10/12/2022). The key RNA is within 2015 ARMPA designated Greater Sage-grouse Priority and General Habitat Management Area (PHMA, GHMA); the nearest lek is more than three miles away.

The old-growth western juniper/Wyoming big sagebrush/bluebunch wheatgrass community is not suitable habitat for sage-grouse because the western juniper provides perch opportunities for predators.

Other Resources

The Black Canyon key RNA is wholly within the Trail Creek lands with wilderness characteristics unit OR-034-031. The 11,890-acre unit possesses naturalness and outstanding opportunities to experience solitude. The entire Black Canyon Creek drainage is within the unit. The BLM decided not to prioritize protection of the wilderness characteristics in the Trail Creek unit (BLM 2024a, Appendix A, p. A-4).

Some drainages possess varying woody riparian vegetation along portions of their canyon channels, dominated by coyote willow and Pacific willow. Existing human imprints within the unit consists of 5.3 miles of motorized primitive routes, 17.5 miles of rangeland fence, three earthen reservoirs, and four developed springs.

The key RNA is utilized by deer and pronghorn year-round and is designated as deer and elk winter range.

The Visual Resource Management Class (VRM) in the key RNA is mostly Class III with some Class II and Class IV.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The vegetative communities identified as important for Greater Sage-grouse habitat within the key RNA continue to be in good condition. Management would continue to protect the relevant and important values of the RNA.

Benches of sagebrush provide suitable nesting and winter habitat for Greater Sage-grouse.

The key RNA retains the following vegetation types important for Greater Sage-grouse: Ecotone between cool-moist and warm-dry sagebrush, shallow-Dry Sagebrush, and Riparian-Wetlands.

Opportunities for nonmanipulative research and baseline data gathering on relatively unaltered plant community types continue to remain, along with vegetative communities identified as important for greater sage-grouse, due to the remote and rugged nature of the area.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Prior to the removal of livestock grazing from this key RNA, there was no indication of negative impacts from livestock grazing to these vegetative communities or the relevant and important values for which the RNA was designated (BLM. Monitoring data. 06/01/2018-06/02/2018; BLM. Monitoring data. 06/26/2020-06/27/2020).

The key RNA portion of the pasture is largely inaccessible to livestock grazing due to topography, such as steep, rugged slopes that are sparely vegetated due to shallow soils and dry south-facing aspects (BLM 2001b,

p. 296). The existing pasture boundaries, which encompass the key RNA on three sides, includes two areas that remain allocated to livestock grazing in the 2015 ARMPA.

Due to the deep canyons and rugged terrain that characterize the key RNA, the current and historical livestock use is limited and provides opportunities for ungrazed areas to be found within the key RNA (Fritts, Susan, McDaniel, Michele, and McGuire, Megan. Site visit. 10/12/2022; R. Bond & D. Thomas site visit 06/23/2023) without retaining an allocation of "unavailable for livestock grazing". The objective for which the RNA was designated in 2002 would continue to be met, which allows for scientific research objectives without the need to make the area unavailable for livestock grazing, thus eliminating the need for fence construction.

The key RNA would continue to provide opportunities to gather baseline data on relatively unaltered plant community types important to Greater Sage-grouse without additional fencing as field observations confirmed that the area has limited access for livestock due to extreme topographic features and it is presently largely undisturbed. Continued livestock grazing is not expected to adversely affect current conditions, and conditions continue to exist at the time the RNA was designated under the 2002 SEORMP.

Environmental Consequences

Consequences Common to all Alternatives

The terrain of the key RNA naturally excludes livestock access from all but the south-eastern boundary. Because of limited livestock presence or use occurring within the key RNA, vegetative communities that are important to Greater Sage-grouse habitat would continue to be relatively unaltered and available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

The removal of livestock grazing under Alternative 1 has not changed the condition of the vegetative communities as access to the area by livestock was limited due to topography regardless of how livestock use is allocated for the area. Vegetative communities were in a desirable state prior to the removal of livestock grazing (BLM. Monitoring data. 06/01/2018-06/02/2018; BLM. Monitoring data. 06/26/2020-06/27/2020). Topography is currently the primary factor in livestock being removed from the area, along with livestock management practices such as herding and placement of salt or other active management practices that deter livestock from entering drainage areas within the key RNA. In the future, should the decision be made to construct fence to keep livestock out of the area, there could be ground disturbance associated with fence construction, and potential for increased weeds, unless specific design features are implemented to reduce or eliminate these negative effects. There would be short-term impacts to visual resources during fence construction.

Alternatives 2, 5, 6, and Proposed RMP Amendment

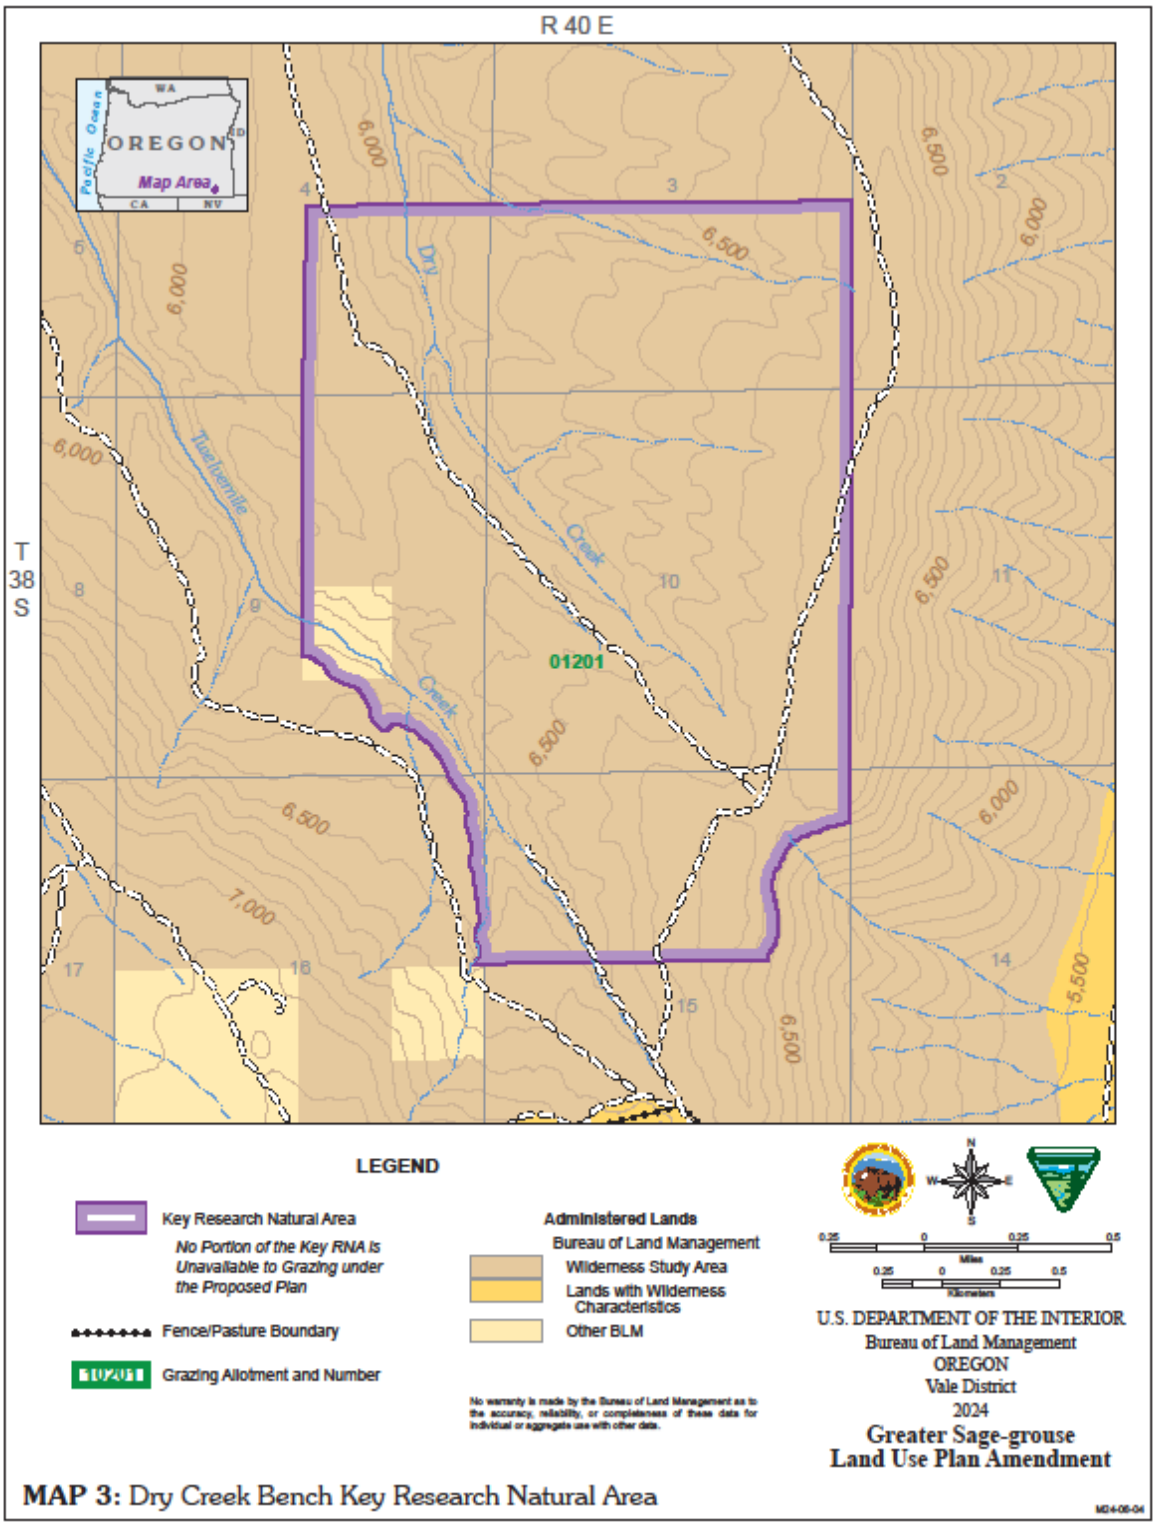
Allocating the 2600-acre area as available for livestock grazing would avoid the need to either construct fencing within areas possessing wilderness characteristics or to implement management actions that require the permittee to manage livestock to avoid incursion into the key RNA that currently receives very little to no use by cattle in the absence of fence construction. There would be no impacts to wildlife, including sage-grouse, from fencing or active livestock management because none would occur for the purposes of removing livestock from the key RNA. There would be no ground disturbance associated with fencing and no associated potential increase in weeds. There would be no impacts to visual resources because there would be no fencing.

No impacts to vegetative communities are expected from re-allocating this key RNA as available for livestock grazing. As stated in the rationale for maintaining the key RNA status, the vegetative communities identified as important for Greater Sage-grouse in 2015 are still present in their entirety as the area has not been subject to wildfire, even though until recently, actions to remove livestock from the area allocated as unavailable for such use had not been implemented. Topographical features allow for long-term natural succession in relatively undisturbed areas from livestock use throughout the majority of the key RNA, and where livestock use does occur, use would be negligible due to limited water availability and access to these areas. Therefore, the condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA while retaining livestock grazing use would continue (BLM. Monitoring data. 06/01/2018-06/02/2018; BLM. Monitoring data. 06/26/2020-06/27/2020).

These alternatives, compared with Alternatives 1, 3, and 4, would have similar impacts from livestock grazing due to limited livestock presence or use occurring in the key RNA boundaries. Vegetation communities that are important to Greater Sage-grouse habitat would continue to be relatively unaltered and provide life-cycle needs (such as nesting, brood rearing, and wintering) under all alternatives.

Outstanding opportunities for solitude would not be negatively impacted because active management by livestock operators to exclude livestock from an unfenced key RNA would not occur nor would there be any short-term disturbances to these opportunities caused by fence construction. The wilderness characteristic of naturalness would not be negatively impacted by the presence of new fencing on the landscape. Fence related conflicts would not occur. Under these alternatives, the BLM could focus management responses on actions that maintain or improve Greater Sage-grouse habitat conditions outside the key RNA rather than focusing on actions that ensure livestock do not enter an area already witnessing limited use.

Alternative 3



Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness and outstanding opportunities for solitude would not be impaired under this alternative, nor would there be any short-term disturbances to these opportunities caused by fence construction. Fence related conflicts would not occur. An ungrazed reference for research would be retained.

Dry Creek Bench (Vale District)

Proposed RMP Amendment

Retain the area identified as a key RNA and reallocate the entire key RNA as available for livestock grazing.

Map 3. Dry Creek Bench Key Research Natural Area

Affected Environment

The 1,635-acre ACEC/RNA is located on the northern edge of the Oregon Canyon Mountains, taking in the upper basin of Dry Creek about 20 miles northwest of McDermitt, Nevada. Terrain of the key RNA naturally excludes livestock access from all but the south-eastern boundary. The area has sizeable patches of mountain mahogany in relatively good condition in association with Saskatoon serviceberry. The mountain mahogany stands in this area are extensive, compared to other stands in the basin, and cover large areas within the steep drainages as well as on the small plateaus that lie at the edge of the drainages. Use by sage-grouse within the key RNA has not been documented, nor were signs of Greater Sage-grouse presence observed during site visits in 2023. The ACEC/RNA is located in the Twelvemile Wilderness Study Area, and classified as VRM class I. The area is known big horn sheep habitat and range. The 2012 Holloway Fire burned through the ACEC/RNA impacting some but not all of the patches of mountain mahogany. The vegetation has been recovering from the fire with grasses and forbs coming back the following year, while mountain mahogany is slower growing and will take time for seedlings to mature.

The 1,635 acre key RNA, including the 622-acre area currently allocated as unavailable for livestock grazing, is in the Green Ponds pasture of the 15-Mile Community allotment (allotment #OR01201). The 15-Mile Community Allotment has seven livestock grazing authorizations associated with it. The allotment currently has a use area agreement in place that formalizes use areas between the livestock operators. There is one AIM plot within the area available for livestock grazing.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use is limited to existing roads and trails. Plant collecting requires a permit. Road maintenance will be limited to the existing roadway, and shoulder/ barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if the values will be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, that could include, but is not limited to, fencing, reduction in livestock numbers, and changes in livestock grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 SEORMP ACEC/RNA Designation

The relevant and important values of this ACEC/RNA are the mountain mahogany/whortleleaf snowberry/Idaho fescue and mountain mahogany/big sagebrush/Idaho fescue Basin and Range Province vegetation cells identified by the ONHP.

2015 Greater Sage-grouse ARMPA

The Dry Creek Bench ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities in this ACEC/RNA include mountain mahogany/mountain big sagebrush woodland with mountain snowberry (*Symphoricarpus oreophilis*) and various bunchgrasses, and mountain mahogany/mountain big sagebrush/Idaho fescue plant associations. Although not mentioned in the 2015 ARMPA as a community present, low sagebrush/Idaho fescue and mountain big sagebrush/bluebunch

wheatgrass are present within the proposed key RNA as observed through site visits. These communities represent the Cool-Moist sagebrush and Shallow-Dry sagebrush communities.

The mountain mahogany plant community does not represent an important Greater Sage-grouse habitat type because the density of mountain mahogany within the key RNA boundaries and its elevated structure can pose an increased likelihood of predation by raptors. The key RNA is within Greater Sage-grouse PHMA; the nearest lek is 1.8 miles away. A total of four pending active leks are within four miles of the key RNA.

Other Resources

The visual resource management is Class I.

The Dry Creek Bench key RNA is wholly located in the 28,000-acre Twelvemile Creek WSA. It is one of five WSAs that make up the Trout Creek Mountains Group of WSAs. The WSA is located approximately 26 miles northwest of McDermitt Nevada. The Twelvemile Creek WSA consists of two fault block plateaus, steeply scarped on the east and sloping gently to the northwest. The elevation ranges from 6,000 to 6,800 feet. The predominant plant communities are typical of sagebrush/grass ecosystems, with low sagebrush dominant on the shallower rocky soils, Wyoming big sage dominant on deeper soils. The Twelvemile Creek WSA has outstanding opportunities for experiencing both solitude and primitive and unconfined recreation. Supplemental values include geologic, scenic, archaeological, big game Habitat, and diverse plant community.

Dry Creek Bench key RNA is utilized by mule deer and pronghorn year-round, designated as deer winter range, and is within bighorn sheep occupied habitat. Rugged topography in the area could constrict wildlife movement between deep drainages and steep terrain, focusing movement on flatter benches.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

Notwithstanding being burned by wildfire in 2012, the area continues to be in desirable condition for the vegetative communities identified in the 2015 ARMPA. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated (BLM. Monitoring data. 06/12/2013-06/13/2013; BLM. Monitoring data. 06/02/2018-06/13/2018; BLM. Monitoring data 07/06/2020). Management will continue to protect the relevant and important values. The area continues to recover and provides opportunities for nonmanipulative research and baseline data gathering where natural recovery post-fire was allowed to occur. Site visits indicate that mountain mahogany stands that were not impacted by the 2012 Holloway fire are dense and continuous, with mountain big sagebrush on the periphery of the mahogany stands. Mountain mahogany impacted by the 2012 wildfire are standing dead, creating perches for raptor species that may occur in the area. However, the key RNA as identified in the 2015 ARMPA includes the mountain big sagebrush that occurs within the mountain mahogany community type. Sagebrush communities within the key RNA provide suitable nesting and winter habitat for Greater Sage-grouse.

Retaining the Dry Creek Bench key RNA would continue to allow natural processes to predominate and research and baseline data gathering on relatively unaltered plant communities important for Greater Sage-grouse: cool-moist sagebrush and shallow-dry sagebrush. The key RNA would continue to be managed for minimum human disturbance and to allow natural processes to predominate.

Research opportunities continue to remain within the area due to its remote and rugged nature, including vegetative communities identified as relevant and important values that are important for greater sage-grouse.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Allocation of the key RNA as unavailable for livestock grazing is unnecessary as this portion of the pasture has limited water availability and consists of topographic features that limit access use. The pasture in which the key RNA is situated has historically received limited use by livestock; this portion of the pasture's vegetative community is in a desired condition. Additional actions or disturbance to exclude livestock are not necessary to protect the relevant and important values because there is limited adequate available water and the remote, rugged nature of the area naturally limits livestock use in this key RNA. Additionally, under the 2015 Biological Opinion this pasture currently receives a minimum 2-year rest followed by a maximum 2-year consecutive livestock grazing use, and livestock grazing use is allowed for a maximum of 61 days during the period of May 15 to July 30. Returning the low level of grazing that occurred until the area was made unavailable for livestock grazing in 2023 is not expected to adversely impact current conditions. Conditions continue to exist (excluding impacts from wildfire) as they did at the time the RNA was designated under the 2002 SEORMP. The potential need to construct fence to create an area to exclude livestock use would be eliminated, therefore reducing the amount of fence on the landscape, as well as the need to address fence maintenance on an annual basis due to snow loads that occur in the area.

The key RNA is located in a WSA. Not building fences to exclude livestock would avoid the potential conflicts fence (exclosure) construction in the WSA would have. Developments that would "impair the suitability of WSAs for the preservation as wilderness" cannot be permitted unless they were to meet one of the exception criteria described in BLM Manual 6330, Management of Wilderness Study Areas. "In determining whether a development meets the protecting or enhancing wilderness characteristics exception, the BLM will determine if the structure's benefits to the natural functioning of the ecosystem outweigh the increased presence of human developments and any loss of naturalness, or outstanding recreational opportunities caused by the new development" (BLM 2012, p. 1-17). However, developments that meet an exception criterion must still be carried out in the least impairing manner practical. Furthermore, if an impairing proposed development—even one that meets an exception—can be implemented outside of a WSA and accomplish the objectives identified in the purpose and need statement prepared under NEPA, the BLM should endeavor to ensure that the project is implemented outside the WSA (BLM 2012, p. 1-11). Under the Proposed RMP Amendment, not building fences to exclude livestock would avoid impacts to wilderness characteristics within the WSA.

Concerns from the public regarding impacts to bighorn sheep were identified through the public scoping process for completing site-specific analysis (BLM 2023a, BLM 2023b) for implementing the removal of livestock grazing from the key RNA. The area is in pristine condition, and in a seral state that is expected to occur post-wildfire, as indicated by the presence of green rabbitbrush within the big sage communities that were affected by the 2012 Holloway wildfire. Although impacts to vegetation and soils may be short-term in nature with the construction of a potential fence to further aid in deterring livestock from using the area allocated as unavailable for livestock grazing, the fence would adversely impact the pristine (naturalness) nature of the area.

The key RNA would continue to provide research opportunities to study relatively unaltered plant community types important to sage-grouse without additional fencing as it is largely undisturbed. Given the topography and limited water sources for livestock use, there are areas that are unused by livestock, allowing

for ungrazed comparison areas without the need of additional fencing or increased livestock grazing management practices to remove livestock from an unfenced exclusion area.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

The removal of livestock grazing under Alternative 1 has not changed the condition of the vegetative communities as access to the area by livestock had been limited due in part to topographical features as well as the management practices prior to the removal of livestock grazing (BLM. Monitoring data. 06/12/2013-06/13/2013; BLM. Monitoring data. 06/02/2018-06/13/2018; BLM. Monitoring data 07/06/2020). Grazing management has been impacted by the need for increased presence to ensure livestock are not entering the area allocated as unavailable for livestock use. These impacts would be witnessed during the portion of the two-year rotation when grazing is allowed within the pasture per the currently prescribed grazing system.

Outstanding opportunities for solitude and primitive and unconfined recreation within the WSA are expected to be negatively impacted by active management to exclude livestock from 622 acres of the key RNA.

Topography and active livestock management through herding, salting, and increased checks on livestock location by the grazing permittee, as well as a grazing system that prescribes a 2-year rest cycle have removed livestock from the area allocated as unavailable for livestock grazing. In the future, should the decision be made to construct fence to exclude livestock from the area, the wilderness characteristic of naturalness would be impacted. Outstanding opportunities for solitude and primitive and unconfined recreation would be impacted by short-term impacts to solitude caused by fence construction. Fence construction may result in short-term disturbance to sage-grouse individuals and fence related conflicts (e.g. bird collisions and entrapments). The area occurs within Visual Resource Management (VRM) Class 1, which would require any fencing to be either screened from view of primary travel corridors by landform and vegetation, or the project elements be small enough and common enough in these landscapes so the level of change would be very low and would not attract attention. A fence is assumed to conform to VRM Class 1 if in an area that would allow for screening and location away from the travel corridor. There would be portions of the fence that would cross the travel corridor due to the location of the key RNA and associated area allocated as unavailable for livestock grazing under these alternatives. Fencing locations to exclude livestock use should consider natural barriers and other topographical features to reduce negative impacts to WSA and VRM Class 1 within the WSA; design features would also need to be incorporated to reduce negative impacts, although any impacts are not expected to be significant.

Wildlife identified for analysis may witness short-term impacts as a result of increased human presence during times when active herding is required to keep livestock out of the area allocated as unavailable for use during the two-year use cycles for the portions of the pasture that remain available for livestock use. If a fence is constructed in the future, impacts to movement within the area may be impacted, but are expected to be short-term in nature, and reduced through fence designs that are intended to reduce long-term impacts. Removal of livestock as a result of the unavailable for livestock use allocation within a portion of the Key RNA is not expected to have positive or negative impacts to wildlife or the associated habitat due to current conditions of the area.

Alternatives 2, 5, 6, and Proposed RMP Amendment

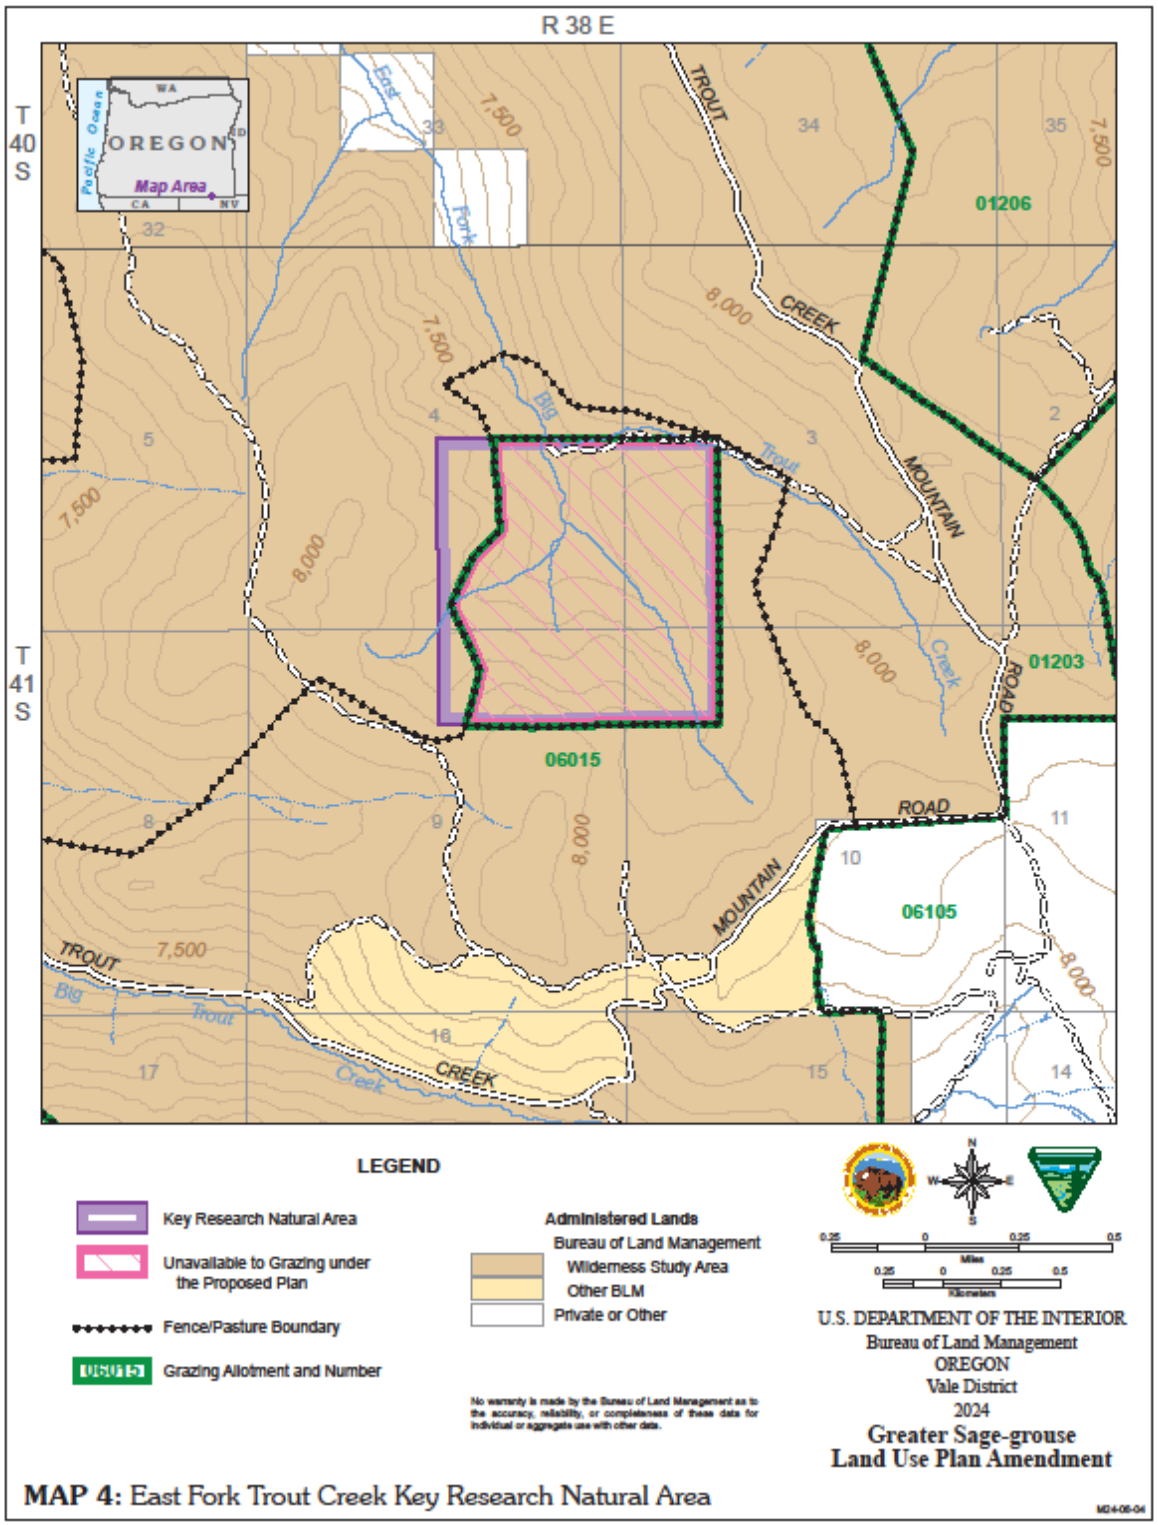
Reallocating the key RNA as available for livestock grazing eliminates the need for additional presence of livestock operators for managing livestock away from unfenced boundaries and the need for additional fence construction. Livestock management that prescribes a 2-year rest followed by 2 years of utilization, which had been in place prior to the 2023 grazing season, would resume.

Throughout the majority of the key RNA, topographical features and current livestock management practices restrict livestock access creating areas relatively undisturbed by livestock (BLM site visits by R. Bond and M. McDaniel July 2023; D. Thomas July 2023) which allows for long-term natural succession. Where livestock use does occur, use would be negligible due to limited water availability and access to these areas. This would result in limited livestock presence or use within the key RNA.

The condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA while retaining livestock grazing use would continue. Livestock grazing management prescribed did not adversely impact conditions of the vegetative communities that support wildlife habitat important to the area or the condition of the important vegetative communities identified for the Greater Sage-grouse.

There are no existing unnatural conditions on the landscape attributed to the livestock grazing that occurred prior to the key RNA being allocated as unavailable for livestock grazing, therefore no additional impacts to wilderness characteristics are anticipated from reallocating livestock grazing in the key RNA.

Alternative 3



Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness, opportunities for solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

East Fork Trout Creek (Burns)

Proposed RMP Amendment

No proposed changes from 2015 ARMPA; the portion of the key RNA that is currently unavailable for livestock grazing would remain unavailable for livestock grazing through a rangeline agreement, which removed the key RNA from the Headwaters Pasture and identified it as an area unavailable for livestock grazing.

Map 4. East Fork Trout Creek Key Research Natural Area

Affected Environment

The East Fork Trout Creek key RNA is located in Southeast Oregon, about 25 miles southeast of Fields, Oregon and 20 miles east of Denio, Nevada. It is situated at the headwaters of the East Fork of Trout Creek in the Trout Creek Mountains. The East Fork Trout Creek key RNA contains 361 acres of BLM managed land. The elevation of the key RNA ranges from 7,350 feet to 8,000 feet and the yearly rainfall averages from 16 to 35 inches per year. Temperatures range from a maximum of 90 degrees F in the summer to an occasional low of minus 20 degrees F in the winter. A 4-strand barbed wire fence runs for 0.75 mile through the west part of the key RNA, running from north to south. The fence will continue to be maintained because it is a pasture boundary. This fence splits the key RNA into two pieces. The piece north-west of the fence is in the East Fork Pasture which is still open to livestock grazing. The portion of the key RNA to the south-east of the fence was previously in the Headwater Pastures, and livestock grazing was limited to 5 days per year. This portion of the key RNA has now been made into its own pasture and has been unavailable for livestock grazing through a rangeline agreement with livestock operators. Livestock grazing is still authorized in the Headwaters Pasture which no longer includes the key RNA.

Specific Management under the 2005 Andrews Management Unit RMP ROD, as Amended

OHV use is limited to existing roads and trails.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2005 Andrews Management Unit ROD/RMP ACEC/RNA Designation

The relevant and important values include several plant community types. The ONHP vegetation cells represented in this area include a riparian community dominated by quaking aspen and Scouler willow, a high-elevation wet meadow dominated by sedges, and a first-to-third order stream system originating in the subalpine zone.

2015 Greater Sage-grouse ARMPA

The East Fork Trout Creek ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities

The vegetation in the key RNA consists of three major plant communities, a riparian community, a mountain big sagebrush (*Artemisia tridentata s. vaseyana*) community and a quaking aspen community (BLM 2007, p. 3). The riparian community is made up of two first order streams with associated meadow and willow (*Salix spp.*) types along the stream route. Meadow types are quite extensive in some areas where springs emerge from the ground and saturate the soil. Sedges and Rushes (*Juncus spp.*) dominate these saturated areas with occasional willow patches. Other species that occur in the meadow type include: aspen, alder, false hellebore (*Veratrum californicum*), monkeyflower (*Mimulus guttatus*), clover (*Trifolium longipes*), cinquefoil (*Potentilla gracilis*), willow herb (*Epilobium watsonii*), and buttercup (*Ranunculus macounii*). The mountain big sagebrush community covers the most area within the RNA. This type covers the dryer upland areas around and between the riparian areas and the aspen groves. Portions of this type include late-lying snow accumulation zones where very little sagebrush grows. Mountain big sagebrush is the dominant shrub in this community and needle grass (*Achnatherum* spp.) and mountain brome (*Bromus carinatus*) are the dominant grass species. Other species include wax currant (*Ribes cereum*), service berry (*Amelanchier alnifolia*), Snowberry (*Symphoricarpos rotundifolius*), lupine (*Lupinus* spp.), Idaho fescue (*Festuca idahoensis*), and phlox (*Phlox* spp.).

The quaking aspen community covers nearly one third of the natural area and includes the Scouler willow vegetation type. Much of this community is comprised of very dense canopy cover with poorly vegetated

understory. Other areas are more sparsely covered with trees and have well vegetated understories. Some of the species include: yarrow (*Achillea millefolium*), columbine (*Aquilegia formosa*), bedstraw (*Galium triflorum*), miner's lettuce (*Mantia perfoliata*), Solomon's seal (*Smilacina stellata*), stinging nettle (*Urtica dioica*), rose (*Rosa woodsii*), snowberry, and creeping wildrye (*Leymus triticoides*). No special status plant species are known to occur within the natural area.

Other Resources

Some of the common wildlife species found in the key RNA include mule deer, pronghorn, cougar, coyote, bobcat, badger, Belding ground squirrel, beaver, weasel, golden eagle, raven, cottontail, snowshoe hare, and spotted frog. The East Fork of Trout Creek supports a population of hybrid rainbow/cutthroat trout up to 10 inches in length. Special status animal species that could be present in the key RNA include Greater Sage-grouse, ferruginous hawk, Northern goshawk, and spotted frog. Many species of migratory birds nest in and around the natural area.

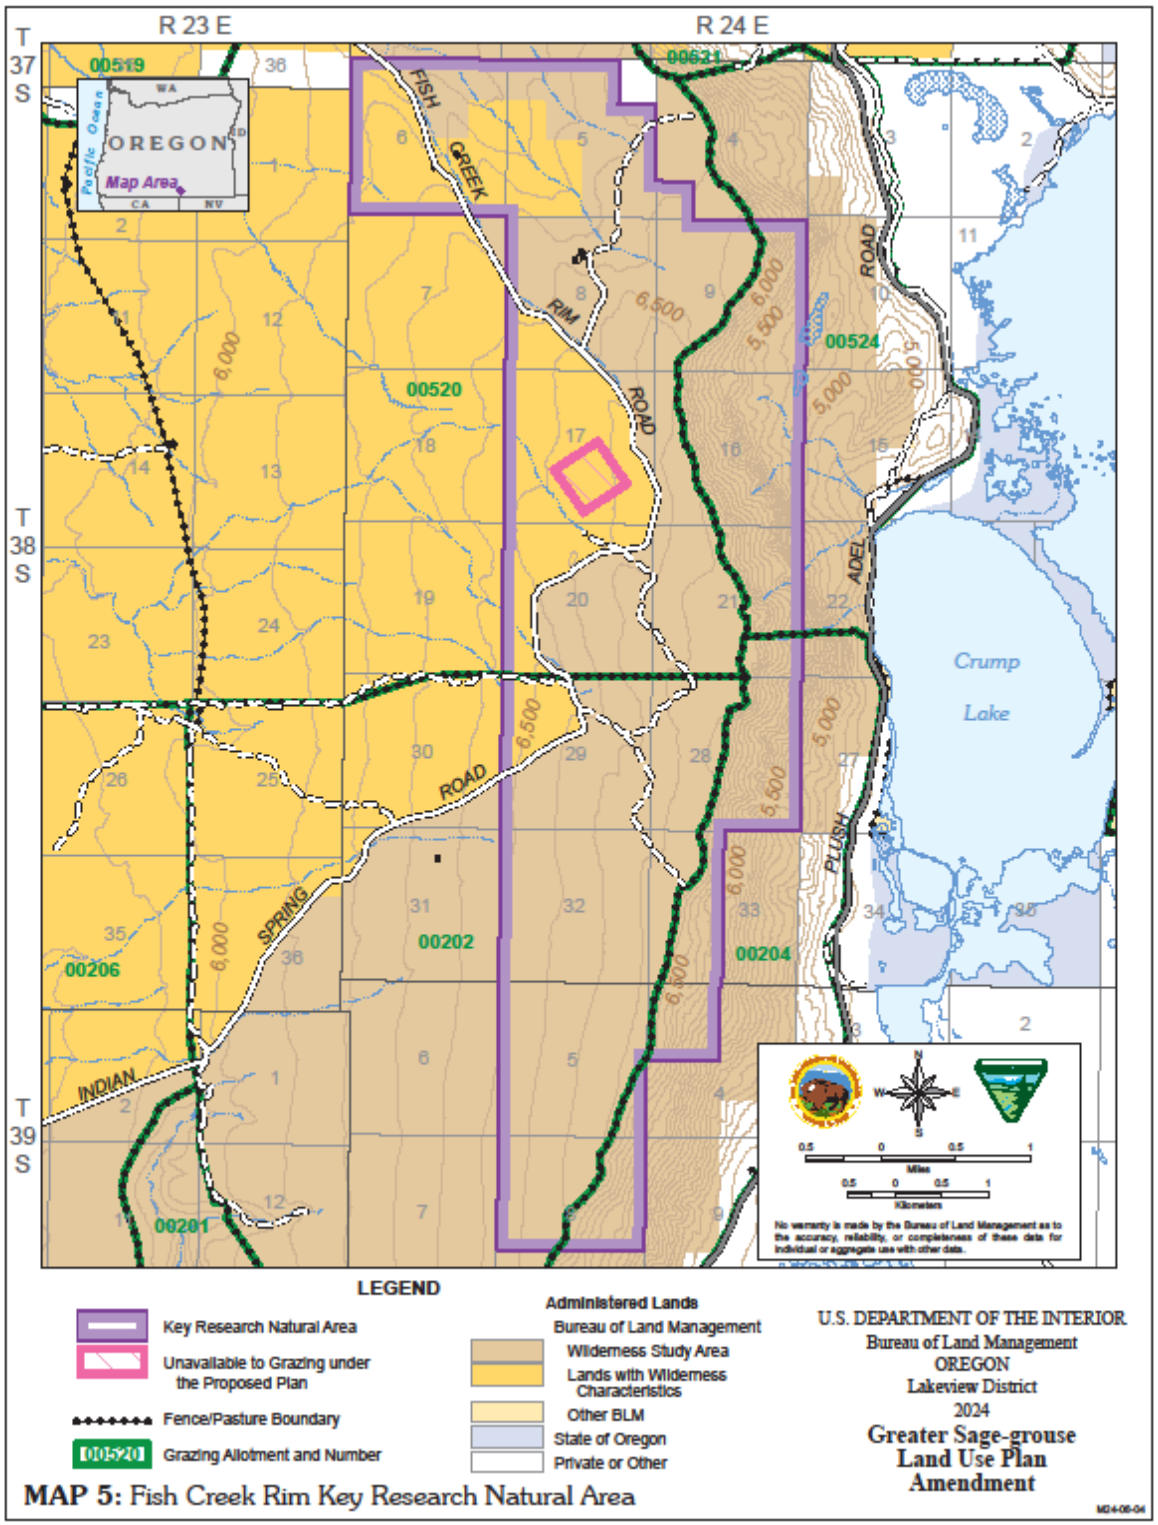
The fire return interval for the area in and around the RNA could be up to 100 years at the top end but the best estimate is between 35 and 50 years. The fine fuels from perennial grasses have increased in the last 15 years due to the change in livestock use (limited to no more than 5 days per grazing season).

The key RNA is located entirely within the Mahogany Ridge Wilderness Study Area (WSA). The area will be managed according to the BLM WSA policy.

Two separate stream forks form the headwaters of the East Fork Trout Creek. Each fork originates as two first order streams coming together to form a second order stream. When the two second order streams flow together in the lower part of the RNA they form a third order stream. All of the first order streams originate at 7,600 feet or higher in elevation. In all, about 1.2 miles of the East Fork Trout Creek and its tributaries are present within the natural area.

The area is encompassed within the 1.2 mile lek buffer and within a WSA. In addition, there are special status species flora located adjacent to the key RNA. The key RNA has been removed from the pasture and a fence is not needed to exclude livestock grazing from the area identified as unavailable for livestock grazing as topography and water sources in lower elevations of the Headwaters Pasture typically prevent livestock from grazing within the RNA. By utilizing a rangeline agreement in lieu of a fence, the BLM removed any resource conflicts that fence construction might present.

Environmental Consequences



As there are no changes in livestock grazing management proposed in this planning effort there would be no effect to the vegetation communities and resources described above. An ungrazed reference for research would be retained.

Fish Creek Rim (Lakeview)

Proposed RMP Amendment

Retain the area identified as a key RNA and reduce the 2,750 acres allocated as unavailable for livestock grazing to 95 acres within a low sagebrush/grassland community.

Map 5. Fish Creek Rim Key Research Natural Area

Affected Environment

The 8,725-acre Fish Creek Rim ACEC/RNA is located about 22 miles northeast of Lakeview. The 2015 Proposed RMPA/Final EIS described the plant communities of the Fish Creek Rim ACEC/RNA as representing mountain mahogany/mountain big sagebrush, low sagebrush/Idaho fescue, low sagebrush/Sandberg's bluegrass, mountain big sagebrush/bitterbrush/Idaho fescue, and a snowbrush/bittercherry shrub (*Ceanothus velutinus*/*Prunus emarginata*) complex (BLM 2015a, p. 3-140). Approximately 2,700 acres of the ACEC/RNA contains these specific plant communities ("cells" identified in Vander Schaaf 1992; BLM 2000a, p. III-30). Sage-grouse use has not been documented in all of these communities. Wyoming big sagebrush, small stands of quaking aspen and white fir (*Abies concolor*), and dense western juniper stands are also found within the ACEC/RNA boundary (BLM 2000a, p. III-30). Only Wyoming big sagebrush, mountain big sagebrush, and low sagebrush communities represent potential sage-grouse habitat.

Specific Management under the Lakeview RMP/ROD

OHV use is limited to existing roads and trails.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

Lakeview RMP ACEC/RNA Designation

The Fish Creek Rim ACEC/RNA was designated in the Lakeview RMP/ROD to protect relevant/important natural system (plant communities) and cultural resource values (BLM 2000a, p. III-30; 2001a, p. A-242 to A-243; 2003b, p. 58).

During the development of the *Lakeview RMP*/*ROD* (BLM 2003b), the BLM expanded the Fish Creek Rim ACEC/RNA (from the original 2,700-acre proposal to 8,725 acres) solely to include important cultural values in the added acreage. These values included the presence of stone rings/occupation sites, lithic scatter, rock art sites, and hunting blinds (BLM 2000a, p. III-28; 2003b, p. 77).

2015 Greater Sage-grouse ARMPA

The 2015 Proposed RMPA/Final EIS described the plant communities of the Fish Creek Rim ACEC/RNA as representing mountain mahogany/mountain big sagebrush, low sagebrush/Idaho fescue, low sagebrush/Sandberg's bluegrass, mountain big sagebrush/bitterbrush/Idaho fescue, and a snowbrush/bittercherry shrub (*Ceanothus velutinus*/*Prunus emarginata*) complex (BLM 2015a, p. 3-140). Approximately 2,700 acres of the ACEC/RNA contains these specific plant communities ("cells" identified in Vander Schaaf 1992; BLM 2000a, p. III-30).

Updated Vegetation Communities

Based on ecological site inventory (ESI) data, the most dominant vegetation communities in the Fish Creek Rim ACEC/RNA include low sagebrush/squirreltail, low sagebrush/Idaho fescue, mountain mahogany/mountain big sagebrush/bluegrass, and juniper-encroached mountain big sagebrush/squirreltail associations.

The Fish Creek Rim ACEC/RNA has extensive current and historical whitetop species (*Lipidium draba, L. appelianum, and L. chalepense*) weed sites along the road system, Canada thistle (*Cirsium arvense*) near water developments, and scattered patches of cheatgrass (*Bromus tectorum*) throughout the area.

Other Resources or Issues

Small riparian/wetland areas occur around several livestock water developments and within existing exclosures around Cleland and Cox Springs (BLM 2024b, p. 24).

The Fish Creek Rim ACEC/RNA includes a diversity of wildlife habitats. The area contains occupied bighorn sheep habitat, mule deer winter habitat, year-round antelope habitat. While the key RNA includes PHMA and GHMA, there are no known leks within the key RNA (BLM 2015a, p. 3-140) and documented use by Greater Sage-grouse within the key RNA is limited. Telemetry data collected in the area from 2009-2017 as part of various studies, documented spring, summer, and winter use in portions of the key RNA, but the majority of use occurred west of the key RNA, and no use was documented within the area allocated as unavailable for livestock grazing considered under Alternative 1 (Olsen *et al.* 2021a, Olsen *et al.* 2021b, and unpublished data).

During the development of the *Lakeview RMP/ROD* (BLM 2003b), the BLM expanded the Fish Creek Rim ACEC/RNA (from the original 2,700-acre proposal to 8,725 acres) to include important cultural values in the surrounding area, in general these additional acres do not include sage-grouse habitat. These values included the presence of stone rings/occupation sites, lithic scatter, rock art sites, and hunting blinds (BLM 2000a, p. III-28). A small portion of the Fish Creek Rim Wilderness Study Area (WSA) (OR-1-117; 1,786 acres) overlaps a portion of the Fish Creek Rim key RNA. A small portion of the Monument Flat wilderness characteristics unit (OR-015-117A) also overlaps a portion of the Fish Creek Rim key RNA.

Fish Creek Rim ACEC/RNA is managed under two different VRM classifications. The Fish Creek Rim WSA portion is managed as VRM Class I. The remainder of the ACEC/RNA is managed as VRM Class II.

The Fish Creek Rim ACEC/RNA falls within portions of the 22,011-acre Lynch-Flynn (00520), 3,548-acre Crump Individual (00201), 3,054-acre Lane Individual (00524), and 8,073-acre Hickey Individual (00202) Allotments. The area allocated as unavailable for livestock grazing under Alternative 1 falls within a portion of the East Pasture of the Lynch-Flynn Allotment. A rangeland health assessment was completed for this allotment in 2003 and updated in 2013 (BLM 2003c, 2013b). During these assessments no rangeland health issues were identified within the allocated as unavailable for livestock grazing under Alternative 1.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated. Management would continue to protect the relevant and important values of the RNA.

The key RNA retains the following vegetation types important for Greater Sage-grouse: cool-moist sagebrush, shallow-dry sagebrush, mountain brush, and riparian-wetlands.

Opportunities for nonmanipulative research and baseline data gathering on relatively unaltered plant community types continue to remain, along with vegetative communities identified as important for greater sage-grouse, due to the remote and rugged nature of the area.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Portions of the boundary around the area allocated as unavailable for livestock grazing in Alternative 1 traversed terrain/topography where the BLM determined, based on further analysis and field inventory, it would be difficult to construct exclosure fencing.

The mountain mahogany plant community does not represent an important sage-grouse habitat type because of the high density and decadent condition of the mountain mahogany stands and lack of sagebrush

understory within this portion within the key RNA boundary. White fir and western juniper stands do not represent important sage-grouse habitats because Greater Sage-grouse are a sagebrush-obligate species and these are forest or woodland habitats rather than sagebrush habitats. In addition, other existing native plant communities within the key RNA boundary are severely degraded by western juniper encroachment. The mountain mahogany, white fir, and western juniper all present perching locations for raptors, decreasing security for sage-grouse and resulting in their avoidance of these areas.

Portions of the existing low sagebrush/grassland community would be located both inside and outside of the boundary of the area allocated as unavailable for livestock grazing creating both grazed and ungrazed (control) sites in the same area suitable for future research related to the effects of livestock grazing.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Livestock are currently being kept out of areas allocated as unavailable for grazing through active management (herding, adjustment of turnout dates, removal of nearby water developments, and/or placement of salt or other supplements). There is an ungrazed reference area for research.

In the future, should the decision be made to construct fence to keep livestock out of the area, there would be impacts to wildlife, including sage-grouse, from fence construction including possible bird collisions and entrapments. There would also be ground disturbance associated with fencing and an associated potential increase in weeds. Construction of fencing and subsequent livestock trailing along the fence would create new ground disturbance within an area that has been relatively undisturbed in the past. Any time equipment and people are working in new areas there is a potential risk of introducing new noxious weeds/invasive species into native communities from equipment and people doing the work. There would be short-term impacts to visual resources during fence construction.

The wilderness characteristic of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired by fence construction under this alternative either in the short-term and long-term. There would be one-time fence construction costs to the BLM. Currently, fence construction costs are estimated at about $10,000 per mile (material and labor). Assuming that local contractors would be hired to construct the fence, there would be a small benefit to the local economy. There would also be additional operational costs to the permittee associated with the annual maintenance of the new exclosure fence.

Under these alternatives there are negative economic effects to affected livestock operators that arose from making 2750 acres (approximately 110 AUMs) unavailable for livestock grazing.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing, active livestock management (herding), or water developments for livestock. The wilderness characteristic of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative either short-term or long-term any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing, active livestock management (herding), or water developments for livestock. Wilderness characteristics of naturalness, opportunities for solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5, 6, and Proposed RMP Amendment

These alternatives would reallocate a portion of the WSA in the RNA as available for livestock grazing. Because the ecological condition had been good when grazing was allowed, the effect from this reallocation on wilderness characteristics is expected to be negligible.

Low sagebrush/grassland wildlife habitat would be present within the area allocated as unavailable for livestock grazing.

The modified boundary of the reduced area allocated as unavailable for livestock grazing under these alternatives would reduce amount of fencing needed within sage-grouse habitat and none of the boundary of the area allocated as unavailable for livestock grazing would be within 1.2 miles of any leks. This modification also eliminates the need for new fencing within the Fish Creek Rim WSA and eliminates the impact such fences would have on WSA values. The modified boundary would avoid all five existing livestock water sources and eliminate the need to mitigate for lost livestock watering sites. 2,655 acres would be reallocated as available for livestock grazing.

Construction of fencing and subsequent livestock trailing along the fence would create new ground disturbance within an area that has been relatively undisturbed in the past. Any time equipment and people are working in new areas there is a potential risk of introducing new noxious weeds/invasive species into native communities from equipment and people doing the work. However, the risk of weed introduction or expansion would be slightly less than Alternative 1 due to less fencing being needed, livestock trailing along the fence and associated ground disturbances.

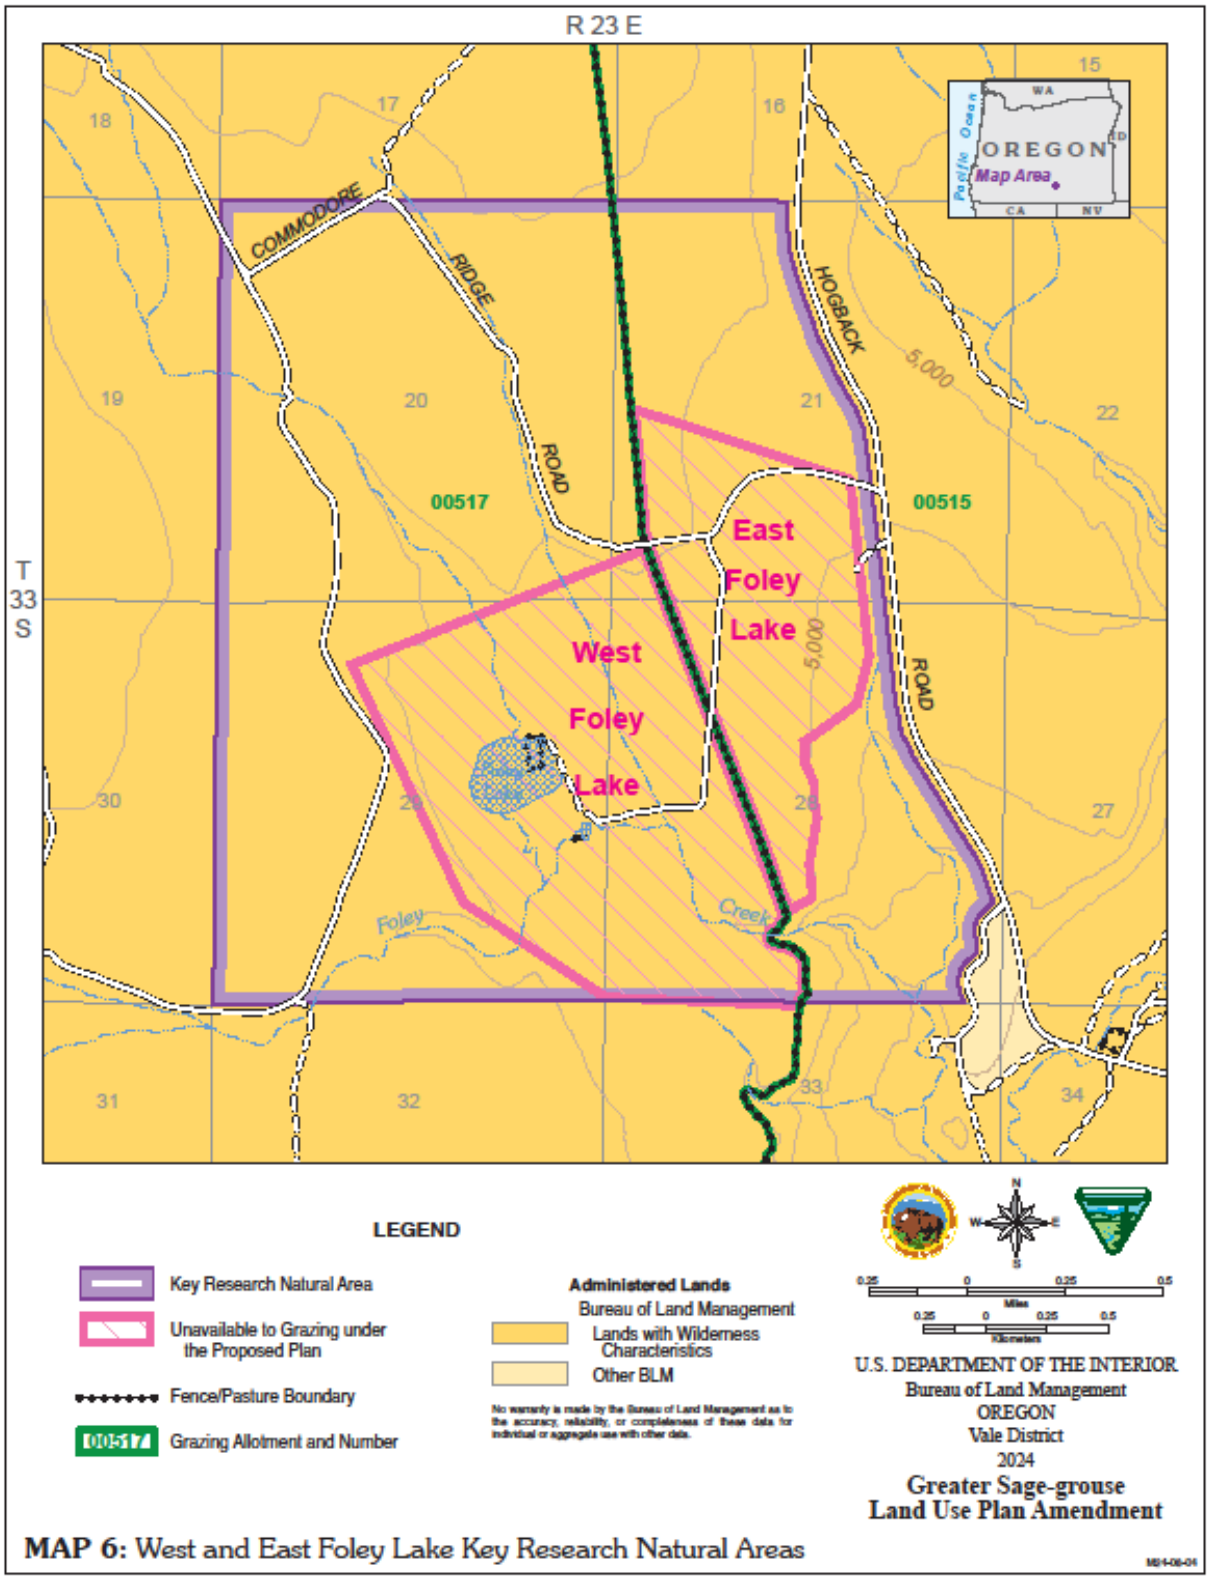
All fencing would pose a low collision risk to sage-grouse and would be constructed with wildlife-friendly specifications.

No fencing or changes in livestock grazing use would occur within the VRM Class I (Fish Creek Rim WSA) area. As a result, there would be no impacts to scenic values within VRM Class I areas. The exclosure fencing would have minor, negative impacts on the scenic quality in the rest of the Fish Creek Rim ACEC/RNA, but these effects would be consistent with VRM Class II management objectives.

A portion of the boundary of the area allocated as unavailable for livestock grazing would be within the Monument Flat wilderness characteristics inventory unit. If it were to be fenced, the fencing would be noticeable within close proximity but would not be substantially noticeable across the unit as a whole.

These alternatives would substantially reverse negative economic effects to affected livestock operators that arose from making 2,750 acres unavailable for livestock grazing. Under these alternatives, 2,655 acres would be reallocated as available for livestock grazing (approximately 106 AUMs).

There would be one-time fence construction costs to the BLM. Currently, fence construction costs are estimated at about $10,000 per mile (material and labor). Assuming that local contractors would be hired



to construct the fence, there would be a small benefit to the local economy. There would also be additional operational costs to the permittee associated with the annual maintenance of the new exclosure fence.

Foley Lake (Lakeview)

Proposed RMP Amendment

Retain the area identified as a key RNA and reduce the area unavailable for livestock grazing use. The area allocated as unavailable for livestock grazing would be reduced from 1269 acres to 797 acres. The western portion would be reduced to 521 acres within the Coyote-Colvin Allotment that contains silver sagebrush/grassland, Wyoming big sagebrush/grassland, and black sagebrush/grassland plant communities. The eastern portion would be reduced to 276 acres within the Juniper Mountain Allotment that contains black sagebrush/grassland and Wyoming big sagebrush/grassland plant communities. Approximately one mile of the existing allotment boundary fence could be removed from the middle of the key RNA once the exclosure fences are completed.

Map 6. Foley Lake Key Research Natural Area

Affected Environment

The Foley Lake ACEC/RNA falls within portions of the 130,345-acre Coyote-Colvin (00517) and 86,518-acre Juniper Mountain (00515) Allotments. There is an existing allotment boundary fence running in a north-south direction through the center of this key RNA. Potential management changes would impact two livestock operators. For this reason, portions of the following discussion for Foley Lake key RNA are broken out into an eastern and western portion. An exclosure fence has been constructed in the western portion along the boundary of the area that would be allocated as unavailable for grazing in the Proposed RMP Amendment.

Updated Vegetation Communities

Foley Lake itself lies in a small basin on the gently sloping backside of the Abert Rim fault within a larger Wyoming big sagebrush/grassland landscape. Black sagebrush is the predominant shrub in the ACEC/RNA with low sagebrush common on lithic soils. Wyoming big sagebrush occurs on deeper soils and silver sagebrush on the large vernally wet playa and (Foley) lake margin. Bud sagebrush (*Artemisia spinescens*) is also present (BLM 2015a, p. 3-140).

The 2015 Proposed RMPA/Final EIS described the plant communities the Foley Lake ACEC/RNA contains as black sagebrush/Sandberg bluegrass shrubland and low sagebrush/bunch grass (Sandberg bluegrass, bottle brush squirreltail, Idaho fescue), silver sagebrush/Sandberg's bluegrass plant associations (BLM 2015a, p. 3-140), however, a smaller portion of this area (approximately 1,035 acres) actually contains those specific plant communities (Vander Schaaf 1992, map pp. 14-15).

Based on ESI data, the most dominant vegetation communities in the Foley Lake ACEC/RNA include Wyoming big sagebrush/squirreltail and black sagebrush/field smartweed plant associations in the western portion and Wyoming big sagebrush/squirreltail and black sagebrush/squirreltail and smartweed plant associations in the eastern portion. Silver sagebrush associated with the margins of Foley Lake also occur in the western portion of the ACEC/RNA. No wetland or riparian areas occur within the east half of the Foley Lake ACEC/RNA (BLM 2024b, p. 25).

There are no known noxious weeds documented in the Foley Lake key RNA. However, cheatgrass has been documented recently in the understory. No special status plants occur within the east half of the Foley Lake ACEC/RNA.

Other Resources

The entire ACEC/RNA area is classified as PHMA and as seasonal breeding, summer, and winter sage-grouse habitat. However, there are no documented leks located within the key RNA boundary. Telemetry data collected from 2009-2017 for various studies failed to document sage-grouse use in the Foley Lake RNA, though summer usage was documented to the northwest and southwest of the RNA. Usage of the RNA has been observed indirectly in recent years (e.g. fecal pellets) (BLM, unpublished data). The eastern portion of the ACEC/RNA lies within sage-grouse Warners PAC, mid-scale HAF (Warner-Meizner), and fine-scale HAF (Warner) boundaries.

The Foley Lake ACEC/RNA provides habitat for a variety of other sagebrush-associated birds, mammals, and reptiles (BLM 2024b, p. 50). The western portion of the key RNA is pronghorn habitat (BLM 2019b, p. 77). While two pygmy rabbit burrows were located near or within the western exclosure area in recent years, the majority of the exclosure area is not an area of high pygmy rabbit use or typical pygmy rabbit habitat due to the shallow, rocky soils. (BLM 2019b, p. 77).

The western portion of the Foley Lake key RNA falls within the Twin Lakes Pasture of the Coyote-Colvin Allotment. A rangeland health assessment was completed for this allotment in 2000 and updated in 2016. No rangeland health issues were identified in the Twin Lakes Pasture during either assessment (BLM 2000b, 2016).

The eastern portion of the Foley Lake key RNA falls within the Flint Hills Pasture of the Juniper Mountain Allotment. A rangeland health assessment was completed for this allotment in 2004 (BLM 2004). No rangeland health issues were identified in the assessment for the Flint Hills Pasture of the allotment which contains the proposed grazing exclosure area.

Specific Management under the Lakeview RMP/ROD

OHV use is limited to existing roads and trails. The Foley Lake ACEC/RNA is managed as VRM Class III.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

Lakeview RMP/ROD ACEC/RNA Designation

The 2,228-acre Foley Lake ACEC/RNA is located about 37 miles northeast of Lakeview and was designated in the Lakeview RMP/ROD to protect relevant/important natural system (plant communities) and cultural resource values (BLM 2000a, pp. II-9, III-39; 2001a, p. A-243 to A-244; 2003b, p. 58). In the *Lakeview RMP/ROD* the BLM expanded the original Foley Lake ACEC/RNA proposal (from 1,035 acres to 2,228 acres) solely to include important cultural resource values in the added acreage. These include the presence of stone rings, rock art, burial sites, rock shelters, and lithic scatters (BLM 2000a, p. III-37 to III-38; 2003a, p. 2-58).

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The vegetative communities identified as important for Greater Sage-grouse habitat within the key RNA continue to be in good condition. Management would continue to protect the relevant and important values of the RNA.

The key RNA retains the following vegetation types important for Greater Sage-grouse: warm-dry sagebrush, shallow-dry sagebrush, and playa.

Opportunities for nonmanipulative research and baseline data gathering on relatively unaltered plant community types continue to remain, along with vegetative communities identified as important for greater sage-grouse, due to the remote and rugged nature of the area. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to these vegetative communities or the relevant and important values for which the RNA was designated.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Portions of the original boundary of the area allocated as unavailable for grazing (Alternative 1) traversed steep slopes and rocky surfaces. The modified proposal avoids these. The modified boundary would not be within 1.2 miles of active or pending active leks and would avoid creating a livestock trailing safety problem along County Road 3-10 (Hogback Road), a main, well-traveled county road on the east. The proposed boundary also takes advantage of existing topographic features (steep rim) on the south.

The western exclosure boundary includes all of the silver sagebrush/grassland community associated with Foley Lake, most of the surrounding black sagebrush/grassland community, and some of the Wyoming big sagebrush/grassland community. This allows both grazed and ungrazed (control) sites located in the same

area for future research related to the effects of livestock grazing on black sagebrush and Wyoming big sagebrush communities.

The proposed eastern exclosure boundary includes some of the black sagebrush/grassland and Wyoming big sagebrush/grassland communities. This would allow both grazed and ungrazed (control) sites to be located in same area for future research related to the effects of livestock grazing on black sagebrush/ grassland and Wyoming big sagebrush/grassland communities. The modified exclosure boundary avoids cultural sites located during field inventories of the original Alternative 1 alignment.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Livestock are currently being kept out of areas allocated as unavailable for grazing through active management (herding, adjustment of turnout dates, removal of nearby water developments, and/or placement of salt or other supplements).

The relevant and important values within the 1,269 acres allocated as unavailable for livestock grazing protected through the elimination of soil and vegetation disturbance. Native plant communities in this area are not subject to cattle trailing and trampling effects. There is an ungrazed reference for research.

Foley Lake waterhole and several existing natural water sources would no longer be available as livestock water sources for cattle grazing in the Twin Lakes Pasture. Excluding these water sources will change livestock distribution, and livestock grazing use will be less in the area immediately surrounding the exclosure and more concentrated in other areas of the Twin Lakes Pasture with water. Water will need to be hauled (at permittee's expense) to temporary troughs near two existing waterholes in the north end of the Twin Lakes Pasture on years when livestock water is limited which could create expanded disturbances due to increased cattle concentration and semi-truck use. These existing watering sites are located along existing roads and are not within 1.2 miles of leks or other important sage-grouse habitats (BLM 2019b, p. 103; Appendix D, Map 7). Vegetation disturbance would occur from semi-trucks turning around near the water trough sites (outside the key RNA).

Removal of livestock grazing removes one potential weed-spreading vector within the exclosure area. However, other vectors (wildlife, vehicles, wind, and water) would continue and potentially spread weed species. The lack of spring livestock grazing could allow more invasive annual grasses to flower and produce seed. Monitoring data has shown that removal of livestock from areas where weeds are present (such as riparian areas and exclosures) often leads to more robust weed infestations and allows the invasive species to negatively impact native vegetation (BLM 2019b, p. 50). Fenceline disturbance could represent an area of increased risk of potential cheatgrass invasion/expansion. Fencing would negatively affect the existing visual quality within the area, but would meet the VRM Class III management objectives.

In the absence of spring grazing, areas with high amounts of annual grasses will continue to degrade the landscape and create a less fire-resistant landscape. There will be an increase in fine fuels and a potential increase in the risk of catastrophic wildfire occurrence within this exclosure (BLM 2019b, p. 42). Should a wildfire occur and impact the proposed grazing exclosure, the exclosure area could be subject to increased

cheatgrass dominance and could require active vegetation management such as herbicide treatment or native grass seeding.

If fencing is used, there would be some surface disturbance to upland native vegetation communities, soils, and biological crusts from vehicle traffic during fence construction and removal and future maintenance of the proposed fence.

Making portions of the key RNA unavailable for livestock grazing would not prevent the use of Foley Lake as a water source by mule deer, pronghorn, bighorn sheep, or other wildlife. A fence could alter behavior and use patterns of big game species, but those effects would be mitigated to the extent feasible by building the fence to standard wildlife passage specifications (BLM 2019b, p. 77).

Fence construction would not impact pygmy rabbits at a population level and would not improve pygmy rabbit habitat or encourage movement of more pygmy rabbits into the exclosure area (BLM 2019b, p. 77).

Excluding the western portion of the Foley Lake RNA would remove approximately 31 AUMs of forage available for livestock grazing use in the Twin Lakes Pasture of the Coyote-Colvin Allotment. Excluding the eastern part of would remove about 32 AUMs of forage available for livestock grazing use in the Juniper Mountain Allotment. This total reduction of about 63 AUMs could be absorbed by spreading the AUMs across other pastures within the allotments, and would not require reducing the permitted number of AUMs.

There would be annual operational costs to the permittee associated with future fence maintenance (estimated at $600-1,200 per year) and water hauling.

Alternative 2

Reallocating the entire key RNA as available for livestock grazing is unlikely to harm the habitat quality of the area, as under the previous grazing regimen, it was in good ecological condition and met applicable rangeland health standards (BLM 2000b; BLM 2016, pp. 7, 9, 10, 12; BLM 2019b, p. 79). Because the entire area would be allocated as available for livestock grazing, there would be no need for additional fencing, active livestock management (herding), or water developments for livestock.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing, active livestock management through increased herding, or water developments for livestock. Eliminating livestock grazing would eliminate soil and vegetation disturbance caused by livestock. This would allow natural processes to occur in the absence of most human-caused disturbances and provide an area for future baseline monitoring and research purposes. Native plant communities and soils would no longer be subject to livestock grazing or trampling effects. An ungrazed reference for research would be retained.

Removal of livestock grazing would remove one potential weed-spreading vector. However, other vectors (wildlife, vehicles, wind, and water) would continue and potentially spread weed species. The lack of spring livestock grazing could allow more invasive annual grasses to flower and produce seed. Monitoring data has shown that removal of livestock from areas where weeds are present (such as riparian areas and exclosures) often leads to more robust weed infestations and allows the invasive species to negatively impact native vegetation (BLM 2019b, p. 50).

In the absence of spring grazing, areas with high amounts of annual grasses would continue to degrade the landscape and create a less fire-resistant landscape. There would be an increase in fine fuels and a potential increase in the risk of catastrophic wildfire occurrence within this exclosure (BLM 2019b, p. 42). Should a

wildfire occur and impact the proposed grazing exclosure, the exclosure area could be subject to increased cheatgrass dominance and could require active vegetation management such as herbicide treatment or native grass seeding.

Alternatives 5, 6, and Proposed RMP Amendment

These alternatives would reallocate a portion of the area that is currently unavailable for livestock grazing as available for livestock grazing. Because the ecological condition had been good when grazing was allowed, the effect from this reallocation on wilderness characteristics is expected to be negligible.

Foley Lake waterhole and several existing natural water sources would remain unavailable as livestock water sources for cattle grazing in the Twin Lakes Pasture, but this would not prevent the use of Foley Lake as a water source by mule deer, pronghorn, bighorn sheep, or other wildlife. For more details, see Alternatives 1 and 4.

There are two special status plant species (Columbia yellowcress and Mesamint) currently located within two existing small exclosures on the west side of Foley Lake RNA. However, most of the Columbia yellowcress and Mesamint populations are located within two smaller existing grazing exclosures (BLM 2019b, p. 49), so the larger exclosure proposed under Alternatives 1, 4, 5, 6, and the Proposed RMP Amendment would do little to further remediate this potential threat.

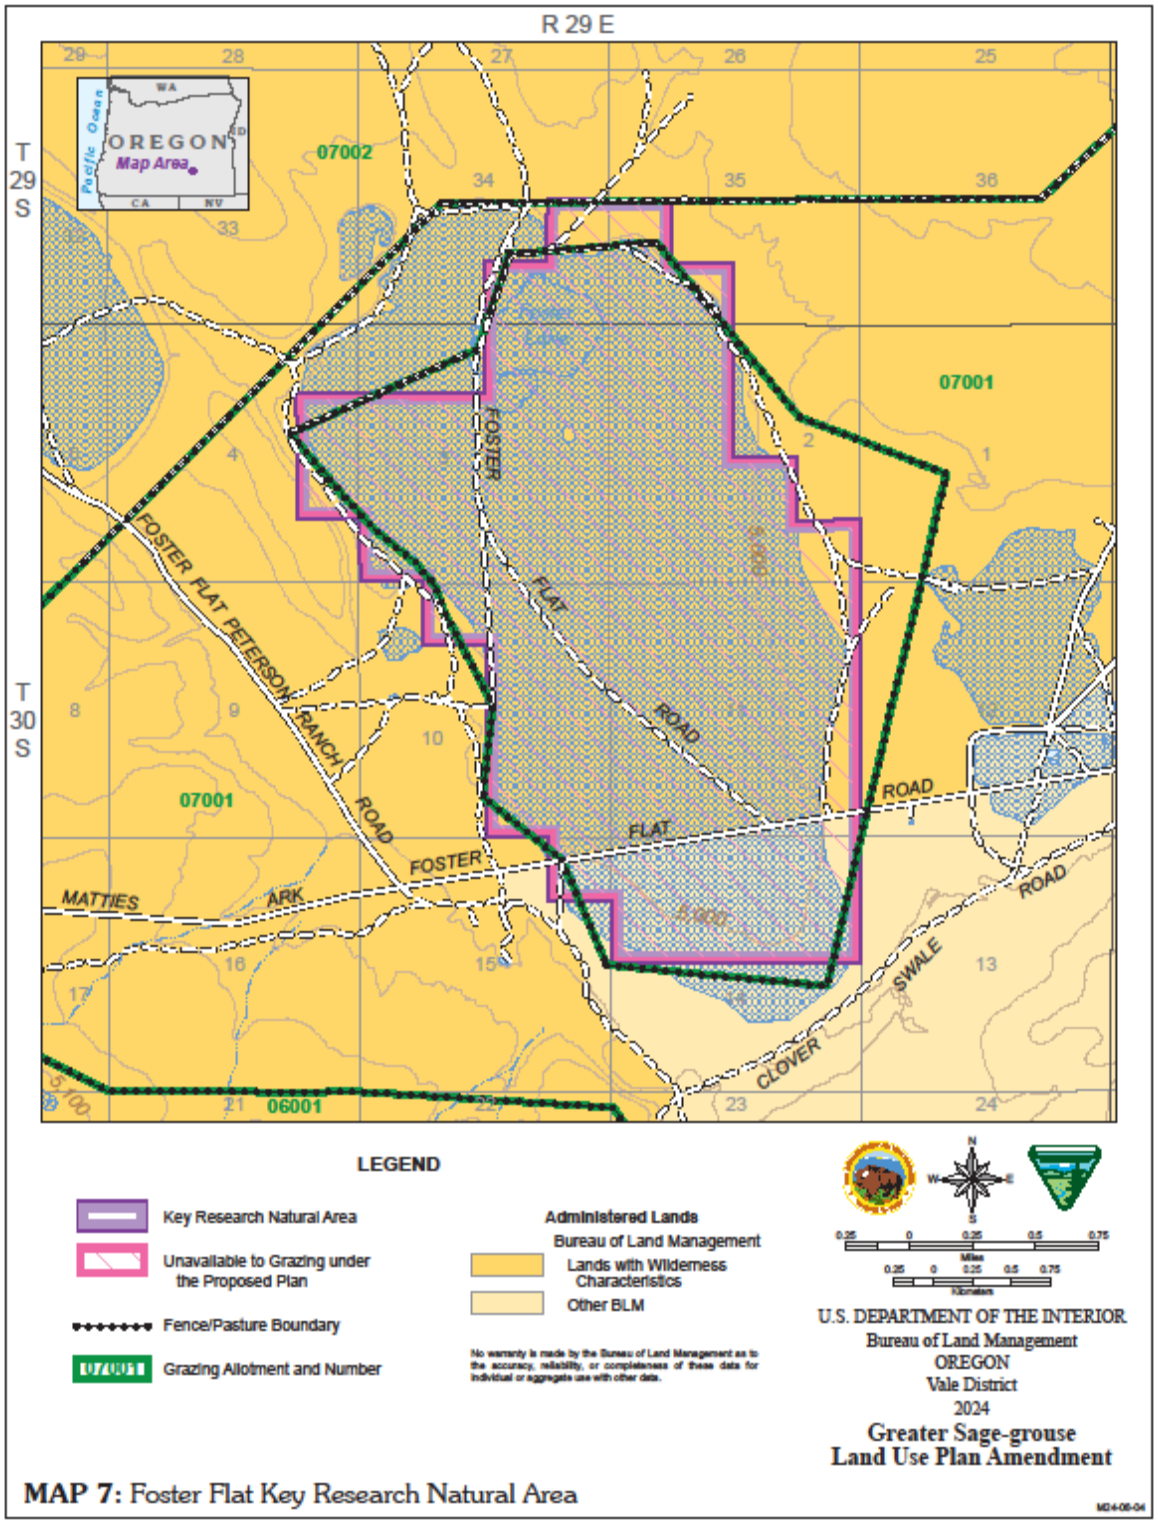
Reallocating a portion of the key RNA as available for livestock grazing is unlikely to harm the habitat quality of the area, as under the previous grazing regimen, it was in good ecological condition and met applicable rangeland health standards (BLM 2000b; BLM 2016, pp. 7, 9, 10, 12; BLM 2019b, p. 79).

If a fence were constructed to make the eastern portion unavailable for livestock, there would be some surface disturbance to upland native vegetation communities, soils, and biological crusts from vehicle traffic during fence construction and removal and future maintenance of the fence. (BLM 2019b, p. 30). A fence could alter behavior and use patterns of big game species, but those effects would be mitigated to the extent feasible by building the fence to standard wildlife passage specifications (BLM 2019b, p. 77). Construction of an exclosure fence would not impact pygmy rabbits at a population level and would not improve pygmy rabbit habitat or encourage movement of more pygmy rabbits into the exclosure area (BLM 2019b, p. 77).

No active or pending active leks are within 1.2 miles of the boundary of the area that would remain unavailable for livestock grazing, so there is not a high risk for fence-sage-grouse collisions.

The proposed exclosure fence would negatively affect the existing visual quality within the area, but would meet the existing visual resource management (VRM Class III) objectives for the surrounding area.

There would be annual operational costs to the permittee associated with future fence maintenance (estimated at $600-1,200 per year) and water hauling. There would also be additional one-time costs to the BLM associated with fence construction (about $10,000 per mile) totaling about $13,000 for the eastern portion. The western portion is already built. Assuming that local contractors would be hired to construct the fence, there would be a small benefit to the local economy.



Foster Flat (Burns)

Proposed RMP Amendment

The Foster Flat key RNA was allocated as unavailable for livestock grazing prior to the 2015 OR Greater Sage-grouse ARMPA via the underlying 1992 Three Rivers Resource Management Plan ROD/RMP. Neither the 2015 nor the 2019 RMP amendment made any changes to the prior district decision. The Proposed RMP

Amendment would not make any changes to management of this RNA, and it would remain unavailable for livestock grazing.

Map 7. Foster Flat Key Research Natural Area

Affected Environment

Foster Flat RNA/ACEC is located in Harney County approximately 42 miles south of Burns, Oregon, and 20 miles west of Highway 205 near the Burns District boundary with Lakeview District. The Foster Flat RNA/ACEC is 2,687 acres in size. It is in East Warm Springs Allotment (No. 7001) and in the Warm Springs HMA. The elevation of the RNA/ACEC is approximately 5,000 feet. There is one AIM plot and one LMF plot within the area unavailable for livestock grazing.

Specific management under the 1992 Three Rivers Resource Management Plan ROD/RMP

The primary management goal of the Foster Flat RNA/ACEC is to the manage the area to preserve the characteristics of the ecosystem and to provide areas for ecological studies, monitoring and research, and education. The primary management action undertaken was construction of perimeter boundary fencing. The perimeter boundary fence excluded livestock and wild horse access the water source and vegetation in the northwestern corner of Foster Flat. The area is open to OHV use.

Summary of key RNA and Relevant and Important values evaluated for ACEC/RNA designation

Foster Flat RNA/ACEC was designated to represent silver sagebrush/Nevada bluegrass communities and provide an area for ecological studies, monitoring and research, and education opportunities.

1992 Three Rivers Resource Management Plan ROD/RMP ACEC/RNA Designation

Foster Flat RNA/ACEC was designated to represent silver sagebrush/Nevada bluegrass communities. This community is found in playas throughout the Great Basin in sites which are flooded for a period of months during the winter and early spring, but which dry up rapidly as the weather warms. Foster Flat covers a large area that is essentially devoid of topographic relief and is dominated by silver sagebrush. The silver sagebrush/Nevada bluegrass community covers approximately 800 acres in the central portion of the playa area. At slightly lower elevation on the playa is a silver sagebrush/rush community which stays wetter longer than the Nevada bluegrass association. The slightly higher elevation areas of the playa contain silver sagebrush/green rabbitbrush. There are also areas of basin wildrye, creeping wildrye or silver sagebrush with no understory. It is ringed by a slightly raised rim that is dominated by greasewood and big sagebrush.

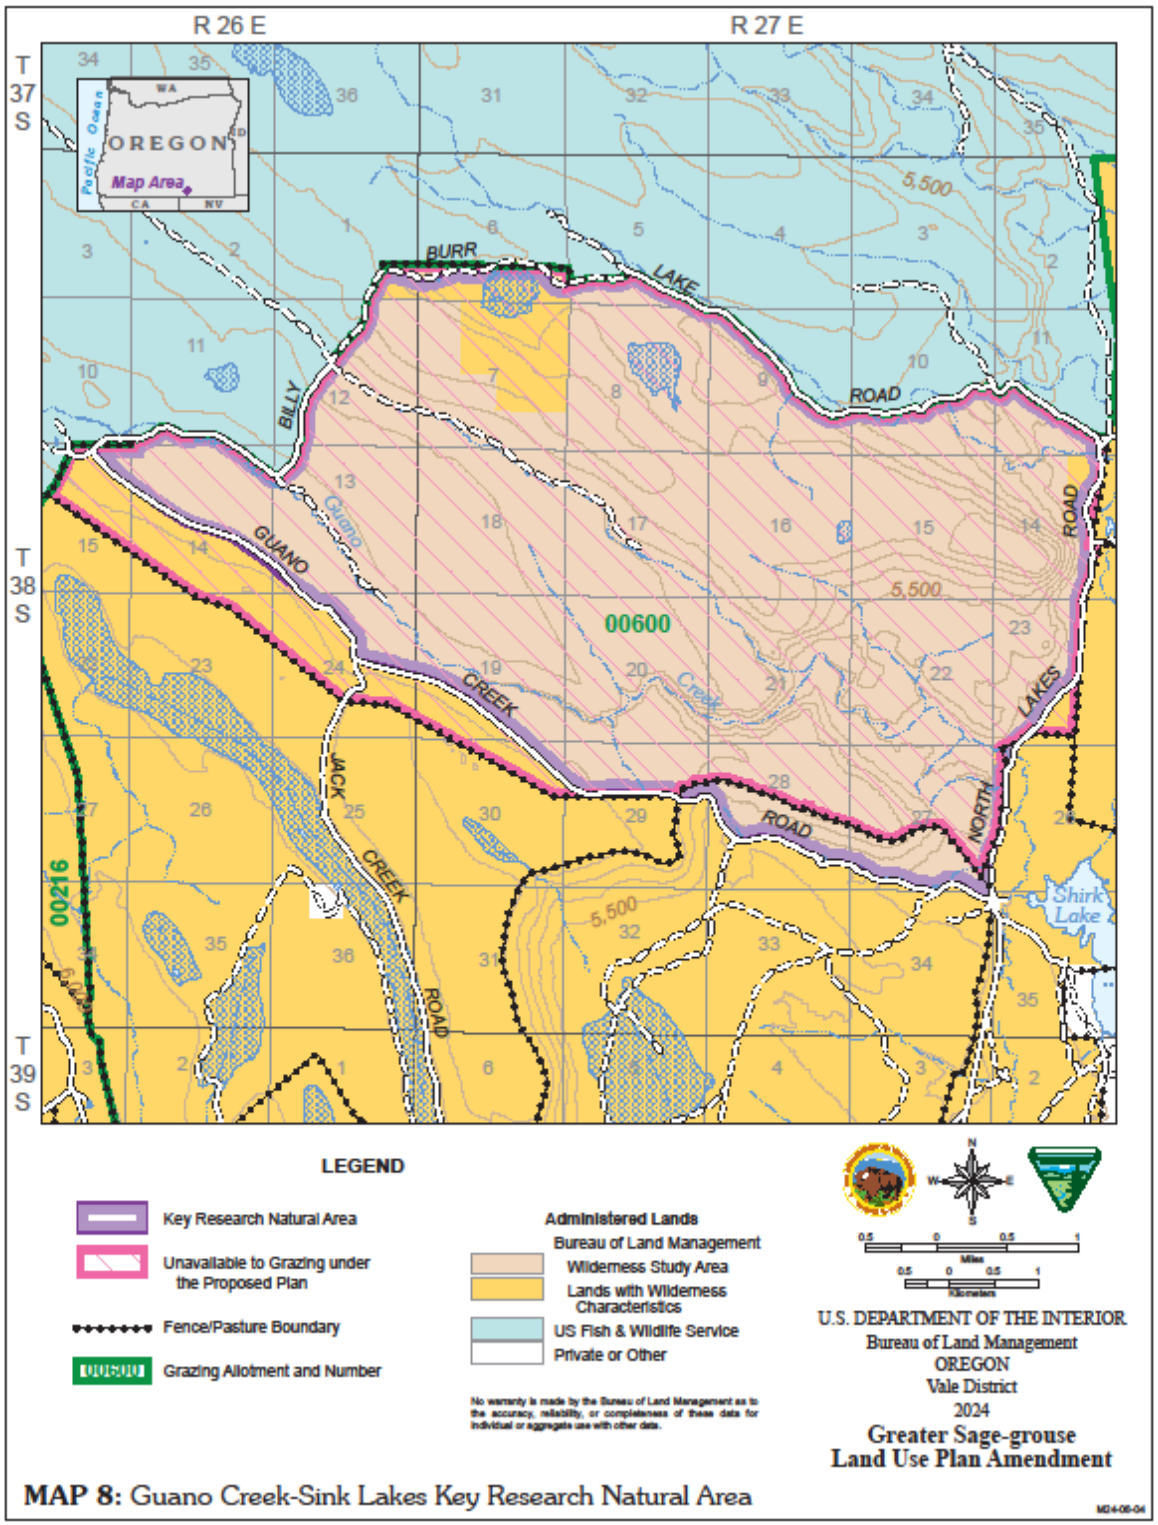
2015 Greater Sage-grouse ARMPA

The Foster Flat RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities

Large playa (dry lakebed) containing silver sagebrush/Baltic rush (*Juncus balticus*), silver sagebrush/Sandberg's blue grass, low sagebrush/Sandberg's bluegrass associations, grading into slightly higher areas and hummocks of basin or Wyoming big sagebrush/bluebunch wheatgrass associations.

Environmental Consequences



As there are no changes in livestock grazing management proposed in this planning effort there would be no potential changes in environmental effects. An ungrazed reference for research would be retained.

Guano Creek – Sink Lakes (Lakeview)

Proposed RMP Amendment

The Guano Creek-Sink Lakes ACEC/RNA falls within the larger Guano Creek wilderness study area (WSA), the majority of which was made unavailable for livestock grazing use through an Act of Congress in 1998. For this reason, no changes in livestock grazing use are proposed. The area unavailable for livestock grazing is set off by the pasture fences so it differs slightly from the ACEC boundary.

Map 8. Guano Creek-Sink Lakes Key Research Natural Area

Affected Environment

The 11,823-acre Guano Creek-Sink Lakes ACEC/RNA complex is located about 39 miles northeast of Lakeview. There are four AIM plots and four LMF plots within the area unavailable for livestock grazing.

Specific Management under the Lakeview RMP/ROD

OHV use is limited to existing roads and trails.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

The 11,823-acre Guano Creek-Sink Lakes ACEC/RNA complex is located about 39 miles northeast of Lakeview and was designated in the Lakeview RMP/ROD to protect relevant/important natural system (plant communities) values (BLM 2000a, pp. II-9, III-16, III-19; 2001a, p. A-244 to A-245; 2003b, p. 58).

Lakeview RMP/ROD

The Guano Creek-Sink Lakes ACEC/RNA complex contains Wyoming big sagebrush/needle-and-thread grass and low sagebrush/Sandbergs bluegrass scablands as well as low elevation vernal pool. The Sink Lakes area contains three vernal lakes (if Billy Burr Lake is included in site) which are essentially dry playas in the drought years and vernal pools during wet years. The playas are all ringed by silver sagebrush (*Artemisia cana*) and surrounded by uplands that are dominated by low sagebrush grasslands. The dry lakebeds differ in their vegetative composition and may be dominated by tansy-leaf evening primrose (*Camissonia tanacitifolia*). The middle lake or playa located in Section 8 is best characterized as a silver sagebrush/Nevada bluegrass (*Poa nevadensis*) community. This is a common playa community. The Guano Creek site has a high-quality natural community that is characterized by and Thurbers needlegrass. There is a rich community of Great Basin wildrye (*Zvmus cinerus*) and other forbs. Two Bureau sensitive plant species, grimy ivesia (J*vesia rhypara* var. *rhypara*) and Crosby's buckwheat (*Eriogonum crosbyae*) are also present. The two species do not grow in the same habitat at the Guano Creek site, nor do they occur in the big sagebrush/needle-and-thread grass community which is the prominent feature in the RNA. (BLM, 2000a, p. III-18).

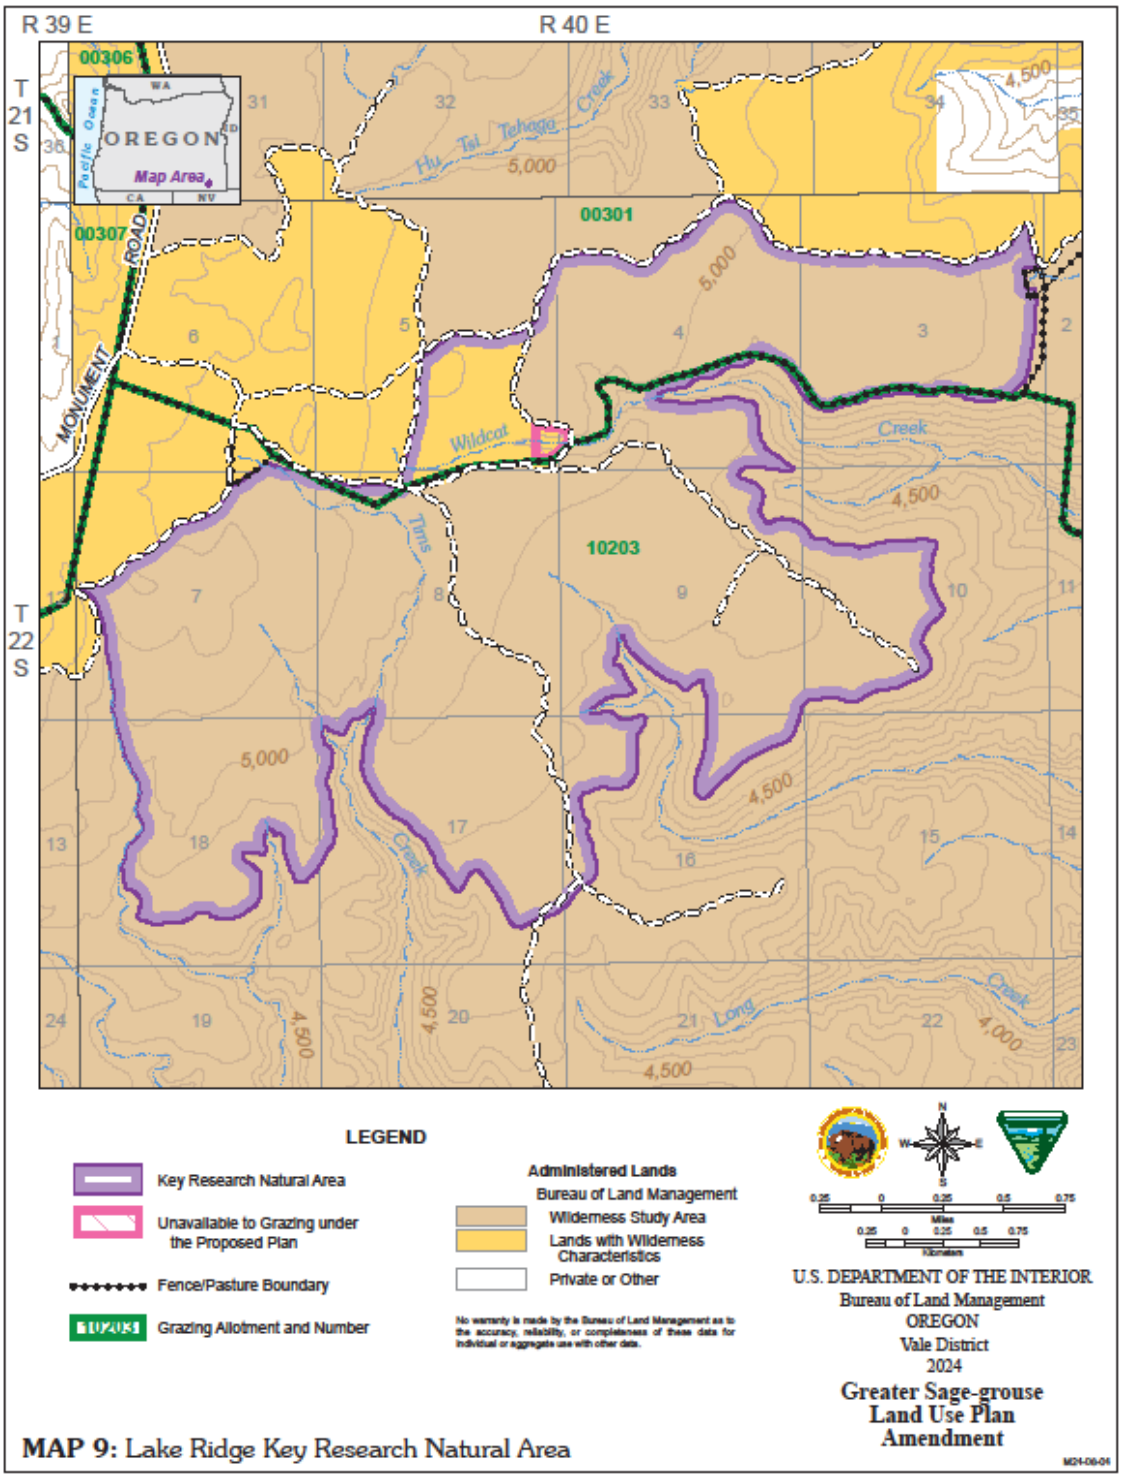
2015 Greater Sage-grouse ARMPA

Updated Vegetation Communities

The Guano Creek-Sink Lakes ACEC/RNA complex contains Wyoming big sagebrush/needle-and-thread (*Hesperostipa comata*) and low sagebrush/Sandberg bluegrass scabland communities, as well as low elevation vernal ponds (aquatic ecosystem). Three vernal ponds (including Billy Burr Lake), which are dry playas in drought years and vernal pools during wet years, are present. The playas are ringed by silver sagebrush and the surrounding uplands contain low sagebrush/grasslands. The dry playa lake beds differ in their vegetative composition and may be dominated by tansy-leaf evening primrose (*Camissonia tanacitifolia*). The middle lake is characterized as a silver sagebrush/Nevada bluegrass (*Poa nevadensis*) playa community. Common riparian vegetation occurs along portions of Guano Creek (BLM 2001a, p. A-244, Vander Schaaf 1992, p. 12).

Environmental Consequences

As there are no changes in livestock grazing management proposed in this planning effort there would be no potential changes in environmental effects. An ungrazed reference for research would be retained.



Lake Ridge (Vale)

Proposed RMP Amendment

BLM proposes no changes to the key RNA boundary, but has reduced the area allocated as unavailable for livestock grazing from 769 acres to 13 acres within the existing key RNA and to the west of the WSAs to reduce conflicts with other resources. The smaller exclosure would still maintain the vegetation

communities that are important to Greater Sage-grouse habitat. The proposed exclosure would be located in a Wilderness Characteristic unit that is prioritized for protection under the 2024 SEORMP Amendment ROD (BLM 2024a, Appendix A, p. A-4).

Map 9. Lake Ridge Key Research Natural Area

Affected Environment

The 3,857-acre Lake Ridge ACEC/RNA is located southeast of Juntura, Oregon, along Tim's Peak Road on a broad plateau dissected by steep canyons, with Tim's Peak rising to the north. A naturally occurring waterhole provides a perennial source of water. The ACEC/RNA is dominated by low sagebrush plant communities with both low sagebrush/bluebunch wheatgrass and low sagebrush/Idaho fescue present. Much of the ACEC/RNA is located in portions of both the Gold Creek and Camp Creek WSAs, where surface disturbing activities requiring reclamation are generally precluded until Congress makes a decision on Wilderness designation.

The key RNA and area allocated as unavailable for livestock grazing is in the Simmons Gulch pasture (55,402 acres) of the Harper allotment. There are six grazing authorizations (grazing permits) for the Harper allotment.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use is limited to existing roads and trails. Plant collecting requires a permit. The entire area is managed under VRM Class I. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. Leasable minerals activities will be open with special stipulations subject to seasonal/timing restrictions, restricted or no uses in avoidance areas for sage-grouse. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, that could include, but is not limited to, fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 SEORMP ACEC/RNA Designation

The relevant and important values identified in this ACEC/RNA are the low sagebrush/bluebunch wheatgrass community and low sagebrush/Idaho fescue community vegetation cells identified by ONHP.

2015 Greater Sage-grouse ARMPA

The Lake Ridge ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities represented in this ACEC/RNA include low sagebrush/bluebunch wheatgrass, low sagebrush/Idaho fescue, and silver sagebrush/Sandberg bluegrass plant associations.

Plant community types important for Greater Sage-grouse habitat continue to be present. These plant communities in this key RNA are low sagebrush/bluebunch wheatgrass, low sagebrush/Idaho fescue, and silver sagebrush/Sandberg bluegrass plant associations, and were observed to be present during site visits in 2023. These plant associations represent the Shallow-Dry Sagebrush community.

The Lake Ridge key RNA is within Greater Sage-grouse PHMA. The nearest active or pending active lek is 0.6 mile away. A total of four active or pending active leks are within 4 miles of the key RNA.

Other Resources or Issues

The visual resource management is Class I.

Most of the key RNA overlaps WSAs (3,677 acres). The remainder of the key RNA (approximately 180 acres) is located within an area identified by BLM as possessing wilderness characteristics. The 2024 SEORMP Amendment ROD prioritizes the protection of the Prava Peak wilderness characteristics unit, which is contiguous with two adjacent WSAs (BLM 2024a, Appendix A, p. A-4).

The proposed 13-acre exclosure is wholly within the Prava Peak lands with wilderness characteristics unit OR-034-042. This 20,654-acre unit possesses naturalness and is contiguous with three WSAs, and shares their outstanding opportunities to experience solitude, and primitive and unconfined recreation. Elevations range from about 4,140 to 5,690 feet (Monument Peak). Existing human imprints in the unit are: 14 earthen reservoirs, four developed springs, 23.2 miles of rangeland fence, one rangeland fenced enclosure, and 43.5 miles of 22 primitive route segments, all which appear substantially unnoticeable to the average visitor. Supplemental values in the unit include Greater Sage-grouse leks and their habitat. The Prava Peak OR-034-042 inventory documentation can be found at https://www.blm.gov/programs/planning-and-nepa/plans-in-development/oregon-washington/vale-wci.

The Camp Creek WSA consists of 19,200 acres. The northwestern portion of the WSA is characterized by tableland, while the rest of the WSA is dissected by steep canyons. The elevation ranges from 2,700 to 5,300 feet. The dominant vegetation on the tablelands is low sagebrush and bluebunch wheatgrass, with some bitterbrush and Idaho fescue. The canyon bottoms support pockets of riparian vegetation. The key RNA is within Greater Sage-grouse PHMA and four active leks are within 4 miles, two of which are within 1.2 miles of the key RNA.

The key RNA is utilized by mule deer during spring and summer, pronghorn year-round, and is designated as elk winter range.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated. The area continues to be in a desirable condition for the vegetative communities identified under the 2002 SEORMP and 2015 ARMPA; management will continue to protect the relevant and important values. Retaining the Lake Ridge key RNA would continue to allow natural processes to predominate and research and baseline data gathering on plant communities important for Greater Sage-grouse.

The key RNA as identified in the 2015 ARMPA is predominately comprised of low sagebrush communities that provide suitable nesting and winter habitat for Greater Sage-grouse.

Values associated with the Shallow-Dry vegetation type would be retained.

Rationale for Modifying the Area Allocated as Unavailable for Livestock Grazing

Active management of livestock to keep them out of the area allocated as unavailable for livestock grazing under the 2015 ARMPA is being undertaken. Construction of a fence to exclude cattle from this same area would require fence construction within a WSA. Fence construction within a WSA requires careful consideration. Developments that would "impair the suitability of WSAs for the preservation as wilderness"

cannot be permitted unless they were to meet one of the exception criteria described in BLM Manual 6330, Management of Wilderness Study Areas. "In determining whether a development meets the protecting or enhancing wilderness characteristics exception, the BLM will determine if the structure's benefits to the natural functioning of the ecosystem outweigh the increased presence of human developments and any loss of naturalness, or outstanding recreational opportunities caused by the new development" (BLM 2012, p. 1-17). However, developments that meet an exception criterion must still be carried out in the least impairing manner practical. Furthermore, if an impairing proposed development—even one that meets an exception—can be implemented outside of a WSA and accomplish the objectives identified in the purpose and need statement prepared under NEPA, the BLM should endeavor to ensure that the project is implemented outside the WSA (BLM 2012, p. 1-11).

An approximately 13-acre fenced exclosure area that would be allocated as unavailable for livestock use would be built outside of the WSA and within the key RNA. The proposed exclosure would be located and designed to avoid resource conflicts while still providing a baseline reference area for the plant communities present that would be undisturbed by livestock grazing. The exclosure would be located more than 1.2 miles from active or pending active Greater Sage-grouse leks.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

The current active management of livestock to keep them out of the key RNA impacts opportunities for solitude and primitive and unconfined recreation within the WSAs. In the future, should the decision be made to construct fence to keep livestock out of the area allocated as unavailable for livestock grazing, it would require fence construction within a WSA and within 1.2 miles of active or pending active leks. A conservation benefit to Greater Sage-grouse or important habitat is not expected from construction of a fence to eliminate livestock grazing due to the current condition of the vegetative communities prior to and after the removal of livestock from the area. There would be short-term and long-term impacts to the WSAs' wilderness characteristics of naturalness, solitude, and primitive and unconfined recreation. There could be short-term negative impacts to opportunities for solitude and primitive and unconfined recreation from construction activities as well as effects to naturalness caused by the soil surface and vegetative disturbance associated with fence construction. These impacts would be expected to fade within one to three years with new vegetation growth. Long-term negative impacts to naturalness would be the additional human imprint of the completed fence in the WSA. If no fence were constructed, there would be long-term impacts to opportunities for solitude and primitive and unconfined recreation from active management of livestock to keep them out of the key RNA.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative either short-term or long-term any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness, opportunities for solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5, 6, and Proposed RMP Amendment

Relocating and reducing the size of the area allocated as unavailable for livestock grazing would eliminate any need to build fence to exclude livestock within WSAs. Fencing to create a 13-acre exclosure could be constructed outside of any WSA and would be designed to limit or avoid impacts to the Prava Peak protected unit. Low sagebrush/bluebunch wheatgrass and low sagebrush/Idaho fescue vegetative communities identified as important for greater sage-grouse as well as relative and important values at the time the RNA was designed are present within the exclosure. Although the silver sagebrush/Sandberg bluegrass plant community occurs within the key RNA, it is not represented in the proposed exclosure and was not identified as a relevant and important value for the RNA. Vegetation communities important to Sage-grouse within the proposed exclosure would be allowed to proceed through natural succession in the absence of livestock grazing.

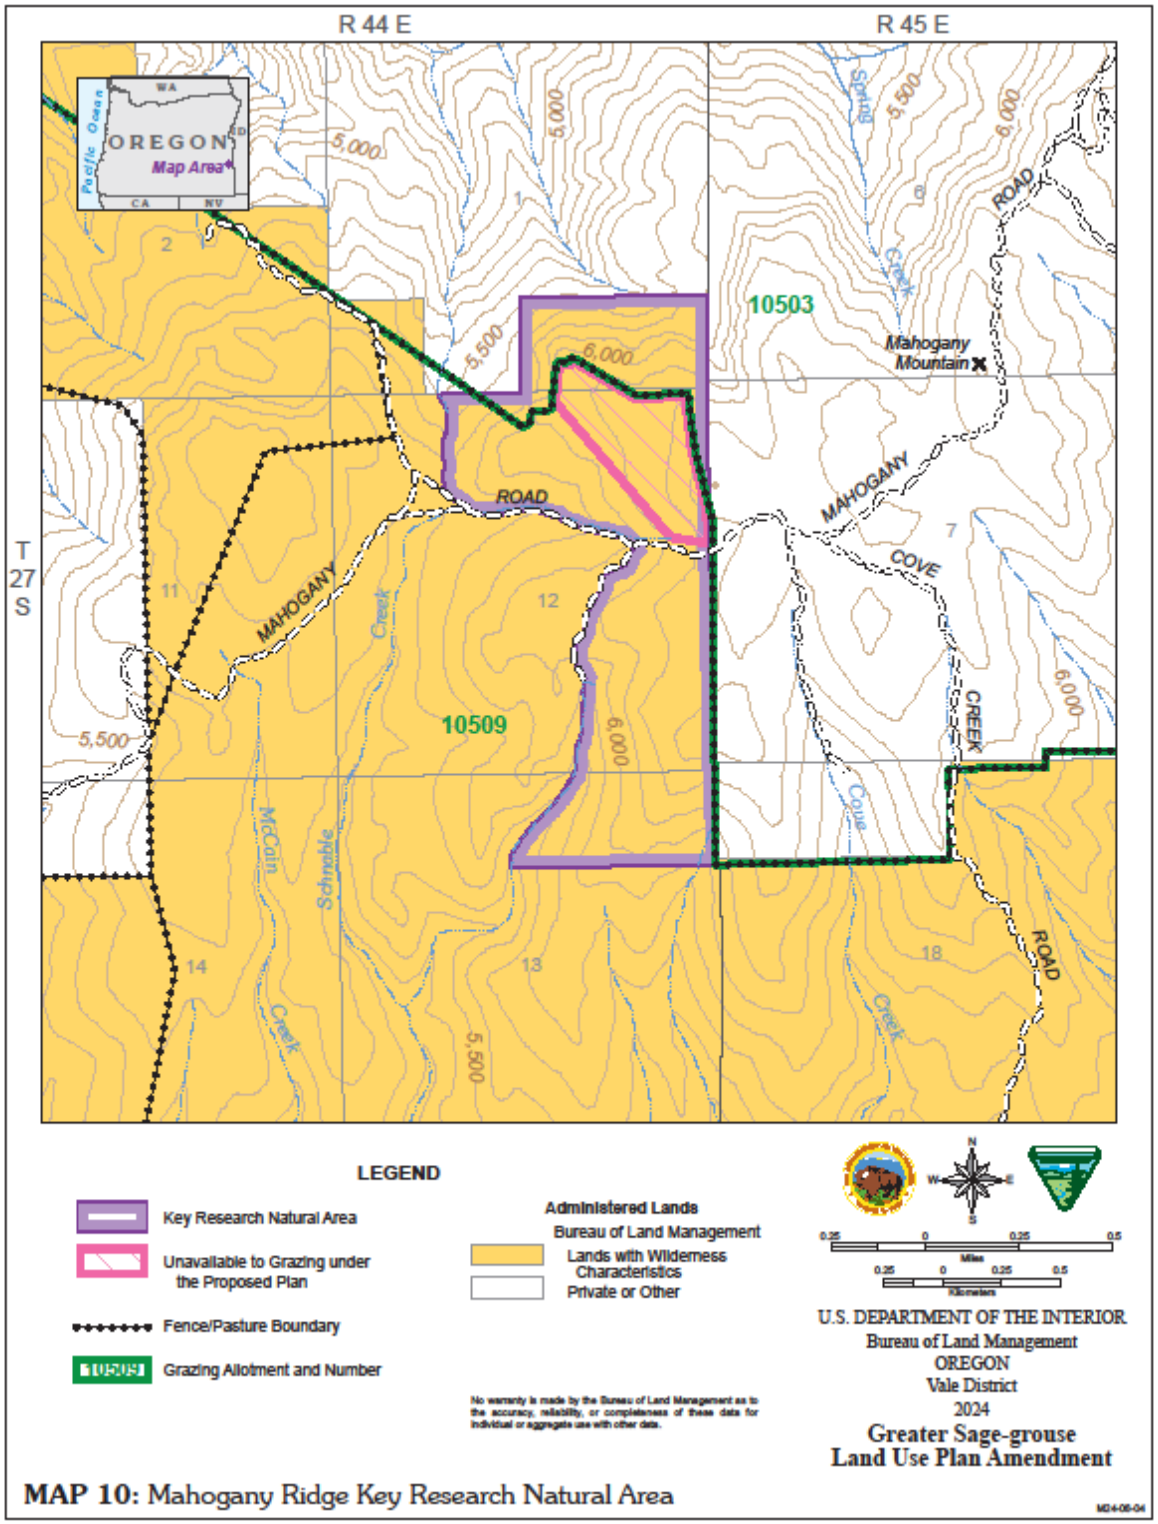
If this 13-acre exclosure is fenced, such fencing would be located more than 1.2 miles from active/pending active leks, would not be considered a high risk for sage-grouse collisions, and would not negatively impact sage-grouse.

BLM monitoring indicates the habitat quality of the area within the key RNA and beyond the 13-acre exclosure is expected to remain in good ecological condition as it was before livestock grazing was made unavailable in this area (BLM. Monitoring data. 06/13/2017-06/15/2017; BLM. Monitoring data. 6/28/2020).

Due to limited livestock use occurring in the key RNA, prior to management agreements initiated annually since 2023, as well as limited presence as a result of annual agreements to manage livestock from accessing the area, vegetative communities that are important to Greater Sage-grouse habitat would continue to be relatively unaltered under both Alternatives 1 and 5. When compared to Alternative 1, impacts to wildlife, including sage-grouse, of reallocating 769 acres as available, and allocating 13 acres as unavailable, to livestock grazing under the Proposed RMP Amendment would eliminate the need for additional presence of livestock operators for managing livestock away from unfenced boundaries. This would benefit wildlife by reducing disturbance to individual animals caused by increased activity from livestock operators around unfenced boundaries.

These alternatives would reallocate portion of the WSAs in the key RNA as available for livestock grazing. Because the presence of livestock in the RNA has been low in the past, and the ecological condition has been good when grazing has been allowed, the effect from this reallocation on wilderness characteristics is expected to be negligible.

The proposed 13-acre exclosure that would continue to be allocated as unavailable for livestock grazing would be located in the Prava Peak wilderness characteristics unit which, under the 2024 SEORMP Amendment ROD (BLM 2024a, Appendix A, p. A-4) is prioritized for protection. Approximately one-half mile of new fence would be constructed in the Prava Peak wilderness inventory unit to create the 13-acre exclosure. This could result in short-term negative impacts to naturalness caused by the soil surface and vegetative disturbance associated with the construction. These impacts would be expected to fade within



one to three years with new vegetation growth. Long-term negative impacts to naturalness would be the additional human imprint of the completed fence in the Prava Peak unit. However, design features to minimize impacts to lands with wilderness characteristics would be implemented. The addition of an exclosure fence would result in a minimal, long-term additional impact to the characteristic of naturalness within the Prava Peak unit. The extent of the additional fence —individually and collectively with the other existing human imprints present in the Prava Peak unit—would result in the Prava Peak unit, overall, still being affected primarily by the forces of nature with the imprint of human work being substantially unnoticeable to the average visitor.

Mahogany Ridge—South Unit Only (Vale)

Proposed RMP Amendment

Retain the Mahogany Ridge key RNA boundary. Clarify that the key RNA identification applies to only the southern portion of the ACEC/RNA (444 acres). Reduce the area allocated as unavailable for livestock grazing from 155 acres to 69 acres to reduce conflicts with other resources. The smaller exclosure would still maintain the vegetation communities that are important to Greater Sage-grouse habitat.

Map 10. Mahogany Ridge Key Research Natural Area

Affected Environment

The 682-acre Mahogany Ridge ACEC/RNA is comprised of two areas; the key RNA is limited to the southern unit (444 acres) and is located on the slope of Mahogany Mountain, west of U.S. Highway 95 and north of Jordan Valley, Oregon. The ACEC/RNA includes undisturbed stands of mountain mahogany on parcels of the northern and western slopes of Mahogany Ridge. It fills a vegetation cell need for mountain mahogany-sagebrush and mountain mahogany-Oregon grape complex identified by ONHP and includes a higher-elevation mountain big sagebrush mountain mahogany/slender wheatgrass-bluebunch wheatgrass community. The unit is bounded on the east and north by private land ownership.

The Mahogany Ridge ACEC/RNA is located within the East Mahogany pasture of the Mahogany Mountain Allotment.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use will be limited to designated roads and trails. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. The area is VRM Class II. Plant collecting requires a permit. Development of leasable minerals is subject to the No Surface Occupancy stipulation. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing use, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Where adverse impacts are identified, existing livestock use allocations will be managed using a variety of methods, including fencing, reduction in livestock numbers, and changes in livestock grazing season. Proposed projects will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 Southeastern Oregon RMP (SEORMP) ACEC/RNA Designation

The relevant and important values in the ACEC/RNA include habitat for the broad-tailed hummingbird and other neotropical migratory birds, a special status plant species (Owyhee clover), and the mountain mahogany-big sagebrush vegetation communities identified by ONHP.

2015 Greater Sage-grouse ARMPA

The Mahogany Ridge ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities represented in this key RNA, that are important to Greater Sage-grouse habitat, continue to be relatively unaltered. These communities are mountain big sagebrush/Idaho fescue associations. These communities represent the Cool-Moist sagebrush community.

The mountain mahogany/mountain big sagebrush woodland and lesser amounts of a mountain mahogany/Oregon grape (*Mahonia repens*) plant communities in this key RNA are not suitable habitat for sage-grouse because the dominant growth structure of mountain mahogany is more tree like, providing no understory cover and providing perch opportunities for predators. These represent the Mountain Shrub vegetation community.

The key RNA is within PHMA and is part of the Cow Lakes Priority Area of Conservation. It is included within the boundary of sage-grouse spring nesting, summer brood-rearing, and winter habitat. The nearest active or pending active lek and the only lek within 4 miles of the key RNA is approximately 3.4 miles away.

Other Resources or Issues

The visual resource management category of the key RNA is Class II.

With the exception of a boundary road between two wilderness characteristics units (The Tongue (OR-034-054) and Schnable Creek (OR-034-057)) the southern portion (444 acres) of the Mahogany Ridge key RNA is within an area possessing wilderness characteristics. The area allocated as unavailable for livestock grazing under the 2015 ARMPA is wholly in The Tongue wilderness characteristics unit. The wilderness characteristics of neither unit are prioritized for protection under the 2024 SEORMP Amendment ROD (BLM 2024a, Appendix A, p. A-4).

The Mahogany Ridge key RNA is located on the edge of bighorn sheep core herd range and is winter range for deer. It is utilized by deer and elk year-round. ODFW's Oregon Connectivity Assessment and Mapping Project (OCAMP) categorized this area as a Priority Wildlife Connectivity Area (PWCA) – Region. Regions are the top 1% of connectivity priorities and represent the highest-value habitat for facilitating species movement. In addition, this area has a priority Recommended Conservation Action of 'Protect', the strongest conservation measure for maintaining wildlife connectivity. Because of the limited number of mountain mahogany stands in southeast Oregon among an abundance of shrublands and grasslands, this key RNA is important nesting and migration habitat for neotropical migratory birds, as is highlighted in the relevant and important values identified in the 2002 ACEC/RNA designation.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated. The area continues to be in a desirable condition for the updated vegetative communities identified under the 2015 ARMPA. Management will continue to protect the relevant and important values. Retaining the Mahogany Ridge Bench key RNA would continue to allow natural processes to predominate and research and baseline data gathering on relatively unaltered plant communities important for Greater Sage-grouse.

Sagebrush communities of the key RNA provide for suitable nesting, brood-rearing, and winter habitat for Greater Sage-grouse.

Site visits indicate that the vegetation types identified for the key RNA in 2015 are present. The area retains the Cool-Moist Sagebrush and Mountain Shrub Vegetation Type.

Rationale for Modifying the Area Allocated as Unavailable for Livestock Grazing

In the 2024 Greater Sage-grouse DEIS, Alternative 5 proposed modifying the boundary of the area allocated as unavailable for livestock grazing from 155 acres to 140 acres. This was proposed to avoid or reduce conflicts between the fence location and wildlife movement, primarily big game species. The modified boundary proposed in the 2024 Greater Sage-grouse DEIS occurred partially within bighorn sheep habitat and passed through a major big game migration area, which would alter natural movement and potentially increase risks of fence collision and/or entanglement. The location of the fenceline was proposed to limit the number of gates by avoiding road crossings and to minimize disturbance to adjacent riparian resources.

Furthermore, the 2024 Greater Sage-grouse DEIS proposal would eliminate the administrative issue of relocating existing fence to avoid private lands and prevent the need to trail livestock through the key RNA.

Further review of the 2024 Greater Sage-grouse DEIS fenceline modification revealed the need for additional modification of the proposed fence location. A new location for the proposed fence was identified that would further minimize remaining issues and concerns identified in the 2024 Greater Sage-grouse DEIS. The Proposed RMP Amendment would result in a reduction from 140 acres to a 69-acre area that is allocated as unavailable for livestock grazing. This modification reduces wildlife conflicts and improves movement by relocating the fence to an area with less topography, requires less fence, and eliminates bighorn sheep habitat concerns. Additionally, this modification avoids potential impacts to riparian resources adjacent to the previously proposed fence by eliminating the travel and congregation of livestock and wildlife along fences near springs and riparian areas. The smaller exclosure would still maintain the vegetation communities consisting of mountain big sagebrush/Idaho fescue associations.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Livestock grazing would not occur in the 155 acres allocated as unavailable for livestock grazing in the southern portion Mahogany Ridge key RNA. Livestock could be kept from this area through active livestock management or the construction of fencing along the border of the area allocated as unavailable for grazing.

Fence construction could disturb nesting sage-grouse if it occurs during the breeding season. Restricting activity during the breeding season to two hours after sunrise to two hours before sunset would minimize disturbance to any sage-grouse that may be present in the area. Sage-grouse-fence collisions are unlikely to occur as the nearest pending active or active lek is approximately 3.45 miles away, the key RNA is in a V-shaped valley with rock outcrops and mountain mahogany stands that present perching locations for raptors, decreasing security for sage-grouse, and abundant habitat to the south and west of the key RNA provides higher quality nesting and brood-rearing habitat, which is not represented in the key RNA.

A fence constructed on the boundary of the area allocated as unavailable for livestock grazing could create conflicts between the fence location and wildlife movement, primarily big game species. This would alter natural movement and potentially increase risks of fence collision and/or entanglement.

An ungrazed reference for research would be retained.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative either short-term or long-term any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness, opportunities for

solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5 and 6

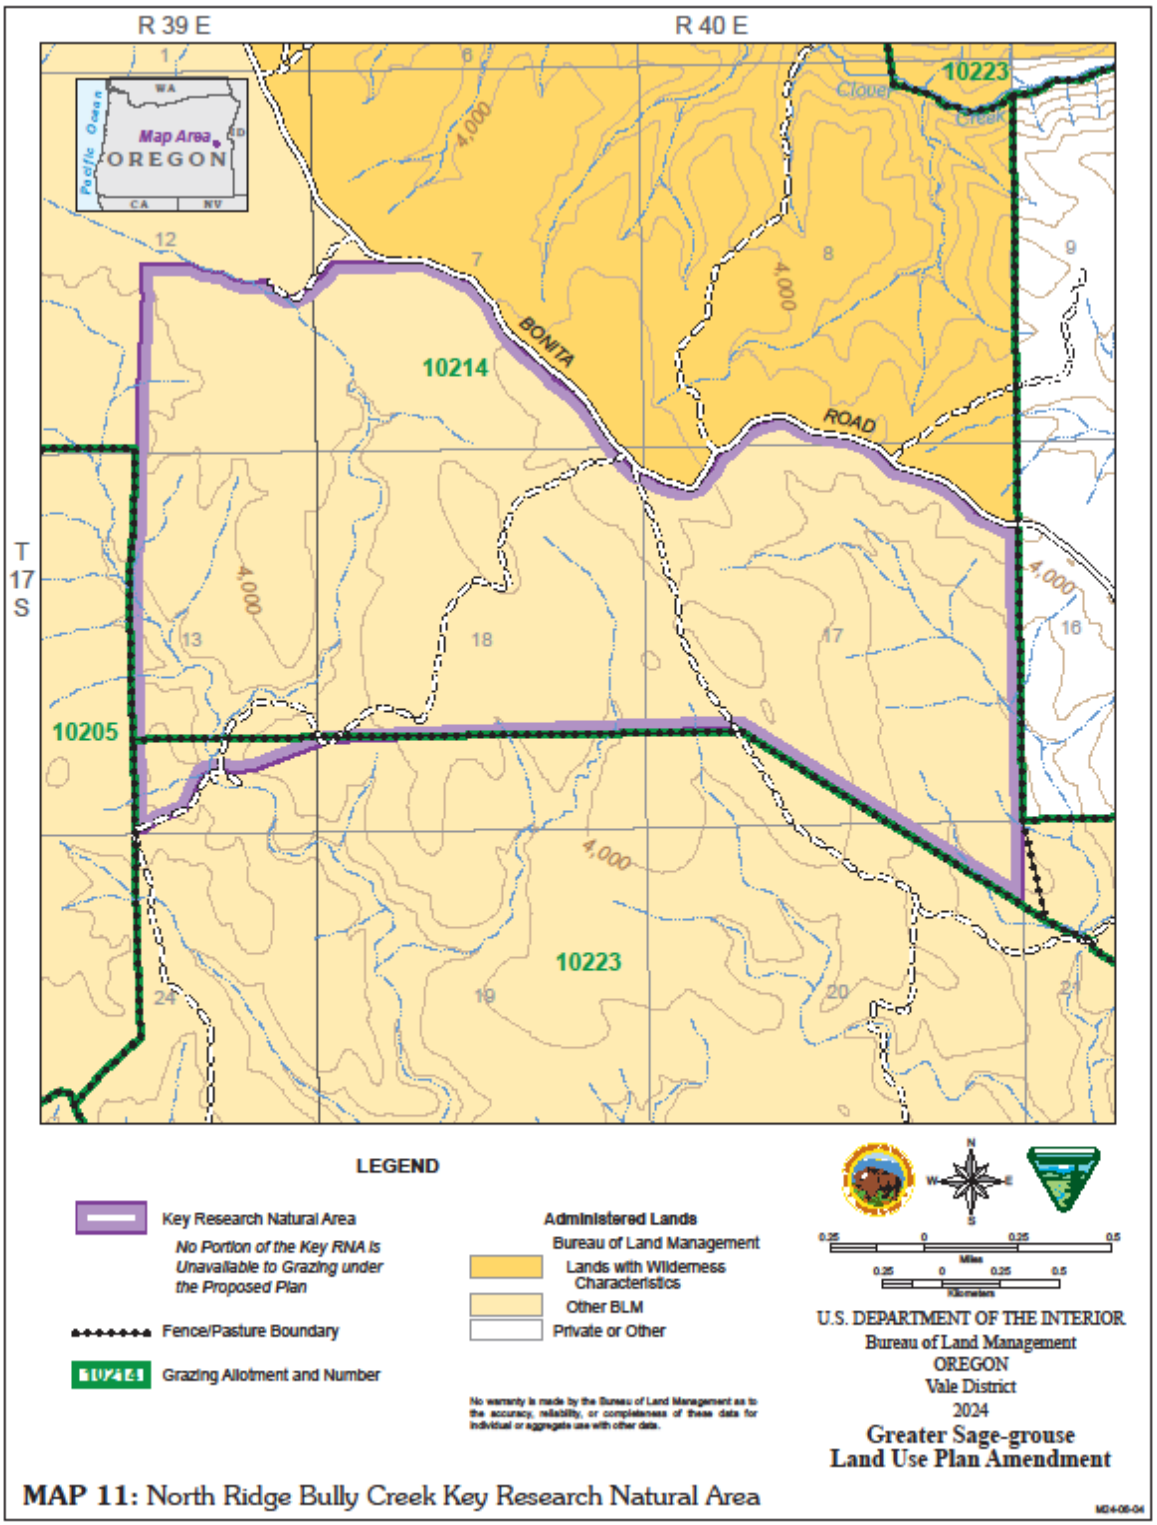
Fifteen acres would be reallocated as available for livestock grazing. Livestock could be kept from the 140 acres allocated as unavailable for livestock grazing through active livestock management or the construction of fencing along the border of the area allocated as unavailable for grazing. The minor deviations from Alternative 1 would reduce resource conflicts between the boundary location and wildlife movement, primarily big game species. The modified boundary occurs partially within bighorn sheep habitat and passes through a major big game migration area, which would alter natural movement and potentially increase risks of fence collision and/or entanglement. The deviations also help maintain fence integrity by limiting the number of gates and keeping the fence design as straight as possible given the topography of the landscape and allotment/pasture. Effects from fence construction would be the same as identified in Alternative 1, but occur to a lesser extent due to the reduced exclosure size.

Impacts to the wilderness characteristic of naturalness would occur, but be limited to near boundary roads or internal primitive trails. If management actions (e.g., herding) other than fence construction were employed to exclude livestock from the unavailable area, there would be no impact to naturalness. Outstanding opportunities for solitude would not be impacted as short-term impacts to solitude caused by fence construction and long-term impacts to solitude caused by active management to exclude livestock from key RNA would not occur.

Proposed RMP Amendment

Eighty-six acres would be reallocated as available for livestock grazing. Livestock could be kept from the 69 acres allocated as unavailable for livestock grazing through active livestock management or the construction of fencing along the border of the area allocated as unavailable for grazing. The deviations from Alternatives 1, 5, and 6 would further reduce resource conflicts. It reduces wildlife conflicts and improves movement by relocating the boundary to an area with less topography, eliminating bighorn sheep habitat concerns. Additionally, this modification avoids potential impacts to riparian resources adjacent to the previously proposed fence by eliminating the travel and congregation of livestock and wildlife along fences near springs and riparian areas. The smaller exclosure would still maintain the vegetation communities consisting of mountain big sagebrush/Idaho fescue associations. Effects from fence construction would otherwise be the same as identified in Alternative 1, but would occur to a lesser extent due to the reduced exclosure size.

Impacts to wilderness characteristics would be reduced with the smaller enclosure. Impacts to naturalness would occur, but be limited to near boundary roads or internal primitive trails. If management actions (e.g., herding) other than fence construction were employed to exclude livestock from the unavailable area, there would be no impact to naturalness. Outstanding opportunities for solitude would not be impacted as short-term impacts to solitude caused by fence construction and long-term impacts to solitude caused by active management to exclude livestock from key RNA would not occur.



North Ridge Bully Creek (Vale)

Proposed RMP Amendment

Retain the area identified as a key RNA and reallocate the entire key RNA as available for livestock grazing. Construct a 5-acre or less exclosure that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the Key RNA or within close proximity to

the Key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the North Ridge Bully Creek key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendiees B and C of the Oregon 2015 GRSG Approved RMP Amendment.

Map 11. North Ridge Bully Creek Key Research Natural Area

Affected Environment

The 1,569-acre North Ridge Bully Creek ACEC/RNA is located west of Westfall, Oregon, along the ridge that separates Clover Creek drainage to the north and Bully Creek drainage to the south. The ACEC/RNA encompasses a number of grassland communities that occur both as distinct communities as well as intermixed within a larger mosaic of types.

A 164-acre area of the key RNA is allocated as unavailable for livestock grazing. The key RNA is wholly within the North Ridge pasture of the Richie Flat allotment. The key RNA is within Greater Sage-grouse PHMA and four active or pending active leks are within 1.2 miles of the key RNA boundary. There is one AIM plot within the area available for livestock grazing.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use is limited to existing roads and trails. Plant collecting requires a permit. The ACEC/RNA is VRM Class III. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing outside of the current authorization, including time and intensity of use, would be analyzed through the appropriate process. Such analysis would evaluate impacts on the associated relevant and important values so that, if permitted, values would be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, including, but not limited to, fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 Southeastern Oregon RMP (SEORMP) ACEC/RNA Designation

The relevant and important values identified in this ACEC/RNA are the Wyoming big sagebrush/Thurber needlegrass community and big sagebrush-threetip sagebrush/Idaho fescue community vegetation cells identified by ONHP.

2015 Greater Sage-grouse ARMPA

The North Ridge Bully Creek ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Wyoming big sagebrush/Thurber's needlegrass, Wyoming big sagebrush/wild crab apple (*Peraphyllum ramosissimum*)/bluebunch wheatgrass, and threetip sagebrush/bluebunch wheatgrass are common plant communities throughout the RNA.

Vegetative communities in this key RNA that are important to Greater Sage-grouse habitat continue to be relatively unaltered. These are Wyoming big sagebrush/Thurber's needlegrass, Wyoming big sagebrush/wild crab apple (*Peraphyllum ramosissimum*)/bluebunch wheatgrass, and threetip sagebrush/bluebunch wheatgrass. These communities represent the Cool-Moist/Warm-Dry Sagebrush Communities. The key RNA is within Greater Sage-grouse PHMA and four active or pending active leks are within 1.2 miles of the key RNA boundary. The North Ridge Bully Creek ACEC/RNA burned in the 2012 Bonita Fire and the 2015 Bendire Fire removing much of the sagebrush present. The North Ridge Bully Creek ACEC/RNA was aerially sprayed with the preemergent herbicide imazapic in October 2015, after the Bendire Fire to reduce invasive annual grasses in the area.

Other Resources

The visual resource management is Class III.

The key RNA is utilized by deer during spring and summer, pronghorn year-round, and is designated as elk winter range.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The area continues to be in desirable condition for the vegetative communities identified for the purposes of providing vegetative communities that are important for Greater Sage-grouse habitat. Although the area burned in 2012 and 2015, the application of herbicide in 2015 prevented the increase of invasive annual grasses that often follow multiple fires. Management would continue to protect the relevant and important values, although shrub components have been impacted by past wildfires. However, in the long-term, shrub components are expected to return. Continued management would retain the Ecotone between Cool-Moist/Warm-Dry vegetation types.

Research opportunities continue to remain, with vegetative communities identified as relevant and important values that are important for Greater Sage-grouse. The area continues to recover and provides opportunities for research and baseline data gathering where post-fire ecological conditions occur. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated.

Rationale for Reallocating the Key RNA as Available for Livestock Grazing

Allocating the entire key RNA as available for livestock grazing removes the possibility of construction of an exclosure fence, reducing conflicts with lek buffers and reducing collision risk. Livestock management prior to the 2015 ARMPA (Alternative 1) did not have a negative impact on the relative and important values identified for the RNA (BLM. Monitoring data. 06/05/2013).

Livestock grazing within the key RNA is not expected to adversely impact current conditions, and conditions continue to exist as they were (excluding impacts from wildfire) at the time the RNA was designated under the 2002 SEORMP (see BLM, North Ridge Bully Creek RNA monitoring data). There is no indication that improper livestock grazing practices are occurring given the current conditions (Site visits, 06/05/2013; 05/30-31/2018; 06/26/2020).

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be present and provide life-cycle needs (such as nesting, brood rearing, and wintering) under all alternatives.

Alternatives 1 and 4

Presence, time, and resources for active management of livestock grazing would continue to be necessary. Vegetative conditions may witness slightly increased recovery with continued elimination of livestock use from the area. Due to the proximity and number of leks within the area and the risk of Greater Sage-grouse-fence collisions, fencing to exclude livestock from the area allocated as unavailable for livestock grazing is not feasible and could not conform with Required Design Features. As a fence within 1.2 miles of leks poses a collision hazard, and the area that would be protected from grazing had previously been properly grazed, which USFWS has said is compatible with GRSG conservation, there is no conservation benefit to

GRSG from placing a fence within 1.2 miles of a lek. While research in the ungrazed area could provide data and insights that could benefit GRSG habitat management, this benefit is not only difficult to measure but would not outweigh the fence collision risk for GRSG. Other wildlife noted to use the area may be negatively impacted, at least seasonally due to increased human presence when managing livestock from entering areas unavailable for livestock use.

Alternatives 2, 5, and 6

Under these alternatives, reallocating the entire key RNA as available for livestock grazing would allow for the resumption of management practices employed prior to 2023 throughout the North Ridge pasture of the Richie Flat allotment. Prior to the removal of grazing from this key RNA, livestock grazing management prescribed had not adversely impacted conditions of the vegetative communities that support wildlife habitat important to the area as well as the condition of the important vegetative communities identified for the Greater Sage-grouse (BLM. North Ridge Bully Creek RNA Monitoring data. 06/05/2013-06/06/2013; 5/30/2018-5/31/2018; 06/26/2020).

Current conditions of the vegetative communities are in a desirable state and are not expected to be adversely affected under proper livestock grazing management. The condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA would continue. Livestock management prior to the 2015 ARMPA does not appear to have had a negative impact on the relative and important values identified for the key RNA (BLM. North Ridge Bully Creek RNA Monitoring data. 06/05/2013-06/06/2013; 5/30/2018-5/31/2018; 06/26/2020). As stated in the rationale for maintaining the key RNA status, the vegetative communities identified as important for Greater Sage-grouse in 2015 are still present post-fire with the exception of sagebrush.

The area continues to recover and provides opportunities for research and data gathering where post-fire ecological conditions occur.

Increased presence, time, and resources for active management to keep livestock from the area identified as unavailable for livestock grazing would not be necessary and impacts to wildlife, including sage-grouse, from these activities would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding), An ungrazed reference for research would be retained.

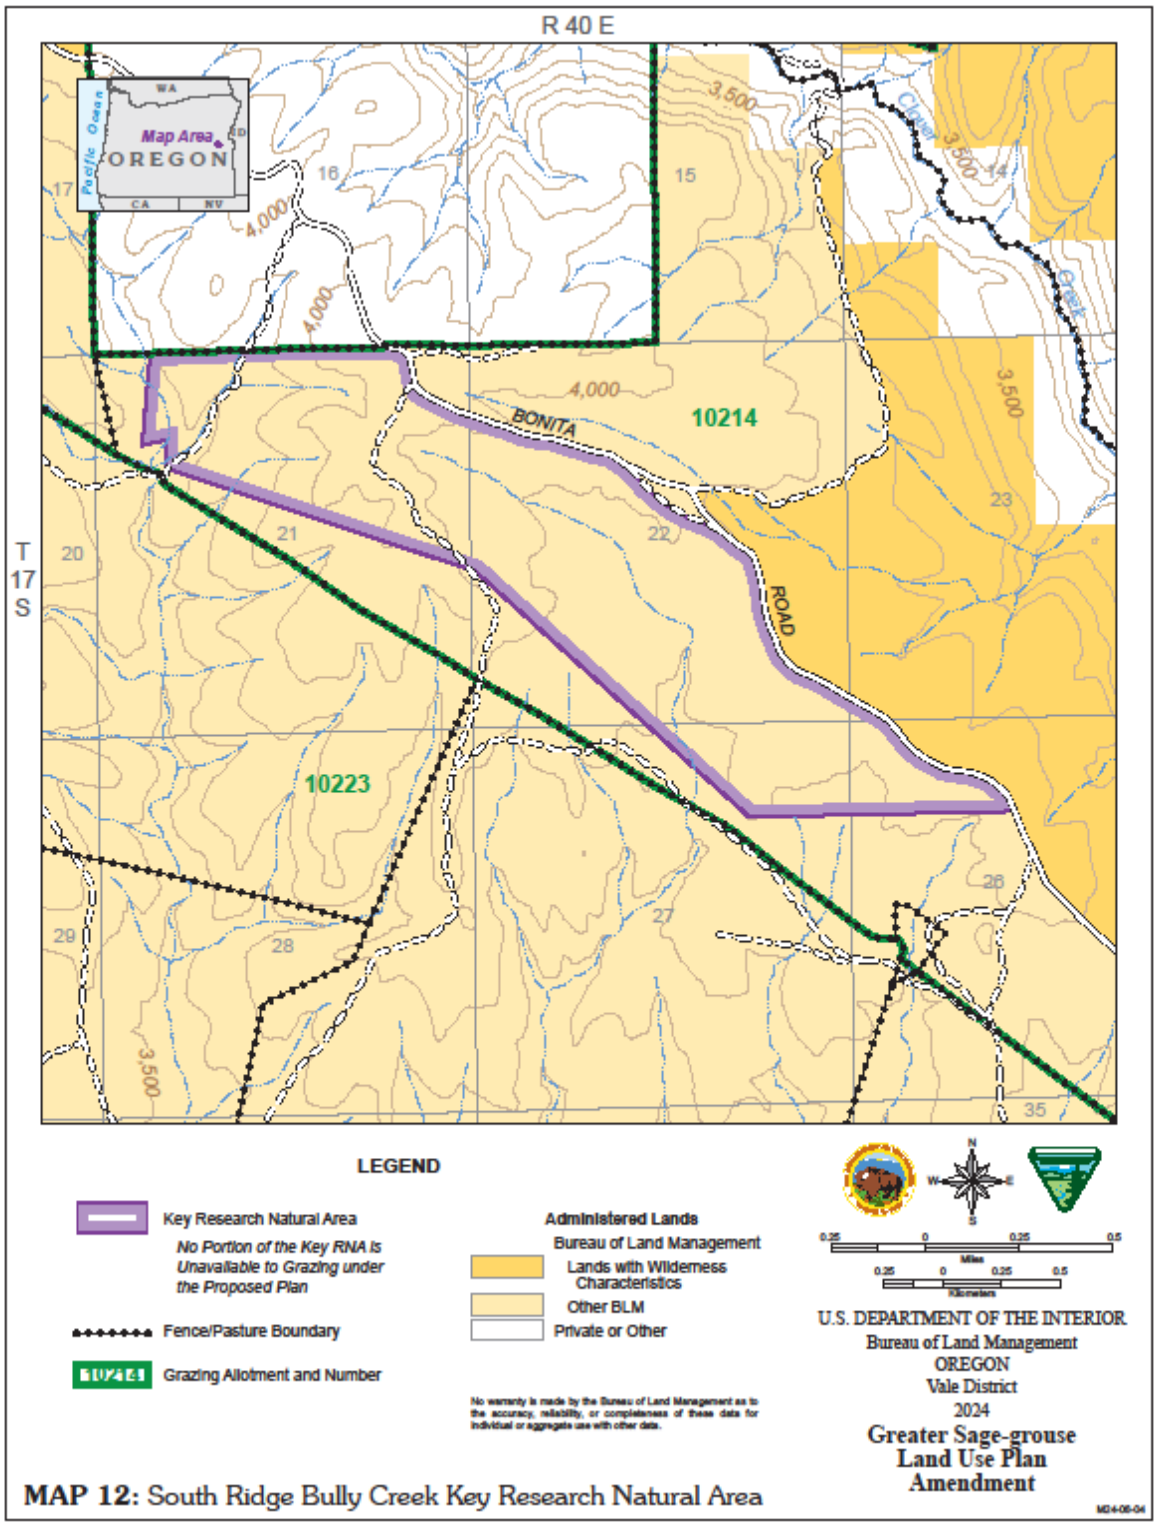
Proposed RMP Amendment

Under this alternative, reallocating the entire key RNA as available for livestock grazing would allow for the resumption of management practices employed prior to 2023 throughout the North Ridge pasture of the Richie Flat allotment. Prior to the removal of grazing from this key RNA, livestock grazing management prescribed had not adversely impacted conditions of the vegetative communities that support wildlife habitat important to the area as well as the condition of the important vegetative communities identified for the Greater Sage-grouse (BLM. North Ridge Bully Creek RNA Monitoring data. 06/05/2013-06/06/2013; 5/30/2018-5/31/2018; 06/26/2020).

Current conditions of the vegetative communities are in a desirable state and are not expected to be adversely affected under proper livestock grazing management. The condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA would continue. Livestock management prior to the 2015 ARMPA does not appear to have had a negative impact on the relative and important

values identified for the key RNA (BLM. North Ridge Bully Creek RNA Monitoring data. 06/05/2013-06/06/2013; 5/30/2018-5/31/2018; 06/26/2020). As stated in the rationale for maintaining the key RNA status, the vegetative communities identified as important for Greater Sage-grouse in 2015 are still present post-fire with the exception of sagebrush.

Active and pending leks are currently documented to exist within less than 1.2 miles of the area identified for livestock removal in Alternatives 1 and 4. However, the construction of a 5-acre or less exclosure that would remove livestock use and other permitted activities would allow for nonmanipulative research and baseline data gathering within close proximity to the Key RNA. This would allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the North Ridge Bully Creek key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendiees B and C of the Oregon 2015 GRSG Approved RMP Amendment. There would be at least short-term impacts from fence construction outside of, but near to, the key RNA.



Increased presence, time, and resources for active management to keep livestock from the area identified as unavailable for livestock grazing would not be necessary and impacts to wildlife, including sage-grouse, from these activities would not occur.

South Ridge Bully Creek (Vale)

Proposed RMP Amendment

Retain the area identified as a key RNA and reallocate all portions of the key RNA as available for livestock grazing. Construct a 5-acre or less exclosure that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the Key RNA or within close proximity to the Key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the South Ridge Bully Creek key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendices B and C of the Oregon 2015 GRSG Approved RMP Amendment.

Map 12. South Ridge Bully Creek Key Research Natural Area

Affected Environment

The 621-acre South Ridge Bully Creek ACEC/RNA is located west of Westfall, Oregon, along the ridge that separates Clover Creek drainage to the north and Bully Creek drainage to the south. The ACEC/RNA encompasses a number of grassland communities that occur as distinct entities intermixed within a larger mosaic of types in excellent ecological condition.

The South Ridge Bully Creek key RNA and 397-acre area allocated as unavailable for livestock grazing occurs within the South Ridge pasture of the Richie Flat allotment. The key RNA is adjacent to the North Ridge Bully Creek key RNA and North Ridge Bully Creek pasture. The key RNA is within Greater Sage-grouse PHMA and two active or pending active leks are within 1.2 miles of the key RNA boundary. There is one AIM plot within the area available for livestock grazing.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use will be limited to existing roads and trails. Plant collecting requires a permit. The ACEC/RNA is managed as VRM Class III. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Where adverse impacts are identified, existing livestock use allocations will be adjusted using a variety of methods that could include fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 Southeastern Oregon RMP (SEORMP) ACEC/RNA Designation

The relevant and important values of the ACEC/RNA are the Wyoming big sagebrush/Thurber needlegrass community and Wyoming big sagebrush- wild crab apple (*Peraphyllum ramosissimum*)/Idaho fescue community vegetation cells identified by ONHP.

2015 Greater Sage-grouse ARMPA

The South Ridge Bully Creek ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities represented in this key RNA include Wyoming big sagebrush/Thurber's needlegrass, a Wyoming big sagebrush/wild crab apple/Idaho fescue, and threetip sagebrush/blue bunch wheatgrass (Idaho fescue) plant association.

Vegetative communities in this key RNA that are important to Greater Sage-grouse habitat continue to be relatively unaltered. These are Wyoming big sagebrush/Thurber's needlegrass, a Wyoming big sagebrush/wild crab apple/Idaho fescue, and threetip sagebrush/blue bunch wheatgrass (Idaho fescue) plant association. These communities represent the Cool-Moist/Warm-Dry Sagebrush Communities. The key RNA is within Greater Sage-grouse PHMA and two active or pending active leks are within 1.2 miles of the key RNA boundary. The South Ridge Bully Creek ACEC/RNA burned in the 2012 Bonita Fire and the 2015 Bendire Fire removing much of the sagebrush present. The South Ridge Bully Creek ACEC/RNA was aerially sprayed with the preemergent herbicide imazapic in October 2015 after the Bendire Fire to reduce invasive annual grasses in the area.

Other Resources

The visual resource management is Class III.

The key RNA is utilized by deer during spring and summer, pronghorn year-round, and is designated as elk winter range.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under all Alternatives

The area continues to be in a desirable condition for the vegetative communities identified. Although the area burned in 2012 and 2015, the application of herbicide in 2015 prevented the increase of invasive annual grasses that often follow multiple fires. Management would continue to protect the relevant and important values, although shrub components have been impacted by past wildfires. In the long-term, shrub components are expected to return. Research opportunities continue to remain with vegetative communities identified as relevant and important values. The area continues to recover and provides opportunities for research and baseline data gathering where post-fire ecological conditions occur. The key RNA retains the following vegetation types important for Greater Sage-grouse: Ecotone between cool-moist and warm-dry sagebrush, shallow-Dry Sagebrush, and Riparian-Wetlands.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Allocating the entire key RNA as available for livestock grazing removes the possibility of construction of an exclosure fence, reducing conflicts with lek buffers and reducing collision risk. Livestock management prior to the 2015 ARMPA (Alternative 1) did not have a negative impact on the relative and important values identified for the RNA (BLM. South Ridge Bully Creek RNA Monitoring data. 06/05/2013; 05/30-31/2018; 06/26/2020).

Livestock grazing within the key RNA is not expected to adversely impact current conditions, and conditions continue to exist (excluding impacts from wildfire) as they were at the time the RNA was designated under the 2002 SEORMP (BLM. South Ridge Bully Creek RNA Monitoring data. 06/05/2013; 05/30-31/2018; 06/26/2020). There is no indication that improper livestock grazing practices are occurring given the current conditions (BLM. South Ridge Bully Creek RNA Monitoring data. 06/05/2013; 05/30-31/2018; 06/26/2020).

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be present and provide life-cycle needs (such as nesting, brood rearing, and wintering) under all alternatives.

Alternatives 1 and 4

Presence, time, and resources for active management of livestock grazing would continue to be necessary. Vegetative and soil conditions are recovering post-wildfire and as expected for the vegetative communities present prior to eliminating livestock from the area allocated as unavailable for livestock use under the 2015 ARMPA ROD. Vegetative conditions may witness slightly increased recovery with the elimination of livestock use from the area. Due to the proximity and number of leks within the area and the risk of Greater Sage-grouse- fence collisions, fencing to exclude livestock from the area allocated as unavailable for livestock grazing is not feasible and could not conform with Required Design Features. As a fence within 1.2 miles of leks poses a collision hazard, and the area that would be protected from grazing had previously been properly grazed, which USFWS has said is compatible with GRSG conservation, there is no conservation benefit to GRSG from placing a fence within 1.2 miles of a lek. While research in the ungrazed area could provide data

and insights that could benefit GRSG habitat management, this benefit is not only difficult to measure but would not outweigh the fence collision risk for GRSG. Other wildlife noted to use the area may be impacted, at least seasonally due to increased human presence when managing livestock from entering areas unavailable for livestock use.

Alternatives 2, 5, and 6

Under these alternatives, reallocating the entire key RNA as available for livestock grazing would allow for the resumption of management practices employed prior to 2023 throughout the South Ridge pasture of the Richie Flat allotment, while continuing to allow for research opportunities. Prior to the removal of grazing from this key RNA, livestock grazing management prescribed had not adversely impacted conditions of the vegetative communities that support wildlife habitat important to the area as well as the condition of the important vegetative communities identified for the Greater Sage-grouse. There is no indication that earlier grazing management practices had negative impacts to Greater Sage-grouse habitat within the key RNA.

Current conditions of the vegetative communities are in a desirable state and are not expected to be adversely affected under proper livestock grazing management. The condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA while retaining livestock grazing use would continue. Livestock management prior to the 2015 ARMPA does not appear to have had a negative impact on the relative and important values identified for the key RNA. As stated in the rationale for maintaining the key RNA status, the vegetative communities identified as important for Greater Sage-grouse in 2015 are still present post-fire with the exception of sagebrush.

The area continues to recover and provides opportunities for research and data gathering where post-fire ecological conditions occur.

Increased presence, time, and resources for active management to keep livestock from the area identified as unavailable for livestock grazing would not be necessary and impacts to wildlife, including sage-grouse, from these activities would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding), An ungrazed reference for research would be retained.

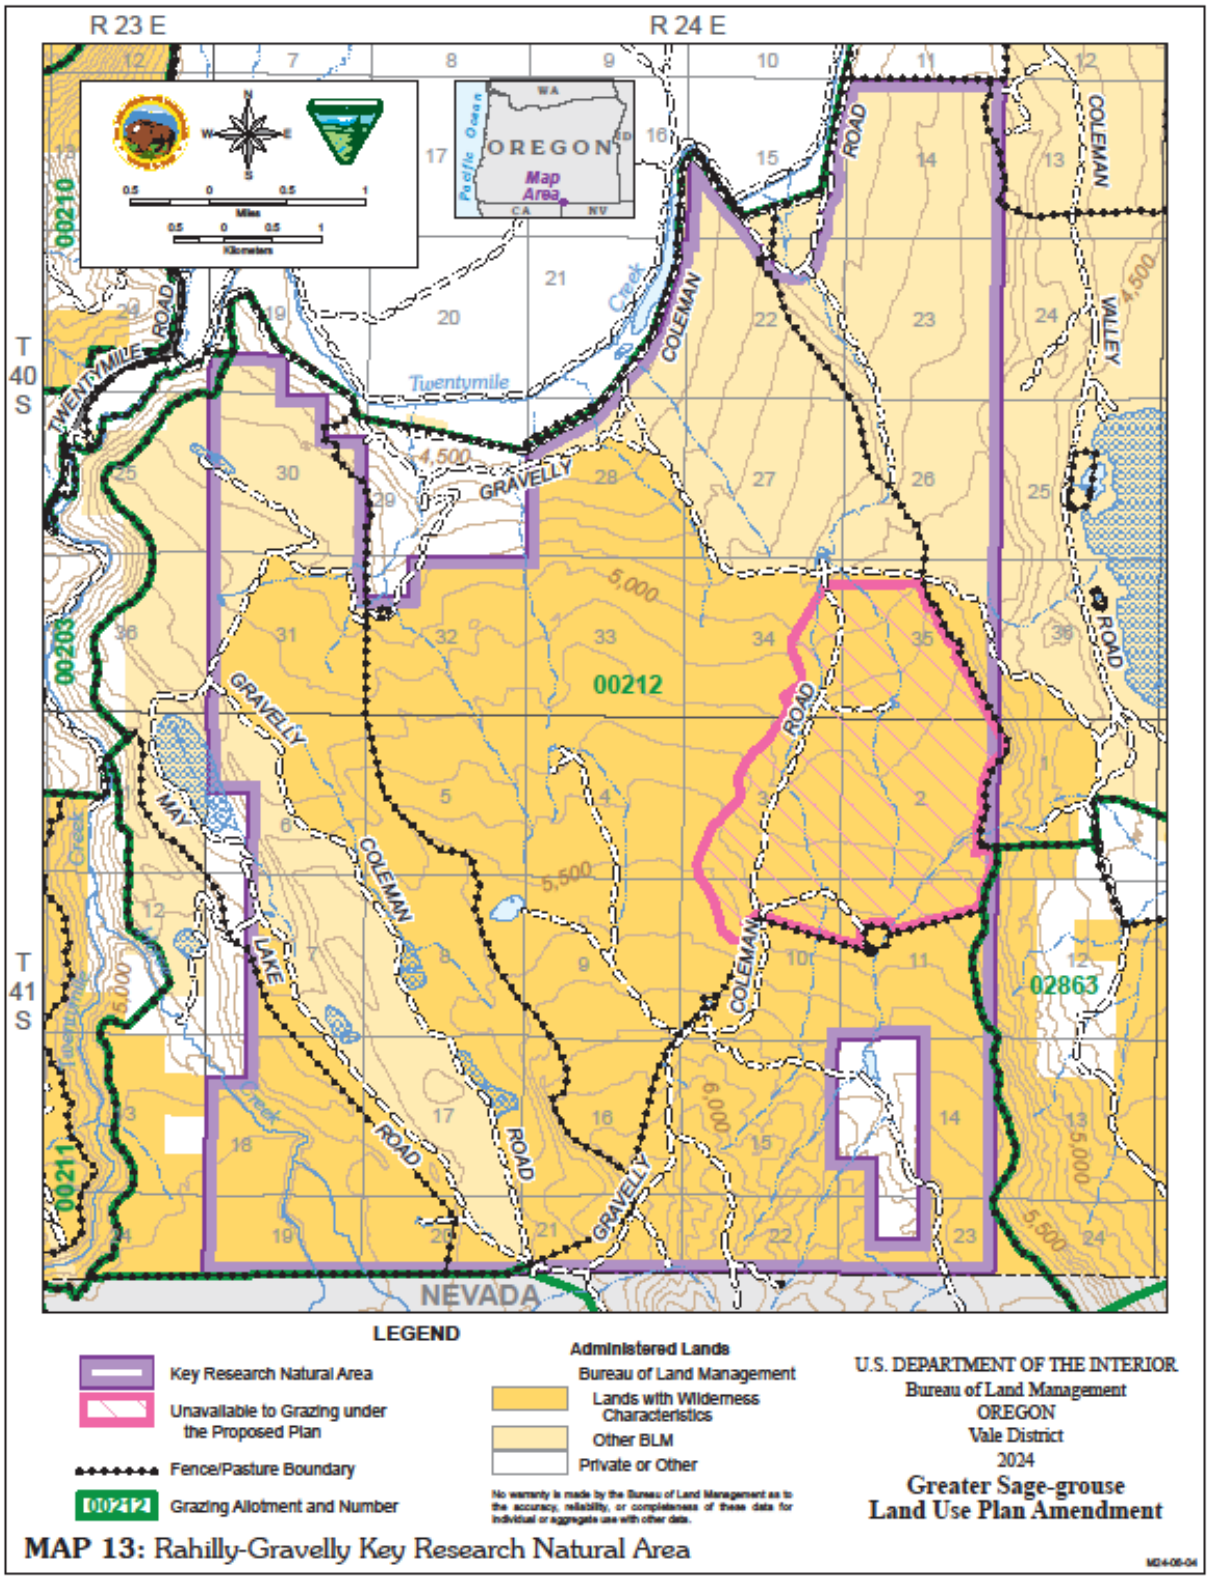
Proposed RMP Amendment

Under this alternative, reallocating the entire key RNA as available for livestock grazing would allow for the resumption of management practices employed prior to 2023 throughout the South Ridge pasture of the Richie Flat allotment. Prior to the removal of grazing from this key RNA, livestock grazing management prescribed had not adversely impacted conditions of the vegetative communities that support wildlife habitat important to the area as well as the condition of the important vegetative communities identified for the Greater Sage-grouse.

Current conditions of the vegetative communities are in a desirable state and are not expected to be adversely affected under proper livestock grazing management. The condition of the vegetative communities that were present when the 2002 SEORMP designated the RNA would continue. Livestock management prior to the 2015 ARMPA does not appear to have had a negative impact on the relative and important values identified for the key RNA. As stated in the rationale for maintaining the key RNA status, the

vegetative communities identified as important for Greater Sage-grouse in 2015 are still present post-fire with the exception of sagebrush.

Active and pending leks are currently documented to exist within less than 1.2 miles of the area identified for livestock removal in Alternatives 1 and 4. However, the construction of a 5-acre or less exclosure that would remove livestock use and other permitted activities would allow for nonmanipulative research and baseline data gathering within close proximity to the Key RNA. This would allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the South Ridge Bully Creek key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendices B and C of the Oregon 2015 GRSG Approved RMP Amendment. There would be at least short-term impacts from fence construction outside of, but near to, the key RNA.



Increased presence, time, and resources for active management to keep livestock from the area identified as unavailable for livestock grazing would not be necessary and impacts to wildlife, including sage-grouse, from these activities would not occur.

Rahilly-Gravelly (Lakeview)

Proposed RMP Amendment

Retain the area identified as a key RNA and reduce the area allocated as unavailable for livestock grazing from 8,282 to 2,025 acres within a portion of the Sucker Creek Pasture (Rahilly-Gravelly Allotment) that contains low sagebrush/Sandberg's bluegrass grassland and Wyoming big sagebrush/bluebunch wheatgrass grassland plant communities.

Map 13. Rahilly-Gravelly Key Research Natural Area

Affected Environment

The 18,734-acre Rahilly-Gravelly ACEC/RNA is located about 24 miles southeast of Lakeview.

Specific management under the Lakeview RMP/ROD

OHV use is limited to existing roads and trails.

Summary of key RNA and Relevant and Important values evaluated for ACEC/RNA designation

Lakeview RMP/ROD

The 18,734-acre Rahilly-Gravelly ACEC/RNA was designated in the Lakeview RMP/ROD to protect relevant/important natural system (plant communities) and cultural resource values (BLM 2000a, pp. II-9, III-37; 2001a, p. A-247; 2003b, p. 68).

During the development of the Lakeview Resource Management Plan and Record of Decision, the BLM expanded the Rahilly-Gravelly ACEC/RNA (from the original 1,400-acre proposal to over 18,700 acres) to include significant cultural values in the added acreage (BLM 2000a, p. III-33). These site types included stone rings, rock art, lithic scatters, rock cairns, hunting blinds, and occupation sites (BLM 2000a, p. III-33 to III-34, III-37; 2003a, p. 2-58).

2015 Greater Sage-grouse ARMPA

The Proposed RMPA/Final EIS described the plant communities of the Rahilly-Gravelly ACEC/RNA as containing important sage-grouse plant communities including western juniper/Wyoming big sagebrush-bitterbrush woodland and some unusual shrublands described by the Oregon Biodiversity Information Center (ORBIC), such as a mountain big sagebrush/bitterbrush/wild crab apple and a mountain big sagebrush/bitterbrush/mountain snowberry/Thurber's needlegrass shrubland. The ACEC/RNA also contains Wyoming big sagebrush/bunchgrass, bluebunch wheatgrass, Thurber's needlegrass, and Sandberg's bluegrass associations, as well as areas of low sagebrush/grassland vegetation types (BLM 2015a, p. 3-142).

Updated Vegetation Communities

Approximately 1,400 acres of this ACEC/RNA contains the plant communities identified in the 2015 ARMPA and they are located within the Nevada Pasture (Vander Schaaf 1992, pp. 15-16 including map; BLM 2000a), not within the original (Alternative 1) exclosure area in the Sucker Creek Pasture. The Sucker Creek Pasture is the portion of the RNA with Greater Sage-grouse habitat and documented Greater Sage-grouse use.

Based on ESI data, the most dominant vegetation communities in the Rahilly-Gravelly ACEC/RNA include low sagebrush/Sandberg bluegrass, big sagebrush/cheatgrass, big sagebrush/Sandberg bluegrass, big sagebrush with no understory, and mountain big sagebrush/bluegrass. However, no mountain big sagebrush/bitterbrush/mountain snowberry/Thurber's needlegrass shrubland communities are present. In addition, western juniper is encroaching into, and degrading the habitat quality of the Wyoming big sagebrush/bitterbrush, big sagebrush, and some of the low sagebrush communities within the ACEC/RNA.

There are some cocklebur species (*Xanthium* sp.) and Canada thistle located around spring and water developments in the Rahilly-Gravelly key RNA. Many of these sites are located in areas that already exclude livestock grazing. This RNA also has a documented site of Mediterranean sage *(Mediterranean sage)* that is a high management priority for containment/control.

The BLM sensitive plant species, Cooper's goldflower (*Hymenoxys cooperi* var *canescens ~ H. lemmonii*), occurs in four places within the ACEC/RNA (BLM 2000a, p. III-26). Cooper's goldflower grows in rocky soils in arid

regions from southern California to New Mexico, north as far as Idaho and Oregon. Not much is known about the life history requirements of this species.

Other Resources

Small riparian/wetland areas occur around Terry Spring, Spearpoint Spring, several livestock water developments, and short reaches of Sucker Creek (BLM 2024b, p. 28).

The Rahilly-Gravelly key RNA lies within the Warner-Meizner mid-scale HAF, and the Warner fine-scale HAF boundaries, but is part of the Beaty PAC. The entire RNA is classified as PHMA and nearly all the area is mapped as seasonal breeding, summer, and winter sage-grouse habitat. Telemetry data collected across several years has documented spring, summer, and winter use within much of the key RNA including the Sucker Creek Pasture (unpublished data). As of 2022 lek surveys, there were 3 active and 4 inactive leks within the Sucker Creek Pasture.

Juniper areas provide habitat for woodland nesting species and cover for big game, while the shrubland/grassland areas provide habitat and forage for sage-steppe associated species. The area includes mule deer winter range, bighorn sheep occupied habitat, and pronghorn winter range and migration (BLM 2024b, p. 51).

The Twelvemile-Horse Creek (OR-015-157 and CA-020-1005; 24,081 acres) and Sucker Creek (OR-015-120A; 7,118 acres) wilderness characteristics units overlap portions of the key RNA.

The Rahilly Gravelly ACEC/RNA is managed as VRM Class III.

The Rahilly-Gravelly ACEC/RNA falls within the 33,571-acre Rahilly-Gravelly (00212) Allotment.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The vegetative communities identified as important for Greater Sage-grouse habitat within the key RNA continue to be in good condition. Management would continue to protect the relevant and important values of the RNA.

The key RNA retains the following vegetation types important for Greater Sage-grouse: cool-moist sagebrush, warm-dry sagebrush, shallow-dry sagebrush, and mountain brush.

Opportunities for nonmanipulative research and baseline data gathering on relatively unaltered plant community types continue to remain, along with vegetative communities identified as important for greater sage-grouse, due to the remote and rugged nature of the area. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to these vegetative communities or the relevant and important values for which the RNA was designated.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

Portions of the original boundary of the area allocated as unavailable for livestock grazing (Alternative 1) were based on property lines that traversed terrain/topography (e.g., steep slopes, rocky surfaces) where the BLM determined, based on further analysis and field inventory, it would be difficult to construct fencing. The modified exclosure boundary would take advantage of existing topographic barriers (e.g. steep rims) and reduce the amount of fencing needed within sage-grouse habitat from an estimated 4.7 miles (under Alternative 1) to about 2.5 miles and move fencing approximately 0.2 miles further from two active leks.

The mountain big sagebrush/ bitterbrush/mountain snowberry/Thurber's needlegrass shrubland plant community was described as occurring in the key RNA by the 2015 ARMPA, however, the BLM has no documentation that this plant community exists within the key RNA. The proposed area to be unavailable for livestock grazing in the Sucker Creek Pasture contains Wyoming big sagebrush and low sagebrush plant communities.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Livestock are currently being kept out of areas allocated as unavailable for grazing through active management (herding, adjustment of turnout dates, removal of nearby water developments, and/or placement of salt or other supplements). Leaving 8,282 acres of the Rahilly-Gravelly ACEC/RNA unavailable for livestock grazing use could eliminate soil and vegetation disturbance from livestock in a portion of the key RNA. This would allow natural succession processes to occur in the absence of most human-caused disturbances and provide an area for future baseline monitoring and research purposes. An ungrazed reference for research would be retained.

If the area were to be made unavailable for livestock grazing using fencing, the new fencing would result in additional cattle trampling/trailing along the fenceline within an area that has been relatively undisturbed in the past. Native plant communities and soils would be impacted. There would be an increased potential risk of introducing new noxious weeds/invasive species into native communities during fence construction. The new disturbance would represent an area of potential cheatgrass invasion/expansion that could potentially impact the Cooper's goldflower over the long-term. A fence would negatively affect existing visual quality, but would meet VRM Class III objectives

Four existing livestock water sources located in areas unavailable for livestock grazing would not be available under these alternatives.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative, either short-term or long-term, any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

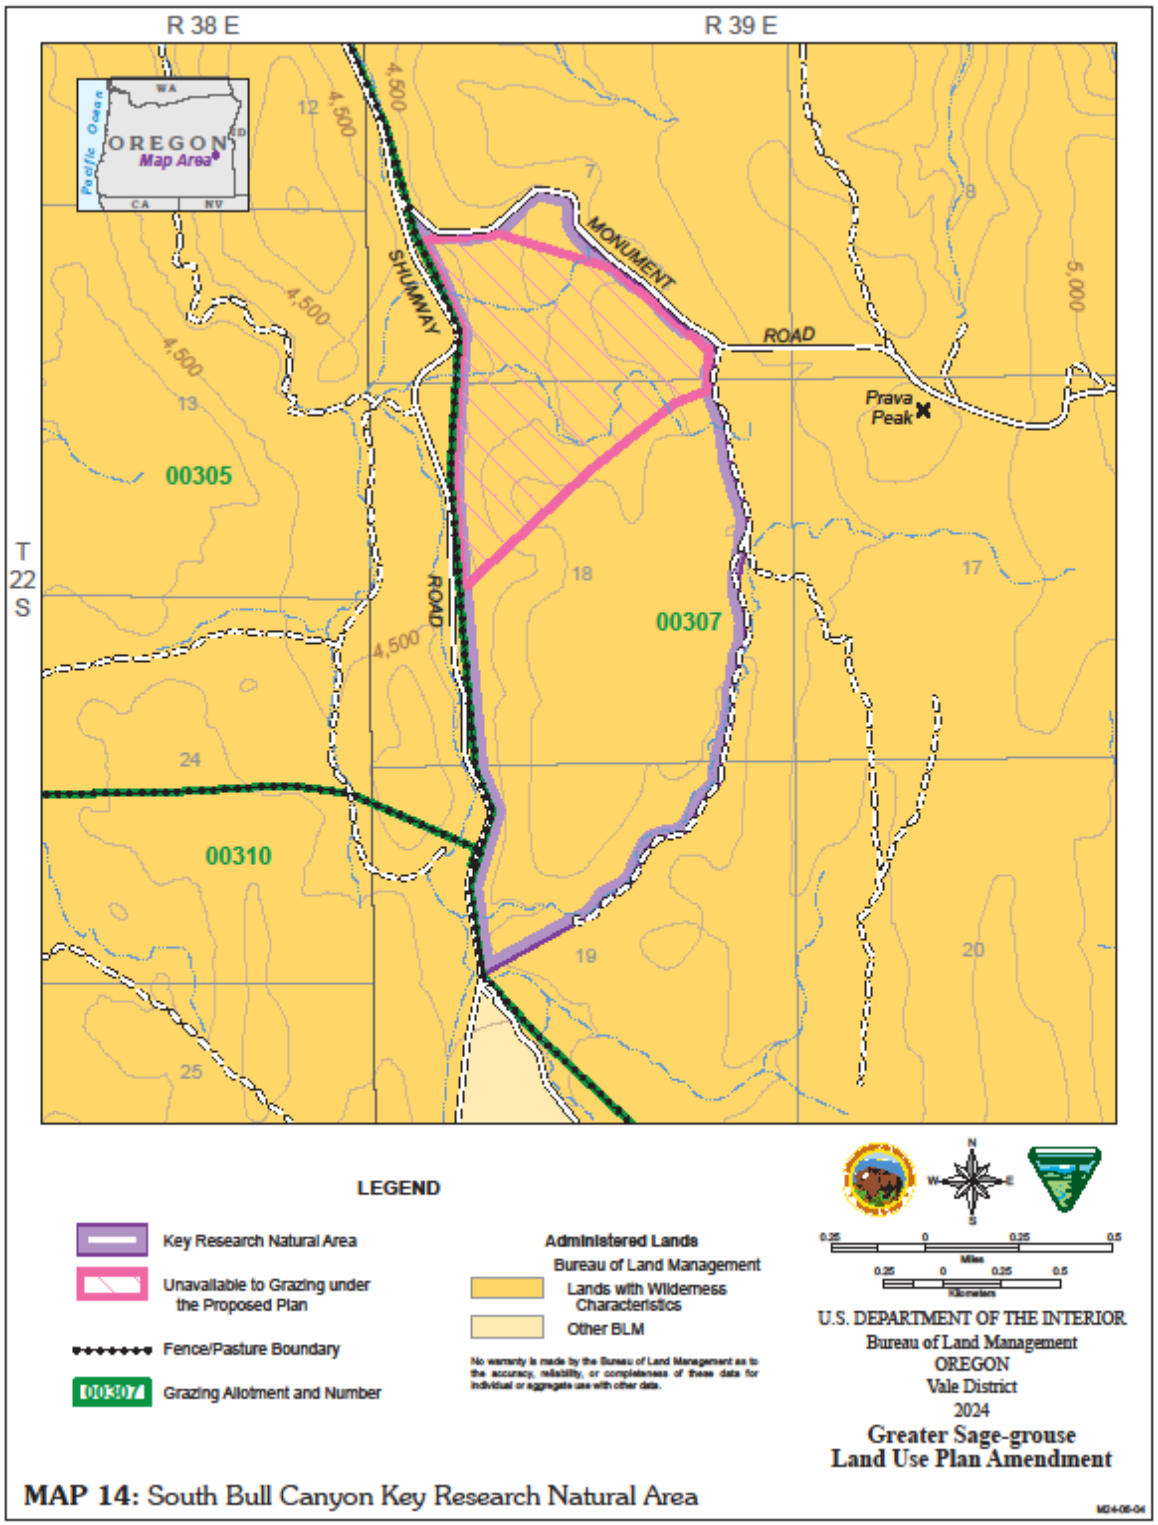
Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness, opportunities for solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5, 6, and Proposed RMP Amendment

Under these alternatives 6,257 acres would be reallocated as available for livestock grazing. An ungrazed 2,025 acre reference area for research would be retained.

If access to the 2,025 acres unavailable for livestock grazing were to be limited by using fencing, the new fencing would result in additional cattle trampling/trailing along the fenceline within an area that has been relatively undisturbed in the past. Native plant communities and soils would be impacted. There would be an increased potential risk of introducing new noxious weeds/invasive species into native communities during fence construction. The new disturbance would represent an area of potential cheatgrass invasion/expansion that could potentially impact the Cooper's goldflower over the long-term. Because there would be less fence construction than under Alternative 1 as portions of natural rim rock would be used as part of the barrier, there would be fewer associated wildlife impacts than under Alternative 1. The western and northern portions of the fence would be moved further away from two active leks and the western fence would not be located in open terrain. These design measures would decrease the risk of collision by sage-grouse when compared to Alternative 1. A fence would negatively affect existing visual quality, but would meet VRM Class III objectives.

These alternatives would reverse negative economic effects to affected livestock operators that arose from making 8,282 acres unavailable for livestock grazing. Under these alternatives, 6,257 acres would be reallocated as available for livestock grazing (approximately 442 AUMs). Compared to Alternative 1 the permittee would not experience as much additional forage costs.



Four existing livestock water sources would be available for livestock grazing that would not be available under alternatives 1 and 4. This would reduce the need to mitigate for lost livestock watering sites when compared to Alternative 1 (BLM, 2024b, p. 17).

South Bull Canyon (Vale)

Proposed RMP Amendment

BLM proposes no changes to the key RNA boundary, but has reduced the area allocated as unavailable for livestock grazing from 749 acres to 257 acres to reduce conflicts with other resources. The smaller exclosure would still maintain the vegetation communities that are important to Greater Sage-grouse habitat.

Map 14. South Bull Canyon Key Research Natural Area

Affected Environment

The 770-acre South Bull Canyon ACEC/RNA is located south of the Malheur River, approximately six miles to the southeast of Juntura, Oregon, along the road that leads to Creston and Turnbull lakebeds. The landscape consists of a series of small drainages off of a low north-south ridge with relatively deep soils and large surface rocks. The gently sloped hills are covered by a mix of plant communities in generally late seral conditions. The ACEC/RNA includes a range of vegetation communities and their subtle variations across the landscape. The key RNA is located wholly within the 20,315-acre Prava Peak wilderness characteristics unit that is identified for prioritized protection of those wilderness values under 2024 SEORMP Amendment ROD (BLM 2024a, Appendix A, p. A-4). South Bull Canyon ACEC/RNA is managed for visual resources as VRM Class II (BLM 2024, p. ARMPA-2).

The South Bull Canyon key RNA and 749-acre area[2] allocated as unavailable for livestock grazing occurs within the Upper Field pasture of the Boney Basin allotment. The terrain in the South Bull Canyon key RNA has a number of hills and drainage features scattered throughout the 749 acres. There are two livestock watering developments within this area, and another three water developments bordering on or directly adjacent to that unavailable area.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use will be limited to designated roads and trails. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. The area will be closed to saleable minerals development, while remaining open for leasable and locatable minerals. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, including but is not limited to, fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 SEORMP ACEC/RNA Designation

The relevant and important value of the ACEC/RNA is the big sagebrush-antelope bitterbrush/Idaho fescue vegetation cell as identified by ONHP.

2015 Greater Sage-grouse ARMPA

The South Bull Canyon ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

[2] The South Bull Canyon ACEC/RNA was originally identified in the 2002 SEORMP ROD as containing 792 acres of public lands in the Malheur Field Office; the entire RNA was identified in the 2015 ARMPA as a Key RNA, of which 747 acres were allocated as unavailable for livestock grazing. The original boundary was updated on the west to the existing pasture boundary (fenceline) and on the north and east to the existing primitive route. This adjustment reduced the total acres in the ACEC/RNA to 770 acres. The adjustment also increased by two acres to 749 the area allocated as unavailable for livestock grazing.

Updated Vegetation Communities and Sage-Grouse Habitats

Wyoming big sagebrush-antelope bitterbrush/Idaho fescue plant association is represented in the South Bull Canyon ACEC/RNA.

Vegetative communities in this key RNA that are important to Greater Sage-grouse habitat continue to be relatively unaltered. These are Wyoming big sagebrush-antelope bitterbrush/Idaho fescue plant association. This community represents the Cool-Moist Sagebrush community. The southern portion of the South Bull Canyon ACEC/RNA burned in the 2016 Sheep Rock Fire. Due to the reduced abundance of these species following the Juntura Complex Fires in 2016, 176 acres in the burned area were planted in the fall of 2017 with sagebrush and bitterbrush seedlings during Emergency Stabilization and Rehabilitation efforts (BLM Vale District Office. 2016. BLM Oregon Post-Fire Recovery Plan: Emergency Stabilization and Burned Area Rehabilitation Juntura Complex Fire). The entire South Bull Canyon ACEC/RNA was aerially treated with the preemergent herbicide imazapic in 2022 to reduce invasive annual grasses in the area.

The key RNA is within PHMA and is in the Crowley Priority Area of Conservation. There are two active leks within 1.2 miles of the key RNA; seven active leks within two miles; and nine active and one pending active lek within four miles of the key RNA.

Other Resources

The South Bull Canyon key RNA is wholly within the Prava Peak (OR-034-042) lands with wilderness characteristics unit and is located in the northwest corner of the Prava Peak unit. The 20,654-acre Prava Peak unit possesses naturalness and is contiguous with three WSAs, and shares their outstanding opportunities to experience solitude, and primitive and unconfined recreation. Elevations range from about 4,140 to 5,690 feet (Monument Peak). Existing human imprints in the unit are: 14 earthen reservoirs, four developed springs, 23.2 miles of rangeland fence, one rangeland fenced enclosure, and 43.5 miles of 22 primitive route segments, all of which appear substantially unnoticeable to the average visitor. Supplemental values in the unit include Greater Sage-grouse leks and their habitat.

The key RNA is utilized by mule deer during spring and summer, pronghorn year-round, and is designated as elk winter range. This area is not classified as an ODFW PWCA. Many migratory birds nest in the area, including many sagebrush obligates such as Brewer's sparrow and sagebrush sparrow, as well as other sagebrush-associated species such as golden eagles and loggerhead shrikes. Many more bird species move through the area during migration. Although habitat potential exists for pygmy rabbits, no known populations exist here.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The area continues to be in a desirable condition for the vegetative communities identified (BLM. Monitoring data. 05/31/2017;BLM. Monitoring data. 06/28/2020). Although the area burned in 2012 and 2015, the application of herbicide in 2015 prevented the increase of invasive annual grasses that often follow multiple fires. Management would continue to protect the relevant and important values. Herbaceous vegetative communities important to Greater Sage-grouse are present throughout the key RNA, although shrub components have been impacted by past wildfires in the southern portion of the area. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated.

Management would retain the ONHP-identified vegetation communities identified as relevant and important and the cool/moist vegetation communities identified under the 2015 ARMPA that are important for sage-grouse and for research purposes. Sagebrush communities of the key RNA provide for suitable nesting, brood-rearing, and winter habitat for Greater Sage-grouse.

Rationale for Modifying the Area Allocated as Unavailable for Livestock Grazing

The proposed, 257-acre livestock exclosure, still within the key RNA, would locate fencing greater than 1.2 miles from active or pending active Greater Sage-grouse leks. This fencing would be constructed by hand.

Reallocating livestock grazing to the remaining, unexclosed area of the key RNA would reduce the impacts to wilderness characteristics from non-infrastructure methods (e.g., decisions that direct the permittee actively manage livestock to avoid incursion). The exclosure would enable the BLM to retain opportunities for research that includes control areas ungrazed by livestock. Relevant and important vegetative communities identified for the key RNA as important for Greater Sage-grouse are relatively unaltered within the excluded area.

The smaller exclosure excludes the portion of the key RNA that burned in 2016 and which was planted with bitterbrush and sagebrush. The seed source for the plants is not from the vegetation within or directly adjacent to the key RNA. The genetics are therefore different and may not represent the local genetics and could impact a research study. This key RNA has one vegetation community present: Wyoming big sagebrush-antelope bitterbrush/Idaho fescue plant association; this community is present in the smaller exclosure area.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Keeping livestock out of the area allocated as unavailable for livestock grazing would require the additional presence and resources of the grazing operator or construction of an exclosure fence. There could be long-term impacts to solitude and primitive and unconfined recreation caused by active management to exclude livestock from the key RNA. Constructing fences to keep livestock out would not conform with the 2015 ARMPA (Management Direction MD LG 10 and RDF Livestock Grazing No. 7). Two leks with "active" or "pending active" status occur less than 1.2 mile from the area boundary with the closest lek occurring approximately 0.5 miles away. A conservation benefit to Greater Sage-grouse or important habitat is not expected from construction of a fence to eliminate livestock grazing due to the current condition of the vegetative communities prior to and after the removal of livestock from the area. Other wildlife noted to use the area may be negatively impacted, at least seasonally due to increased human presence when managing livestock from entering areas unavailable for livestock use, or in the short-term (1-3 years) due to construction of new fence to exclude livestock from these areas. Additionally, there are no allowed variations to the RDF that would fall within the requirements described in Appendix C,. As a fence within 1.2 miles of leks poses a collision hazard, and the area that would be protected from grazing had previously been properly grazed, which USFWS has said is compatible with GRSG conservation, there is no conservation benefit to GRSG from placing a fence within 1.2 miles of a lek. While research in a fenced, ungrazed area could provide data and insights that could benefit GRSG habitat management, this benefit is not only difficult to measure but would not outweigh the fence collision risk for GRSG.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness would not be impaired under this alternative, either short-term or long-term, any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness would not be impaired under this alternative either short-term or long-term. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5, 6, and Proposed RMP Amendment

Allocating the southern portion of the key RNA as available for livestock grazing would allow livestock grazing to return to 513 acres of the key RNA which contains the majority of reliable water sources for the Upper Field of the Boney Basin allotment. If the area is not fenced, additional presence and resources of the grazing operator would be required for active management in order to keep livestock out of the unfenced area.

If the 257-acre area allocated as unavailable for livestock grazing is fenced, impacts to livestock management would be minimized as available water sources would remain available for use throughout the remaining portions of the Upper Field pasture. A fence surrounding the area allocated as unavailable for livestock grazing would have minor effects on the movement of big game through the area. The Oregon Conservation Assessment Mapping Program did not consider this area a high priority for wildlife movement, and therefore it was not designated as a Priority Wildlife Connectivity Area. The risk to big game movement would be minimized by using wildlife-friendly fence design, as big game would be able to move more easily under, over, and through the fence.

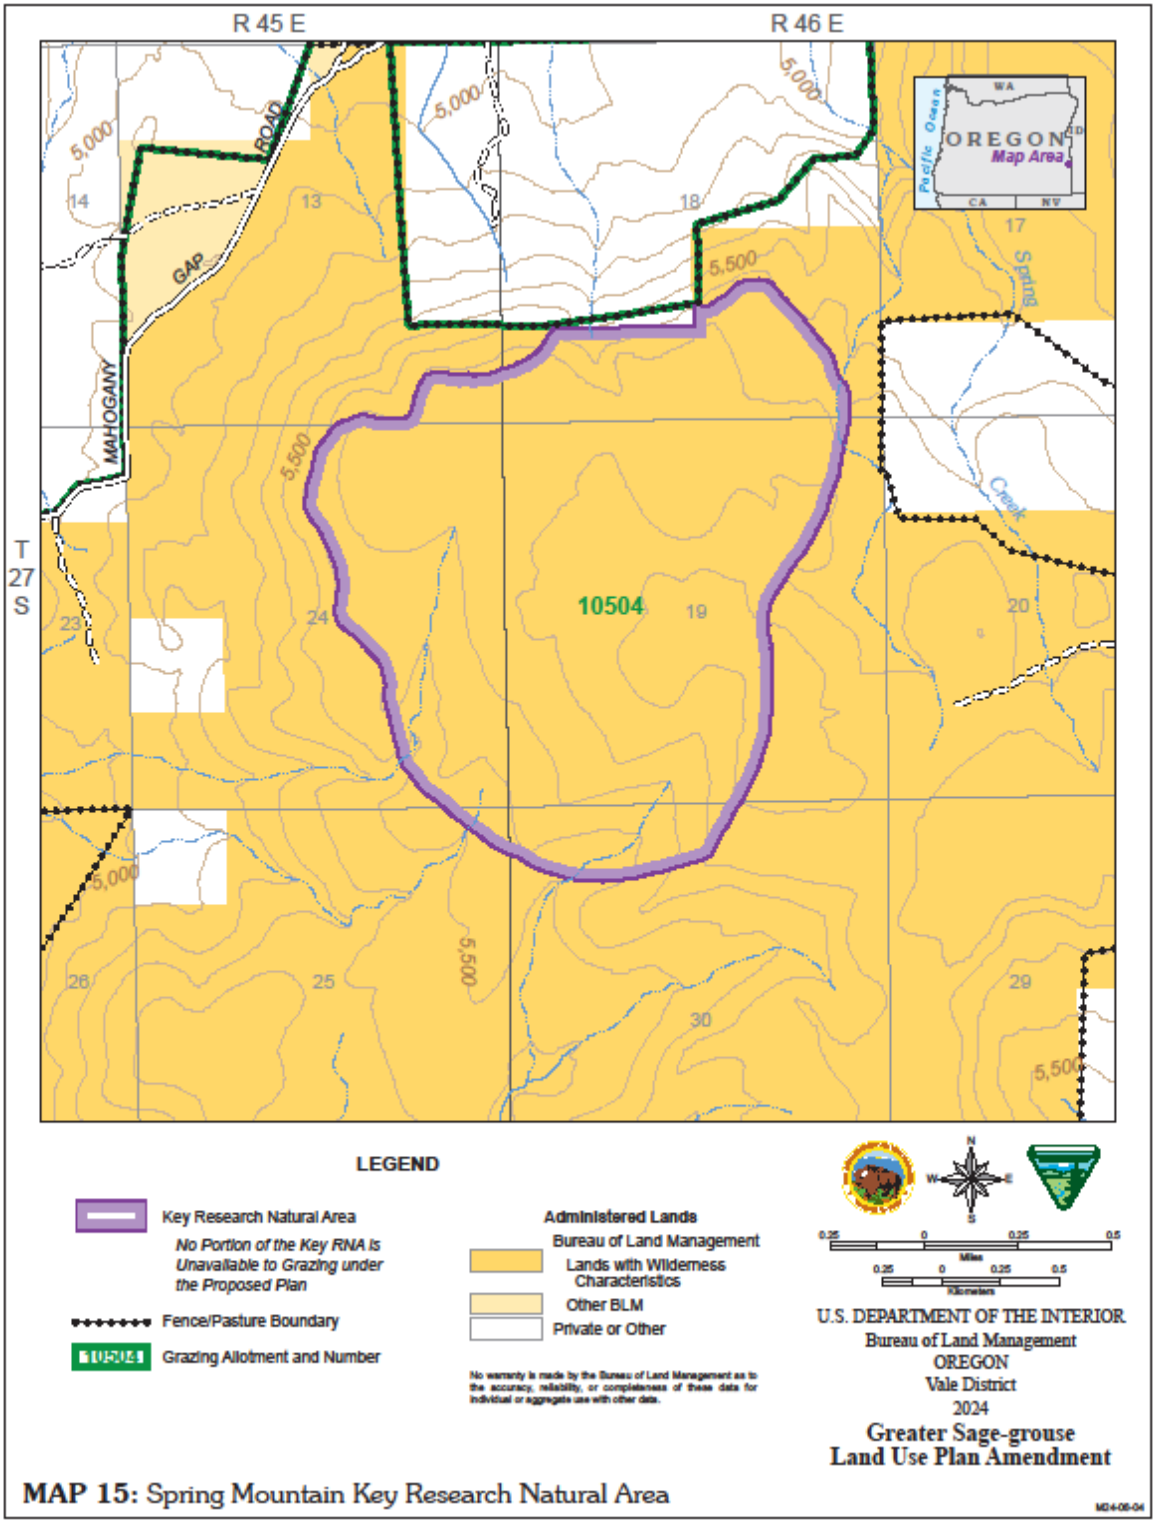
Constructing the fence would cause temporary disturbance to migratory bird habitat. Minor damage to sagebrush within the disturbance area could destroy nesting habitat, but fence construction by hand – particularly where the new fence construction is along the existing boundary road for the key RNA - generally doesn't damage much vegetation. If constructed during nesting season, some individuals could be displaced at the time, but the effects of temporary minor habitat disturbance to the overall population of migratory birds would be negligible.

Similar to migratory birds, if a fence is constructed during breeding or nesting season it could disturb sage-grouse nesting habitat or temporarily displace nesting sage-grouse. Minor damage to sagebrush could occur but fence construction by hand generally doesn't damage much vegetation. Restricting activity during those months to two hours after sunrise to two hours before sunset would minimize this disturbance. A fence is this area is not modeled as high collision risk for sage-grouse. However, if monitoring suggests collisions could occur, anti-strike fence markers could reduce the risk.

Returning livestock grazing to the remaining 513 acres of the key RNA would not cause measurable impacts to big game or migratory birds.

Outstanding opportunities for solitude and unconfined and primitive recreation would be impacted in the short-term by fence construction. The long-term negative effects to naturalness caused by the addition of fencing would be the additional structures in the Prava Peak wilderness characteristics unit. If encounters

with visitors occur during construction of the proposed fence, they may be temporarily disruptive to visitors who may be in the proximity, but this adverse impact would be brief.



The VRM in the project area is Class II. A fence would affect the existing visual quality within the area, but would meet the existing visual resource management objectives for the surrounding area.

Spring Mountain (Vale)

Proposed RMP Amendment

Retain the area identified as a key RNA and reallocate the entire key RNA as available for livestock grazing. Construct a 5-acre or less exclosure that would remove livestock use and other permitted activities to allow for nonmanipulative research and baseline data gathering within the key RNA or within close proximity to the key RNA to allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the Spring Mountain key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendices B and C of the Oregon 2015 GRSG Approved RMP Amendment.

Map 15. Spring Mountain Key Research Natural Area

Affected Environment

The 996-acre Spring Mountain ACEC/RNA is located west of U.S. Highway 95 and north of Jordan Valley, covering a portion of the top of Spring Mountain east of Mahogany Mountain. The top of the mountain is a mix of mountain big sagebrush/Idaho fescue steppe in areas with deep soils. The northern portion of the ACEC/RNA is composed of steep, talus scree. This area supports stands of western chokecherry, whortleleaf snowberry, Saskatoon serviceberry, and Lewis' mock orange. The scree tops out to a larger, relatively flat tableland dominated by diverse, large low sagebrush scablands.

The Spring Mountain key RNA is located in the Spring Mountain Native Range pasture of the Spring Mountain allotment. This area contains the majority of the access routes for livestock from one side of the pasture to the other in the upper elevations. The developed Aspen Grove Spring is a critical water source along these routes for livestock. Steep and extremely rocky slopes descend over 1000 feet in elevation to the lower pasture boundaries. Access and travel along the steep rocky slopes are limited to livestock/wildlife and are extremely difficult. The north and east sides of the pasture have fenced private land inholdings that are either partially or entirely within the pasture boundary, further compounding access and travel issues. The key RNA is centrally located in the northern portion of the "top" of Spring Mountain, creating numerous issues with access and travel routes for livestock. There is one AIM plot within the area available for livestock grazing.

The key RNA occurs within the highest elevations of the Spring Mountain Native Range pasture, and in an area where topography allows for feasible movement of livestock within and throughout the Spring Mountain Native Range pasture, as well as to other pastures within the Spring Mountain allotment. Fencing is expected to be difficult to construct due to the talus slopes and would also require above-normal (annual) maintenance by BLM due to weather conditions (evidence of natural snowbanks are common) as well as a result of anticipated damage by elk and other big game. The area is reported to have significant use by elk traveling between Oregon and Idaho ranges.

To achieve the orderly administration of livestock grazing management, throughout that season of use, livestock operators are authorized to move livestock through the key RNA, utilizing existing trailing routes. Trailing occurs to access to BLM pastures within both the Spring Mountain and adjacent allotments, as well as private lands within the Spring Mountain allotment boundary.

Specific Management under the 2002 SEORMP ROD, as Amended

The area is closed to OHV use. Plant collecting requires a permit. VRM class is Class III. Livestock use allocations will continue based on existing permit stipulations and approved AMP's, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if values will be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, including but not limited to, fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 SEORMP ACEC/RNA Designation

The relevant and important values of the ACEC/RNA are the mountain big sagebrush/Idaho fescue, low sagebrush/bluebunch wheatgrass, and riparian community dominated by peachleaf willow and coyote willow

with quaking aspen/whortleleaf snowberry vegetation cells identified by ONHP. There are several quaking aspen patches associated with springs and north-facing talus slopes within the ACEC/RNA.

2015 Greater Sage-grouse ARMPA

The Spring Mountain ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities represented in this key RNA include mountain big sagebrush/Idaho fescue community, mountain big sagebrush/mountain snowberry/Idaho fescue, mountain mahogany/chokecherry scrub (Prunus virginiana), and relatively flat tableland, dominated by low sagebrush/bunchgrass scabland community. Quaking aspen and bitter cherry communities dominate the springs.

Vegetation communities represented in this key RNA that are important to Greater Sage-grouse habitat continue to be provide life-cycle needs (such as nesting, brood rearing, wintering) despite being burned in a wildfire in 2007. Vegetative communities consist of mountain big sagebrush/Idaho fescue community, mountain big sagebrush/whortleleaf snowberry/Idaho fescue, chokecherry scrub (*Prunus virginiana*), and relatively flat tableland, dominated by low sagebrush/bunchgrass scabland community; however, sagebrush species are limited due to effects of wildfire. These communities represent the Cool-Moist Sagebrush, Dry-Shallow Sagebrush, and Riparian community types.

The chokecherry scrub (*Prunus virginiana*) plant community in this key RNA is not suitable habitat for sage-grouse because the growth structure of the dominant species is more tree like, providing no understory cover and providing perch opportunities for predators. This represents the Mountain Shrub community. The entirety of Spring Mountain ACEC/RNA burned in the 2007 Old Maid Fire. While there are some islands of sagebrush that did not burn in the fire, the majority of the ACEC/RNA lost the sagebrush component due to the fire. While some diverse vegetation communities important to Greater Sage-grouse habitat are still present within the key RNA, they are limited to unburned islands and riparian areas. The burned areas are now composed mainly of perennial bunchgrasses. Monitoring shows a strong component of native grasses and forbs present in the ACEC/RNA.

Other Resources

The Spring Mountain key RNA is wholly within the Spring Mountain lands with wilderness characteristics unit and is located in the northern portion of the Spring Mountain unit. The 18,311-acre Spring Mountain unit possesses naturalness, and outstanding opportunities to experience solitude. Elevations range from 4,565 to 5,987 feet within the unit. The unit contains the 5,987-foot tabletop mountain known as Spring Mountain. Existing human imprints in the unit include 10.9 miles of rangeland fence, 11.2 miles of 10 primitive routes,19 developed springs, 2 pipelines totaling 2.7 miles and an associated trough, all of which appears substantially unnoticeable to the average visitor. The BLM decided not to prioritize protection of the wilderness characteristics in the Spring Mountain unit (BLM 2024a, Appendix A, p. A-4).

The visual resource management is Class II.

The key RNA is within PHMA and is part of the Cow Lakes Priority Area of Concentration. It is included within the boundary of Greater Sage-grouse spring nesting, summer brood-rearing, and winter habitat. One site within the key RNA has been evaluated using the Greater Sage-grouse Habitat Assessment Framework (HAF). It had an abundance of perennial grasses but almost no sagebrush. The site was determined to be marginally suitable for spring nesting habitat and unsuitable for winter habitat. There are two pending active

leks approximately 1.2 miles from the key RNA boundary; and 11 active and 4 total pending active leks within 4 miles of the key RNA.

The Spring Mountain key RNA is essential year-round range for pronghorn. It is utilized by deer, elk, and pronghorn throughout the year. ODFW's Oregon Connectivity Assessment and Mapping Project (OCAMP) categorized this area as a Priority Wildlife Connectivity Area (PWCA) – Region. Regions are the top 1% of connectivity priorities and represent the highest-value habitat for facilitating species movement. In addition, this area has a priority Recommended Conservation Action of 'Protect,' the strongest conservation measure for maintaining wildlife connectivity.

Aspen Grove Spring is the only flowing spring within the key RNA. It is developed with a trough for livestock water. Outside the key RNA, the nearest springs include the following developed springs: Old Maid Spring to the southeast, Gap Spring the northwest, and Lunch and Chukar Spring to the northeast. Several undeveloped springs occur in the vicinity as well, most notably the undeveloped Old Maids Basin Spring Complex just south of the key RNA. This spring complex was rated as Functioning-at-risk (FAR) using the Proper Functioning Condition protocol (PFC Assessment Form (Lentic) completed for the Old Maid Basin Spring Complex by Cloud, Dugan, Ketcham, and Wilson, 09/16/21), with the main compromising characteristics being hummocks in spring heads, eroded banks, and a large headcut in the lotic portion. Even though it is rated FAR, the Greater Sage-grouse HAF site-scale evaluation of the spring complex rated it as suitable late brood-rearing habitat based on a high diversity and abundance of sage-grouse preferred forbs, and high perennial herbaceous plant cover mixed with areas of sagebrush and other shrubs in the uplands for shelter.

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The area continues to be in a desirable condition, notwithstanding being burned by wildfire in 2007. The area continues to recover and provides opportunities for research where natural recovery post-fire is occurring.

The entire key RNA burned in 2007, eliminating the majority of the sagebrush within the area. However, the area continues to be in a desirable condition, notwithstanding being burned by wildfire in 2007. The area continues to recover and provides opportunities for research where natural recovery post-fire was allowed to occur. The area remains composed of diverse vegetation community types of native bunch grasses, snowberry, and riparian areas that are important to Greater Sage-grouse. In the long-term, and upon full recovery from the 2007 fire, some occurrence of vegetative communities including Cool-Moist Sagebrush, Shallow-Dry Sagebrush, and Mountain Shrub, and Riparian are expected to be represented. Use by Greater Sage-grouse within the key RNA has not been documented.

Management would continue to protect the relevant and important values of the RNA. Opportunities for nonmanipulative research and baseline data gathering on plant community types relatively unaltered by human activity continue to remain, along with vegetative communities identified as important for greater sage-grouse, due to the remote and rugged nature of the area. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated.

Rationale for Reallocating the Area as Available for Livestock Grazing under Proposed RMP Amendment

On-the-ground site specific visits revealed remote and rugged terrain that would be challenging for the construction of new fencing. Fencing is expected to be difficult to construct due to the talus slopes and would also require above-normal (annual) maintenance by BLM due to weather conditions (evidence of natural snowbanks are common) as well as anticipated damage by elk and other big game. The area is reported to have significant use by elk traveling between Oregon and Idaho ranges.

Excluding livestock from the area currently allocated as unavailable for livestock grazing without construction of new physical barriers would require higher levels of BLM and permittee management. Similarly constructing and maintaining new fencing in this area would require time and resources that would reduce BLM's ability to allocate resources to other projects and other areas.

Reallocation would eliminate increased commitments of management investments (time, materials, etc.) for BLM and the livestock operators in the key RNA and allotment. Both parties would have improved opportunities to allocate resources to higher priorities within the allotment such as range improvement projects and maintenance. Reallocation of livestock grazing would reduce socio-economic effects to livestock operators by eliminating the potential reduction of AUMs associated with Alternative 1.

The location of the area currently unavailable for livestock use (and under Alternative 1) impacts trailing routes used for moving livestock between other portions of the Spring Mountain Native Range pasture as well as other pastures within the Spring Mountain allotment.

Allocating the area as available for livestock grazing would eliminate the need for fencing or other management actions that impact feasible livestock movement and distribution due to the limited number of developed water sources in the area.

While some sagebrush communities are still present, the majority of the key RNA is now grassland. Livestock using the key RNA if it were reallocated as available for livestock grazing would concentrate in areas where the best forage is available, which would be the portions of the key RNA with high perennial grass cover. Thus, the livestock would not concentrate on the remaining islands of sage-grouse habitat.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

Under these alternatives, there would be either the construction of a fence or increased human presence needed to prevent livestock incursion into the key RNA. Either would disrupt wildlife, particularly big game such as elk that are known to occur within the Spring Mountain key RNA and associated Spring Mountain Native pasture.

Vegetative communities important to greater sage-grouse within the area where livestock are removed is expected to have a positive response. Due to the central location of the Key RNA within the pasture, shifts in grazing use to other portions of the pasture may have negative impacts if changes in grazing systems or management practices are not adjusted as a result of excluding livestock from the Key RNA, which is allocated as unavailable for livestock use in its entirety.

Aspen Grove spring would no longer be available as a livestock water source and, if permitted AUMs were not reduced or other adjustments to grazing systems did not occur, displaced livestock would need to find alternative water sources to replace it. The replacement of an existing water development with the construction of a new one would result in an increased level of disturbance in the short-term, including impacts to vegetation and soils, and long-term impacts to livestock management and upland and riparian resources due the water development itself and the resulting modified livestock grazing distribution. Short-term impacts would range between 1.79 and 3.04 acres, and long-term impacts would range between 0.76 and 1.53 acres, depending on the extent of new water development and/or existing water development replacement.

The need for management actions for livestock exclusion would result in disturbance to wildlife, including sage-grouse and large ungulates. The Oregon Department of Fish and Wildlife identified this area as important habitat for wildlife movement (Oregon Connectivity Assessment and Mapping Project. 2023. Oregon Department of Fish and Wildlife, Salem, OR. The addition of a fence or increased presence of livestock operators would hinder or alter wildlife movement although impacts are not expected to be significant if design features that reduce negative effects to wildlife are put in place. Additionally, there is the opportunity for fence related conflicts (e.g. bird collisions and entrapments).

Livestock crossing permits would need to be issued on an annual basis; these permits would be limited to a one-day crossing on identified routes for each requested application (up to an average of four times annually), depending on the annual livestock grazing schedule and rotation. These actions are not expected to cause additional impacts (negative or positive) to vegetation or soils due to the activity occurring primarily on existing roads or trails.

Unless AUMs were reduced, grazing rotations are adjusted, and/or additional infrastructure such as water developments and fences are constructed, livestock displaced from the key RNA would disperse to adjacent unburned sagebrush and abundant riparian areas, thus increasing livestock concentration in good quality sagebrush and riparian habitat. These activities may have impacts to other resource values as well, which would be determined through implementation-level analysis and additional monitoring to determine impacts to the portions of the pasture that remain available for livestock use.

The construction of fencing would decrease the sense of naturalness, a wilderness characteristic. Fence construction or the need for additional active livestock management (e.g., herding) would create short-term impacts to outstanding Opportunities for Solitude during fence construction or longer-term impacts caused by active management to exclude livestock from the key RNA.

Alternatives 2, 5, and 6

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing, active livestock management (herding), crossing permit authorizations, or water developments for livestock. Impacts to vegetative communities, riparian areas, or wildlife would not occur as infrastructure and/or increased human presence to deter livestock incursions within the Key RNA would not be required. Changes in livestock grazing management to address possible impacts to relative and important values within the Key RNA, if caused by livestock, would continue to be allowed. The wilderness characteristics of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative, either short-term or long-term, any more than it had been at the time that this unit was identified as one with wilderness characteristics.

Although research opportunities would remain, a designated area for non-manipulative research (aka control area) would not be established at this time. However, this does not prevent the opportunity to construct a 5-acre or less exclosure to remove livestock and other permitted activities to allow for non-manipulative research site or a control area, as long as the location of the infrastructure meets required specifications of Appendix B and C of the 2015 ARMPA.

These alternatives would allow livestock grazing to resume within the key RNA and would not require management actions to keep livestock from entering the Spring Mountain key RNA. Prior to grazing being removed from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated (BLM. Monitoring data. 05/31/2017; BLM. Monitoring data. 07/07/2020). Even with disturbance from fire, and with livestock use present, vegetative condition remained adequate to support studies of long-term natural processes, particularly recovery post-fire (BLM. Monitoring data. 05/31/2017; BLM. Monitoring data. 07/07/2020).

All existing water sources would be available for livestock and an additional water development elsewhere within the Spring Mountain Native pasture would not be necessary, resulting in no new disturbances to soils, vegetation, and associated wildlife habitats.

The wilderness characteristic of naturalness would not be impacted because new fence construction or increased presence of humans would not occur under the Proposed RMP Amendment. Outstanding opportunities for solitude would not be impacted as short-term impacts to solitude caused by fence construction would not occur. Long-term impacts to solitude caused by active management to exclude livestock from key RNA would also not occur. The return of livestock grazing to the area would not impact naturalness to the extent that it would no longer be present as cows were on the landscape when these wilderness characteristics were identified.

Livestock use occurring as a result of reallocating the key RNA as available for livestock grazing would likely be in the areas where the best forage species are available; this is the burned areas where there are abundant perennial bunchgrasses, rather than in the remaining islands of sagebrush where grasses may be present but are much more limited; such use would not be concentrated on the vegetative communities identified as important for greater sage-grouse.

Reallocating livestock grazing to the key RNA would eliminate the need for fencing or additional active livestock management (e.g., herding) to avoid livestock incursion into the key RNA. The reallocation of the area as available for livestock grazing would not impact the wilderness characteristic of naturalness beyond that which was present when this characteristic was identified. Further, naturalness would not be impacted by new fence construction or the additional presence of people. Outstanding opportunities for solitude would remain as short-term impacts to solitude caused by fence construction and long-term impacts to solitude caused by active management to exclude livestock from key RNA would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). Wilderness characteristics of naturalness, opportunities for solitude, or primitive and unconfined recreation would not be impaired under this alternative, nor would there be any short-term disturbances to these characteristics caused by fence construction. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

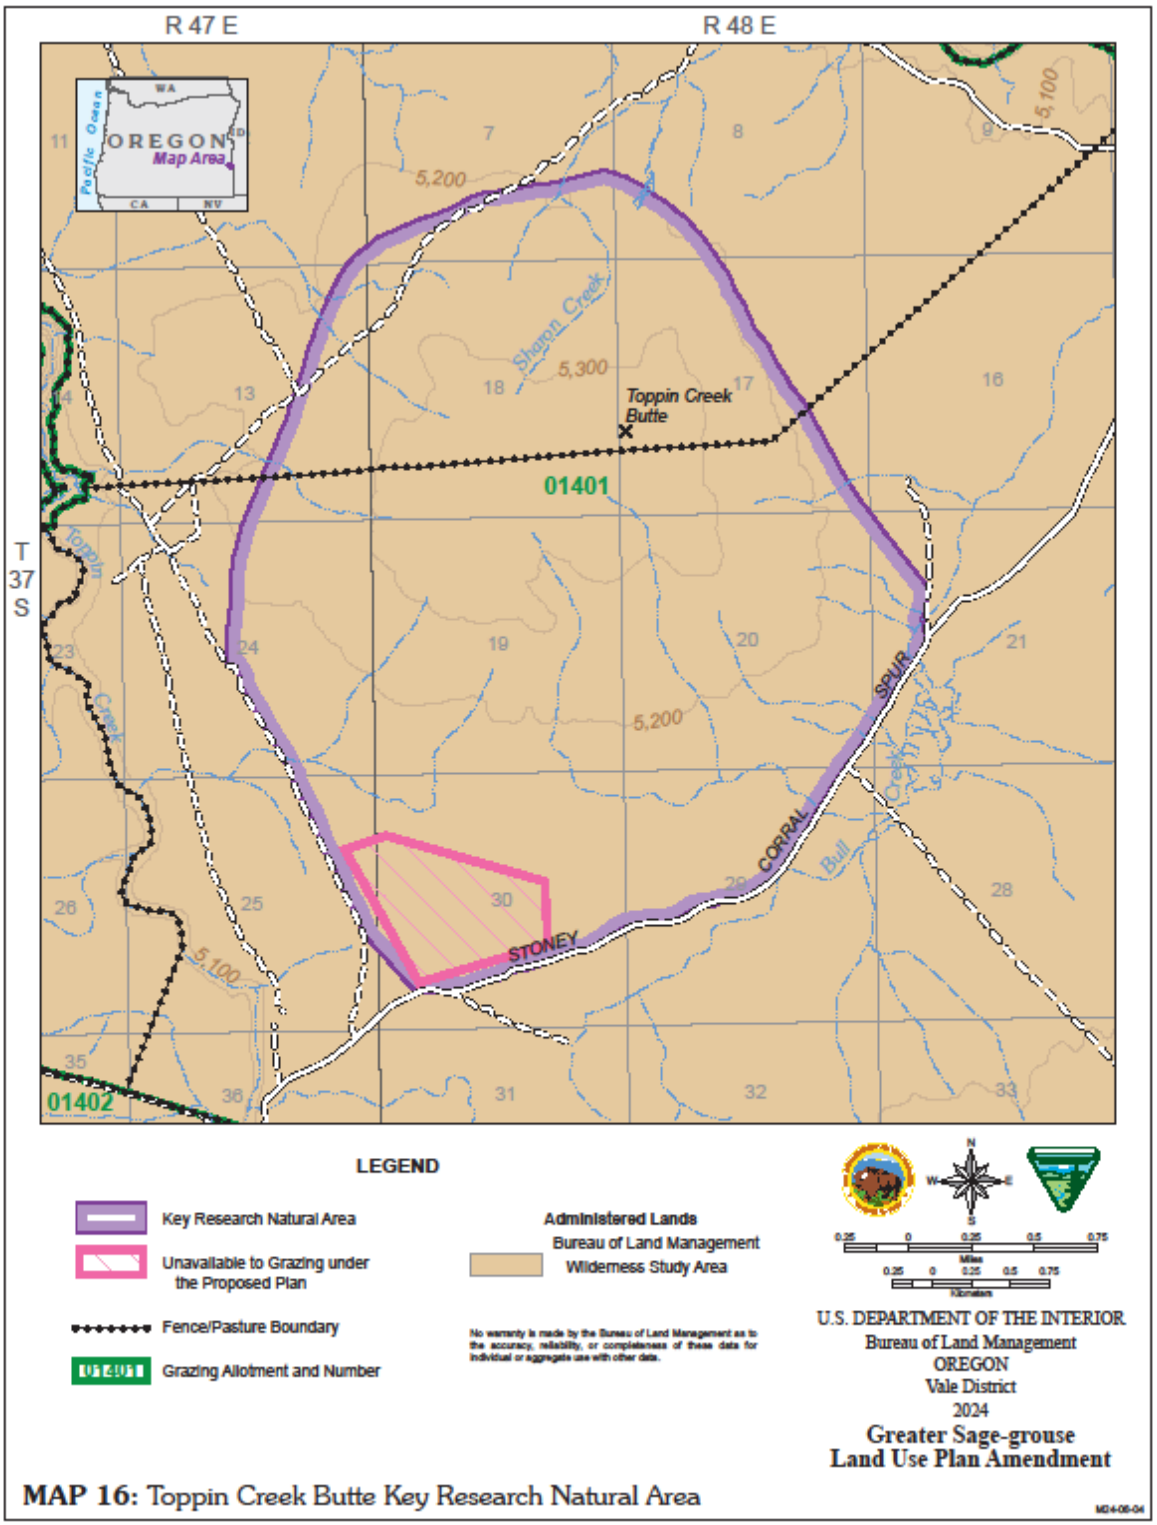
Proposed RMP Amendment

The construction of a 5-acre or less exclosure that would remove livestock use and other permitted activities would allow for nonmanipulative research and baseline data gathering within close proximity to the key RNA. This would allow for ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for greater sage-grouse within the Spring Mountain key RNA. The location, size, and design of the exclosure site would adhere to variations in lek buffers and required designed features as specified in Appendiees B and C of the Oregon 2015 GRSG Approved RMP Amendment. There would be at least short-term impacts from fence construction outside of, but near to, the key RNA which may affect wildlife and wilderness characteristics. However, in the long-term he wilderness characteristics of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative any more than they had been at the time that this unit was identified as one with wilderness characteristics.

Reallocating the entire key RNA as available for livestock grazing would allow for the resumption of management practices employed prior to 2023. Prior to the removal of grazing from this key RNA, livestock grazing management prescribed had not adversely impacted the important vegetative communities identified for the Greater Sage-grouse.

Because the entire key RNA would be allocated as available for livestock grazing, there would be no need for fencing, active livestock management (herding), crossing permit authorizations, or water developments for livestock. Impacts to vegetative communities, riparian areas, or wildlife would not occur as infrastructure and/or increased human presence to deter livestock incursions within the Key RNA would not be required. Changes in livestock grazing management to address possible impacts to relative and important values within the Key RNA, if caused by livestock, would continue to be allowed. The wilderness characteristics of naturalness, outstanding opportunities for solitude, and unconfined primitive recreation would not be impaired under this alternative, either short-term or long-term, any more than it had been at the time that this unit was identified as one with wilderness characteristics.

All existing water sources would be available for livestock and an additional water development elsewhere within the Spring Mountain Native pasture would not be necessary, resulting in no new disturbances to soils, vegetation, and associated wildlife habitats.



Livestock use occurring as a result of reallocating the key RNA as available for livestock grazing would likely be in the areas where the best forage species are available; this is the burned areas where there are abundant perennial bunchgrasses, rather than in the remaining islands of sagebrush where grasses may be present but are much more limited; such use would not be concentrated on the vegetative communities identified as important for greater sage-grouse.

Toppin Creek Butte (Vale)

Proposed RMP Amendment

BLM proposes no changes to the key RNA boundary, but has reduced the area allocated as unavailable for livestock grazing from 2,865 acres to 203 acres to reduce conflicts with other resources. The smaller exclosure would still maintain the vegetation communities that are important to Greater Sage-grouse habitat.

Map 16. Toppin Creek Butte Key Research Natural Area

Affected Environment

The 3,998-acre Toppin Butte ACEC/RNA is located 30 miles northeast of McDermitt, Nevada, and adjacent to the Idaho state line. The topography includes a gently sloping hill with a rapidly draining soil. Little water has been available for livestock on the Butte, and the topography still limits livestock use on the upper slopes. Two playas at the base of Toppin Butte contain a bare playa vegetation community and a silver sagebrush community. The key RNA is located in portions of Owyhee River Canyon WSA. The southern portion (2,865 acres) of the ACEC/RNA is allocated under the 2015 ARMPA as unavailable for livestock grazing.

Specific Management under the 2002 SEORMP ROD, as Amended

OHV use is limited to designated roads and trails. The area is VRM Class I. Plant collecting requires a permit. Road maintenance will be limited to the existing roadway, and shoulder/barrow ditch construction will be limited to that necessary to control runoff, minimize soil erosion, and ensure public safety and serviceability of the road. Surface-disturbance will be deferred while soils are wet, and any future rehabilitation will be with local source native plant species. Livestock use allocations will continue based on existing permit stipulations and approved AMPs, unless modified under subsequent land use planning. Any proposed changes in livestock grazing, including time and intensity of use, will be evaluated for impacts on the relevant and important values and will be permitted if the values will be maintained or enhanced. Existing livestock use allocations will be adjusted where adverse impacts are identified using a variety of methods, including, but not limited to, fencing, reduction in livestock numbers, and changes in grazing season. Proposed projects in the area will be evaluated for impacts and permitted where relevant and important values will be maintained or enhanced. Noxious weeds will be aggressively controlled using limited methods, such as backpack hand sprayers, focusing on roads and other disturbed areas in and adjacent to the ACEC/RNA.

Summary of Key RNA and Relevant and Important Values Evaluated for ACEC/RNA Designation

2002 SEORMP ACEC/RNA Designation

The relevant and important values of this ACEC/RNA are the low sagebrush/bluebunch wheatgrass community in excellent condition and low sagebrush/Idaho fescue plant community vegetation cells identified by the ONHP.

2015 Greater Sage-grouse ARMPA

The Toppin Creek Butte ACEC/RNA was identified as a key RNA for sagebrush plant communities that are important for Sage-grouse.

Updated Vegetation Communities and Sage-Grouse Habitats

Vegetation communities present in this key RNA include low sagebrush/Idaho fescue, low sagebrush/bluebunch wheatgrass, silver sagebrush/Sandberg's bluegrass plant communities. In addition, bare playa, Wyoming big sagebrush and basin big sagebrush communities are also present in the key RNA though not identified in the 2015 ARMPA.

Vegetation communities represented in this key RNA that are important to Greater Sage-grouse habitat continue to be relatively unaltered. These communities are low sagebrush/Idaho fescue, low sagebrush/bluebunch wheatgrass, silver sagebrush/Sandberg's bluegrass, and Wyoming sagebrush plant communities. These communities represent the Cool-moist/Warm-Dry Sagebrush, Shallow-Dry Sagebrush, and playa communities. The key RNA is within Greater Sage-grouse Priority Habitat Management Area (PHMA)); two pending active leks are within two miles of the key RNA boundary, one of which is located inside the key RNA. The western side of Toppin Creek Butte ACEC/RNA burned in the 2013 Sharon Creek Fire. In the burned area there are islands of sagebrush habitat which did not burn. Monitoring has indicated

invasion of cheatgrass post fire has occurred but is isolated and minimal (2018 Louse Canyon GMA Land Health Assessment and Evaluation).

Other Resources

Toppin Creek Butte key RNA is 3,998 acres and is located wholly within the Owyhee River Canyon WSA. The WSA's outstanding opportunities for solitude are attributed to the isolated, intimate seclusion of canyonlands and the vastness of seemingly undisturbed desert plateau lands and distant mountain ranges. The Main Owyhee River and West Little Owyhee River are designated portions of the National Wild and Scenic River System (NWSRS) and flow through the Owyhee River Canyon WSA. River running opportunities are of exceptionally high quality and considered nationally significant. The scenic natural features and diversity of rugged landforms attract people interested in hunting, fishing, backpacking, sightseeing, outdoor photography, and wildlife viewing.

There is one population of mesamint (*Pogogyne floribunda*), a Bureau sensitive plant, located at the eastern edge of the key RNA. This population straddles Stoney Corral Spur Road.

The key RNA is designated as bighorn sheep occupied habitat.

The visual resource management is Class II (BLM 2002, p. 71).

Rationale for Proposing Alternative that Modifies Key RNA Management

Rationale for Retaining the Key RNA under All Alternatives

The area continues to be in a desirable condition for the vegetative communities identified; management will continue to protect the relevant and important values. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing to the vegetative communities identified as important for Greater Sage-grouse or the relevant and important values for which the RNA was designated.

Existing management would retain the following vegetation types important to Greater Sage-grouse: Cool-Moist/Warm-Dry Sagebrush, Shallow-Dry Sagebrush, and Playa.

Rationale for Modifying the Area Allocated as Unavailable for Livestock Grazing

Exclosure fence construction in the WSA is an issue that would be addressed with the proposed modification for the area allocated as unavailable for livestock grazing. Developments that would "impair the suitability of WSAs for the preservation as wilderness" cannot be permitted unless they were to meet one of the exception criteria described in BLM Manual 6330, Management of Wilderness Study Areas. "In determining whether a development meets the protecting or enhancing wilderness characteristics exception, the BLM will determine if the structure's benefits to the natural functioning of the ecosystem outweigh the increased presence of human developments and any loss of naturalness, or outstanding recreational opportunities caused by the new development" (BLM 2012, p. 1-17). However, developments that meet an exception criterion must still be carried out in the least impairing manner practical.

The location of the 203-acre exclosure under this alternative is within intact sagebrush communities that were not impacted by wildfire. Making this area unavailable for livestock grazing would reduce the impacts of fencing or increased management presence in the Owyhee River Canyon WSA required to implement the closure. Disturbance in the WSA from fencing would be reduced compared to Alternative 1 with half of this distance occurring along the existing key RNA road boundary.

Environmental Consequences

Consequences Common to all Alternatives

Vegetative communities that are important to Greater Sage-grouse habitat would continue to be available for provide baseline data on relatively unaltered plant community types important to Greater Sage-grouse.

Alternatives 1 and 4

The current active management of livestock to keep them out of the key RNA impacts opportunities for solitude and primitive and unconfined recreation within the Owhyee River Canyon WSA. In the future, should the decision be made to construct fence to keep livestock out of the area allocated as unavailable for livestock grazing, it would require fence construction within a WSA. The fence would be located approximately 60 feet from the mesamint (*Pogogyne floribunda*) site, with the plant site being on the side of the fence that would retain livestock grazing. The proximity of the fence to the plant site could potentially directly impact the plants in the short- and long-term due to livestock walking along the fence line, disturbing the ground. There may be impacts to individual plants, but the population as a whole is expected to persist. The proposed fence location for the Proposed RMP Amendment is approximately 1.5 miles from the plant site and would have no impacts on individual plants or the population in the short- and long-term.

Alternative 2

Because the entire area would be allocated as available for livestock grazing, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness, outstanding opportunities for solitude, and primitive and unconfined recreation would not be impaired under this alternative either short-term or long-term any more than it had been at the time that this unit was identified as one with wilderness characteristics. Fence-related conflicts would not occur.

Alternative 3

Because livestock grazing would not occur in the vicinity of this key RNA, there would be no need for fencing or active livestock management (herding). The wilderness characteristic of naturalness, outstanding opportunities for solitude, and primitive and unconfined recreation would not be impaired under this alternative either short-term or long-term. Fence-related conflicts would not occur. An ungrazed reference for research would be retained.

Alternatives 5, 6, and Proposed RMP Amendment

The plant communities included in the 203-acre exclosure are the low sagebrush/Idaho fescue, low sagebrush/bluebunch wheatgrass, silver sagebrush/Sandberg's bluegrass plant communities. Prior to the removal of grazing from this key RNA, there was no indication of negative impacts from livestock grazing on these communities (BLM 2018b, p. 25).

These alternatives would reallocate as available for livestock grazing to 2,662 acres in the key RNA and reduce potential new fence length. Reducing the area that would be allocated as unavailable for livestock grazing would reduce the amount of fence needed and that would reduce the possibilities of wildlife-fence collisions.

A fence around the area allocated as unavailable for livestock grazing would be located approximately 1.5 miles from the mesamint (*Pogogyne floribunda*) site, and would have no impacts on individual plants or the population in the short- and long-term.

Livestock management under these alternatives would continue to allow for maintenance of recent conditions, which were found to be in desirable condition and near proper functioning condition under the 2017 Standards for Rangeland Health Assessment and Evaluation (BLM 2018b, p. 72-75).

There would be impacts to the wilderness characteristics of naturalness as well as outstanding opportunities for solitude, and primitive and unconfined recreation, although they would be less than under Alternative 1. Short-term impacts to solitude caused by fence construction and long-term impacts to solitude caused by active management to exclude livestock from key RNA would not be as extensive.

Appendix 18. Social and Economic Impact Analysis Methodology and State-Specific Impact Analysis

18.1 Introduction

This appendix describes the methods and data that underlie the social and economic impact analysis, the economic impact modeling analysis, and the environmental justice impact discussions. The social and economic impact analysis uses two general approaches. These are quantitative analysis and qualitative analysis. Input-output models such as the Impact Analysis for Planning (IMPLAN) model, an input-output (IO) model, provide a quantitative representation of the final demand and production relationships between individual economic sectors. This quantitative analysis approach is used when adequate information on physical production quantities and the prices and costs for goods and services is available. The first portion of the following discussion describes general aspects of the quantitative, qualitative, and environmental justice impact analysis methodologies. The quantitative methodology discussion describes the inputs required to run the IMPLAN model and how IMPLAN is used to estimate quantitative economic impacts. The resulting estimates from the IMPLAN model, by alternative, are in the Social and Economic Conditions (Including Environmental Justice) section of **Chapter 4**. The remaining sections provide additional detailed data used in the analysis for oil and gas, renewable energy (including geothermal, wind, and solar), and livestock grazing.

18.2 General Aspects of the Methodologies

18.2.1 Quantitative Economic Impact Analysis Using IMPLAN

A quantitative economic impact analysis was conducted for three resource uses: oil and gas development and production, geothermal development and production, and livestock grazing. Due to limitations on availability of data on production and quantity of market activities, analyses for nonenergy leasable minerals, locatable minerals, mineral materials, wind and solar energy, and greater sage grouse conservation were conducted qualitatively (see **Section 18.2.2**, Qualitative Economic and Social Impact Analysis, for discussion on the qualitative methodology used in the social and economic impacts analysis).

The basic approach used in quantitative economic impact analysis is to identify the economic sectors to be directly impacted and estimate the amount of direct economic activity likely to be affected by management decisions. For instance, management actions affecting oil and gas development on federal minerals could affect the Drilling Oil and Gas Wells sector if expenditures made by oil and gas companies to drill and complete new wells changes in response to these management actions. Potential direct impacts could also stem from changes in the amount of oil and gas produced. When direct impacts to economic activity can be quantified, they can be run through an economic input-output model to estimate the secondary economic activity that is generated as the direct impact ripples through the economy, "upstream" to providers of goods and services necessary for production, and "downstream" as income generated from production is spent by the households that receive the income.

The upstream, downstream, and total effects on economic activity are estimated through use of the IMPLAN model, an off-the-shelf input-output model that provides a mathematical accounting of the flow of money, goods, and services through a specified region's economy and yields estimates of gross economic output, jobs, and labor income. The model provides estimates of how economic activity (i.e., economic output,

income, and employment) in one sector of the economy ripples through the broader economy, affecting seemingly unrelated sectors. These ripple effects include both indirect and induced impacts of proposed management actions. Indirect impacts result from changes in economic activity in industries that sell inputs to the industries that may be directly impacted (for example, varying levels of economic output stemming from changes in supply purchases made by firms contracted to drill oil and gas wells). Induced impacts result from changes in household spending as households adjust their spending in response to increases or decreases in labor income supported by industries directly and indirectly affected by management actions (for example, changes in purchases at local stores for personal groceries).

This analysis used IMPLAN Cloud and data from IMPLAN's 2021data release. This means that parameters such as productivity and trade data reflect annual average economic conditions in the analysis areas during 2021. IMPLAN 2021 is the most recent vintage of data currently available in the IMPLAN Cloud platform. Prior to running the model, cost and price data were converted to a consistent dollar year (2023) using sector-specific adjustment factors from the IMPLAN model. Unless stated otherwise, the values in this appendix are expressed in year 2023 dollars.

Two models for each of the 10 states in the planning area were run, separately. The first model analyzed only the impacts on the counties in each state's analysis area, combined for each state. This provides information on the local economic contributions from direct economic changes in the analysis area, but it does not provide data on the economic contributions that result in other neighboring regions in the state from the direct changes in the analysis area. The second model took a multi-regional approach and analyzed the impacts on each state from direct impacts in the analysis area. The trade data available in the current version of IMPLAN (IMPLAN Cloud) make it possible to do multi-regional input-output (MRIO) analysis to track how an impact on any of the IMPLAN sectors in the identified socioeconomic analysis areas affects outputs in any of the sectors in other regions outside of the analysis area. For this analysis, this feature allowed the estimation of how an impact in the counties in the analysis area disperses into the counties in the rest of the state, and how these effects in the rest of the state create additional local effects in the analysis area. As a result, it was possible to estimate not only the jobs and income generation in the analysis area, but to also estimate how the economic activity in the analysis area affected jobs and income in each state as a whole.

The current IMPLAN model has 546 economic sectors, of which 507 are represented in the analysis area counties across all 10 states and 539 are represented across all counties in all states in the planning area (IMPLAN 2021 data).

Economic impacts were estimated and provided as an annual average over a 20-year time period (2023-2042). All dollar figures throughout the economic analysis area in constant 2023 dollars.

18.2.2 Qualitative Economic and Social Impact Analysis

The second methodological approach relies on qualitative discussions to describe potential economic and social impacts when impacts cannot be quantified. In such cases, the analysis describes the type of impact in a base scenario (in this planning effort, Alternative 1) and then assesses the relative changes in terms of increases or decreases in costs, the value of production, or differences in social conditions and changes in way of life for the communities across the analysis areas. This approach is used to describe potential impacts on market values, nonmarket values, and social conditions, which are all interconnected and discussed together by alternative.

Some of the management decisions under this planning action would result in increased costs to operators – the firms or individuals who undertake the activities – or to project proponents. The economic impacts of decisions that increase costs for operators and/or project proponents are many and can be complex. Cost increases may cut into profitability and drive delays to, reductions in, or cessation of operations or projects. However, where operations or projects are not delayed, reduced, or terminated, increased costs also represent increased economic activity. For instance, if changes in ROW avoidance and exclusion areas under an alternative result in a change in solar plant siting and would require a new transmission line having to take a longer route, additional expenditures for materials, equipment, and labor would be made. These increased expenditures would support some amount of additional income and employment. However, increased costs may also represent opportunity costs; that is, the project proponent or society may have benefited more if the additional funds were used in another way. In the socioeconomic analysis in **Chapter 4**, where management actions would potentially increase costs to operators or project proponents, these increased costs are pointed out and discussed qualitatively. Readers should keep in mind that these increased costs reflect an opportunity cost which may negatively impact operators and be perceived as a benefit by others but may not be socially optimal overall.

Some effects associated with land management actions stem from changes in environmental goods and services that are not traded on traditional markets and whose value is not captured in standard measures of economic activity. Since these goods and services exist outside of observable markets, they lack prices that reveal people's willingness-to-pay for the benefits derived from them and are commonly referred to as nonmarket goods. The term "nonmarket values" refers to the benefits individuals derive from nonmarket goods, such as clean air and water, and healthy populations of wildlife. These values include the personal benefits derived from experiences in the natural environment or uses of natural and cultural resources. Nonmarket values also include passive use values (i.e., existence, option, and bequest) which are independent from the direct and indirect use of natural resources. Since these values are difficult to quantify because they cannot be estimated using observable market prices, qualitative discussions are essential to identifying and assessing impacts to nonmarket values in the planning process (see **Chapter 3** for more information on nonmarket values in the planning area).

Qualitative analysis is critical to understanding how management actions may affect social structures and values. While some social impacts stem from economic impacts, such as when changes in mineral payments and tax revenue impact the provisioning of public services and maintenance of infrastructure. Other potential impacts are social and cultural in nature and can affect quality of life, recreation and amenity values, and traditional land uses and associated cultural values. Social impacts stemming from BLM management decisions can vary considerably depending on the characteristics and diversity of the communities of interest that are involved. Additionally, the level of impacts is dependent on the degree to which new and revised management actions alter the course set in previous BLM decisions, and the degree to which local populations are dependent on BLM lands and resources. For a planning effort that covers 10 state analysis areas, analysis of social impacts must necessarily focus on broader discussion of impacts. As a result, in **Chapter 4**, a qualitative review is provided on potential social impacts resulting from changes in public service available for populations, based on anticipated changes to employment levels and tax revenues. These social impacts are discussed alongside the economic changes in employment, output, and tax revenues as well as the impacts on quality of life and non-market values associated with GRSG conservation as well as livestock grazing and wild horse and burros.

Additionally, the social impacts analysis addresses impacts based on the varying points of view of key types of communities of shared interest. **Chapter 3** and **Appendix 13**, Socioeconomics Baseline Report, identify

several broad categories of communities of shared interest that could be impacted by sage-grouse management decisions in the planning area. These categories reflect different linkages people have to public land and reflect distinct sets of attitudes, beliefs, values, opinions, and perceptions about natural resources and the effects of various management policies and actions. It should be noted that individuals and social groups may have multiple interests and often identify with more than one community of shared interest category. This categorization allows for differentiation of social impacts based on broad differences in points of view. The social impacts analysis in **Chapter 4** of the EIS assesses the alternatives against the different points of view in the broad communities of shared interest categories.

As mentioned above, impacts to market, nonmarket, and social conditions are interrelated, so in **Chapter 4**, they are discussed together for each resource use. The methodology and assumptions for each resource use are discussed below, in **Section 18.3**, Methodologies by Resource Use.

18.2.3 Environmental Justice Impact Analysis

Definitions and methods for analysis of potential environmental justice issues are described in **Appendix 13**, Socioeconomic Baseline Report. In short, the socioeconomic study area was screened to identify counties with minority, low-income, or American Indian and Alaska Native populations that qualify as potential environmental justice populations based on guidance for environmental justice analysis from the Council on Environmental Quality and the BLM (CEQ 1997, BLM 2022). These counties and their potential environmental justice populations are noted in **Chapter 3** of the EIS, as well as **Appendix 13**, Socioeconomic Baseline Report. The BLM reviewed public comments and issues of concern that were brought up in 2012 economic workshops and public scoping comments received in 2012, 2019, and for the current planning effort. These issues were considered for carrying forward for impact analysis based on the BLM-management decisions included under the alternatives for this planning effort. Assessment of the likelihood of disproportionate and adverse impacts to these populations was conducted as described in **Chapter 4** of the EIS.

18.3 Methodologies by Resource Use

18.3.1 Oil and Gas

The economic impact of oil and gas reflects drilling, completion, production and tax revenue activities, and changes in economic impacts of oil and gas stem from changes in these activities due to a change in the level of stipulations for the protection of Greater Sage-Grouse under each alternative. Under alternative 3, all areas managed for GRSG would be PHMA and fluid minerals in these areas would be closed to leasing (see **Section 4.9**, Mineral Resources, of this EIS for more details). Closing areas to fluid mineral leasing could result in impacts on level of oil and gas activities and associated jobs, income, and tax revenue supported by local operations. Under alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment, all states include language to maintain and enhance sagebrush habitats with the intent of conserving sage-grouse populations; however, there would be fewer areas closed to leasing than under alternative 3 (the stipulations on oil and gas leasing and the areas closed to leasing for these alternatives vary by state and alternative and are described in detail in **Section 4.9**, Mineral Resources).

The estimated number of wells drilled and completed, and production from new wells were projected for a 20-year period (2023 to 2042) for each alternative and state as part of the Reasonably Foreseeable Development Scenario (see **Appendix 12**, Reasonably Foreseeable Development Scenario, which provides a complete description of the assumptions and methodology used in developing these estimates). These projections were used as inputs in IMPLAN to model the economic impacts of oil and gas development under each alternative.

Drilling and completion costs per well were developed from Spears & Associates, Inc.'s Drilling and Completion Services Cost Index.[1] These estimates were developed per state, and the weighted average costs were calculated based on the percentage of well type for each state.

Total regional expenditures from drilling costs are calculated by multiplying the drilling cost per well by the projected average annual number of new wells spud (see **Appendix 12**, Reasonably Foreseeable Development Scenario). The number of new wells spud per year is multiplied by the completion ratio (which is estimated by state based on historical completion rates) to calculate the average annual new wells completed. Total regional expenditures from completion costs are calculated by multiplying the average annual number of new wells completed each year by the completion cost per well. Total regional expenditures from drilling and completion costs were used as an input in IMPLAN to generate total regional output, employment, and earnings from oil and gas development.

Projected annual production for new wells developed from 2023 to 2043 is from the reasonably foreseeable development scenario (see **Appendix 12**, Reasonably Foreseeable Development Scenario). Projected oil and gas production under each alternative represents the forecast under varying levels of stipulations and restrictions on leasable mineral development. These stipulations and restrictions could deter operators from leasing, drilling, and producing oil and gas on BLM-administered lands. Instead, operators could choose to develop oil and gas on non-federal lands, or they could choose to reduce production altogether. For the purposes of this analysis, it is assumed that operators choose to reduce production rather than choose to develop on non-federal lands. This means the reported economic impacts associated with changes in federal mineral development may overstate the potential economic impacts within an analysis area due to the ability of some operators to shift operations to non-federal lands and minerals.

The market value of production per well from 2023 to 2043 was calculated using projected annual oil wellhead and natural gas supply prices, from the 2023 Annual Energy Outlook (AEO) reference case published by the US Energy Information Administration (EIA) (EIA 2023). The EIA forecasts oil and gas prices as an average across eight multi-state regions (EIA 2023). For the purposes of this analysis, the price used for each state was taken from the regional average where the state is located. **Table 18-1** shows the 20-year average price, from 2023 to 2042, for oil and gas for each state in the planning area.

Table 18-1. 20-Year Average Oil and Gas Prices, by State

State	Multi-State Region	Oil Wellhead Price ($/barrel)	Natural Gas Supply Price ($/thousand cubic feet)
California	West Coast	93.31	2.75
Colorado	Rocky Mountain	87.22	2.92
Idaho	Rocky Mountain	87.22	2.92
Montana	Northern Great Plains	87.22	3.79
Nevada	Rocky Mountain	87.22	2.92
North Dakota	Northern Great Plains	87.22	3.79
Oregon	West Coast	93.31	2.75
South Dakota	Northern Great Plains	87.22	3.79
Utah	Rocky Mountain	87.22	2.92
Wyoming	Rocky Mountain	87.22	2.92

Source: US EIA 2023

[1] These estimates for drilling and completion costs can be provided from the BLM upon request.

The pace and timing of mineral development activities is dependent on a variety of factors outside the management decisions of the BLM, some of which cannot be foreseen with reasonable certainty. These include national and international energy demand and prices, enactment of future laws and regulatory policies, global supply disruptions, technological advances, and business strategies of operators. The RFD projects future production based on expected rates of well drilling, estimated completion rates, and current production decline curves. Together these parameters allow for projection of future oil and gas production volumes for use in the economic impact analysis. Future real world economic impacts could vary if actual development or production varies from the projection schedule under the RFD, if prices change, or if there are significant structural changes within the oil and gas sector or the broader economies of these study areas.

The IMPLAN sector 35, drilling oil and gas wells, was used to model an exogenous change in demand for oil and gas well drilling. Sector 20, oil and gas extraction, was used to model a change in oil and gas production.

Changes in oil and gas development could also affect state and county public finances through disbursements of federal mineral leasing revenue, state severance taxes, ad valorem taxes, sales and use taxes, and other local and state taxes and fees. The analysis of potential changes in federal mineral leasing payments is calculated from the projected production revenue and the federal royalty rate enacted in August 2022 (16.67 percent) for alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment or the previous federal royalty rate (12.5 percent) for Alternative 3.[2] Revenue from rents and bonus bids depend on other site-specific factors, such as size of operation and proprietary information, so impacts on revenues from rents and bonus bids are discussed qualitatively. The impacts to the revenue from state severance taxes is calculated based on the severance tax rate for each state (see **Chapter 3**, Affected Environment, Social and Economic Conditions for the current severance tax assumptions by state). Revenue from ad valorem taxes and other oil and gas production taxes or fees are calculated based on the assumptions shown in **Table 18-2**. Sales and use taxes vary across states and often counties, so impacts on revenue from sales and use taxes are discussed qualitatively.

Tax and royalty revenues derived from activities on BLM-administered lands and minerals would continue to have fiscal implications for communities within the socioeconomic analysis area, the state, and the Federal Government.

[2] The new rate (16.67 percent) only applies to federal leases issued after the IRA was signed. Many new wells development, and the production associated from these new wells, occur on these leases that were issued prior to August 2022 and the royalties from this production would be assessed based on the old rate of 12.5 percent. Because Alternative 3 would close areas to new leasing, the production from oil and gas projected under Alternative 3 is assumed to occur under existing leases that were issued prior to August 2022..

Table 18-2. State and Local Taxes on Oil and Gas Production

State	Estimated Ad Valorem Property Tax Rate[1]	Other Oil and Gas Production Tax or Fee	Estimated Other Oil and Gas Production Tax or Fee Rate[2]
Colorado	5.00%	Oil and Gas Conservation Fee	0.11%
Idaho	—	Oil and Gas Production Tax	1.50%
Montana	—	Privilege and License Tax	0.27%
Nevada	—	Net Proceeds of Minerals Tax	3.66%
North Dakota	—	Oil Extraction Tax	5.00%
South Dakota	—	—	—
Utah	5.00%	Conservation Fee	0.02%
Wyoming	6.30%	Oil and Gas Conservation Tax	0.05%

Source: BLM 2018; Colorado Fiscal Institute 2018; Covenant Consulting Group 2017; Montana Department of Revenue 2020, 2022; Nevada Department of Taxation 2022; State of Utah 2014.
— = Not applicable to the state.
[1]Ad Valorem property tax revenue is calculated as the percent of annual production revenue for Utah and Wyoming, and for Colorado, it is calculated as the percent of assessed property value, which is calculated as 87.5 percent of annual production revenue.
[2]Other oil and gas production tax or fee revenues are calculated as the percent of annual production revenue.

18.3.2 Locatable Minerals

The qualitative analysis of impacts on social and economic conditions due to potential changes in locatable minerals focuses on the impacts of proposed conservation measures to protect Greater Sage-Grouse under the alternatives. Under alternative 3, all PHMA would be recommended withdrawal from mineral entry (see **Section 4.9**, Mineral Resources, of this EIS for more details). Recommending areas for closure to the mining laws for locatable exploration or development does not restrict any activities and therefore, such recommendation does not have any impacts. However, the BLM could ask the Secretary of the Interior to propose and make a withdrawal of the land from location and entry under the Mining Law of 1872 pursuant to Section 204(a) of FLMPA following subsequent NEPA analysis. Proposing and making a withdrawal cannot be done as part of the land use planning process. Should the Secretary propose a withdrawal, the proposal would require environmental and other analysis under NEPA and other applicable authorities before the minerals could be withdrawn. For purposes of this planning initiative, the alternatives analysis includes a description of the types of environmental effects that could occur should the Secretary propose and make a mineral withdrawal in the future (e.g., reduced potential for behavioral disturbance and habitat loss/alterations). If the Secretary ultimately decided to withdraw the land, under Alternative 3, such a withdrawal would likely result in impacts on the level of mineral extraction and associated jobs, income, and tax revenue supported by local mining operations. Under alternatives 1 (in all states) and 2 (in Montana only), actions would be taken to maintain and enhance sagebrush habitats with the intent of conserving sage-grouse populations; however, there would be fewer areas recommended for withdrawal than under alternative 3 (the areas recommended for withdrawal for these alternatives vary by state and alternative and are described in detail in **Section 4.9**, Mineral Resources). Under alternatives 2 (in all states except Montana), 4, 5, 6, and the Proposed RMP Amendment (in all states), no areas would be recommended for withdrawal.

18.3.3 Mineral Materials

The qualitative analysis of impacts on mineral materials are based on discussions of how changes in the acres available or unavailable for mineral material disposal, under each alternative, would impact mineral material extraction and costs associated with extraction, access to the resources, and transportation of minerals after they are extracted. Under alternative 3, all areas managed for GRSG would be PHMA and mineral materials would be closed to disposal in all PHMA (see **Section 4.9**, Mineral Resources, of this EIS for more details). Under alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment , actions would be taken to maintain and enhance sagebrush habitats with the intent of conserving sage-grouse populations; however, there would be fewer areas closed to disposal than under alternative 3 (the areas closed to disposal for these alternatives vary by state and alternative and are described in detail in **Section 4.9**, Mineral Resources). Social impacts to communities due to availability of materials in free-use permits are also explored.

18.3.4 Renewable Energy (Geothermal, Wind, and Solar)

Geothermal

Economic impacts from changes geothermal exploration and development due to a change in the level of stipulations for the protection of Greater Sage-Grouse, under each alternative, are a function of construction and operation expenditures for geothermal electricity development, including drilling wells (exploratory, production, and injection), constructing power plants, and operating facilities. Under alternative 3, all areas managed for GRSG would be PHMA and these areas would be closed to all geothermal leasing (see **Section 4.9**, Mineral Resources, of this EIS for more details). Closing areas to geothermal leasing could result in impacts on level of future geothermal activities and associated jobs, income, and tax revenue supported by local operations. Under alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment , all states include language to maintain and enhance sagebrush habitats with the intent of conserving sage-grouse populations; however, there would be fewer areas closed to leasing than under alternative 3 (the stipulations on geothermal leasing and the areas closed to leasing for these alternatives vary by state and alternative and are described in detail in **Section 4.9**, Mineral Resources). In the Reasonably Foreseeable Development Scenarios for geothermal development, the BLM analyzed future leasing and development of federal geothermal resources within the decision area over the next 20 years for each alternative. The outputs from the scenarios in the Reasonably Foreseeable Development Scenarios on projected capacity and number of geothermal plants was used to model economic impacts from economic activity (see **Appendix 12**, Reasonably Foreseeable Development Scenarios for more details on how these projections were calculated).

To estimate economic activity associated with geothermal development, BLM used the National Renewable Energy Laboratory's Jobs and Economic Development Impact (JEDI) model (National Renewable Energy Laboratory 2016) to calculate the gross regional economic output, employment, and labor income associated with a representative power plant. The assumptions used 20 MW nameplate capacity for the analyses in Colorado, Idaho, Oregon, and Wyoming, 30 MW nameplate capacity for the analysis in Utah, and 28.8 MW nameplate capacity for the analysis in Nevada (based on the average plant capacity of existing geothermal plants in the planning area). BLM used standard assumptions from the National Renewable Energy Laboratory for the inputs, where data was not available. The economic impacts from the JEDI model were multiplied by the number of geothermal power plants projected, as described in **Appendix 12**, Reasonably Foreseeable Development Scenarios.

The pace and timing of geothermal development activities is dependent on a variety of factors outside the management decisions of the BLM, some of which cannot be foreseen with reasonable certainty. These include demand for electricity, availability of transmission infrastructure capacity, geothermal energy prices relative to the prices for electricity from other sources, cost of energy generation technologies, technological

advances, and business strategies of operators. The RFD projects future production based on expected rates of well drilling, estimated completion rates, and current production decline curves. Together these parameters allow for projection of future oil and gas production volumes for use in the economic impact analysis. Future real world economic impacts could vary if actual development or production varies from the projection schedule under the RFD, if prices change, or if there are significant structural changes within the oil and gas sector or the broader economies of these study areas.

Wind and Solar Energy

The qualitative analysis of impacts on wind and solar energy from BLM-management decisions are based on how the number of acres designated as ROW exclusion or ROW avoidance areas, under each alternative, would impact wind and solar energy development and costs associated with development and transmission of wind and solar energy. Under alternative 3, all PHMA would be managed as ROW exclusion (outside of designated corridors; see **Section 4.8**, Lands and Realty (Including Wind and Solar), of this EIS for more details). Under alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment , actions would be taken to maintain and enhance sagebrush habitats with the intent of conserving sage-grouse populations; however, there would be fewer areas managed as ROW exclusion than under alternative 3 (the areas managed as ROW avoidance and exclusion under these alternatives vary by state and alternative and are described in detail in **Section 4.8**, Lands and Realty (Including Wind and Solar)).

The pace and timing of wind and solar energy development activities are dependent on a variety of factors outside the management decisions of the BLM. These include demand for electricity, availability of transmission infrastructure capacity, renewable energy prices relative to prices for electricity from other energy sources, costs of energy generation technologies, technological advances, and business strategies of operators. Due to uncertainties in these factors as well as data limitations, potential economic and social impacts stemming from wind and solar energy affected by BLM-management decisions will be discussed qualitatively.

18.3.5 Livestock Grazing

Economic impacts from changes to livestock grazing are a function of the amount of forage utilization and the market value of livestock whose feed requirements are partially met through grazing on BLM managed allotments. Forage utilization is measured in animal unit months (AUMs), with one AUM defined as the amount of forage needed to feed a cow or five sheep for one month.

Two types of AUM measures are tracked: active AUMs, which measure the amount of forage from land available for grazing, and billed AUMs, which measure the amount of forage that the BLM bills for in a Grazing Fee Year. For the purposes of the analysis in **Chapter 4**, impacts were estimated based on the 5-year average (2018-2022) of billed AUMs, which is the closest available proxy for actual forage use. Because billed use may exceed actual grazing use, the economic analyses may overstate the actual economic impacts of grazing to some degree; however, the comparison across alternatives is still representative of the impacts from BLM-management decisions.

The number of billed AUMS on allotments with greater than 15 percent PHMA land was determined by overlaying GIS data layers. The 5-year average total billed AUMs as well as the billed AUMs on allotments with greater than 15 percent PHMA land by livestock type and state were reported in **Appendix 13**, Socioeconomic Baseline Report. **Table 18-3** shows the estimated projected number of billed AUMs by alternative for each state, broken out by livestock type and total. The total billed AUMs and billed AUMs by

Table 18-3. Number of Estimated AUMs by Livestock Type, State, and Alternative[1]

State	Alternative	Total Billed AUMs	Billed AUMs by Livestock Type	
			Cattle	Sheep
California	Alternatives 1, 2, 4, and 5	121,325	115,259	6,066
	Alternative 3	0	0	0
Colorado	Alternatives 1, 2, 4, and 5	126,183	104,227	21,956
	Alternative 3	0	0	0
Idaho	Alternatives 1, 2, 4, and 5	741,979	696,719	45,261
	Alternative 3	0	0	0
Montana	Alternatives 1, 2, 4, and 5	885,551	866,954	18,597
	Alternative 3	0	0	0
Nevada	Alternatives 1, 2, 4, and 5	1,092,825	1,019,606	73,219
	Alternative 3	0	0	0
North Dakota	Alternatives 1, 2, 4, and 5	3,871	3,863	8
	Alternative 3	0	0	0
Oregon	Alternatives 1, 2, 4, and 5	678,191	674,122	4,069
	Alternative 3	0	0	0
South Dakota	Alternatives 1, 2, 4, and 5	35,588	31,638	3,950
	Alternative 3	0	0	0
Utah	Alternatives 1, 2, 4, and 5	258,438	201,840	56,598
	Alternative 3	0	0	0
Wyoming	Alternatives 1, 2, 4, and 5	1,334,637	1,190,497	144,141
	Alternative 3	0	0	0

Source: BLM 2023

— = Data not available

[1]Data reported is for allotments where PHMA accounted for 15 percent or more of the acreage.

livestock type for Alternatives 1, 2, 4, and 5 was assumed to be consistent with the 5-year average billed AUMs. Under Alternative 3, all of the allotments where PHMA accounts for 15 percent or more of the acreage would be completely closed to grazing, so the billed AUMs would be reduced to zero.

The economic value of livestock whose annual feed requirements are partially met by grazing on BLM lands is estimated based on the market value of cattle and sheep. Values for cattle and sheep are estimated separately, and other grazing animals are considered of negligible commercial value. The direct value of production per AUM was estimated based on regional livestock production value data over 5 years and ratios in the livestock economics literature. **Table 18-4** shows the value of production per cow, AUMs per cow, and adjusted value of production per AUM. The value for cattle is $37.00 per AUM and the value for sheep is $59.56 per AUM.

The analysis focused on the economic impacts associated with cattle and sheep because those are the predominate types of livestock permitted to graze on BLM lands, however, BLM grazing permits may be issued for other classes of livestock. For the purposes of this analysis, one AUM for buffalo is assumed to be equivalent to one AUM for cattle and one AUM for goats is equivalent to one AUM for sheep. Forage utilization by horses was excluded from the analysis because it was assumed that most of this forage utilization for horses occurs as support for a ranching operation grazing other livestock and would thus be an input cost for producing cattle and sheep. The IMPLAN sectors, 11, beef cattle ranching and farming, including feedlots and dual-purpose ranching and farming, and 14, animal production, except cattle and poultry and eggs were used to model an exogenous change in demand for cattle and sheep grazing on BLM lands, respectively.

Table 18-4. Value of Livestock

Year	Value of Livestock Production (Nominal $)[1,2]		AUMs per Animal[3]		Adjusted Value of Livestock Production per AUM (2021$)[4]	
	Cow	Sheep/Ewe	Cow	Sheep/Ewe	Cow	Sheep/Ewe
2015	1015.79	214	16	3.2	49.76	54.50
2016	704.62	202	16	3.2	41.41	60.96
2017	710.20	203	16	3.2	40.66	59.44
2018	589.29	204	16	3.2	35.00	61.47
2019	558.00	203	16	3.2	33.15	61.43
2020	565.77	—	16	—	35.66	—

Source: [1]USDA Economic Research Service 2023; [2]USDA National Agricultural Statistics Service 2021; [3]The AUMs per animal is the number of months of forage one animal needs to grow to market weight, and was estimated from the estimated number of months to get an animal to market weight minus the estimated number of months the animal spends in a feedlot (Pennsylvania Beef Council 2024; US Agency for International Development; US Department of Agriculture 2013)
[4] Nominal values were converted to 2021 dollar values using IMPLAN deflators (IMPLAN 2021 Data).
— = Data not available

The economic impacts were evaluated at both the analysis areas and state level for each state. The multi-regional input-output analysis feature of IMPLAN was used to evaluate the economic impacts at the state level from changes made in the analysis areas.

Forage utilization estimates in this analysis, and thus the economic impact estimates, only represent livestock grazing in allotments where PHMA accounts for at least 15 percent of total allotment acreage. They do not represent the total impact of livestock grazing in each state or county. Because of this, a percentage decrease between the action alternatives and Alternative 1 would be less on a total impact from livestock grazing basis than in the figures in **Chapter 4**, which are for livestock grazing in GRSG HMAs only.

18.4 State-Specific Impacts on Social and Economic Conditions (Including Environmental Justice)

18.4.1 Introduction

Rangewide impacts from BLM decisions on economic and social conditions and nonmarket values are discussed in **Section 4.8**, Social and Economic Conditions (Including Environmental Justice), of the EIS; however, due to variations in BLM decision for certain states, some impacts vary by geographic region. In the subsections below are detailed discussions on the state-specific impacts on economic and social conditions for each state that differs from the rangewide impacts.

18.4.2 Alternative 1

Fluid Minerals (Oil and Gas) Management

Table 18-5 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-5** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations in each state with reasonably foreseeable future development of oil and gas.[3]

[3] California and Oregon did not have reasonably foreseeable future oil and gas development in the planning area, so they are not included in the discussion.

Table 18-5. Average Annual Economic Contributions from Oil and Gas, Under Alternative I

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Colorado

On annual average, oil and gas production revenue and well development expenditures in the Colorado analysis area is expected to result in a range of about 22,000 to 43,000 total jobs (from 7,000 to 13,000 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $1.9 billion to $3.7 billion in total labor income (from $791 million to $1.5 billion in direct labor income), and about $7.0 billion to $13.7 billion in economic output (from $4.0 billion to $7.7 billion in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 87.0 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in Colorado could range from about $453 million to $878 million. The Colorado severance tax revenue is expected to range from about $31.8 million to $61.7 million, under Alternative 1, and the oil and gas conservation fee could generate a range of $3.0 million to $5.8 million. Assuming an average tax rate of 5 percent across counties in the analysis area, oil and gas production could generate a range of about $119 million to $230 million in county revenues from ad valorem taxes. These revenues that are disbursed to counties would continue to support local public services.

Idaho

On annual average, oil and gas production revenue and well development expenditures in the Idaho analysis area is expected to result in about 14 total jobs (about 6 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $759,000 in total labor income (about $360,000 in direct labor income), and about $3.2 million in economic output (about $1.9 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 94.1 percent of the total economic output.

Under Alternative 1, fluid mineral leasing would continue to be managed as NSO in Idaho IHMA and as CSU in GHMA. In IHMA, impacts on nonmarket and social conditions would be the same as described in *Rangewide Environmental Consequences* under the *Fluid Minerals (Oil and Gas) Management* subsection of **Section 4.8.2**, Alternative 1, of the EIS; however, within GHMA, if there is an increase in mineral development and activities, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality, as described in **Section 4.8.1,** Nature and Type of Effects, of the EIS.

Montana

On annual average, oil and gas production revenue and well development expenditures in the Montana analysis area is expected to result in about 5,000 total jobs (about 2,000 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $485 million in total labor income (about $285 million in direct labor income), and about $1.9 billion in economic output (about $1.3 billion in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 97.6 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in Montana would be about $112 million. The Montana severance tax revenue is expected to be about $62.6 million, under

Alternative 1, and the state is expected to generate about $1.8 million from the privilege and license tax. These revenues that are disbursed to counties would continue to support local public services.

Nevada

On annual average, oil and gas production revenue and well development expenditures in the Nevada analysis area is expected to result in about 42 total jobs (about 18 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $2.2 million in total labor income (about $249,000 in direct labor income), and about $11.7 million in economic output (about $6.4 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 98.0 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in Nevada would be about $520,000. The Nevada severance tax revenue is expected to be about $5,000, under Alternative 1. Additionally, oil and gas production could generate about $114,000 across the analysis area in revenue from the Net Proceeds of Minerals Tax. These revenues that are disbursed to counties would continue to support local public services.

Under Alternative 1, Nevada GHMA would continue to be managed as open to fluid mineral leasing, subject to CSU stipulations. If there are increased mineral development and activities in GHMA, there would likely continue to be impacts on nonmarket and social conditions due to changes in access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality, as described in **Section 4.8.1**, Nature and Type of Effects, of the EIS.

North Dakota

On annual average, oil and gas production revenue and well development expenditures in the North Dakota analysis area is expected to result in about 573 total jobs (about 275 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $48 million in total labor income (about $32 million in direct labor income), and about $471 million in economic output (about $406 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 99.0 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in North Dakota would be about $51.6 million. The North Dakota severance tax revenue is expected to be about $14.7 million, under Alternative 1. Additionally, oil and gas production could generate about $15.5 million across the analysis area in oil extraction tax revenues. These revenues that are disbursed to counties would continue to support local public services.

South Dakota

On annual average, oil and gas production revenue and well development expenditures in the South Dakota analysis area is expected to result in about 264 total jobs (about 89 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $15.7 million in total labor income (about $7.1 million in direct labor income), and about $67 million in economic output (about $35 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 91.5 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in South Dakota would be about $2.4 million. The South Dakota severance tax revenue is expected to be about $644,000, under Alternative 1. These revenues that are disbursed to counties would continue to support local public services.

Utah

On annual average, oil and gas production revenue and well development expenditures in the Utah analysis area is expected to result in about 7,000 total jobs (about 2,000 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $454 million in total labor income (about $162 million in direct labor income), and about $2.5 billion in economic output (about $1.6 billion in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 86.7 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in Utah would be about $186 million. The Utah severance tax revenue is expected to be about $55.7 million, under Alternative 1, and the conservation fee is expected to generate about $223,000. Additionally, oil and gas production could generate about $55.6 million across the analysis area in county revenues from ad valorem taxes. These revenues that are disbursed to counties would continue to support local public services.

Under Alternative 1, Utah GHMA would continue to be managed as NSO near leks or CSU based on allocations in the plans that predate the 2015 amendment. In areas managed as NSO, impacts on nonmarket and social conditions would be the same as described in *Rangewide Environmental Consequences;* however, in areas managed as CSU, if there is an increase in mineral development and activities, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality, as described in **Section 4.8.1**, Nature and Type of Effects, of the EIS.

Wyoming

On annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area is expected to result in about 26,000 total jobs (about 12,000 direct jobs in the drilling oil and gas wells sector and the oil and gas extraction sector), $2.0 billion in total labor income (about $1.1 billion in direct labor income), and about $14.2 billion in economic output (about $11.3 billion in direct economic output) throughout the state. Most of the impacts on employment and economic output from oil and gas production revenue and well development expenditures would occur in the analysis area, accounting for about 99.96 percent of the total economic output.

Under Alternative 1, the total royalty revenue generated from oil and gas production in Wyoming would be about $1.5 billion. The Wyoming severance tax revenue is expected to be about $557 million, and the oil and gas conservation tax could generate about $4.6 million, under Alternative 1. Additionally, oil and gas production could generate about $585 million across the analysis area in county revenues from ad valorem taxes. These revenues that are disbursed to counties would continue to support local public services.

Under Alternative 1, in Wyoming, GHMA would be managed as NSO within 0.25 miles of leks, and seasonal limitations within 2 miles of leks, while PHMA would continue to be managed as NSO within 0.6 miles of leks and as CSU or with timing limitations outside. In areas managed as NSO, impacts on nonmarket and social conditions would be the same as described in *Rangewide Environmental Consequences;* however, in areas managed as CSU, if there is an increase in mineral development or activities, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and

reduced visitor and viewer enjoyment from changes in air quality, as described in **Section 4.8.1,** Nature and Type of Effects, of the EIS.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-6 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-6** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in geothermal in each state with reasonably foreseeable future development of geothermal.[4]

Table 18-6. Average Annual Economic Contributions from Geothermal, Under Alternative 1

State	Type of Impact	Employment	Labor Income	Economic Output

Source: National Renewable Energy Laboratory 2016

Note: There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

[4] There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

California and Nevada

On annual average, geothermal development in the states of California and Nevada is expected to support about 540 total jobs (about 276 direct jobs), $36.0 million in total labor income (about $17.1 million in direct labor income), and about $106 million in economic output (about $24.4 million in direct economic output).

Colorado

On annual average, geothermal development in the state is expected to support about 16 total jobs (about 8 direct jobs), $1.1 million in total labor income (about $537,000 in direct labor income), and about $2.7 million in economic output (about $761,000 in direct economic output).

Idaho

On annual average, geothermal development in the state is expected to support about 36 total jobs (about 22 direct jobs), $1.8 million in total labor income (about $1.0 million in direct labor income), and about $4.9 million in economic output (about $1.4 million in direct economic output).

Under Alternative 1, in GHMA where lands would continue to be open for wind and solar development and in IHMA that would continue to be managed as avoidance for solar and wind development and only excluded for utility scale projects, there would continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality from changes in surface disturbance due to potential wind and solar development, as described in **Section 4.8.1**, Nature and Type of Effects, of the EIS.

Nevada

Under Alternative 1, in GHMA that would continue to be managed as avoidance for wind projects or in PHMA that would be open for non-utility-scale solar and wind projects, there would continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality from changes in surface disturbance due to potential wind and solar development, as described in **Section 4.8.1,** Nature and Type of Effects, of the EIS.

Oregon

On annual average, geothermal development in the state is expected to support about 11 total jobs (about 6 direct jobs), $577,000 in total labor income (about $297,000 in direct labor income), and about $1.5 million in economic output (about $402,000 in direct economic output).

Under Alternative 1, in PHMA that would continue to be managed as avoidance for solar and wind development and only excluded for utility scale projects, there would continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality from changes in surface disturbance due to potential wind and solar development, as described in **Section 4.8.1,** Nature and Type of Effects, of the EIS.

Utah

On annual average, geothermal development in the state is expected to support about 22 total jobs (about 12 direct jobs), $1.3 million in total labor income (about $743,000 in direct labor income), and about $3.6 million in economic output (about $1.1 million in direct economic output).

Under Alternative 1, in GHMA that would continue to be open to solar and wind projects and in PHMA that would continue to be open to wind projects within 5 miles of leks, there would continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor

and viewer enjoyment from changes in air quality from changes in surface disturbance due to potential wind and solar development, as described in **Section 4.8.1,** Nature and Type of Effects, of the EIS.

Wyoming

On annual average, geothermal development in the state is expected to support about 9 total jobs (about 6 direct jobs), $432,000 million in total labor income (about $288,000 in direct labor income), and about $1.3 million in economic output (about $388,000 in direct economic output).

Under Alternative 1, in PHMA where it would still be open to solar and wind development, there would continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality from changes in surface disturbance due to potential wind and solar development, as described in **Section 4.8.1**, Nature and Type of Effects, of the EIS.

Livestock Grazing Management

Table 18-7 shows the direct, indirect, induced, and total impacts on economic contributions from livestock grazing in allotments where PHMA accounted for at least 15 percent of the acreage. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-7** are provided.

Table 18-7. Average Annual Economic Contributions from Livestock Grazing in Allotments where PHMA Accounted for 15 Percent or More of the Acreage, Under Alternative 1

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.

California

BLM decisions on GRSG HMAs, under Alternative 1, are not expected to change economic contributions from livestock grazing from current conditions. On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the California analysis area is expected to support about 22 total jobs (about 7 direct jobs in the animal production and ranching sectors), $3.4 million in total labor income (about $2.1 million in direct labor income), and about $8.4 million in economic output (about $4.6 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing would occur in the analysis area, accounting for about 88.6 percent of the total economic output.

Colorado

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Colorado analysis area is expected to support about 82 total jobs (about 50 direct jobs in the animal production and ranching sectors), $3.2 million in total labor income (about $1.8 million in direct labor income), and about $9.8 million in economic output (about $5.1 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 91.9 percent of the total economic output.

Idaho

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Idaho analysis area is expected to support about 221 total jobs (about 77 direct jobs in the animal production and ranching sectors), $22.8 million in total labor income (about $13.3 million in direct

labor income), and about $57.3 million in economic output (about $28.5 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 97.4 percent of the total economic output.

Montana

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Montana analysis area is expected to support about 381 total jobs (about 186 direct jobs in the animal production and ranching sectors), $21.0 million in total labor income (about $10.5 million in direct labor income), and about $67.3 million in economic output (about $33.2 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 96.5 percent of the total economic output.

Nevada

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Nevada analysis area is expected to support about 236 total jobs (about 82 direct jobs in the animal production and ranching sectors), $23.6 million in total labor income (about $13.7 million in direct labor income), and about $76.7 million in economic output (about $42.1 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 97.6 percent of the total economic output.

North Dakota

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the North Dakota analysis area is expected to support about 1 total jobs (about 1 direct jobs in the animal production and ranching sectors), $64,000 in total labor income (about $39,000 in direct labor income), and about $235,000 in economic output (about $143,000 in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 97.2 percent of the total economic output.

Oregon

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Oregon analysis area is expected to support about 206 total jobs (about 78 direct jobs in the animal production and ranching sectors), $14.1 million in total labor income (about $6.5 million in direct labor income), and about $50.0 million in economic output (about $25.2 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 95.4 percent of the total economic output.

South Dakota

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the South Dakota analysis area is expected to support about 10 total jobs (about 5 direct jobs in the animal production and ranching sectors), $402,000 in total labor income (about $186,000 in direct labor income), and about $2.5 million in economic output (about $1.4 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on

these allotments would occur in the analysis area, accounting for about 95.0 percent of the total economic output.

Utah

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Utah analysis area is expected to support about 90 total jobs (about 54 direct jobs in the animal production and ranching sectors), $6.2 million in total labor income (about $4.6 million in direct labor income), and about $16.9 million in economic output (about $10.8 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 96.2 percent of the total economic output.

Wyoming

On annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Wyoming analysis area is expected to support about 552 total jobs (about 301 direct jobs in the animal production and ranching sectors), $25.1 million in total labor income (about $14.7 million in direct labor income), and about $91.3 million in economic output (about $52.6 million in direct economic output) throughout the state. Most of the impacts on employment and economic output from livestock grazing on these allotments would occur in the analysis area, accounting for about 98.9 percent of the total economic output.

Environmental Justice

Below is a detailed discussion of adverse and disproportionate impacts on environmental justice populations by state that contained identified environmental justice populations.[5]

California

BLM decisions, under Alternative 1, that impact low-income environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the California analysis area, since both counties in analysis area were identified as meeting the criteria for containing low-income populations. These impacts include impacts on access to subsistence resources.

Colorado

BLM decisions, under Alternative 1, that impact low-income and American Indian and Alaska Native environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Colorado analysis area, since seven of counties in analysis area were identified as meeting the criteria for containing low-income populations and two of the counties were identified as meeting the threshold for American Indian and Alaska Native populations. These impacts include impacts on access to cultural and subsistence resources.

Idaho

The Idaho analysis area had 25 counties that met criteria for minority, low-income, and American Indian and Alaska Native environmental justice populations. All of the BLM decisions, under Alternative 1, that impact environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Idaho analysis area.

[5] There were no counties in the North Dakota analysis area that met the threshold for environmental justice populations, so North Dakota is not included in the state-by-state discussion.

Under Alternative 1, in GHMA, fluid mineral leasing would continue to be managed as CSU and lands would continue to be open to wind and solar development and in IHMA, only utility-scale wind and solar projects would be excluded. If there would be an increase in mineral and ROW development and activities in GHMA and IHMA, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality. These impacts could lead to disproportionate and adverse impacts on environmental justice populations, depending on where the environmental justice populations are located within each county in relation to the change in air quality.

Montana

The Montana analysis area had 18 counties that met criteria for minority, low-income, and American Indian and Alaska Native environmental justice populations. All of the BLM decisions, under Alternative 1, that impact environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Montana analysis area.

Nevada

The entire Nevada analysis area (a total of 10 counties) met criteria for minority, low-income, and American Indian and Alaska Native environmental justice populations. All of the BLM decisions, under Alternative 1, that impact environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Nevada analysis area.

Under Alternative 1, within GHMA, where fluid mineral leasing would continue to be managed as CSU and lands would continue to be managed as avoidance for wind projects and in PHMA, where only utility-scale wind and solar projects would be excluded. If there is an increase in mineral development and activities, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality. These impacts could lead to disproportionate and adverse impacts on environmental justice populations, depending on where the environmental justice populations are located within each county in relation to the change in air quality.

Oregon

The Oregon analysis area had 7 counties that met criteria for minority, low-income, and American Indian and Alaska Native environmental justice populations. All of the BLM decisions, under Alternative 1, that impact environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Oregon analysis area.

Under Alternative 1, in PHMA, where only utility-scale wind and solar projects would be excluded, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality. These impacts could lead to disproportionate and adverse impacts on environmental justice populations, depending on where the environmental justice populations are located within each county in relation to the change in air quality.

South Dakota

BLM decisions, under Alternative 1, that impact low-income environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in Butte County, South Dakota, since the county was identified as meeting the criteria for containing low-income populations. These impacts include impacts on access to subsistence resources.

Utah

BLM decisions, under Alternative 1, that impact low-income and American Indian and Alaska Native environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Utah analysis area since 18 counties in analysis area were identified as meeting the criteria for containing low-income or American Indian and Alaska Native populations.

Under Alternative 1, in GHMA, where fluid mineral leasing would continue to be managed as NSO near leks or CSU based on allocations in the plans that predate the 2015 amendment and lands would continue to be open to solar and wind projects and in PHMA, where lands would continue to be open to wind projects within 5 miles of leks, if there is an increase in development, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality. These impacts could lead to disproportionate and adverse impacts on environmental justice populations, depending on where the environmental justice populations are located within each county in relation to the change in air quality.

Wyoming

The Wyoming analysis area had 15 counties that met criteria for minority, low-income, and American Indian and Alaska Native environmental justice populations. All of the BLM decisions, under Alternative 1, that impact environmental justice populations would likely have disproportionate and adverse impacts on environmental justice populations in the Wyoming analysis area.

Under Alternative 1, within GHMA, where fluid mineral leasing would continue to be managed as NSO within 0.25 miles of leks with seasonal limitations within 2 miles of leks, and within PHMA, where fluid mineral leasing would continue to be managed as NSO within 0.6 miles of leks and as CSU or with timing limitations outside and where it would still be open to solar and wind development, if there is an increase in development and activities, there would likely continue to be impacts on access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality due to less restrictions than other areas. These impacts could lead to disproportionate and adverse impacts on environmental justice populations, depending on where the environmental justice populations are located within each county in relation to the change in air quality. In areas open to fluid mineral leasing with CSU stipulations or timing limitations, if there is an increase in mineral development and activities, potential for impacts on air quality would continue to exist.

18.4.3 Alternative 2

Fluid Minerals (Oil and Gas) Management

Table 18-8 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-8** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations in each state with reasonably foreseeable future development of oil and gas and with differing impacts from the rangewide impacts, as discussed in **Section 4.8** of the EIS.[6]

[6] California and Oregon did not have reasonably foreseeable future oil and gas development in the planning area, so they are not included in the discussion.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Colorado

Under Alternative 2, on annual average, oil and gas production revenue and well development expenditures and well development in the Colorado analysis area is expected to support about 320 more total jobs (about 95 additional direct jobs), about $27million more in total labor (about $11 million in additional direct labor income), and about $100 million in economic output (about $57 million in additional direct economic output) on annual average across the state relative to Alternative 1.

The increase in projected oil and gas activity could result in a small increase in tax revenues compared with Alternative 1. Under Alternative 2, the total royalty revenue generated from oil and gas production in Colorado could range from $459 million to $884 million, which is about $6.4 million to $6.5 million more than under Alternative 1. The Colorado severance tax revenue could range from $32.3 million to $62.2 million, which is almost $500,000 more than under Alternative 1. The oil and gas conservation fee could generate a range of $3.0 million to $5.8 million, slightly more than under Alternative 1. Additionally, oil and gas production could generate a range of $121 million to $232 million in county revenues from ad valorem taxes, which is about $1.7 million more than under Alternative 1). The increase in oil and gas activity would likely lead to an increase in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. These revenues are disbursed to the counties and would continue to support local public services, such as education.

The potential increase in oil and gas activity is not likely to result in large impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest.

Under Alternative 2, PHMAs in Colorado would be designated as NSO for fluid mineral development. Compared with Alternative 1, changing GHMA from closed to fluid mineral leasing within 1 mile of leks and NSO within 2 miles of leks under Alternative 1 to NSO within 1 mile of leks under this alternative would likely result in an increase in air emissions because the amount of federal mineral estate available for leasing and development would be greater under this alternative. This could lead to less access to clean air, health and safety from changes in air quality and GHG emissions, and reduced visitor and viewer enjoyment from changes in air quality.

Idaho

Under Alternative 2, on annual average, oil and gas production revenue and well development expenditures in the Idaho analysis area is expected to support about 5 total additional jobs (about 2 additional direct jobs), $253,000 in additional total labor income (about $120,000 in additional direct labor income), and about $1.1 million in additional economic output (about $625,000 in additional direct economic output), across the state, compared to development under Alternative 1.

The small increase in projected oil and gas activity In Idaho could result in a small increase in tax revenues compared with Alternative 1, which would be disbursed to counties and would continue to support local public services, such as education.

The potential increase in oil and gas activity is not likely to result in large impacts from BLM-management decisions on lifestyles and culture for those in mineral development communities of interest.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-9 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-9** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in geothermal in each state with reasonably foreseeable future development of geothermal and with differing impacts from the rangewide impacts, as discussed in **Section 4.8** of the EIS.[7]

Source: National Renewable Energy Laboratory 2016

Note: There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

Nevada

Under Alternative 2, there would be an exception criterion avoidance for ROWs and to the closure to wind and solar development in Nevada PHMA and to wind development in Nevada GHMA. Compared with Alternative 1, this could increase the potential for impacts on nonmarket and social conditions due to

[7] There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

changes in air quality and GHG emissions because there would be a higher chance of development. However, the exception criteria would likely avoid impacts.

Utah

Under Alternative 2, areas outside PHMAs that are within 5 miles of leks in Utah would be avoidance for wind development. This could increase the potential for impacts on nonmarket and social conditions due to changes in air quality and GHG emissions compared with Alternative 1. This is because there would be a higher chance of development in an avoidance area as opposed to an exclusion area that includes an exception criterion to closure.

Livestock Grazing Management

Table 18-10 shows the direct, indirect, induced, and total impacts on economic contributions from livestock grazing in allotments where PHMA accounted for at least 15 percent of the acreage. A discussion on impacts is provided at the rangewide-level in **Section 4.8** of the EIS.

Environmental Justice

Below is a detailed discussion of adverse and disproportionate impacts on environmental justice populations by state that contained identified environmental justice populations and with potential impacts that differ from the rangewide impacts, as discussed in **Section 4.8** of the EIS.[8]

Colorado

Impacts on environmental justice populations from potential impacts on cultural resources would be the same as described for Alternative 1, except in Colorado PHMAs, which would have no closed areas, and Colorado GHMAs, which would have NSO in place of closed areas. The exposure of areas in Colorado to fluid mineral leasing could increase the risk of potential impacts to cultural resources and decrease opportunities for American Indian and Alaska Native populations to maintain traditional cultural practices and values in areas where fluid mineral leasing occurs, although site specific NEPA analysis will be conducted to assess alternatives to avoid, minimize and/or compensate for identified impacts. This could have disproportionate and adverse impacts on environmental justice populations in the Colorado, especially on the American Indian and Alaska Native environmental justice populations located in Moffat County and Rio Blanco County (where American Indian and Alaska Native environmental justice populations were identified) as well as on American Indian and Alaska Native environmental justice populations that live outside of the analysis area that use the planning area for spiritual, cultural, and traditional uses. Future site-specific implementation analysis would be needed to determine the level and intensity of impacts.

Under Alternative 2, BLM-management decisions on fluid mineral development would increase potential impacts on nonmarket and social conditions due to changes in GHG emissions and air quality, compared with Alternative 1, which would disproportionately impact environmental justice populations throughout

[8] There were no counties in the North Dakota analysis area that met the threshold for environmental justice populations, so North Dakota is not included in the state-by-state discussion.

the Colorado analysis area. The extent to which environmental justice populations are impacted would depend on site-specific factors.

Idaho

In Idaho, removing SFAs and allowing consideration of new free use permits for salable minerals would reduce protections for GRSG and habitat, which could have negative impacts on cultural resources and decreased opportunities for American Indian and Alaska Native populations to maintain traditional cultural practices and values, such as observing lekking behavior. This could have disproportionate and adverse impacts on environmental justice populations in the Idaho, especially on the American Indian and Alaska Native environmental justice populations located in Adams, Bingham, Cassia, Clark, Custer, Elmore, Jefferson, Lemhi, Lincoln, Minidoka, Owyhee, Payette, Power, and Washington counties (where American Indian and Alaska Native environmental justice populations were identified) as well as on American Indian and Alaska Native environmental justice populations that live outside of the analysis area that use the planning area for spiritual, cultural, and traditional uses. Future site-specific implementation analysis would be needed to determine the level and intensity of impacts.

Under Alternative 2, allowing consideration of new free use permits for salable minerals in Idaho IHMA, would increase the potential for associated impacts on nonmarket and social conditions due to changes in air quality and GHG emissions compared with Alternative 1. This is because there would be a greater chance for more acres of salable mineral activities to occur in these areas. However, the impacts might be small due to the small amount of extraction.

Nevada

In Nevada, removing SFAs would reduce protections for GRSG and habitat, which could have negative impacts on cultural resources and decreased opportunities for American Indian and Alaska Native populations to maintain traditional cultural practices and values, such as observing lekking behavior. This could have disproportionate and adverse impacts on environmental justice populations in all counties in the Nevada analysis area as well as on American Indian and Alaska Native environmental justice populations that live outside of the analysis area that use the planning area for spiritual, cultural, and traditional uses. Future site-specific implementation analysis would be needed to determine the level and intensity of impacts.

Under Alternative 2, BLM-management decisions in Nevada would increase the potential for associated impacts on nonmarket and social conditions due to changes in air quality and GHG emissions from the potential for more nonenergy leasable mineral and salable mineral activities to occur.

Utah

In Utah, removing SFAs would reduce protections for GRSG and habitat, which could have negative impacts on cultural resources and decreased opportunities for American Indian and Alaska Native populations to maintain traditional cultural practices and values, such as observing lekking behavior. This could have disproportionate and adverse impacts on environmental justice populations in the Utah, especially on the American Indian and Alaska Native environmental justice populations located in Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Rich, and Uintah counties (where American Indian and Alaska Native environmental justice populations were identified) as well as on American Indian and Alaska Native environmental justice populations that live outside of the analysis area that use the planning area for spiritual, cultural, and traditional uses. Future site-specific implementation analysis would be needed to determine the level and intensity of impacts.

Under Alternative 2, areas outside PHMAs that are within 5 miles of leks in Utah would be avoidance for wind development. This could increase the potential for impacts on nonmarket and social conditions due to changes in air quality and GHG emissions compared with Alternative 1. This is because there would be a higher chance of development in an avoidance area as opposed to an exclusion area that includes an exception criterion to closure. This could have a disproportionate impact on environmental justice populations in analysis area counties in Utah.

Wyoming

In Wyoming, removing SFAs would reduce protections for GRSG and habitat, which could have negative impacts on cultural resources and decreased opportunities for American Indian and Alaska Native populations to maintain traditional cultural practices and values, such as observing lekking behavior. This could have disproportionate and adverse impacts on environmental justice populations in the Wyoming, especially on the American Indian and Alaska Native environmental justice populations located in Fremont County and Weston County, as well as on American Indian and Alaska Native environmental justice populations that live outside of the analysis area that use the planning area for spiritual, cultural, and traditional uses. There are protections in place for cultural resources within existing RMPs that would mitigate impacts on environmental justice populations. Future site-specific implementation analysis would be needed to determine the level and intensity of impacts.

18.4.4 Alternative 3

Fluid Minerals (Oil and Gas) Management

Table 18-11 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-11** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations in each state with reasonably foreseeable future development of oil and gas.[9]

[9] California and Oregon did not have reasonably foreseeable future oil and gas development in the planning area, so they are not included in the discussion.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Colorado

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Colorado analysis area is expected to result in about 1,000 to 13,000 fewer total jobs (about 300 to 3,600 fewer direct jobs), about $104 million to $1.1 billion less in total labor income (about $36 million to $439 million less in direct labor income), and about $390 million to $4.0 billion less in economic output (about $210 million to $2.3 billion less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, would result in reductions in tax revenues, compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in Colorado could range from $312 million to $454 million, which is about $140 million to $424 million less than under Alternative 1. The Colorado severance tax revenue could range from $29.3 million to $42.6 million, which is about $2.5 million to $19.2 million less than under Alternative 1. The oil and gas conservation fee could generate a range of $2.7 million to $4.0 million, which is about $240,000 to $1.8 million less than under Alternative 1. Additionally, oil and gas production could generate a range of $109 million to $159 million in county revenues from ad valorem taxes, which is about $9.5 million to $71.5 million less than under Alternative 1). The reduction in oil and gas activity, in Colorado, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a large effect on communities throughout the analysis area in Colorado due to the reliance on the mineral industry and oil and gas development on federal estate for the local economies.

Idaho

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Idaho analysis area is expected to result in about 2 fewer total jobs (about 1 fewer direct jobs), $101,000 less in total labor income (about $48,000 less in direct labor income), and about $432,000 less in economic output (about $250,000 less in direct economic output) across the state compared to development under Alternative 1.

The small decrease in projected oil and gas activity in Idaho could result in reductions in tax revenues compared with Alternative 1, which could impact public services that are offered to the communities.

The potential decrease in oil and gas activity could result in impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest.

Montana

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Montana analysis area is expected to result in about 1,400 fewer total jobs (about 550 fewer direct jobs), $127 million less in total labor income (about $76 million less in direct labor income), and about $499 million less in economic output (about $337 million less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, would result in reductions in tax revenues, compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas

production in Montana would be about $75.7 million, which is about $36.8 million less than under Alternative 1. The Montana severance tax revenue is expected to be about $56.0 million, which is about $6.6 million less than under Alternative 1. Additionally, oil and gas production could generate about $1.6 million in the privilege and license tax revenue, which is about $186,000 less than under Alternative 1. The reduction in oil and gas activity, in Montana, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

Additionally, there could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a larger effect on communities in southeastern and northeastern Montana, where the local economies have relied on mineral industry and oil and gas development on federal estate.

Nevada

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Nevada analysis area is expected to result in about 29 fewer total jobs (about 13 fewer direct jobs), $1.5 million less in total labor income (about $173,000 less in direct labor income), and about $8.2 million less in economic output (about $4.5 million less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, could result in reductions in tax revenues, compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in Nevada would be about $111,000, which is about $409,000 less than under Alternative 1. The Nevada severance tax revenue is expected to be about $2,000, which is about $4,000 less than under Alternative 1. Additionally, oil and gas production could generate about $33,000 across the analysis area in revenue from the Net Proceeds of Minerals Tax, which is about $82,000 less than under Alternative 1. The reduction in oil and gas activity, in Nevada, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

There could be impacts from BLM-management decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a larger effect on communities in southern Nevada, where the local economies have relied on extractive minerals and oil and gas development on federal estate.

North Dakota

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the North Dakota analysis area is expected to result in about 88 fewer total jobs (about 42 fewer direct jobs), $7.4 million less in total labor income (about $4.9 million less in direct labor income), and about $72 million less in economic output (about $62 million less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, would result in reductions in tax revenues, compared to Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in North Dakota would be about $32.7 million, which is about $18.8 million less than under Alternative 1. The North Dakota severance tax revenue is expected to be about $12.4 million, which is about $2.3 million less than under Alternative 1. Oil and gas production could generate about $13.1 million

across the analysis area oil extraction tax revenues, which is about $2.4 million less than under Alternative 1. The reduction in oil and gas activity, in North Dakota, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a larger effect on communities in southwestern North Dakota, where the local economies have relied on extractive minerals and oil and gas development on federal estate.

South Dakota

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the South Dakota analysis area is expected to result in about 12 fewer total jobs (about 4 fewer direct jobs), $701,000 less in total labor income (about $292,000 less in direct labor income), and about $3.1 million less in economic output (about $1.6 million less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity in South Dakota could result in reductions in tax revenues compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in South Dakota would be about $1.8 million, which is about $616,000 less than under Alternative 1. The South Dakota severance tax revenue is expected to be about $637,000, which is about $7,000 less than under Alternative 1. The reduction in oil and gas activity, in South Dakota, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could impact public services that are offered to the communities.

The potential decrease in oil and gas activity could result in impacts from BLM-management decisions on lifestyles and culture for those in mineral development communities of interest.

Utah

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Utah analysis area is expected to result in about 700 fewer total jobs (about 200 fewer direct jobs), $47 million less in total labor income (about $17 million less in direct labor income), and about $252 million less in economic output (about $167 million less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, would result in reductions in tax revenues, compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in Utah would be about $125 million, which is about $60.4 million less than under Alternative 1. The Utah severance tax revenue is expected to be about $50.0 million, which is about $5.6 million less than under Alternative 1. The conservation fee is expected to generate about $200,000, which is about $22,000 less than under Alternative 1. Additionally, oil and gas production could generate about $50.0 million across the analysis area in county revenues from ad valorem taxes, which is about $5.6 less than under Alternative 1. The reduction in oil and gas activity, in Utah, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

Additionally, there could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a larger effect on communities in central and northeastern Utah, where the local economies have relied on mineral industry and oil and gas development on federal estate.

Wyoming

Under Alternative 3, on annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area is expected to result in about 14,000 fewer total jobs (about 6,000 fewer direct jobs), $1.0 billion less in total labor income (about $612 million less in direct labor income), and about $6.8 billion less in economic output (about $5.3 billion less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 3, would result in reductions in tax revenues, compared with Alternative 1. Under Alternative 3, the total royalty revenue generated from oil and gas production in Wyoming would be about $671 million, which is about $877 million less than under Alternative 1. The Wyoming severance tax revenue is expected to be about $322 million, which is about $235 million less than under Alternative 1. The oil and gas conservation tax is expected to generate about $2.7 million, which is about $2.0 million less than under Alternative 1. Additionally, oil and gas production could generate about $338 million across the analysis area in county revenues from ad valorem taxes, which is about $247 million less than under Alternative 1. The reduction in oil and gas activity, in Wyoming, would likely lead to a decrease in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities.

There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment. These impacts would have a large effect on communities throughout the analysis area in Wyoming, due to the reliance on extractive minerals and oil and gas development on federal estate for the local economies.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-12 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-12** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in geothermal in each state with reasonably foreseeable future development of geothermal.[10]

[10] There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

Table 18-12. Average Annual Economic Contributions from Geothermal, Under Alternative 3

State	Type of Impact	Employment	Labor Income	Economic Output

Source: National Renewable Energy Laboratory 2016
Note: There were no geothermal power plant developments projected for Montana, North Dakota, and South Dakota due to limited geothermal potential in the analysis areas under all alternatives.

California and Nevada

The number of geothermal plants developed in California and Nevada would be the same as under Alternative 1 because the amount of acreage under existing leases within GRSG HMAs is sufficient to meet the projected growth in geothermal production capacity (see **Appendix 12**, Reasonably Foreseeable Development Scenario), so the impacts on jobs, labor, income, economic output from geothermal development would also be the same as described under Alternative 1.

Colorado

Under Alternative 3, on annual average, geothermal development in the state is expected to result in about 16 fewer total jobs (about 8 fewer direct jobs), $1.1 million less in total labor income (about $537,000 less in direct labor income), and about $2.7 million less in economic output (about $761,000 less in direct economic output), compared with Alternative 1.

Idaho

Under Alternative 3, on annual average, geothermal development in the state is expected to result in about 18 fewer total jobs (about 11 fewer direct jobs), $892,000 less in total labor income (about $506,000 less in direct labor income), and about $2.5 million less in economic output (about $702,000 less in direct economic output), compared with Alternative 1. The reduction in geothermal activities, under Alternative 3 would likely lead to a slight reduction in tax revenue collected by the state for geothermal production and disbursed to the counties. This reduction in tax revenue would reduce the quality and level of public services that are funded by the geothermal production tax.

If there is a reduction in wind and solar energy activities, under Alternative 3, due to BLM-management decision, such as a reduction in development and production, there would likely result in a decrease in tax revenue collected by the state and distributed to the counties, which could result in a decrease in quality and quantity of public services in the analysis area.

Oregon

Under Alternative 3, on annual average, geothermal development in the state is expected to result in about 11 fewer total jobs (about 6 fewer direct jobs), $577,000 less in total labor income (about $297,000 less in direct labor income), and about $1.5 million less in economic output (about $402,000 less in direct economic output), compared with Alternative 1. However, existing leases could still be used for geothermal development, so if any of these leases are developed, the impacts on economic contributions would change.

North Dakota

If there is a reduction in wind energy activities, under Alternative 3, due to BLM-management decision, such as a reduction in development and production, there would likely result in a decrease in tax revenue collected by the state and distributed to the counties, which could result in a decrease in quality and quantity of public services in the analysis area.

South Dakota

If there is a reduction in wind and solar energy activities, under Alternative 3, due to BLM decision, such as a reduction in development and production, there would likely result in a decrease in tax revenue collected by the state and distributed to the counties, which could result in a decrease in quality and quantity of public services in the analysis area.

Utah

Under Alternative 3, on annual average, geothermal development in the state is expected to result in about 22 fewer total jobs (about 12 fewer direct jobs), $1.3 million less in total labor income (about $743,000 less in direct labor income), and about $3.6 million less in economic output (about $1.1 million less in direct economic output), compared with Alternative 1. However, existing leases could still be used for geothermal development. If any of these leases are developed, the impacts on economic contributions would change, but development is less likely, under Alternative 3.

Wyoming

Under Alternative 3, on annual average, geothermal development in the state is expected to result in about 9 fewer total jobs (about 6 fewer direct jobs), $432,000 less in total labor income (about $288,000 less in direct labor income), and about $1.3 million less in economic output (about $388,000 less in direct economic output), compared with Alternative 1.

If there is a reduction in wind energy activities, under Alternative 3, due to BLM-management decision, such as a reduction in development and production, there would likely result in a decrease in tax revenue collected by the state and distributed to the counties, which could result in a decrease in quality and quantity of public services in the analysis area.

Livestock Grazing Management

Table 18-13 shows the direct, indirect, induced, and total impacts on economic contributions from livestock grazing in allotments where PHMA accounted for at least 15 percent of the acreage. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-13** are provided.

Table 18-13. Average Annual Economic Contributions from Livestock Grazing in Allotments where PHMA Accounted for 15 Percent or More of the Acreage, Under Alternative 3

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.

California

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the California analysis area is expected to result in about 22 fewer total jobs (about 7 fewer direct jobs), $3.4 million less in total labor income (about $2.1 million less in direct labor income), and about $8.4 million less in economic output (about $4.6 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely disproportionately impact those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Colorado

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Colorado analysis area is expected to result in about 82 fewer total jobs (about 50 fewer direct jobs), $3.2 million less in total labor income (about $1.8 million less in direct labor income), and about $9.8 million less in economic output (about $5.2 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely disproportionately impact those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Idaho

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Idaho analysis area is expected to result in about 221 fewer total jobs (about 77 fewer direct jobs), $22.8 million less in total labor income (about $13.3 million less in direct labor income), and about $57.3 million less in economic output (about $28.5 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely be substantial, especially for those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely

be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Montana

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Montana analysis area is expected to result in about 381 fewer total jobs (about 186 fewer direct jobs), $21.0 million less in total labor income (about $10.5 million less in direct labor income), and about $67.3 million less in economic output (about $33.2 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely be substantial, especially for those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Nevada

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Nevada analysis area is expected to result in about 236 fewer total jobs (82 fewer direct jobs), $23.6 million less in total labor income (about $13.7 million less in direct labor income), and about $76.7 million less in economic output (about $42.1 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely be substantial, especially for those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

North Dakota

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the North Dakota analysis area is expected to result in about 1 fewer total jobs (1 fewer direct jobs), $64,000 less in total labor income (about $39,000 less in direct labor income), and about $235,000 less in economic output (about $143,000 less in direct economic output) throughout the state, compared with Alternative 1. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3, although to a lesser degree.

Oregon

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Oregon analysis area is expected to result in about 206 fewer total jobs (78 fewer direct jobs), $14.1 million less in total labor income (about $6.5 million less in direct labor income), and about $50.0 million less in economic output (about $25.2 million less in direct economic output) across the state compared with Alternative 1. These impacts on economic conditions would likely be substantial, especially for those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

South Dakota

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the South Dakota analysis area is expected to result in about 10 fewer total jobs (about 5 fewer direct jobs), $402,000 less in total labor income (about $186,000 less in direct labor income), and about $2.5 million less in economic output (about $1.4 million less in direct economic output) across the analysis area, compared with Alternative 1. These impacts on economic conditions would likely disproportionately impact those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Utah

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Utah analysis area is expected to result in about 90 fewer total jobs (54 fewer direct jobs), $6.2 million less in total labor income (about $4.6 million less in direct labor income), and about $16.9 million less in economic output (about $10.8 million less in direct economic output) across the analysis area, compared with Alternative 1. These impacts on economic conditions would likely disproportionately impact those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

Wyoming

Under Alternative 3, on annual average, livestock grazing on allotments where PHMA accounted for at least 15 percent of the acreage in the Wyoming analysis area is expected to result in about 552 fewer total jobs (about 301 fewer direct jobs), $25.1 million less in total labor income (about $14.7 million less in direct labor income), and about $91.3 million less in economic output (about $52.6 million less in direct economic output) across the analysis area, compared with Alternative 1. These impacts on economic conditions would likely be substantial, especially for those communities in the analysis area with small family ranches that rely on federal lands for forage for their farming and ranching operations. Impacts on nonmarket and social conditions would likely be similar to those described in the *Rangewide Environmental Consequences* subsection under **Section 4.12.4**, Alternative 3.

18.4.5 Alternative 4

Fluid Minerals (Oil and Gas) Management

Table 18-14 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-14** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations in each state with reasonably foreseeable future development of oil and gas and with differing impacts from the rangewide impacts, as discussed in **Section 4.8** of the EIS.[11]

[11] California and Oregon did not have reasonably foreseeable future oil and gas development in the planning area, so they are not included in the discussion.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Colorado

On annual average, oil and gas production revenue and well development expenditures in the Colorado analysis area is expected to result in 1,300 to 2,000 additional total jobs (about 374 to 574 additional direct jobs), about $111 million to $172 million in additional total labor income (about $45 million to $68 million in additional direct labor income), and about $414 million to $639 million in additional economic output, compared with Alternative 1 (about $232 million to $357 million in additional direct economic output) throughout the state.

Under Alternative 4, the total royalty revenue generated from oil and gas production in Colorado could range from $482 million to $924 million, which is about $29.3 million to $45.8 million more than under Alternative 1. The Colorado severance tax revenue could range from $33.9 million to $64.9 million, which is about $2.1 million to $3.2 million more than under Alternative 1. The oil and gas conservation fee could generate a range of $3.2 million to $6.1 million, which is about 193,000 to 302,000 more than under Alternative 1. Additionally, oil and gas production could generate a range of $126 million to $242 million in county revenues from ad valorem taxes, which is about $7.7 million to $12.0 million more than under Alternative 1. The increase in oil and gas activity, in Colorado, would likely lead to an increase in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. This increase in revenues that are disbursed to counties could bolster public finances which may be used to support additional public services, compared with Alternative 1. Additionally, there could be more support and preservation of nonmarket values associated lifestyles and culture for those in mineral development communities of interest and those who value preservation of historical mining communities.

In Colorado more acreage would be available for fluid mineral leasing than under Alternative 1, since closures within one mile of leks in GHMA would no longer apply. This could allow for more development-related impacts on nonmarket and social conditions associated with changes in air quality and GHG emissions, compared with Alternative 1.

Idaho

On annual average, oil and gas production revenue and well development expenditures in the Idaho analysis area is expected to result in about 9 total additional jobs (about 4 additional direct jobs), $506,000 in additional total labor income (about $240,000 in additional direct labor income), and about $2.2 million in additional economic output (about $1.2 million in additional direct economic output) throughout the state, compared with Alternative 1.

The small increase in projected oil and gas activity In Idaho could result in a small increase in tax revenues compared with Alternative 1, which would be disbursed to counties and would continue to support local public services, such as education.

The potential increase in oil and gas activity is not likely to result in large impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest.

Wyoming

Under Alternative 4, NSO stipulations would be applied to all land in PHMA and within 0.25 miles of leks in GHMA. This would reduce the acreage available for fluid mineral leasing, compared to Alternative 1. On annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area are expected to result in about 7,000 fewer total jobs (about 3,000 fewer direct jobs), $547 million less in total labor income (about $319 million less in direct labor income), and about $3.5 billion less in economic

output (about $2.8 billion less in direct economic output) across the state compared to development under Alternative 1.

The decrease in projected oil and gas activity, under Alternative 4, would result in reductions in tax revenues, compared with Alternative 1. The total royalty revenue generated from oil and gas production in Wyoming would be about $1.2 billion, which is about $341 million less than under Alternative 1. The Wyoming severance tax revenue is expected to be about $434 million, which is about $123 million less than under Alternative 1. The oil and gas conservation tax is expected to generate about $3.6 million, which is about $1.0 million less than under Alternative 1. Oil and gas production could generate about $456 million across the analysis area in county revenues from ad valorem taxes, which is about $129 million less than under Alternative 1. The decrease in oil and gas activity, in Wyoming, would likely lead to a reduction in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities, including education.

There could be impacts on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment.

The reduction in the acreage available for fluid mineral leasing could reduce the development-related impacts on nonmarket and social conditions associate with changes in air quality and GHG emissions, compared with Alternative 1.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-15 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. A discussion on impacts are provided at the rangewide-level in **Section 4.8** of the EIS.

Table 18-15. Average Annual Economic Contributions from Geothermal, Under Alternative 4

18.4.6 Alternative 5

Fluid Minerals (Oil and Gas) Management

Table 18-17 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers, a discussion on quantitative impacts shown in **Table 18-17** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations in each state with reasonably foreseeable future development of oil and gas and with differing impacts from the rangewide impacts, as discussed in **Section 4.8** of the EIS.[12]

[12] California and Oregon did not have reasonably foreseeable future oil and gas development in the planning area, so they are not included in the discussion.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Colorado

The economic and social impacts of changes in oil and gas development in the Colorado analysis area due to the BLM decisions would be the same as under Alternative 4.

Idaho

On annual average, oil and gas production revenue and well development expenditures in the Idaho analysis area is expected to result in about 8 total additional jobs (about 4 additional direct jobs), $456,000 in additional total labor income (about $216,000 in additional direct labor income), and about $1.9 million in additional economic output (about $1.1 million in additional direct economic output) throughout the state, compared with Alternative 1.

The small increase in projected oil and gas activity In Idaho could result in a small increase in tax revenues compared with Alternative 1, which would be disbursed to counties and would continue to support local public services, such as education.

The potential increase in oil and gas activity is not likely to result in large impacts from BLM-management decisions on lifestyles and culture for those in mineral development communities of interest.

Wyoming

On annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area is expected to result in about 1,000 fewer total jobs (about 530 fewer direct jobs), about $92 million less in total labor income (about $53 million less in direct labor income), and about $595 million less in economic output (about $464 million less in direct economic output), compared with Alternative 1 throughout the state.

The decrease in projected oil and gas activity, under Alternative 5, would result in reductions in tax revenues, compared with Alternative 1. Under Alternative 5, the total royalty revenue generated from oil and gas production in Wyoming would be about $1.5 billion, which is about $57 million less than under Alternative 1. The Wyoming severance tax revenue is expected to be about $537 million, which is about $21 million less than under Alternative 1. The oil and gas conservation tax could generate about $4.5 million, which would be about $172,000 less than under Alternative 1. Oil and gas production could generate about $563 million across the analysis area in county revenues from ad valorem taxes, which is about $22 million less than under Alternative 1. The decrease in oil and gas activity, in Wyoming, under Alternative 5, would likely lead to a reduction in revenue from rents, bonus bids, and sales and use tax, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities, including education.

There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment.

The reduction in the acreage available for fluid mineral leasing could reduce the development-related impacts on nonmarket and social conditions associate with changes in air and GHG emissions, compared with Alternative 1.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-18 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. A discussion on impacts is provided at the rangewide-level in **Section 4.8** of the EIS.

Table 18-18. Average Annual Economic Contributions from Geothermal, Under Alternative 5

18.4.7 Alternative 6

Fluid Minerals (Oil and Gas) Management

Table 18-20 shows the direct, indirect, induced, and total impacts on economic contributions from projected oil and gas activity. In the state-specific sub headers for Wyoming, below, a discussion on quantitative impacts shown in **Table 18-20** are provided as well as a qualitative discussion on the market and nonmarket impacts from potential changes in oil and gas operations.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Wyoming

Management of ACECs as open to leasing subject to NSO stipulations with an exception/modification to allow occupancy if there are drainage concerns from adjacent development and if it can be demonstrated that no direct or indirect impacts on GRSG will occur could lead to a reduction in the number of wells drilled and completed as well as oil and gas production from these wells in Wyoming, compared with Alternative 1.

On annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area is expected to result in about 1,000 fewer total jobs (about 640 fewer direct jobs), about $110 million less in total labor income (about $64 million less in direct labor income), and about $717 million less in economic output (about $559 million less in direct economic output), than under Alternative 1, throughout the state (see **Table 18-9** in **Appendix 18**).

The decrease in projected oil and gas activity, under Alternative 6, would result in reductions in tax revenues, compared with Alternative 1. The total royalty revenue generated from oil and gas production in Wyoming would be about $1.5 billion, which is about $69 million less than under Alternative 1. The Wyoming severance tax revenue is expected to be about $532 million, which is about $25 million less than under Alternative 1. The oil and gas conservation tax is expected to generate about $4.4 million, which is about $208,000 less than under Alternative 1. Oil and gas production could generate about $559 million across the analysis area in county revenues from ad valorem taxes, which is about $26 million less than under Alternative 1. Additionally, a reduction in oil and gas activity, in Wyoming, under Alternative 6, could lead to a decrease in revenue from rents, bonus bids, and sales and use taxes, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities, including education. There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment.

The reduction in the acreage available for fluid mineral leasing could reduce the development-related impacts on nonmarket and social conditions associate with changes in air and GHG emissions, compared with Alternative 1.

Renewable Energy (Geothermal, Wind, and Solar) Management

Table 18-21 shows the direct, indirect, induced, and total impacts on economic contributions from projected geothermal activity. A discussion on impacts are provided at the rangewide-level in **Section 4.8** of the EIS.

Source: IMPLAN 2021 Data for model region including counties in the socioeconomic analysis area in California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming as well as for all counties in the state using the multi-regional input-output analysis.
Note: There were no oil and gas developments projected for California and Oregon under all alternatives.

Wyoming

Impacts under the Proposed RMP Amendment would be similar to those as those described under Alternative 5, except in some areas, management decisions on PHMA would lead to a reduction in oil and gas activity, compared with Alternative 5. These decisions would lead to the same impacts on economic and social conditions as under Alternative 6. On annual average, oil and gas production revenue and well development expenditures in the Wyoming analysis area is expected to result in about 1,000 fewer total jobs (about 640 fewer direct jobs), about $110 million less in total labor income (about $64 million less in direct labor income), and about $717 million less in economic output (about $559 million less in direct economic output), than under Alternative 1, throughout the state (see **Table 18-9** in **Appendix 18**).

The decrease in projected oil and gas activity, under Alternative 6, would result in reductions in tax revenues, compared with Alternative 1. The total royalty revenue generated from oil and gas production in Wyoming would be about $1.5 billion, which is about $69 million less than under Alternative 1. The Wyoming severance tax revenue is expected to be about $532 million, which is about $25 million less than under Alternative 1. The oil and gas conservation tax is expected to generate about $4.4 million, which is about $208,000 less than under Alternative 1. Oil and gas production could generate about $559 million across the analysis area in county revenues from ad valorem taxes, which is about $26 million less than under Alternative 1. Additionally, a reduction in oil and gas activity, in Wyoming, under Alternative 6, could lead to a decrease in revenue from rents, bonus bids, and sales and use taxes, compared with Alternative 1. The reductions in tax revenues could put strain on local governments' budgets and could impact public services that are offered to the communities, including education. There could be impacts from BLM decisions on lifestyles and culture for those in mineral development communities of interest, especially for those individuals who rely on oil and gas extraction for employment.

The reduction in the acreage available for fluid mineral leasing could reduce the development-related impacts on nonmarket and social conditions associate with changes in air and GHG emissions, compared with Alternative 1.

Appendix 19

Idaho Buffers and Required Design Features

This page intentionally left blank.

Appendix 19. Idaho Buffers and Required Design Features

19.1 Introduction

Under Idaho's state-specific circumstances, there are proposed changes to Appendix B: Buffers and Appendix C: Required Design Features of the BLM Idaho's 2015 RMP Amendment. Proposed changes include changes to which leks buffers would be applied to for BLM management and project NEPA analysis, and several modifications to lek buffer distances based on the updated plan for GRSG by the State of Idaho, i.e. the 2021 Idaho Sage-grouse Plan (State of Idaho 2021).

19.1.1 Lek Definitions

In the "2015 Idaho ARMPA" (Southwestern Idaho and Montana Approved Resource Management Plan Amendment [BLM and Forest Service 2015a]; Alternative 1), lek definitions were based on Idaho Department of Fish and Game's (IDFG) lek management status and described in the 2015 Idaho ARMPA (also see **Appendix 4**). No changes were made in the 2019 Idaho ARMPA (BLM Idaho 2019; Alternative 2). A lek with a five-year management status of *occupied* was a lek that had been active at least one breeding season within the prior five years. An *active* lek was an annual status and meant that the lek had been attended by more than one male GRSG during the most recent breeding season. A lek with a five-year management status of *unoccupied* was a lek that had not been active for five consecutive years.

19.1.2 Lek Buffer Distances

In the 2015 ARMPA ROD (Alternative 1), BLM based lek buffer distances on the USGS Report, *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* (Manier et al. 2014) which provided a summary of scientific literature on the influence of anthropogenic disturbance and infrastructure on GRSG. The BLM decision was to apply lek buffer distances specified as the 'lower end of the interpreted range' in the report which was based on multiple research studies.

The 2019 proposal for the Idaho management alignment alternative included reduced lek buffers. BLM Idaho's 2019 ROD (BLM Idaho 2019; Alternative 2) did not reduce lek buffers in PHMA but did reduce lek buffers in IHMA and GHMA to better align buffer distances with the Governor's three-tiered habitat approach. Lek buffer distances were most restrictive in PHMA (same as 2015 Idaho ARMPA), and slightly reduced in IHMA and further reduced in GHMA. Instead of the 'lower end of the interpreted range' (basis for the 2015 ARMPA buffer distances), buffer distances were based on the 'literature minimum' in the USGS report, i.e., the lowest effect distance reported from multiple research studies. Buffer exception criteria were possible in IHMA and GHMA. This approach encouraged development outside of the best habitat and into lesser quality or non-habitat. The proposal was also consistent with acknowledgement in the USGS report that no single buffer distance would be appropriate for all populations and habitats across the range of sage-grouse (Manier et al. 2014).

19.2 Alternatives 3, 4, 5, and 6

19.2.1 Lek Definitions

For range wide consistency and analysis of lek data, BLM will adopt the updated WAFWA lek definitions (Cook et al. 2022; **Appendix 4**). These differ from the lek definitions in the 2015 Idaho ARMPA (Alternative 1). In Idaho, BLM would apply buffers to *active* and *pending active* leks under Alternatives 3, 4, 5, and 6. An

active lek is a lek that has more than two or more males counted during two or more lek counts within the last 10 years. A *pending active* lek is a lek with one observation of at least two males in the last 10 years and at least one observation of at least two males more than 10 years ago. BLM will rely on the lek status determinations of the Idaho Department of Fish and Game based on their most recent lek data. The change in lek definitions and change from a five-year to a ten-year lek management status better captures fluctuations in GRSG population dynamics, which generally follow 9- to 10-year population cycles (Fedy and Aldridge 2011, Fedy and Doherty 2011). Under Alternatives 3, 4, and 6, any *active* and *pending active* leks would be evaluated whereas under Alternative 5, lek buffers would only apply to *active* and *pending active* leks within HMA.

19.2.2 Lek Buffer Distances

Under Alternatives 3 and 4, lek buffer distances in IHMA and GHMA would be the same as in PHMA, as in the 2015 Idaho ARMPA or Alternative 1 (**Table ID-1**). Lek buffer distances in the 2015 Idaho ARMPA were based on the 'lower end of the interpreted range' of potential effect area and potential distribution of habitat as outlined in Manier et al. (2014).

Under Alternatives 5 and 6, lek buffer distances in IHMA and GHMA are largely based on the 'literature minimum' (Manier et al. 2014), or the minimum distance where effects were documented in the scientific literature, similar to the lek buffer distances in the 2019 Idaho ARMPA (Alternative 2). Alternatives 5 and 6 also includes changes to lek buffer distances in the 2021 Idaho Sage-grouse Plan (Executive Order 2022-03; State of Idaho 2022).

The following modifications were made to the lek buffer distances under Alternatives 5 and 6:

- A decrease for minor linear features (e.g. minor roads) in PHMA from 3.1 to 1.2 miles
- An increase for major linear features in IHMA from 0.8 to 2.0 miles
- An increase for transmission line towers in IHMA from 1.2 to 1.7 miles
- A decrease for communication and meteorological towers in IHMA from 2.0 to 1.7 miles
- A decrease for other types of surface disturbance in GHMA from 2.0 to 0.6 miles

Buffer distances would remain the same in PHMA under all Alternatives, with the one exception for minor linear features noted above. Approximately 75% of all active and pending active leks are in PHMA; thus, buffer distances in PHMA would provide protection for GRSG habitat in PHMA. In areas with tripped triggers, i.e. neighborhood lek clusters for population triggers and fine-scale HAF for habitat triggers, IHMA would be treated as PHMA and PHMA buffers would be applied in NEPA analyses and any associated management decisions.

19.2.3 Required Design Features (RDFs)

Alternatives 3 through 6, consider Required Design Features (RDFs) the same as the 2019 Idaho ARMPA (Alternative 2). Under the Proposed RMP Amendment, RDFs would be the same as under the 2015 Idaho ARMPA (Alternative 1) and incorporate the best management practices and design features for livestock grazing management described in **Appendix 15**.

Table ID-1. Lek Buffer Distances by Disturbance Type, Habitat Management Area (HMA), and Alternative

Disturbance Type	HMA	Lek Buffer Distance[1] (miles)				
		Alts 1[2]	Alt 2[3]	Alts 3 and 4[1]	Alts 5 and 6[4]	Proposed RMP Amendment
Linear features (e.g. roads)[5] - Major / Minor	PHMA	3.1	3.1	3.1	Major – 3.1 Minor – 1.2	3.1
	IHMA	3.1	0.8	3.1	Major – 2.0 Minor – 0.8	3.1
	GHMA	3.1	0.25	3.1	Major – 0.25 Minor – 0.25	3.1
Infrastructure related to energy development	PHMA	3.1	3.1	3.1	3.1	3.1
	IHMA	3.1	2.0	3.1	2.0	3.1
	GHMA	3.1	0.6	3.1	0.6	3.1
Tall structures[6]	PHMA	2.0	2.0	2.0	2.0	2
- Com. or met. towers	IHMA	2.0	--	2.0	--	2.0
- Transmission line towers		--	2.0	--	1.7	--
- Distribution poles		--	1.2	--	1.7	--
		--	0.6	--	0.6	--
	GHMA	2.0	0.6	2.0	0.6	2.0
Low structures (e.g. fences, rangeland structures)	PHMA	1.2	1.2	1.2	1.2	1.2
	IHMA	1.2	0.6	1.2	0.6	1.2
	GHMA	1.2	0.12	1.2	0.12	1.2
Surface disturbance (continuing human activities that alter or remove the natural vegetation)	PHMA	3.1	3.1	3.1	3.1	3.1
	IHMA	3.1	2.0	3.1	2.0	3.1
	GHMA	3.1	2.0	3.1	0.6	3.1

[1] Alternatives are grouped by similar HMA extent and buffer distances, but allocations and management may differ Alts 3 vs. 4, and Alts 5 vs. 6.
[2] Based on the 'lower end of the interpreted range' from the USGS report (Manier et al. 2014) for disturbances in all HMA
[3] For disturbances in PHMA, and IHMA/GHMA, based on the 'lower end of the interpreted range', and the 'literature minimum', respectively (Manier et al. 2014)
[4] Distances from the 2021 Idaho Sage-grouse Plan. In accordance with the 2021 Idaho Sage-grouse Plan, linear features are split into major and minor linear features, and tall structures are split out for disturbances in IHMA.
[5] Roads are linear routes declared as a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use. Roads do not include trails, primitive roads, temporary routes, or administrative routes with maintenance intensity of 0 or 1 (2015 ARMPA ROD).
[6] Communication or meteorological towers

Disturbance Type	HMA	Lek Buffer Distance[1] (miles)				
		Alts 1[2]	Alt 2[3]	Alts 3 and 4[1]	Alts 5 and 6[4]	Proposed RMP Amendment
Noise and related disruptive activities including those do not result in habitat loss	PHMA	≥ 0.25	n/a	≥ 0.25	n/a	≥ 0.25
	IHMA	≥ 0.25	n/a	≥ 0.25	n/a	≥ 0.25
	GHMA	≥ 0.25	n/a	≥ 0.25	n/a	≥ 0.25

19.3 *ALTERNATIVES 3 AND 4* APPENDIX B: BUFFERS

19.3.1 Applying Lek Buffer-Distances When Approving Actions

Buffer Distances and Evaluation of Impact on Leks

Evaluate impacts from actions requiring NEPA analysis on active and pending active leks (Cook, et al. 2022; **Appendix 4**) within HMA. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report, *Conservation Buffer Distance Estimates for Greater Sage-Grouse - A Review* (Manier et al. 2014). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

- Linear features (roads)[7] within 3.1 miles of leks
- Infrastructure related to energy development within 3.1 miles of leks.
- Tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
- Low structures (e.g., fences, rangeland structures) within1.2 miles of leks.
- Surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
- Noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized "that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range". The USGS report also states that "various protection measures have been developed and implemented… [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands". All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent lek determination available from the state wildlife agency.

For Actions in GHMA

- The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should first be avoided by locating the action outside of the applicable lek buffer – distance(s) identified above.
- The BLM may approve actions in GHMA that are within the applicable lek buffer distance identified above only if:
  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

[7] Roads are linear routes declared as a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use. Roads do not include trails, primitive roads, temporary routes, or administrative routes with maintenance intensity of 0 or 1 (2015 ARMPA ROD).

- If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
  - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; **or**
  - The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); **and**
  - Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix J).

For Actions in PHMA and IHMA

- The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
- The BLM may approve actions in PHMA and IMHA that are within the applicable lek buffer distance identified above only if with input from state fish and wildlife agency, it determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than identified above offers the same or greater level of protection for GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- Range improvements which do not impact GRSG, or range improvements which provide a conservation benefit to GRSG such as fences for protecting important seasonal habitats, meet the lek buffer requirement.

The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

19.4 *ALTERNATIVES 5 AND 6* APPENDIX B: BUFFERS

19.4.1 Applying Lek Buffer-Distances When Approving Actions

Buffer Distances and Evaluation of Impact on Leks

Evaluate impacts from actions requiring NEPA analysis on active and pending active leks (Cook, et al. 2022; **Appendix 4**) within HMA. In addition to any other relevant information determined to be appropriate (e.g., state wildlife agency plans), the BLM will apply the lek buffer-distances described below, unless justifiable departures are determined to be appropriate or buffer exception criteria for GHMA. Buffers do not apply to vegetation treatments specifically designed to improve or protect Greater Sage-Grouse habitat.

The BLM will apply lek buffer-distances as specified in the USGS Report, *Conservation Buffer Distance Estimates for Greater Sage-Grouse - A Review* (Manier et al. 2014). In general, buffer distances would be the 'lower end of the interpreted range' in the USGS report for disturbances in PHMA, the 'literature minimum' for disturbances in IHMA or GHMA, or as specified in the 2021 Idaho Sage-grouse Plan.

PHMA

- Major linear features (roads)[8] within 3.1 miles of leks
- Minor linear features (e.g. minor roads) or low structures (e.g., fences and rangeland structures) within 1.2 miles of leks
- Tall structures (e.g., communication or transmission towers and transmission lines) within 2 miles of leks
- Infrastructure related to energy development within 3.1 miles of leks
- Surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks

IHMA

- Major linear features (e.g., roads) within 2 miles of leks
- Minor linear features within 0.8 miles or low structures within 0.6 miles of leks
- Tall structures (e.g., electrical, communication, and meteorological) within 1.7 miles of leks
- Transmission lines/towers within 1.2 miles of leks[2]
- Distribution lines/poles within 0.6 miles of leks[1]
- Infrastructure related to energy development (e.g., oil, gas, wind, and solar) within 2 miles of leks
- Surface disturbance (continuing human activities that alter or remove the natural vegetation) within 2 miles of leks

GHMA

- Major linear features (e.g., roads) within 0.25 miles of leks
- Minor linear features within 0.25 miles of leks; low structures within 0.12 miles of leks
- Tall structures (e.g., electrical, communication, and meteorological) within 0.6 miles of leks

[8] Roads are linear routes declared as a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use. Roads do not include trails, primitive roads, temporary routes, or administrative routes with maintenance intensity of 0 or 1 (2015 ARMPA ROD).

- Infrastructure related to energy development (e.g., oil, gas, wind, and solar) within 0.6 miles of leks; 2-mile feasibility/practicality conditions
- Surface disturbance (continuing human activities that alter or remove the natural vegetation) within 0.6 miles of leks

Justifiable Departures—Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations and state regulations) may be appropriate for determining activity impacts. The USGS report recognized "that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage- grouse range." The USGS report also states that "various protection measures have been developed and implemented…[which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands." All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent lek determination available from the state wildlife agency.

For Actions in PHMA and IHMA

- The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts on leks, as identified in the NEPA analysis. Impacts should be avoided by locating the action outside the applicable lek buffer-distances identified above.
- The BLM may approve actions in PHMA and IHMA that are within the applicable lek buffer- distance identified above, only if, with input from the state fish and wildlife agency, it determines, based on best available science, landscape features, and other existing protections, that a buffer-distance other than that identified above offers the same or greater level of protection to Greater Sage-Grouse and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- Range improvements that do not affect Greater Sage-Grouse, or range improvements that provide a conservation benefit to Greater Sage-Grouse, such as fences for protecting important seasonal habitats, meet the lek buffer requirement.

The BLM will explain its justification for determining if the approved buffer-distances meet these conditions in its project decision.

Buffer Exception Criteria for IHMA and GHMA—If it is impracticable, technically, or economically, to locate the project outside of the buffer area and impacts are avoided through project siting and design, to the extent reasonable, BLM may approve actions within buffers in IHMA and GHMA.

19.5 *PROPOSED RMP AMENDMENT* UPDATE 2015 IDAHO GRSG RMP AMENDMENT, APPENDIX B: BUFFERS

Under the Proposed RMP Amendment, BLM is proposing the following management direction relative to lek buffers:

- Management direction would apply the buffer distances as defined under the 2015 RMPA as analyzed in Alternatives 1, 3 and 4 of the DEIS;
- Buffers would apply to *pending active* as well as *active* leks instead of *occupied* leks as analyzed in Alternative 5 of the DEIS

Lek buffer distances would be the same as under Alternatives 1, 3 and 4, based on the lower end of the interpreted range from Manier et al. (2014). In addition, the buffer exception criteria would only apply to GHMA, as described under Alternative 4. Please refer to **Appendix 2**, **Table 2.1** for a summary of the 2015 and 2019 buffer management direction and please refer to MD SSS 35 and Alternatives 1 and 2 of the DEIS for the complete set of direction from these two amendments.

Following is the proposed management direction:

19.6 APPLYING LEK BUFFER-DISTANCES WHEN APPROVING ACTIONS

19.6.1 Buffer Distances and Evaluation of Impact on Leks

Evaluate impacts from actions requiring NEPA analysis on active and pending active leks (Cook, et al. 2022; **Appendix 4**) within HMA. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report, *Conservation Buffer Distance Estimates for Greater Sage-Grouse - A Review* (Manier et al. 2014).

The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

- Linear features (roads)[9] within 3.1 miles of leks
- Infrastructure related to energy development within 3.1 miles of leks.
- Tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
- Low structures (e.g., fences, rangeland structures) within1.2 miles of leks.
- Surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
- Noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized "that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance

[9] Roads are linear routes declared as a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use. Roads do not include trails, primitive roads, temporary routes, or administrative routes with maintenance intensity of 0 or 1 (2015 ARMPA ROD).

type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range". The USGS report also states that "various protection measures have been developed and implemented… [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands". All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent lek data available from the state wildlife agency.

For Actions in GHMA

- The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should first be avoided by locating the action outside of the applicable lek buffer – distance(s) identified above.
- The BLM may approve actions in GHMA that are within the applicable lek buffer distance identified above only if:
  - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
  - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
    - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; **or**
    - The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); **and**
    - Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix J).

For Actions in PHMA and IHMA

- The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
- The BLM may approve actions in PHMA and IMHA that are within the applicable lek buffer distance identified above only if with input from state fish and wildlife agency, it determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than identified above offers the same or greater level of protection for GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- Range improvements which do not impact GRSG, or range improvements which provide a conservation benefit to GRSG such as fences for protecting important seasonal habitats, meet the lek buffer requirement.

The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

19.7 *PROPOSED RMP AMENDMENT*
ADOPT 2015 IDAHO GRSG RMP AMENDMENT, APPENDIX C: REQUIRED DESIGN FEATURES

For consistency with the Proposed RMP Amendment's goal to "conserve, enhance, restore, and manage GRSG habitats to support persistent, healthy populations", the Proposed RMP Amendment is proposing to adopt the 2015 Idaho GRSG RMP Amendment Appendix C: Required Design Features (RDFs) from the 2015 Idaho RMPA and incorporate the BMPs and Design Features for livestock grazing management described in **Appendix 15** of this RMP Amendment. The BLM Idaho is currently implementing RDFs from the 2019 Idaho GRSG RMP Amendment under Alternative 2 (No Action). Please refer to **Appendix 2**, **Table 2** for a summary of the 2015 and 2019 RDF management direction.

19.8 AFFECTED ENVIRONMENT

In September 2023, IDFG adopted the new WAFWA lek definitions (Cook et al. 2022; **Appendix 4**). Since current management is the 2015 Idaho ARMPA, BLM uses 2015 Idaho ARMPA definitions for implementation decisions. BLM Idaho applied these definitions to 2023 lek data to determine management status of leks as *occupied* or *unoccupied* (BLM Idaho IM 2024-003). There were 1104 leks in 2023 that would be considered *occupied* under Alternatives 1 and 2; **Table ID-2**). Under the proposed action, there would be 1093 *active* and 161 *pending active* leks (Alternatives 3, 4, 5, and 6).

Table ID-2. Number of Leks by Management Status, Habitat Management Area (HMA), and Alternatives

Lek Management Status	HMA	Alt 1	Alt 2	Alts 3 and 4	Alts 5 and 6
Number of leks where buffers would apply					
Occupied	n/a	1104	1104	n/a	n/a
Active	n/a	n/a	n/a	1093	1093
Pending Active	n/a	n/a	n/a	161	159
Total Leks	n/a	1104	1104	1254	1252
Percent of leks where buffers would apply by HMA type					
Occupied	PHMA IHMA GHMA Non	68 25 5 2	67 26 5 2	n/a	n/a
Active	PHMA IHMA GHMA Non	n/a	n/a	78 19 3 0	73 22 4 0
Pending Active	PHMA IHMA GHMA Non	n/a	n/a	67 22 10 0	67 21 11 0

19.9 ENVIRONMENTAL CONSEQUENCES

19.9.1 Analytical Assumptions

Methods for analyzing impacts are described in **Section 4.1.1**, General Methodology for Analyzing Impacts, and include definitions for 'type of impact', 'context', 'duration', 'intensity', and 'direct, indirect, and cumulative impacts'.

BLM analyzed:

- Changes in lek definitions and number of leks where buffers would be applied, and
- Changes in lek buffer distances

For analytical purposes and comparisons of lek buffer distances among alternatives, buffer distances were considered potential 'protection' or non-development areas, and, thus, percent of HMA closed for development (i.e. areas within HMA and lek buffers) were compared among alternatives. Effects under Alternatives 3 and 4 were assumed to be the similar since buffer distances are the same among these alternatives. Buffer distances for Alternatives 3 and 4 are also the same as buffer distances under Alternative 1 but would apply to *pending active* as well as *active* leks instead of *occupied* leks. Buffer distances under Alternatives 5 and 6 are most similar to Alternative 2 but with some additional modifications.

The analysis focused on differences between:

- Alternatives 1 and 4 (changes in lek definitions),
- Alternatives 2 and 5 (changes in lek buffer distances), and
- Alternatives 4 and 5 (changes in lek buffer distances)

Comparisons between lek buffer distances under Alternatives 1 and 2 were made in the 2018 FEIS (BLM Idaho 2018) and 2020 FSEIS (BLM Idaho 2020). Comparisons of HMA acres and percent of HMA were made on BLM lands only, i.e. 8.7 to 8.8 million acres depending on Alternative (**Table 2-3**).

Changes in Lek Definitions

Adopting range wide lek definitions (Cook et al. 2022; **Appendix 4**) changes both the number of leks evaluated for BLM management leks where buffers would apply from the 2015 Idaho ARMPA lek definitions. This change would result in a 1% change from *occupied* leks under Alternatives 1 and 2 to *active* leks under Alternatives 3 through 6. It would also be a 5 to 10% increase from the number of *occupied* leks in PHMA to the number of *active* leks in PHMA (**Table ID-2**). With the proposed action, there would be a slight increase in the number of active leks in PHMA and IHMA combined and a decrease in the number of leks outside of HMA.

Based on recommendations from the State of Idaho, in addition to *active leks,* the proposed action also considers management for *pending active* leks. This change in 161 *pending active* leks would result in a 15% increase in the number of leks considered for BLM management (**Table ID-2**).

Changing which leks buffers apply to, i.e. *active* and *pending active* leks, could provide protection to additional BLM lands from new disturbances with Alternative 4's lek buffers when compared with Alternative 1. Since two thirds of the pending active leks are in PHMA and PHMA is closed or excluded for multiple disturbance types, such as renewable energy or non-energy leasable minerals, or salable minerals, effects of the proposed action to consider *pending active* leks would be realized more in IHMA and GHMA. However, these changes would be minimal in IHMA and GHMA, with only 6% additional BLM lands in IHMA and 1% in GHMA that would be protected under Alternative 4 compared with Alternative 1.

Resources Potentially Affected by Modifying Lek Buffer Distances

- GRSG
- Mineral Resource Management
- Lands and Realty
- Renewable Energy
- Livestock Grazing
- Travel and Transportation
- Cumulative Effects – Social and Economic Conditions

General Effects of Lek Buffers

Known effects of anthropogenic disturbance on GRSG are described in **Section 4.2.1**. Effects of various anthropogenic disturbances and lek buffer distances were analyzed in the USGS report (Manier et al. 2014) and in 2015 FEIS (BLM and Forest Service 2015), 2018 FEIS (BLM Idaho 2018), and 2020 FSEIS (BLM Idaho 2020). The lek buffer distances from the 2015 Idaho ARMPA (Alternative 1) were based on the lower end of the interpreted range from the USGS Report (Manier et al. 2014) for various types of anthropogenic disturbances, with the major types of anthropogenic disturbance such as energy development with a 3.1-mile buffer. The recommended 3.1-mile buffer was based on disturbance effects reported in the literature and that the majority of nesting birds from a given lek would be protected by that buffer distance. For example, in Nevada and California, 95% of all nests are within 3.1 miles of leks (Coates et al. 2013), and in Wyoming, 64% of nests within 3.1 miles of leks (Holloran and Anderson 2005). In some populations, hens may nest further from leks and a 3.1-mile buffer would protect fewer nesting birds from a given lek. In Idaho, less than 50% of GRSG hens nest within 1.9 miles and 80% within 6 miles from leks where they were captured (Connelly et al. 2013). However, effects of anthropogenic disturbance do not depend solely on where hens are nesting. In some areas, depending on existing disturbance, habitat conditions, and topography, smaller buffers may suffice to protect leks from development. The interpreted range in the USGS report is based on a "typical response" but "there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range" (Manier et al. 2014).

Reducing lek buffers could impact GRSG, including avoidance behavior, reduced productivity, declines in lek attendance, and extirpation of leks. However, the type of impacts and intensity would vary depending on several factors, including habitat conditions, breeding bird density in the area and proximity to other leks, home range size for that particular population, existing anthropogenic disturbance, and whether the potentially impacted area provides unique seasonal habitats or connectivity among other habitat patches. Project-level impacts would be analyzed during NEPA.

Effects of Modified Lek Buffers under Alternatives 3 and 4

Under Alternatives 3, and 4, lek buffer distances would remain the same as in the 2015 Idaho ARMPA (Alternative 1). Therefore, there would be no effects to GRSG under these Alternatives.

Effects of Modified Lek Buffers under Alternatives 5 and 6

The proposed changes to lek buffer distances under Alternatives 5 and 6 would result in the following changes compared with the 2019 Idaho ARMPA (Alternative 2):

- Increase in lek buffers in IHMA—For major linear features, e.g. major roads, in IHMA, the buffer distance would increase from 0.8 to 2.0 miles (**Table ID-1**). This would increase the portions of IHMA protected from major linear features from 6% (0.8-mile buffer) to 24% (2.0-mile buffer), or an increase of 18% in the portion of IHMA protected from major linear features. For transmission

line towers in IHMA, the buffer distance would increase from 1.2 to 1.7 miles. This would increase the portions of IHMA protected from transmission line towers from 12% (1.2-mile buffer) to 19% (1.7-mile buffer), or an increase of 7% in the portion of IHMA protected from transmission line towers.

- Decrease in lek buffers in PHMA—For minor linear features, e.g. minor roads, in PHMA, the buffer distance would decrease from 3.1 to 1.2 miles. This would decrease the portions of PHMA protected from minor linear features from 72% (3.1-mile buffer) to 28% (1.2-mile buffer) or a 44% decrease in the portion of PHMA protected from minor linear features.
- Decrease in lek buffers in IHMA—For communication and meteorological towers in IHMA, the buffer distance would decrease from 2.0 miles to 1.7 miles. This change is due to more recent literature on the effects of tall structures (Kohl et al. 2019a, b). This would decrease the portions of IHMA protected from communication and meteorological towers from 25% (2.0-mile buffer) to 19% (1.7-mile buffer), or a 6% decrease in the portion of IHMA protected from communication and meteorological towers.
- Decrease in lek buffers in GHMA—For surface disturbances due to continuing human activities that alter or remove the natural vegetation, other than infrastructure related to energy development, major and minor linear features, tall structures, and low structures, the buffer distance would decrease from 2.0 miles to 0.6 miles. This change would make the buffer distance consistent with buffer distances for other anthropogenic disturbance in GHMA, such as infrastructure related to energy development also 0.6 miles. This would decrease the portions of GHMA protected from other surface disturbance from 5% (2.0-mile buffer) to 1% (0.6-mile buffer), or a 4% decrease in the portion of GHMA protected from surface disturbance.

The proposed changes to lek buffer distances under Alternative 5 would result in the following changes compared with Alternative 4:

- PHMA—Lek buffers would remain the same in PHMA for all disturbance types across all Alternatives, except for the modification for minor linear features noted above. Under Alternative 5, the buffer distance for minor linear features, e.g. minor roads, would decrease from 3.1 to 1.2 miles (**Table ID-3**). This would decrease the portions of PHMA protected from minor linear features from 93% (3.1-mile buffer) to 28% (1.2-mile buffer) or a 65% decrease in the portion of PHMA protected from minor linear features. Buffer distances for all other types of disturbance would remain the same and provide protection for approximately 76% of all *active* and *pending active* leks that are in PHMA (Alternatives 3 through 6; **Table ID-2**).
- IHMA—Under Alternative 5, reduced buffer distances for disturbances, such as infrastructure related to energy development, other surface disturbance, and linear features, would result in 23% less IHMA protected compared with Alternative 4 (i.e., 47% for a 3.1-mile buffer to 24% for a 2-mile buffer; **Table ID-3**). Buffer distances would be reduced for other types of disturbances compared with Alternative 4 and also result in less IHMA protected, i.e. tall structures 7% less; low structures 5% less; and noise and disruptive activities 1% less.
- GHMA—Under Alternative 5, buffer distances for disturbances would result in 1 to 13% less GHMA protected, where the largest difference would be for infrastructure related to energy development, other types of surface disturbance, and linear features (i.e. 3.1-mile buffer reduced to 0.6- or 0.25-mile buffer; **Table ID-3**). Impacts on GRSG would vary widely since only 5% of all *active* and *pending active* leks are in GHMA and scattered across nearly 2 million acres of BLM lands. On a project-specific basis, BLM would continue to avoid and minimize impacts to the extent practicable within GHMA.

Table ID-3. Habitat Protected by Lek Buffers under Alternatives 4 and 5

Action	PHMA (4,472,499 acres)		IHMA (2,410,920 acres)		GHMA (1,908,361 acres)	
	Buffer	Percent Protected	Buffer	Percent Protected	Buffer	Percent Protected
Alternative 4						
Linear Features (roads)	3.1 Miles	93	3.1 Miles	47	3.1 Miles	13
Infrastructure Related to Energy Development	3.1 Miles	93	3.1 Miles	47	3.1 Miles	13
Tall Structures	2 Miles	58	2 Miles	26	2 Miles	6
Low Structures	1.2 Miles	29	1.2 Miles	11	1.2 Miles	2
Surface Disturbance	3.1 Miles	93	3.1 Miles	47	3.1 Miles	13
Noise and Related Disruptive Activities	0.25 Miles	1	0.25 Miles	1	0.25 Miles	0
Action	**PHMA (4,452,947 acres)**		**IHMA (2,440,288 acres)**		**GHMA (1,717,050 acres)**	
	Buffer	**Percent Protected**	**Buffer**	**Percent Protected**	**Buffer**	**Percent Protected**
Alternative 5						
Linear Features: major minor	3.1 Miles 1.2 Miles	92 28	2 Miles 0.8 Miles	24 6	0.25 Miles 0.25 Miles	0 0
Infrastructure Related to Energy Development	3.1 Miles	92	2 Miles	24	0.6 Miles	1
Tall Structures Distribution poles *only*	2 Miles	49	1.7 Miles 0.6 Miles	19 6	0.6 Miles	1
Low Structures	1.2 Miles	28	0.6 Miles	6	0.12 Miles	0
Surface Disturbance	3.1 Miles	92	2 Miles	24	0.6 Miles	1
Noise and Related Disruptive Activities	--	--	--	--	--	--

Besides differences to Alternatives 2 and 4 described above, Alternative 5 would not include any buffers for noise and related disruptive activities that do no result in habitat loss. Also, Alternative 5 would include 'Buffer Exception Criteria', where BLM may approve actions within IHMA and GHMA, if it is impracticable, technically or economically, to locate the project outside of the buffer and impacts are avoided through project siting and design, to the extent reasonable. The Buffer Exception Criteria and reduced buffers in GHMA and IHMA should encourage development outside of PHMA.

The reduced buffer distances, primarily in IHMA and GHMA, along with the Buffer Exception Criteria in IHMA and GHMA would improve alignment with the Governor's Plan by having the most restrictive management in PHMA and reducing those restrictions in IHMA and further reducing restrictions in GHMA. Other restrictions in IHMA such as RDFs, Mitigation, Disturbance cap, and NSO with limited exception would serve to ensure responsible development. However, infrastructure and development could be allowed closer to leks, subject to the before mentioned restrictions. As described above, the amount of GRSG habitat and HMA that could be protected with lek buffers under Alternative 5 would be lower compared to protections under Alternative 4. As a result, under Alternative 5 development could occur closer to some leks (smaller buffer) than under Alternative 4 and result in increased impacts to GRSG. Project-level impacts would be analyzed during NEPA and consider other measures to ensure responsible development.

Effects of Required Design Features under Alternatives 3 through 6

The RDFs from the 2019 Idaho ARMPA (Alternative 2, No Action) mostly differ from the 2015 Idaho ARMPA in treating RDFs for actions in GHMA as BMPs. Therefore, applying RDFs from the 2019 ARMPA would result in less protection for all GRSG leks and habitat in GHMA than under the 2015 Idaho ARMPA, (Alternative 1).

Effects of Buffers and Required Design Features under the Proposed RMP Amendment

The proposed changes to lek buffer distances under the Proposed RMP Amendment would offer a similar level of protection to GRSG leks in IHMA and GHMA as with Alternatives 1 and 4, and a greater level of protection for GRSG leks in IHMA and GHMA than under Alterative 5. Furthermore, under the Proposed RMP Amendment, there would be additional protection of leks in IHMA compared with Alternative 5, since the buffer exception criteria would only apply to GHMA, not IHMA, as under Alternatives 1 and 4. Compared with Alternative 4, the Proposed RMP Amendment would have negligible impacts on GRSG leks outside of HMA since there are only five leks of the 1252 active and pending leks. These five leks were not included in the HMA mapping since they are small, declining leks and/or on private lands.

The proposed changes to RDFs under the Proposed RMP Amendment would offer similar protection to GRSG in GHMA as in IHMA and PHMA, similar to protections under Alternative 1. In addition, the new BMPs and RDFs for livestock grazing management would be incorporated, consistent with the rangewide Proposed RMP Amendment.

Appendix 20

Changes between Draft RMP Amendment/Draft EIS and Proposed RMP Amendment/Final EIS

This page intentionally left blank.

Appendix 20. Changes Between Draft RMP Amendment/Draft EIS and Proposed RMP Amendment/Final EIS

This appendix provides a summary of the primary changes between the Draft RMP Amendment/Draft EIS (Draft RMPA/EIS) and this Proposed RMP Amendment/Final EIS (Proposed RMPA/Final EIS) by document section (chapters and appendices).

CHAPTER 1, INTRODUCTION

Chapter 1 has been updated to provide new information on the BLM's Proposed RMPA/Final EIS. Specifically, Chapter 1 has been updated to refine and clarify the Purpose and Need. Information previously in this chapter regarding alternative management approaches considered but not analyzed in detail has been moved to Chapter 2 and included in the Alternatives Considered but not Analyzed in Detail Table 2-1. Two new sections have been added to this Chapter: Section 1.7, summarizing changes between the Draft RMPA/EIS and this Proposed RMPA/Final EIS, and Section 1.9, which details how the BLM anticipates applying this RMPA to ongoing actions. Section 1.8, summarizing consistency with state and local land use plans, was updated based on input received on the Draft RMPA/EIS. Editorial changes were also made throughout Chapter 1 to improve clarity.

CHAPTER 2, ALTERNATIVES

Chapter 2 has been updated to present the goals, objectives, allocations, and management direction of the Proposed RMPA, presented by Habitat Management Area designation and resource topic. The chapter summarizes the alternatives considered in the Draft RMPA/EIS, but the full description of Alternatives 1-6 from the Draft EIS has been moved, with clarifying edits in response to cooperating agency and public comments, to Appendix 21. Chapter 2 also now provides an updated table of alternatives considered but not analyzed in detail and a summary table of the alternatives.

CHAPTER 3, AFFECTED ENVIRONMENT

The BLM has clarified language and incorporated new information since the Draft RMPA/EIS to reflect better or more current information, where available and germane to the current conditions and analysis. Most notably, such updates have been made in Sections 3.2, Greater Sage-Grouse; 3.5, Fish and Wildlife, 3.6, Special Status Species, 3.7, Wild Horses and Burros; 3.9, Lands and Realty (Including Renewable Energy); 3.11, ACECs and RNAs; 3.12 Social and Economic Conditions (Including Environmental Justice); 3.14, Soil Resources; and 3.15, Water Resources.

Additional literature was reviewed and added to the baseline information, particularly in Sections 3.2, Greater Sage-Grouse; 3.12 Social and Economic Conditions (Including Environmental Justice); 3.14, Soil Resources; and 3.15, Water Resources.

CHAPTER 4, ENVIRONMENTAL CONSEQUENCES

Analysis of Alternatives 1 through 6 has been moved to Appendix 10, and the state-specific Socioeconomic and Environmental Justice analysis for all alternatives (including the Proposed RMP Amendment) has been moved to Appendix 18. Chapter 4 now includes a summary of environmental consequences table, and for each resource, the nature and type of effects, likely direct and indirect impacts on the human and natural

environment that could occur from implementing the BLM Proposed RMP Amendment presented in Chapter 2, Alternatives, and cumulative effects.

The BLM has clarified language and incorporated new information since the Draft RMPA/EIS to reflect better or more current information, where available and germane to the current conditions and analysis. The BLM updated all sections of Chapter 4 with such changes.

CHAPTER 5, CONSULTATION AND COORDINATION

The BLM updated Chapter 5 to include information related to ongoing consultation and coordination efforts that have progressed since the Draft RMPA/EIS. Specifically, additional information has been added, summarizing formal consultation efforts with Federally recognized Tribes and the U.S. Fish and Wildlife Service, pursuant to Section 7(a)(2) of the Endangered Species Act, and coordination efforts with State Historic Preservation Officers, consistent with Section 106 of the National Historic Preservation Act. Sections have been updated that detail BLM's public outreach efforts and coordination with cooperating agencies on the Draft RMPA/EIS. Two new sections have been added in Sections 5.5 and 5.6 detailing the BLM's next steps, including the protest period on the Proposed RMPA/Final EIS and Governors consistency review, and BLM's intent to issue Approved RMPA/Records of Decisions for each state in the planning area, have also been added. Refinements were made to the list of preparers.

APPENDIX 1, MAPS

Maps in Appendix 1 were updated based on refinements to alternatives considered in the Draft RMPA/EIS. New maps were added that display the BLM's Proposed RMPA.

APPENDIX 2, COMPARISON OF PROPOSED RMP AMENDMENT TO EXISTING GREATER SAGE-GROUSE RMP MANAGEMENT DIRECTION

Appendix 2 was updated to provide a description of changes between BLM's existing RMP management direction for GRSG and the BLM's Proposed RMPA, including the appendices from prior planning efforts. For each state, tables now display BLM's management direction in the 2015 BLM GRSG Approved RMP Amendment, 2019 BLM GRSG Approved RMP Amendment, and a summary of the Type of Change to Existing Management Direction that would be made by the Proposed RMPA: no change, partial revision, complete revision, or new direction. Consistent with these updates, the appendix was renamed from "Existing Greater Sage-Grouse RMP Management Direction" to "Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction".

APPENDIX 3, GREATER SAGE-GROUSE HABITAT MANAGEMENT AREA STATE-BY-STATE MAPPING STRATEGIES

This appendix has been updated to reflect changes made to GRSG HMA mapping strategies since the Draft RMPA/EIS. The HMA delineation approaches utilized in the Proposed RMPA for all HMA types, both rangewide and state specific, are identified.

For the rangewide HMAs, clarifying language has been made to the descriptions of Priority Habitat Management Areas (PHMA) and General Habitat Management Areas (GHMA) to better describe how BLM identified these areas and BLM's management intent. Based on internal review and input received on the Draft RMPA/EIS, BLM has identified areas within PHMA that require additional protections to support conservation of GRSG habitat, referred to as PHMA with limited exceptions. Appendix 3 details the process and criteria BLM used to identify PHMA with limited exceptions and provides a state-by-state summary of the areas identified as PHMA with limited exceptions.

In Oregon and Nevada/California, HMAs were refined based on updated data (from Oregon Department of Fish and Wildlife and US Geological Survey, respectively) that became available between the publication of the Draft RMPA/EIS and the Proposed RMPA/Final EIS.

APPENDIX 4, LEK STATUS DEFINITION COMPARISON

In 2022 the Western Association of Fish and Wildlife Agencies (WAFWA) Sage and Columbian sharp-tailed grouse Technical Committee published a list of lek definitions to allow for more consistent data sharing and analyses across the range of GRSG. All the state wildlife agencies have adopted these new definitions. The BLM has adopted these definitions to ensure consistency with the state wildlife agencies and provide consistent management direction when implementing habitat conservation and allocations across the planning area. This appendix compares the 2022 lek definitions adopted by the BLM and state wildlife agencies and compares them to previous definitions used in 2015 and 2019 by state.

APPENDIX 5, EVALUATION OF AREAS OF CRITICAL ENVIRONMENTAL CONCERN FOR GREATER SAGE-GROUSE HABITAT

This appendix has been updated to provide a comprehensive review of the internally and externally nominated ACECs; the relevance and importance criteria evaluation process that was conducted for the nominated ACECs; and a summary the potential ACECs identified in the Draft EIS. The appendix also describes changes made in the ACECs analyzed between Draft and Final EIS, provides maps of the ACECs considered in each state, and describes the effects of the alternatives and the Proposed RMP Amendment on the 32 potential ACECs considered in Alternatives 3 and 6 in the Final EIS.

APPENDIX 6, NTT, COT, AND USGS SCIENCE INCORPORATION

This appendix clarifies the role of the NTT report, COT report and USGS science in developing this RMPA for GRSG. While both the NTT and COT reports provide conservation recommendations for GRSG and their habitats, neither was intended as the definitive directive for management. This appendix clarifies the role of these reports in the development of the GRSG RMPA.

APPENDIX 7, GREATER SAGE-GROUSE MONITORING FRAMEWORK

The BLM GRSG Monitoring Framework outlines how the BLM tracks sagebrush habitats across the planning area. The appendix provides the updated monitoring framework. Since implementing the monitoring efforts described in the original Monitoring Framework, new data has become available and new approaches to analyzing these data have been developed. This update maintains the existing measures included in the original document and expands upon them to include this new science. Measures for monitoring are identified at two scales: the rangewide scale and land use plan scale. The former will provide insight into habitat conditions and BLM management actions across jurisdictional boundaries which will, in turn, provide context to the smaller scale land use plan monitoring.

APPENDIX 8, GREATER SAGE-GROUSE HABITAT INDICATORS AND BENCHMARKS

The BLM uses the multi-scale Habitat Assessment Framework (HAF) to determine whether an area is likely to provide GRSG habitat, and if so, the quality of that habitat to inform management. The HAF (BLM TR 6710-1, as revised) provides a standardized, scientifically based methodology to assess sage-grouse habitat suitability at multiple scales (broad, mid, fine, and site-scales). Habitat suitability occurs along a gradient ranging from unsuitable to suitable and is rarely uniform within and across the scales. Using multi-scale evaluations is important for assessing GRSG habitat by considering the entire suite of conditions that contribute to high quality habitat, the success of past conservation actions, and prioritizing future land uses

and conservation actions. This appendix provides the updated habitat indicators and benchmarks used by the HAF, as adjusted by individual states to consider ecological differences across the species' range.

APPENDIX 9 TABLES AND FIGURES

Tables and Figures in Appendix 9 were updated based on refinements to alternatives considered in the Draft RMPA/EIS. Several tables were removed since they were not used to inform the analysis. Several tables were consolidated and revised to provide more informative data by HMA category. New tables and figures were added that detail the BLM's Proposed RMPA.

APPENDIX 10, CHAPTER 4 METHODOLOGY, ASSUMPTIONS, INDICATORS, AND ENVIRONMENTAL CONSEQUENCES FOR ALTERNATIVES 1-6

Analyses for the draft alternatives (Alternatives 1 through 6) were moved to this appendix and adjusted based on public and internal comments. Notably, additional analysis of effects on ACECs was included in Section 10.11, Special Designations. Other changes were made in Sections 10.2 (Greater Sage-Grouse), 10.3 (Vegetation), 10.5 (Fish and Wildlife), 10.9 (Lands and Realty), 10.12 (Social and Economic Conditions (Including Environmental Justice)), 10.14 (Soil Resources), 10.15 (Water Resources), 10.18 (Lands with Wilderness Characteristics), and 10.19 (Recreation and Visitor Services).

APPENDIX 11, SPECIAL STATUS SPECIES

Appendix 11 includes an updated list of special status species in the planning area and associated descriptions of preferred habitat. The BLM maintains a list of special status species across all taxa to for conservation consideration. Each BLM state office updates these lists as new information becomes available. These state lists were reviewed and compared to the planning area for this RMPA. Overlapping species were updated in this appendix.

APPENDIX 12, REASONABLY FORESEEABLE DEVELOPMENT SCENARIO

The BLM revised the Wyoming section of the document to better reflect changes in the nature and type of development that has occurred in recent years. The changes also use information provided by Cooperating Agencies to improve the accuracy of the included information and analysis. Minor edits were made throughout the appendix to improve clarity.

APPENDIX 13, SOCIOECONOMIC BASELINE REPORT

The BLM has clarified language to reflect better or more current information, where available and germane to the current conditions and analysis. The BLM updated the baseline information for wind and solar ROWs (in Section 3.4) and percentages of ranches by type (in Section 3.5) to reflect the latest and best available information.

APPENDIX 14, CUMULATIVE EFFECTS SUPPORTING INFORMATION

BLM refined the list of state and local conservation plans detailed in Section 14.1 and the list of past, present, and reasonably foreseeable future actions in Section 14.3 to reflect more current information and suggestions received during public comment of the Draft RMPA/EIS. BLM also adjusted the order of the sections and made editorial changes throughout this appendix to improve clarity.

APPENDIX 15, LIVESTOCK GRAZING MANAGEMENT BEST MANAGEMENT PRACTICES AND DESIGN FEATURES AND SUPPLEMENTAL INFORMATION

Minor editorial changes were made to improve clarity of Appendix 15.

APPENDIX 16, MONTANA/DAKOTAS OIL AND GAS LEASE STIPULATIONS

The BLM has updated the appendix to include the oil and gas lease stipulations identified in the Proposed RMP Amendment.

APPENDIX 17, PROPOSED RMP AMENDMENT AND ANALYSIS OF KEY RESEARCH NATURAL AREAS IN OREGON

The analysis in this appendix has been updated and now includes the Proposed RMPA. In the Proposed RMPA, the size of the area allocated as unavailable to grazing in the Mahogany Ridge key Research Natural Area (RNA) would change. The Proposed RMPA also includes exclosures near the North Ridge Bully Creek RNA, the South Ridge Bully Creek RNA, and the Spring Mountain RNA in vegetative communities identified as important for Greater Sage-grouse.

APPENDIX 18, SOCIAL AND ECONOMIC IMPACT ANALYSIS METHODOLOGY AND STATE-SPECIFIC IMPACT ANALYSIS

Analysis of the state-specific impacts on socioeconomic conditions and environmental justice populations were moved to this appendix for all alternatives (including the Proposed RMP Amendment). The BLM updated the description to include the assumptions and methodology used to calculate impacts on socioeconomic conditions from changes in revenue from rents and bonus bids, ad valorem taxes, sales and use taxes, and other local state taxes and fees.

The BLM has clarified language and incorporated new information since the Draft RMPA/EIS to reflect better or more current information, where available and germane to the impact analysis, specifically the state-specific socioeconomic impact analysis due to potential changes in oil and gas activity from BLM decisions, in Section 18.4.

APPENDIX 19, IDAHO BUFFERS AND REQUIRED DESIGN FEATURES

This appendix has been updated to identify the buffer management direction for the Proposed RMP Amendment and include required design features management direction for all of the alternatives, including the Proposed RMP Amendment.

APPENDIX 20, CHANGES BETWEEN DRAFT RMP AMENDMENT/EIS AND PROPOSED RMP AMENDMENT/FINAL EIS

This new appendix provides a summary of the primary changes between the Draft RMPA/Draft EIS and this Proposed RMP Amendment/Final EIS by document section (chapters and appendices).

APPENDIX 21, DETAILED DESCRIPTION OF DRAFT EIS ALTERNATIVES

This new appendix provides the description of the six alternatives analyzed in the Draft EIS in the same manner they were presented in the Draft EIS. Some updates to the alternatives have been made in response to internal review and comments received from cooperating agencies and the public during the Draft EIS comment period. These updates include edits in the comparison of alternatives tables to improve the clarity of the description of the alternatives and updates to the Areas of Critical Environmental Concern Table 2-14.

APPENDIX 22, DRAFT RMPA/EIS PUBLIC OUTREACH AND RESPONSES TO SUBSTANTIVE PUBLIC COMMENTS

This new appendix summarizes public outreach conducted on the Draft RMPA/EIS during the 90-day comment period. It also includes substantive comment summaries and general responses by topic, along with a list of commenters and the topics they provided comments on.

APPENDIX 23, CONSISTENCY WITH STATE AND LOCAL LAND USE PLANS

This new appendix details known inconsistencies between the Proposed RMPA and federal, state, local, and Tribal plans.

21-39 Wyoming State-Specific Circumstances – Additional Habitat Management Area 21-183

Appendix 21. Detailed Description of Draft EIS Alternatives

This appendix provides the description of the six alternatives analyzed in the Draft EIS in the same manner they were presented in the Draft EIS. Some updates to the alternatives have been made in response to internal review and comments received from cooperating agencies and the public during the Draft EIS comment period. These updates include edits in the comparison of alternatives tables to improve the clarity of the description of the alternatives and updates to the Areas of Critical Environmental Concern (ACEC) **Table 21-13**. Please also refer to **Appendix 5** for updates and clarifications on the ACECs proposed for nomination under Alternatives 3 and 6 between the Draft EIS and the Final EIS.

21.1 Detailed Description of Draft Alternatives

At the beginning of each management direction section there is a brief description introducing the action/topic and rationale for alternatives development. These introductions are not planning decisions but are included to establish context for the alternatives. **Section 2.5** includes rangewide alternatives applicable to all states, organized by the cross-cutting management topics/issues identified during scoping (see **Section 1.6**). Accompanying these narratives are tables showing side-by-side descriptions of the alternatives. **Section 2.6** includes the alternatives associated with state-specific circumstances, organized by state. Alternatives 1 and 2 in **Section 2.5** are presented as summaries due to variations by state or planning area. Not all decisions from the 2015 and 2019 amendment efforts are included in Alternatives 1 and 2. Only management actions being considered for amendment in Alternatives 3, 4, and 5 are brought forward from the 2015 and 2019 efforts. The remaining decisions from the prior planning efforts will remain in place regardless of which alternative is selected. **Appendix 2**, Existing GRSG Management in BLM RMPs identifies all existing GRSG management (inclusive of both 2015 and 2019 ARMPAs) for each state and identifies whether an action may be amended in the current effort.

Actions applicable to all alternatives are shown in one cell across a row and would be implemented regardless of which alternative is ultimately selected. Actions applicable to more than one but not all alternatives are indicated by either combining cells for the applicable alternatives, or by denoting them as the same for another alternative (e.g., "same as Alternative A"). "No similar action" is used to indicate there is no similar goal, objective or action to the other alternatives, or that the similar goal, objective or action is reflected in another management action in the alternative.

Many management actions are informed by the location of GRSG leks (breeding areas associated with GRSG nesting habitat). Existing management actions across the species' range use different lek definitions (e.g., active, occupied, pending, or historic), as identified by state wildlife agencies where the lek occurred. In 2022, the Western Association of Fish and Wildlife Agencies (WAFWA) published standardized definitions for leks to resolve inconsistencies between states, thereby allowing for comparable data analyses across the species' range (Cook et. al., 2022). Through these plan amendments, the BLM proposes to adopt the lek definitions published by WAFWA and use them when implementing GRSG management. **Appendix 4** compares the new WAFWA lek definitions to definitions used in each existing BLM RMP/EIS. Unless otherwise specifically noted, the term "lek" applies to the WAFWA definition for "active lek."

21.1.1 Clarifying the RMP Goal for GRSG

In 2015, BLM RMPs were amended or revised to include updated goals or objectives for GRSG management in consideration of the National Technical Team (NTT) Report (BLM 2011). The NTT comprised resource specialists and scientists from the BLM, State Fish and Wildlife Agencies, U.S. Fish and Wildlife Service (USFWS), Natural Resources Conservation Service (NRCS) and U.S. Geological Survey (USGS). In the report the authors identified a management goal to: "Maintain and/or increase sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners."

Some iteration of the NTT Report goal is in all current BLM RMPs for GRSG. Through this planning effort, the BLM proposes to clarify its goal, which is to conserve, enhance, restore, and manage GRSG habitats to support persistent, healthy populations, consistent with BLM's Special Status Species Management Policy (BLM-M-6840) and in coordination and cooperation with state wildlife agencies. Habitat conservation and management should maintain existing connectivity between GRSG populations.

Table 21-1, Comparison of Alternatives, GRSG RMP Goal, presents management by alternative for this management issue.

Table 21-1. Comparison of Alternatives, GRSG RMP Goal

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states have at least one goal or objective that includes the following language and/or concept: • Maintain and enhance populations and distribution of GRSG by protecting and improving sagebrush habitats and ecosystems that sustain GRSG populations. • Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners. • Maintain and enhance quality/suitable habitat to support the expansion of GRSG populations on federally-administered lands within the planning area.		BLM resource management plans (RMPs) would identify the desired condition for GRSG in the following overarching goal: Conserve, enhance, restore and manage GRSG habitats to support persistent, healthy populations, consistent with BLM's Special Status Species Management Policy (BLM-M-6840) and in coordination and cooperation with state wildlife agencies. Habitat conservation and management should maintain existing connectivity between GRSG populations.		

21.1.2 Habitat Management Area Alignments and Associated Major Land Use Allocations

The BLM has reviewed new scientific publications since our previous planning efforts which provide key population (e.g., Doherty et al. 2016, Coates et al., 2021), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021). This information was used to update GRSG habitat designations in concert with state wildlife agencies, to determine if BLM was applying appropriate management allocations consistent with the purpose and need of this amendment. While HMAs may encompass multiple land ownerships, reflecting the wide-ranging ecological needs of GRSG, management actions that follow are specific to BLM-administered lands.

Priority Habitat Management Areas (PHMA) have the highest value to maintaining sustainable GRSG populations and can include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors. The BLM objective for these areas is to maintain and enhance habitat conditions that will support persistent and healthy GRSG populations through management to minimize habitat loss and degradation. See **Appendix 3** for a description of the strategies applied by each state to identify PHMA.

Important Habitat Management Areas (IHMA; ID only) are defined as lands that encompass moderate to high-quality GRSG habitat and populations necessary for providing a management buffer for PHMA, connecting patches of PHMA, and in some cases supporting important populations and habitat independent of PHMA. The objective for IHMA is to maintain habitat conditions that will support persistent and healthy GRSG populations.

General Habitat Management Areas (GHMA) are lands that are or have the potential to become occupied seasonal or year-round habitat outside of PHMA or IHMA, managed to sustain GRSG populations. These areas are defined differentially by state wildlife management agencies, but generally are of poorer GRSG habitat quality with reduced occupancy when compared to PHMA. Some state wildlife agencies have identified areas of GHMA as important for restoration, connectivity, or seasonal habitats, and most require mitigation for unavoidable impacts within this designation. The objective for GHMA is to maintain habitat conditions to support GRSG populations consistent with the state agency designations of recovery, connectivity, or seasonal habitats.

Other habitat management areas are identified by individual states for a variety of purposes, typically as subsets of GHMA (i.e., lower priority than PHMA). These are defined and described in detail in **Appendix 3**.

Table 21-2, Comparative Summary – Acres GRSG Habitat Management Areas by State by Alternative. **Appendix 3** provides a summary of each state strategy in developing their habitat management areas, as well as the definitions for the GRSG habitat management areas used in each state. **Maps 2.1** through **2.6** show the relationship of the habitat management areas across the west.

In addition to habitat management areas, this section summarizes allocations for major land uses. Additional details for alternatives 1 and 2 (e.g., specific avoidance criteria for rights-of-way, specific controlled surface use stipulations for fluid minerals, etc.), is presented in **Appendix 2**. If specific language from previous plans is not included in this amendment, it is not being considered for amendment in this effort.

Table 21-2. Comparative Summary – Acres GRSG Habitat Management Areas by State by Alternative (BLM administered surface only)

Habitat Management Area	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Rangewide Habitat Management Area Alignments					
PHMA	32,465,000	32,535,000	69,199,000	36,701,000	34,803,000
GHMA	26,383,000	25,878,000	N/A	25,946,000	23,718,000
Colorado Habitat Management Area Alignments					
PHMA	748,000	921,000	1,538,000	751,000	751,000
GHMA	788,000	727,000	N/A	786,000	786,000

Table 21-3. Comparison of Alternatives, Habitat Management Area Alignments, Associated Major Land Use Allocations, and Non-Habitat

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Habitat Management Area Alignments and Associated Major Land Use Allocations				
GRSG habitat management areas would be identified and managed using the boundaries from the 2015 amendments or revisions (as maintained). See **Map 2.1** for the HMA map. Acres by state and rangewide are shown in **Table 21-2** above. Information on state-by-state GRSG HMA mapping strategies is in **Appendix 3**. ID, MT, NV, OR, UT, WY: Manage Sagebrush Focal Areas (SFAs) as described in the 2015 amendments or revisions. CA, CO, ND, SD: Does not include SFAs.	GRSG habitat management areas would be identified and managed using the boundaries from the 2019 amendments. See **Map 2.2** for the map of the HMAs. Acres by state and rangewide are shown in **Table 21-2** above. Information on state-by-state GRSG HMA mapping strategies is in **Appendix 3**. MT/DK: Manage the same HMAs as Alternative 1. ID, NV, UT, WY removed SFAs and associated management. CA, CO, MT/DK are the same as Alternative 1. OR retained the SFAs, but removed the recommendation for withdrawal from location and entry under the Mining Law of 1872.	GRSG habitat management areas would be identified and managed as shown on **Map 2.3**. Acres by state and rangewide are shown in **Table 21-2** above. Information on state-by-state GRSG HMA mapping strategies is in **Appendix 3**. Under Alternative 3, all areas managed for GRSG would be PHMA. (In addition to the PHMA, there would be ACECs designated. See the ACEC section below, and **Appendix 5**.)	GRSG habitat management areas would be identified and managed as shown on **Map 2.4**. Acres by state and rangewide are shown in **Table 21-2** above. Information on state-by-state GRSG HMA mapping strategies is in **Appendix 3**. No areas would be identified or managed as SFAs.	GRSG habitat management areas would be identified and managed as shown on **Map 2.5**. Acres by state and rangewide are shown in **Table 21-2** above. Information on state-by-state GRSG HMA mapping strategies is in **Appendix 3**. No areas would be identified or managed as SFAs. (HMA boundaries under Alternative 6 are the same as those under Alternative 5. **Map 2.6** shows the HMA boundaries and the GRSG ACECs that would be designated.See the ACEC section below, and **Appendix 5**.)

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Summarized PHMA (and ID IHMA) allocations: (Wind, solar, livestock grazing, and major ROWs are addressed in separate tables below.) • Fluid minerals: o Except as noted below, all states are open to new leasing, with no surface occupancy (NSO) stipulations in PHMA (and in IHMA in ID). o WY: NSO within 0.6 mi of leks. PHMA outside 0.6 mi has seasonal limitations (breeding, nesting, early brood-rearing & winter habitat) and CSU (density and disturbance). o CO: Closed within 1 mile of leks. • Saleable Minerals/Mineral Materials: o Except as noted below, all states are closed in PHMA (and in IHMA in ID), but open for new free use permits and expansion of existing pits. o WY: Open subject to occupancy, seasonal limitations, disturbance, and density.	**Summarized PHMA (and ID IHMA) allocations:** (Wind, solar, livestock grazing, and major ROWs are addressed in separate tables below.) • Fluid minerals: Same as Alternative 1, except CO PHMA is NSO (no closed areas). • Saleable Minerals/Mineral Materials: Same as Alternative 1, except as noted below: o NV/CA: Exception criteria added to the closure.	**Summarized PHMA allocations**: (Wind, solar, livestock grazing, and major ROWs are addressed in separate tables below.) • Fluid minerals: Closed to leasing • Saleable Minerals/Mineral Materials: Closed	**Summarized PHMA allocations:** (Wind, solar, livestock grazing, and major ROWs are addressed in separate tables below.) • Fluid minerals: o Except as noted below, all states have NSO in PHMA (and IHMA in ID and RHMA in MT). o MT: Closed in UMRBNM; CSU in Cedar Creek RHMA; NSO 0.6 mile from lek, then CSU for Musselshell RHMA. (See the CO, MT/DK, and WY state specific circumstances for additional details for fluid mineral allocation decisions) • Saleable Minerals/Mineral Materials: o Except as noted below, all states are closed in PHMA, but open for new free use permits and expansion of existing pits. o ID: open for new free use permits and expansion of existing pits if screening and development criteria met o ID IHMA open o WY: Same as Alternative 1. (See the ID and OR state specific circumstances for additional details for saleable mineral allocation decisions)	**Summarized PHMA allocations:** (Wind, solar, livestock grazing, and major ROWs are addressed in separate tables below.) • Fluid minerals: o Same as Alternative 2. (See the CO, MT/DK, and WY state specific circumstances for additional details for fluid mineral allocation decisions) • Saleable Minerals/Mineral Materials: Same as Alternative 4 except ID PHMA, which is open for new free use permits and expansion of existing pits subject to screening and development criteria. (See the ID and OR state specific circumstances for additional details for saleable mineral allocation decisions)

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• Non-Energy minerals: o Except as noted below, all states are closed, but can consider expansion of existing leases. o WY: Open subject to occupancy, seasonal limitations, disturbance, and density. o IHMA in ID is open in Known Phosphate Leasing Areas (KPLAs). IHMA Outside KPLAs is open subject to disturbance thresholds.	• Non-Energy minerals: Same as Alternative 1, except NV/CA added exception criteria to the closure.	• Non-Energy minerals: Closed	• Non-Energy minerals: o Except as noted below, all states are closed. o NV/CA: Closed with exceptions. o ID IHMA: Open o WY: Same as Alternative 1. (See the NV/CA state specific circumstances for additional details for non-energy mineral allocation decisions)	• Non-Energy minerals: Same as Alternative 4.
• Coal: o CO, MT/DK, UT, and WY include the following language: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria as per 43 CFR Part 3461.5(o)(1). o ID, NV/CA, and OR: Did not address coal due to absence of the mineral.	• Coal – All States same as Alt 1, except UT: At time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR Part 3461.5. Coordination with the appropriate State of Utah agency and the determination of essential habitat for maintaining GRSG as per the suitability criteria at 43 CFR Part 3461.5(o)(1) will consider site-specific information associated with lease nomination areas as part of the unsuitability process identified above.	• Coal: o CO, MT/DK, UT and WY would include the same language as UT Alt 2, unless a suitability process has already been conducted that considered GRSG HMAs. o ID, NV/CA, and OR would not address coal due to absence of the mineral.	• Coal: Same as Alternative 3	• Coal: Same as Alternative 3.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• Locatable minerals: ID, MT, NV, OR, UT, WY: SFAs were recommended for withdrawal from location and under the Mining Law of 1872. The BLM applied for a withdrawal pursuant to 204(a) of FLPMA and the Secretary initiated the withdrawal process for those lands. That process is currently underway. o MT: UMRBNM is already withdrawn.	• Locatable minerals: o MT/DK: Same as Alternative 1. o ID, NV/CA, OR, UT, and WY: Same as alternative 1, except removed the recommendation for withdrawal from location and entry under the Mining Law of 1872 associated with SFAs.	• Locatable minerals. The BLM recommends PHMA for withdrawal from location and entry under the Mining Law of 1872. The portion of the PHMA that is within the SFA boundaries from 2015 were recommended for withdrawal from location and under the Mining Law of 1872. The BLM applied for a withdrawal pursuant to 204(a) of FLPMA and the Secretary initiated the withdrawal process for those lands. That process is currently underway.	• Locatable minerals: o MT: UMRBNM is already withdrawn	• Locatable Minerals: Same as Alternative 4.
• Minor Rights-of-Way (ROW): o Except as noted below, PHMA in all states is avoidance for minor ROWs (<100 kV transmission lines and < 24" pipelines) o IHMA in ID is avoidance when consistent with screening criteria and subject to RDFs and buffers. o WY: Open to smaller ROWs, subject to buffers and mitigation.	• Minor ROW: Same as Alternative 1, except NV/CA added exception criteria to the Avoidance.	• Minor ROW: Exclusion (outside of designated corridors)	• Minor ROW: o Same as Alternative 1(including IHMA), except as noted below: o For minor ROWs, MT/DK exclusion within 1.2 miles of active leks and crucial winter range. Avoidance in designated corridors in those areas, and in the remainder of PHMA and RHMA. (See the CO state specific circumstances for additional details for ROW allocation decisions)	• Minor ROW: o Same as Alternative 1 (including IHMA), except as noted below: o For minor ROWs, MT/DK exclusion within 0.6 miles of active leks and crucial winter range. Avoidance in designated corridors in those areas, and in the remainder of PHMA. RHMA Avoidance within 1.2 miles of active leks and in crucial winter range. Remainder of RHMA open. (See the CO state specific circumstances for additional details for ROW allocation decisions)

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• Travel and Transportation Management: o All states: Manage PHMA and IHMA as limited to existing roads and trails, with isolated areas open to cross-country use where suitable based on local conditions (e.g., sand dunes, rocky areas, etc.).	• Travel and Transportation Management: Same as Alternative 1.	• Travel and Transportation Management: Same as Alternative 1.	• Travel and Transportation Management – Same as Alternative 1.	• Travel and Transportation Management – Same as Alternative 1.
Summarized GHMA allocations: • Fluid minerals: o CO: closed within 1 mile of leks, NSO within 2 miles of leks, and seasonal limitations elsewhere. o ID: CSU (lek buffers) o MT/DK – varies by local office (see **Table 21-27**). o NV/CA: CSU (lek buffers and seasonal limitations) o OR: NSO within 1 mile of leks, and CSU (seasonal limitations) o UT: NSO near leks (varies by office) and CSU (seasonal limitations) based on allocations in plans that predated the 2015 amendment. o WY: NSO within 0.25 miles of leks, and seasonal limitations within 2 miles of leks. open with standard terms and conditions outside of 2-mile lek buffer.	**Summarized GHMA allocations:** • Fluid minerals: Same as Alternative 1, except CO changed the closure within one mile of leks to be an NSO.	**Summarized GHMA allocations:** Not applicable to this alterative, as GHMA, IHMA, OHMA, and RHMA under Alternative 3 would be managed as PHMA.	**Summarized GHMA allocations:** • Fluid minerals: o CO: NSO w/in 2 miles of leks, TL elsewhere. o ID: CSU o MT/DK: NSO w/in 0.6 mile of leks and in crucial winter range; CSU elsewhere and in CHMA. o NV/CA, OR: open with minor stipulations (CSU – seasonal limitations) o UT: NSO near leks and seasonal limitations (varies by office) o WY: NSO w/in 0.25 mile of leks; seasonal limitations within 2 miles of leks; open with standard terms and conditions outside of 2-mile lek buffer. (See the CO and WY state specific circumstances for additional details for fluid mineral allocation decisions)	**Summarized GHMA allocations:** • Fluid minerals: o Same as Alternative 4 for all states except CO: CSU w/in 2 miles of leks, TL w/in rest of GHMA o CO Alternative 6: CSU w/in 1 mile of PHMA, TL w/in rest of GHMA. (See the CO and WY state specific circumstances for additional details for fluid mineral allocation decisions)

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• Saleable minerals/Mineral Materials: o All states: no allocations for GHMA (meaning open), though most have minimization measures such as RDFss/BMPs and mitigation.	• Saleable minerals/Mineral Materials: Same as Alternative 1, except ID changed applying "RDFs and buffers" in GHMA to applying "BMPs."	—	• Saleable minerals/Mineral Materials: Same as Alternative 2.	• Saleable minerals/Mineral Materials: Same as Alternative 2.
• Non-energy minerals: o All states: no specific allocations for GHMA(meaning open) though most have minimization measures such as RDFs/BMPs and mitigation	• Non-energy minerals: Same as Alternative 1, except ID changed applying "RDFs and buffers" in GHMA to applying "BMPs."	—	• Non-Energy minerals – Same as Alternative 1.	• Non-Energy minerals – Same as Alternative 1.
• Coal: No states mentioned coal management in GHMA.	• Coal: Same as Alternative 1.	—	• Coal – Unsuitability evaluation approach same as applied in PHMA.	• Coal – Same as Alternative 4.
• Locatable minerals: SFAs were recommended for withdrawal from location and under the Mining Law of 1872. The BLM applied for a withdrawal pursuant to 204(a) of FLPMA and the Secretary initiated the withdrawal process for those lands. That process is currently underway.	• Locatable minerals: Same as Alternative 1.	—	• Locatable minerals – Same as Alternative 1.	• Locatable minerals – Same as Alternative 1.
• Minor Rights-of-Way: Substantial variation by state: o All states: open to minor ROWs with mitigation, except in WY.	• Minor Rights-of-Way: Same as Alternative 1, except ID changed applying "RDFs and buffers" in GHMA to applying "BMPs."	—	• Minor Rights-of-Way: o CO, MT/DK: Avoidance o OR: Avoidance within breeding, nesting, and/or seasonal habitats, otherwise open o ID, NV/CA, UT, WY: Open	• Minor Rights-of-Way: o CO: Avoidance o ID, UT, WY: Open o MT/DK: Avoidance w/in 1.2 miles of active leks and w/in crucial winter range, open elsewhere. CHMA: Avoidance o NV/CA, OR: Open with minimization measures

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6

Criteria-Based Management for Non-Habitat within GRSG Habitat Management Areas				
All states include language encouraging location of potential projects in areas of non-habitat before considering them in areas with habitat in GRSG habitat management areas. UT included management (MA-SSS-1) allowing managers to identify areas of GHMA that lack principal habitat components necessary for GRSG, including but not limited to rock outcrops, alkaline flats, and pinyon-juniper ecological sites. This non-habitat in GHMA could be identified when considering a project proposal and application of GHMA objectives and management actions could be excepted if: • the non-habitat does not provide important connectivity between areas with existing or potential habitat; • all direct and indirect impacts that impair the function of adjacent seasonal habitats or the life-history or behavioral needs of the GRSG population are eliminated through project design (e.g.,	All states include language encouraging location of potential projects in areas of non-habitat before considering them in areas with habitat in GRSG habitat management areas. UT adjusted MA-SSS-1 to apply to PHMA – allowing managers to identify areas of PHMA that lack principal habitat components necessary for GRSG, including but not limited to rock outcrops, alkaline flats, pinyon-juniper ecological sites, and areas that have crossed an ecological threshold to a different stable non-GRSG habitat vegetation community, such as cheatgrass monocultures or pinyon/juniper woodlands (phase 3, absent sagebrush understory) . This non-habitat in PHMA could be identified when considering a project proposal and application of PHMA objectives and management actions could be excepted if: • the non-habitat does not provide important connectivity between seasonal habitats; and	No similar action.	The GRSG habitat management areas include areas where goals, objectives, and management for conservation of GRSG are applied. The habitat management area boundaries are not intended to represent a survey-grade habitat boundary, may include results of large-scale modeling, and are not to be used exclusively for habitat determinations at a project or site-level scale. However, habitat use and occupancy, and vegetation communities are dynamic, and therefore careful consideration of areas within habitat management areas and field investigations are needed to apply GRSG management in a manner that meets GRSG plan goals and objectives. In accordance with existing law, regulation and policy, inventories will continue to be conducted to provide information on GRSG habitat and distribution (FLPMA, 43 USC 1701 Sec. 201 (a), BLM Manual 6840 .04 D 3; BLM-M-6840 .04 E 2). If during consideration of a proposed action (project level authorization) within GRSG PHMA, GHMA, IHMA (in ID), RHMA (in MT), SHMA (in WY) and OHMA (in NV/CA) potential non-habitat is identified, a field investigation should be conducted by a BLM biologist (or reviewed and accepted for confirmation). This investigation should use published, scientific methods (preferably more than 1) for identifying GRSG habitat (e.g., Stiver et. al. 2015 [as revised], NRCS ecological site descriptions (ESDs) and associated state and transition models) and be coordinated with the interdisciplinary team. Any discrepancies between the mapped GRSG habitat management areas and the site-specific conditions will be disclosed, with supporting data (e.g., vegetation monitoring, state and transition models, ecological site descriptions, etc.) and analyzed as a component of the NEPA process. In the mapped GRSG habitat management areas there may be areas of non-habitat – areas that lack the ecological potential to provide principal habitat components necessary to support GRSG and where conformance with the RMP would not support GRSG conservation (see definitions for existing habitat, potential habitat,	

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document. Any exception granted by the Authorized Officer based on above criteria would only apply to the specific project-level authorization. Excepting a site-specific project from compliance with GRSG management in an area of non-habitat would not change the boundaries of GHMA.	• direct and indirect impacts on adjacent seasonal habitats (disturbance to or disruption of) that would impair their biological function of providing the life-history or behavioral needs of the GRSG population are eliminated through project design (e.g., minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document. Any exception granted by the Authorized Officer based on the above criteria would only apply to the specific project-level authorization. Excepting a site-specific project from compliance with GRSG management in an area of non-habitat would not change the boundaries of PHMA. NV/CA added management (MD SSS 5) that allowed the State Director to grant exceptions to allocations and stipulations in PHMA, GHMA, and OHMA if location of the proposed activity is determined to be unsuitable"(by a biologist with GRSG experience using methods such as Stiver et. al. 2015, as revised) and lacks the ecological potential to become marginal or suitable habitat; and will not result in direct, indirect, or cumulative impacts on GRSG and its habitat. Management allocation decisions will not apply to those areas determined	*(See above.)*	and non-habitat in glossary). However indirect and direct impacts to adjacent GRSG populations and their habitats (including potential habitat) still need to be considered when planning and authorizing projects in these non-habitat areas. All management objectives and decisions associated with each management area type will apply unless all the following criteria are documented: • The project is proposed in verified non-habitat. • In addition to indirect impacts associated with distance (as established above), indirect impact consideration also includes: no direct or indirect impacts (considering impacts within distances described in applicable research) to adjacent habitat and potential habitat or individual or populations of GRSG occupying these adjacent areas due to project design and required design features (e.g., minimize noise, preclude tall structures, require perch deterrents, etc.), as demonstrated in the project's NEPA document. Indirect impact consideration includes the following: o The project does not impact connectivity: (1) within or between populations, (2) between seasonal habitats (e.g., nesting, early brood rearing, winter, etc.), or (3) within or between existing habitat. o Project related access through/across GRSG habitat (as verified through site-specific field checks) only occurs on existing routes, and the proposed action would not include new roads or upgrades to roads that would change the vehicle use, vehicle type, or traffic volume during the applicable season of GRSG use, subject to valid existing rights, throughout all stages of the proposed project. • Coordination with the appropriate state and federal agencies, including applicable biologists, has been documented. If coordination is not possible the reasons will be documented. Any proposed action approved through application of the above criteria would only apply to that specific project-level authorization. Any other proposed projects in the same area would need to undergo individual analysis to confirm the criteria are met prior to subsequent authorizations. Excepting a site-specific project from conformance with GRSG management in an area of non-habitat based on the above criteria would not change the GRSG habitat management area boundaries as identified in the RMP.	

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	to be unsuitable if the area has passed a threshold and lacks the ecological potential to become marginal or suitable habitat.	*(See above.)*	The determination to not apply GRSG management to a proposed project based on the above criteria may only be made by the Authorized Officer. However, if there is not concurrence between the coordinating federal and/or state biologists, then the conclusion will be at the discretion of the BLM State Director. Projects that do not meet the above criteria are not automatically denied by the Authorized Officer, but they must comply with the applicable habitat management area management. Further consideration of projects that don't meet the above criteria will be subject to the analysis and requirements (disturbance, RDFs, buffer distances, mitigation, etc.) outlined for GRSG.	

21.1.3 Mitigation

FLPMA provides the Secretary and the BLM broad authority to conserve and enhance public land values, including requiring mitigation. In all GRSG habitat management areas and consistent with valid existing rights and applicable law, BLM will apply the mitigation hierarchy (avoidance first, then minimization, compensation last) when authorizing actions resulting in GRSG habitat loss and degradation. For alternatives 3 through 6 the proposal is to achieve the at a minimum no net habitat loss (full restoration of functional habitats or enhancement of habitats such that it offsets the loss of capacity in impacted areas). The principles of HAF can be used to measure habitat sufficiency in implementing mitigation. The BLM is focusing on habitat mitigation, as sagebrush habitat fragmentation, loss and disturbance have been identified as the primary influences on GRSG population trends (Knick and Hanser, 2011). Compensatory mitigation should be durable, ensuring it will be resilient and persist as GRSG habitat (barring any natural disaster), and should be completed prior to associated actions occurring. Compensatory mitigation should also be prioritized to occur within the same area of the impact (within the same HAF fine scale area, or if not possible, within the same neighborhood cluster (e.g., Greater sage-grouse hierarchical population monitoring framework level 2; Coates et al. 2021) or HAF mid-scale area where practicable) so that it provides habitat for GRSG populations affected by the project.

Table 21-4, Comparison of Alternatives, Mitigation, presents management by alternative for this management issue.

Table 21-4. Comparison of Alternatives, Mitigation

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
CO, ID, MT/DK (most plans), NV/CA, OR, and UT: Requires and ensures mitigation provides a net conservation gain to GRSG. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR Part 1508.20), referred to as the mitigation hierarchy. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation. The BLM will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy. The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows: • Avoidance ○ Include avoidance areas; and, ○ Include any potential, additional avoidance actions with regard to GRSG conservation. • Minimization ○ Include minimization actions already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and, ○ Include any potential, additional minimization	CO, ID, NV/CA, OR, UT and WY: Specify compensatory mitigation would be voluntary unless required by laws other than FLPMA or by the State. Other differences are described below.	In all GRSG habitat management areas and consistent with valid existing rights and applicable law, BLM will apply the mitigation hierarchy when authorizing third-party actions resulting in GRSG habitat loss and degradation (including indirect impacts) to achieve the minimum standard of no net habitat loss (see **Appendix 7**, Monitoring Framework for table of activities related to habitat loss and degradation). BLM will apply mitigation in accordance with the BLM mitigation handbook and other mitigation related BLM policy, as well as CEQ regulations (40 CFR Part 1508.20). Mitigation shall be durable and resilient ensuring GRSG habitat will persist (barring any natural disaster). Mitigation shall be prioritized to occur within the same area of the impact (within the same HAF fine scale area (Stiver et al., 2015, as revised), or if not possible, within the same neighborhood cluster (Coates et al. 2021) to the extent practicable or nearest equivalent HMA designated habitat so that it provides habitat for GRSG populations affected by the project. Compensatory mitigation will not be required for activities implemented to conserve species listed as threatened or endangered under the Endangered Species Act. Application of Mitigation Hierarchy: *Avoidance*: Avoiding impacts is defined by not taking certain action or parts of an action (CEQ regulations; 40 CFR Part 1508.20). Impact avoidance in GRSG habitats is the priority since restoration of most sagebrush systems can take decades. While the avoidance priority is reflected in many PHMA allocations, BLM may also determine on a case-by-case basis to avoid impacts by not issuing an authorization in areas open to development. *Minimization*: Where avoidance is not possible, impacts can be minimized through managing the severity of a project impact at a specific location. If impacts to GRSG habitats cannot be avoided, minimization measures will be applied (e.g., minimizing the disturbance footprint, lek buffers, BMPs, and RDFs). BLM can consider site-specific minimization measures beyond those listed in this plan, through site-specific environmental review to meet the no net habitat loss standard. Minimization does not eliminate project impacts and remaining residual impacts may require compensatory mitigation for habitat loss or degradation. *Compensation*: Any impacts that cannot be avoided or minimized to no net habitat loss would be compensated at a level and in a manner to fully offset both direct and indirect (e.g., disturbance, noise, changes in water availability) impacts to habitat function. Mitigation amounts should comply with State agency or regulatory requirements and consistent with BLM mitigation policy. In States without a mitigation requirement, mitigation should minimally meet no net habitat loss. Establishing no net loss will require full restoration of functional habitats or enhancement of habitats to minimally support the number of GRSG present prior to disturbance at the apex of the population cycle. The metrics identified in the HAF should be used to determine if restoration actions provide GRSG habitat. Where restoration is not possible, preservation (e.g., conservation easements, acquisition of inholdings) can be used to offset impacts and should be designed to protect uniquely important habitats (e.g., limiting winter habitats, connectivity corridors) or areas of GRSG habitats that are at a high risk of conversion. Compensatory mitigation should be completed prior to initiating the activity causing the need for compensation and monitored for retention and efficacy. Compensatory		

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
actions with regard to GRSG conservation. • Compensation o Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. No similar language for WY.	*(See above.)*	mitigation is not required by the BLM for operations conducted under the Mining Law of 1872, but operators may always voluntarily engage in compensatory mitigation. Minimization actions and compensation should be discussed with project proponents/operators and incorporated into alternatives when appropriate. Compensation may also be required by state regulations.		
• CO, ID, MT/DK, NV/CA, OR, UT: When authorizing actions that result in habitat loss and degradation, require and ensure mitigation achieves a net conservation gain in all HMA types. • In WY: Same as other states in PHMA. No mitigation required in GHMA. • UT: Includes exception for vegetation treatments to benefit Utah prairie dog. • ID and NV (not CA): Includes specific language regarding coordination with local GRSG teams to develop or implement compensatory mitigation programs. • CO, ID, MT/DK (most plans), NV/CA, OR, and UT: Includes an appendix with further details on how mitigation would be applied. • WY: Mitigation applied according to the Wyoming Strategy (EO2015-4).	• MT/DK and OR: Same as Alternative 1. • CO: Would work with the state to provide mitigation with outcomes that are "at least equal to the lost or degraded values." • ID: Similar to Alternative 1, except would manage for a no net loss standard. • NV/CA: Maintains net conservation gain standard, in coordination with State goals for GRSG. • UT and WY: Removed the net conservation gain requirement. • ID, NV/CA, UT, and WY: Reference mitigating to meet the BLM's overarching planning goals and objectives, as well as the BLM Manual 6840 to "minimize or eliminate threats affecting the status of [GRSG] or to improve the condition of [GRSG] habitat…"	The BLM will apply the mitigation hierarchy to address changes in existing development or new development as the result of valid existing rights. Where avoidance or minimization will not fully offset a project's impacts compensatory mitigation is required and will at minimum meet the requirements of the state wildlife agency or other appropriate state authority, and BLM/DOI mitigation policy. If the state agency does not require mitigation, BLM will require compensatory mitigation to achieve no net habitat loss.	The BLM will apply the mitigation hierarchy. Where avoidance or minimization will not fully offset a project's impacts compensatory mitigation is required and will at minimum meet the requirements of the state wildlife agency or other appropriate state authority, and BLM/DOI mitigation policy. If the state agency does not require mitigation, or state-sponsored mitigation is determined by BLM to be inconsistent with BLM/DOI policy, BLM will require compensatory mitigation to achieve no net habitat loss. Where habitat and/or population adaptive management thresholds have been met, compensatory mitigation beyond what is required by the States may be considered. BLM shall coordinate closely with the state wildlife management or other appropriate state agency in determining the amount and form of additional mitigation on	The BLM will apply the mitigation hierarchy. Where avoidance or minimization will not fully offset a project's impacts compensatory mitigation is required and will at minimum meet the requirements of the state wildlife agency or other appropriate state authority, and BLM/DOI mitigation policy. If the state agency does not require mitigation, or state-sponsored mitigation is determined by BLM to be inconsistent with BLM/DOI policy, BLM will require compensatory mitigation to achieve no net habitat loss.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• ID: Full reclamation bond required, consistent with regulations for minerals activities, in all HMA types.	• CO, ID, NV/CA, UT, and WY: Describe various processes for coordinating mitigation efforts with the state.	*(See above.)*	a case-by-case basis, considering project activity, direct and indirect impacts to GRSG habitats, and restoration success rates.	*(See above.)*

21.1.4 Application of Habitat Objectives

Habitat objectives identify the desired habitat outcome on BLM-administered lands in GRSG HMAs at multiple scales including seasonal habitats and connectivity within and between populations. Tables identifying indicators and benchmarks for use as guidelines at the site-scale will be retained in the Habitat Indicators appendix (**Appendix 8**) as a tool through which habitat suitability is informed based on location and ecological conditions.

The Habitat Assessment Framework (HAF/ BLM TR 6710-1; Stiver et al., 2015, as revised) provides a standardized, scientifically based methodology to assess GRSG habitat suitability at multiple scales (mid, fine, and site-scale, see Map 3.7 and 3.8). Using multi-scale evaluations considers the entire suite of conditions contributing to high quality habitat, the success of past conservation actions, and prioritizing future land uses and conservation actions. Descriptions of habitat scales (broad-, mid-, fine-, and site-) and associated indicators for assessment at each scale are available in the HAF (BLM TR 6710-1). The Habitat Indicators Tables (**Appendix 8, Tables 8-1.A-G**) provide a list of indicators and benchmarks, derived from local and regional research on GRSG habitat selection, that collectively are used to inform habitat suitability. BLM offices will use **Appendix 8**, Greater Sage-grouse Habitat Indicators and Benchmarks, notably **Tables 8-1.A-G** to assess each monitoring location within seasonal habitats for site-scale suitability, with data collected during the appropriate corresponding seasonal use period, as applicable to address phenological changes.

The BLM will use terrestrial AIM methods (Herrick et al., 2017), additional monitoring approaches for wetland & riparian habitats, partner data as available, and supplemental guidelines (e.g., training, monitoring guidelines, sampling protocols, etc.) to collect data on site-scale habitat condition (**Appendix 8**). As research advances, new data could refine, or clarify GRSG selection for vegetation structure and composition in seasonal habitats. The Habitat Indicators Table(s) (**Appendix 8, Table 8-1.A-G**) will be periodically reviewed to consider, and as needed, incorporate the best available science in coordination with applicable federal, state, and tribal agencies. The addition or adjustment to indicators or benchmarks in the Habitat Indicators Table must include the reference or basis for which the changes are made. Revisions will only be made if warranted by scientific evidence. Use and inclusion of the HAF, including the relationship to Land Health Standards and monitoring is covered in more detail in the appendices (e.g., **Appendix 8, Table 8-2**).

Table 21-5, Comparison of Alternatives, Application of Habitat Objectives, presents management by alternative for this management issue.

Table 21-5. Comparison of Alternatives, Application of Habitat Objectives

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• CO, ID, MT/DK, NV/CA, UT: Include language noting indicators and values from habitat objectives table would be considered when authorizing activities in GRSG habitat. • CO, ID, MT/DK, NV/CA, UT, and WY: Note the values in the table would be used during the land health evaluation process to help determine if the standard applicable to GRSG habitat is being met. • ID, MT/DK, UT and WY: The values may not be obtainable on every acre, and/or should consider local ecological ability. • MT/DK and UT: The values may be adjusted based on local factors, data, or updated science. • NV/CA and OR: Land uses will be managed to meet the desired conditions identified in the tables. • UT: Identifies a qualitative desired condition, with a note that the table is a summary of what science indicates may be needed to meet the qualitative objective.	• CO, ID, MT/DK, NV/CA, UT: Same language regarding considering indicators and values as Alternative 1. • All States: Same language regarding using the habitat objectives table during the land health evaluation process as Alternative 1. • ID, MT/DK, OR, UT and WY: Same language regarding values not being obtainable on every acre as Alternative 1. • ID, MT/DK, NV/CA, OR, and UT: Same language regarding values being adjusted as Alternative 1. • ID and UT: Identify a qualitative desired condition separate from the quantitative values in the table.	The tables with the attributes, indicators, and values with associated text would be replaced in the action alternatives with the following new objectives and management actions: **Objective SSS [X]:** Within GRSG habitat management areas provide suitable habitat by managing for connected mosaics of sagebrush and associated communities that provide for seasonal habitats, dispersal, and migration, while limiting widespread anthropogenic disturbances and fragmentation. This objective will be accomplished by applying RMP land use allocations and management actions among HMAs, proactive habitat treatments, and project-level application of mitigation (avoiding, minimizing, and compensating, per MS-1794 and H-1794) for internal and external project proposals. **Management Action SSS [X1]:** Assess the suitability of GRSG habitat at HAF mid- and fine-scales (HAF Levels 2 and 3, respectively) based on the methods in the Sage-grouse Habitat Assessment Framework (HAF, Stiver et al. 2015, BLM TR 6710-1, as revised; see **Appendix 8**). **Management Action SSS [X2]:** Design and implement projects that will maintain or improve habitat suitability, availability, and connectivity, based on site location, existing seasonal values, and habitat needs using the results of mid- and fine-scale habitat assessments and other complementary research, tools, or information and in coordination with partners across land management jurisdictions. **Objective SSS [Y]:** Manage GRSG habitat management areas to provide seasonal habitats at the HAF Site Scale (Level 4) by providing for habitat characteristics that support seasonal habitat needs, including adequate protective cover and food needed to survive and reproduce. Seasonal habitats may include areas where sagebrush is the current dominant vegetation type, sagebrush is a primary shrub species within the various states of the ecological site, or dominated by other vegetation types but still provides GRSG habitats, such as mesic areas. This objective will be accomplished through the combination of RMP land use allocations and management actions and restoration – based on ecological potential, current vegetative condition, and existing seasonal values – and the project-level application of mitigation (avoiding, minimizing, and compensating, per MS-1794 and H-1794) for internal and external project proposals. **Management Action SSS [Y1]:** Assess suitability of GRSG habitat at the HAF site-scale (Level 4) based on the methods in Sage-grouse HAF (Stiver et al. 2015, BLM TR 6710-1, as revised; **Appendix 8**) utilizing current geographically applicable research on seasonal habitat requisites of GRSG (see **Appendix 8**). Updates to seasonal habitat indicators and ESDs will be developed locally and coordinated with partners (see **Appendix 8**). **Management Action SSS [Y2]:** Maintain, improve, or restore the suitability of GRSG seasonal habitats using the Habitat Indicators Table (see **Appendix 8**) to inform measurable project objectives during implementation-level planning for BLM-permitted and BLM-initiated site-specific actions in HMAs, in coordination with applicable partners. Use the results of site-scale habitat assessments and other best available information to inform management decisions and the design and implementation of habitat projects.		

21.1.5 Disturbance Cap

Anthropogenic disturbance negatively impacts GRSG abundance and persistence (Knick et al., 2011, 2013). When authorizing disturbing activities within important GRSG habitats (PHMA and IHMA in Idaho) the BLM applies disturbance caps to limit habitat losses associated with discrete anthropogenic disturbances and their associated human activity. Other management tools consider effects from diffuse or non-anthropogenic disturbances such as wildfire, such as sagebrush availability objectives, GRSG habitat objectives, and adaptive management thresholds. Disturbance caps identify an upper limit (maximum disturbance permitted) above which no new development is generally permitted (subject to applicable laws and regulations and valid existing rights). A disturbance cap acts as a "backstop" to ensure that total disturbance does not exceed the level of GRSG tolerance for anthropogenic activities. Disturbance caps only address direct impacts and indirect impacts associated with anthropogenic disturbances may not be fully captured by use of this tool; other management tools consider indirect impacts, such as noise required design features/actions and mitigation requirements. Additional minimization measures may be necessary to reduce the full impact of a project on GRSG.

To conserve seasonal habitat requirements associated with a local GRSG populations disturbance caps will be applied to PHMA within the Habitat Assessment Framework (HAF) fine scale (Stiver et al. 2015, as revised)., as well as at the project scale. Previous application of a disturbance cap at a larger scale (e.g., biologically significant unit) did not limit the consideration to local populations and were often "diluted" by large amounts of non-habitat. Calculation of disturbance caps must consider all disturbances (existing and new) since GRSG are negatively impacted by the total disturbance. Within designated spatial analysis areas, disturbance on all surface ownerships should be considered to accurately capture potential impacts of new authorizations on GRSG.

With the exception of Wyoming and Montana, disturbance caps are currently set at 3% of the project and "biologically significant units" identified by the BLM at the state level, but do not include habitat loss from wildfire or agricultural conversion. The latter two factors will be quantified by separate calculations of sagebrush availability via the vegetation objectives, habitat objectives, and adaptive management thresholds, as tracked by approaches described in the Monitoring Framework (**Appendix 7**). Ninety-nine percent of active leks occurred within landscapes that were less than 3% developed in a landscape analysis of GRSG (Knick et al. 2013) and a follow-up study on disturbance from existing energy infrastructure and human activity supported those findings (Kirol et al. 2020). Similar results were observed for other species that use sagebrush for all or part of their life cycle, including mule deer (Sawyer et al. 2020, Lambert et al. 2022), pronghorn (Lambert et al. 2022) pygmy rabbits (Germaine et al. 2017), elk (Gigliotti et al. 2023), and sagebrush songbirds (Kirol and Fedy 2021). Wyoming and Montana use a 5% disturbance cap but include wildfire and agricultural conversion (the latter is not applicable on BLM lands) to their calculations. North Dakota and South Dakota apply a mix of the two approaches – with a 5% cap that includes wildfire and agriculture, but also limiting anthropogenic disturbances to 3%.

Table 21-6, Comparison of Alternatives, Disturbance Cap, presents management by alternative for this management issue.

Table 21-6. Comparison of Alternatives, Disturbance Cap

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Disturbance Cap Overview				
• CO, ID, NV/CA, OR, UT, ND, SD: 3% disturbance cap in PHMA (and IHMA in ID) on specific anthropogenic activities such as development of minerals and renewable energy, as well as ROWs. • CO, ID, NV/CA, OR, UT, ND, SD: disturbance cap applies at both BSU-scale and at proposed project analysis area (calculated similar to WY Disturbance Density Calculation Tool – DDCT) within PHMA. • MT, ND, SD, WY: 5% disturbance cap at the project DDCT area scale in PHMA. Includes wildfire and agriculture.	• CO, ID, NV/CA, OR, UT, ND, SD: 3% disturbance cap in PHMA (and IHMA in ID) on specific anthropogenic activities such as development of minerals and renewable energy, as well as ROWs. • CO, NV/CA, OR, UT, ND, SD: disturbance cap applies at both BSU-scale and at proposed project DDCT analysis area within PHMA. • ID cap applies at just the BSU scale. • MT, ND, SD, WY: Same as Alt 1.	In PHMA (and IHMA in ID), direct habitat disturbance from existing infrastructure developments would be limited to 3% at the 1) project scale (see description below) and 2) Habitat Assessment Framework (HAF) Fine Scale habitat selection area (or CO management zones and populations – see **Section 2.7.1**). The disturbance cap would not be applicable to new authorizations since all PHMA would be closed to new infrastructure projects. The disturbance cap would be applied to existing authorizations within the agencies' capacity to do so to the extent allowable under applicable law and while recognizing prior authorizations, lease terms, and valid existing rights.	In PHMA (and IHMA in ID), if direct habitat disturbance from existing and proposed infrastructure developments exceeds either 3% at the 1) project scale (see description below) or 2) Habitat Assessment Framework (HAF) Fine Scale habitat selection area (or CO management zones and populations – see **Section 2.7.1**), new infrastructure projects would be deferred to the extent allowable under applicable laws (such as the Mining Law of 1872), or valid existing rights: • until such time as the percentage of habitat disturbance in the areas has been reduced below the cap threshold through restoration of existing disturbance to meeting habitat objectives, or • redesigned to not result in additional surface disturbance (co-location), redesigned to move it outside of habitat in PHMA (and IHMA in Idaho) (see non-habitat criteria), or redesigned to move it outside PHMA (and IHMA in Idaho).	In PHMA (and IHMA in ID), if direct habitat disturbance from existing and proposed infrastructure developments exceeds either 1) 3% at the project scale (see description below) in all states except MT and WY, where it is 5% at the project scale, or 2) 3% at the Habitat Assessment Framework (HAF) Fine Scale habitat selection area for all states (or CO management zones and populations – see **Section 2.7.1**), new infrastructure projects would be deferred to the extent allowable under applicable laws (such as the Mining Law of 1872), or valid existing rights: • until such time as the percentage of habitat disturbance in the areas has been reduced below the cap threshold through restoration of existing disturbance to meeting habitat objectives or increasing the amount of suitable habitat through restoration, or • redesigned to not result in additional surface disturbance (co-location), redesigned to move it outside of habitat in PHMA (and IHMA in Idaho) (see non-habitat criteria), or redesigned to move it outside PHMA (and IHMA in Idaho).

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Disturbance Cap Numerator				
• CO, ID, NV/CA, OR, UT, ND, SD: infrastructure only - cap does not include wildfire or agriculture. • MT, WY, ND, SD: 5% cap includes infrastructure, wildfire and agriculture.	• CO, ID, NV/CA, OR, UT, ND, SD: same as Alt 1. • MT, WY: Same as Alt 1.	For all states, the disturbance cap calculation is limited to the following specific activities, whether existing projects or new proposals (see **Appendix 7** for additional details on how these items would be monitored): • Oil and gas wells and development facilities • Coal mines • Wind developments (e.g., towers, sub-stations, etc.) • Solar fields • Geothermal development facilities • Mining (active locatable, nonenergy leasable and saleable/mineral material developments) • Roads (transportation features with a maintenance intensity of level 3 or 5 – see BLM Technical Note 422 – Roads and Trails Terminology, 2006 or as updated (does not include two-tracks) • Railroads • Power lines • Communication towers • Other vertical infrastructure, as well as developed rights-of-way with habitat loss (e.g., pipelines) • Coal bed methane ponds (at the project scale) • Meteorological towers (e.g., wind energy testing) (at the project scale) • Nuclear energy facilities (at the project scale)	Same as Alternative 3, however under this alternative wildfire would not be included as a numerator for disturbance.	Same as Alternative 3 at the project scale for all states except for WY and MT which would include disturbances associated with their respective DDCT approaches (e.g., wildfire and agricultural, with Montana also including subdivisions and urban development) in the numerator (agriculture and subdivision disturbance data would be provided by the state, since no such activities are permitted on public lands). None of the states would include wildfire and agriculture (or Montana subdivisions and urban development) in the numerator at the HAF Fine Scale.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	• Airport facilities and infrastructure (at the project scale) • Military range facilities and infrastructure (at the project scale) • Hydroelectric plants/facilities (at the project scale) • Recreation areas facilities and infrastructure larger than 0.25 acres (e.g., parking lots, campgrounds, trail heads, etc.) (at the project scale) • Wildfire Where such data are available, this disturbance is measured by the footprint of direct disturbance of the PHMA (and IHMA in ID) area where habitat is removed (including staging areas, dispersed structures, parking lots, equipment storage areas, etc.), or by the distance between the outermost lines for transmission lines. When considering new project proposals, any project associated with the above list that has been approved/authorized but not yet constructed should be treated as though it were already constructed when calculating the disturbance cap to account for authorized but not yet constructed disturbance. No other activities or actions beyond those listed in the above list are included when calculating the cap (e.g., wildfire, agriculture, vegetation treatments, residences, barns, fencing or range improvements, etc.).	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	A disturbed area is included in the numerator until it has been restored to provide equal or improved habitat function as was provided by the area before the disturbance. Consistent with the BLM's responsibility to consider cumulative impacts when making decisions for activities on public lands, the disturbance percentage includes acres from the above disturbances regardless of land ownership, where such data are available. This will only inform decision-making on public lands and cannot impact private property rights.	*(See above.)*	*(See above.)*
Disturbance Cap Denominator				
• CO, ID, NV/CA, OR, UT, ND, SD 3% cap applies at both BSU-scale and at proposed project DDCT analysis area within PHMA. • MT, ND, SD, WY: 5% cap applies at the project DDCT area scale in PHMA. Includes wildfire and agriculture. Using the DDCT approach to identify project level boundaries developed by the State of Wyoming is, in summary, as follows: 1) Determine potentially affected active leks by placing a 4-mile buffer around the proposed area of physical disturbance related to the proposed project. All active leks located within the 4-mile project buffer and within PHMA	• CO, NV/CA, OR, ND, SD same as Alt 1. • UT similar to Alternative 1, but allows project boundaries to be identified based on what areas of PHMA are used by the birds affected by the project. • ID removed the disturbance cap at the project scale, applying it only at the BSU scale. • MT, ND, SD, WY: Same as Alternative 1.	At the project scale, the assessment area (denominator) is determined by identifying the extent of the GRSG PHMA (and IHMA in ID) that supports the GRSG population potentially affected by the proposed project that is also located in PHMA (and IHMA); it is not to be limited to the area where indirect impacts are anticipated. The project scale denominator should include the PHMA (and IHMA) used by the potentially affected local GRSG population, including the associated seasonal habitats and the transition zones between those habitats (only within PHMA) associated with where the project is proposed.	Same as Alternative 3.	Same as Alternative 3, except as noted below: At either scale, all areas in PHMA (and IHMA in ID) would be included in the denominator unless specific information documents otherwise (i.e., seasonal habitat maps for the HAF Fine Scale assessment area). Any potential areas that are unsuitable at the HAF site scale are treated neither as habitat nor disturbance, which results in the area being removed from the denominator piece of the formula.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(and IHMA) will be considered affected by the project. 2) Next, place a 4-mile buffer around each of the affected active leks. 3) All PHMA (and IHMA) within the 4-mile project buffer, combined with the 4-mile lek buffer(s), creates the project analysis area for each individual project, absent other monitoring data. If there are no active leks within the 4-mile project buffer, the project scale analysis area will be that portion of the 4-mile project buffer within PHMA.	*(See above.)*	If sufficient monitoring information is not available to identify the portions of the PHMA used by the potentially affected local GRSG population, identify project level boundaries using an approach similar to the DDCT approach developed by the State of Wyoming: 1) Determine potentially affected active leks by placing a 4-mile buffer around the proposed area of physical disturbance related to the proposed project. All active leks located within the 4-mile project buffer and within PHMA (and IHMA) will be considered affected by the project. 2) Next, place a 4-mile buffer around each of the affected active leks. 3) All PHMA (and IHMA) within the 4-mile project buffer, combined with the 4-mile lek buffer(s), creates the project analysis area for each individual project, absent other monitoring data. If there are no active leks within the 4-mile project buffer, the project scale analysis area will be that portion of the 4-mile project buffer within PHMA. "Pending leks" and other similarly defined state-based lek categories can be considered as active leks based on inclusion from the state wildlife agency. In CO, BLM would use the state management zones (see **Section 2.7.1**). At the HAF Fine Scale, the assessment area (denominator) is the acres of PHMA (and IHMA in Idaho) within the boundaries of	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	the HAF Fine Scale habitat delineation area. Calculation of the 3 percent cap would include all acres of PHMA (and IHMA in Idaho) in the Fine Scale area as the denominator. In CO, BLM would use the state identified populations (see **Section 2.7.1**). At either scale, all areas in PHMA (and IHMA in ID) would be included in the denominator. Portions of PHMA that are potential or non-habitat (e.g., areas not currently supporting sagebrush cover due to wildfire) would still be included in the denominator piece of the formula. The denominator includes all lands (regardless of land ownership) to help the BLM consider the cumulative impacts of disturbances on GRSG when considering projects on public lands.	*(See above.)*	*(See above.)*
Disturbance Cap Exceptions				
• ID: 3% cap can be exceeded within existing designated utility corridors at the project scale only if there would be a net benefit to GRSG (multiple states have this in the Lands section, ID just has it specifically in the disturbance cap section) • NV: Disturbance can exceed 3% at the project or BSU scale except where a biological analysis indicates a net conservation to GRSG.	• ID: 3% cap can be exceeded within existing designated utility corridors at the project scale only if there would be a net benefit to GRSG (multiple states have this in the Lands section, ID just has it specifically in the disturbance cap section). • UT: 3% can be exceeded if will benefit GRSG. • NV: Disturbance can exceed 3% at the project or BSU scale except where a biological	Unless required by law, regulation, policy, or presence of valid existing rights, the BLM would not consider allowances for exceptions to the disturbance cap. All states: Apply the disturbance cap to the extent consistent with applicable law (such as the Mining Law of 1872) and valid existing rights.	All states: The Authorized Officer may consider projects on public lands that could result in exceeding the 3% disturbance cap across all ownerships at the project scale only if the following three criteria are met: 1) with concurrence from the State Director, 2) if the environmental review document(s) explains how the GRSG RMP goals and objectives will be met, including compliance	Same as Alternative 4, except in WY and MT where the project scale disturbance cap is 5%. All states would also replace bullet #4 under criteria #3 with the following: • Compensatory mitigation would not have to be completed and functioning prior to being able to grant the exception. To grant the activity based on compensatory mitigation, prior to construction, surface

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Exceedance may be approved only with concurrence of the State Director, and unless NDOW, USFWS, and BLM unanimously find the proposed action achieves a net conservation gain. • MT: Any proposals for deviations must demonstrate that the proposed activities will not cause declines in GRSG populations in core areas, with input from MT FWP and USFWS (see **Appendix 2** for specific text). • WY: 5% cap can be exceeded if the project, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of GRSG. All states: Apply the disturbance cap to the extent consistent with applicable law (such as the Mining Law of 1872) and valid existing rights.	analysis indicates a net conservation to GRSG. The requirement for unanimous concurrence was removed. • NV/CA: includes exception options if: ○ The area is non-habitat including through ground-truthing of areas mapped as habitat, and will not have direct, indirect, or cumulative effects, or ○ Compensatory mitigation is provided, or ○ The proposed activity addresses public health and safety concerns, or ○ The proposed activity is a renewal or re-authorization of existing infrastructure in previously disturbed sites and would not result in direct, indirect, or cumulative impacts, or ○ The proposed activity is determined to be a routine administrative function…and will have no adverse impacts on GRSG and its habitat • MT: Same as Alternative 1. • WY: Same as Alternative 1. All states: Apply the disturbance cap to the extent consistent with applicable law (such as the Mining Law of 1872) and valid existing rights.	*(See above.)*	with the RMP's GRSG mitigation strategy, documenting efforts to: • First avoid impacts by locating the proposed project in areas outside of PHMA, collocated within the footprint of existing disturbance, or in areas of non-habitat shall be documented. • Second to minimize impacts by applying project design features shall be documented (e.g., use of RDFs, buffer distances, seasonal limitations, etc.). • Third, only then to consider using compensatory mitigation. It is important to note compensatory mitigation may not be appropriate in some GRSG habitats/populations. Before using compensatory mitigation as an approach for this exception, the effectiveness of whether compensatory mitigation can offset impacts to the affected habitat and associated population without risking impacts to those GRSG habitats and populations shall consider local biological considerations, including, but not limited to population size, connectivity to other populations, availability of existing functional habitat, and the availability of mitigation projects that could benefit the impacted population. **and**	occupancy, or surface disturbing activities the compensation project must be planned, funded, and approved by the operator, BLM, surface owner, and in coordination with the appropriate State agency. However, due to the uncertainty associated with whether the planned compensatory mitigation project would successfully become habitat in order to offset the impacts, one of the following would need to apply: ○ The area of habitat improvement associated with compensatory mitigation would need to increase to account for a level of risk that the compensatory mitigation action may fail or not persist for the full duration of the impact based on the type of specific compensatory project(s) and ecological conditions, or ○ The operator provides long-term assurances that the compensatory project would become functional (e.g. project maintenance or retreatment, easements, mitigation bonding – BLM H-1794-1, section 7.3, etc.). Compensatory mitigation rate would need to consider number of acres necessary to offset acres affected by direct and indirect effects (see

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	3) if one of the following circumstances can be documented: • The exceedance at the project scale is the result of consolidating disturbance associated with the proposed project as a strategy to leave other undisturbed portions of the PHMA (and IHMA) undisturbed from new authorizations, and the third bullet below, addressing compensatory mitigation, is applied to any residual impacts. • Within RMP designated utility corridors, the 3% disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that doing so will decrease the impacts to GRSG habitat in comparison to siting a project outside the designated corridor in areas under the disturbance cap and requiring mitigation. This exception is limited to projects that fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location. • If a technical team evaluates and recommends that site-specific GRSG habitat and population information, combined with project design elements – including	Mitigation section), as well as likelihood that the mitigation project may not provide the anticipated compensation for the duration of the impact. In addition, the compensation necessary to grant this exception must provide the offsetting benefit in the same HAF Fine Scale unit being impacted by the potential development.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	compensatory mitigation, indicates the proposed project is expected to improve the condition of GRSG habitat within the proposed project analysis area. Factors considered by the team will include GRSG abundance and trends, movement patterns – including impacts to connectivity, habitat amount and quality, extent and alignment of project disturbance, location and density of existing disturbance (e.g., potential for increased fragmentation), project design options, and other biological factors (e.g., potential for topographic screening, impacts from other threats such as predation, invasive species, drought, noise, etc.). The technical team should consist of, at a minimum, a BLM field biologist and a biologist from the appropriate State agency. The methods, rationale, and data used in developing recommendations shall be retained as part of the project record. • If the exception relies on compensatory mitigation, the mitigation must be completed prior to the disturbance that results in the exceedance of the disturbance cap so the value of the mitigation can be accurately compared to the value of the habitat to be affected by the proposed disturbance. In addition, the	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	compensation necessary to grant this exception must provide the offsetting benefit in the same HAF Fine Scale unit being impacted by the potential development. Consideration may be given to providing compensatory mitigation in adjacent fine-scale HAF areas if doing so will more effectively provide the offsetting benefit. • Disturbance associated with the renewal or re-authorization of existing infrastructure in previously disturbed sites or expansions of existing infrastructure that do not result in new direct, indirect, or cumulative impacts on GRSG and its habitat. There would be no exceptions to the 3% PHMA (and IHMA) disturbance cap at the HAF Fine Scale unless the disturbance is needed for the protection of human life and safety, as concurred by the State Director. If proposed disturbance cap exception is requested in an area (neighborhood cluster) that has met one of the adaptive management thresholds (hard or soft), no exceptions to the 3% disturbance cap at the project scale would be considered until the causal factor analysis is completed unless the disturbance is needed for the protection of human life and safety, as concurred by the State Director.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	To approve this exception, the Authorized Officer must document, in coordination with the appropriate State agency, that the proposed action satisfies the three criteria listed above. All states: Apply the disturbance cap to the extent consistent with applicable law (such as the Mining Law of 1872) and valid existing rights.	*(See above.)*

21.1.6 Fluid Mineral Development and Leasing Objective

Research indicates fluid mineral development can negatively affect GRSG at multiple scales through direct impacts (habitat loss and fragmentation; Connelly et al. 2004, Lyon and Anderson 2003, Walker et al. 2007, Holloran et al. 2010, Knick et al. 2011, Green et al. 2017) and indirect impacts (increased noise and behavioral avoidance of human activity and infrastructure, including roads; Aldridge and Boyce 2007, Holloran et al. 2010, Kirol et al. 2015, Rice et al. 2016, Coates et al. 2023). Development can also contribute to cumulative impacts if it results in an increased distribution of invasive annual grasses or predator abundance.

This section addresses the RMP objective for GRSG habitat in relation to fluid minerals, RMP management actions providing guidance when considering leasing GRSG habitat management areas, and development associated with existing fluid mineral leases. Other aspects of fluid mineral leasing and development are addressed elsewhere in this amendment or existing RMP language, including specific fluid mineral allocations and associated stipulations (see **Section 2.5.2**), and waivers, exceptions, modifications (see **Section 2.5.7**). and application of RDFs (existing RMP decisions that are not being considered for amendment in this process).

Table 21-7, Comparison of Alternatives, Fluid Mineral Development and Leasing Objective, presents management by alternative for this management issue.

Table 21-7. Comparison of Alternatives, Fluid Mineral Development and Leasing Objective

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• CO, ID, ND, NV/CA, OR, UT, WY, parts of MT/DK (Dillon, Billings, HiLine, Miles City, ND, SD): Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMAs and GHMAs, or within the least impactful areas within PHMA and GHMA if avoidance is not possible. • No similar objective in Lewistown or Butte.	• CO, ID, OR, and MT/DK offices: Same as Alternative 1. • UT, NV/CA: No similar objective (removed the objective). • WY: Clarified the objective to acknowledge that leasing is allowed in PHMA, and that if the BLM has a backlog of Expressions of Interest for leasing, the BLM would prioritize its work first in non-habitat management areas, followed by lower priority habitat management areas (e.g., GHMA) and then higher priority habitat management areas (i.e., PHMA). Clarified that for fluid mineral development on existing leases that could adversely affect GRSG populations or habitat, the BLM would work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources.	All States: • No leasing strategy/objective is needed since PHMA would be closed to leasing. Leasing objective language would be removed. • New Management Action to address development in areas already leased: In PHMA (and IHMA), the BLM will work with lessees, operators, or other project proponents to avoid, minimize, and compensatorily mitigate for impacts to GRSG and their habitat (e.g., habitat loss, fragmentation, indirect impacts, etc.) from new oil and gas development on existing leases to the extent consistent with surface use rights as part of the environmental review process (e.g., 43 CFR Part 3101.1-2). If possible, place development outside of PHMA (and IHMA); if determined that such placement renders the recovery of fluid minerals on the lease infeasible, or where development of existing leases exceeds a disturbance density of 1 per 640, and/or 3 percent disturbance cap, seek to apply other measures to site the proposed lease activities to meet GRSG habitat objectives and require compensatory mitigation to replace direct and indirect habitat impacts. Locate infrastructure in areas that avoids or minimizes	Revised Fluid Mineral Objective for all states: • Manage fluid mineral leasing and development (including geothermal) in GRSG habitat management areas to avoid, minimize, and compensate for adverse impacts to GRSG habitat to the extent practical under the law and BLM jurisdiction. New management action: • Leasing is allowed in GRSG habitat management areas open to fluid mineral leasing (including geothermal), subject to the stipulations and RDFs included in the RMP. The BLM will evaluate parcels or those portions of parcels available for leasing associated with nominations (e.g., expressions of interest) and determine areas to continue analyzing for inclusion in a lease sale as part of the lease sale NEPA review or analysis. Where there is an existing evaluation process that considers at a minimum GRSG habitat and development proximity, the BLM will use that evaluation process. However, in the absence of an existing evaluation process or where informative to an existing process, the BLM will evaluate parcels with GRSG habitat management areas as part of the lease sale NEPA review or	Revised Fluid Mineral Objective for all states would be the same as Alternative 4. No specific objective or management action would specify a fluid mineral leasing strategy. However, not including specific leasing prioritization language or a leasing strategy does not remove the desired condition to manage public lands to provide suitable GRSG habitat at the HAF mid-, fine- and site-scales. Fluid mineral leasing would be considered in GRSG habitat management areas consistent with the Secretary's discretion under the Mineral Leasing Act (as amended), as well as applicable BLM regulations and policies, and in conformance with RMP goals, objectives, stipulations, and required design features to avoid, minimize, and compensate impacts to GRSG. • Management Action to address development in areas already leased would be the same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	habitat loss and impacts to breeding and nesting habitats. Work with lessees, operators, or other project proponents to place development at the most distal part of the lease from the lek or in areas least harmful to GRSG populations and habitat (e.g., where local terrain features such as ridges and ravines may shield nearby habitat from disruptive factors, or co-location with existing disturbance). For developments that cannot avoid impacts to GRSG, apply conservation measures that reduce impacts to GRSG through implementation decisions (e.g., approval of an application for permit to drill, geothermal drilling permit, Sundry Notice, Master Development Plans, etc.) and upon completion of the environmental record of review (43 CFR Part 3162.5). In this process, evaluate whether the conservation measures are "reasonable" (43 CFR Part 3101.1-2) and consistent with the valid existing rights. • If an existing lease terminates by operation of law, the reinstatement will not be authorized within PHMA (and IHMA).	• analysis by considering, at a minimum, the following: o Proximity to existing oil and gas developments, giving preference to lands upon which a prudent operator would seek to expand existing operations (e.g., existing leases, leases held by production, designated units, etc.). Such existing developments would not usually include areas with minimal existing infrastructure such as wildcat well locations. Areas with development in PHMA (and IHMA) that is at or approaching the density or disturbance caps at the project scale would indicate areas that would meet this criteria. Any nominated parcel subject to immediate drainage or within five miles of existing development would have a higher preference value for analysis in lease documents. o Potential impacts to important GRSG habitats or areas that provide important connectivity, giving preference to lands that would not result in impairing habitat suitability and proper function (see GRSG habitat objectives). This evaluation should consider impacts to GRSG habitat suitability at the	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	HAF mid-, fine- and site-scales, considering information including, but not limited to the presence and distance from leks; presence of nesting and brood rearing habitats, important winter habitat, or other limiting habitat types; the relationship between leks, nesting habitat and other seasonal habitats with topography; migration/movement corridors; adaptive management thresholds (hard and soft); amount and distribution of existing disturbances; the presence of degraded or non-habitat, and impacts to adjacent habitat that may affect the biological importance of the remaining intact habitat. Coordinate with the applicable State agencies to ensure the most current and applicable biological information is considered. Parcels where development would not decrease habitat suitability would have higher preference value for analysis in lease documents. If a parcel receives a low preference value for impacts to important GRSG habitats, it will receive an overall low preference value. An office may offer low preference	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	parcels in a lease sale if the Field Office resources (e.g., staff time) allow after all high preference parcels have been evaluated for inclusion in the sale. In such a scenario, the office will select one or more low preference parcels that present the least conflicts based on the evaluation criteria to analyze for inclusion in the sale. • Management Action to address development in areas already leased: When considering exploration and development on areas leased for fluid mineral resources in PHMAs (and IHMA in ID), including geothermal, application of measures to avoid, minimize, rectify, reduce and/or mitigate potential impacts will be considered through completion of the environmental record of review (43 CFR Part 3162.5 and 36 CFR Part 228.108), including appropriate documentation of compliance with NEPA. Such measures may include existing lease stipulations, project design, operator-committed measures, RMP required design features (RDFs), and local conditions of approval (COAs). The BLM will work with project proponents to promote measurable GRSG	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	conservation objectives such as, but not limited to, consolidation of project related infrastructure to reduce habitat fragmentation and loss and to promote effective conservation and connectivity of seasonal habitats and PHMAs (and IHMAs). The BLM will continue to work with project proponents and the state wildlife agency to site their projects in a manner that honors their lease rights but have been determined to contain the least sensitive habitats (based on vegetation, topography, or other habitat features) and resources whether inside or outside of PHMAs (and IHMA). Surface use rights associated with existing leases will be recognized and respected. For proposed operations in PHMAs (and IHMAs), the Surface Use Plan of Operations (see 43CFR Part 3162.3-1(f)) shall address, at a minimum, the applicable RDFs in the RMP. Seasonal habitats or project features related to potential GRSG impacts that are not addressed in the Surface Use Plan of Operations based on site-specific or project-specific considerations shall be noted in the project file, along with a rationale for not including them.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	In this process the BLM will evaluate whether each conservation measure is reasonable and consistent with surface use rights as part of the environmental review process (e.g., 43 CFR Part 3101.1-2).	*(See above.)*

21.1.7 Fluid Mineral Lease Stipulation Waivers, Exceptions, and Modifications

Federal regulations at 43 CFR Part 3171.24 provide the BLM direction for conditions under which variance from specific stipulations can be considered. This document presents the draft range of alternatives for waivers, exceptions, and modifications (WEMs) associated with the described stipulations on new fluid mineral leasing (e.g., oil, gas, and geothermal) in GRSG habitat management areas. Consideration of amending the WEM language in this planning effort is limited to future leases that have stipulations associated with no surface occupancy (NSO), disturbance cap – generally applied as a controlled surface use (CSU) stipulation, and seasonal timing limitations. This planning effort is not considering amendment of WEMs associated with other stipulations.

This section is limited to consideration of WEMs during the development phase. Other aspects of fluid mineral leasing and development are addressed elsewhere in this amendment or existing RMP language, including specific fluid mineral allocations and associated stipulations (see **Section 2.5.2**), the RMP objective for GRSG habitat in relation to fluid minerals (see **Section 2.5.6**), RMP management actions providing guidance when considering leasing GRSG habitat management areas (see **Section 2.5.6**), development associated with existing fluid mineral leases (see **Section 2.5.6**), and application of RDFs (existing RMP decisions that are not being considered for amendment in this process).

The WEMs in this document would apply to new fluid mineral leases and lease reinstatements on public lands, as well as existing leases if they do not specifically include WEMs associated with lease stipulations, and are limited to the stipulations described below. GRSG fluid mineral stipulations not mentioned in this document, as well as those program areas/stipulations not considered in this planning effort would continue where they apply. If there is a conflict between such stipulations and those presented in this document, the more restrictive would take precedence during implementation.

Description of Surface Stipulations

This planning process is considering an amendment to the language for WEMs associated with three general types of GRSG surface stipulations that would be applied to new fluid mineral leases.

No Surface Occupancy (NSO)

Use or occupancy of the land surface for fluid mineral exploration or development is prohibited to protect GRSG and GRSG habitat. Generally considered a major constraint, in areas open to fluid mineral leasing with NSO stipulations, fluid mineral leasing activities are permitted, but activities with surface occupancy cannot be conducted unless an exception, modification, or waiver is granted. Absent the approval of a waiver, exception, or modification, access to fluid mineral deposits would require drilling from outside the boundaries of the NSO stipulation. In the 2015 not warranted determination for GRSG the USFWS cited application of regulatory tools, such as NSO stipulations, as an effective conservation tool in minimizing exposure of the species to fluid mineral development.

Controlled Surface Use (CSU) – Disturbance Cap

This planning effort is considering amendments to the GRSG disturbance cap, including clarifying that it will be applied to new fluid mineral leases as a CSU stipulation. A CSU stipulation is a category of moderate constraint that allows some use and occupancy of public land while protecting identified resources or values. A CSU stipulation allows the BLM to require additional conditions be met to protect a specified resource or value in addition to standard lease terms and conditions. A new lease with the disturbance cap CSU stipulation would not guarantee the lessee the right to occupy the surface of the lease for the purpose of producing fluid minerals within GRSG designated PHMAs

(and IHMA in Idaho). The surface occupancy restriction criteria identified in this stipulation may preclude surface occupancy and may be beyond the ability of the lessee to meet due to existing surface disturbance on federal, state, or private lands within designated PHMAs/IHMAs or surface disturbance created by other land users.

Seasonal Timing Limitations (TL)

Areas identified for TLs, a moderate constraint, are closed to fluid mineral exploration and development during identified time frames to eliminate, to the degree possible, activities disruptive to GRSG during the associated seasons of use. Ground disturbing activities, drilling, stimulation, and plug and abandonment work should not be allowed during the identified periods. Production and maintenance activities on wells and well work required by another program to protect the environment (e.g. Underground Injection Control) and administrative activities may be exempt from the timing limitations at the discretion of the BLM Authorized Officer. GRSG seasonal timing limitations from prior planning efforts will not change, but waivers, exceptions, and modifications for seasonal timing limitations are being updated.

Project-specific Flexibility

For fluid minerals, surface stipulations could be excepted, modified, or waived by the Authorized Officer. An exception exempts the holder of the lease from the stipulation on a one-time basis. A modification changes the language or provisions of a stipulation due to changed conditions or new information either temporarily or for the term of the lease. A modification may or may not apply to all other sites within the leasehold. A waiver permanently exempts the surface stipulation for a specific lease, planning area, or resource based on absence of need.

An exception, modification, or waiver may be granted at the discretion of the BLM Authorized Officer if the specific criteria described below are met. WEMs specific to each stipulation are included in the leasing documents and are considered based on site-level conditions during implementation of the lease terms. The proponent must submit a written request for an exception, modification, or waiver and provide the data necessary to demonstrate that specific criteria have been met. The BLM would consider that information, in combination with all other information provided by State, County, and other local agencies; tribal governments; other federal agencies; or interested stakeholders as applicable, though decision to grant the WEM remains with the Authorized Officer.

In the event there are overlapping stipulations (e.g., NSO area overlapping a disturbance cap CSU overlapping a seasonal timing limitation), WEMs would need to be considered for each stipulation separately based on the processes identified below.

Table 21-8, Comparison of Alternatives, Fluid Mineral Leasing Waivers, Exceptions, and Modifications, presents management by alternative for this management issue.

Table 21-8. Comparison of Alternatives, Fluid Mineral Leasing Waivers, Exceptions, and Modifications

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
No Surface Occupancy Stipulations for GRSG within PHMA (and IHMA in Idaho and West Decker RHMA in MT):				
• ID, MT/DK, NV/CA, OR, UT: In SFA, there will be no waivers, exceptions, or modifications. • CO, ID, MT/DK, NV/CA, OR, UT: The Authorized Officer may grant an **exception** to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action: i. Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or, ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid federal fluid mineral lease existing as of the date of this ARMPA. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such	• MT/DK, OR, and WY: Same as Alternative 1. • CO: <u>NSO-1 – Within One mile of Active Leks:</u> **__Exceptions__ or __modifications__ may be considered if, in consultation with the State of Colorado, it can be demonstrated that there is no impact on Greater Sage-Grouse based on one of the following: ○ Topography/areas of non-habitat create an effective barrier to impacts. ○ No additional impacts would be realized above those created by existing major infrastructure (for example, State Highway 13). ○ The exception or modification precludes or offsets greater potential impacts if the action were proposed on adjacent parcels (for example, due to landownership patterns). **In order to approve exceptions or modifications to this lease stipulation, the Authorized Officer must obtain: agreement, including written justification, between the BLM District Managers and CPW that the proposed action satisfies at least one of the criteria listed above.*	No new WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing so there would be no new leases with associated stipulations.	**Exception #1 – applicable to the NSO stipulation within 0.6 miles of active leks (WAFWA definition) in PHMA (and IHMA in Idaho)**: The Authorized Officer may consider and grant an **exception** to the NSO stipulation within 0.6 miles of active leks in PHMA (and IHMA in Idaho) if it can be demonstrated that development and surface occupancy would have no direct impacts to or disruption of GRSG or its habitat based on at least one of the following – after documenting the review of available information associated with the site proposed for the exception – both internally compiled and as provided by State, County and other local agencies, tribal governments, project proponents, other federal agencies, or interested stakeholders: • The location of the proposed authorization is determined to be non-habitat (see Glossary; as determined by a biologist with GRSG experience using methods such as the Habitat Assessment Framework), does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect disturbance to or disruption of adjacent seasonal habitats (whether adjacent seasonal habitat are within 0.6	Same as Alternative 4, except in CO where the exception would apply in PHMA within 1 mile of active leks.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
benefits will endure for the duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publicly available at least quarterly. • WY: NSO 0.6 lek buffer in PHMA: **Exception**: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater	• ID: The Authorized Officer may grant an exception to a fluid mineral lease NSO stipulation only where the proposed action: i. Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or, ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide no net loss to GRSG. Exceptions based on no net loss (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP amendment. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director and in coordination with the Technical and Policy	*(See above.)*	• miles of an active lek or greater than 0.6 miles from active leks) that would impair their biological function. • Topography/areas of non-habitat create an effective barrier to adverse impacts (e.g., protected from visual and audible disturbances to GRSG and its habitat). • By co-locating the proposed authorization with existing disturbance, no additional impacts would be realized above those already associated with the existing similarly-sized infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function. Beyond considering an exception where no direct or indirect impacts on GRSG or its habitat would occur, an exception could also be considered if the proposed location on public lands would be undertaken as an alternative to a similar action occurring on a nearby non-public lands parcel (for example, due to landownership patterns), and development on the public parcel in question would eliminate impacts on more important and/or limited GRSG habitat (e.g., wet meadows, brood-rearing habitat, etc.) on the non-public nearby parcel; this exception must also include measures sufficient to allow the BLM to conclude in its documenting analysis that such	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Sage-Grouse. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected.	Team. Approved exceptions will be made publicly available at least quarterly. • NV/CA: An **exception** to stipulations associated with GRSG Habitat Management Areas (HMAs) may be granted by the authorized officer (State Director), in coordination with the appropriate state agency (NDOW, SETT, and/or CDFW), if one the following conditions are met: i. The location of the proposed authorization is determined to be unsuitable (by a biologist with GRSG experience using methods such as Stiver et al 2015) and lacks the ecological potential to become marginal or suitable habitat; and would not result in direct, indirect, or cumulative impacts on GRSG and its habitat. Management allocation decisions would not apply to those areas determined to be unsuitable because the area lacks the ecological potential to become marginal or suitable habitat, and/or ii. The proposed activity's impacts could be offset to result in no adverse impacts on GRSG or its habitat, through use of the mitigation hierarchy consistent with Federal law	*(See above.)*	benefits will endure for the duration of the proposed action's impacts on public lands (e.g., confirmation of an easement). To approve this exception based on any of the above criteria, after coordination with the appropriate State agency, the Authorized Officer must document, that the proposed action satisfies at least one of the criteria listed above. If the State agency does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides. Prior to granting an exception to an NSO stipulation, the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process). If the area associated with the proposed development seeking the exception (e.g., well pad, compressor station, etc.) is in an area (neighborhood cluster) that has met one of the adaptive management thresholds (hard or soft) (see **Section 2.5.13**), no exceptions would be considered until the causal factor analysis is completed. If the causal factor analysis concludes that development associated with the type of activity seeking the exception is or could contribute to the threshold being met or not recovering, no exception would	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	and the state's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations developed to implement this order). In cases where exceptions may be granted for projects with a residual impact, voluntary compensatory mitigation consistent with the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations developed to implement this order) would be one mechanism by which a proponent achieves the Approved RMP Amendment goals, objectives, and exception criteria. When a proponent volunteers compensatory mitigation as their chosen approach to address residual impacts, the BLM can incorporate those actions into the rationale used to grant an exception. The final decision to grant a waiver, exception, or modification would be based, in part, on criteria consistent with the State's GRSG management plans and policies. • UT: Within PHMA, the Authorized Officer may grant an **exception** to a fluid mineral lease NSO	*(See above.)*	be granted. If the analysis is inconclusive on cause, exceptions could be considered.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	stipulation where the proposed action: ○ Occurs in non-habitat that does not provide important connectivity between habitat areas and the development would not cause indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function of providing the life-history or behavioral needs of the Greater Sage-Grouse population due to project design (e.g., minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document; or ○ Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and development on the parcel in question would have less of an impact on Greater Sage-Grouse or its habitat than on the nearby parcel; this exception must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. Approved exceptions will be made publicly available at least quarterly. In addition, any lease activities will apply the pertinent management for discretionary	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, seasonal restrictions, and RDFs), including if an exception to the NSO is granted.	*(See above.)*	*(See above.)*	*(See above.)*
Not applicable	A two-tiered NSO exception is not applicable for any state but CO. • CO: NSO-2 – One Mile from Active Leks to the Remainder of PHMA: **Exception: The BLM will grant an exception (any occupancy must be removed within 1 year of approval) to NSO-2 after consulting with the State of Colorado, consistent with MD-SSS-3 and based on the following factors: o It is determined by evaluating the proposed lease activities that adverse or undesirable impacts to Greater Sage-Grouse can be avoided based on site-specific terrain, topography and habitat type, or offset consistent with criterion #2 below. For example, in the vicinity of leks, local terrain features such as ridges and ravines may shield potential disruptive impacts from affecting nearby Greater Sage-Grouse habitat. or o It is determined, based on site-specific information (using tools such as the Habitat Assessment Framework, the Colorado Habitat Exchange Habitat	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Exception #2 – No Surface Occupancy Stipulation in the Remainder of PHMA (or IHMA in Idaho) beyond 0.6 miles from active leks – as applicable:** The Authorized Officer may consider and grant an **exception** to the NSO stipulation associated with the remainder of PHMA (and IHMA in Idaho) if one of the following criteria apply – after documenting the review of available information associated with the site proposed for the exception – both internally compiled and as provided by State, County and other local agencies, tribal governments, project proponents, other federal agencies, or interested stakeholders: 1) The criteria presented in Exception #1. 2) If it can be demonstrated by a biologist with GRSG experience, based on site-specific information (using tools such as the Habitat Assessment Framework, State mitigation programs, or others), where it has been demonstrated that the project cannot be avoided or minimized and granting the exception would not result in adverse effects to GRSG	**Exception #2 – No Surface Occupancy Stipulations in the Remainder of PHMA (or IHMA in Idaho) beyond 0.6 miles from active leks – as applicable:** Same as Alternative 4, except under the #2 criteria, compensatory mitigation would not have to be completed and functioning prior to being able to grant the exception. To grant the activity based on compensatory mitigation, prior to construction, surface occupancy, or surface disturbing activities the compensation project must be planned, funded, and approved by the operator, BLM, surface owner, and in coordination with the appropriate State agency. However, due to the uncertainty associated with whether the planned compensatory mitigation project would successfully become habitat in order to offset the impacts, one of the following would need to apply: • The area of habitat improvement associated with compensatory mitigation would need to increase to account for a level of risk that the compensatory mitigation action may fail or not persist for the full duration of the impact based on the type of

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	Quantification Tool, or others), that the impacts anticipated by the proposed activity would be offset through compensatory mitigation developed in coordination with the State of Colorado (as a requirement of State policy or authorization or as offered voluntarily by leaseholder) that meets accepted principles of compensatory mitigation including: ➢ Achieving measurable outcomes for Greater Sage-Grouse habitat function that are at least equal to the lost or degraded values. **If, prior to development, the county in which the tract is located provides information indicating that an NSO stipulation can be excepted or modified based on a reasonable understanding of likely development because either of the criterion above would apply, the BLM would manage that lease accordingly unless the BLM determines, at the APD stage and in consultation with the State of Colorado, that neither of the criteria identified above is met. *In order to approve exceptions or modifications to this lease stipulation, the Authorized Officer must obtain agreement, including written justification, between the BLM District Manager and CPW*	*(See above.)*	seasonal habitats. Granting the exception must be in conformance with the RMP GRSG goal and habitat objectives, and the impacts anticipated by the proposed activity would be addressed through application of the mitigation hierarchy, including consideration of compensatory mitigation developed in coordination with the applicable state agency that meets the GRSG mitigation principles identified in the RMP, including providing for no net loss of habitat. To grant an exception based on the use of compensatory mitigation, the following must be followed and documented: a. As the first step in mitigating impacts to GRSG, efforts to avoid impacts by locating the proposed project in areas outside the NSO areas or in areas of non-habitat shall be documented. b. As the second step in mitigating impacts to GRSG, efforts to minimize impacts by applying project design features shall be documented (e.g., use of RDFs, buffer distances, seasonal limitations, etc.). c. Using compensatory mitigation may not be appropriate in some GRSG habitats/populations. Before using compensatory mitigation	the specific compensatory project(s) and local ecological conditions, or • The operator provides long-term assurances that the compensatory project would become functional for the duration of the impact (e.g. project maintenance or retreatment, easements, mitigation bonding – BLM H-1794-1, section 7.3, etc.). Compensatory mitigation rate would need to consider number of acres necessary to offset acres affected by direct and indirect effects (see Mitigation section), as well as likelihood that the mitigation project may not provide the anticipated compensation for the duration of the impact.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*that the proposed action satisfies at least one of the criteria listed above.*	*(See above.)*	as an approach for this exception, the effectiveness of whether compensatory mitigation can offset impacts to the impacted habitat and associated population without risking other impacts shall consider local biological considerations, including, but not limited to population size, connectivity to other populations, availability of existing functional habitat, and the availability of mitigation projects that could benefit the impacted population. d. The compensation project must be completed and habitat functionality documented before the exception is granted to ensure the offset in impacts will occur. e. The compensation necessary to grant this exception must provide the offsetting benefit to the population being impacted by the potential development. For a description of what qualifies as an offsetting benefit, refer to the mitigation framework. To approve this exception, the Authorized Officer must document, in coordination with the appropriate State authority,	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	that the proposed action satisfies at least one of the criteria listed above. If the State agency does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides. Prior to granting an exception to an NSO stipulation the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process). If the area associated with the proposed development seeking the exception (e.g., well pad, compressor station, etc.) is in an area (neighborhood cluster) that has met one of the adaptive management thresholds (hard or soft) (see **Section 2.5.13**), no exceptions would be considered until the causal factor analysis is completed. If the causal factor analysis concludes that development associated with the type of activity seeking the exception is or could contribute to the threshold being met or not recovering, no exception would be granted. If the analysis is inconclusive on cause, exceptions could be considered.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• CO, ID, MT/DK, NV/CA, OR, UT: None • WY: NSO 0.6 lek buffer in PHMA: **Modification**: The authorized officer may modify the area subject to the stipulation or the NSO criteria if an environmental record of review finds that a portion of the NSO area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting.	• ID, MT/DK, OR and WY: Same as Alternative 1. • CO: <u>NSO-1 – Within One mile of Active Leks:</u> **__Exceptions__** or **modifications** may be considered if, in consultation with the State of Colorado, it can be demonstrated that there is no impact on Greater Sage-Grouse based on one of the following: o Topography/areas of non-habitat create an effective barrier to impacts. o No additional impacts would be realized above those created by existing major infrastructure (for example, State Highway 13). o The exception or modification precludes or offsets greater potential impacts if the action were proposed on adjacent parcels (for example, due to landownership patterns). **_In order to approve exceptions or modifications to this lease stipulation, the Authorized Officer must obtain: agreement, including written justification, between the BLM District Managers and CPW that the proposed action satisfies at least one of the criteria listed above._	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Modification**: The Authorized Officer may consider and grant a **modification** to the fluid mineral lease NSO stipulation, allowing for surface occupancy only where: • an exception is granted, as described above, for the primary disturbance (e.g., well pad, compressor station), and • the potential associated infrastructure related to the development is not individually precluded by other GRSG actions (e.g., roads, pipelines, power lines that could otherwise be considered through a ROW). While the NSO stipulation could be modified for these additional developments, they must still comply with other GRSG management actions (e.g., mitigation, disturbance cap, minerals/energy density, seasonal restrictions, RDFs, etc.) if an exception to the NSO is granted. Prior to modifying the area subject to the NSO stipulation, the potential modification shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process). If the area (neighborhood cluster) associated with the proposed exception has met one of the adaptive management thresholds (hard or soft) (see **Section 2.5.13**), no exceptions would be considered until the causal factor	Same as Alternative 4, except for the addition of the following: <u>Specifically for Wyoming</u>: In addition to the above, the Authorized Officer may consider and grant a **modification** if after documenting the review of available information, in coordination with the appropriate State agency, that a portion of the NSO area is nonessential (e.g., the lek upon which the NSO is centered is not active), or it is identified through scientific research or monitoring that the existing area (i.e., the active lek and associated buffer) is inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the GRSG, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	• CO: NSO-2 – One Mile from Active Leks to the Remainder of PHMA: ****Modification**: The BLM will grant modifications (changes to the stipulation either temporarily or for the term of either part of the entire lease) to NSO-2 after consultation with the State of Colorado, consistent with MD-SSS-3 and based on the following factors: ○ It is determined by evaluating the proposed lease activities that adverse or undesirable impacts to Greater Sage-Grouse can be avoided based on site-specific terrain, topography and habitat type, or offset consistent with criterion #2 below. For example, in the vicinity of leks, local terrain features such as ridges and ravines may shield potential disruptive impacts from affecting nearby Greater Sage-Grouse habitat. or ○ It is determined, based on site-specific information (using tools such as the Habitat Assessment Framework, the Colorado Habitat Exchange Habitat Quantification Tool, or others), that the impacts anticipated by the proposed activity would be with the State of Colorado (as a requirement of State	*(See above.)*	analysis is completed. If the causal factor analysis concludes that development associated with the type of activity seeking the exception is or could contribute to the threshold being met or not recovering, no modification would be granted. If the analysis is inconclusive on cause, modifications could be considered.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	offset through compensatory mitigation developed in coordination policy or authorization or as offered voluntarily by leaseholder) that meets accepted principles of compensatory mitigation including: ➢ Achieving measurable outcomes for Greater Sage-Grouse habitat function that are at least equal to the lost or degraded values; ➢ Accounting for a level of risk that the mitigation action may fail or not persist for the full duration of the impact. **If, prior to development, the county in which the tract is located provides information indicating that an NSO stipulation can be excepted or modified based on a reasonable understanding of likely development because either of the criterion above would apply, the BLM would manage that lease accordingly unless the BLM determines, at the APD stage and in consultation with the State of Colorado, that neither of the criteria identified above is met. *In order to approve exceptions or modifications to this lease stipulation, the Authorized Officer must obtain agreement, including*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*written justification, between the BLM District Manager and CPW that the proposed action satisfies at least one of the criteria listed above.* • NV/CA: The only language for modifications and waivers related to timing stipulations. The language from the NV/CA 2019 ARMPA is located in that section. • UT: The BLM Authorized Officer may grant a **modification** to a fluid mineral lease no surface occupancy stipulation only where an exception is granted, as described above, for the primary disturbance (e.g., well pad, compressor station). A modification to the no surface occupancy stipulation could be considered for the associated infrastructure related to the development that are not individually precluded by other Greater Sage-Grouse actions (e.g., roads, pipelines, power lines). While the no surface occupancy stipulation could be modified for this infrastructure, it must still comply with other Greater Sage-Grouse management contained in MA-SSS-3.	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• CO, ID, MT/DK, NV/CA, OR, UT: None • WY: NSO 0.6 lek buffer in PHMA: **Waiver**: This stipulation may be waived over the entire lease if, in coordination with the state wildlife agency, it is determined that the Greater Sage-Grouse lek has been classified as unactive as determined by the state wildlife agency. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)	• ID, MT/DK, OR, WY: Same as Alternative 1. • CO: <u>NSO-1 (Within One mile of Active Leks) and NSO-2 (One Mile from Active Leks to the Remainder of PHMA):</u> No waivers are authorized unless the area or resource mapped as possessing the attributes protected by the stipulation is determined during collaboration with the State of Colorado to lack those attributes or potential attributes. A 30-day public notice and comment period is required before waiver of a stipulation. Waivers would require BLM State Director approval. • NV/CA: **Waiver**: The stipulation may be waived if the authorized officer, in consultation with the appropriate state agency (NDOW, SETT, and/or CDFW), determines that the entire leasehold is within unsuitable habitat (see exceptions above) and would not result in direct, indirect, or cumulative impacts to GRSG and/or its habitat. • UT: The BLM Authorized Officer may grant a **waiver** to a fluid mineral lease no surface occupancy stipulation if, through the appropriate planning process (i.e., plan maintenance, amendment) the area is no longer within PHMA.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Waiver**: The Authorized Officer may consider and grant a **waiver** of the NSO stipulation on an existing lease after documenting, in coordination with the appropriate State agency, that the lease with the GRSG NSO stipulation is no longer in PHMA (and IHMA in Idaho). This would only be applicable on leases that were issued when the parcel was in PHMA, then the PHMA boundaries were subsequently adjusted through the appropriate planning process (i.e., plan maintenance or amendment). Prior to waiving the NSO stipulation for a given area, the potential waiver shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
No Surface Occupancy Stipulations Associated with Active Leks in GHMA (applicable in MT/DK, WY, CO, OR, and UT), and Musselshell RHMA in MT:				
• ID, NV/CA do not have NSO for GRSG in GHMA. • While UT has NSO on leks in GHMA, they are associated with RMP decisions that pre-date the 2015 amendment. As such, no new stipulations or WEMs were considered in the 2015 ARMPA. • CO: w/in 2 miles of active leks: **Exception**: In consultation with the State of Colorado, an exception to occupancy of the surface associated with GRSG NSO-46e(2) in GHMA could be granted on a one-time basis (any occupancy must be removed within 1 year of approval) based on an analysis of the following factors: o Location of proposed lease activities in relation to critical GRSG habitat areas as identified by factors including, but not limited to, average male lek attendance and/or important seasonal habitat o An evaluation of the potential threats from proposed lease activities that may affect the local population as compared to benefits that could be accomplished through compensatory or off-site mitigation (see Chapter 2, Section 2.6.3 of the Proposed LUPA/Final EIS, Regional Mitigation)	• CO, ID, MT/DK, NV/CA, OR, UT, WY: Same as Alternative 1.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Exception**: The Authorized Officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of GRSG due to site-specific terrain and habitat features, such as topographic features that would reduce the habitat impacts by shielding nearby habitat from disruptive factors. An exception could also be granted if it can be demonstrated by a biologist with GRSG experience, based on site-specific information (using State mitigation tools such as Habitat Equivalency Analysis or Habitat Quantification Tool, or other State mitigation programs), that the impacts anticipated by the proposed activity would be offset through compensatory mitigation developed in coordination with the appropriate State agency that meets principles of GRSG compensatory mitigation identified in the RMP, including providing for no net loss of habitat.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
○ An evaluation of the proposed lease activities in relation to the site-specific terrain and habitat features. For example, in the vicinity of leks, local terrain features such as ridges and ravines may reduce the habitat importance and shield nearby habitat from disruptive factors. • MT/DK: Miles City (w/in 0.6 miles of a lek in GHMA: The AO, may grant an **Exception** if the action will not result in sage-grouse lek abandonment. South Dakota (w/in .06 miles of leks in GHMA and in winter habitat): The AO may grant an **Exception** only where the proposed action: i. Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel and will provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in: a) PHMAs of mixed ownership where Federal minerals underlie less than fifty percent (50%) of the total surface, or	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
b) Areas of the public lands where the proposed Exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP. (See further requirements in the WEMs preamble near the beginning of the Appendix G.1.) Billings (w/in .06 miles of leks in GHMA): A **Modification** or **Exception** may only be considered where the proposed action is determined to be non-habitat, the area is not used by GRSG, and the proposed action would not have direct, indirect, or cumulative effects to GRSG or its habitat. The determination would be made by the BLM in consultation with a team of agency GRSG experts, including an expert from the state wildlife agency, USFWS, and BLM/USFS. The State Director must have received a determination before approving any Modification or Exception. All Modifications or Exceptions must be approved by the State Director. Billings: winter habitat: The AO, after coordination with the state wildlife management agency, may grant an Exception if the action will not result impair the function or suitability of the winter range habitat. HiLine (w/in 0.6 miles of leks in GHMA): The AO, in consultation with Montana Fish, Wildlife and Parks (MFWP), may grant an	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

• ID: None • CO: w/in 2 miles of active leks: No **waivers** are authorized unless the area or resource mapped as possessing the attributes protected by the stipulation is determined during collaboration with the State of Colorado to lack those attributes or potential attributes. A 30-day public notice and comment period is required before waiver of a stipulation. Waivers would require BLM State Director approval. • MT/DK: NSO 0.6 lek buffer in GHMA: Miles City: The AO, may **waive** this stipulation if no portion of the leasehold is within 6/10 mile of the perimeter of an active lek. South Dakota: The AO, may waive this stipulation if no portion of the leasehold is within 6/10 mile of the perimeter of an active lek. Billings: The AO may waive this stipulation if: o The entire leasehold is no longer within 0.6 mile of the perimeter of a lek; o It is determined sage-grouse are no longer a BLM special status species or federally threatened or endangered;	• CO, ID, MT/DK, NV/CA, OR, UT, WY: Same as Alternative 1.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Waiver**: This stipulation may be waived for a specific lek if, in coordination with the appropriate State agency, it is determined that the GRSG lek that was active has been classified as inactive as determined by the WAFWA definitions and confirmed by the appropriate State agency. Prior to waiving the stipulations, surveys should confirm that the lek is inactive and not moved to another location in the vicinity. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
○ No reasonable alternative development scenario exists; or ○ The habitat has been altered to the point sage-grouse no longer use the site and there is little likelihood of habitat capable of supporting sage-grouse being restored. Billings: winter habitat: The AO, after coordination with the state wildlife management agency, may waive this stipulation if the entire leasehold has been altered to an extent that future use by wintering wildlife is unlikely. HiLine (w/in 0.6 miles of leks in GHMA): The stipulation may be waived if the AO, in consultation with MFWP, determines that no portion of the leasehold is within 0.6 mile of the perimeter of an active lek. Lewistown (winter habitat): The Authorized Officer, after coordination with the state wildlife management agency, may waive this stipulation if the entire leasehold has been altered to an extent, future use by wintering wildlife is unlikely. Lewistown (w/in 0.6 miles of leks in GHMA): The Authorized Officer may waive this stipulation if no portion of the leasehold is within 0.6 miles of the perimeter of an active lek • OR: NSO within 1 mile of pending or occupied lek in GHMA:	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Waiver: The BLM Field Manager may waive application of the above use restrictions and meeting objectives within general habitat if off-site mitigation were successfully completed in priority habitat or opportunity areas, following discussions with the BLM and ODFW. Even in situations where use restrictions are waived in general habitat, to avoid direct disturbance or mortality of GRSG, disturbances would not be approved during the sensitive seasons. • WY: NSO 0.25 lek buffer outside PHMA: **Waiver**: This stipulation may be waived over the entire lease if, in coordination with the state wildlife agency, it is determined that the Greater Sage-Grouse lek has been classified as unactive as determined by the state wildlife agency. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Controlled Surface Use: Disturbance Cap				
• CO, ID, MT/DK and OR did not include the disturbance cap as a stipulation. As such, there were no WEMs. • CA: No exceptions. • NV: Nevada lands only—Any **exceptions** to the disturbance cap may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the NDOW, the USFWS, and the BLM unanimously find that the proposed action satisfies the conditions stated in the stipulation. Initially, the technical team would make such finding; the team consists of a field biologist or other GRSG expert from each respective agency. In the event the initial finding were not unanimous, the finding may be elevated to the BLM State Director, USFWS State Ecological Services Director, and NDOW Director for final resolution. In the event their recommendation were not unanimous to grant the exception, the exception would not be granted. • UT: No exceptions. • WY (Core only): **Exception**: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site	• CO, ID, MT/DK, OR, WY: Same as Alternative 1. • CA: New development/activity would not exceed the 3% disturbance cap protocol at the project scale in PHMA, except in situations where a net conservation gain to the species is achieved as a component of compliance with a state mitigation plan, program, or authority. • NV: Nevada lands only— New development/activity would not exceed the 3% disturbance cap protocol at the project scale in PHMA, except in situations where a net conservation gain to the species is achieved as a component of compliance with a state mitigation plan, program, or authority, such as required by the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). • UT: The 3 percent cap may be exceeded at the proposed project analysis scale if a technical team determines that site-specific Greater Sage-Grouse habitat and population information, combined with project design elements indicates the project will improve the condition of Greater Sage-Grouse habitat within the	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	All States: **Exception**: The Authorized Officer may consider fluid mineral infrastructure on public lands that could result in exceeding the 3 percent disturbance cap at the project scale only if the following three criteria are met: 1) with concurrence from the State Director, 2) if the environmental review document(s) explains how the RMP GRSG goals and objectives will be met, including compliance with the RMP's GRSG mitigation strategy, documenting efforts to: • First avoid impacts by locating the proposed project in areas outside of PHMA, collocated within the footprint of existing disturbance, or in areas of non-habitat shall be documented. • Second to minimize impacts by applying project design features shall be documented (e.g., use of RDFs, buffer distances, seasonal limitations, etc.). • Third, only then to consider using compensatory mitigation. It is important to note compensatory mitigation may not be appropriate in some GRSG habitats/populations. Before using compensatory mitigation as an approach for this exception, the effectiveness of whether compensatory mitigation can offset impacts to the affected habitat and associated population without risking impacts to those GRSG	Same as Alternative 4, except in WY and MT where the project scale disturbance cap is 5%. All states would also include the following additional exceptions included under criteria #3: Compensatory mitigation would not have to be completed and functioning prior to being able to grant the exception. To grant the activity based on compensatory mitigation, prior to construction, surface occupancy, or surface disturbing activities the compensation project must be planned, funded, and approved by the operator, BLM, surface owner, and in coordination with the appropriate State agency. However, due to the uncertainty associated with whether the compensatory mitigation project would successfully offset the impacts, one of the following would need to apply: • the area of habitat improvement associated with compensatory mitigation would need to increase to account for a level of risk that the compensatory mitigation action may fail or not persist for the full duration of the impact based on the type of specific compensatory project(s) and ecological conditions, or • The operator provides long-term assurances that the compensatory project would become functional (e.g., project maintenance or

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. • WY (Connectivity only): **Exception**: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse. An exception to the stated limits may be granted when compensatory mitigation is determined to provide an overall beneficial effect to sage-grouse habitat and populations. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected.	proposed project analysis area. Factors considered by the team are in Appendix E and in MA-SSS-3B (of the 2019 Utah GRSG ARMPA). Such exceptions to the 3 percent disturbance cap may be approved by the Authorized Officer only with the concurrence of the State Director. The finding and recommendation shall be made by the technical team, which should consist of a BLM field biologist, other local Greater Sage-Grouse experts, and biologists and other representatives from the appropriate State of Utah agency. *This would only be applicable to new fluid minerals leases if the exception criteria identified for the NSO stipulation above were granted.	*(See above.)*	habitats and populations shall consider local biological considerations, including, but not limited to population size, connectivity to other populations, availability of existing functional habitat, and the availability of mitigation projects that could benefit the impacted population. **and** 3) if one of the following circumstances can be documented: • The exceedance at the project scale is the result of consolidating disturbance associated with the proposed project as a strategy to leave other portions of the PHMA (and IHMA) undisturbed from new authorizations, and the third bullet below, addressing compensatory mitigation, is applied to any residual impacts. No exceedances would be allowed at the HAF Fine Scale. • If a technical team evaluates and recommends that site-specific GRSG habitat and population information, combined with project design elements – including compensatory mitigation, indicates the proposed project is expected to improve the condition of GRSG habitat within the proposed project analysis area. Factors considered by the team will include GRSG abundance and trends, movement patterns – including impacts to connectivity, habitat amount	retreatment, easements, mitigation bonding – BLM H-1794-1, section 7.3, etc.). Compensatory mitigation rate would need to consider number of acres necessary to offset acres affected by direct and indirect effects (see Mitigation section), as well as likelihood that the mitigation project may not provide the anticipated compensation for the duration of the impact. In addition, the compensation necessary to grant this exception must provide the offsetting benefit in the same HAF Fine Scale unit being impacted by the potential development.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	and quality, extent and alignment of project disturbance, location and density of existing disturbance (e.g., potential for increased fragmentation), project design options, and other biological factors (e.g., potential for topographic screening, impacts from other threats such as predation, invasive species, drought, noise, etc.). The technical team should consist of, at a minimum, a BLM field biologist and a biologist and other representatives from the appropriate State agency. • Disturbance associated with the renewal or re-authorization of existing infrastructure in previously disturbed sites or expansions of existing infrastructure that do not result in new direct, indirect, or cumulative impacts on GRSG and its habitat. To approve this exception, the Authorized Officer must document, in coordination with the appropriate State agency, that the proposed action satisfies the three criteria listed above. For this exception to apply, the compensatory mitigation must be completed prior to the disturbance that results in the exceedance of the disturbance cap so the value of the mitigation can be accurately compared to the value of the habitat to be affected by the proposed disturbance. In	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	addition, the compensation necessary to grant this exception must provide the offsetting benefit to the population being impacted by the potential development. Prior to granting an exception to the disturbance cap stipulation the potential exception shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process). If the area associated with the proposed development seeking the exception (e.g., well pad, compressor station, etc.) is in an area (neighborhood cluster) that has met one of the adaptive management thresholds (hard or soft) (see **Section 2.5.13**), no exceptions would be considered until the causal factor analysis is completed. If the causal factor analysis concludes that development associated with the type of activity seeking the exception is or could contribute to the threshold being met or not recovering, no exception would be granted. If the analysis is inconclusive on cause, exceptions could be considered.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• NV/CA, and UT: No modifications. • WY (Core only): **Modification**: The authorized officer may modify the area subject to the stipulation or surface occupancy criteria if an environmental record of review finds that a portion of the CSU area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. • WY (Connectivity only): **Exception**: The authorized officer may modify the area subject to the stipulation or surface occupancy criteria if an environmental record of review finds that a portion of the CSU area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting.	• CO, ID, MT/DK, NV/CA, OR, WY: Same as Alternative 1. • UT: The stipulation can be modified to allow disturbance to exceed 3 percent on the lease if disturbance in the project analysis area and PHMA associated with a Greater Sage-Grouse population area remains under 3 percent. *This would only be applicable to new fluid minerals leases if the exception criteria identified for the NSO stipulation above were granted.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Modification:** None.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• NV/CA, and UT: No waivers. • WY (Core only): **Waiver**: No waiver. • WY (Connectivity only): **Waiver**: No waiver.	• CO, ID, MT/DK, NV/CA, OR, WY: Same as Alternative 1. • UT: The Authorized Officer may grant a waiver to a fluid mineral lease NSO stipulation if, through the appropriate planning process (i.e., maintenance, amendment), the area is no longer within PHMA. *This would only be applicable to new fluid minerals leases if the exception criteria identified for the NSO stipulation above were granted.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Waiver**: The Authorized Officer may consider and grant a **waiver** of the stipulation on an existing lease if the area mapped as PHMA (and IHMA in Idaho) when the lease was issued is no longer mapped as such through the appropriate planning process (i.e., plan maintenance or amendment). Prior to waiving the disturbance cap stipulation for a given area, the potential waiver shall be subject to public review for at least a 30-day period (e.g., could be part of the APD NEPA process).	Same as Alternative 4.
Seasonal Constraints/Stipulations (WEMs associated with such GRSG stipulations in all applicable habitat management area types)				
• ID: No timing/seasonal stipulations were included in the stipulations appendix. • CO: In consultation with the State of Colorado, a **modification** or an **exception** to GRSG TL-46 could be granted based on an analysis of the following factors: o Location of proposed lease activities in relation to critical GRSG habitat areas as identified by factors including, but not limited to, average male lek attendance and/or important seasonal habitat o An evaluation of the potential threats from proposed lease activities that may affect the local population as compared to benefits that could be accomplished through compensatory or off-site	• CO, ID, OR, UT, WY: Same as Alternative 1. • NV/CA: In the 2019 ARMPA, WEMs for all the seasonal/timing stipulations refer the reader back to the same WEMs for the NSO.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Exception**: The Authorized Officer may consider and provide temporary relief from seasonal constraints by granting an **exception** after documenting the review of available information associated with the site proposed for the exception. While the BLM considers information from all sources, the State wildlife agency can provide information directly associated with bird use, including whether GRSG populations are not using the seasonal habitat during that year's seasonal life cycle period. Based on this information and recommendation, and documented variability in climatic conditions (e.g., early/late spring, long/heavy winter), use patterns, or other applicable information the Authorized Officer may consider a one-time exception if development associated with it will not affect GRSG habitat use, movement or	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
mitigation (see Chapter 2, Section 2.6.3 of the Proposed LUPA/Final EIS, Regional Mitigation) ○ An evaluation of the proposed lease activities in relation to the site-specific terrain and habitat features. For example, within 4 miles of a lek, local terrain features such as ridges and ravines may reduce the habitat importance and shield nearby habitat from disruptive factors. • MT/DK: Dillon: An Exception to this stipulation may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated. Butte and Dillon: An Exception to this stipulation may be granted by the authorized officer, in consultation with the Montana Fish, Wildlife and Parks (FWP) and the U.S. Fish and Wildlife Service (FWS), if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated. North Dakota: This stipulation may be waived or reduced if circumstances change, or if the lessee can demonstrate that operations can be conducted without causing unacceptable impacts. Exceptions to this	*(See above.)*	*(See above.)*	reproduction, including seasonal reproductive displays, nest attendance, egg or chick survival, or early brood-rearing success or otherwise impair the seasonal function, suitability, and use of winter concentration areas.	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
limitation in any particular year may be specifically approved in writing by the authorized officer. In all cases, the stipulation (including any Modification) will be designed to present the least restrictive measure for avoiding unacceptable adverse impacts. Butte: An Exception to this stipulation may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action are minimal or can be adequately mitigated. Billings: An Exception to this stipulation may be granted by the AO, in consultation with Montana FWP, if the operator submits a plan which demonstrates that the proposed action will not affect sage grouse or their habitat. Refer to "Requirements and/or Guidelines for Wildlife Controlled Surface Use (CSU) and Exceptions to No Surface Occupancy (NSO) and Timing Limitation Stipulations", Appendix H or portions of the area no longer have sage grouse or their habitat, or the lek is confirmed inactive (10 years with no males or sign of lek activity). Activities would be allowed, if they are consistent with the goals and objectives for the Restoration Area (RA) or General habitat. HiLine: The AO may grant an Exception if the operator submits a plan that demonstrates the impacts from the proposed action are acceptable or can be adequately mitigated.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• NV/CA: (w/in 4 miles of active or pending leks in GHMA, winter habitat, early and late brood rearing habitat): The Authorized Officer may grant an **exception** where an environmental review and consultation with the appropriate state agency (Nevada Department of Wildlife, Sagebrush Ecosystem Technical Team, California Department of Fish and Wildlife) determines that the action, as proposed or otherwise restricted, does not adversely affect GRSG or its habitat. An exception may also be granted if the proponent, the BLM, and the appropriate state agency negotiate mitigation that would provide a clear net conservation gain to GRSG and its habitat. • OR GHMA (Winter habitat): The BLM Field Manager could grant **exceptions** to the seasonal restrictions and use restrictions if the project plan and NEPA document demonstrate that impacts from the proposed action can be adequately mitigated. • OR GHMA (Breeding, Nesting, Early and late brood rearing habitat): The BLM Field Manager could grant exceptions to the seasonal and use restrictions under the following conditions: o If surveys determine there are no active or occupied	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
leks within 4 miles of the proposed project during the year (based on ODFW lek survey protocol) and the proposed activity would not take place beyond the season being excepted ○ If the project plan and NEPA document demonstrate that impacts from the proposed action could be adequately mitigated • UT (breeding, nesting, early and late brood rearing, and winter habitat): No exceptions. • WY PHMA (Core and Connectivity) and GHMA: **Exception**: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not affect reproductive displays, nest attendance, egg or chick survival, or early brood-rearing success. Actions designed to enhance the long-term utility or availability of suitable Greater Sage-Grouse habitat may be exempted from this timing limitation. The BLM can and does grant exceptions to seasonal restrictions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• WY Winter Concentration Areas: **Exception**: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not impair the function and suitability of the winter concentration area, or it is determined that the winter concentration area is not active by concentrated populations of Greater Sage-Grouse during the period of concern. Actions designed to enhance the long-term utility or availability of suitable Greater Sage-Grouse habitat may be exempted from this timing limitation. The BLM can and does grant exceptions to seasonal restrictions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• CO: Modification language included in the exception language above. • MT/DK: Dillon: The boundaries of the stipulated area may be modified if the authorized officer determines that portions of the area can be occupied without adversely affecting sage grouse leks. Butte and Dillon: The boundaries of the stipulated area may be modified if the authorized officer determines that portions of the area no longer contain Sage Grouse winter/spring range. The dates for the timing restriction may be modified if new information indicates that the December 1 through May 15 dates are not valid for the leasehold. North Dakota: This stipulation may be waived or reduced if circumstances change, or if the lessee can demonstrate that operations can be conducted without causing unacceptable impacts. Exceptions to this limitation in any particular year may be specifically approved in writing by the authorized officer. In all cases, the stipulation (including any Modification) will be designed to present the least restrictive measure for avoiding unacceptable adverse impacts. Butte: The boundaries of the stipulated area may be modified if the authorized officer determines that portions of the area can be occupied without adversely affecting sage grouse leks.	• CO, ID, MT/DK, OR, UT, WY: Same as Alternative 1. • NV/CA: The authorized officer, in coordination with the appropriate state wildlife agency (NDOW, and/or CDFW), can **modify** and/or **waive** dates for seasonal timing restrictions based on the criteria described below, based on site-specific information that indicates: i. A project proposal's NEPA analysis and/or project record, and correspondence from NDOW and/or CDFW, demonstrates that any modification (shortening/extending seasonal timeframes or waiving the seasonal timing restrictions all together) is justified on the basis that it serves to better protect or enhance GRSG and its habitat than if the strict application of seasonal timing restrictions are implemented. Under this scenario modifications can occur if: a. A proposed authorization would have beneficial or neutral impacts on GRSG and its habitat. b. Topography or other factors eliminate direct and indirect impacts from visibility and audibility to GRSG and its habitat.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Modification:** The BLM can and does grant modifications to seasonal restrictions if the BLM, in coordination with the state wildlife agency on a case-by-case basis, determines that granting the modification would not adversely impact the population being protected. The authorized officer may consider and grant a **modification** to the dates and areas associated with seasonal timing restrictions based on the criteria described below – after documenting the review of available information associated with the site proposed for the modification, if: i. The geographic and temporal conditions demonstrate that any modification (shortening/extending seasonal timeframes) is justified on the basis that it serves to better protect or enhance GRSG and its habitat than if the strict application of seasonal timing restrictions are implemented. Under this scenario modifications can occur if one or more of the following conditions can be documented: a. A proposed authorization is expected to have beneficial or neutral impacts on GRSG and its habitat. b. Topography or other factors eliminate direct and indirect impacts	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Billings: The boundaries of the stipulated area may be modified if the AO determines that portions of the area can be occupied without adversely affecting sage grouse leks or portions of the area no longer have sage grouse or their habitat. The timing restriction dates may be modified if new information indicates that the dates are not valid for the leasehold. HiLine: The boundaries of the stipulated area may be modified if the AO determines that portions of the area no longer contain viable winter range. The dates for the timing restriction may be modified if new wildlife use information indicates that the dates are not valid for the leasehold. The AO may also modify the size and shape of the area based on studies documenting actual habitat suitability and/or local periods of actual use • NV/CA: (w/in 4 miles of active or pending leks in GHMA, winter habitat, early and late brood rearing habitat): The Authorized Officer may **modify** the size and shape of the restricted area or the period of limitation where an environmental review and consultation with the appropriate state agency (Nevada Department of Wildlife, Sagebrush Ecosystem Technical Team, California Department of Fish and Wildlife) determines that	c. There are documented local variations (e.g., higher/lower elevations) and/or annual climatic fluctuations (e.g., early/late spring, long/heavy winter) that indicate the seasonal life cycle periods are different than presented, or that GRSG are not using the area during a given seasonal life cycle period. ii. Modifications are needed to address an immediate public health and safety concern in a timely manner (e.g., maintaining a road impacted by flooding).	*(See above.)*	from visibility and audibility to GRSG and its habitat. c. There are documented local variations that indicate the seasonal life cycle periods are different than presented. ii. Modifications are needed to address an immediate public health and safety concern in a timely manner (e.g., maintaining a road impacted by flooding).	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
the action, as proposed or otherwise restricted, does not adversely affect GRSG or its habitat. • OR GHMA (Winter and breeding, nesting, and early and late brood-rearing habitat): Additionally, the BLM Field Manager may modify the seasonal restrictions and use restrictions under the following conditions: ○ If portions of the area do not include winter habitat (lacking the principle habitat components of winter GRSG habitat, as defined in GRSG habitat indicators **Table 21-2**) or are outside the current defined winter habitat area, as determined by the BLM in discussion with the ODFW, and indirect impacts would be mitigated ○ If documented local variations (e.g., higher or lower elevations) or annual climate fluctuations (e.g., early or late spring, long or heavy winter) reflect a need to change the given dates to better protect GRSG in a given area and the proposed activity would not take place beyond the season being excepted	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• UT (breeding, nesting, early and late brood rearing, and winter habitat): Specific time and distance determinations would be based on site-specific conditions and may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) in order to better protect GRSG, in coordination with UDWR biologists. • WY PHMA (Core and Connectivity) and GHMA **Modification**: The authorized officer may modify the size and shape of the TLS area or the TLS criteria if an environmental record of review indicates the actual habitat suitability for seasonal Greater Sage-Grouse activities is greater or less than the stipulated area, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. • WY Winter Concentration Areas: **Modification**: The authorized officer may modify the size and shape of the TLS area or the TLS	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
criteria if an environmental record of review indicates the actual habitat suitability for seasonal Greater Sage-Grouse activities is greater or less than the stipulated area, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*
• CO: No **waivers** are authorized unless the area or resource mapped as possessing the attributes protected by the stipulation are determined during collaboration with Colorado Parks and Wildlife to lack those attributes or potential attributes. A 30-day public notice and comment period is required before waiver of a stipulation. Waivers would require BLM State Director approval. • MT/DK: Dillon: This stipulation may be waived if the authorized officer, in consultation with the Montana Fish, Wildlife and Parks, determines that the entire leasehold can be occupied without adversely affecting Sage Grouse Leks or the surrounding breeding habitat. Butte and Dillon: This stipulation may be waived if the authorized officer determines that the entire leasehold no longer contains sage	• CO, ID, MT/DK, OR, UT, WY: Same as Alternative 1. • NV/CA: In the 2019 ARMPA, WEMs for all the seasonal/timing stipulations refer the reader back to the same WEMs for the NSO.	No WEMs would be necessary, since all GRSG habitat management areas would be closed to new fluid mineral leasing.	**Waiver**: The Authorized Officer may consider and grant a **waiver** of the stipulation on an existing lease if the area that was mapped as a GRSG habitat management area (regardless of type) when the lease was issued is no longer mapped as such through the appropriate planning process (i.e., plan maintenance or amendment).	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
grouse winter/spring range or, if in coordination with the FWP and FWS, determines that the area is not critical for Sage Grouse. Butte: This stipulation may be waived if the authorized officer, in consultation with the Montana Fish, Wildlife and Parks and U.S. Fish and Wildlife Service, determines that the entire leasehold can be occupied without adversely affecting Sage Grouse Leks or the surrounding breeding habitat. North Dakota: This stipulation may be waived or reduced if circumstances change, or if the lessee can demonstrate that operations can be conducted without causing unacceptable impacts. Exceptions to this limitation in any particular year may be specifically approved in writing by the authorized officer. In all cases, the stipulation (including any Modification) will be designed to present the least restrictive measure for avoiding unacceptable adverse impacts. Billings: This stipulation may be waived if the AO, in consultation with Montana FWP and the USFWS, determines that the entire leasehold can be occupied without adversely affecting sage grouse leks or the surrounding breeding habitat, the lek is confirmed inactive (10 years with no males or sign of lek activity), or sage grouse are no longer considered BLM special status species and not listed by USFWS.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
HiLine: This stipulation may be waived if the AO determines that the entire leasehold no longer contains viable winter range. • NV/CA: (w/in 4 miles of active or pending leks in GHMA, winter habitat, early and late brood rearing habitat): The Authorized Officer may waive the stipulation where an environmental review and consultation with the appropriate state agency (Nevada Department of Wildlife, Sagebrush Ecosystem Technical Team, California Department of Fish and Wildlife) determines that the described lands do not contain GRSG or suitable habitat or are otherwise incapable of serving the requirements of GRSG and therefore no longer warrant consideration as a component necessary for their protection. • OR GHMA (Winter and breeding, nesting, and early and late brood-rearing habitat): No waivers. • UT (breeding, nesting, early and late brood rearing, and winter habitat): No waivers. • WY PHMA (Core only): **Waiver**: No waiver. • WY PHMA (Connectivity only), and GHMA: **Waiver**: This stipulation may be waived over the entire lease if, in coordination with the state wildlife agency, it is determined that the Greater Sage-Grouse lek	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
has been classified as unactive as determined by the state wildlife agency. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.) • WY Winter Concentration Areas: **Waiver**: No waiver.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

21.1.8 Renewable Energy Development and Associated Transmission

There have been very few published scientific studies on the impacts of wind development on GRSG (Lloyd et al., 2022), direct habitat loss and degradation from facilities and human disturbance are known impacts, and are similar to impacts from development of non-renewable energy resources. Roads account for most of the direct, permanent ground disturbance at wind facilities (Lloyd et al., 2022). Mortality from collision with turbine blades is infrequent (Lloyd et al. 2022). Indirect impacts include potential avoidance of tall structures (Pruett et al., 2009), disturbance due to noise (Blickley et al., 2012) and changes in habitat use by female GRSG (LeBeau et al., 2020). Habitat avoidance and changing habitat use may have compounding effects for extremely philopatric (species that return or stay at a particular location) species, such as GRSG. Increased numbers of known and novel predators may also be a concern, although research on changes in predator abundance at wind facilities is limited. Indirect impacts from solar energy development are anecdotal (Gerringer et al., 2022) and mostly unknown. Loss of habitat from clearing sites for solar panel installation is a direct impact, and can include hundreds to thousands of acres, depending on the scale of the solar development. Such direct habitat loss can also increase habitat fragmentation.

Impacts of transmission lines on GRSG vary with topography and habitat suitability. In general, the presence of transmission lines negatively impacted GRSG habitat selection (Gibson et al., 2018, Kohl et al., 2019, Lebeau et al., 2019, Kirol and Fedy 2023), demographic rates (Gibson et al., 2018) and survival rates (Lebeau et al., 2019). Long-term impacts to GRSG or their demographics are unknown. Ravens using powerline poles for perching and nesting significantly affected habitat use in proximity to powerlines out to a distance of 12.5 km in Nevada (Gibson et al. 2018), but lesser distances were reported in other studies (e.g., Boarman and Heinrich 1999, Bui et al. 2010).

The BLM is currently updating the BLM RMPs for solar energy development in the Solar Programmatic Environmental Impact Statement (PEIS). The is updating the BLM's RMPs related to solar energy development In that analysis of impacts the Solar PEIS considers existing management associated with the 2015 GRSG amendments as those direct current GRSG habitat management on BLM- administered lands. However, the Solar PEIS update defers to this GRSG planning effort to decide how solar energy development is conducted in GRSG habitat management areas.

The following range of alternatives allow for renewable energy development that will contribute to meeting administrative objectives while conserving GRSG habitats from known impacts and addressing potential indirect impacts.

Table 21-9, Comparison of Alternatives, Renewable Energy Development and Associated Transmission, presents management by alternative for this management issue.

Table 21-9. Comparison of Alternatives, Renewable Energy Development and Associated Transmission

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Wind and Solar				
• PHMA/IHMA (ID): ○ Except as noted below, PHMA in all states are Exclusion for wind and solar. ○ ID, NV/CA, and OR specify that the exclusion applies to utility scale wind and solar development. ○ WY is Avoidance for wind unless sufficiently demonstrated that development would not result in population declines. ○ WY does not specifically address solar but general surface disturbance limits would exclude solar near leks (0.6 miles) and minimize (e.g., disturbance cap, mitigation) elsewhere in PHMA. ○ ID IHMA is Avoidance for wind and solar. ○ OR is Avoidance for wind and solar in Lake, Harney, and Malheur Counties outside of SFAs. ○ UT includes an Exception for wind outside PHMA but w/in 5 miles of leks inside PHMA.	• PHMA/IHMA (ID): ○ Same as Alt 1, except NV/CA added exception criteria to the closure and UT changed to Avoidance for wind outside PHMA but w/in 5 miles of leks inside PHMA.	• PHMA: ○ All states: Exclusion.	• PHMA: ○ All states: Manage PHMA as exclusion areas for utility scale wind and solar, including testing and development (including all associated infrastructure [e.g., met towers, powerlines]). ○ Manage ID IHMA as exclusion areas within 3.1 miles from active leks (Cook et al., 2023; unless there are justifiable departures – see buffer appendix) and avoidance in the remainder of the IHMA. Infrastructure could be considered only if it can be demonstrated that as proposed or conditioned it would not impair habitat use by GRSG and will meet that the RMP GRSG goal and habitat objective. Additionally, do not allow surface use, occupancy, or placement of utility scale wind and solar facilities and associated infrastructure within one-half mile of PHMA to protect adjacent PHMA from indirect impacts from development in IHMA. Renewable energy decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.	• PHMA: ○ All states except MT/DK: PHMA and IHMA (ID) would be avoidance areas for utility scale wind and solar energy testing and development (including met towers). Development in all states but ID would not be allowed in breeding and nesting habitats, or in limited/high value (e.g., winter, limited mesic) seasonal habitats unless one of the criteria below is met. In ID, development would not be allowed inside lek buffers (ID Buffers Appendix). ▪ The area is determined to be non-habitat or unsuitable, lacks the ecological potential to become marginal or suitable habitat, and does not provide important connectivity between habitat areas (as determined by a GRSG biologist using criteria such as the Habitat Assessment Framework and coordinated with appropriate state authority). The project should be designed to prevent indirect disturbance to or

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	*(See above.)*	disruption of adjacent seasonal habitats. ▪ Topography/areas of non-habitat create an effective barrier to impacts. ▪ Co-location of the proposed authorization with existing disturbance will result in no additional impacts to those already associated with the existing major infrastructure, including indirect disturbance to or disruption of adjacent seasonal habitats. o The remainder of PHMA/IHMA would be avoidance areas for utility scale wind and solar testing and development. Infrastructure could be considered only if it can be demonstrated that as proposed or conditioned (including disturbance cap and mitigation requirements) it would not impair habitat use by GRSG (as determined in coordination with state wildlife agency) and will meet that the RMP GRSG goal and habitat objective. Renewable energy decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• GHMA: o CO, MT, ND and OR are Avoidance for wind and solar. o SD is Exclusion for solar in winter habitat and within 1 mile of leks. o SD and NV/CA are Avoidance for wind. o NV/CA and UT are Exclusion for solar but can co-locate with existing disturbances in CA. o ID and WY are open for wind and solar. o UT is open for wind.	• GHMA: o Same as Alt 1, except ID changed applying "RDFs and buffers" in GHMA to applying BMPs and NV/CA added exception criteria to the Avoidance for wind.	Other HMA types are not applicable to this alterative.	• GHMA: o All states: Manage GHMA in all states as avoidance areas for utility scale wind and solar testing and development.: ▪ Do not allow surface use, occupancy, or placement of utility scale wind and solar facilities including transmission facilities within one-half mile of PHMA (or 2 miles in CO) unless adjacent PHMA is protected from indirect impacts from development in GHMA. ▪ Surface use, occupancy, or placement of utility scale wind and solar facilities should be avoided in accordance with the lek buffer recommendations for tall structures in the lek buffer appendix (contained in the 2015 ARMP/ARMPAs) to minimize impacts to breeding birds unless local data suggest a larger buffer is needed. ▪ Surface use, occupancy or placement of utility scale wind and solar facilities should be avoided in limited/high value seasonal habitats and movement corridors between those areas to protect birds moving from	• GHMA (and SHMA in WY): Open with minimization measures and compensatory mitigation, to maintain habitat supporting GRSG populations consistent and concurrent with state agency habitat designations (e.g., restoration, connectivity, seasonal, or other), and to preclude negative impacts to any adjacent PHMA habitats. Renewable energy decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	▪ PHMA to use GHMA seasonal habitats. ▪ Work with State and County governments to locate developments in areas of prior disturbance, including areas where invasive vegetation populations are dominant and areas of non-habitat. • Apply compensatory mitigation to offset habitat losses due to direct and indirect impacts (see mitigation section). Renewable energy decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.	*(See above.)*
Major Rights-of-Way (ROWs)				
• PHMA/IHMA (ID): o All states are Avoidance for major ROWs (≥100 kV transmission and ≥24" pipeline). o OR, UT and WY encourage placement of new lines in designated corridors, or collocated with existing disturbance. o Except as noted below, all states are avoidance for smaller ROWs	• PHMA/IHMA (ID): o Same as Alternative 1, except NV/CA added exception criteria to the Avoidance.	• PHMA: o All states: Exclusion for major rights-of-way (≥100 kV transmission and ≥24" pipeline) outside of RMP designated corridors. o Within designated corridors, avoid PHMA, if possible. If not possible, locate major ROWs within designated corridors and compensate for impacts according to the mitigation strategy.	• PHMA/IHMA (ID): o All states (except MT/DK) are Avoidance for major ROWs (≥100 kV transmission and ≥24" pipeline). o Where development cannot be avoided it would not be allowed in breeding and nesting habitats, or in other limiting/high value seasonal habitats unless one of the following criteria is met: ▪ The ROW can be routed through non-habitat/unsuitable (as determined by a GRSG biologist using criteria such as the Habitat Assessment Framework	• PHMA/IHMA (ID): o All states (except MT/DK) are Avoidance for major ROWs (≥100 kV transmission and ≥24" pipeline). o Micro-siting (siting based on local data) is required to avoid placement near active leks or in connectivity corridors between seasonal habitats. o Areas where major ROWs cannot be avoided apply minimization measures (e.g., disturbance cap, seasonal constraints, tall structure limitations, RDFs, nest and perch deterrents, etc.). Residual direct and indirect impacts

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	and coordinated with State wildlife agencies) and lacks the ecological potential to become suitable habitat. ROWS shall not disrupt connectivity between habitat areas and should be designed to prevent indirect disturbance to or disruption of adjacent seasonal habitats (as disclosed in the environmental analysis). ▪ Co-location of the proposed authorization with existing ROW disturbance results in no additional impacts to those already associated with the existing major infrastructure, including construction, indirect disturbance to or disruption of adjacent seasonal habitats. ○ Additionally, where major ROWs cannot be avoided apply minimization measures (e.g., disturbance cap, seasonal constraints, tall structure limitations, RDFs, nest and perch deterrents, etc.). Residual direct and indirect impacts would be mitigated through compensatory mitigation. ○ Micro-siting is required to avoid disrupting connectivity corridors between seasonal habitats.	would be mitigated through compensatory mitigation. ○ Major ROWs that are located inside RMP designated utility/ROW corridors would not need to comply with disturbance cap (at either the HAF fine scale or project level) or compensatory mitigation requirements unless required by State regulations.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
GHMA – substantial variation by state: ○ CO, NV/CA, and OR GHMA are Avoidance for major ROWs. ○ ID and UT GHMA are open to major ROWs subject to minimization measures such as RDFs, and mitigation. ○ WY is open to major ROWs.	GHMA: • Same as Alt 1, except ID changed applying "RDFs and buffers" in GHMA to applying BMPs.	• Other HMA types are not applicable to this alterative.	GHMA: All states except MT/DK: Avoidance within breeding and nesting habitats and other limited seasonal habitats to meet the RMP GRSG goal and habitat objective. Additionally, any ROW should not be placed within one-half mile of PHMA or IHMA unless adjacent PHMA and IHMA are protected from indirect impacts. Outside those areas, open with compensatory mitigation requirements. Major ROW decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.	GHMA (and SHMA in WY): All States except MT/DK: Open with minimization measures and compensatory mitigation, to maintain habitat supporting GRSG populations consistent with state agency habitat designations (e.g., restoration, connectivity, seasonal, or other), and to preclude negative impacts to adjacent PHMA habitats. Major ROW decisions in MT/DK include state specific differences. See **Section 2.6.3** for allocations in those offices.

21.1.9 Minimizing Threats from Predation

GRSG are a prey species and face a suite of non-specialist predators across their range (Hagen 2011, USFWS 2023). Where sagebrush habitats are intact nest success and adult survival rates are high (Hagen 2011), indicating that predators generally do not limit GRSG populations. However, highly fragmented sagebrush landscapes reduce protective cover and often provide subsidies for sustaining abnormally large populations of predators, and the establishment of novel predators (predators not typically found in sagebrush, Coates et al., 2020). One example is the common raven which has experienced population growth across sagebrush ecosystems due to anthropogenic development (Coates et al., 2020, Dinkins et al. 2021, USFWS 2023). Reduction, isolation, and fragmentation of native shrublands increase GRSG nest exposure to ravens (Lyon and Anderson 2003, Bui et al., 2010, Coates and Delehanty 2010), although research has not been able to determine if raven predation contributes to compensatory or additive GRSG mortality (Taylor et al., 2017) in some areas of the GRSG range ravens are now considered a hyperpredator – having an increased population and therefore increased predation impacts due to the availability of multiple anthropogenic subsidies (e.g., food, nesting substrates) within previously undisturbed sagebrush (Coates et al., 2020).

Where sagebrush habitats are diminished by anthropogenic subsidies and disturbances or other ecological disturbance (i.e., wildfire) predator management may be necessary to conserve local at-risk GRSG populations (Hagen 2011, USFWS 2023). The BLM has committed to work with APHIS and local predator management groups as needed. To address habitat concerns associated with increasing predator abundance, the BLM will minimize new infrastructure and other human subsidies associated with permitted activities to conserve intact landscapes and implement RDFs and BMPs to reduce risk where infrastructure is unavoidable. New anthropogenic developments shall consider their influence on increasing predator abundance, and subsequent impacts on GRSG and make appropriate design modifications. Where ravens have been documented as a concern (e.g., densities greater than 0.4 ravens/km^2; Coates et al., 2022), the BLM supports implementation of the strategy outlined by Dettenmaier et al. (2021) and adopted by the U.S. Fish and Wildlife Service (2023).

Table 21-10, Comparison of Alternatives, Minimizing Threats from Predation, presents management by alternative for this management issue.

Table 21-10. Comparison of Alternatives, Minimizing Threats from Predation

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states include some language related to reducing opportunities for avian predators (e.g., nest and perch deterrents, considering burying powerlines, etc.), though the location and except varies substantially between states (e.g., some include references in an objective, some in a management action, some in a Required Design Feature or Best Management Practice). NV/CA, UT, and WY include language encouraging coordinating with other partners on predator management issues. NV/CA, OR, UT, and WY include management precluding and/or minimizing subsidies for predators. CO, NV/CA, and UT include language related to habitat management to provide GRSG concealment from predators. UT includes a header section with management that addresses the threats from predation. WY includes management for monitoring predator populations.	Same as Alternative 1, except UT added language addressing corvid nests discovered during habitat treatments.	All states: Manage habitats to maintain, and as needed, restore healthy native vegetation conditions, especially with respect to providing adequate sagebrush, other shrub, and herbaceous vegetation cover on the landscape, to minimize occurrence and effectiveness of predators. The BLM will collaborate with appropriate state agencies, other landowners, federal agencies (e.g., USFWS, APHIS), and tribal governments in their efforts to minimize impacts from predators on GRSG where needs have been documented (e.g., reduced recruitment of GRSG from predation), including providing needed authorizations, to support predator management actions. Prior to implementation of control actions, data must be presented that demonstrates the targeted predators are limiting GRSG populations in a specified area. A strategy for monitoring removal efficacy shall be developed. Where infrastructure associated authorizations and activities in PHMA (and IHMA in Idaho) are not avoidable, apply or request, consistent with applicable law, minimization measures and BMPs to minimize threats from predators shown to pose a threat to GRSG. This includes, but is not	All states: Same as Alternative 3. Additionally, Alternative 4 would apply minimization measures and BMPs to new authorizations and activities in PHMA (and IHMA in Idaho) and GHMA to minimize threats from predators shown to pose a threat to GRSG, consistent with applicable law. This includes, but is not limited to stopping, slowing, and/or discouraging the incursion of new predators, increased levels of predators, or predators expanding into new areas and can be accomplished by including the following: • Avoiding new anthropogenic infrastructure into undisturbed habitats, • Eliminating or minimizing external food resources from anthropogenic sources (e.g., road killed animals, carcass dumps, trash resources from human activities associated with development or recreation). Where avoidance of new infrastructure is not feasible the project proponent shall develop a predator management plan that: o Outlines how the project will be designed to minimize increasing predator abundance,	All states: Same as Alternative 3. Additionally, Alternatives 5 and 6 would apply minimization measures and BMPs to new authorizations and activities in PHMA (and IHMA in Idaho) to minimize threats from predators shown to pose a threat to GRSG, consistent with applicable law. This includes, but is not limited to stopping, slowing, and/or discouraging the incursion of new predators, increased levels of predators, or predators expanding into new areas and can be accomplished by including the following: • Avoiding new anthropogenic infrastructure into undisturbed habitats, • Eliminating or minimizing external food resources from anthropogenic sources (e.g., road killed animals, carcass dumps, trash resources from human activities associated with development or recreation). Where avoidance of new infrastructure is not feasible the AO could require the project proponent to develop a predator management plan that: o Outlines how the project will be designed to minimize increasing predator abundance,

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	limited to stopping, slowing, and/or discouraging the incursion of new predators, increased levels of predators, or predators expanding into new areas and is accomplished : • Precluding new anthropogenic infrastructure if consistent with applicable law and subject to existing authorizations and valid existing rights. Where preclusion is not possible, avoid new anthropogenic infrastructure into undisturbed habitats, • Eliminating or minimizing external food resources from anthropogenic sources (e.g., road killed animals ASAP, carcass dumps, trash resources from human activities associated with development or recreation). Where avoidance of new infrastructure is not feasible the project proponent shall develop a predator management plan that: ○ Outlines how the project will be designed to minimize increasing predator abundance, ○ Details structure design to reduce or eliminate opportunities for raven and raptor perching and nesting (e.g., burying powerlines, locating structures out of line of site of breeding and nesting habitat, using tubular non-branching	○ Details structure design to reduce or eliminate opportunities for raven and raptor perching and nesting (e.g., burying powerlines, locating structures out of line of site of breeding and nesting habitat, using tubular non-branching material for structures, etc.), ○ Identifies predators to remove, with an estimate of predator abundance, • Includes a monitoring strategy to assess efficacy of the predator removal (e.g., number and location of removal) and GRSG population response. and ○ Explains how predator control programs will be developed and coordinated if they become necessary. ○ Is coordinated with the appropriate state agency and other federal agencies (e.g., USFWS, APHIS) as appropriate. • For existing development, reduce opportunities for raven and raptor perching and nesting through measures such as nest/perch deterrents (including regular maintenance).	○ Details structure design to reduce or eliminate opportunities for raven and raptor perching and nesting (e.g., burying powerlines, locating structures out of line of site of breeding and nesting habitat, using tubular non-branching material for structures, etc.), ○ Identifies predators to remove, with an estimate of predator abundance, • Includes a monitoring strategy to assess efficacy of the predator removal (e.g., number and location of removal) and GRSG population response. and ○ Explains how predator control programs will be developed and coordinated if they become necessary. ○ Is coordinated with the appropriate state agency and other federal agencies (e.g., USFWS, APHIS) as appropriate. • For existing development, reduce opportunities for raven and raptor perching and nesting through measures such as nest/perch deterrents (including regular maintenance).

21.1.10 Livestock Grazing

Livestock grazing is the most widespread land use in the sagebrush ecosystem (Knick et al. 2011, Boyd et al. 2014). Well-managed public lands grazing done in accordance with the laws that guide livestock grazing management, (including but not limited to 43 CFR Part 4100, Taylor Grazing Act of 1934, FLPMA, and the Public Rangelands Improvement Act of 1978) and with consideration of local climatic conditions (e.g., drought) can be compatible with GRSG persistence (FWS 2015). In the 2015 USFWS not-warranted determination on GRSG, the agency determined that meeting Land Health Standards, including proper management of livestock numbers, season of grazing and application of adaptive management strategies minimized population level effects on the species (FWS 2015).

On BLM grazing allotments, grazing activities are managed through several mechanisms (permit terms and conditions, allotment management plans, annual pre-turnout authorization meetings, and ongoing monitoring) to ensure that grazing meets or move towards meeting Land Health Standards. Management for meeting land health standards avoids long-term and wide-spread improper grazing will be avoided. Table 3-7 shows that of the allotments with at least 15% PHMA, 5,140 allotments (53% of all allotments) are in Category A, meeting all standards or making significant progress toward meeting the standard, while 1,887 allotments (19% of all allotments) are in Categories B through F, representing different categories of not meeting land health standards. The remainder of the allotments do not have information on evaluations.

In some instances grazing activities may not meet or make significant progress toward meeting Land Health Standards. In such cases, improper grazing (defined as grazing at an intensity or in ways that impair ecosystem functions of the sagebrush ecosystem) can have localized adverse effects to GRSG habitats by altering the composition, productivity and structure of plants resulting in the loss of abundance or quality of GRSG food and cover (Boyd et al., 2014, Fleischner 1994). Improper grazing may also work synergistically with other threats, such as invasive plants and wildfire, increasing impacts from those sources. The USFWS found improper grazing by domestic livestock and free-roaming horses and burros can have negative impacts to sagebrush and GRSG at local scales (USFWS 2015) but previously did not find it was a principal factor affecting the status of the species (USFWS 2010).

Impacts from improper grazing associated with not meeting Land Health Standards are analyzed in **Chapter 4**. Areas experiencing these effects are generally spatially and temporally distinct, and are addressed through implementation-level corrective actions.

Livestock/range management actions were reviewed to determine if they address potential threats to GRSG at the RMP-level of decision-making. Alternatives 1 and 2 include many livestock grazing actions addressed by regulation, policy, or that duplicate actions already in the RMPs. As these actions would be implemented whether included in this amendment or not they are being considered for removal in Alternatives 4, 5, and 6. The actions from Alternatives 1 and 2 are summarized in the table below with the full text included in **Appendix 15**. Alternatives 4, 5, and 6 would focus on the threat to GRSG from improper livestock grazing and relocating or removing actions that are not needed in the RMP to implement.

Table 21-11, Comparison of Alternatives, Livestock Grazing, presents management by alternative for this management issue.

Table 21-11. Comparison of Alternatives, Livestock Grazing

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
There is substantial variation between the various states in the language and actions that address how domestic livestock grazing would be administered in GRSG HMAs. There are some consistent concepts across GRSG range, but there is substantial variability beyond these main concepts, and even in details associated with those main concepts. There are a number of other management actions that some states include that others don't, including addressing issues such as livestock trailing, placement of feed or mineral supplements, language encouraging coordination, prioritization of various other grazing-related actions, or suggestions of what could be considered during implementation of the grazing program in GRSG HMAs. See **Appendix 2** or **Appendix 15** for specific language by state.	All States: Same as Alternative 1, except: • UT: all actions addressing prioritization, or issues addressed through law, regulation or policy were removed, since they are addressed outside the RMP. • WY: clarifications were provided regarding grazing in riparian areas, management of range improvements, and prioritization (removed SFAs). Additionally, clarifications to applying GRSG objectives to land health standards and applying thresholds and responses were made. • ID: areas that met an adaptive management hard trigger would be prioritized for monitoring. Additionally, clarifications to applying the habitat objectives to land health standards were made. • NV/CA: prioritization in SFAs was removed. Additionally, clarifications to applying the habitat objectives to land health standards were made. • OR: Livestock grazing in the 13 key RNAs was returned to language that pre-dated the 2015 amendments. See **Appendix 2** or **Appendix 15** for specific language by state.	All states: Because PHMA would be unavailable for livestock grazing, no overarching livestock grazing objective would be needed.	All states: **Objective RM-1**: Specific to GRSG habitat, manage livestock grazing in a manner that 1) meets or makes progress toward meeting the Land Health Standard for special status species; 2) avoid direct adverse impacts to limiting GRSG habitats from livestock management range improvements; and 3) applies the guideline for grazing administration that addresses "restoring, maintaining, or enhancing habitats of...special status species to promote their conservation" (43 CFR Part 4180.2(e)(9).	All states: **Objective RM-1**: Specific to GRSG habitat, manage livestock grazing in a manner that 1) meets or makes progress toward meeting the Land Health Standard for special status species, and applies the guideline that addresses "restoring, maintaining, or enhancing habitats of...special status species to promote their conservation" (43 CFR Part 4180.2(e)(9) or subsequent changes to regulations or policy).

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
There is substantial variation between the various states in the language and actions that address how domestic livestock grazing would be administered in GRSG HMAs. There are some consistent concepts across GRSG range, including the following concepts in all states, unless noted otherwise: • GRSG management areas are available for livestock grazing, except in OR, where all or portions of 13 key Research Natural Areas (RNAs) would be unavailable, though not every state has a management action that explicitly states that. • Include/adjust permit terms and conditions needed to meet land health standards and GRSG habitat objectives, including suggestions for what the BLM could do on specific allotments if problems were identified. See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1, except as summarized under the row for Objective RM-1 above. See **Appendix 2** or **Appendix 15** for specific language by state.	All states: PHMA would be unavailable for livestock grazing.	**Management Action RM-1**: The presence of GRSG HMAs would not affect whether an area is available for livestock grazing; maintain existing areas designated as available or unavailable for livestock grazing. During grazing authorization renewals, Allotment Management Plan development, or other appropriate implementation-level planning, consider adjustments to active AUMs, timing, intensity, duration, and frequency of grazing are completed at the allotment scale based on site-specific conditions to meet or make progress towards meeting Land Health Standard for special status species. Additionally, temporary adjustments of timing, intensity, duration, and frequency of grazing can be made annually to livestock numbers, the number of AUMs, and season of use within the range of the terms and conditions and in accordance with applicable regulations. In managing livestock grazing, consider and apply where appropriate the livestock grazing best management practices and design features in **Appendix 15**.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
There is substantial variation between the various states in the language and actions that address how domestic livestock grazing would be administered in GRSG HMAs, including addressing issues such as livestock trailing, placement of feed or mineral supplements, language encouraging coordination, prioritization of various other grazing-related actions, or suggestions of what could be considered during implementation of the grazing program in GRSG HMAs. Many actions are not decisions, but lists of items to consider during implementation. There are some consistent concepts across GRSG range, including the following concepts in all states,: • Prioritize monitoring (both field checks and land health assessments) and renewal of grazing in SFAs (as applicable) and PHMAs outside of SFAs. • Include/adjust permit terms and conditions needed to meet land health standards and GRSG habitat objectives, including suggestions for what the BLM could do on specific allotments if problems were identified. See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1, except as summarized under the row for Objective RM-1 above. See **Appendix 2** or **Appendix 15** for specific language by state.	Not applicable.	**Management Action RM-2**: (PHMA/IHMA, GHMA) During the land health assessment (LHA) process, use the criteria identified in the Sage-Grouse Habitat Assessment Framework (BLM-TR-6710-1 - Stiver et al. 2015 – as revised) and other BLM approved methodology to provide multiple lines of evidence (which are consistent with BLM Manual 1283) for determining whether vegetation structure, condition, and composition are meeting or making significant progress towards meeting the Land Health Standards (LHS) for BLM special status species – which includes GRSG. referencing appropriate ESD, associated State and Transition Model (STM) and existing ecological condition information. , For GRSG, the standard would generally be met when vegetation conditions provide for suitable or marginal GRSG habitat at the HAF site scale (see **Table 8-1**, **Appendix 8**), based on existing ecological condition, ecological potential, and existing vegetation information. Where the LHS for SSS habitat (including GRSG) is not being met – as indicated by an unsuitable site-scale HAF assessment relative to site potential – and existing livestock grazing is a significant causal factor (43 CFR Part 4180, BLM H-4180-1 or subsequent changes to regulations or policy),	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	adjustments to livestock grazing practices and activities will be made at the authorization, allotment or activity plan level and in accordance with applicable regulations (43 CFR Part 4180.2l or subsequent changes to regulations or policy). Any adjustments to grazing will be made based on current ecological potential according to ESD, associated STM and existing ecological state.	*(See above.)*
All the states include language related to thresholds and responses to address and respond to future conditions in new fully processed permits. The specificity of this language and when it is required varies by state. See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1, except as summarized under the row for Objective RM-1 above. See **Appendix 2** or **Appendix 15** for specific language by state.	Not applicable.	**Management Action RM-3:** In PHMA (and IHMA in ID) the NEPA analysis when fully processing grazing authorizations (I.e., permit or lease) shall include at least one alternative that includes specific thresholds and defined responses in the terms and conditions of the grazing authorization in the following circumstances, as workload capacity allows: • Where the special status species standard is not being met, specific to GRSG habitat suitability and current livestock grazing has been identified as a significant causal factor (43 CFR Part 4180, BLM H-4180-1 or subsequent changes to regulations or policy); • In high priority allotments (e.g., based on prioritization from IM 2018-024, as amended or superseded) in PHMA/IHMA; or • When changing grazing management on a grazing authorization (e.g., new season of use, rotation schedule, new	**Management Action RM-3:** In PHMA (and IHMA in ID) the NEPA analysis when fully processed grazing authorizations should consider including at least one alternative that considers specific thresholds and defined responses in the terms and conditions of the grazing authorization, where the special status species standard is not being met, specific to GRSG habitat suitability, and current livestock grazing has been identified as a significant causal factor (43 CFR Part 4180, BLM H-4180-1 or subsequent changes to regulations or policy), as workload capacity and priorities allow. One or more defined responses will allow the authorizing officer to implement adjustments to livestock grazing during the term of the authorization that have already been analyzed in a NEPA document. Thresholds specific to GRSG habitat would be developed to maintain or move

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	livestock type, etc.) to provide an alternative approach if the terms and conditions do not have the desired intent. One or more defined responses will allow the authorizing officer to implement adjustments to livestock grazing during the term of the authorization that have already been analyzed in a NEPA document. Thresholds specific to GRSG habitat will be developed to maintain or move PHMA/IHMA toward providing suitable GRSG habitat (**Table 8-1**, **Appendix 8**), designed to address the site-level HAF indicators that warranted the HAF assessment rating, and consider ecological site potential, and relevant locally specific conditions, and Land Health Standards (43 CFR 4180.2).	PHMA/IHMA toward providing suitable GRSG habitat (**Table 8-1**, **Appendix 8**), and be designed to address the site-level HAF indicators that warranted the HAF assessment rating, and consider ecological site potential, and relevant locally specific conditions, and Land Health Standards (43 CFR Part 4180.2 or subsequent changes to regulations or policy).

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states include guidance on how livestock grazing/range management infrastructure projects are addressed. Some states include actions for existing water projects, new water projects, existing non-water projects, and new non-water projects. All generally relate to limiting impacts from new and existing water and structural range improvements, See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1, except UT consolidated multiple actions into one, and WY clarified their action.	Not applicable.	**Management Action RM-4 (existing Range Improvement Projects):** During the grazing authorization renewal process, evaluate all existing livestock management range improvements with respect to their effect on GRSG and GRSG habitat. Consider removal or modification of projects that negatively affect GRSG or GRSG habitat. Functional projects needed for management of sensitive species habitat or other sensitive resources should be maintained but consider improving in a manner less impactful to GRSG (See **Appendix 15** for Livestock Grazing Management Best Management Practices and Design Features).	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states include guidance on how livestock grazing/range management infrastructure projects are addressed. Some states include actions for existing water projects, new water projects, existing non-water projects, and new non-water projects. All generally relate to limiting impacts from new and existing water and structural range improvements, See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1, except UT consolidated multiple actions into one, and WY clarified their action.	Not applicable.	**Management Action RM-5 (new Range Improvement Projects):** Design new range improvement projects (any activity or program relating to rangelands which is designed to improve forage, change vegetative composition, control patterns of use, provide water, stabilize soil and water conditions and provide habitat for livestock and wildlife) to enhance livestock distribution or management and to control the duration, timing and intensity of utilization, including application of new technologies such as virtual fencing. In PHMA, focus authorization of new water developments and structural range improvements (e.g., fences) to projects that have a nominal or incidental effects or that are beneficial to GRSG seasonal habitats. Any new structural range improvements should be placed along existing disturbance corridors or in the least suitable habitat, to the extent practical, and are subject to appropriate design features (**Appendix 15**).	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states include a management action related to fences in GRSG habitat management areas, though the level of detail varies state-to-state. See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1.	Not applicable.	**Management Action RM-6 (fences):** Identify fences in high-risk areas - especially within 1.2 miles of an active lek (Christiansen 2009; Stevens 2011) - or other areas identified as important seasonal habitats or areas of GRSG concentration (e.g., geophagy sites) in coordination with the state wildlife agency. Evaluate if the fence is needed and/or up to BLM fencing standards (BLM H 1741). If the fence is unnecessary, remove it. If the fence is needed to support management, mark fences (install reflective fence markers) in high risk or important areas (Christiansen 2009; Stevens 2011). Where marking fences does not reduce fence-related GRSG mortality, modify fences. Modification could include re-routing, altering construction materials, drop fencing, or limiting perch potential. New fences within high-risk areas would only be authorized if: • It is consistent with the overall RMP GRSG objective; • Local terrain features shield nearby habitat or reduce the habitat importance; • The fence is constructed to BLM standards and with high visibility markers to reduce GRSG strikes. Monitoring of existing fences to assess mortality risk is recommended in all GRSG habitats.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states include language related to agency considerations if a permittee voluntarily relinquishes a permit or lease. See **Appendix 2** or **Appendix 15** for specific language by state.	Same as Alternative 1.	Not applicable.	**Management Action RM-7:** At the time a permittee or lessee voluntarily relinquishes grazing preference and the associated authorization, the BLM will consider whether to offer the permit for re-authorization to other grazing applicants or if the public lands where that permitted use was authorized shall be used for other resource management objectives. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR Part 4110.2-3. When a permittee or lessee voluntarily relinquishes grazing preference and associated grazing authorization, consider conversion of the allotment to a reserve common allotment that will remain available for use on a temporary, nonrenewable basis for the benefit of GRSG habitat. Authorize temporary nonrenewal permits in reserve common allotments to meet resource objectives elsewhere such as rest or deferment due to wildfire or vegetation treatments. Temporary use of reserve common allotments would not be allowed due to drought or overuse of allotments.	Same as Alternative 4.

21.1.11 Wild Horse and Burro Management

Grazing of wild horses and burros results in reduced plant diversity, altered soil characteristics, lower grass cover, lower grass density, fragmented and reduced shrub cover and increased abundance of cheatgrass (Beever et al. 2008, Beever and Brussard 2000, Coates et al. 2021), although impacts vary with elevation, density, and season and duration of use (Beever and Aldridge, 2011). The loss of shrub and grass cover can increase predation risk to nesting GRSG (Connelly et al., 2000). Wild horse and burros also negatively impact important mesic areas that provide GRSG brood-rearing habitats (Beever and Aldridge 2011). Unlike domestic livestock there is little if any direct management of wild horses and burros, such as fencing, lease deferral and pasture rest, potentially exacerbating their impacts on GRSG habitats at local scales. Recent research in Nevada predicted GRSG declines due to habitat alteration and loss from wild horses when appropriate management levels established for wild horse herds are exceeded (Coates et al., 2021). Therefore, management of wild horses and burros at appropriate management levels is a key component for GRSG planning.

At the RMP-level, the BLM identifies wild horse or burro Herd Areas, Herd Management Areas, and Herd Areas not designated as Herd Management Areas. This planning effort considers not designating wild horse and burro Herd Management Areas in areas that overlap PHMA under Alternative 3. Under alternatives 4, 5, and 6, changes focus on the few actions described below, but the rest of existing wild horse and burro actions would be unchanged. See **Appendix 2** for a description of which actions would be unchanged under Alternatives 4, 5 and 6 by state. Defining the appropriate management level (AML) and managing wild horse and burro populations in designated Herd Management Areas to the AML are implementation-level actions rather than RMP-level decisions. Such actions are dependent on local conditions and available resources to manage the populations using the available tools.

Table 21-12, Comparison of Alternatives, Wild Horse and Burro Management, presents management by alternative for this management issue.

Table 21-12. Comparison of Alternatives, Wild Horse and Burro Management

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
All states (where wild horses and burros overlap with GRSG): • Manage wild horse and burro populations within established appropriate management levels (AML). • Incorporate GRSG habitat objectives into wild horse and burro management (e.g., herd management area plans, AML) monitoring, and gather prioritization, with prioritization of such activities in SFAs, then PHMA, then GHMA. • CO, ID, NV/CA, OR, UT: Prioritize gathers in GRSG SFAs and PHMA unless removals are necessary in other areas to address higher priority issues, including herd health impacts.	Same as Alternative 1, except removal of references to SFAs for the states that removed them, and removal of the reference to GHMA in UT, which removed that HMA type under this alternative.	No new wild horse and burro herd management areas would be designated in areas that overlap PHMA. Where there are currently herd management areas, wild horses and burros would be removed. Because there would be no wild horse and burros herd management areas in PHMA, the wild horse and burro objectives and associated management actions associated with GRSG would be removed. These areas will be monitored and any wild horses or burros that re-establish in PHMA will be removed.	Same as Alternative 2, except references to GHMA in Utah would be retained and applied to GHMA as defined under this alternative.	Same as Alternative 4.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
ID, NV/CA, OR, UT, WY: Manage wild horse and burros herd management areas in GRSG habitat within established appropriate management level (AML) ranges to achieve and maintain GRSG habitat objectives. CO: Manage wild horse population levels within established AML.	Same as Alternative 1.	No wild horse and burro herd management areas would be designated in the Herd Areas that overlap PHMA, or portions of the Herd Areas, if the remaining areas outside PHMA could still support herd management areas. In those areas where there are currently herd management areas, wild horses and burros would be removed. Because there would be no wild horse and burros herd management areas in PHMA, the wild horse and burro objectives and associated management actions associated with GRSG would be removed. These areas will be monitored and any wild horses or burros that re-establish in PHMA will be removed	All States: • Manage wild horse and burros herd management areas in GRSG habitat (or portions of the herd management area overlapping or within GRSG habitat) within the low-end of the established AML ranges to achieve and maintain GRSG habitat objectives and achieve or make significant progress towards achieving LHS, considering the full suite of approaches to maintain AML, including temporary fertility control and non-reproducing, or partially non-reproducing herds.	All States: • Manage wild horse and burros herd management areas in GRSG habitat (or portions of the herd management area overlapping or within GRSG habitat) within the established AML ranges to achieve and maintain GRSG habitat objectives and achieve or make significant progress towards achieving LHS, considering the full suite of approaches to maintain AML, including temporary fertility control and non-reproducing, or partially non-reproducing herds.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
ID, NV/CA, OR, UT: In SFA (where applicable) and PHMA outside of SFA, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current AML is not being exceeded. CO: AML would be prioritized for all BLM HMAs within PHMA based on indicators that address vegetation structure/condition/composition and measurements specific to achieving GRSG habitat objectives. GRSG habitat requirements would be considered, and preference given to GRSG habitat unless site-specific circumstances warrant an exemption. WY: PHMA (core only) management objectives will be considered when evaluating AML.	Same as Alternative 1, except removal of references to SFAs for the states that removed them.	No wild horse and burro herd management areas would be designated in the Herd Areas that overlap PHMA, or portions of the Herd Areas, if the remaining areas outside PHMA could still support herd management areas. In those areas where there are currently herd management areas, wild horses and burros would be removed. Because there would be no wild horse and burros herd management areas in PHMA, the wild horse and burro objectives and associated management actions associated with GRSG would be removed. These areas will be monitored and any wild horses or burros that re-establish in PHMA will be removed	All States: • If GRSG site scale habitat objectives are not being met in PHMA and GHMA (and IHMA in Idaho), evaluate AMLs and adjust if necessary through the NEPA process where wild horse or burro use is identified as significant causal factor to not meeting LHS, or is a factor in the area not meeting the GRSG habitat objectives.	Same as Alternative 4.

21.1.12 Areas of Critical Environmental Concern

Areas of Critical Environmental Concern (ACECs) are designated where special management attention is needed to protect important historical, cultural, and scenic values, or fish and wildlife or other natural resources. To be analyzed in the EIS, potential ACECs must be evaluated and determined to meet two evaluation criteria – relevance and importance. The presence of GRSG meets the relevance criteria across the entire range. Importance evaluations considers substantial significance to include special worth, consequence, distinctiveness, or cause for concern. For the importance criteria to be met values must be more than locally significant.

An evaluation of importance for all GRSG habitats was conducted to determine if any habitat within the range of GRSG met the importance criteria. Evaluation criteria included population density (e.g., Doherty et al., 2016), lek and habitat persistence (e.g., Wann et al., 2022, Palmquist et al., 2021, Rigge et al. 2021), genetic uniqueness and connectivity (e.g., Cross et al, 2018, Row et al. 2018, Cross et al. 2023, Oyler-McCance et al., 2022), amount of existing habitat disturbance and habitat quality (e.g., Doherty et al., 2022). Areas identified with the above criteria are analyzed in this EIS to determine if they meet the third FLPMA required: the need for special management to protect and prevent irreparable damage.

The BLM also received multiple nominations for ACEC designations. Each of these nominations were reviewed using the criteria presented by the nominator(s) and the criteria listed above. Nominated areas that met the importance criteria based on the rangewide review listed above and subsequent local evaluations were moved forward for further consideration. Additional details associated with the ACEC evaluation process is available in **Appendix 5**. These evaluations will be updated and finalized following the public comment period.

ACEC designations are only presented for Alternatives 3 and 6. Management allocations within potential ACECs is targeted at maintaining the importance value for which they would be designated, which varied across the range of GRSG.

Table 21-13, Comparison of Alternatives, ACEC Management, presents management by alternative for this management issue.

Table 21-13. Comparison of Alternatives, ACEC Management

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6
No new ACECs specific to management of GRSG were designated as part of the 2015 planning effort.	No new ACECs specific to management of GRSG were designated as part of the 2019 planning effort.	ACECs specific to the management of GRSG would be designated (Refer to **Map 2.3** and **state-specific ACEC** maps in **Appendix 5. Also** refer to **Appendix 5** for additional ACEC information and analysis). **Colorado:** Case Flats – 4,547 acres **Idaho:** Owyhee – 653,199 acres Shoshone Basin – 244, 935 acres Camas-Laidlaw – 457,724 acres Big Desert – 333,528 acres **Montana**: South Valley Phillips – 615,888 acres Carter Crook – 110,162 acres **Nevada/California**: Warm Springs – 89,539 acres North Fork O'Neil – 937,512 acres Grass-Kobeh Valley – 852,979 acres South Fork Dixie Flats – 122,395 acres Idaho Border – 49,019 acres Hays Canyon – 340,850 acres Vya-Massacre – 239,677 acres Montana Mountain – 314,370 acres Butte Long Valley – 606,293 acres Eureka North and South – 66,905 acres Monitor Valley – 173,507 acres Reese River – 85,000 acres Utah Border – 58,650 acres Buffalo Skedaddle – 182,213 acres Owyhee East - 487,122 acres Owyhee West - 704,650 acres **Oregon**: None identified. **Utah**: Rich – 132,924 acres Box Elder – 232,258	No new ACECs specific to management of GRSG would be designated.	Same as Alternative 4.	ACECs specific to the management of GRSG would be designated (Refer to **Map 2.3** and **state-specific ACEC** maps in **Appendix 5. Also** refer to **Appendix 5** for additional ACEC information and analysis). **Colorado:** Case Flats – 4,547 acres **Idaho:** Owyhee – 653,199 acres Shoshone Basin – 244, 935 acres Camas-Laidlaw – 457,724 acres Big Desert – 333,528 acres **Montana**: South Valley Phillips – 615,888 acres Carter Crook – 110,162 acres **Nevada/California**: Warm Springs – 89,539 acres North Fork O'Neil – 937,512 acres Grass-Kobeh Valley – 852,979 acres South Fork Dixie Flats – 122,395 acres Idaho Border – 49,019 acres Hays Canyon – 340,850 acres Vya-Massacre – 239,677 acres Montana Mountain – 314,370 acres Butte Long Valley – 606,293 acres Eureka North and South – 66,905 acres Monitor Valley – 173,507 acres Reese River – 85,000 acres Utah Border – 58,650 acres Buffalo Skedaddle – 182,213 acres Owyhee East - 487,122 acres Owyhee West - 704,650 acres **Oregon**: None identified. **Utah**: Rich – 132,924 acres Box Elder – 232,258

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6
(See above.)	*(See above.)*	**Wyoming**: Golden Triangle/Little Sandy – 272,557 acres Carter-Crook (border w/MT) – 19,400 acres Sagebrush Focal Areas in South Central and Southwestern Wyoming – 33,166 acres Greater South Pass and Upper Green River Basin – 311,229 acres Under Alternative 3, the ACECs would have the same allocations as the rest of PHMA: • Locatable minerals –The BLM recommends all PHMA for withdrawal from location and entry under the Mining Law of 1872. The portion of the PHMA that is within the SFA boundaries from 2015 is already being analyzed for withdrawal in a separate NEPA document. Lands recommended for withdrawal would remain open for mineral location and entry under the Mining Law of 1872 unless and until the Secretary of the Interior withdraws them. In addition, In designated ACECs operators must submit a plan of operations and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use (as defined in 43 CFR Part 3809.5). (see 43 CFR Part 3809.11(c)(3)). • Fluid minerals (including geothermal) – Closed to leasing • Non-Energy minerals – Closed to leasing • Saleable Minerals/Mineral Materials – Closed to saleable mineral sale/development, including sand and gravel and other common variety minerals. • Major ROWs – Exclusion area for major ROWs.	*(See above.)*	*(See above.)*	**Wyoming**: Golden Triangle/Little Sandy – 272,557 acres Carter-Crook (border w/MT) – 19,400 acres Sagebrush Focal Areas in South Central and Southwestern Wyoming – 33,166 acres Greater South Pass and Upper Green River Basin – 311,229 acres In addition to the management of the GRSG habitat management areas described in Alternative 5, apply the following management in the potential ACECs: • Locatable minerals –Available for mineral location. Based on federal regulations (43 CFR 3809.11(c)(3)), within In designated ACECs operators must submit a plan of operations and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use (as defined in 43 CFR Part 3809.5). (see 43 CFR Part 3809.11(c)(3)). • Fluid minerals (including geothermal) – Open to leasing subject to major constraints (no surface occupancy stipulation). An exception could be considered to allow surface occupancy only if the criteria described under the NSO Exception #1 are met, but applicable to the entire ACEC area, not just in areas near to the lek(s) (see WEMs language). • Non-Energy minerals – Closed to new leases and expansion associated with existing operations (e.g., fringe leases).

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6
(See above.)	*(See above.)*	• Wind – Exclusion • Solar – Exclusion All management not included above would be same as described for PHMA.	*(See above.)*	*(See above.)*	• Saleable Minerals/Mineral Materials – Closed to new operations for all sale types except for free-use pits in order to support maintenance needs for existing local roads to ensure public safety. Even in these instances, new pits should avoid the ACEC; if avoidance is not possible, they would need to apply the minimization measures identified for PHMA (e.g., disturbance cap, noise reduction, seasonal limitations, etc.). • Major ROWs – Exclusion to major ROWs (≥100 kV transmission lines and ≥24" pipelines). Minor ROWs would be avoidance. Designated RMP ROW corridors in the ACECs would be open for new ROWs, but new ROWs within the corridor would require compensatory mitigation to offset direct and indirect impacts of the development. • Wind – Exclusion • Solar – Exclusion • No exceptions to the disturbance cap otherwise available in PHMA. All management not included above would be same as described for PHMA.

21.1.13 Adaptive Management

Implementing adaptive management can address unanticipated negative impacts to GRSG and its habitat before consequences become severe or irreversible. Adaptive management was identified by the U.S. Fish and Wildlife Service (FWS) as a key component of BLM land use plans "…to help ensure that implementation of allocative decisions and limitations on disturbance are effective at conserving sage-grouse and their habitats, and mitigation provisions where disturbance cannot be avoided. Like monitoring, adaptive management is a key element of complex long-term conservation strategies, particularly where there is uncertainty" (FWS, 2015).

Establishing thresholds for adaptive management is essential to identify when potential management changes are needed to continue meeting GRSG conservation objectives. "Soft" thresholds are indicators that management or specific activities may not be achieving the intended results of conservation actions or that unanticipated changes have occurred that have the potential to place habitats or populations at risk. "Hard" thresholds are indicators that management for species conservation is likely not achieving desired conservation results. Adaptive management thresholds are not specific to any one project, but rather identify anomalies in habitat and/or population status. For this planning effort adaptive management responses are directed to addressing habitat concerns on BLM lands and are limited to PHMA (and IHMA in Idaho) even though data are collected across the entire species' range. Local responses to thresholds reached in GHMA can be considered if deemed necessary by the BLM and the appropriate state agency.

Sagebrush habitat fragmentation, loss and disturbance have been identified as the primary influences on GRSG population trends (Knick and Hanser, 2011). GRSG population trends can provide valuable information about habitat conditions on BLM lands. Both the BLM and the States have a responsibility to use the best available information for assessing whether a habitat and/or population threshold (as described below) has been met, and to work together to address causes.

To accurately assess any anomalies or thresholds being met, and any necessary responses, monitoring of habitat and population trend should be conducted at the same scale. The BLM will use neighborhood clusters identified by USGS (Coates et al., 2021) to track habitat conditions, the same spatial scale used by USGS for population trend analyses. A neighborhood cluster generally represents a GRSG population unit and includes local aggregations of leks and seasonal habitats used by birds attending those leks based on state wildlife agency and research data. Habitat trends can also be monitored at smaller scales (e.g., lek level) as identified by state wildlife agency plans for GRSG, or at larger scales if local GRSG populations are known to consistently range outside of neighborhood clusters. (Note: Monitoring habitat for adaptive management purposes does not preclude the need to track habitat losses for conformance with the anthropogenic disturbance caps).

To assess sagebrush habitat availability, the BLM will use geospatial data, updated at a minimum biennially (e.g., RCMAP, LandFire, and multiple geospatial data sources for habitat degradation; see 2023 Monitoring Framework, **Appendix 7**). Additional data collected through the Habitat Assessment Framework (HAF) – a multi-scale assessment tool that provides data to evaluate sagebrush habitats for GRSG suitability (Stiver et al., 2015 and subsequent updates) may also be considered where available. HAF data can inform pre-existing habitat conditions and threshold analyses. Habitat baselines will be determined using geospatial data layers updated in the year prior to threshold assessment.

State wildlife agencies have primacy over GRSG populations and collect data essential for estimating population trends. Population data collected by States are important to the BLM for effective management of the species habitat. Population monitoring methods in previous adaptive management strategies varied

by state, and the metrics to measure trends varied widely. In most instances methods used were inadequate to establish when an anomaly in population trends could be linked to habitat management actions. Further, results were not comparable across political boundaries, creating challenges in determining effective habitat management responses and applying differential management to projects crossing state boundaries. Finally, none of the previous methods identified where habitat concerns, and not climatic conditions were contributing to trends.

The BLM's use of a population threshold as a proxy for habitat condition does not supersede the responsibility of the state for monitoring populations and identifying population areas of concern. The BLM must consider all available information regarding population threshold status. This includes state wildlife agency population trend analyses and annual population trend results published using the Hierarchical Population Monitoring Framework (currently the Targeted Annual Warning System procedures [TAWS]; Coates et al., 2021) or subsequent updates or revisions which provides a consistent and objective range-wide tool incorporating state lek count data and is able to identify if habitat conditions, not climatic conditions, are likely influencing populations. This model was developed with the cooperation of state wildlife agencies to provide an objective and consistent tool to alert land managers to potential habitat issues affecting population trends anywhere within the range of the species. The BLM will additionally use results from population trend analyses provided by state wildlife agencies in determining if habitat concerns may be affecting populations. If a soft or hard population trend threshold is identified by either source, the BLM will coordinate with the state wildlife agency to verify the trend as the first step in an initial causal factor analysis (see below).

Table 21-14, Comparison of Alternatives, Adaptive Management, presents management by alternative for this management issue.

Table 21-14. Comparison of Alternatives, Adaptive Management

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Every state has an adaptive management process. All the states include language to the effect of the following: • While there should be no expectation of hitting a hard trigger, if unforeseen circumstances were to occur that trip either a habitat or population hard trigger, more restrictive management would be required. • Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from GRSG conservation objectives set forth in the BLM plans. • The BLM will also undertake any appropriate plan amendments or revision if necessary. While the adaptive management concept and the potential for changes in management are consistent across the GRSG range, there is no consistency in the specific triggers between states or the strategies associated with responding to those triggers. The metrics, thresholds, and timeframes and spatial scales vary state by state, as does the level of detail that explains each of these. Similarly, the responses associated with adaptive management triggers varies by state, with some prescribing specific actions and others identifying teams to develop a response.	Same as Alternative 1, though some states applied strategies to improve the process based on lessons learned during implementation between 2015 and 2019. This included the addition of "un-triggers" in some states, to allow management to return to what was in the RMP amendments if conditions improved, requiring timeframes for determining the cause of the trigger being met, or clarifying what management changes would apply. The differences between the states persisted, creating challenges for comparing range-wide trends by using adaptive management triggers, as well as identifying and addressing concerns in populations that cross state lines.	Habitat Adaptive Management Thresholds: • A soft habitat threshold is met when any single occurrence or combination of occurrences in PHMA/IHMA in a neighborhood cluster result in the loss of more than 5% of the area capable of supporting sagebrush in a given year (including wildfire). Where a neighbor cluster overlaps with more than one habitat designation (e.g., PHMA and GHMA) the percent habitat loss will be calculated on the PHMA/IHMA only. Baselines for calculating sagebrush loss will be determined by the sagebrush base layer delineated using LandFire data (detailed in **Appendix 7**) and from the most recent year prior to publication of the RODs. • A hard habitat threshold will be met when existing sagebrush extent, as described in the first bullet, within a neighborhood cluster drops below 65% of the area capable of supporting sagebrush (Aldridge et al., 2008; Connelly et al., 2000). • A hard habitat threshold will also be met if a soft habitat threshold is met in 4 consecutive years (≥5% decline in each of 4 consecutive years). A hard or soft habitat threshold can be reversed if restoration of sagebrush vegetation communities within the neighborhood cluster returns to the sagebrush conditions and/or habitat function prior to the events that resulted in meeting a habitat threshold. If the neighborhood cluster cannot be restored to original sagebrush conditions and/or habitat function due to ecological or disturbance limitations (e.g., intense fire killed soil microfauna, dense anthropogenic activities) restoration and/or habitat enhancement in adjacent neighborhood clusters can be considered to increase the number of GRSG supported in those areas. This will be done in coordination with appropriate state agencies. If enhancing habitats in adjacent areas does not reverse the threshold, and further assessment may be necessary to determine if the area in which the habitat threshold was met should still be considered GRSG habitat.		

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Population triggers vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Population triggers vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Population Trend Adaptive Management Thresholds: State wildlife agencies can alert the BLM when population thresholds (soft or hard) are met to initiate a causal factor analysis. The BLM will also review the annual results of TAWS in determining if population trends indicate potential habitat concerns. All population thresholds identified by TAWS will be confirmed with the state wildlife agency within 60 days (preferably less) of being identified at the neighborhood cluster scale by the model. If the state wildlife agency determines the TAWS model was in error, the data supporting reversal of the threshold will be documented. If there is disagreement in the analyses, BLM and the state will work together to identify the source of the error (in either agency's analysis). Interpretation of TAWS model results will be as follows: • A soft population trend threshold is equivalent to a TAWS watch (a 2 consecutive year, negative rate of population change at the neighborhood cluster that shows a population decline that is either different or more rapid than that of the associated climate cluster; Coates et al., 2021). • A hard population trend threshold is equivalent to a TAWS warning (a 2 out of 3 (fast) or 3 out of 4 (slow) consecutive year negative rate of population change at the neighborhood cluster that is either different or more rapid than those of the associated climate cluster; Coates et al., 2021). A hard or soft population trend threshold can be reversed if the following criteria are met: • Population trends at the neighborhood cluster trend realigns with the climate cluster trend as indicated by the TAWS model (i.e., no longer a TAWS "watch" or "warning"); OR • There are sufficient numbers of GRSG (abundance) to allow for recovery of population numbers to those present at or before the threshold was met, based on local growth rates determined by the state wildlife management agency, and BLM has the concurrence of the state wildlife management agency; OR • The state wildlife management agency can demonstrate the TAWS model incorrectly identified a watch or warning. If a habitat or population threshold is met the BLM, along with state wildlife management personnel and other stakeholders with		Same as Alternatives 3 and 4 except new authorizations can be considered during the rapid assessment period. Project level NEPA will specifically evaluate if any new permitted activity could contribute to any cause identified during the rapid assessment.

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	knowledge of local conditions will initiate an assessment as soon as alerted to a threshold being hit to determine the causal factor(s). Causal Factor Analysis (CFA) teams will include at a minimum the local BLM biologist, BLM state sage-grouse lead, and a representative from the state wildlife agency. Additional subject matter experts and other affected parties can be added as necessary for individual site-specific analyses. Causal factor analyses will occur within the time periods described below and will be used to inform the adaptive management response, if needed. The analysis shall be detailed in a written report that includes descriptions of existing land uses, landownership patterns, history of population and habitat trends in the area, condition of the habitat, cause(s) of habitat and/or population decline, recommendations of management actions to address the potential causes of decline, and the data and expertise used to reach conclusions presented in the report. The report will be submitted to the local BLM manager, the BLM state sage-grouse lead in the state(s) the threshold was met, and the BLM national sage-grouse coordinator as well as all members on the CFA team as soon as the analyses are complete. An annual review of habitat and population information between the BLM and associated state wildlife agency is encouraged even if no thresholds are identified.		*(See above.)*
Habitat and population adaptive trigger responses vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Habitat and population adaptive trigger responses vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Adaptive Management Responses: When any adaptive management threshold is met, (and population thresholds confirmed with the state wildlife agency) a rapid assessment to identify "obvious" causes will be completed within 60 days (or less). Obvious causes are those easily identified such as a large wildfire. If the rapid assessment identifies the cause, a formal CFA will not be needed. No new permitted activities will be authorized until the rapid assessment is completed and documented. Existing permitted activities can continue unless those activities are causing mortality to GRSG or direct loss or degradation of occupied GRSG habitat. If an obvious causal factor cannot be identified in the rapid assessment, a l CFA to identify potential causes of the adaptive management threshold being met will be completed within 6 months of the rapid assessment. If a soft threshold is met, new permitted activities can be considered during the completion of the CFA as long as those activities do not result in mortality of GRSG or GRSG habitat loss and degradation. However, if a soft threshold is met and the CFA is not completed within the above time frame, no new permitted activities will be authorized until a CFA is completed, as legally allowed. New		—

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	authorizations, or reauthorization of existing permits can then be considered if similar activities were not contributing to factors resulting in meeting either a population or habitat threshold. Project level NEPA will specifically evaluate if the new permitted activity could result in the threshold being sustained or met again. If a hard threshold is met no new proposed permitted activities will be authorized until a CFA is completed. Project level NEPA will then specifically evaluate if the new permitted activity could result in additional or cumulative impacts to GRSG. The CFA team can alter the level of the threshold met (soft to hard, or hard to soft) based on their review and if supported by local data. For example, habitat loss of 5 percent results in a soft threshold, but if the loss is of limited crucial habitat (e.g., the only winter or mesic habitat in the neighborhood cluster) the CFA team can request hard threshold management responses be implemented. Similarly, a local assessment of habitat loss meeting a hard threshold may be reversed if the loss is of marginal areas, or areas documented as not supporting GRSG. These threshold reversals must be supported by data and fully detailed in a written report. Final determination of the reversal will be made by the authorizing officer, in consultation with the local CFA team. The CFA team can expand the analysis and management response to adjacent neighborhood clusters based on their review. For example, migratory populations that utilize multiple neighborhood clusters may require increased protection during other seasonal habitats and use areas to reverse population declines. If the CFA identifies the cause for habitat or population declines BLM will modify any permitted activity identified as a causal factor to meeting a threshold, as legally allowable, on BLM lands in coordination with the permit holder. Monitoring of the affected habitat or population (or both if appropriate) will be necessary to assess the efficacy of the modification. For new authorizations project level NEPA will specifically evaluate if the proposed new activity could result in contributing to sustaining the threshold or result in the threshold being met again. New authorizations may be limited to restrictions identified in Alts. 3 or 4 for the specific resource, as determined necessary by local information.		*(See above.)*

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6

(See above.)	*(See above.)*	Exceptions to limitations imposed for exceeding thresholds include:
		• Renewal of existing activities that require a permit if:
		  ○ The activity is scheduled within 60 days of when a threshold is met and identified, and
		  ○ The project proponent can show significant negative economic impacts (i.e., documented loss of income equivalent to the income potential of the event), and The renewal can only be considered if it does not result in known impacts to habitats or populations.
		• Activities essential for human health and safety in a current or likely catastrophic event (e.g., repair of dams, emergency vehicle access).
		• ES&R activities essential to restoration after a wildfire.
		• Grazing permits that will expire within the same year the threshold is identified. A permit or lease to extend the current grazing practice for less than 10 years may be renewed until the causal factor analysis is completed. If grazing is not determined as a causal factor to an adaptive management threshold, grazing permit or lease renewal can proceed normally. If grazing is a contributing cause to an adaptive management threshold, the terms and conditions of the grazing permit or lease will need to be examined and based on the outcome, would need to appropriately be modified to reduce or eliminate the impact.
		• Continuing the terms and conditions for livestock grazing when a permit or lease has expired or was terminated due to a grazing preference transfer in accordance with Section 402(c)(2) of the FLPMA as amended by Public Law No. 113-291.
		
		BLM will work with proponents identified in the above exceptions to reduce potential impacts on GRSG habitats.
		
		If the neighborhood cluster in which a population trend threshold is met is 50% or greater GHMA, lek level threshold TAWS analyses should be conducted to determine which leks are contributing to the trend deviation. If meeting the threshold is the result of lek attendance declines entirely within GHMA new permits can be considered prior to completing a CFA if that activity is not in conflict with any GHMA designation identified by the state wildlife agency (restoration, connectivity, seasonal, or other), and if that
				(See above.)

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	activity will not negatively impact habitats or populations in the adjacent PHMA. If a reduction in the ability for the habitat to support GRSG occurs as a result of habitat impacts, additional restrictions may be necessary to preclude further habitat losses. Local responses to thresholds in GHMA can be considered if deemed necessary by the BLM and the appropriate state agency. A similar analysis will be conducted if a neighborhood cluster covers mixed landownerships. The lek level cluster will determine the landownership that is contributing to the threshold. If the threshold is the result of habitat conditions on non-BLM administered lands, new authorizations can be considered if the activity will not negatively impact habitats or populations in the adjacent lands or contribute to indirect or cumulative impacts. The restrictions from meeting soft or hard habitat or population trend thresholds will be removed once the criteria for reversing the threshold, described above are met.		*(See above.)*
Habitat triggers vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Habitat triggers vary by state. See **Appendix 2**, Existing GRSG Management, for specifics.	Habitat Threshold due to Wildfire: An assessment of impact on affected GRSG habitat will be conducted within 60 days (or less) by BLM staff and appropriate state agency personnel of the event to determine the actual extent of habitat loss (which can include an assessment of burn severity – did the wildfire burn hot enough to kill the sagebrush) within the wildfire perimeter. This will be done in addition to any BLM ESR review. No new discretionary authorizations that would result in additional habitat loss within PHMA or IHMA in affected neighborhood clusters will be authorized until the assessment of habitat impacted is completed (this can include the initial 60-day rapid assessment if the results indicate the threshold can be reversed). If the assessment indicates wildfire severity is such that habitat services (the ability of the area to provide food, cover, water, and connectivity at the time just prior to the wildfire) for GRSG within the wildfire perimeter remain and the area can support the same abundance of GRSG that was present prior to the wildfire the threshold will be considered reversed. If habitat assessment determines the PHMA (and IHMA) influenced by the wildfire can no longer support GRSG populations at levels prior to the wildfire, new infrastructure projects or permits may be deferred if consistent with applicable law (such as the Mining Law of 1872), and valid existing rights until an assessment demonstrates the habitat can support GRSG at the levels that existed prior to the wildfire event have been restored. Authorizations may be considered if the proposed project will have no direct or indirect impact to GRSG or their habitats. The associated determination must be documented in a report to the BLM state sage-grouse lead, the BLM state director and the National BLM GRSG coordinator. If the wildfire event precludes restoration to GRSG habitat permanently, further assessment may be necessary to determine if the area in should still be considered GRSG habitat.		

Summary of Alternative 1	Summary of Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
No similar action.	No similar action.	Inconclusive CFAs: If no cause for a habitat or population decline can be determined the BLM may consider implementing additional restrictions on existing or new authorizations in the area, consistent with permits/surface use rights in coordination with the permit holder and the state wildlife management agency. This is to reduce disturbance until either a causal factor can be determined through additional monitoring and analyses, or the population declines cease. The state wildlife agency can provide data that supports limiting these potential restrictions made solely on population threshold data (vs. habitat data) if they can demonstrate the population analyses are incorrect. New authorizations must disclose a threshold has been met and consider the proposed activity's potential cumulative impact to either the habitat or population trend (dependent on which threshold has been met). Any restrictions will be determined by the authorizing officer, with the documented biological rationale from BLM field biologists. Any disagreement between BLM staff will be elevated to the BLM State Director for resolution. New permits in an area where the CFA is inconclusive cannot be authorized until the full CFA analyses is completed and reports submitted.		

21.2 STATE-SPECIFIC CIRCUMSTANCES

Though this EIS is range-wide in its scope, there are also state-specific circumstances that will be considered. Such state specific circumstances may warrant consideration at the state level rather than at a range wide level. This could include the following:

- Differences in management tools or approaches specific to a given state – such as Research Natural Areas present in Oregon, Important Habitat Management Areas in Idaho, or Restoration Habitat Management Areas in Montana. These tools are limited to those given states, and adjustments to their management, if considered, would only be applicable in those states.
- Ecological and topographic differences such as the differences between the sweeping prairies of eastern Montana and Wyoming compared to the basin and range of the Great Basin, or the high mountain valleys in Idaho and Utah, or the areas with substantial differences in elevation and vegetation associated with the plateaus associated with the Colorado Plateau in Utah and Colorado.
- Different management situations in different states such as the presence of state-run management tools such as mitigation banks, regulatory state plans, etc.

Issues or management differences between states are not based on preference, but rather on specific circumstances that fall into the above categories. And are focused on issues, topics, and actions that would help meet the purpose and need of improving GRSG conservation. Through the alternative development process all states identified at least one state-specific circumstance. However consideration of non-habitat in the habitat management areas during implementation identified by one state became a cross-cutting topic after discussion with agency staff and cooperating agencies. The following sections present the alternatives associated with state-specific circumstances.

21.2.1 Colorado

Most state-specific circumstances in Colorado are a result of different planning approaches in the 2015 and 2019 NWCO GRSG ARMPAs (plans). The BLM will also clarify management decisions that have been unclear since implementation of the 2015 plan.

Colorado has variable topography leading to naturally fragmented habitats, affecting ecology and plant communities, and therefore differences between GRSG population areas. Significant elevational changes may fall within standard lek buffer distances in some Colorado GRSG populations (e.g., Parachute Piceance Roan (PPR) population). Colorado typically does not see large wildfires in sagebrush ecosystems or conversion to agriculture to the same degree as other states.

Prior to the current planning process, the BLM and the State of Colorado adopted refined habitat management area maps. The multi-year (2016-2019), collaborative mapping process refined previously mapped areas to remove non-habitat in habitat management areas or expand areas with documented GRSG use. The re-mapping effort incorporated state-specific, timely research and mapping tools. See **Appendix 3** for a summary of the Colorado habitat management area mapping strategy. The state specific circumstances for the State of Colorado being addressed in this effort include the following: 1) management scale, 2) application and use of lek buffers, 3) consistency across resource uses, and 4) integration of lessons learned during implementation.

Management Scale

Colorado manages populations and sub-populations by Management Zone (MZ) which are biologically driven units delineated by GRSG use, topographic and other natural features, differences in ecological potential, and differences in issues affecting GRSG (Colorado Greater Sage-grouse Steering Committee 2008). The BLM uses the CO MZs to calculate project-scale disturbance and density caps rather than the density and disturbance methodology used by many other states. The MZs are geographically consistent with the areas used by Colorado Parks and Wildlife (CPW) but have different numbering (e.g.- BLM MZ 2 is the same area as CPW MZ 1). For ease of communication, the BLM intends to adjust the MZ numbering during this planning effort to be more consistent with the CPW naming convention.

Lek Buffers

Clarification of Lek Activity Periods

The BLM will clarify the activity period for the leks being included in management allocations and decisions. Both the 2015 and 2019 plans included allocations and management decisions based on the distance from "active" leks using CPW's definition, which is an area used by two or more displaying males in two of the last five years in larger populations and one or more males in any of the last five years in small populations (Colorado Greater Sage-grouse Steering Committee 2008). There are inconsistencies between the CPW definition and the WAFWA definition, which describes an active lek as a lek that has 2 or more males counted during two or more years within the last 10 years (Cook et al. 2022, Connelly et al. 2000). Because GRSG populations generally follow 9- to 10-year population cycles (Rich 1985, Fedy and Aldridge 2011, Fedy and Doherty 2011), the BLM will use a lek definition that better captures the fluctuation of population dynamics. The BLM will analyze use of the "occupied" lek definition from the 2015 and 2019 plans, which is defined as a lek that has been active during at least one strutting season within the past 10 years. CPW concurs with the approach.

The clarification of lek activity periods results in an increase to the amount of BLM-managed lands within the corresponding buffer distances. According to the Colorado 2022 lek count data from CPW, 276 leks are classified as active using the 5-year activity timeframe. The total number of leks with activity in the last 10 years increases to 445 leks. Using the 2015 and 2019 plan definitions, approximately 571,375 acres of BLM-managed lands were within 1-mile of an active lek (CPW, 5-year timeframe). With the clarification, approximately 811,215 acres are within 1-mile of an occupied lek, representing a 42% increase in BLM-managed lands that are subject to more intensive management decisions for the protection of leks, nesting, and early brood-rearing habitat.

Distance of Buffer

In the 2015 plan, fluid mineral leasing was closed within 1-mile of an active lek compared to a 0.6 mile. In coordination with CPW, the BLM increased the previous stipulation area (i.e.- 0.6-mile buffer NSO) to a 1-mile closure to provide protection for leks and nesting and early brood rearing habitat in the closest proximity to leks. The 2019 plan amended the decision from a 1-mile closure to a 1-mile NSO with a different set of waiver, exception, and modification (WEM) criteria than the rest of PHMA (also NSO) but maintained the 1-mile closure around an active lek. The 1-mile standard was subsequently incorporated into the State of Colorado oil & gas regulations (CO Code § 34-60-101, 2022). The BLM will analyze the 1-mile lek buffer distance as the minimum threshold in Colorado under Alternatives 1 and 2 (No Action alternatives), and 5.

Allocations/Management Decisions within 1-mile Buffer

The 2019 plan amended the decision from a 1-mile closure to a 1-mile NSO with a different set of WEM criteria than the rest of PHMA (also NSO). To reconcile the difference between the 2015 and 2019 plans, the BLM will analyze PHMA as being open to fluid mineral leasing subject to NSO. WEMs will include additional criteria within 1-mile of occupied leks rather than being limited to active (CPW) leks. This clarification would allow for PHMA to remain NSO with the distinction of more intensive management within 1-mile of a lek requiring the use of one NSO stipulation.

Allocations for GHMA

In the 2015 and 2019 plans, Colorado included a NSO stipulation within 2-miles of active leks in GHMA. Because of the lek status clarification above, the BLM will analyze the change between an NSO around active leks versus occupied leks in Alternative 4. The BLM will also analyze using a Controlled Surface Use (CSU) stipulation within 2-miles of occupied leks in Alternative 5 and a CSU within 1-mile of PHMA in Alternative 6 instead of the NSO to assess the impacts of different stipulation types.

CSU stipulations are applied at the leasing phase and allow the BLM to carefully consider site-specific factors during implementation that provide the appropriate level of protection and restrictions. Common CSU measures include relocating operations by more than 200 meters (656 ft) or deferring the action for more than 60 days to avoid or minimize impacts.

Alternative 4 would increase the acreage of GHMA with NSO stipulations compared to Alternatives 1 and 2. Under Alternative 5, the same amount of acreage under major stipulation (NSO) in Alternative 4 would be under moderate stipulation (CSU). Alternative 5 would allow for more flexibility in development while maintaining the BLM's ability to apply site-specific criteria for GRSG habitat protection. Alternative 6 also analyzes CSU stipulations but would be applied in GHMA within 1 mile of PHMA. This would allow for increased flexibility while allowing the BLM to consider the indirect effects that development in GHMA may have on all PHMA, not just where leks occur.

Consistency Across Resources

The BLM will analyze use of more consistent criteria for management actions such as fluid mineral permitting and ROW authorizations. Many fluid mineral permits include both an Application for Permit to Drill (APD) and a ROW (e.g.- an access road to a well pad begins off-lease and crosses on-lease). Under the 2015 and 2019 plans, the authorization would be subject to two varying sets of siting criteria. By using consistent criteria, the BLM intends to ease plan conformance and coordination across resource uses.

Lessons Learned

The BLM is including clarifications to several management decisions because of lessons learned during implementation of the previous GRSG plans. The BLM will clarify management decisions in the Fluid Mineral and Land and Realty sections. Lessons learned primarily involve administrative clarifications and remedies and are not likely to impact GRSG habitat, other resources, or resource uses.

Table 21-15. Colorado State-Specific Circumstances – Fluid Minerals (MR)

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Unleased Fluid Minerals				
MD MR-1: No new leasing 1 mile from active leks in ADH.	**MD MR-1:** One mile from active leks: Open to leasing subject to **NSO-1.** See Appendix B (Existing Management) for WEM criteria.	No new leasing in PHMA. Upon expiration or termination of existing leases, prohibit issuance of new leases or reinstatement of leases in PHMA.	No similar action (see line below)	No similar action (see line below)
MD MR-2: No Surface Occupancy (NSO) without waiver or modification in PHMA. See Appendix B (Existing Management) for exception criteria.	**MD MR-2:** (one mile from active leks to the remainder of PHMA): Open to leasing subject to No Surface Occupancy (**NSO-2**) with waivers, exceptions, or modifications in PHMA. See Appendix B (Existing Management) for WEM criteria.	No similar action (Alternative 3 is closed to new leasing)	PHMA will be open to fluid mineral leasing subject to No surface occupancy with waivers, exceptions, or modifications (WEMs). See range-wide WEM criteria.	PHMA will be open to fluid mineral leasing subject to No surface occupancy with waivers, exceptions, or modifications (WEMs). See range-wide WEM criteria, but the exception distance for Colorado will be 1 mile from occupied leks.
MD MR-3: In GHMA, any new leases would include **TL** stipulations to protect GRSG and its habitat. The following stipulation would apply: **GRSG TL-46e:** No activity associated with construction, drilling, or completions within 4 miles from active leks during lekking, nesting, and early brood-rearing (March 1 to July 15). Authorized Officer could grant an exception, modification, or waiver in consultation with the State of Colorado.	Same as Alternative 1 (no change made in 2019).	No similar action (Alternative 3 is closed to new leasing)	In PHMA & GHMA, any new leases would include TL stipulations to minimize impacts to GRSG during lekking, nesting, and early brood-rearing. The following stipulation would apply: No activity associated with construction, drilling, or completions within 4 miles of occupied leks during lekking, nesting, and early brood-rearing (March 1 to July 15). The Authorized Officer could grant an exception, modification, or waiver in coordination with the State of Colorado.	Same as Alternative 4

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6	
				Alt 5	**Alt 6**
MD MR-4: No Surface Occupancy (NSO) within 2 miles of active (CO definition) leks in GHMA. See Appendix B (Existing Management) for WEM criteria.	Same as Alternative 1 (no change made in 2019).	No similar action (Alt 3 is closed to new leasing)	GHMA will be open to fluid mineral leasing subject to **No Surface Occupancy (NSO)** within 2 miles of **active*** (WAFWA active, CO occupied) leks. See range-wide WEM criteria.	GHMA will be open to fluid mineral leasing subject to **Controlled Surface Use (CSU)** within 2 miles of **active*** leks. See CSU criteria below. See range-wide WEM criteria.	GHMA will be open to fluid mineral leasing subject to **Controlled Surface Use (CSU)** in GHMA within 1 mile of PHMA. See CSU criteria below. See range-wide WEM criteria.
No similar action	No similar action	No similar action	No similar action	**Controlled Surface Use (CSU):** Apply CSU constraints on surface use, occupancy, placement of permanent tall structures, and surface-disturbing activities in *[GHMA within 2 miles of occupied leks for Alt 5/GHMA within 1 mile of PHMA for Alt 5a*] that would decrease breeding/nesting habitat availability or functionality, or that create new perching/nesting opportunities for avian predators. Surface use including infrastructure and surface-disturbing activities may require special design, construction, and implementation measures. The actual required measures will be based on the purpose, nature, and extent of the surface occupancy including infrastructure and total surface disturbance, the affected seasonal habitat, and the feasibility of relocating the project. A tall structure is any man-made		

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	*(See above.)*	structure that provides for perching/nesting opportunities for predators (e.g., raptors, ravens) that may naturally be absent, or that decreases the use of an area. A determination as to whether something is considered a tall structure would be made based on local conditions such as existing vegetation or topography. Examples of measures and limitations include: 1) Relocate operations more than 200 meters (656 feet) to areas outside of habitat, to areas of existing disturbance, or to areas where site-specific topography mitigates project impacts; 2) Defer activities longer than 60 days to avoid seasonal habitat use periods; 3) Modify project design to discourage avian predator perching; 4) Limit or relocate placement of tall structures to reduce impacts of project infrastructure; 5) Limit activity associated with construction, drilling, or completions to certain seasons or times of day; 6) Minimize noise using the best available technology to dampen or direct noise away from breeding or nesting habitat. Modify access routes to avoid important areas or habitats.

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
MD MR-5: Disturbance on new leases would be limited to 3 percent in PHMA (biologically significant unit) (see Appendix E, Methodology for Calculating Disturbance Caps) and would limited to 1 disturbance per 640 acres calculated by Colorado MZ. The following Lease Notice (LN) would apply: **GRSG LN-46e**: Any lands leased in PHMA are subject to the restrictions of 1 disturbance per 640 acres calculated by biologically significant unit (Colorado populations) and proposed project analysis area (Colorado MZ) to allow clustered development.	Same as Alternative 1 (no change made in 2019).	No similar action (Alt 3 is closed to new leasing)	Disturbance on new leases would be limited to 3 percent in PHMA (biologically significant unit) and would be limited to 1 disturbance per 640 acres calculated by Colorado MZ. The following Controlled Surface Use (CSU) would apply: Any lands leased in PHMA are subject to the restrictions of 3 percent disturbance and 1 disturbance per 640 acres calculated by Fine Scale and proposed project analysis area (Colorado MZ) to allow clustered development.	Disturbance on new leases would be limited to 3 percent in PHMA (biologically significant unit) and would be limited to 1 disturbance per 640 acres calculated by Colorado MZ. The following Controlled Surface Use (CSU) would apply: Any lands leased in PHMA are subject to the restrictions of 3 percent disturbance and 1 disturbance per 640 acres calculated by biologically significant unit (Colorado populations) and proposed project analysis area (Colorado MZ) to allow clustered development.
MD MR-7: (PHMA) Allow geophysical exploration within PHMA to obtain information for existing federal fluid mineral leases or areas adjacent to state or fee lands within PHMA. Allow geophysical operations only using helicopter-portable drilling, wheeled or tracked vehicles on existing roads, or other approved methods conducted in accordance with seasonal TLs and other restrictions that may apply. Geophysical exploration shall be subject to seasonal restrictions that preclude activities in breeding, nesting, brood-rearing, and winter habitats during their season of use by GRSG.	Same as Alternative 1 (no change made in 2019).	Same as Alternative 1	(PHMA) Allow geophysical exploration within PHMA to obtain information for existing federal fluid mineral leases or areas adjacent to state or fee lands within PHMA. Allow geophysical operations with the application of reasonable measures that minimize impacts to GRSG and GRSG habitat (e.g., helicopter-portable drilling, wheeled or tracked vehicles on existing roads) and are in accordance with seasonal TLs and other applicable restrictions. Geophysical exploration shall be subject to seasonal restrictions that preclude activities in breeding, nesting, brood-rearing, and winter habitats during the season of use by GRSG.	Same as Alternative 4

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Leased Fluid Minerals				
MD MR-8: Within 1 mile of active leks, disturbance, disruptive activities, and occupancy are precluded. If it is determined that this restriction would render the recovery of fluid minerals infeasible or uneconomic, considering the lease as a whole, or where development of existing leases requires that disturbance density exceeds 1 disturbance per 640 acres and/or the 3 percent disturbance cap (see Appendix E, Methodology for Calculating Disturbance Caps), use the **criteria*** below to site proposed lease activities to meet GRSG habitat objectives and require mitigation as described in Appendix F (Greater Sage-Grouse Mitigation Strategy).	Same as Alternative 1 (no change made in 2019).	—	Within 1 mile of occupied leks, disturbance, disruptive activities, and occupancy are precluded. If it is determined that this restriction would render the recovery of fluid minerals infeasible or uneconomic, considering the lease as a whole, or where development of existing leases requires that disturbance density exceeds 1 disturbance per 640 acres and/or the 3 percent disturbance cap, use the **criteria*** below to site proposed lease activities to meet GRSG habitat objectives and require mitigation.	Same as Alternative 4, but with siting criteria from Alternatives 5 and 6 (see below)
MD MR-9: In PHMA and within 4 miles of an active lek, the **criteria*** below would be applied to guide development of the lease or unit that would result in the fewest impacts possible to GRSG. **Criteria*:** • Location of proposed lease activities in relation to critical GRSG habitat areas as identified by factors, including, but not limited to, average male lek attendance and/or important seasonal habitat • An evaluation of the potential threats from proposed lease activities that may affect the	Same as Alternative 1 (no change made in 2019).	In PHMA and GHMA, the **criteria*** below would be applied to guide development of the lease or unit that would result in the fewest impacts possible to GRSG. Additionally, both PHMA and GHMA would be classified as PHMA under this alternative. 1) The location of the proposed authorization is determined to be nonhabitat, lacks the ecological potential to become habitat, does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect	Same as Alternative 3, but both PHMA and GHMA would not be classified as PHMA.	In PHMA and GHMA, the **criteria*** below would be applied to guide development of the lease or unit that would result in the fewest impacts possible to GRSG. 1) The location of the proposed authorization is determined to be nonhabitat, lacks the ecological potential to become habitat, does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function.

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
local population as compared to benefits that could be accomplished through compensatory or off-site mitigation • An evaluation of the proposed lease activities, including design features, in relation to the site-specific terrain and habitat features. For example, within 4 miles from a lek, local terrain features such as ridges and ravines may reduce the habitat importance and shield nearby habitat from disruptive factors. This is particularly likely in Colorado MZ 17, which has an atypical GRSG habitat featuring benches with GRSG habitat interspersed with steep ravines To authorize an activity based on the criteria above, the environmental record of review must show no significant direct disturbance, displacement, or mortality of GRSG.	*(See above.)*	disturbance to or disruption of adjacent seasonal habitats that would impair their biological function. 2) Topography/areas of non-habitat create an effective barrier to impacts. 3) By co-locating the proposed authorization with existing disturbance, impacts would be minimized or similar to impacts associated with the existing infrastructure. 4) The proposed location would be undertaken as an alternative to a similar action occurring on a nearby parcel (for example, due to landownership patterns), and authorizing the activity on the parcel in question would have less of an impact on GRSG or its habitat than on the nearby parcel; this criterion must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. If the criteria above do not apply but it can be demonstrated that the direct and indirect impacts of the proposed activity would be offset through compensatory mitigation, the authorized officer may consider permitting the action. The environmental record of review must demonstrate the following: 1) As the first step in mitigating impacts to GRSG, efforts to avoid impacts by locating the	*(See above.)*	2) Topography/areas of non-habitat create an effective barrier to impacts. 3) By co-locating the proposed authorization with existing disturbance, impacts would be minimized or similar to impacts associated with the existing infrastructure. 4) The proposed location would be undertaken as an alternative to a similar action occurring on a nearby parcel (for example, due to landownership patterns), and authorizing the activity on the parcel in question would have less of an impact on GRSG or its habitat than on the nearby parcel; this criterion must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. In addition to meeting one of the criteria above, applicable minimization measures including Disturbance Caps, Timing Limitations, Design Features, or other site-specific constraints would be included as Conditions of Approval (COAs) on the authorized activity. If the criteria above do not apply but it can be demonstrated that the direct and indirect impacts of the proposed activity would be offset through compensatory mitigation, the authorized officer may consider permitting the action. The environmental record

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	proposed project in areas outside the NSO areas or in areas of non-habitat shall be documented. 2) As the second step in mitigating impacts to GRSG, efforts to minimize impacts by applying project design features shall be documented (e.g., use of RDFs, buffer distances, seasonal limitations, etc.). The compensation project must be completed and habitat functionality documented before the authorization is granted to ensure the offset in impacts will occur.	*(See above.)*	of review must demonstrate why avoidance is not attainable. To grant the activity based on compensatory mitigation, the compensation project must be planned, funded, and approved by the operator, BLM, surface owner, in coordination with the State of Colorado prior to construction, surface occupancy, or surface disturbing activities.
MD MR-10: Based on site-specific conditions, prohibit construction, drilling, and completion within PHMA within 4 miles of a lek during lekking, nesting, and early brood-rearing (March 1 to July 15). In consultation with the State of Colorado, this TL may be adjusted based on application of the **criteria*** above.	Same as Alternative 1 (no change made in 2019).	Prohibit construction, drilling, and completion within PHMA during lekking, nesting, and early brood-rearing (March 1 to July 15).	Based on site-specific conditions, prohibit construction, drilling, and completion in PHMA or GHMA within 4 miles of an occupied lek during lekking, nesting, and early brood-rearing (March 1 to July 15). In coordination with the State of Colorado, this TL may be adjusted based on application of the **criteria*** above.	Same as Alternative 4, but with siting criteria from Alternatives 5 and 6 (see above)

Lands and Realty (LR)				
MD LR-1: Manage areas within PHMA as avoidance areas* for BLM ROW permits. (See Appendix G, Stipulations Applicable to Fluid Mineral Leasing and Land Use Authorizations.) ***GRSG PHMA ROW Avoidance.** ROWs may be issued after documenting that the ROWs would not adversely affect GRSG populations based on the following criteria: • Location of proposed activities in relation to critical GRSG habitat areas as identified by factors, including, but not limited to, average male lek attendance and/or important seasonal habitat. • An evaluation of the potential threats from proposed activities that may affect the local population as compared to benefits that could be accomplished through compensatory or off-site mitigation An evaluation of the proposed activities in relation to the site-specific terrain and habitat features. For example, within 4 miles from a lek, local terrain features such as ridges and ravines may reduce the habitat importance and shield nearby habitat from disruptive factors.	Same as Alternative 1 (no change made in 2019).	Manage areas within PHMA as exclusion areas for BLM ROW permits, except for designated corridors.	Manage areas within PHMA as avoidance areas* for BLM ROW permits. ***ROW Avoidance Criteria:** ROWs may be issued if it can be demonstrated that the proposed authorization would have no adverse impacts on GRSG or its habitat based on at least one of the following: 1) The location of the proposed authorization is determined to be nonhabitat, lacks the ecological potential to become habitat, does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function. 2) Topography/areas of non-habitat create an effective barrier to impacts. 3) By co-locating the proposed authorization with existing disturbance, impacts would be minimized or similar to impact associated with the existing infrastructure. 4) The proposed location would be undertaken as an alternative to a similar action occurring on a nearby parcel (for example, due to landownership patterns), and authorizing the ROW on the	Manage areas within PHMA as avoidance areas* for BLM ROW permits, except for designated corridors, which would be open to ROW permits. ***ROW Avoidance Criteria:** ROWs may be issued if it can be demonstrated that the proposed authorization would have no adverse impacts on GRSG or its habitat based on at least one of the following: 1) The location of the proposed authorization is determined to be nonhabitat, lacks the ecological potential to become habitat, does not provide important connectivity between habitat areas, and the project includes design features to prevent indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function. 2) Topography/areas of non-habitat create an effective barrier to impacts. 3) By co-locating the proposed authorization with existing disturbance, impacts would be minimized or similar to impact associated with the existing infrastructure. 4) The proposed location would be undertaken as an alternative to a similar action occurring on a nearby parcel (for example, due to

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	parcel in question would have less of an impact on GRSG or its habitat than on the nearby parcel; this criterion must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. In addition to meeting one of the criteria above, applicable minimization measures including Disturbance Caps, Timing Limitations, Design Features (Appendix XX- Design Features), or other site-specific constraints would be included as Terms & Conditions of the ROW. If the **criteria*** above do not apply but it can be demonstrated that the direct and indirect impacts of the proposed activity would be offset through compensatory mitigation, the authorized officer may consider permitting the action. The environmental record of review must demonstrate the following: 1) As the first step in mitigating impacts to GRSG, efforts to avoid impacts by locating the proposed project in areas outside the NSO areas or in areas of non-habitat shall be documented. 2) As the second step in mitigating impacts to GRSG, efforts to minimize impacts by applying project design features shall be documented (e.g., use of RDFs, buffer	landownership patterns), and authorizing the ROW on the parcel in question would have less of an impact on GRSG or its habitat than on the nearby parcel; this criterion must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. In addition to meeting one of the criteria above, applicable minimization measures including Disturbance Caps, Timing Limitations, Design Features (Appendix XX- Design Features), or other site-specific constraints would be included as Terms & Conditions of the ROW. If the **criteria*** above do not apply but it can be demonstrated that the direct and indirect impacts of the proposed activity would be offset through compensatory mitigation, the authorized officer may consider granting a ROW. The environmental record of review must demonstrate why avoidance is not attainable. To grant a ROW based on compensatory mitigation, the compensation project must be completed prior to construction, surface occupancy, or surface disturbing activities. Applicable minimization measures including Disturbance Caps, Timing Limitations, Design Features (Appendix XX- Design Features), or other site-specific constraints

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	*(See above.)*	*(See above.)*	distances, seasonal limitations, etc.). 3) The compensation project must be completed and habitat functionality documented before the authorization is granted to ensure the offset in impacts will occur. The compensation necessary to grant this authorization must provide the offsetting benefit to the population being impacted by the potential development.	would be included as Terms & Conditions of the ROW.
MD LR-2: Manage areas within GHMA as avoidance areas* for major (transmission lines greater than 100 kilovolts and pipelines greater than 24 inches) and minor BLM ROW permits (see avoidance criteria above).	Same as Alternative 1 (no change made in 2019).	No similar action	Manage areas within GHMA as avoidance areas* BLM ROW permits (see avoidance criteria above).	Manage areas within GHMA as avoidance areas* for BLM ROW permits, except for designated corridors, which would be open to ROW permits (see avoidance criteria above).
No similar action	No similar action	No similar action	In PHMA and GHMA, If the ROW authorization is the off-lease component of an action that occurs on-lease (e.g.- a road beginning off-lease that crosses on-lease would require both a ROW and subject to the conditions of the APD), ensure that the conditions for each authorization are consistent for mitigation, reclamation, and design features, as appropriate.	Same as Alternative 4

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
MD LR-3: No new roads or above-ground structures would be authorized within 1 mile of an active lek. Above-ground structures are defined as structures that are located on or above the surface of the ground, including but not limited to: roads, fences, communication towers, and/or any structure that would provide perches. Above-ground structures would only be authorized if: 1. It is consistent with the overall objective of the RMP Amendment; 2. The effect on GRSG populations or habitat is nominal or incidental; 3. Allowing the exception prevents implementation of an alternative more detrimental to GRSG or similar environmental concern, and; Rigid adherence to the restriction would be the only reason for denying the action.	Same as Alternative 1 (no change made in 2019).	No similar action	No new tall structures would be authorized within 1 mile of an occupied lek. Tall structures are defined as any man-made structure that provides for perching/nesting opportunities for predators (e.g., raptors, ravens) that may naturally be absent, or that decreases the use of an area. A determination as to whether something is considered a tall structure would be made based on local conditions such as existing vegetation or topography. Tall structures include but are not limited to: communication towers, meteorological towers, power lines, and transmission lines. Tall structures would only be authorized if it can be demonstrated that the proposed authorization would have no adverse impacts on GRSG or its habitat based on the **ROW Avoidance Criteria*** above. Additionally, if tall structures cannot be buried (i.e.- power lines), require perch deterrents.	Same as Alternative 4, but with ROW avoidance criteria from Alternatives 5 and 6

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
MD LR-4: PHMA and GHMA are designated as avoidance areas for high-voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the following identified projects, must comply with the conservation measures outlined in this ARMPA, including the RDFs and avoidance criteria presented in this document. The BLM is currently processing applications for the TransWest and Energy Gateway South Transmission Line projects, and the NEPA review for these projects is well underway. Conservation measures for GRSG are being analyzed through the projects' NEPA review process, which should achieve a net conservation benefit for the GRSG.	Same as Alternative 1 (no change made in 2019).	No similar decision	No similar decision	No similar decision
MD LR-6: Prohibit surface occupancy and surface-disturbing activities associated with BLM ROW within 4 miles from active leks during lekking, nesting, and early brood-rearing (March 1 to July 15). (See special stipulations applicable to **GRSG PHMA ROW TL**.)	Same as Alternative 1 (no change made in 2019).	No similar decision	In PHMA and GHMA, prohibit surface occupancy and surface-disturbing activities associated with BLM ROW within 4 miles of occupied leks during lekking, nesting, and early brood-rearing (March 1 to July 15).	Same as Alternative 4
MD LR-8: (PHMA) In PHMA, or within 4 miles of an active lek, for ROW renewals, where existing facilities cannot be removed, buried, or modified, require perch deterrents.	Same as Alternative 1 (no change made in 2019).	No similar decision	(PHMA and GHMA) In PHMA and GHMA, for ROW renewals, where existing facilities cannot be removed, buried, or modified, require perch deterrents.	Same as Alternative 4
MD LR-9: (PHMA) Reclaim and restore ROWs considering GRSG habitat requirements.	Same as Alternative 1 (no change made in 2019).	—	(PHMA and GHMA) Reclaim and restore ROWs considering GRSG habitat requirements.	Same as Alternative 4

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
MD LR-10: (PHMA) Designate new ROW corridors in GRSG PHMA only where there is a compelling reason to do so and location of the corridor within PHMA will not adversely affect GRSG populations due to habitat loss or disruptive activities.	Same as Alternative 1 (no change made in 2019).	No similar decision	(PHMA and GHMA) Designate new ROW corridors in GRSG PHMA and GHMA only where there is a compelling reason to do so and location of the corridor within PHMA will not adversely affect GRSG populations due to habitat loss or disruptive activities.	Same as Alternative 4

21.2.2 Idaho

In addition to Idaho's three-tier habitat approach, state specific circumstances are a result of specific language unique from 2015 and 2019, and clarifying 2015 implementation management decisions. State specific circumstances for the State of Idaho include 1) management of saleable minerals/mineral materials – specifically consideration of new free use pits in PHMA, 2) application and use of lek buffers (see **Appendix 19**), and 3) application of renewable energy management to nuclear and hydropower developments in addition to wind and solar.

Table 21-18. Idaho State-Specific Circumstances – Mineral Resources (MR)

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Saleable Minerals/Mineral Materials				
MD MR 11: PHMA are closed to new mineral materials sales. However, these areas remain "open" to free use permits and the expansion of existing active pits only if the following criteria are met: • the project area disturbance cap is not exceeded within a BSU; • the activity is subject to the provisions set forth in the mitigation framework [Appendix F in the 2015 ARMPA]; • all applicable required design features are applied; and • the activity is permissible under the Idaho exception and development criteria (MD SSS 29 and MD SSS 30 in the 2015 ID ARMPA) IHMA: All IHMA will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria (MD SSS 30 in the 2015 ID ARMPA), and subject to RDFs, and buffers. Sales from existing community pits within IHMA will be subject to seasonal timing restrictions (Appendix C in 2015 ARMPA). GHMA: All GHMA will be open to mineral materials development, subject to RDFs and buffers. Sales from existing community pits within GHMA will be subject to seasonal timing restrictions (Appendix C in 2015 ARMPA).	**MD MR 11:** PHMA: All PHMA will be closed to new mineral materials development, but continued use of existing pits will be allowed. New free use permits and the expansion of existing free use permits may be considered only if the following criteria are met: • the project area disturbance cap is not exceeded within a BSU; • the activity is subject to the provisions set forth in the mitigation framework [Appendix F in the 2015 ARMPA]; • all applicable required design features are applied; and • the activity is permissible under the Idaho exception and development criteria (MD SSS 29 and MD SSS 30 in the 2019 ID ARMPA) IHMA: All IHMA will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria (MD SSS 30 in the 2019 ID ARMPA), and subject to RDFs, and buffers. GHMA: All GHMA will be open to mineral materials development, subject to best management practices, as described in Appendix C (in 2019 ARMPA).	**MD MR 11:** PHMA—All PHMA will be closed to new mineral materials development.	**MD MR 11:** PHMA—All PHMA will be closed to new mineral materials development but continued use of existing pits will be allowed. New free use permits and the expansion of existing pits may be considered only if the following criteria are met: a. The disturbance cap is not exceeded in a within a fine-scale HAF; b. The activity is subject to the provisions set forth in the mitigation framework (Appendix F in the 2019 ARMPA); c. All applicable RDFs are applied; and d. The activity is permissible under the Idaho exception and development criteria (MD SSS 29 and MD SSS 30 in the 2019 ID ARMPA). In order to support maintenance needs for existing local roads and ensure public safety, exceptions to criteria b) and d) listed above may be granted for new free-use permits in areas with existing anthropogenic disturbance. IHMA—All IHMA will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria (MD SSS 30 in the 2019 ID ARMPA) and subject to RDFs and buffers. GHMA—All GHMA will be open to mineral materials development, subject to BMPs as described in Appendix C (in the 2019 ID ARMPA).	**MD MR 11:** Same as Alternative 4

Buffers** (in the 2019 ID ARMPA) {The management action associated with the buffers is MD SSS 35; the details on buffer sizes and how to apply them is in the appendix.}	**Appendix B. Buffers** (see proposed changes in the Idaho Buffers Appendix Alternative Language (**Appendix 19**). Modified from Appendix B referenced in Alt 1 to apply to active or pending active leks, with no buffer exceptions.	Same as Alternative 3.	**Appendix B. Buffers** (see proposed changes in the Idaho Buffers Appendix Alternative Language (**Appendix 19**). Modified from Appendix B referenced in Alt 2 to apply to active and pending leks and providing buffer exception for IHMA/GHMA.

Table 21-20. Idaho State-Specific Circumstances – Renewable Energy (Wind and Solar) (RE)

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Industrial Solar, Wind, Nuclear, and Hydropower Development				
MD RE 1: PHMA: Designate and manage PHMA as exclusion areas for utility scale (20 MW) wind and solar testing and development, nuclear and hydropower energy development. IHMA: Designate and manage IHMA as avoidance areas for wind and solar testing and development, nuclear and hydropower development. GHMA: Designate and manage GHMA as open for wind and solar testing and development and nuclear and hydropower development subject to RDFs and buffers.	**MD RE 1:** PHMA: Designate and manage PHMA as exclusion areas for utility scale (20 MW) wind and solar testing and development, nuclear and hydropower energy development. IHMA: Designate and manage IHMA as avoidance areas for wind and solar testing and development, nuclear and hydropower development. GHMA: Designate and manage GHMA as open for wind and solar testing and development and nuclear and hydropower development	Same as cross-cutting language for wind and solar described above, but with the additional application to nuclear and hydropower energy development.	Same as Alternative 3.	Same as Alternative 3.

21.2.3 Montana/Dakotas

GRSG in Montana range across most of the state, with about 1,000 confirmed active sage-grouse leks. GRSG in North and South Dakota have limited distributions and small population sizes. These differences resulted in variable factors being considered for identifying HMAs (in cooperation with state natural resource entities) (see **Appendix 3**, GRSG HMA State-by-State Mapping Strategies). Factors include differences in the amount of the population in GHMA, HMAs to address different seasonal movement strategies, and addressing cross-state populations. These differences also require consideration of different management approaches at a local level (state specific circumstances) in contrast to range-wide approaches (cross-cutting issues) considered in this EIS/RMPA.

GRSG planning efforts completed in 2015 were initiated while plan revisions were ongoing for multiple other plans in the region. The 2015 effort resulted in updated GRSG management in seven plans. However, the Butte Field Office (BFO) and the Upper Missouri River Breaks National Monument (UMRBNM) were not included due to minor amounts of habitat (BFO) and protections provided by inclusion of GRSG as an object and value of the UMRBNM proclamation. Subsequently, the Lewistown Field Office completed a plan revision in 2021, and the North Dakota Field Office is currently undergoing a plan revision. Montana-Dakotas BLM offices were not part of the GRSG plan amendments completed in 2019.

While concepts and approaches are generally consistent between the plans, separate planning efforts resulted both wording and management action inconsistencies. State-specific circumstances address: 1) measures to improve consistency between the nine Field Offices (RMPs) for sage-grouse management; 2) incorporating unique circumstances of peripheral populations and accounting for the higher proportion of sage-grouse leks found in GHMA in Montana; and 3) applying 2021 Plan Evaluation recommendations and lessons learned from implementation of the 2015 plans.

Increasing Consistency between Montana-Dakotas BLM Plans and State Conservation Approaches

BLM's review of the seven Montana-Dakotas plans included in the 2015 planning effort identified varying management recommendations. While some of these differences are simply minor wording differences, other inconsistencies include the omission or inclusion of actions not included in neighboring plans. These differences also include numerous stipulations for oil and gas leasing in HMAs and occupied GRSG habitat. Among offices, there are varying objectives for GRSG management under the sensitive status species sections or may contain objectives listed as management action in different plans. Furthermore, BLM identified differences in buffer distances for ROW avoidance around leks, variation in protections for winter range, and several other differences in management among HMAs between offices.

The BLM examined these inconsistencies to determine if they are justified using the following criteria: 1) Biological circumstances between offices that warrant distinction; 2) Wording differences that create inconsistent interpretation and management; 3) Whether specific management objectives and actions were needed within BFO and the UMRBNM, and; 4) Relationships with the state GRSG conservation plans from North Dakota, South Dakota, and Montana.

The action alternatives below strive to provide better consistency among BLM offices and partner natural resource entities. They are intended to provide clear and consistent direction to applicants and partners for cross-office boundary projects and simplify the coordination among field offices. Other potential changes including monitoring, adaptive management, and implementation tracking would be streamlined to increase internal efficiencies and improve coordination with partners.

Addressing Variations in HMAs and Peripheral Populations

In Montana, general habitat, and BLM GHMA, contains a larger proportion of leks relative to these habitat types than many other states (see **Appendix 3**, GRSG HMA State-by-State Mapping Strategies). To meet objectives for GRSG and be more consistent with state management approaches, more restrictive GHMA management is presented for some resources in the alternatives below. The Montana-Dakotas BLM is considering crucial winter range in stipulations and maintains lek-based buffers for ROWs in GHMA (including utility scale renewable energy projects). Peripheral populations present unique challenges to management approaches. The population spanning the Montana and North Dakota Border (Cedar Creek Anticline area) has specific objectives considered to address ongoing development in the area, restoration needs, and cross-state and cross organizational GRSG management in this mixed-ownership area. In Montana, this area is considered as an RHMA in most alternatives to reflect the desire for long-term restoration. In North Dakota, GRSG range is PHMA, but specific objectives and management are considered to address restoration and habitat enhancement, including protecting historical leks (those active in 2010) similar to currently active leks. This is intended to conserve the landscape to provide opportunities for restoration. GRSG in northern Montana and Canada exhibit unique migratory behavior, moving from breeding habitat in silver sage communities to winter south in Wyoming Big Sagebrush dominated communities. To capture these migratory pathways and protect stopover sites the BLM identified connectivity areas, called CHMA, based on the State of Montana connectivity areas (see **Appendix 3**, GRSG HMA State-by-State Mapping Strategies). While the revised GRSG HMAs in the action alternatives and the Pryor Mountain Wild Horse Range overlap by just over 300 acres in the Billings Field Office, GRSG and wild horse use do not overlap due to physical barriers. Therefore, this topic is not addressed in detail.

2015 Plan Evaluations and Lessons Learned

Implementation of the 2015 plans (including 2021 plan evaluations) has identified areas of potential misunderstanding that are included as cross cutting issues in alternatives in this EIS. The BLM Montana-Dakotas has also identified opportunities, unique to the region, including cross-boundary coordination with other natural-resource management entities. Additionally, new local and range-wide research provides updated information to consider for GRSG management action adjustments. As a result, the state-specific alternative below incorporates the following new information. The Dillon FO was previously included in a combined Idaho-SW Montana amendment. However, that amendment included management unique to Idaho, but not applicable in Montana including Wild Horse and Burro management, use of the Fire and Invasives Assessment Tool, and incorporation of Key Habitat references. The Montana-Dakotas BLM also considers options to remove the distinction between major and minor rights of way, both for consistency with state management and to address specific impacts of the proposed disturbance or disruption of ROW actions relative to GRSG. Lastly, the revised guidance on conservation buffer distances, project screens, and design features provides a common approach for analyzing different program and project types that result in similar impacts.

The remainder of this section includes the alternatives related to the applicable management actions. Columns for Alternatives 1 and 2 have been merged, since the BLM RMPs in the Montana/Dakota State Office did not amend any plans in 2019.

Table 21-21. Montana State-Specific Circumstances – Special Status Species (GRSG): Goals and Objectives

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species (GRSG): Goals and Objectives				
Goal: Maintain and/or increase GRSG abundance and distribution by conserving, enhancing, or restoring the sagebrush ecosystem upon which populations depend, in cooperation with other conservation partners. (Language varies between plans) **Objective**: Sage-grouse management will utilize the 2005 Management Plan and Conservation Strategies for Sage-Grouse in Montana – Final for overall guidance and direction. (Various inclusion of BLM and state GRSG plans) West Nile Virus: When developing or modifying water developments, use applicable RDFs (see RDF/BMP appendix from each RMP) to mitigate potential impacts from West Nile virus. (Various inclusion as goal, objective, or management action, in different program areas)		Apply the cross-cutting GRSG goal, Habitat Objectives, etc. In addition, retain existing goals and objectives, but edit or add to ensure the following direction is contained: **Goal:** (see cross-cutting issue). **Objective**: Maintain, improve, and restore sagebrush habitats to increase habitat availability and quality for GRSG, sagebrush obligates and other sagebrush dependent species. **Objective**: Manage GRSG through collaborative, coordinated efforts that utilize cooperative planning and implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts can include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, nongovernmental organizations, and other interested parties/stakeholders. **All HMAs MA**: Greater sage-grouse management will be consistent with current adopted BLM conservation strategies, will utilize GRSG conservation plans, as revised or updated, from partners such as WAFWA (e.g., Sagebrush conservation strategy; Remington et al. 2021), USFWS (e.g., Greater Sage-grouse (Centrocercus urophasianus) Conservation Objectives: Final Report; USFWS 2013), and state wildlife or habitat management agency action, management, or conservation plans (e.g., MT EO 2015, MT SGWG 2005, SD GF&P 2022, ND G&F 2014), and the best available science. **All HMAs MA**: Assess and modify as needed water features to reduce the risk of potential impacts from West Nile Virus or other disease outbreaks (see RDF/BMP appendix from each RMP).		

Table 21-22. Montana State-Specific Circumstances – Special Status Species (GRSG): Cedar Creek Anticline RHMA Objectives

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species (GRSG): Goals and Objectives				
Objective 1: Strive for proponents to develop area-wide Habitat Recovery Plans. **Objective 2**: Strive for no net loss of GRSG habitat. **Objective 3:** Strive for the restoration of previously disturbed landscapes in a manner which increases or improves the quality and quantity of GRSG habitat.		**Objective 1:** Develop and implement an area-wide habitat restoration plan. The plan will identify restoration opportunities, including short term actions that can reduce disturbance and threats to sage-grouse (conifer encroachment, duplicative roads, infrastructure removal, etc.), habitat restoration (areas to increase sagebrush cover and understory plants), and longer-term actions to put in place as development is completed. **Objective 2**: Manage for no net loss of GRSG habitat, subject to valid existing rights, and maintained connectivity with North Dakota GRSG habitat. **Objective 3:** Strategically target restoration, as possible with partners across jurisdictions, in disturbed landscapes in a manner which increases or improves the quality and quantity of GRSG habitat.		

Table 21-23. Montana State-Specific Circumstances – Special Status Species (GRSG): North Dakota Specifics

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species (GRSG): Goals and Objectives				
Objective SSS-1.1 through Objective SSS-1.4: These objectives cover disturbance cap, delineate PHMA and GHMA, and identify the Habitat Objectives **Objective SSS-1.5:** No similar objective		**Objective SSS 1.1-1.4:** See cross-cutting language for HMAs, disturbance, and habitat objectives above. **Objective SSS-1.5** (New): Maintain the existing distribution of occupied GRSG habitat while taking strategic opportunities to enhance existing habitat and expand occupied habitat through restoration actions that remove the primary threats found on BLM managed surface acres (e.g., conifer encroachment, infrastructure, etc.) in North Dakota. **MA SSS-X** (New): Develop a MOU and/or restoration plan between interested partners such as the Forest Service, State of North Dakota USFWS, NRCS and other conservation partners and adjacent states (Montana, South Dakota) to establish a cooperative approach regarding implementation of sage-grouse conservation measures, proposed management changes, mitigation, site-specific monitoring, adaptive management, and addressing threats to GRSG. The MOU/plan will identify responsibilities, roles and interaction to maximize the party's individual conservation efforts.		

Table 21-24. Montana State-Specific Circumstances – Vegetation: GRSG Objectives and Actions

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Vegetation: GRSG Objectives and Actions				
All HMAs: Various objectives and management actions **PHMA (Goal, Objective, or MA):** The desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush canopy cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6). (Slight variations between plans, no quantitative objective for Butte and UMRBNM) **PHMA**: Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) a high priority for restoration efforts in PHMA. Prioritize areas for juniper removal to benefit GRSG habitat. (Slight variation between plans, juniper not only issue in MT/Dak). **MA (All HMAs):** Conifers encroaching into sagebrush habitats will be removed, in a manner that considers tribal cultural values. Treatments will be prioritized closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and principles like those included in the Fire and Invasives Assessment Tool (FIAT) report (Chambers, et al. 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated. (Slight variations between plans, no FIAT analysis for MT/Dak) **PHMA:** Treatment actions (Slight variations between plans)		**Retain existing objectives and management actions, but edit or add to ensure the following direction is contained:** **VEG OBJ-X (PHMA):** The desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush canopy cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6). **VEG OBJ-Y (PHMA):** Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) a high priority for restoration efforts in PHMA. Prioritize areas for conifer removal to benefit GRSG habitat. **MA (All HMAs):** Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal and cultural values, as well as other key resources (e.g., other SSS, including T&E, species, soils, etc.). Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where encroachment is phase 1 or phase 2. Use of site-specific analysis and tools will help refine the location for specific areas to be treated. **VEG MA-X (PHMA):** Treatments that conserve, enhance or restore GRSG habitat will be allowed as well as treatments that benefit other resources and do not adversely affect GRSG or their habitat.	

Table 21-25. Montana State-Specific Circumstances – Special Status Species: Surface Disturbing Activities in GRSG Habitat Objective

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species: Surface Disturbing Activities in GRSG Habitat Objective				
All HMAs: In undertaking BLM management actions and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the United States geological Survey (USGS) Report (see Appendix B, GRSG Conservation Buffer). [*Minor variations between plans, including if buffers are referenced, or not, in different program areas*] (Plans variable in including additional language such as: • Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix C. • Other resource uses within PHMA may be allowed pending project level environmental review provided that Mitigation, BMPs Guidelines, standard operating procedures (SOP), and RDFs are implemented, Impacts are evaluated as described in the GRSG Effects Analysis Process (Appendix I) and the project does not exceed the disturbance cap (Appendix E) and the goals for sage-grouse and sage-grouse habitat are not compromised.)		**Objective:** Limit overall surface disturbance and disruption that impacts GRSG habitat through factors such as the reduction, co-location, and siting of activities and occupancy, and the restoration and enhancement of habitat. Uses in HMAs should be neutral or beneficial to GRSG as determined by analysis for projects. Consider general management practices as well as specific approaches and management for each program area when considering projects in all HMAs. **Management Action (all HMAs):** For all activities, in undertaking BLM management actions and consistent with valid existing rights and applicable law in authorizing actions, the BLM will assess impacts to seasonal habitat and apply conservation measures and the mitigation hierarchy. Analyses for any individual action will apply best available science and consider the type and location of activities during implementation-level project analysis. BLM will apply applicable BMPs, design features, and COAs (see applicable appendices in existing plans) as needed and demonstrated through project analysis.		

Table 21-26. Montana State-Specific Circumstances – Wind, Solar, and Associated ROWs

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Utility Scale Solar and Wind (>20 MW and/or based on power supply to a community)				
PHMA: Exclusion **RHMA**: • Exclusion (Elk Basin, Cedar Creek, South Carter County, West Decker) • Avoidance (Outside Elk Basin in Billings) **GHMA**: • Avoidance • Exclusion (SD in winter habitat and within 1 mile of leks) **CHMA**: No similar action (No specific action in Butte. UMRBNM is Exclusion.)		**PHMA**: Exclusion **RHMA**: No similar action **GHMA**: No similar action **CHMA**: Avoidance	**PHMA**: Exclusion **RHMA**: • Exclusion (Cedar Creek, West Decker) • Same as GHMA (Billings) **GHMA**: • Exclusion o Within 3.3 km (2 miles) of active leks o UMRBNM o Crucial winter habitat • Avoidance o >2 miles from active leks **CHMA**: Avoidance	**PHMA**: • Exclusion o Within 3.3 km (2 miles) of active leks o UMRBNM o North Dakota o Crucial winter habitat • Avoidance o >2 miles from active leks **RHMA**: • Exclusion (Cedar Creek, West Decker) • Same as GHMA (Billings) **GHMA**: • Exclusion o UMRBNM o Crucial winter habitat • Avoidance o Within 3.3 km (2 miles) of active leks o Wind in HiLine per existing management actions • Open, subject to GRSG LUP objectives o >2 miles from active leks **CHMA**: Same as GHMA

Table 21-28. Montana State-Specific Circumstances – Fire and Fuels

Alternative 1 Summary	Alternative 2 Summary	Alternative 3	Alternative 4	Alternatives 5 and 6
Fire and Fuels				
All HMAs: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT Report objectives will be addressed and met; • a risk assessment to address how potential threats to GRSG habitat will be minimized Prescribed fire as vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality. (Slight variations between plans)		**All HMAs**: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT Report objectives will be addressed and met; • a risk assessment to address how potential threats to GRSG habitat will be minimized Prescribed fire as vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Remove MDs or clarify these only apply to WH&B's in Idaho (no WH&B HMAs in Dillon)		

21.2.4 Nevada/California

As noted in **Appendix 3** (GRSG HMA State-by-State Mapping Strategies) Nevada and California states developed their HMAs using a habitat prioritization model based on an intersection of seasonal habitat selection patterns and indices of space use to prioritize areas with varied relevance to GRSG. This model was initially developed for 2015 and is periodically updated with additional field data and advances in mapping products. An update of this model provided the base for HMA delineation in the 2019 planning effort. The model is currently being updated again and will incorporate GRSG survival metrics, which allow for the identification of population source areas. The latest version will be incorporated into this EIS following publication. The identification of source areas is unique to the States of Nevada and California, and the alternatives consider this draft data in both HMA identification and several management actions within this document. The role wildfire and invasive grasses play in the health of GRSG habitat in Nevada and California resulted in considering adjustments to several management actions focused on addressing these threats compared to the 2015 and 2019 decisions. Decisions being considered for amendment for these states are development of non-energy leasable minerals on lands where mining operations are currently authorized under 43 CFR Subpart 3715, 3802, or 3809, adjustment of allocation exception language considered in 2019, and clarification of application of perch deterrents and lek buffers to newly discovered leks.

Table 21-30. Nevada/California State-Specific Circumstances – Special Status Species

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species				
MD SSS 1: In PHMAs and GHMAs, work with the proponent/applicant, whether in accordance with a valid existing right or not, and use the following screening criteria to avoid effects of the proposed human activity on GRSG habitat. A. First priority—locate project/activity outside PHMAs and GHMAs B. Second priority—if the project/activity cannot be placed outside PHMAs and GHMAs, locate the surface-disturbing activities in non-habitat areas first, then in the least suitable habitat for GRSG I. In non-habitat, ensure the project/activity will not create a barrier to movement or connectivity between seasonal habitats and populations C. Third priority—collocate the project/activity next to or in the footprint of existing infrastructure	Same as Alternative 1 (no change made in 2019). A.	**MD SSS 1:** In PHMAs and GHMAs, work with the proponent/applicant, whether in accordance with a valid existing right or not, and use the following screening criteria to avoid effects of the proposed human activity on GRSG: A. First priority—locate project/activity outside PHMAs and GHMAs while avoiding and/or minimizing direct and indirect impacts to GRSG and/or their habitat; B. Second priority—if the project/activity cannot be placed outside PHMAs and GHMAs, locate and adjust the project/activity to: a. avoid and/or minimize indirect impacts to lekking and source areas (e.g., PHMA+ in Coates et al. HMA manuscript in review; See **Appendix 3**) by using topography and/or other available methods to negate or reduce auditory and visual intrusions; AND b. locate direct impacts (i.e., surface-disturbing activities) in non-habitat areas first, then in the least suitable habitat for GRSG without creating a barrier to movement or connectivity between GRSG seasonal habitats and populations. C. Third priority—collocate the project/activity next to or in the footprint of existing infrastructure.		

Table 21-31. Nevada/California State-Specific Circumstances – Fire and Vegetation

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Fire and Vegetation Actions				
Not included	Not included	**MD VEG X (new):** Use collaborative planning efforts (e.g., Cooperative Range Improvement Agreement, Local Area Working Groups, Shared Stewardship, etc.) to develop and implement habitat restoration and enhancement projects. Projects of this type will use expertise and ideas from entities such as local landowners, local GRSG working groups, permitted land users, and other federal, state, county, and private organizations. Input from interested partners will be solicited by BLM and considered in development of restoration projects.		
Objective Fire 3: Protect post-fire treatments in SFA first, followed by PHMAs outside of SFA, and then GHMAs from subsequent wildfires.	**Objective Fire 3:** Protect post-fire treatments in PHMAs first, followed by GHMAs from subsequent wildfires.	**Objective FIRE 3**: Protect post-fire treatments, source areas (e.g., see **Appendix 3**), or areas that are vulnerable to invasive annual grass conversion, including areas essential for connectivity, in PHMAs first, followed by similar areas in GHMAs from subsequent wildfires. Incorporate the best available science in the prioritization of post-fire treatments.		
Not included	Not included	**MD FIRE X (new):** Prioritize actions (pre-suppression, suppression, and rehabilitation) that support the persistence of GRSG source areas (e.g., see **Appendix 3**). Use the best available science (e.g., Doherty et al. 2022, Ricca and Coates 2020, Stringham et al. 2016, etc.) to identify habitats essential for maintaining current GRSG populations.		
MD FIRE 23: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • Why alternative techniques were not selected as a viable option • How GRSG goals and objectives will be met by its use • How the COT report objectives will be addressed and met • A risk assessment to address how potential threats to GRSG habitat will be minimized. Allow prescribed fire as a vegetation or fuels treatment, and it shall only be considered after the NEPA analysis for the burn plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific	Same as Alternative 1 (no change made in 2019).	**MD FIRE 23:** Use prescribed fire designed to reduce wildfire risk or improve GRSG habitat, only when there is no other feasible means to achieve the same or similar result. The NEPA analysis for project implementation will address: • Why alternative techniques were not selected as a viable option • How GRSG goals and objectives will be met by its use • How the COT report objectives, as updated, will be addressed and met • A risk assessment to address how potential threats to GRSG habitat will be minimized. Prescribed fire shall only be considered after the NEPA analysis for the project has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMAs (e.g., creation of fuel breaks, burning slash piles from conifer reduction treatments, burning high-elevation late brood-rearing habitat (e.g., restore senescent vegetation, etc.), used as a component with other treatment methods to combat annual grasses and restore native plant communities, etc.). Avoid prescribed broadcast burns in known GRSG winter habitat.		

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
fuels objectives that will protect GRSG habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Allow prescribed fire in known winter range, and it shall only be considered after the NEPA analysis for the burn plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	*(See above.)*	*(See above.)*		
MD FIRE 25: Design fuels treatments through an interdisciplinary team process to expand, enhance, maintain, and protect PHMAs and GHMAs. Fuel reduction techniques, such as prescribed fire and chemical, biological (including targeted grazing), and mechanical treatments, are acceptable. Use green strips and fuel breaks, where appropriate, to protect seeding from subsequent fires.	Same as Alternative 1 (no change made in 2019).	**MD FIRE 25:** Design fuels treatments such as, but not limited to, conifer or annual invasive grass removal through an interdisciplinary team process to expand, enhance, maintain, and protect PHMAs and GHMAs. Fuel reduction techniques, such as mechanical, chemical, and biological (including prescribed and targeted grazing) treatments and prescribed fire (see MD FIRE 23), are acceptable. Use green strips and fuel breaks, where appropriate, to protect treatment areas from subsequent fires. Use the best available science (e.g., Doherty et al. 2022, Ricca and Coates 2020, Stringham et al. 2016, etc.) to identify habitats essential for maintaining current GRSG populations.		

Table 21-32. Nevada/California State-Specific Circumstances – Non-Energy Minerals

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Non-Energy Minerals				
MD MR 25: Manage PHMAs as closed to new non-energy leasable mineral leasing (see Appendix A; Figure 2-7).	**MD MR 25:** Manage PHMAs as closed to new non-energy leasable mineral leasing, unless the new non-energy leasable mineral lease meets one of the allocation exception criteria outlined in MD SSS 5 (see Appendix A; Figure 2-7).	**MD MR 25:** Manage PHMA as closed to new non-energy leasable mineral leasing.	**MD MR 25:** Manage PHMAs as closed to new non-energy leasable mineral (e.g., phosphate, sodium, potassium, sulfur, etc.) leasing, unless the new non-energy leasable mineral lease meets one of the allocation exception criteria outlined in MD SSS 5 (see Appendix A; Figure 2-7, in the 2019 NV/CA ARMPA) or the new non-energy leasable mineral has coincident occurrence within existing disturbance and is subject to a non-competitive lease. No additional direct or indirect impacts shall result from extraction of the new non-energy leasable mineral.	

Table 21-33. Nevada/California State-Specific Circumstances – Allocation Exception Criteria

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Allocation Exception Criteria				
{*MD SSS 5 in the 2015 NV/CA ARMPA addressed designation and management of SFAs. In the 2019 effort the SFAs were removed. This management action number was then used for the Allocation Exception Criteria. In this effort, SFAs are addressed as a cross-cutting topic in the HMA actions above. The management number here is less important than the management being considered. Under the 2015 NV/CA ARMPA, there was no specific action that provided exception criteria for allocations.*} **MD SSS 5:** Designate SFA, as shown on Figure 1-3 (of the NV/CA 2015 ARMPA) (2,797,400 acres). SFA will be managed as PHMAs, with the following additional management: • Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights	**MD SSS 5 (Allocation Exception Criteria):** In PHMA, GHMA, and OHMA, the State Director may grant an exception to the allocations and stipulations described in Table 2-1 (of the 2019 NV/CA ARMPA): Comparative Summary of Alternatives if one of the following applies (in coordination with NDOW, SETT, and/or CDFW): i. The location of the proposed activity is determined to be unsuitable (by a biologist with GRSG experience using methods such as Stiver et. al. 2015, as revised) and lacks the ecological potential to become marginal or suitable habitat; and will not result in direct, indirect, or cumulative impacts on GRSG and its habitat. Management allocation decisions will not apply to those areas	**MD SSS 5 (Allocation Exception Criteria):** In PHMA, GHMA, and OHMA, the State Director (in coordination with NDOW, SETT, and/or CDFW) may grant an exception to the allocation decisions (described in Table 2-1: Summary of Allocation Decisions by GRSG Habitat Management Areas, in the 2019 NV/CA ARMPA and potentially amended through this planning effort in **Section 2.5.2**) if one of the following applies: i. {Consideration of non-habitat is removed from this section and addressed in **Section 2.5.2**, Criteria-Based Management for Non-Habitat within GRSG Habitat Management Areas. See that section for comparable language for these alternatives.} ii. The proposed activity will be authorized to address federal, state, or local government public health and safety concerns, specifically as they relate to preventing an emergency or responding to a catastrophic event such as a flood, wildfire, or earthquake. iii. The proposed activity is determined to be a routine administrative function conducted by federal, state or local governments, including renewal or reauthorization of prior existing uses, valid existing rights and existing infrastructure (i.e., rights-of-way for roads) or expansion of existing county or local government infrastructure that serves a public purpose and will have no adverse impacts on GRSG and its habitat, or is in compliance with BLM mitigation policy, CEQ regulations (40 CFR Part 1508.1(s) and the State's mitigation policy (NAC 232.400-480). iv. Exceptions to non-disposal or exchange of lands that are identified for retention in Appendix A, Figure 2-12 (in the 2019 NV/CA ARMPA) could be considered if (a) the lands in question are identified for disposal through previous planning efforts or address a Congressional Acts (e.g., the respective Lincoln and White Pine County Conservation, Recreation, and Development Acts) and are in conformance with State law (e.g., NAC 232.400-480), or (b) the agency can demonstrate that the disposal, including land exchanges, will have no adverse direct, indirect or cumulative impacts on GRSG and its habitat.	

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing • Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	determined to be unsuitable if the area has passed a threshold and lacks the ecological potential to become marginal or suitable habitat. ii. The proposed activities impacts will be offset to result in no adverse impacts on GRSG or its habitat, through use of the mitigation hierarchy and the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). In cases where exceptions may be granted for projects with a residual impact, voluntary compensatory mitigation consistent with the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law) will be one mechanism by which a proponent achieves the Approved RMPA goals, objectives, and exception criteria. When a proponent volunteers compensatory mitigation as their chosen approach to address residual impacts, the BLM will incorporate those actions	*(See above.)*		

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	into the rationale used to grant an exception. The final decision to grant a waiver, exception, or modification will be based, in part, on criteria consistent with the State's GRSG management plans and policies. iii. The proposed activity will be authorized to address public health and safety concerns, specifically as they relate to federal, state, local government and national priorities. iv. Renewals or re-authorizations of existing infrastructure in previously disturbed sites or expansions of existing infrastructure that do not result in direct, indirect, or cumulative impacts on GRSG and its habitat. v. The proposed activity is determined to be a routine administrative function conducted by federal, state or local governments, including prior existing uses, authorized uses, valid existing rights and existing infrastructure (i.e., rights-of-way for roads) that serve a public purpose and will have no adverse impacts on GRSG and its habitat, consistent with the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of	*(See above.)*		

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
(See above.)	Nevada regarding compensatory mitigation, consistent with federal law). vi. Exceptions to non-disposal or exchange of lands that are identified for retention in Appendix A, Figure 2-12 could be considered if (a) they are identified for disposal through previous planning efforts or address a Congressional Acts (e.g., the respective Lincoln and White Pine County Conservation, Recreation, and Development Acts), (b) the agency can demonstrate that the disposal, including land exchanges, will have no adverse direct, indirect or cumulative impacts on GRSG and its habitat, or (c) adverse impacts on GRSG or its habitat will be offset, through use of voluntary compensatory mitigation, consistent with the States' mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law).	*(See above.)*		

Table 21-34. Nevada/California State-Specific Circumstances – Lek Buffers

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Lek Buffers				
MD LR 17: Within 4 miles of active and pending leks in GRSG habitat, require ROW, permit, and lease holders to retrofit those portions of power lines and other utility structures with nesting and perch- deterring devices. Do this during the renewal and amendment process if adverse effects, such as increased nest predation, on GRSG populations have been documented. This requirement shall be predicated on research and monitoring studies specific to power lines or other utility structures.	Same as Alternative 1 (no change made in 2019).	**MD LR 17:** Within 4 miles of active and pending leks, require ROW, permit, and lease holders to retrofit those portions of power lines and other utility structures with nesting and perch- deterring devices. Do this during the renewal and amendment process. Monitor and maintain perch-deterring effectiveness through the life of the structures following guidance from scientifically accepted protocols.		
Concept not included.	Concept not included.	**MD SSS 18 (new**) – (insert after MD SSS 17, then move subsequent MDs down a number): If an Active or Pending Active lek is identified in an area outside of PHMA or GHMA lek buffer-distances will be applied as described in Appendix B (of the 2019 NV/CA ARMPA) to avoid direct and indirect impacts to lek activity and habitat. Active or Pending Active leks not included in the HMA model will be added when the model is updated.		

21.2.5 Oregon

State specific circumstances for the State of Oregon include management of 18 Areas of Critical Environmental Concern/Research Natural Areas (ACEC/RNA) as "Key RNAs" or "Key ACECs", as well as management of saleable minerals/mineral materials in GRSG HMAs. This amendment effort is limited to RMP-level actions needed to provide guidance for subsequent implementation-level actions. The land use allocation will be identified in the ROD, but if public lands are disposed of or devoted to a public purpose which precludes livestock grazing, a site-specific NEPA and a site-specific decision process pursuant to the Taylor Grazing Act and 43 C.F.R. 4100.4-2 is necessary to cancel permits and/or removal of livestock from these areas.

Key ACECs/RNAs

The 2015 Oregon GRSG ARMPA designated the entirety of fifteen (15) existing Areas of Critical Environmental Concern/Research Natural Areas (ACEC/RNAs) as "Key RNAs" and all of three additional ACECs as "Key ACECs" (see 2015 ARMPA Special Designations Objective SD 4 and Table 2-6). The 2015 Oregon ARMPA also allocated all or portions of thirteen Key RNAs as unavailable to livestock grazing. Two ACEC/RNAs are already unavailable to livestock grazing; Foster Flat in Three Rivers Field Office under the 1992 Three Rivers RMP and Guano Creek-Sink Lakes in Lakeview Field Office by a 1998 act of Congress. The three ACECs and fifteen ACEC/RNAs were designated in various, underlying district Resource Management Plans (RMPs) prior to the 2015 amendment.

During the 2019 GRSG RMP amendment process, BLM Oregon proposed and analyzed a reversal of the 2015 decision to make all or portions of the 13 key RNAs (excluding the two ACEC/RNAs allocated as unavailable to livestock grazing under the 1992 Three Rivers and 2003 Lakeview RMPs) available to livestock grazing. However, the 2019 GRSG ARMPA retained the Key RNA designations, along with the applicable Management Objectives and Management Direction (BLM OR 2019 FEIS; Pages 2-8 and 2-9). **Table 21-35** below displays, as Alternatives 1 and 2 respectively, the 2015 and 2019 estimated acreages available or unavailable to livestock grazing, along with anticipated changes to the number of Animal Unit Months (AUMs) affected by the availability/unavailability decisions.

Alternatives 3, 4, 5, and 6 are based upon changed habitat management area boundaries. In 2022, ODFW informed BLM that they were going to update core and low density HMA s. The timeline outlined by ODFW for updating and approving Core- and Low-Density areas was inconsistent with the EIS analysis process. Therefore, after coordination with the state, BLM used ODFW's published methodology and data up through the 2022 field season to estimate likely core habitat and draft PHMA map.

Under Alternative 3, all proposed PHMA and GHMA from Alternative 4 would become PHMA and be allocated as unavailable to livestock grazing, including all of the 13 key RNAs. The mapping process referenced above became the basis for BLM's proposed PHMA and GHMA designations in Alternative 4. This alternative would retain the 2015 decision that makes all or portions of the 13 key RNAs as unavailable to livestock grazing. Alternatives 5 and 6 propose management clarifications and changes to areas unavailable to livestock grazing. The updated Key RNAs and revised portions allocated as unavailable to livestock grazing would continue to be managed over the long term to meet the objectives established by the 2015 ARMPA and to reflect a diversity of vegetative communities that are representative of important GRSG habitat needs.

Under Alternatives 5 and 6, modifications to areas allocated as unavailable to livestock grazing in the 13 key RNAs are based on district-generated, site-specific information. The proposed modifications vary by individual Key RNA and reflect site specific vegetation or habitat conditions in those areas (**Table 21-35**

below). In most cases, the Key RNA designation and objectives to provide opportunities for research and serve as a broad spectrum of vegetation communities across GRSG habitat are retained. Additionally, the BLM is proposing eliminating or modifying certain portions or all of areas within Key RNAs that were allocated as unavailable to livestock grazing, to avoid resource conflicts. These conflicts include but are not limited to constructing fences in proximity to cultural sites, within 1.2 miles of an occupied or pending lek (a conformance violation of the 2015 ARMPA) or within existing designated Wilderness Study Areas. Under Alternatives 5 and 6, and depending on the specific Key RNA, the area presently allocated as unavailable to livestock grazing under the 2015 ARMPA may be reallocated to livestock grazing or the size and/or location of the area excluded from grazing may be modified.

The alternatives below present the range of alternatives for management of the Key RNAs/Key ACECs.

Table 21-35. Oregon Key RNAs – Summary of Estimated Acres and AUMs by Alternative[1]

RNA Name	District	Total Acres of the Key RNA	Alternative 1		Alternative 2		Alternative 3		Alternative 4		Alternatives 5 and 6

Notes:

1 – Acreage estimates and AUM estimates/calculations have been updated from the 2015 ARMPA ROD .

2 – Black Canyon ACEC/RNA acres were reduced by 40 acres to reflect corrections in GIS of the boundary.

3 – The Oregon 2015 ARMPA estimated that 47 AUMs may be removed based strictly on the change in acreage. The 2019 RMPA used the same estimate of 47 AUMs. Alternatives 1 and 2 reflect the numbers from the prior EISs. This key RNA has been excluded from the allotment and pasture through an administrative process; no change to permitted AUMs is necessary because the remaining pasture can support the estimated 47 AUMs associated with the key RNA made unavailable to livestock grazing.

4 – Estimated AUMs for Alternatives 5 and 6 associated with the area allocated as 'unavailable to livetock grazing' would be absorbed in portions of the associated pasture and/or allotment in which the Key RNA exists. Site-specific monitoring would inform if AUMs cannot be absorbed, with site-specific NEPA and grazing decisions to implement any reductions in AUMs as a result of implementing removal of livestock from those areas allocated as unavailable to livestock grazing as a result of this alternative.

5 – The 2015 and 2019 estimates of acres used the Guano Creek Wilderness Study Area boundary. The Guano Creek-Sink Lakes ACEC/RNA is much smaller and contained entirely within the larger WSA boundary. The corrected acres reflect just the ACEC/RNA portion that is, and would continue to be, unavailable to livestock grazing use under all alternatives.

6 – Lakeridge key RNA would become available for livestock grazing, however a 13-acre area adjacent to the 2015 ARMPA identified Lakeridge key RNA and still within the ACEC/RNA would be available for research and would be unavailable to livestock grazing.

7 – Mahogany Ridge ACEC/RNA is divided into two "Parcels", totaling 622 acres. The southern parcel is 476 acres; the Key RNA is located solely in the southern parcel and totals 155 acres. In Alternatives 5 and 6, OR/WA BLM proposes 140 acres be retained as Key RNA and allocated as unavailable to livestock grazing. 15 acres would be outside of the Key RNA under this alternative and reallocated to available to livestock grazing.

8 – South Bull Canyon data has been revised based on district specific information resulting from assessments made during the closure process. The entire ACEC/RNA acreage is 770 of which 749 acres were designated as Key RNA (and allocated as unavailable to livestock grazing). The acres that would be allocated as available to livestock grazing under Alternatives 5 and 6 is the proposed new exclosure (and retention of unavailable allocation) subtracted from the 2015 Key RNA (749 minus 257 = 492)

9 – Exception criteria would be have to be met for construction of exclosure fencing within WSA or increased management presence would be needed.

Table 21-36. Oregon State-Specific Circumstances – Research Management Areas

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Research Natural Areas				
Objective SD 4: Manage key RNAs, or large areas within the RNAs, as undisturbed baseline reference areas for the sagebrush plant communities they represent that are important for Greater Sage-grouse. Manage key RNAs for minimum human disturbance allowing natural succession to proceed.	**Objective SD 4:** Manage the Foster Flat and Guano Creek–Sink Lakes RNAs as undisturbed baseline reference areas for the sagebrush plant communities they represent that are important for Greater Sage Grouse. Minimize human disturbance in all 15 key RNAs, allowing natural ecological processes to proceed.	**Objective SD 4:** Manage Key RNAs, or large areas within the RNAs, as baseline reference areas for sagebrush plant communities they represent that are important to Greater Sage-grouse. Active or passive restoration actions are allowed within Key RNAs to support maintenance or improvement of identified vegetation communities and to meet GRSG habitat objectives.		
MD LG 1: All or portions of key RNAs will be unavailable to grazing (see **Table 21-35** above). Determine whether to remove fences, corrals, or water storage facilities (e.g. reservoirs, catchments, ponds).	**MD LG 1** is deleted. Livestock grazing management in the 13 key RNAs returns to being governed by applicable district RMPs as amended by the 2015 Oregon Greater Sage-Grouse ROD/ARMPA goals, objectives, and management decisions.	**MD LG 1:** All, some, or none of key RNAs will be unavailable to livestock grazing (see **Table 21-35** above). Determine whether to remove, modify or construct additional fences, corrals, or water storage facilities (e.g. reservoirs, catchments, ponds). New proposed water-related range improvements (springs, pipelines, troughs, etc.) may be authorized where existing critical water development is no longer accessible as a result of implementing areas within the Key RNAs as unavailable to livestock grazing.		
All or part of Key RNAs identified would be closed to all disturbance types, including livestock grazing, OHV, minerals development, and lands and realty actions. The reason for these closures would be for research-related activities, including studying vegetative communities important to GRSG that do not contain land disturbing activities, as well as studying the effects of climate change on these vegetative communities.	RNAs remain subject to management to promote the key characteristics of the RNAs, including regulation of grazing, to maintain and promote the key characteristics of the RNAs.	Key RNAs and all PHMA areas allocated as unavailable to livestock grazing.	Key RNAs and areas allocated as unavailable to livestock grazing to facilitate the ability to compare un-grazed vegetation types to grazed vegetation types.	

Table 21-37. Oregon State-Specific Circumstances – Saleable Minerals/Mineral Materials

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Saleable Minerals/Minerals Management				
MD MR 14: PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: • The activity is within the Oregon PAC (also called BSU, and is the same footprint as PHMA) and project area disturbance cap. • The activity is subject to the provisions set forth in the mitigation framework in Appendix F (in the 2015 OR GRSG ARMPA). • All applicable required design features are applied and the activity is permissible under screening criteria (see SSS 13 in the 2015 OR GRSG ARMPA). Federal Highway Act material sites are a ROW and not subject to mineral sale requirements. See ROW section for management (MD LR 7 in the 2015 OR GRSG AMPRA).	Same as Alternative 1 (no change made in 2019).	**MD MR 14:** PHMA are closed to new mineral material sales.	Same as Alt 1, with the following addition: If BLM's NEPA analysis determines that the use or expansion of an existing, authorized material site (up to the entire footprint of the existing authorized area) could be implemented without significant impacts (i.e., upon completion of an Environmental Assessment, BLM determines that a FONSI is applicable) and the applicable area has not met the disturbance cap, BLM is authorized to implement without further analysis or mitigation.	

21.2.6 Utah

The BLM will address GHMA management as a Utah state-specific circumstance. HMA management in Utah is a result of different approaches to planning in the 2015 and 2019 Utah GRSG RMP amendments. In the BLM's 2019 GRSG ARMPA, the BLM increased habitat management area alignment with the State of Utah's Sage-Grouse Management Areas (SGMAs) and prioritized the importance of management prescriptions on PHMA. This was to focus protection on seasonal habitats that support over 95 percent of GRSG populations in Utah, and removed GHMA designation and management. .

The state-specific circumstances for the State of Utah being addressed in this effort is the result of the 2019 amendment effort. The remainder of this section includes management alternatives specific to GHMA in Utah under alternatives 4, 5 and 6. Refer to **Appendix 2** for specific language from the 2015 and 2019 amendments, and **Appendix 3** for additional information on the Utah approaches for identifying habitat management areas.

Table 21-38. Utah State-Specific Circumstances – General Habitat Management Areas

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Special Status Species (SSS)				
MA-SSS-5: In GHMA, apply the following management to meet the objective of a net conservation gain for discretionary actions that can result in habitat loss and degradation: A- Existing Management: Implement GRSG management actions included in the existing RMPs and project specific mitigation measures associated with existing decisions. B- Net Conservation Gain: In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Exceptions to net conservation gain for GRSG may be made for vegetation treatments to benefit Utah prairie dog. Mitigation will be conducted according to the mitigation	**MA-SSS-5:** No similar action.	**MA-SSS-5:** No similar action.	**MA-SSS-5:** In GHMA, apply the following management to meet a minimum standard of no net loss for discretionary actions that can result in habitat loss and degradation: A- Existing Management: Same as Alternative 1. B- Net Conservation Gain: Apply a minimum standard of no net loss consistent with cross-cutting language. Refer to Mitigation in **Table 21-4**. C- Buffers: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will assess and address impacts within the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239; Manier et al. 2014) in accordance with Appendix B, Applying Lek-Buffer Distances (Utah 2019 ARMPA). D- Required Design Features/Best Management Practices: Same as Alternative 1.	**MA-SSS-5:** Same as Alternative 4

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
framework contained in Appendix F (Utah 2015 ARMPA). C- Buffers: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239; Manier et al. 2014) in accordance with Appendix B (Utah 2015 ARMPA). D- Required Design Features/Best Management Practices: In GHMA, apply the fluid mineral RDFs that are associated with GHMA identified in Appendix C (Utah 2015 ARMPA) when authorizing/permitting site-specific fluid mineral development activities/projects. The applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site specific circumstances, some RDFs may not apply to some projects and/or may require slight variations. All variations in RDFs will require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity:	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
• A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g. due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*
MA-SSS-6 <u>Sage-Grouse Management Outside PHMA/GHMA</u> Proposed projects within State of Utah SGMA and USFWS priority areas for conservation (PAC), as well as adjacent to PHMA outside these areas, will consider impacts on GRSG and implement measures to mitigate impacts when preparing site-specific planning and environmental compliance documents. Outside of PHMA, prior to site-specific authorizations, the BLM will evaluate habitat conditions and may require surveys to determine if the project area contains GRSG habitat (FLPMA, 43 United States Code (USC) 1701 Sec. 201 (a); BLM Manual	**MA-SSS-6:** <u>Sage-Grouse Management Outside PHMA</u> Outside PHMA, implement GRSG management actions included in the RMPs and project-specific mitigation measures associated with decisions that predated the 2015 amendments. Proposed projects within State of Utah SGMA and USFWS PACs, as well as adjacent to PHMA outside these areas, will consider impacts on GRSG and may implement measures to mitigate impacts on GRSG populations within adjacent PHMA when preparing site-specific planning and environmental compliance documents.	**MA-SSS-6:** Same as Alternative 2.	**MA-SSS-6**: Same as Alternative 2 but applying management to areas outside GHMA based on amended GHMA boundaries.	**MA-SSS-6:** Same as Alternative 4.

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
6840.04 D3; BLM-M-6840.04 E2). Surveys will be required prior to authorizing discrete anthropogenic disturbances within 4 miles of an occupied lek that is located in PHMA, but only in existing sagebrush. If an area is determined to be GRSG habitat (e.g., nesting, brood-rearing, winter, transition), mitigation will be considered as part of the project level NEPA analysis and will be attached as conditions of approval to new discretionary actions, if deemed necessary to protect the habitat (BLM Manual 6840.04 D 5). Measures that may be considered include those identified in Appendix C. (Utah 2015 ARMPA) Outside of PHMA, but within SGMAs and PACs, avoid removal of sagebrush and minimize development that creates a physical barrier to GRSG movement; these areas may be used by GRSG to connect to other populations or seasonal habitat areas. Exceptions shall be made for vegetation treatments to benefit Utah prairie dog, where the landscape will be managed for both species. Outside of PHMA, but within SGMAs and PACs, consider noise and permanent structure stipulations around leks. Outside PHMA, portions of State of Utah opportunity areas (see	Outside of PHMA, but within SGMAs and PACs, avoid removal of sagebrush and minimize development that creates a physical barrier to GRSG movement; these areas may be used by GRSG to connect to other populations or seasonal habitat areas. Exceptions shall be made for vegetation treatments to benefit Utah prairie dog, where the landscape will be managed for both species. Outside of PHMA, but within SGMAs and PACs, consider noise and permanent structure stipulations around leks. Outside PHMA, after analyzing the impacts using the buffer distances identified in Appendix B (Utah 2019 ARMPA) from a lek that is located in PHMA, portions of State of Utah opportunity areas will be managed with the following allocations: • Fluid minerals will be open for leasing with CSU stipulations (noise and tall structures). • Lands ROWs, permits, and leases will be avoided, applying avoidance criteria for noise and tall structures. Avoid siting wind energy development in opportunity areas within the buffer distances identified in Appendix B (Utah 2019 ARMPA) from occupied GRSG leks that are in PHMA, if the lek buffer analysis as identified in Appendix B (Utah 2019	*(See above.)*	*(See above.)*	*(See above.)*

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Utah 2015 Final EIS Map 2.4) within 4 miles of a lek that is located in PHMA will be managed with the following allocations: • Fluid minerals will be open for leasing with CSU stipulations (noise and tall structures). • Lands ROWs, permits, and leases will be avoided, applying avoidance criteria for noise and tall structures. Do not site wind energy development in opportunity areas within 5 miles from occupied GRSG leks that are in PHMA. Outside of PHMA, avoid and minimize effects from discrete anthropogenic disturbances in areas that have been treated with the intent of improving or creating new GRSG habitat. Evaluate conditions in the treated area to determine if it is providing habitat for GRSG and if additional measures are necessary to protect the habitat.	ARMPA) shows that siting wind energy development in opportunities areas will impact lek persistence within PHMA. Outside of PHMA, avoid and minimize effects from discrete anthropogenic disturbances in areas that have been treated with the intent of improving or creating new GRSG habitat. Evaluate conditions in the treated area to determine if it is providing habitat for GRSG and if additional measures are necessary to protect the habitat. Outside of PHMA, provide that acres of GRSG seasonal habitat (based on best available maps, then confirmed to be regularly used by GRSG Grouse to sustain one or more seasonal habitat requirements through coordination with the appropriate State of Utah agency and through on-the-ground information) that is lost to habitat degradation actions (Appendix C, Table C.2 of the Utah 2015 ROD/ARMPA) are replaced by creating/improving GRSG habitat within PHMA.	*(See above.)*	*(See above.)*	*(See above.)*

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Changes to Other Sections/Management Actions				
The following management actions include a reference to GHMA, usually just pointing to the GHMA polygons or in a prioritization approach (see **Appendix 2**, Utah existing GRSG management): • MA-SSS-1 • MA-FIRE-8 • MA-LG-1 • MA-LG-5 • MA-WHB-2 • Objective MR-1 • MA-MR-20 • MA-MR-24 • MA-RE-1	No GHMA in Utah under these alternatives, so no similar action.		Same as Alternative 1, but with the inclusion of the changes by alternative described in the rangewide alternatives (**Section 2.5**), including the updated GHMA boundaries described under Alternatives 4, 5 and 6.	
The following management actions include a reference to GHMA, only include a reference to GHMA that references application of MA-SSS-5. • MA-MR-1 • MA-MR-4 • MA-MR-14 • MA-MR-16 • MA-MR-23 • MA-LR-7	No GHMA in Utah under these alternatives, so no similar action.		Same as Alternative 1, by applying the amended MA-SSS-5 language described above and the updated GHMA boundaries described under Alternatives 4, 5, and 6.	

21.2.7 Wyoming

Wyoming's Alternatives 5 and 6 are considering Stewardship Habitat Management Areas (SHMA) in addition to PHMA and GHMA. The SHMA designation is being applied in northeastern Wyoming where private landowners worked with the State of Wyoming to establish management objectives and approaches.

The remainder of this section includes the alternatives related to the applicable management actions associated with SHMA. Because these areas are only being considered under Alternative 5 and 6, there is no corresponding actions under Alternatives 1-4.

Table 21-39. Wyoming State-Specific Circumstances – Additional Habitat Management Area

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Habitat Management Area Alignments				
Not applicable	Not applicable	Not applicable	Not applicable	Stewardship Habitat Management Areas (SHMAs) as defined for Wyoming are GRSG habitats that are generally characterized by large percentages of private land, existing disturbance and prior and existing rights, and fragmented landscapes but that continue to support substantial populations of GRSG, provide important connections between populations, and are important for maintaining GRSG populations. Management in SHMA is consistent with GHMA restrictions.
Major Land Use Allocations				
Not applicable	Not applicable	Not applicable	Not applicable	Allocations in SHMA same as GHMA restrictions as proposed for Alternatives 5 and 6 in the cross-cutting topics above.
Fluid Mineral Leasing/Development				
Not applicable	Not applicable	Not applicable	Not applicable	Fluid mineral leasing/development in SHMA same as proposed for Alternatives 5 and 6 in the cross-cutting topics above.
Waivers, Exceptions, and Modifications (WEMs)				
Not applicable	Not applicable	Not applicable	Not applicable	WEMs in SHMA same as those proposed for active leks in GHMA for Alternatives 5 and 6 in the cross-cutting topics above.
Mitigation				
Not applicable	Not applicable	Not applicable	Not applicable	Mitigation in SHMA same as proposed for Alternatives 5 and 6 in the cross-cutting topics above.
Wind/Solar and Major ROWs				
Not applicable	Not applicable	Not applicable	Not applicable	Wind/Solar and Major ROWs in SHMA same as proposed for GHMA in Alternatives 5 and 6 in the cross-cutting topics above.
Adaptive Management				
Not applicable	Not applicable	Not applicable	Not applicable	Adaptive management in SHMA same as proposed for GHMA.
Application of Habitat Objectives				
Not applicable	Not applicable	Not applicable	Not applicable	Application of Habitat objectives in SHMA same as proposed for Alternatives 5 and 6 in the cross-cutting topics above.
Disturbance Caps				
Not applicable	Not applicable	Not applicable	Not applicable	Not applicable (disturbance caps in SHMA same as current GHMA)
Threats from Predation				
Not applicable	Not applicable	Not applicable	Not applicable	Threats from predation in SHMA same as proposed for PHMA for Alternatives 5 and 6 in the cross-cutting topics above.
Livestock Grazing				
Not applicable	Not applicable	Not applicable	Not applicable	Livestock grazing in SHMA same as proposed for PHMA for Alternatives 5 and 6 in the cross-cutting topics above.
Wild Horse and Burro Management				
Not applicable	Not applicable	Not applicable	Not applicable	Wild horse and burro management in SHMA same as proposed for PHMA for Alternatives 5 and 6 in the cross-cutting topics above.

Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternatives 5 and 6
Additional Management Considerations				
Not applicable	Not applicable	Not applicable	Not applicable	In partnership with appropriate Federal and State Agencies and landowners and their representatives, encourage the development and implementation of landowner-led conservation benefit agreements in SHMA that focus on ensuring the long-term viability of GRSG populations in the area, and at a minimum identify key habitats and linkages, potential threats to GRSG and its habitat, appropriate conservation measures, and an avoid/minimize/compensate strategy that identifies mitigation opportunities within the boundaries of SHMA.
Not applicable	Not applicable	Not applicable	Not applicable	Because the functional movement (i.e., movements that result in genetic connectivity) of GRSG likely occurs among leks, encourage the establishment of conservation benefit agreements that include management measures specific to maintaining active leks in SHMAs.
Not applicable	Not applicable	Not applicable	Not applicable	Support research that identifies habitat conditions that promote or limit the movement of GRSG through a landscape to better inform management of SHMAs. Research supported by BLM and partners should be actionable.
Not applicable	Not applicable	Not applicable	Not applicable	Encourage the development and implementation of invasive vegetation – including encroaching native species – management strategies in SHMA. Strategies should be inclusive of all private and public land managers and include, but not be limited to: engagement of all pertinent stakeholders, inventory and monitoring requirements, prioritization approaches, treatment and removal options, restoration (to include site-specific management of livestock), responses to wildfire, and an adaptive management framework.
Not applicable	Not applicable	Not applicable	Not applicable	Work with the appropriate State and Federal agencies to establish wildfire response in SHMA at the same priority as protection of property.
Not applicable	Not applicable	Not applicable	Not applicable	To minimize impact of predators to GRSG, encourage the development of a predator management plan in SHMA. Plans should include, but not be limited to: coordination requirements with appropriate State and Federal agencies if implementation of the plan becomes necessary, assessments of habitat conditions and relationships with predator populations and impacts to GRSG, anthropogenic structure design details to reduce opportunities for corvid and raptor perching and nesting, disposal options for anthropogenic food subsidies, approaches for addressing predation from domestic pets, descriptions of concurrent management actions required to address GRSG survival concerns long-term (for example, habitat enhancement), and monitoring requirements.

22-4 Correspondence Submitted on the Draft RMPA/EIS Containing Unique Content 22-120

Appendix 22. Draft RMPA/EIS Public Outreach and Responses to Substantive Public Comments

This appendix details the BLM's public comment period on the Draft RMPA/EIS and summarizes and provides responses to all substantive public comments received.

22.1 Draft RMPA/EIS Comment Process

Section 202 of the Federal Land Policy Management Act, as amended, the National Environmental Policy Act (NEPA), as amended, the Council on Environmental Quality NEPA implementing regulations at 40 CFR 1500, the Department of the Interior NEPA Implementing regulations at 43 CFR 46, and BLM's Resource Management Planning (RMP) regulations at 43 CFR 1610.2 all guide public involvement in the BLM's RMP and NEPA processes. All comments received before reaching a decision must be considered to the extent feasible. Specifically, for Environmental Impact Statements (EIS), agencies must respond to all substantive written comments submitted during the public comment period (40 CFR 1503.4). Non-substantive comments are reviewed and considered by the BLM, but only substantive comments are responded to. To merit a written response, comments must be in writing (including paper or electronic format), substantive, and timely.

22.1.1 Public Comment Period

BLM published a Notice of Availability (NOA) of Draft RMPA/EIS in the *Federal Register* on March 14, 2024, on the same day as the Environmental Protection Agency's NOA in the *Federal Register*, initiating a 90-day comment period that ended on June 13, 2024. As required by the BLM RMP regulations in place at the time of publication at 43 CFR 1610.7-2, the comment period also included a 60-day comment period on the Areas of Critical Environmental Concern (ACECs) being considered[1]. The BLM accepted written comments by mail, fax, email, and through an online comment form on the BLM's National NEPA Register (https://eplanning.blm.gov/eplanning-ui/project/2016719/510).

During the comment period, the BLM held two virtual public meetings and eleven in-person meetings throughout the planning areas (see **Table 22-1**, Public Meeting Summary).

Table 22-1. Public Meeting Summary

Meeting Date	Location	Meeting Time
April 9, 2024	Virtual/Zoom	1:00-3:00pm MT
April 11, 2024	Billings, MT	6:00-8:00pm MT
April 16, 2024	Reno, NV	6:00-8:00pm PT
April 17, 2024	Craig, CO	6:00-8:00pm MT
April 17, 2024	Lakeview, OR	6:00-8:00pm PT

[1] The 43 CFR 1610.7-2 regulations have been revised since the Draft RMPA/Draft EIS was issued. Under the revised regulations, the public comment and review period for ACECs is not specified in the regulation and would follow the same public comment and review period as specified and required for the associated RMP, RMP revision, or applicable RMP amendment.

Meeting Date	Location	Meeting Time
April 18, 2024	Cheyenne, WY	5:00-7:00pm MT
April 18, 2024	Boise, ID	5:00-7:00pm MT
April 18, 2024	Ontario, OR	6:00-8:00pm MT
April 22, 2024	Rock Springs, WY	5:00-7:00pm MT
April 23, 2024	Worland, WY	5:00-7:00pm MT
April 23, 2024	Salt Lake City, UT	6:00-8:00pm MT
April 24, 2024	Casper, WY	5:00-7:00pm MT
April 25, 2024	Virtual/Zoom	6:00-8:00pm MT

The BLM received a total of 39,307 comment letter submissions during the comment period, including approximately 6,000 individual comments. Most comment submissions were form letters, as detailed below.

BLM received some submissions past the close of the comment period, during the development of the GRSG Proposed RMPA/Final EIS. To the extent practicable, the BLM has considered these submissions received; however, late submissions are not addressed in the response to comments and are not summarized in this report.

22.1.2 Review of Public Comments

The BLM recognizes that commenters invested considerable time and effort to submit comments on the Draft RMPA/EIS. The agency utilized a systematic comment analysis method to ensure all timely comments were considered, as directed by CEQ, DOI NEPA regulations, and BLM's RMP regulations.

Table 22-2 summarizes the 39,307 comment letters by submittal type, and Table 22-3 summarizes comment submissions by delivery type. The BLM received most comment submissions via email, followed by those submitted through the National NEPA Registers (**Table 22-3**). The BLM also received hard-copy submissions at the scheduled public meetings and via mail.

Table 22-2. Comment Submissions, by Type

Submission Type	Number of Submissions
Unique submissions	557
Form letters	38,715
"Form plus" submissions	35
Total	**39,307**

Table 22-3. Comment Submissions, by Delivery Type

Delivery Type	Number of Submissions
BLM's National NEPA Register	845
Email	38,447
Hard-copy submission	15
Total	**39,307**

The BLM diligently considered each comment letter. The comment analysis process involved determining whether a comment was substantive or not substantive. According to the BLM NEPA Handbook (H-1790-1), a substantive comment does one or more of the following:

- Questions, with a reasonable basis, the accuracy of the information or analysis in the EIS
- Questions, with a reasonable basis, the adequacy of the information or analysis in the EIS
- Presents reasonable alternatives other than those in the Draft EIS that meet the purpose and need of the proposed action and address significant issues
- Questions, with a reasonable basis, the merits of an alternative or alternatives
- Causes changes in or revisions to the proposed action
- Questions, with a reasonable basis, the adequacy of the planning process itself

The BLM's NEPA handbook further specifies that substantive comments include comments on the adequacy of the analysis, comments that identify new impacts, alternatives, or mitigation measures, and disagreements of significance determinations. Comments that failed to meet the above description were considered and identified as not substantive.

On receipt, each comment letter was assigned an identification number and logged into a database that allowed the BLM to organize, categorize, and respond. Comments from each letter were coded to appropriate categories, based on content. The categories generally follow the sections presented in the Draft RMPA/EIS, though some related to the planning process or editorial concerns.

Some comments received throughout the comment analysis process expressed personal opinions or preferences, had little relevance to the adequacy or accuracy of the Draft RMPA/EIS, or represented commentary on management actions that are outside the scope of this NEPA analysis. These comments did not provide specific information to assist the BLM in making a change to the existing action alternatives, did not suggest new alternatives, and did not take issue with methods used in the Draft RMPA/EIS. These comments were considered and identified as not substantive. The BLM read, analyzed, and considered all comments of a personal or philosophical nature and all opinions, feelings, and preferences for one element or one alternative over another. However, because such comments were not substantive, the BLM has not prepared a written response to them.

Comments that recommended additional studies, data, or scientific literature to be incorporated into the analysis were reviewed by subject matter experts; new information and citations were incorporated into the Proposed RMP Amendment/Final EIS, as appropriate. Comments requesting editorial changes to the document were also reviewed and incorporated, as appropriate. The Proposed RMPA/Final EIS was technically edited and revised to fix typos, missing references, definitions, and acronyms, and to provide other clarifications as needed. Section 22.5 provides a list of all agencies, organizations, industry groups, and Tribal entities who submitted unique comments on the Draft RMPA/EIS and the topics addressed in their correspondence. Copies of these letters will also be posted to the project's National NEPA Register eplanning page at https://eplanning.blm.gov/eplanning-ui/project/2016719/510.

22.1.3 How this Appendix is Organized

This appendix is split up into two main sections: Rangewide Comment Responses and State-Specific Comment Responses. The Rangewide Comment Responses includes summaries and responses for categories of comments received that apply mostly rangewide. The State-Specific Comment Responses

section contains a summary of comments received specific to a particular state in the planning area and responses to those comments.

22.2 RANGEWIDE COMMENT RESPONSES

22.2.1 ACECs and RNAs

Summary: The BLM should clarify the information they would like to receive regarding the Areas of Critical Environmental Concern (ACECs) considered in the Draft RMPA/EIS.

Response: As stated in the announcements at the beginning of the public comment period in March 2024, comments are most useful that provide the BLM feedback concerning the adequacy and accuracy of the proposed alternatives, the analysis of their respective management decisions, and any new information that would help the BLM as they develop the plan. Your comments should be as specific as possible and include suggested changes, sources, methodologies, and references to a section or page number. Comments containing only opinion or preferences will be considered and included as part of the decision-making process; however, they will not receive a formal response from the BLM.

Summary: The BLM should/should not designate ACECs to protect GRSG as a part of this RMPA/EIS process.

Response: The BLM addresses ACECs when developing Resource Management Plans (RMPs), during RMP revisions, and when ACECs are within the scope of an RMP amendment (43 CFR 1610.7-2). The BLM considered ACECs as within the scope of this RMP amendment process as it is the mechanism by which relevant and important GRSG habitat attributes could be identified and protected and is consistent with the BLM ACEC and RMP regulations. Due to the GRSG conservation specific purpose and need for this planning effort, the BLM initiated an extensive internal review of updated scientific data to identify potential ACECs and solicited external nominations for areas that have relevant and important GRSG values may for potential designation as an ACEC (refer to Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat). In the DEIS, 32 areas were analyzed as potential ACECs under Alternatives 3 and 6. In the Proposed RMP Amendment/Final EIS, ACEC acreages were refined in some States; four ACECs were removed from consideration in Idaho; and one ACEC was removed from consideration in Nevada as result of updates and refinements in data. The identification, evaluation, and analysis of the effects of the alternatives on the nominated and proposed ACECs are described in Appendix 5. Chapters 3 and 4, Appendix 10, and Appendix 5 were updated and clarified in response to comments between the Draft EIS and Proposed RMP Amendment/Final EIS.

In response to public and cooperating agency comments and in consideration of important habitat factors such as connectivity, population strongholds, and the potential for threats from development, the BLM adjusted the Priority Habitat Management Areas (PHMA) allocation in the Proposed RMP Amendment/Final EIS and identified areas within PHMA that would benefit from management that will provide additional protection. These areas within PHMA would have more limited exceptions than the rest of PHMA. These areas are made up of 12 of the areas identified as ACECs under Alternatives 3 and 6 and are discussed in detail in Appendix 3, Greater Sage-Grouse Habitat Management Area State-by-State Mapping Strategies and Appendix 5. With this management direction that will provide additional protections, the relevant and important values in proposed ACECs will also be (refer to effects analysis in Appendix 5). In the Proposed RMP Amendment, the BLM is not proposing to designate any of the potential ACECs. Appendix 5 describes the effects of the alternatives (including the Proposed RMP Amendment) on the potential ACECs proposed for designation under Alternatives 3 and 6.

During the comment period on the Draft EIS, the BLM received 35 ACECs nominations. This included 30 nominations specific to Oregon, one nomination specific to Nevada, one that included portions of Oregon and Nevada, and three that included portions of Oregon, Nevada, and Idaho. BLM reviewed all of the nominations and determined they did not meet the relevance and importance criteria necessary to consider them as potential ACECs in the Proposed RMP Amendment/Final EIS.

The BLM Oregon reviewed the 30 nominations received for Oregon during the Draft EIS comment period and took the lead on addressing the four nominations that shared acreage in Idaho and Nevada. In evaluating the nominated ACECs the BLM found that the nominated areas did not meet the relevance and importance criteria. BLM Oregon's ACEC review, assessment, and evaluation process focused on the new GRSG scientific information on key population (e.g., Doherty et al. 2016, Coates et al., 2021b), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021c) and coordinated with state authorities (such as wildlife agencies) to identify and update GRSG habitat management areas (HMA). The BLM Oregon ACEC review, assessment, and evaluation process did not consider or consider in detail potential historic, cultural, scenic, or non-GRSG fish and wildlife values in accordance with the purpose and need for this planning effort. Nominations that addressed resource values beyond GRSG could be considered by the BLM during future planning efforts. Refer to Appendix 5 for additional detail on Oregon's evaluation process.

Nevada reviewed the one nomination received during the Draft EIS comment period that was specific to lands in Nevada and entailed the nomination of all Nevada Department of Wildlife Population Management Units (PMUs). The PMUs include all habitat management areas as well as areas of non-habitat within the Nevada and northeastern California sub-region. The BLM evaluated the PMUs and concluded that these areas generally meet the relevance criteria for fish and wildlife resource specific to GRSG, but did not meet the importance criteria of being more than locally significant. Because the nominated areas did not meet both relevance and importance criteria, and because GRSG habitat within the PMUs are already identified for GRSG-specific management, the BLM did not identify the PMUs as a potential ACEC.

Summary: The BLM should analyze an alternative that proposes designating the Sagebrush Sea nominated ACEC.

Response: The BLM considered the Sagebrush Sea nomination and the evaluation of the nomination is described in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat.

The BLM received the Sagebrush Sea ACEC nomination during scoping. This nomination includes approximately 48.2 million acres of BLM managed public land in the planning area. The nomination is based on sage-grouse priority areas of conservation referred to as PACs in the US Fish and Wildlife Service's (USFWS) 2013 Conservation Objectives Team Report (COT Report) as well as the 75% breeding density areas from Doherty, et. al 2010[2], as well as new Wyoming Core Area designations from 2015. From all those areas in Wyoming the nominators removed areas with a density of active oil and gas wells that exceeded five wells per square mile. For Nevada, the nominated area expanded beyond the PACs "to increase coverage of important seasonal habitats for [GRSG] and ensure connectivity between numerous

[2] Doherty, K.E., J.D. Tack, J.S. Evans, J.SN. and D.E. Naugle. 2010. Mapping breeding densities of greater sage-grouse: a tool for range-wide conservation planning. BLM completion report: Agreement # L10PG00911.

patches of high-quality habitat that are separated by rocky mountain ranges, playas, and other expanses of marginal quality habitat."

The BLM did not identify the Sagebrush Sea as a potential ACEC in any of the Draft or Final EIS alternatives because the area did not meet the ACEC relevance and importance criteria (1610.7-2 (d)) because the BLM believes the PAC criteria utilized in identifying the Sagebrush Sea nomination no longer reflects the most up to date science on habitat connectivity, populations, effects to habitat from climate change, and genetic information across the range of the species. In this RMP Amendment effort, the BLM is choosing to focus management direction that protects and conserves GRSG in Priority and General GRSG Habitat Management Areas (PHMA, PHMA with limited exceptions, and GHMA). The BLM reviewed new scientific publications since our previous planning efforts on key population (e.g., Doherty et al. 2016, Coates et al., 2021b), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021c) and coordinated with state authorities (such as wildlife agencies) to identify and update GRSG habitat management areas (HMA). The HMAs are identified using inventory data on habitat use and occupancy and reflect the dynamic nature of the vegetation communities that make-up GRSG habitat. Analyzing the Sagebrush Sea would not meet the BLM's purpose and need to amend a subset of 2015 and 2019 GRSG RMP Amendment decisions based on new scientific information or changes in land use.

Summary: ACEC designation is duplicative, either that it is the same as PHMA or no special management was identified.

Response: To comply with the BLM's ACEC regulations at 43 CFR 1610.7-2, all nominated areas in the planning area which meet the relevant and important criteria and may need special management were considered for potential designation as an ACEC in the DEIS, under Alternative 3 and 6. A varied set of management direction for the potential ACECs was identified under both alternatives. The effects of the management direction in all of the alternatives (including the Proposed RMP Amendment) are described in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat. BLM analyzed a reasonable range of alternatives in order to meet the BLM's purpose and need and included ACEC designation as one potential management tool for meeting those conservation objectives in areas where relevant and important GRSG habitat values were identified. In considering a variety of management approaches and analyzing the effects of them, the BLM fully complied with BLM's ACEC regulations and with NEPA.

In response to public and cooperating agency comments and in consideration of important habitat factors such as connectivity, population strongholds, and the potential for threats from development, the BLM has made adjustments to the Priority Habitat Management Areas (PHMA) allocation in the Proposed RMP Amendment/Final EIS and identified areas within PHMA that will benefit from additional protection. These areas within PHMA would have more limited exceptions than the rest of PHMA. These areas are made up of 12 of the areas identified as ACECs under Alternatives 3 and 6 and are discussed in detail in Appendix 3, Greater Sage-Grouse Habitat Management Area State-by-State Mapping Strategies and Appendix 5. With these additional protections, the relevant and important values in proposed ACECs will be protected (refer to effects analysis in Appendix 5). The associated management direction for these areas provides strengthened protections by removing exceptions described in the PHMA exclusion language for Utility Scale Solar, Utility Scale Wind, and Fluid Mineral No Surface Occupancy direction. In addition, the management direction for Major Rights-of-Way is "exclusion with exceptions" rather than "avoidance with exceptions

and conditions" as described in PHMA. In the Proposed RMP Amendment, the BLM is not proposing to designate any ACECs.

Summary: BLM should clarify the additional protections that would be in place for Alternative 6 under ACEC designation for fluid minerals management.

Response: In the Draft RMPA/EIS, Table 2-14 states that for Alternative 6 ACECs, fluid minerals would be No Surface Occupancy (NSO) and that only NSO Exception #1 could be considered and would be considered for the full ACEC area, not just within 0.6 miles of an active lek as allowed under the PHMA management direction in Alternative 6. The Proposed RMP Amendment/Final EIS does not propose the designation of any ACECs.

Summary: The ACEC analysis was incomplete. For instance, the Draft RMPA/EIS did not identify relevance criteria, did not identify existing ACECs, did not clarify how Sagebrush Focal Areas (SFAs) would interact with existing ACECs.

Response: In the Proposed RMP Amendment/Final EIS, the internal and external ACEC nomination process, the evaluation of relevance and importance criteria, and the analysis of effects on the potential ACECs identified in Alternatives 3 and 6 were updated and clarified in response to comments. These updates and clarifications are primarily found in Appendix 5, Areas of Critical Environmental Concerns for Greater Sage-Grouse Habitat, but are also included in Chapters 3 and 4 and Appendix 10. This includes a clarified discussion in Appendix 5 of how the BLM considered SFAs in identifying internally and externally nominated ACECs. Additionally, the management direction proposed under each alternative addresses the degree to which SFAs are or are not addressed and the management direction can be found in Table 2-4 in Appendix 21. In Alternative 1, there are SFAs in Idaho, Montana, Nevada, Oregon, Utah, and Wyoming. In Alternative 2, SFAs would be removed from the BLM's RMPs in all states except Oregon and Montana. Alternatives 3,4, 5, and 6 utilized updated science and data to identify habitat areas of importance to GRGS and this process is described in Appendix 3, Greater Sage-grouse Habitat Management Area State-by-State Mapping Strategies. The areas identified as SFAs in the 2015 RMPAs no longer reflect the most up to date science on habitat connectivity, populations, effects to habitat from climate change, and genetic information across the range of the species. In this RMP Amendment effort, the BLM is choosing to focus management direction that protects and conserves GRSG in Priority and General GRSG Habitat Management Areas (PHMA, PHMA with limited exceptions, and GHMA). The BLM reviewed new scientific publications since our previous planning efforts on key population (e.g., Doherty et al. 2016, Coates et al., 2021b), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021c) and coordinated with state authorities (such as wildlife agencies). As such, the BLM did not retain the SFA areas in Alternatives, 3, 4, 5, 6, or the Proposed RMP Amendment. The BLM did, however, consider these SFA areas in concert with the updated in science and data in identify ACECs and, as noted, this is described in Appendix 5.

BLM considered all habitat areas in light of new science and data, including areas that are currently designated as ACECs and this process has been clarified in Appendix 5. For example, in Oregon, in reviewing GRSG habitat across the State, the BLM identified the High Lakes ACEC as requiring limited exceptions to PHMA protections in the Proposed RMP Amendment. The additional protections will protect the area from threats from major rights of way and renewable energy development and will help maintain the sagebrush landscape integrity in that area (refer to Appendix 3, Greater Sage-Grouse Habitat Management Area State-by-State Mapping Strategies and Appendix 5).

Summary: ACEC designation exceeds the BLM's regulatory authority, is contrary to state/local statutes, or violates valid existing rights.

Response: The BLM followed the applicable federal laws, regulations, and policies in calling for ACEC nominations, evaluating the internally and externally identified ACECs, proposing ACECs for consideration under Alternatives 3 and 6, and analyzing the effects of the alternatives on the potential ACECs. Updates and clarifications to the ACEC analysis have been made in response to comments in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat. The proposed management direction for the ACECs in Alternatives 3 and 6 do not conflict or violate valid existing rights. As stated in Section 1.5 of the Draft EIS and in Section 1.4.1 of the Final EIS, all proposed actions will be subject to valid existing rights. Accordingly, the BLM will ensure that its implementation of the management actions in the Proposed RMP Amendment is consistent with the terms and conditions in existing leases or existing contracts. The BLM also recognizes that it has limited authority to impose conditions on certain uses related to the Mining Law of 1872 through land use planning decisions. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations.

The language in state or local statutes are generally not inconsistent with the ACEC evaluation and analysis approach contained in FLPMA, relevant federal regulations and BLM policy. The BLM must comply with federal law, regulations and policies when developing land use plans. The BLM can consider and align with state and local plans to the maximum extent practicable while complying with federal law and policies. State and local plans and policies that are inconsistent with federal law, regulations, and policies do not allow the agency to operate contrary to those federal directives. Appendix 5 demonstrates evaluation of relevance and importance for GRSG habitat for those areas nominated as ACECs. The Proposed RMP Amendment/Final EIS analysis informs whether the management proposed under the various alternatives will or will not meet the ACEC criteria for requiring "special management." Section 1.8 in Chapter 1 and Appendix 23, Consistency with State and Local Land Use Plans, address potential inconsistencies with State and local plans in detail.

Summary: The BLM should designate ACECs based on wilderness characteristics.

Response: By regulation, wilderness characteristics are not one of the potentially relevant values for which an ACEC can be designated.

Summary: The BLM should adjust management within ACECs to be more or less restrictive, for example, ACECs should be closed to oil and gas leasing, comply with the 2015 RMPA regarding fencing in RNAs, or should be open to livestock grazing.

Response: Thirty-two ACECs are considered for designation in the Draft and Final EIS under Alternatives 3 and 6. Table 2-14 in the Draft EIS and Appendix 21 in the Final EIS outline the comparison of management actions within potential ACECs in Alternative 3 and 6. Under Alternative 3 all areas, including the proposed ACECs are closed to fluid mineral leasing and are closed to livestock grazing. Under Alternative 6 in ACECs fluid mineral development would be subject to No Surface Occupancy with a possible exception if criteria for the exception are met throughout the entire ACEC. Alternatives 4, 5, and 6 include Management Action RM-6 that calls for identifying and addressing livestock grazing fences that pose a high risk to GRSG. The variation in management direction with Alternative 3 and 6 and throughout the rest of the alternatives represent an appropriate range of alternatives in compliance with NEPA. The effects of these management actions are analyzed in detail in Chapters 3 & 4 and the effects of the alternatives on the ACECs are analyzed in detail in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat. In the

Final EIS, clarification was added to Appendix 5 including additional details on the evaluation process. We clarified the ACECs considered for nomination in Alternatives 3 and 6 in Chapter 3, and updated the analysis in Chapter 4, Appendix 10, and Appendix 5 to show how all the alternatives affect these potential ACECs. Finally, the BLM clarified in the Final EIS that under Alternative 3 ACECs, where not otherwise described, would be managed with the same management direction as PHMA and not that all of the PHMA area identified in Alternative 3 would be designated as ACEC.

None of the alternatives in the Draft RMPA/EIS or Proposed RMP Amendment/Final EIS propose to eliminate existing RNA or ACECs.

Summary: The BLM should address indicated issues with ACEC evaluations and analysis, including not justifying boundaries, not taking into account future development including locatable mining, analyzing impacts to grazing permittees and access, using too coarse scale data for the analysis, and no transparency on evaluations.

Response: In the Final EIS, the internal and external ACEC nomination process, the evaluation of relevance and importance criteria, and the analysis of effects on the potential ACECs identified in Alternatives 3 and 6 were updated and clarified in response to comments. These updates and clarifications are primarily found in Appendix 5, Areas of Critical Environmental Concerns for Greater Sage-Grouse Habitat but are also included in Chapters 3 and 4 and Appendix 10. As specified in Appendix 5: The evaluation for relevance and importance criteria was conducted in a two-step approach that started with rangewide scientific data and models, followed by a review by staff at the state and field office levels who are more familiar with the local habitat conditions. The BLM's GRSG RMPA/EIS planning page has the ACEC data available: https://eplanning.blm.gov/eplanning-ui/project/2016719/510.

To comply with BLM policies and FLPMA, all nominated areas in the planning area which meet the relevant and important criteria were considered for potential designation as an ACEC in the Draft EIS, under Alternative 3 and 6. In both alternatives, only a subset of the planning area is proposed for ACEC designation. The BLM analyzed a reasonable range of alternatives and followed the procedural requirements for the designation of ACECs through the land use planning, revision, or amendment process in BLM planning regulations 43 CFR 1610.7-2. The alternatives identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. This includes alternatives that provide a greater and lesser degree of restrictions in various use programs but would not eliminate or invalidate any valid existing development rights.

Only Alternatives 1, 2 and 3 propose the BLM recommend a withdrawal from location and entry under the Mining Law of 1872. Analysis of this is included in Chapter 4 in sections 4.10 Mineral Resources, 4.11 ACECs and Research Natural Areas, and 4.12 Social and Economic Conditions (Including Environmental Justice). Socioeconomic analysis of the range of alternatives is included in the DEIS Chapter 3 & 4 with additional county specific information in Appendix 13 Socioeconomic Baseline Report.

The Proposed RMP Amendment does not propose the designation of any ACECs.

Summary: The BLM should address how the recently promulgated Public Lands Rule interacts with the ACEC evaluations.

Response: The recently promulgated Conservation and Landscape Health Rule (aka Public Lands Rule; 89 FR 403080) implements the BLM's longstanding statutory authority to manage lands for conservation,

including by taking account of certain resource values explicitly addressed in the rule. As a result, the management actions considered here are consistent with the Public Lands Rule (PLR), notwithstanding that they are within the BLM's discretion with or without the rule. Since the Notice of Availability for this Draft EIS was published prior to the effective date of the PLR, this planning process is not incorporating PLR elements into the Final EIS (BLM IB 2024-048).

The PLR confirms that ACECs are to be addressed in revisions or amendments of land use plans and establishes a clear and comprehensive framework for identifying, evaluating, and considering the need for special management attention for each ACEC during the land use planning process. ACECs are proposed and evaluated during land use planning using the best available science and information, extensive public involvement, and Tribal consultation. ACECs must meet three criteria: relevance, importance, and need for special management attention to be designated. The rule clarifies that an ACEC can be designated to protect ecological intactness and habitat connectivity, emphasizing the role of ACECs in maintaining resilient lands and waters. This GRSG planning process, the associated ACEC evaluations which were conducted, and the manner in which the potential ACECs were considered and analyzed in the Draft and Final EIS are consistent with the updated BLM ACEC regulations at 43 CFR 1610.7-2.

Summary: BLM should clarify the definition of "irreparable damage" related to ACECs.

Response: The term irreparable damage is used in FLPMA section 103(a) in the definition of an ACEC. The recently promulgated Public Lands Rule implements the BLM's longstanding statutory authority to manage lands for conservation, including by taking account of certain resource values explicitly addressed in the rule. As a result, the management actions considered here are consistent with the Public Lands Rule, notwithstanding that they are within the BLM's discretion with or without the rule. The updated regulations define "irreparable damage" to mean: "harm to a value, resource, system, or process that substantially diminishes the relevance or importance of that value, resource, system, or process in such a way that recovery of the value, resource, system, or process to the extent necessary to restore its prior relevance or importance is impossible." The Proposed RMP Amendment does not propose the designation of any ACECs.

Summary: The BLM should analyze the effects on mining and mining operations from the designation of ACECs.

Response: Impacts from designation of ACECs to mineral development are analyzed in detail in Section 4.10.4 of the Draft RMPA/EIS and in Section 4.10.4 of the Final EIS.

22.2.2 Adaptive Management

Summary: The adaptive management process is too prescriptive and burdensome.

Response: As described in the Draft RMPA/EIS Section 1.3 Purpose and Need, the objective of this planning effort is to ensure management on BLM-administered lands responds to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. The adaptive management language details coordination with state wildlife agencies and other stakeholders as appropriate. Final determinations of what may change occurs at the local level.

Previous adaptive management systems varied by state and resulted in inconsistent, and in some cases subjective and erroneous results. The population system detailed in the Draft RMPA/EIS was requested by the state wildlife agencies following the 2015 plans to allow for an objective and quantifiable method across

the range of GRSG. The product being used as one of the tools for assessing population and habitat anomalies (Targeted Annual Warning System; TAWS) has been peer-reviewed and published (Coates et al., 2021). U.S. Geological Survey (USGS) provides the calculations and results using lek data provided by state wildlife agencies. The results are used by BLM and others to identify where population anomalies may be occurring. The current language also details collaboration with individual state wildlife management agencies to confirm results, and to review other pertinent data.

Unlike some commenter's assertions, "canned thresholds" are not presented in the adaptive management language. The threshold definitions provide a quantifiable and repeatable measure of potential population anomalies and must be verified by the state wildlife agency. They are not "canned" as they are calculated using lek data provided by state wildlife agencies and are updated annually.

Summary: The BLM should defer to the state agencies regarding data collection or management decisions that pertain to population trends.

Response: BLM does not manage GRSG populations and therefore must rely on the States to provide population information. Each State has signed an agreement with USGS to synthesize the population data through their population hierarchical modeling tool, Targeted Annual Warning System (TAWS), which is what BLM will review when making decisions. However, as stated in the adaptive management section, that tool is only one piece of information the BLM will be using to assess population trends. The tool itself is not a decision point, but rather a data-driven mechanism to start a conversation with the State wildlife agencies about population status and anomalies. The Draft RMPA also outlines opportunities for state wildlife agencies to provide their information separately and to work with the BLM on concerns not identified by TAWS or other resources. The BLM recognizes State's authority to manage wildlife. However, population trends can be an indicator of habitat condition, which BLM has the authority to manage on BLM-administered lands.

The adaptive management language has been modified in the Proposed RMP Amendment/Final EIS to clarify the collaboration with state wildlife agencies and ensure that the population results start the adaptive management conversation. It was never intended that the threshold in and of itself was the decision point.

Summary: The BLM should clarify the adaptive management process, particularly regarding management and resolution of triggering thresholds and timeframes to complete Causal Factor Analysis and rapid assessments.

Response: The citation provided in the adaptive management language (Coates et al., 2021) describes the process that resolved the inconsistencies in adaptive management strategies for GRSG populations in the 2015 and 2019 plans. While the BLM did not provide the details of that one population analysis in the Draft EIS, it is cited, and the publication is public and widely available. In response to comments received the BLM also made several clarifications in the Proposed RMP Amendment/Final EIS to the adaptive management process (e.g., scale of analysis for examining habitat changes, population trends and causal factor analysis (CFA) processes). However, some generalities are appropriate to allow for local conditions and circumstances. For example, while well managed livestock grazing can be compatible with sage-grouse habitat, changes in range condition as a result of drought (as an example) may be identified in a local CFA, potentially necessitating changes in permit conditions to ensure sufficient nesting cover or forb availability for GRSG. Additionally, it's not possible at the RMP level to anticipate every potential causal factor that may result in a threshold being met. The BLM has also adjusted timelines with the adaptive management strategy to address some of the commenters' concerns.

Given the purpose of these planning efforts, the inclusion of hard and soft thresholds is appropriate to assist in defining those actions which might require immediate attention to preclude further population declines if BLM can make appropriate habitat modifications. Close coordination with state wildlife agencies and stakeholders is detailed throughout the adaptive management language in the Proposed RMP Amendment/Final EIS.

Summary: The adaptive management process is not consistent with current rules and regulations nor is it consistent with the alternatives for livestock grazing.

Response: The BLM adaptive management language as written is consistent with the DOI policy and has been closely reviewed for consistency with BLM livestock grazing management.

Summary: TAWS is not appropriate to rely on for adaptive management. The BLM should modify its reliance on TAWS.

Response: TAWS is one tool that provides a consistent and quantitative metric for identifying GRSG population anomalies across all states. It does not include habitat. State input is an important component of the TAWS model and adaptive management. The results of the model are also used to start a conversation on adaptive management and do not require a specific on-the-ground response. As stated in previous responses, previous adaptive management systems varied by state and resulted in inconsistent, and in some cases subjective and erroneous results. The system proposed was requested by the state wildlife agencies following the 2015 plans to allow for an objective and quantifiable method across the range of GRSG.

Summary: The BLM should consider the provided information on TAWS and neighborhood clusters in the adaptive management process.

Response: The BLM considered the citations provided by commenters. The TAWs process simply triggers the CFA team (which includes the state wildlife agency) to discuss GRSG population anomalies. It is a conversation starter and does not automatically dictate on-the-ground management changes. The TAWS tool is only one component of assessing population anomalies. The state wildlife agency is identified as confirming those anomalies and if there are concerns with lek numbers they should bring that data forward.

TAWs uses the best available and most recent science - including the latest USGS and state datasets. The TAWs process does not in any way consider neighborhood clusters to be "closed populations" - nor is that ever mentioned in the Draft RMPA/EIS. The CFA team process incorporates potential disagreements and timelines, as established by USGS in conjunction with states. The TAWs process is another tool in the multifaceted toolbox to ensure GRSG habitat on BLM-administered lands responds to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals.

Summary: The BLM should adjust the adaptive management process so it is more protective of GRSG.

Response: The adaptive management process outlined in the Draft RMPA/EIS identifies when additional actions may be necessary to address habitat conservation for the benefit of GRSG. The actual management required will depend on local information and coordination with partners. Identifying precise management reactions when a threshold is met in the RMPA is not appropriate as the BLM cannot anticipate all potential scenarios under which might occur. Providing detailed management direction at the plan level about specific

management responses may result in an ineffective management response that is not based on the local conditions under which the population or habitat anomaly occurred.

Summary: The BLM should coordinate with other federal and state agencies in implementing adaptive management.

Response: The BLM will coordinate with other agencies as appropriate for data collection and during adaptive management implementation.

22.2.3 Air Resources and Climate Change

Summary: The BLM should acknowledge in the analysis that restrictions on oil and gas leasing would push development to other areas, which would still cause air quality and climate effects.

Response: This introductory paragraph of the Nature and Type of Effects section of 4.13.2 Climate Change and Greenhouse Gases does not indicate if the proposed alternatives would increase or reduce GHG emissions. There is no supposition or presumption listed that the proposed alternatives would reduce emissions. The BLM added a sentence in Section 4.13.2 similar to the one stated below (which is used elsewhere in the DEIS): "However, restrictions to development on BLM lands might push development onto private land, which could result in indirect impacts as described under Nature and Types of Effects."

Summary: The BLM should consider climate-ready management principles and climate change adaptation planning throughout all future management actions for GRSG.

Response: The BLM appreciates the commenters providing questions and considerations that could assist us in subsequent implementation level analysis and decisions including:

- Resist-Accept-Direct framework
- USGS Climate Toolbox and other climate adaptation tools
- Climate Impact Evaluations
- Systematic Monitoring.

Summary: The BLM should update the EIS with the best available information regarding drought and associated combined impacts from grazing.

Response: In the Proposed RMP Amendment/Final EIS, updates to Chapter 3 Affected Environment were made to incorporate more recent drought data for the planning area, and language was included in Chapter 4 and Appendix 10 to reflect the potential impacts of grazing during drought.

Summary: BLM should update analysis to include impacts from wild horses, burros, and big game on GHG emissions and carbon sequestration.

Response: In the Proposed RMP Amendment /Final EIS, Chapter 4 and Appendix 10 were updated with wild horse and burro discussion.

Summary: The BLM should update and clarify the analysis on climate change.

Response: Climate change and associated socioeconomic impacts are analyzed in the Draft and Final RMPA/EIS with supporting documentation provided in Appendix 10, Appendix 12, Appendix 13, and Appendix 18. Specific to GRSG, Section 3.2.2 includes an entire section describing persistent and emerging

threats to GRSG from interactions between climate change, wildfire, invasive species, and diseases relative to climate change.

Section 4.13.2 of the Draft RMPA/EIS and Appendix 10 and 14 and Chapter 4 of the Proposed RMP Amendment/Final EIS describes the direct and indirect environmental consequences of minerals projects, lands and realty projects, and livestock grazing management impacts on climate change and greenhouse gases and cites the best available science utilized in the analysis. There are no specific implementation level grazing decisions proposed in this analysis. Any future proposals would be addressed in an individual site-specific analysis in accordance with applicable laws and regulations. The BLM updated the analysis in the Proposed RMP Amendment/Final EIS with social cost of carbon and livestock grazing emissions estimates.

Summary: The BLM should update the analysis to include the role of renewable energy development regarding climate change and the use of methane as a renewable natural gas.

Response: This Draft RMPA/EIS process is to update a sub-set of the GRSG goals, objectives, allocations, and management actions to ensure management on BLM-administered lands respond to changing land uses, improve efficiency and effectiveness of GRSG management, provide for consistent conservation based on ecological boundaries, and provide the BLM with locally relevant decisions that accord with rangewide GRSG conservation goals. There are no specific implementation level renewable energy projects proposed in this analysis. Any future proposals would be addressed in an individual site-specific analysis.

Summary: The BLM should update the climate change analysis to include uncertainty analysis, an assessment of the uncertainties associated with climate models, data sources, and projections, as well as the development of methods to quantify and communicate these uncertainties effectively.

Response: The BLM utilizes the best available science in all NEPA documents. Chapter 6 includes all published science used in this planning effort and environmental analysis. Analysis of Climate Change and Greenhouse Gases is included in the Draft RMPA/EIS in section 4.13.2 and Chapter 4 in the Final EIS is at an appropriate scale and level for a land use planning process.

Summary: The BLM should update the analysis to recognize all new and existing rules and regulations pertaining to air quality and climate change, such as the new PM2.5 National Ambient Air Quality Standard and the New Source Performance Standards for Greenhouse Gas Emissions From New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; and describe how restrictions on development negatively impact the Biden Administration's climate goals.

Response: The regulatory framework considered for the Air Resources and Climate analysis in the Draft RMPA/EIS is described in Section 3.13.1 and Chapter 3 in the Final EIS. The commenters included text from Alternative 3 in the Draft RMPA/EIS, which represents the greatest measures to protect and preserve GRSG and its habitat.

Summary: The BLM should update and clarify the analysis on air quality, including adding Alternative 6 into the cumulative effects analysis and adjusting Alternative 3 analysis related to the removal of livestock grazing

Response: The BLM updated the Alternative 6 descriptions in Section 4.21.12 in the Proposed RMPA/Final EIS. While Alternative 3 does identify PHMA as unavailable for permitted livestock grazing, it does not preclude active vegetation or fuels treatments. The BLM did not address vegetation treatments in this amendment, which means that the prioritization of PHMAs for vegetation treatments as identified in prior

planning efforts remains unchanged. The BLM updated the analysis in the Proposed RMP Amendment/Final EIS with social cost of carbon and livestock grazing emissions estimates.

22.2.4 Best Available Information-Baseline Data

Summary: The BLM should include more specific baseline data for the impacts analysis, such as acreages at every relevant geographic scale (rangewide, statewide, population level, and subpopulation), specific lek count data, and all photos of land health and riparian assessments.

Response: The BLM has reviewed the requests for quantitative data. Quantitative data regarding changed conditions is included in Appendix 9, Tables and Figures. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). As such, the exact locations or numbers of all range-wide resources is not presented as a part of the analysis as that degree of localized information does not help differentiate between the impacts of the alternatives.

Summary: The BLM should consider provided science on acoustic impacts and include range-wide sound measuring standards.

Response: The BLM considered acoustics as a part of indirect effects analysis in Section 4.2.1 of the Draft RMPA/EIS and Chapter 4 in the Final EIS. In addition, acoustic impacts would be considered in the analysis for implementation projects.

Summary: The BLM should consider the provided science on positive sage grouse/grazing interactions.

Response: While some commenters reference grazing data which has yet to be scientifically published (e.g., Bartholdt 2023), the Draft RMPA/EIS does not preclude implementation level decisions to utilize different grazing strategies to address GRSG habitat goals.

Summary: The BLM should consider the provided science on negative sage grouse and grazing interactions, including cumulative impacts on climate change.

Response: The BLM considered the provided citations and has incorporated several changes, including acknowledging ecological differences across the GRSG range. Citations provided by commenters on grazing impacts were reviewed, and if not previously considered were incorporated. Some suggested citations were not provided by commentors (e.g., Bartholdt 2023) and if they could not be found through a search of scientific literature they were not considered further. See Draft RMPA/EIS Section 3.2 for a description of the threats impacting GRSG including climate change and Section 4.2 for a description of the effects of the alternatives on GRSG and its habitat.

Summary: The BLM should consider provided GRSG data on leks & buffers.

Response: The BLM considered the citations provided. Lek buffers are another tool in the multifaceted toolbox to ensure GRSG habitat on BLM-administered lands responds to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with rangewide GRSG conservation goals. Lek buffers are not the only protection available - disturbance caps, adaptive management, seasonal

timing and NSO restrictions are all used in concert not in isolation. As described in Manier et al 2014, there is no one buffer distance that is perfect and applicable everywhere across GRSG range.

The BLM is not proposing rangewide changes to lek buffers in this RMPA. The BLM adopted The BLM adopted lek buffers identified by state wildlife management agencies at their request and based on their experiences and local conditions. A As noted in Appendix 4, the BLM is adopting the lek and lek status definitions developed by the Western Association of Fish and Wildlife Agencies (WAFWA) to promote consistency across the BLM states. Appendix 4 provides a comparison of the lek status definitions for each state for ease of reference.

Summary: The BLM should consider provided data on disturbance, habitat fragmentation, and reclamation.

Response: We considered the provided citations and several clarifications have been made to the Proposed RMPA/Final EIS. The BLM updated citations in Chapter 6, a no net habitat loss in the mitigation requirements, and several conservation measures to minimize GRSG habitat loss. For North Dakota benchmarks for perennial forb cover in breeding and nesting habitat, the BLM relied on Doherty et al. 2010, Doherty et al. 2011, Hagen et al. 2007, and Holloran et al. 2005. For Utah benchmarks for perennial forb canopy cover in breeding/nesting habitat and brood rearing habitat, the BLM relied on Stiver et al. 2015, Connelly et al. 2000, and Dahlgren et al. 2019. Table 8-1.B in Appendix 8 includes the Idaho perennial forb cover benchmarks for nesting/early brood rearing and late brood-rearing/summer habitat and the BLM relied on Connelly et al. 2000.

Summary: The BLM should consider the provided GRSG data on population levels and genetics, including historic species range and impacts from climate change.

Response: The BLM has reviewed available data on GRSG population levels as provided by state wildlife management agencies and published in the scientific literature. As stated in the DEIS Section 1.3 Purpose and Need - the goal is to ensure management on BLM-administered lands responds to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. The BLM provides a little less than half of the habitat for GRSG, and the RMPA focuses on maintaining GRSG populations on BLM-managed lands while acknowledging multiple use of public lands. While the document does reference historical leks, the Draft RMPA/EIS does not propose to restore GRSG to any perceived historic range.

The published genetic information in the DEIS (including the citations provided by commenters) was one of many components considered in the multi factorial analysis. Genetic connectivity /diversity was a primary consideration in revising habitat management areas (e.g., PHMA) to ensure key areas received protections to conserve this key issue.

To respond to a comment arguing that the BLM fails to acknowledge that its analysis on impacts to sagebrush and GRSG populations from long-term climate change relies on a scientifically-discredited SSP5-8.5 worst-case climate scenario that is no longer considered likely by the International Panel on Climate Change (IPCC) in their IPCC Sixth Assessment Report, the BLM relies on the best available science when formulating alternatives and management actions. The reference to the IPCC Fifth Assessment Report connects with the modifications in the sixth assessment report. The statement highlights that evidence of observed changes and human influence in extreme events, like heatwaves, heavy precipitation, and droughts, has strengthened since the IPCC Fifth Assessment Report (IPCC 2013). For instance, it is now "virtually certain" that the

frequency and intensity of extreme heat events have increased across most regions since the 1950s, while cold extremes have become less severe. There is "high confidence" that human-induced climate change is the primary driver of these changes (IPCC 2021).

Summary: The BLM should address identified issues with the development assumptions in the analysis, consider the provided development data, and show that it used adequate data for analysis on topics including consequences to the environment, impacts from domestic energy (both mineral and renewable) development and facilities on GRSG, and impacts to economic development from new restrictions.

Response: The BLM considered the provided citations. Currently, there is no science specific to renewable energy or geothermal impacts on GRSG- therefore we can only use the best available info on comparable disturbance and extrapolate.

Several commenter's concerns were alternative specific. NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. Alternative 3 includes the greatest measures to protect and preserve GRSG and its habitat. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis.

All proposed actions will be subject to valid existing rights, including those associated with leases issued under the Mineral Leasing Act of 1920. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. For example, if the BLM previously issued an oil and gas lease with standard lease terms and conditions, and the lessee submits an application for permit to drill, the BLM will ensure that any management actions from the RMPA will be applied in a manner that is consistent with the terms and conditions of the underlying oil and gas lease.

The BLM also recognizes that it has limited authority to impose conditions on certain uses related to the Mining Law of 1872 through land use planning decisions. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations.

Summary: The BLM should consider tools other than HAF, such as the Density and Disturbance Calculation Tool (DDCT).

Response: HAF and the Density and Disturbance Calculation Tool (DDCT) are not interchangeable. HAF is used to assess whether an area provides GRSG habitat and, in this proposal, it is not the only tool used to complete that assessment. HAF is not used to measure disturbance levels. By contrast, the DDCT is a measure of disturbance used by the states of Wyoming and Montana and is not a habitat assessment tool.

Summary: Some commenters requested that the BLM address a possible discrepancy in NTT report usage, argue that the NTT and COT reports represent the best available science on GRSG needs, and propose management recommendations regarding the protection of GRSG.

Response: The science included in the National Technical Team (NTT; 2011) and Greater Sage-grouse Conservation Objectives: Final Report (COT Report–2013) was in no way dismissed in the Draft RMPA/EIS - simply updated with more recent research. As stated in Section 2.3, the BLM, the USFWS, States and other federal agency partners prepared the NTT and COT reports to identify rangewide GRSG conservation

objectives and conservation measures that would inform the USFWS 2015 Endangered Species Act decision and provide guidance for the BLM to consider through land use planning, which the BLM did in 2015, 2019, and again in 2020 planning efforts. The NTT and COT reports constituted starting points for the BLM to consider in at least one alternative through the NEPA and land use planning process. They are not compendiums that, standing alone, represent best available science. The NTT and COT reports do not address how the implementation of their GRSG conservation measures would affect other uses of the public lands—such as recreation, fluid mineral development, mining, and livestock grazing. Moreover, the NTT and COT reports do not quantify the GRSG conservation benefits of each respective conservation measure. Additional context related to the COT and NTT reports and rationale why they were not included as specific alternatives in this effort is provided in Appendix 6.

Summary: The BLM should not rely on open file reports, such as Teige, et al. 2023 or Carter, et al. 2020 that have not been made available for peer review, or public review and comment.

Response: Citations specifically listed are open file reports from USGS which serve simply as annotated bibliographies of recent GRSG science, with convenient links to each original publication - and are only cited in Section 1.2.3 of the Draft RMPA/EIS. These two USGS open file reports have been available to the public since October 27, 2023, and September 30, 2020, respectively. There are an additional 35 pages of literature cited in Chapter 6 of the Draft RMPA/EIS which are cited throughout the document.

Summary: The BLM should consider the provided science and information which relate to implementation level activities.

Response: As defined in the BLM's Land Use Planning Handbook (H-1601), BLM makes two types of decisions, Land Use Plan-level decisions, which establish desired outcomes and actions needed to achieve them, reached using the planning process in 43 CFR 1600, and implementation-level decisions, which are decisions that take action to implement land use plan decisions. No implementation-level decisions are under consideration as part of the RMP Amendment effort. However, the BLM appreciates commenters providing questions/considerations that will assist us in subsequent implementation level analysis and decisions including:

- continued close coordination and consultation with federal, tribal, state and local governments
- utilizing leading academic, governmental, and NGO sage-steppe scientists as a politically independent,
- standing panel of experts to help guide Plan implementation and assure its scientific veracity;
- consideration of other Special Status Species in possible vegetation treatments;
- restoration seed mixes considerations to maximize forb diversity and insect populations critical to GRSG chick development;
- grazing practice considerations;
- site specific habitat status when prioritizing and analyzing impacts of projects;
- geographic and temporal impacts to GRSG individuals and populations from specific actions;
- BMP selection and monitoring their use/results;
- considerations for compensatory mitigation
- project specific monitoring suggestions; and
- adaptive management models for underlying habitat issues and GRSG population levels.

22.2.5 Coal

Summary: The BLM should update the resource and economic analysis to reflect impacts on closing checkerboard lands to coal mining.

Response: The BLM incorporated indirect impacts for checkerboard land patterns into the Proposed RMP Amendment/Final EIS in the Air Resources and Climate Change, Minerals, Lands and Realty, and Socioeconomic sections.

Summary: The BLM should adjust PHMA and essential habitat designations from the Draft RMPA/EIS, which exceed the protections already in place under the Wyoming core area strategy and are not consistent with state and local plans. Placing unsuitability designations on top of the Wyoming core area strategy will not provide needed additional protections but will lock up the coal resources on the lands that are designated unsuitable.

Response: The management actions for coal in the Draft RMPA/EIS across the alternatives are largely the same as either the 2015 or 2019 planning efforts, which did not determine rangewide suitability or unsuitability in the RMPA process. Instead, they deferred that determination to the time an application for a new coal lease or lease modification is submitted.

Summary: The BLM should update analysis to specifically identify how GRSG HMA overlap with coal resources.

Response: Sections 3.10.3 and 4.10.3 of the Proposed RMP Amendment/Final EIS were updated with this information.

22.2.6 Comment Period Extension Request

Summary: BLM should extend the comment period due to the content, complexity, new science and size of the EIS.

Response: Consistent with the BLM's planning regulations, CEQ regulations, and applicable policy, the BLM provided multiple opportunities for public involvement as explained in Chapter 5 of the Draft RMPA/EIS and Proposed RMPA/Final EIS. This includes public scoping, public meetings, and a 90-day public comment period on the Draft RMPA/DEIS. Consistent with the BLM's planning regulations at 43 CFR part 1610, the BLM will also provide a 30-day protest process prior to issuing a final decision.

22.2.7 Consistency with State and Local Plans

Summary: The BLM received feedback from multiple states and counties that management direction and allocations proposed in one or more of the alternatives in the Draft RMPA/EIS were inconsistent with their state and county plans. Livestock grazing, ACECs, mineral development, renewable energy, fire and fuels management and taking a single-species approach were among the topics identified as inconsistent. State wildlife agencies provided feedback on inconsistencies between their state GRSG plan and the management direction proposed in one or more alternatives in the Draft EIS. Multiple states and counties suggested that BLM adopt the policies outlined in their plans.

Response: The BLM's land use plans must be "consistent with officially approved or adopted resource-related plans, and the policies and procedures contained therein, of other Federal agencies, and State and local governments, and Indian Tribes, so long as the guidance and resource management plans are consistent with the purposes, policies and programs of Federal laws and the regulations applicable to the public lands.43 CFR 1610.3-2(a). The BLM has worked closely with State and local governments throughout the preparation

of the Draft EIS. The Draft EIS lists the cooperating agencies involved in the planning process in Section 5.3, Cooperating Agencies. As described in Section 1.8, Consistency with State and Local Land Use Plans and Programs and Policies Therein, the BLM requested the cooperating agencies assist in the consistency reviews by reviewing the range of alternatives associated with the Draft EIS, and identifying potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans.

The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent practical" (FLPMA 202(c)(9)). In a situation where State and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. Thus, while State, county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM does need to describe the known inconsistencies between the proposed action and the other plans and policies, so that the State and local governments have a complete understanding of the impacts of the Proposed RMP Amendment on State and local management options. Known inconsistencies between the Proposed RMPA and Federal, State, local, and Tribal plans is updated in the Proposed RMP Amendment/Final EIS in Section 1.8, Consistency with State and Local Land Use Plans and Programs and Policies Therein and Appendix 23 Consistency with State and Local Land Use Plans.

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the states have clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

Additionally, the Preferred Alternative in the DEIS specifically incorporates continued coordination and collaboration with state agencies throughout multiple aspects of the implementation process, such as - but not limited to - data collection, mitigation considerations, and adaptive management monitoring, to ensure consistency across land managers wherever possible.

Finally, within the range of alternatives analyzed in the Draft and Final EIS, state specific management direction was proposed and analyzed (refer to Section 2.5 in Chapter 2, State-Specific Circumstances. Each BLM state will issue their own Record of Decision which identify RMP Amendment decisions within that State, including those that are State-specific. The State-specific management direction identified in the Proposed RMP Amendment address geographically unique situations while still ensuring overall rangewide GRSG conservation goals."

22.2.8 Cultural Resources

Summary: The BLM should acknowledge the importance of Traditional Ecological Knowledge and Indigenous Knowledge into the analysis.

Response: In the Proposed RMPA/Final EIS, Sections 3.16 and 3.17 were updated with this information.

Summary: The BLM should revise impacts on cultural resources in the analysis to mention that the surface disturbance and field surveys associated with development often lead to discovery of cultural resources that contribute to scientific knowledge of the local cultural history.

Response: In the Draft RMPA/EIS, Section 4.16.1 includes the following language: "Additionally, many cultural resources have been discovered because of field surveys associated with anticipated mineral development activities. Reducing mineral development could have the unintended effect of reducing surveys and discoveries." For clarity, Sections 3.17, 4.16, 4.17, and 4.21 of the Proposed RMPA/Final EIS were updated with suggestions provided by commenters.

22.2.9 Cumulative Impacts

Summary: The BLM should consider additional actions and include more details in its list of past, present, and reasonably foreseeable future actions.

Response: The BLM has updated the past, present, and reasonably foreseeable actions in Appendix 14 to reflect several suggestions made by commenters. The list in Table 14-1 does not represent a full list of all projects at the site-specific level, but as stated in Section 14.2, it focuses on those actions that are at a similar level of decision-making to this RMPA and are most likely to have a cumulative impact with the actions considered in the alternatives. The level of detail presented in Table 14-1 is consistent with the broad and generalized nature of the cumulative impacts analysis presented in Chapter 4. The intent of Table 14-1 and the related cumulative impacts analyses is not to analyze every potential future land use in GRSG habitat. Each action conducted on public lands must go through its own analysis, including consideration of the direct, indirect, and cumulative effects associated with that project.

Summary: The BLM should consider additional cumulative impacts, such as those from large scale vegetation treatments, water developments, voluntary landowner and permittee GRSG conservation, drought, livestock grazing, wildfire, projects built before 2018, and the SFA mineral withdrawal.

Response: The BLM incorporated several of the commenters' suggestions for additional cumulative impacts. However, many of the suggested impacts are already described in the Draft RMPA/EIS, Section 4.21. For instance, cumulative impacts from the proposed SFA withdrawal on GRSG are described on page 4-230 and voluntary agreements with landowners, vegetation treatments, and wildfire are described on page 4-231. Projects built before 2018 are considered in the past actions contributing to cumulative effects, which are described in Section 4.21 and incorporated into the existing conditions in Chapter 3. In addition, each treatment or other action mentioned would also be subject to a NEPA analysis to assess additional impacts as the actions are proposed.

To address concerns raised about combined impacts of drought and livestock grazing, the BLM recently issued an Instruction Memorandum (IM) which provides policy and guidance for integrating the consideration of drought conditions and the availability of water for public land management purposes into decision-making process. BLM IM 2024-034 and an Information Bulletin (IB) for the National Grazing Drought Response Dashboard, a voluntary drought tool, are sources of information that can assist during drought planning and decision-making processes related to livestock grazing management.

Summary: The BLM should better describe cumulative impacts on socioeconomics, including the impacts on social sustainability of communities near public lands.

Response: Section 4.21.11 includes a discussion and analysis on the cumulative impacts on economic and social conditions. Section 4.12 includes an analysis on the impacts on economic and social values and

conditions, as described in the comment. Clarifications and revisions have been made to the socioeconomic analysis, as described under the Socioeconomics topic below in this Appendix.

Summary: The BLM should not predetermine the scope of the cumulative effects analysis at the RMPA level. The Draft RMPA/EIS is required to consider cumulative effects as part of its NEPA analysis of the RMPA; it is not meant to prescribe what cumulative effects should be considered as part of BLM's NEPA analysis of other future federal actions.

Response: The cumulative effects analysis in the Draft RMPA/EIS is in no way prescriptive of how future, site specific NEPA should conduct their cumulative effects analysis. The BLM conducted the cumulative effects at the appropriate scope and scale for the RMPA/EIS, limited to the scope of the proposed action. Because of the programmatic nature of an RMPA/EIS and cumulative impacts assessment, the analysis tends to be broad and generalized. This allows BLM to examine the impacts that could occur from a reasonably foreseeable management scenario, combined with other reasonably foreseeable activities or projects. Consequently, this assessment is primarily qualitative for most resources because of a lack of detailed project-scale information at the planning stage. As projects are proposed at a site-specific scale, additional site-specific NEPA will be conducted including more resource specific and cumulative effects analysis completed at a scale appropriate for each project.

Summary: The cumulative effects analysis is not detailed enough. The BLM should be more specific about the impacts on current projects and conduct site-specific surveys to determine actual cumulative impacts.

Response: The BLM has complied fully with the requirements of 40 CFR 1508.1 and prepared a cumulative impact analysis to the most detailed extent possible considering the broad nature and scope of the proposed management options at the land use planning level. The BLM thoroughly explained its consideration and analysis of cumulative effects, as well as assumptions regarding proposed projects and other reasonably foreseeable future actions in Appendix 14 of the Draft RMPA/EIS. Appendix 14 also includes a quantitative analysis of the cumulative effects by HAF group in Section 14.3.

The Draft RMPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) federal and nonfederal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis.

The BLM conducted the cumulative effects at the appropriate scope and scale for the RMPA/EIS. Because of the programmatic nature of an RMPA/EIS and cumulative impacts assessment, the analysis tends to be broad and generalized. This allows BLM to examine the impacts that could occur from a reasonably foreseeable management scenario, combined with other reasonably foreseeable activities or projects. Consequently, this assessment is primarily qualitative for most resources because of a lack of detailed project-scale information at the planning stage. As projects are proposed, additional site-specific NEPA will be conducted, and a cumulative effects analysis will be completed at a scale appropriate for each project. As needed, these analyses may involve site-specific surveys.

22.2.10 Direct/Indirect Impacts

Summary: The BLM should highlight the potential for development without significant impact on lek attendance in recognition of the estimate from the 2021 GRSG Monitoring Report that less than 1% of GRSG PHMA habitat loss was associated with anthropogenic disturbance.

Response: The effect of existing habitat loss is incorporated into the existing conditions for GRSG described in Section 3.2 of the Draft RMPA/EIS. These conditions are then used as the baseline for the analysis of effects in Section 4.2 for each alternative.

Summary: The BLM should better characterize indirect effects, including those from pushing impacts onto adjacent lands and impacts from developing nonhabitat.

Response: While decisions made from this EIS will only apply to BLM-administered lands, the analysis was conducted regardless of land status to facilitate a broader examination of the total direct, indirect, and cumulative impacts on GRSG and resources considered in the EIS. The Proposed RMPA/Final EIS provides an updated and expanded discussion of indirect impacts in Chapter 4 and Appendix 10, including indirect impacts for checkerboard land patterns into the Air Resources and Climate Change, Minerals, Lands and Realty, and Socioeconomic sections. Analysis of impacts on adjacent lands are described in cumulative impacts.

Summary: The BLM should analyze the effects on agricultural lands, including socioeconomic, environmental justice, and right of way impacts.

Response: Since cropland agriculture does not occur on BLM-administered lands, direct impacts on agriculture are not analyzed in the EIS. However, some socioeconomic impacts on the agricultural sector are described in Section 4.12, Social and Economic Conditions (Including Environmental Justice), and Appendix 18. Impacts on environmental justice are also described in Section 4.12. Analysis specific to burying powerlines to benefit agricultural landowners is not addressed in this document because we are not proposing specific construction or assembly methods, would be project specific, implementation level actions and analysis.

Summary: The BLM needs to analyze irretrievable and irreversible impacts.

Response: As required by 40 CFR 1502.16, the Draft RMPA/EIS provides a discussion of the environmental impacts of the alternatives including the no action alternative; any adverse environmental effects that cannot be avoided should the alternatives be implemented (e.g., impacts from existing infrastructure); the relationship between short-term uses of the built environment and the maintenance and enhancement of long-term productivity; and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. While the description of irretrievable and irreversible impacts is not a separate section, they are incorporated into the discussion of effects for each resource.

Summary: The BLM should clarify the assumptions and discussion of effects, and fully disclose nature and magnitude of the resource impacts associated with each alternative.

Response: The Proposed RMPA/Final EIS includes an updated and expanded discussion of the environmental consequences, including the assumptions, of the presented alternatives in Chapter 4 and Appendix 10 per suggestions made by commenters. Additionally, Appendix 21 provides updated, detailed descriptions of the impacts of the management actions associated with each alternative.

Summary: The EIS should not separate the analysis of the SFA withdrawals and this RMPA.

Response: The analysis of the SFA withdrawals is not a land use planning decision and thus is being prepared in a separate EIS. The United States District Court for the District of Idaho ordered the BLM to "re-initiate" the NEPA process for the proposed withdrawal. The effect of the SFA Withdrawal EIS in concert with this RMPA is analyzed in the cumulative effects, described for each resource in Section 4.21 and in further detail in Appendix 14.

Summary: The BLM must analyze all possible combinations of the alternatives and the associated direct and indirect impacts that could result from these combinations before choosing a Proposed RMP Amendment.

Response: Chapter 4, Environmental Consequences, of the Draft RMPA/EIS presents the impacts anticipated from the various alternatives based on best available science and professional judgment. The Draft RMPA/EIS provides sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or to make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.16. Since the BLM analyzed six alternatives in the Draft RMPA/EIS and added analysis of the Proposed RMP Amendment in the Proposed RMPA/Final EIS, this analysis sufficiently covers the range of impacts that could potentially occur by choosing a combination of alternatives in the decision.

22.2.11 Disturbance Cap

Summary: The BLM should provide additional detail and clarification on the disturbance cap process, including calculations of restoration acreage that could reduce the amount of disturbance measured towards the disturbance cap, how density caps relate, and how the BLM would ensure that the disturbance cap would be met.

Response: Disturbance cap is one tool in the toolbox to achieve no net loss of habitat across the landscape. The range of alternatives in the Draft RMPA/EIS outline variations in the disturbance cap process and analyzes the effects of these differences.

Rather than directing a specific calculation in the RMP, the BLM will use the best available disturbance information when determining whether a proposed action would be in conformance with the disturbance cap described in the RMP. This could be the disturbance estimate using the data, approach, and timing described in the Monitoring Framework. It could also include data from more specific disturbance inventories, as described in Appendix 7 on page 7-14 of the Framework, "more complex disturbance…estimation approaches may also be implemented…" While the BLM has a process to maintain and update data associated with disturbances across the west, committing to only use a specific dataset limits the BLM's ability to adapt to newer, more accurate data or approaches that could better inform whether a project conforms to the RMP disturbance cap.

We have included language in the Proposed RMP Amendment/Final EIS to include in-place, and pre-development compensatory mitigation requirements. The preferred alternative also identifies 3% as the maximum disturbance. The 1% per decade component of the Oregon disturbance cap was included in Appendix 2 as part of the Oregon existing approach for the disturbance cap in that state. The Proposed RMP Amendment has been clarified to retain that 2015 aspect of the disturbance cap as a state-specific retention for Oregon.

This planning effort is not considering any changes to the density caps in the existing plans and as such, comments on the density cap are not within the scope of this planning effort. Those actions would remain in the plans as described in the prior planning efforts, unchanged by this amendment. Density caps are independent of disturbance caps. The first measures the density of the facilities, while the second measures the amount of cumulative disturbance from all facilities. Density caps are part of most state wildlife agency management plans for GRSG and are based on published research cited in the NTT.

Summary: The BLM should apply the disturbance cap once a population trend threshold has been identified and should include all types of disturbances. Concrete actions that may be taken to reverse negative GRSG population trends should be explicitly stated in the RMP.

Response: When authorizing disturbing activities within important GRSG habitats (PHMA and IHMA in Idaho) the BLM applies disturbance caps to limit habitat losses associated with discrete anthropogenic disturbances and their associated human activity. Other management tools consider effects from diffuse or non-anthropogenic disturbances like wildfire, such as sagebrush availability objectives, GRSG habitat objectives, and adaptive management thresholds for population trends. Disturbance caps identify an upper limit (maximum disturbance permitted) above which no new development is generally permitted (subject to applicable laws and regulations and valid existing rights). A disturbance cap acts as a "backstop" to ensure that total disturbance does not exceed the level of GRSG tolerance for anthropogenic activities.

The Proposed RMP Amendment addresses declining habitat and population trends as part of its adaptive management approach that is described in detail in Chapter 2, Table 2-3, Adaptive Management in the Proposed RMP Amendment. When a population threshold is identified, the BLM and the State wildlife agency will coordinate to confirm the data and if a threshold has been met and will determine the causal factor. The BLM will identify appropriate management responses to any thresholds being met. Changes to existing management would be addressed through site-specific NEPA analysis.

Summary: The BLM should provide a disturbance cap exemption in certain instances such as when compensatory mitigation would offset disturbance cap exceedance. Other examples of exceptions to disturbance caps that were requested by commenters included the development of projects related to public health and safety issues, co-location of transmission facilities with existing infrastructure, and maintenance of critical roads.

Response: The disturbance cap process is only one of the tools to help the BLM analyze new project proposals while meeting the GRSG habitat objectives. The range of alternatives in the Draft RMPA/EIS includes some alternatives with exceptions for the disturbance cap, and others that do not include the exception, and discloses the effects of these differences. As noted in the Draft RMPA/EIS, an exception could only be granted according to specific criteria, including documentation that avoidance and minimization occurs before compensation is even considered, and so long as the BLM's GRSG goals and objectives are met. As outlined in the Proposed RMP Amendment/Final EIS, there are four categories for possible exceptions to the disturbance cap, found in Table 2-4 Priority Habitat Management Area (PHMA) Allocations and Management Direction.

Co-location of facilities is considered an exception to the disturbance cap under Alternatives 4 and 5 and would be considered minimization of impacts under the mitigation hierarchy, as described in Section 2.5 of the Draft RMPA/EIS. Compensatory mitigation would be required under Alternatives 3 through 6 where avoidance or minimization will not fully offset a project's impacts.

One comment raised hypothetical situations with only vague suggestions of proposed activities on uncertain rights-of-way or roads. It would be speculative for BLM to conclude whether these vague, hypothetical situations would or would not be allowed and under what circumstances, and whether "road improvements" would affect or be restricted by the disturbance caps considered in the Proposed RMP Amendment/Final EIS. Whether the disturbance cap applies at all would depend on several factors, including the authority under which the ROW was granted, the scope of the ROW, and potentially consultation with the BLM to determine whether the proposed improvement is reasonable and necessary. In sum, the hypothetical situations raised in this comment would need to be addressed at the implementation level on a case-by-case basis.

Summary: The BLM should consider the provided information and raise/lower the disturbance cap allowances.

Response: The disturbance cap process is only one of the tools in the toolbox to help the BLM analyze new project proposals while meeting the GRSG habitat objectives. It works in concert with specific management actions, mitigation, and adaptive management to address overarching GRSG goals. The alternatives in the Draft RMPA/EIS analyze a reasonable range of alternatives, including the addition of wildfire in the numerator calculation along with various exceptions. The BLM's RMPs use different management tools to manage for the appropriate levels of sagebrush, namely sagebrush availability objectives, habitat objectives, and adaptive management thresholds. The disturbance cap is primarily focused on discrete anthropogenic disturbances. GRSG are sensitive to increasing levels of anthropogenic disturbance with recent science indicating that levels of about 3% of disturbance result in GRSG moving out of an area and that about 70% of nests were located in habitats with 0-1% disturbance (Kirol et al., 2020). Additionally, Knick et al. 2013 specifically identified a relationship between disturbance and leks being abandoned, demonstrated by the finding that less than 10% of leks occur in areas with greater that 1% development. While these results are similar to those identified in the NTT, the BLM did not rely on the NTT report in developing this RMPA, but rather on published data that post-dates the 13-year-old NTT report which supports limiting disturbance to the levels presented. While the disturbance cap does not address every aspect of impact from developments, it does address the direct loss of habitat. The BLM analyzed the impacts of the proposed disturbance cap process in the Draft RMPA/EIS and disclosed the potential impacts.

Limiting disturbance is supported by the scientific literature to prevent or minimize impacts of development on GRSG. If a project results in loss of greater than 3%, habitat function for GRSG in the area may also be lost, and thus it may be difficult for BLM management to be responsive to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. While some states may not currently have a high level of anthropogenic infrastructure throughout the state, the location of the infrastructure is important in assessing actual impacts to GRSG, which is the intent of using HAF fine scale and project scale levels. Further, the exercise of valid existing rights does not preclude inclusion of disturbance associated with those leases in HMAs or disturbance calculations when considering whether to authorize future disturbances not covered by the lease; rather, it only protects the actual development as it is allowed under the lease. Understanding the amount of disturbance in an area provides the BLM with important information on how to consider new developments and still meet our GRSG conservation objectives.

Some commenters suggested application of the DDCT across the range of GRSG. However, in many areas of the GRSG range the habitat is not typically large contiguous areas of sagebrush as in Wyoming and

Montana, where the DDCT was developed. In such areas, use of a four-mile buffer could include substantial areas of non-habitat entirely unused by GRSG. Further, in some areas limiting the project area denominator to just the four-mile buffer omits areas that a GRSG population may regularly use in the seasonal use patterns. Finally, HAF and the DDCT are not interchangeable. HAF is used to assess whether an area provides GRSG habitat and, in this proposal, it is not the only tool used to complete that assessment. HAF is not used to measure disturbance levels. By contrast, the DDCT is a measure of disturbance which does not incorporate all of the seasonal habitat types such, winter range or connectivity. DDCT is not a habitat assessment tool. In many areas of the GRSG range the habitat is not typically large contiguous areas of sagebrush as in Wyoming and Montana, where the DDCT was developed. In such areas, use of a four-mile buffer could include substantial areas of non-habitat entirely unused by GRSG. Further, in some areas limiting the project area denominator area to just the four-mile buffer omits areas that a GRSG population may regularly use in the seasonal use patterns. The language that was added provides an opportunity for local monitoring of GRSG use patterns to guide definition of the project-level denominator. If such data is not available, the use of the DDCT-based approach would still be required. This approach provides flexibility to adjust the methodology of the disturbance cap to fit ecological and topographic variations across the range.

Summary: The BLM should provide additional detail and clarification on the disturbance cap process, specifically the usage of HAF.

Response: The HAF is a multi-scale assessment approach; addressing only a single scale in isolation misses the overall approach. To conserve seasonal habitat requirements associated with a local GRSG populations, disturbance caps will be applied to PHMA within the Habitat Assessment Framework (HAF) fine scale (Stiver et al. 2015, as revised), as well as at the project scale. Previous applications of a disturbance cap at a larger scale (e.g., biologically significant unit) did not limit the consideration to local populations and were often "diluted" by large amounts of non-habitat.

HAF fine scale units were delineated using the methodology identified by Stiver et al. 2015, and are available on the BLM GRSG web page. The units themselves are not RMP decisions, but are boundaries informed by the best available science to reflect the characteristics of the scale described in the HAF. As GRSG data continue to be collected, the Fine Scale areas could be refined and updated in coordination with the applicable state agencies to reflect the scale of habitat use described in the HAF.

The DEIS analyzes a range of alternatives for the disturbance cap process. The preferred alternative outlines the relationship between the disturbance cap at the project scale and the HAF Fine Scale habitat selection in Table 2-7.

Summary: The BLM should correct the analysis of the disturbance cap in the Draft RMPA/EIS, including failing to analyze the disturbance cap being reached more quickly using Habitat Assessment Framework (HAF) fine scale versus biologically significant units (BSU) or density and disturbance calculation tool (DDCT) methods and the possibility of encouraging development in undeveloped areas to avoid areas which are close to hitting the cap.

Response: The Draft RMPA/EIS includes this analysis in Section 4.2.3. The BSUs were developed inconsistently in the 2015 effort and were not always based on biological considerations. HAF fine-scale areas incorporate habitat associated with the seasonal habitats of GRSG populations. As such, there is a consistent biological metric from which disturbance will be calculated at a biologically meaningful scale. Using the HAF boundaries provides a more biologically meaningful assessment of impacts to GRSG. There is no

evidence that project approval rates are influenced by the scale at which disturbance is measured, and exact project location is an implementation level decision.

Summary: The BLM should provide additional detail and clarification on the disturbance cap process not applying to locatable mining.

Response: It is explicitly listed in Table 2-7 Comparison of Alternatives, Disturbance Cap and in multiple locations in the Draft RMPA/EIS that the disturbance cap would be applied to "the extent allowable under applicable laws (such as the Mining Law of 1872), or valid existing rights." While mining activity could count towards meeting the cap, further exploration and development would continue consistent with the Mining Law of 1872 as amended.

The disturbance cap only includes on-the-ground disturbance from anthropogenic sources listed in the Draft RMPA/EIS. That list does not include acres of oil and gas leases or mining claims since a lease or a claim does not itself have any disturbance until actual infrastructure is authorized. There are many examples across the west of leases going the entire ten-year term with no development, then expiring.

Summary: The BLM should not consider non-federal lands as a part of the disturbance cap.

Response: It is common and standard scientific practice to assess habitat for sensitive species across an entire landscape to ensure an accurate picture of the potential on BLM managed lands specifically. Disturbances on non-Federal lands may affect GRSG and need to be considered in potential development on BLM managed lands for biological accuracy. While the disturbance cap would not limit development on non-BLM managed lands, that development would be included in the disturbance cap calculation and thus may impact further development on BLM lands within the cap's boundary.

Summary: The BLM should provide additional detail and clarification on the disturbance cap process when it comes to indirect impacts, degraded lands, vegetation treatments, and livestock grazing.

Response: The disturbance cap process is only one of the tools available to help the BLM analyze new project proposals while meeting the GRSG habitat objectives. Disturbance caps are a tool to manage actual anthropogenic disturbance. For a management tool to be effective it needs to be implementable and there is substantial variability in the literature for a consistent distance associated with indirect impacts. While the disturbance cap does not address every aspect of impact from developments, it does address the direct loss of habitat, which reduces risks from other sources of mortality such as predation. In addition, limiting disturbance is supported by the scientific literature to prevent or minimize impacts of development on GRSG. Indirect disturbance from anthropogenic activities (e.g., noise, project traffic) will vary in intensity and impact depending on the project and local conditions (e.g., topography, distance) which cannot be assessed at a programmatic level.

Sagebrush availability is addressed in the vegetation objective that is already present in the plans and is not being proposed for change in this effort. In addition, habitat availability, including sagebrush cover, is included in the GRSG habitat objectives included in this effort that establish that the desired conditions in GRSG HMAs is to manage for suitable habitat, based on the best science available for the various ecological conditions across the range. Sagebrush availability is calculated annually through spatial analyses and is included both as the vegetation objective and as a component of the adaptive management approach. Additional management actions from the prior planning efforts that are not being changed as part of this amendment process establish guidance for GRSG habitat treatments.

Some commenters misunderstood the analysis of the disturbance cap with Alternative 4 livestock grazing management actions. In the Draft RMPA/EIS, Section 4.8.5 does not describe how the disturbance cap will limit livestock grazing, but how impacts to livestock grazing from development would be affected by the application of exceptions to the disturbance cap. This is noted in the 4th paragraph of the section which states that allowing cap exceedances "may lead to more development and increased impacts on livestock grazing operations, forage, and increased human-livestock conflicts." The effect is not a reduction of grazing or livestock-related infrastructure due to the cap, but the conclusion that the potential for more development due to cap exceptions could increase impacts on livestock grazing operations. The disturbance cap numerator does not include livestock grazing or associated infrastructure, as reflected in the Draft RMPA/EIS disturbance cap numerator section: "No other activities or actions beyond those listed in the above list are included when calculating the cap (e.g., wildfire, agriculture, vegetation treatments, residences, barns, fencing or range improvements, etc.)."

Summary: The BLM should remove or add exceptions to the disturbance cap process, including exceptions associated with the completion of any required compensatory mitigation.

Response: The range of alternatives in the DEIS includes some alternatives with exceptions for the disturbance cap, and others that do not include the exception. The DEIS discloses the effects of these differences. As noted in the DEIS, the exception can only be granted according to specific criteria, including documentation that avoidance and minimization occurs before compensation is even considered, and so long as the BLM's GRSG goals and objectives are met.

We have included language in the Proposed RMP Amendment/Final EIS to include in-place, and pre-development compensatory mitigation requirements. The Proposed RMP Amendment also identifies 3% as the maximum disturbance. This planning effort is not considering any changes to the density caps from the prior land use plan amendments, and as such, comments on the density cap are not within the purpose of this planning effort. Those actions would remain in the plans as described in the prior planning efforts, unchanged by this amendment. Considering the exception to the disturbance cap, in the Proposed RMP Amendment they are only allowable if the compensatory mitigation is implemented and functioning as habitat before the exception is granted. In addition, the compensation must benefit the GRSG population being impacted by the disturbance. These requirements ensure that any exceptions to the cap will not occur unless the compensatory mitigation is in place and documented to offset the impacts from the disturbance, eliminating the concern that the restoration/compensation would take decades to offset the immediate impacts of disturbance.

22.2.12 ESA Consultation

Summary: The BLM should disclose the biological assessment for the candidate, threatened, or endangered species with potential and/or actual habitat in the greater sage grouse habitat

Response: The Biological Assessment will be made available to the public on the project's ePlanning website.

Summary: The EIS is placing management restrictions that exceed the scope of the BLM's authority via FLPMA for a species that does not warrant restrictions as it is not listed as threatened or endangered under the ESA.

Response: While GRSG is not listed under the ESA, it is considered a BLM sensitive species. FLPMA gives BLM broad authority to conduct land use planning, including considering special status species as outlined in Manual 6840, Special Status Species, which states that "...the BLM shall designate Bureau sensitive species

and implement measures to conserve these species and their habitats ... to promote their conservation and reduce the likelihood and need for such species to be listed pursuant to the ESA." This EIS/RMPA process is not about "recovery," as defined by the ESA. Further, FLPMA describes "fish and wildlife development and utilization" as one of the six "principal or major uses of the public lands" and mandates that "the public lands will be managed in a manner that will...provide food and habitat for fish and wildlife."

22.2.13 Fish and Wildlife

Summary: Management strategies should align with historical data and local community values, incorporating active human management to ensure both ecological and economic sustainability, and not focus on single species management for GRSG.

Response: The BLM is not proposing single species management. The BLM manages the largest single share of GRSG habitat in the United States – nearly 69 million of 145 million acres total. These same lands sustain Western rural economies built on outdoor recreation, ranching, farming, energy development, and small businesses, and are critical for more than 350 other wildlife species – including pronghorn, mule deer, and pygmy rabbits. They are also the headwaters for the West's major river systems.

For decades, federal, state and private land managers have worked to conserve and restore the sagebrush ecosystem, with federal agencies managing habitat on the lands whose surface they administer and states managing and monitoring wildlife populations. Despite these best efforts, the GRSG is in sharp decline. Populations once in the millions now number fewer than 800,000, largely due to habitat loss exacerbated by climate change effects such as drought, increasing wildfires, and the spread of invasive species.

The Proposed RMP Amendment seeks to continue providing the BLM with locally relevant decisions that achieve rangewide GRSG conservation goals consistent with the agency's multiple use and sustained yield mission, and GRSG management efforts with federal, State, local, and Tribal partners.

Summary: The Draft RMPA/EIS should emphasize the importance of coordination with state wildlife management agencies and recognize their responsibility in the regulation of hunting, fishing, and predator control actions.

Response: The Draft RMPA/EIS clearly articulates that the BLM does not manage GRSG populations, only their habitat on BLM administered lands. Section 5 of the EIS discusses coordination with other agencies. See also Range of Alternatives and Section 1.8 of the Draft RMPA/EIS for a discussion of consistency with state and local plans. The BLM has worked extensively with the ten State Governments within the planning area to promote consistency with each of the States' GRSG plans and with the GRSG plans of the many cooperating local and county governments. The feedback and input of State fish and wildlife agencies and local governments significantly shaped the Draft Plan Amendment/Draft Environmental Impact Statement (EIS) and the Proposed RMP Amendment/Final EIS. Each BLM State Office has held numerous meetings with State wildlife agencies and county cooperating agencies to seek consistency with their respective plans. Additionally, the BLM and the States have each participated in over twenty meetings as part of Western Governor's Sage-grouse Task Force, including weekly meetings preparing the alternatives in the fall of 2023.

Summary: The EIS should be updated with provided text revisions. These include updates to address inconsistencies, adding citations, impacts to amphibians, a list of species that will benefit or be harmed by the proposed action, and impacts of livestock grazing management to fish and wildlife.

Response: A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. Given the large geographic scope of the effort,

the EIS does not include a list of all species potentially affected by the RMPA. A representative list of species is included in Section 3.5 and a list of BLM Special Status Species and their habitats is included in Appendix 11. Similarly, detailed site-specific conditions are not included at this planning level of analysis but will be considered during project-level NEPA reviews. The baseline data and impacts analysis in the EIS provides the necessary basis to make informed land use plan-level decisions. The agency does not need to determine that the RMP nor any subsequent implementation level projects need to benefit all wildlife species. Impacts on fish and wildlife under each alternative are described in Section 4.5 of the Draft RMPA/EIS to a level that would allow for an informed decision among alternatives. The BLM has made several clarifying edits in the Proposed RMP Amendment/Final EIS to the affected environment (Section 3.5) and impacts analysis (Section 4.5 and Appendix 10) based on comments received on the Draft RMPA/EIS.

22.2.14 FLPMA

Summary: The BLM should analyze multiple use and sustained yield under the Federal Land Policy and Management Act (FLPMA).

Response: FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. FLPMA does not mandate all uses be allowed on all areas of the public lands. Instead, it requires the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. FLPMA also directs the BLM to develop and periodically revise or amend its resource management plans, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

BLM's planning processes allows for analysis and consideration of a range of alternatives that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. This includes alternatives that provide a greater and lesser degree of restrictions in various use programs but would not eliminate or invalidate any valid existing development rights. Chapter 4 presents the anticipated direct and indirect impacts on the human and natural environment that could result from implementing each of the alternatives.

The BLM is striving to slow or stop the decline of GRSG on BLM-administered lands with this planning amendment. The goal to conserve and manage GRSG habitats to support persistent, healthy populations, consistent with BLM's sensitive species policy (BLM-M-6840) and in conformance with inventory requirements found in Section 201 of FLPMA.

In all GRSG habitat management areas, and consistent with valid existing rights and applicable law, BLM will apply the mitigation hierarchy (avoidance first, then minimization, compensation last) when authorizing third-party actions resulting in GRSG habitat loss and degradation to achieve minimum standards. The mitigation hierarchy to achieve either "no net loss" or "net conservation gain" are designed to comply with CEQ regulations (40 Part 1508.20), State regulatory requirements while conforming with the basis of multiple use and sustained yield in a manner that provides for habitat, ecological, and environmental protection.

This amendment effort recognizes the importance of including RMP actions that address GRSG threats on BLM-administered public lands in context of the 2010 and 2015 USFWS GRSG listing decisions. This effort also recognizes the legal and functional imperative of coordinating management with state, federal, tribal, and local plans and policies. Many actions from the 2015 and 2019 efforts already accomplish this. As a result, the purpose of the current BLM RMPA is to amend a sub-set of the GRSG management actions to ensure

management actions on BLM-administered lands support GRSG conservation goals, respond to changing land uses in GRSG habitats, improve the efficiency and effectiveness of GRSG management actions, provide for consistent conservation outcomes in GRSG habitat, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. The purpose of this amendment is focused on cross-cutting management actions/topics that are applicable throughout the planning area. Land use plan revisions will be completed on an individual basis as specific land use plan evaluations warrant.

Summary: BLM illegally applies FLPMA and multiple use lands use plans to wild horse areas. FLPMA did not amend the Wild Free-Roaming Horses and Burros Act of 1971

Response: Commenter's assertion that FLPMA did not amend the Wild Free-Roaming Horses and Burros Act of 1971 is incorrect. FLPMA incorporated the existing sections of the Act, renumbered them, and added a new section allowing the Secretary to use or contract for the use of helicopters for transporting captured animals. See Sec. 404 of P.L. 94-579.

Summary: The BLM should not select certain alternatives because they conflict with the multiple use mandate under FLPMA.

Response: FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. FLPMA does not mandate all uses be allowed on all areas of the public lands. Instead, it requires the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. FLPMA also directs the BLM to develop and periodically revise or amend its resource management plans, which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used. Under Alternative 3 BLM would recommend that certain areas are withdrawn from locatable mineral entry as a conservation measure to attempt to reduce impacts on GRSG from locatable mineral development. BLM planning efforts are able to recommend areas for withdrawal, but the Secretary of the Interior must act on the recommendation for the lands to be withdrawn from mineral entry by Public Land Order. While Alternative 3 Is the most restrictive to certain uses, all alternatives comply with FLPMA.

Summary: BLM should not use compensatory mitigation because FLPMA does not authorize it.

Response: In all GRSG habitat management areas and consistent with valid existing rights and applicable law, BLM will apply the mitigation hierarchy (avoidance first, then minimization, compensation last) when authorizing third-party actions resulting in GRSG habitat loss and degradation to achieve minimum standards. The mitigation hierarchy is designed to comply with CEQ regulations (40 Part 1508.20) and State regulatory requirements while conforming with the basis of multiple use and sustained yield in a manner that provides for habitat, ecological and environmental protection. Management actions related to mitigation are also in conformance with Executive Order (EO) 13990, Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis (January 20, 2021) and Secretarial Order (SO) 3398, Revocation of Secretary's Orders Inconsistent with Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis (April 16, 2021) and IM 2021-038. The BLM's multiple use and sustained yield mission as defined under FLPMA supports policy direction to:

- Implement consistent principles and procedures for mitigation in the BLM's authorization of public land uses;

- Apply mitigation to address reasonably foreseeable impacts to resources (and their values, services, and/or functions) from public land uses; and
- Follow the mitigation hierarchy by first avoiding damage to the public lands and resources; second, minimizing damage that cannot be avoided; and third, compensating for any residual impacts to important, scarce, or sensitive resources or resources protected by law.

Summary: BLM should only use landscape scale planning in land use plans which is authorized and led by a BLM State Director.

Response: This amendment effort recognizes the importance of including RMP actions that address GRSG threats on BLM-administered public lands in context of the 2010 and 2015 USFWS GRSG listing decisions. This effort also recognizes the legal and functional imperative of coordinating management with state, federal, tribal, and local plans and policies. The purpose of the current BLM RMPA is to amend a sub-set of the GRSG management actions to ensure management actions on BLM-administered lands support GRSG conservation goals, respond to changing land uses in GRSG habitats, improve the efficiency and effectiveness of GRSG management actions, provide for consistent conservation outcomes in GRSG habitat, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. The purpose of this amendment is focused on cross-cutting management actions/topics that are applicable throughout the planning area with state-specific variation. Records of Decision will be issued using a state-by-state approach that further accounts for site-specific variation at the discretion of each State Director.

Summary: The BLM's management and policy decisions to prevent degradation should be applied to all uses, not just grazing.

Response: Where land is not achieving or making progress toward achieving land health standards, the BLM will evaluate the causal factors responsible and take appropriate action under either or both the grazing regulations (43 C.F.R. subpart 4180) or the conservation regulations recently promulgated by the Public Lands Rule, once fully implemented (43 C.F.R. subpart 6103). Appropriate actions will be taken for the identified causal factor.

22.2.15 Fluid Minerals

Summary: Positive contributions from oil and gas development, including restoration efforts and new technologies, should be considered in the document.

Response: The BLM recognizes that restoration efforts and new technologies used by operators can reduce impacts on sage-grouse habitat and has reviewed the referenced studies for potential inclusion in the document.

Summary: For fluid minerals, designation of NSO, major stipulation areas and minor stipulation areas considered resources other than GRSG and would therefore not adequately protect GRSG while placing undue restrictions on public land users.

Response: Section 202 of the FLPMA requires the BLM, to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of, or for, such lands with the land use planning and management programs of other federal departments and agencies, and of the States and local governments within which the lands are located. This coordination will help balance all resource needs, including conservation.

NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis.

In addition, Table 2-4 includes a description for Alternative 4, 5 & 6 for how to address areas of non-habitat within mapped GRSG habitat management areas.

Summary: The BLM should improve its analysis of impacts on split estate lands and checkerboard.

Response: The BLM incorporated and clarified indirect impacts for checkerboard land patterns into the Proposed RMP Amendment/Final EIS in Air Resources and Climate Change, Minerals, Lands and Realty, and Socioeconomic sections.

Future activities that are expected to cause disturbance, such as rights or way or special use permit applications, would be evaluated and approved on a case-by-case basis based upon site-specific determination of ability to avoid, minimize, and/or mitigate impacts on GRSG habitat at the implementation phase. A proposed project's contribution to the amount of disturbance on the landscape will be evaluated during site-specific NEPA analysis. Per NEPA requirements, the BLM will consider disturbance on private lands as appropriate when making land use decisions since actions on private lands could impact the agencies' ability to manage GRSG.

Summary: The BLM should change fluid minerals management, such as having a 1-mile no leasing buffer around leks and NSO within PHMA and outside of the 1-mile lek buffer. Waivers, exceptions, and modifications to NSO stipulations and the mitigation hierarchy should be limited, changed, or clarified.

Response: Under the Proposed RMP Amendment/Final EIS, waivers, exemptions and modifications (WEM) would be granted only when meeting specific criteria designed to advance the management goals and objectives in the RMP Amendment. The Proposed RMP Amendment balances the risk of uncertainty against the benefits of management flexibility when considering whether to grant a WEM. Planning criteria identified for this amendment include consideration of how planning decisions may impact future listing determinations under the ESA. Where NSOs are less than 1 mile BLM has deferred to the local state wildlife agency and their authority on GRSG.

The BLM continually meets with state wildlife agency and other appropriate state authorities on a local basis for individual projects, to clarify how BLM, project proponents, and state management agencies will collaborate to implement a mitigation hierarchy and compensatory mitigation. This allows consideration of local ecological and topographical information in determining how to best avoid and minimize impacts, and if needed, implement compensatory mitigation.

Summary: The reasonably foreseeable development scenario requires changes and updates. Additional data should be incorporated to improve the analysis. Other data submitted needs to be considered.

Response: The BLM places great import on the best available information, including new scientific studies and government reports that indicate a potential change in our assumptions or conditions related to a land use planning effort. The BLM has to balance reviewing new information with determining what information is relevant to a decision in light of the BLM's purpose and need. Many commenters highlighted information and studies to the BLM to consider, and the BLM has reviewed each source submitted. Further, the BLM

asked the USGS to participate in the review, and to verify if information was included in the USGS synthesis report that was developed for the Draft EIS. Many suggested articles were already included for analysis in the USGS report and may have been missed by commenters in the initial review of the synthesis report and Draft EIS.

Both known and new studies were reviewed by BLM staff, including scientists and NEPA specialists, and each BLM State Office reviewed each study specific to how it informed their planning decisions and environmental conditions. The BLM has included, where appropriate, updates to analysis in the appropriate EISs. Overall, submitted studies did not offer information that changed the analysis of the plans/EISs and did not offer any new conditions or other information the BLM had not considered already. In addition, subsequent proposed projects will require additional NEPA analysis.

Summary: The Draft EIS does not allow any flexibility for development of fluid mineral resources and potential could close areas to mineral entry or leasing, or put subject to burdensome and unnecessary NSO stipulations or right-of-way restrictions because of BLM's management decisions. Valid existing rights will be restricted in the proposed in the Draft EIS.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis.

As stated in the Draft EIS in Section 1.5, all proposed actions will be subject to valid existing rights, including those associated with leases issued under the Mineral Leasing Act of 1920. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. For example, if the BLM previously issued an oil and gas lease with standard lease terms and conditions, and the lessee applies for permit to drill, the BLM will ensure that any management actions from the RMPA are applied in a manner that is consistent with the terms and conditions of the underlying oil and gas lease. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

Summary: The BLM should clarify what management would apply in situations where updates to sage-grouse habitat maps result in existing leases being classified as PHMA, or where leases that had been classified as PHMA are no longer PHMA.

Response: In each case any valid existing legal rights and grants would remain in place. As stated in the Draft RMPA/EIS in Section 1.5, all proposed actions will be subject to valid existing rights, including those associated with leases issued under the Mineral Leasing Act of 1920. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. For example, if the BLM previously issued an oil and gas lease with standard lease terms and conditions, and the lessee submits an application for permit to drill, the BLM will ensure that any management actions from the RMPA will be applied in a manner that is consistent with the terms and conditions of the underlying oil and gas lease. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

Summary: Geothermal energy has no carbon emissions and should be considered a renewable resource. Expanding geothermal energy is an important way to minimize impacts on Sage-Grouse while still meeting

broad multi-use management, energy production, and climate objectives. Geothermal impacts need to be considered further. The Proposed RMP Amendment does not consider the impacts of this type of renewable energy in detail.

Response: While geothermal resources are renewable, they follow a leasing process similar to fluid minerals and the ground disturbance associated with their development is comparable. The regulations for geothermal are housed in 43 CFR 3000 – Minerals Management. Thus, it is addressed as such in the EIS. Impacts from geothermal development is analyzed in the Draft RMPA/EIS in Chapter 4 for GRSG, Fish and Wildlife, Lands and Realty, Mineral Resources, and Social and Economic Conditions. The BLM will work with the lessee, operator, or project proponent in developing an APD or Geothermal Drilling Permit (GDP) for the lease to apply the mitigation hierarchy to impacts on GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such federal leases.

Summary: The BLM should disclose the effects of Fee/Fee/Fed and State minerals in further detail.

Response: While the development of wells on non-BLM managed surface in GRSG habitat results in impacts on GRSG it is not appropriate to analyze these in the plan and is outside the scope and management area. For fluid minerals, the term "Fee/Fee/Fed" refers to all situations where a well is located on non-Federal land overlying non-Federal minerals, but some portion of the wellbore enters and produces from the Federal mineral estate. Because fee/fee/fed wells are initially drilled on private surface and private minerals, they may be drilled without BLM knowledge or input, before being later extended into federal mineral estate. Therefore even if BLM did not approve the Federal portion in these cases impacts to GRSG would already have occurred. Because of such issues it is not possible to accurately determine what impacts might result from fee/fee/fed wells under all the Alternatives.

Summary: There are no BLM habitat management areas called "Winter Concentration Areas" or by extension any stipulations associated with it. References to exceptions in these areas should be removed from Fluid Mineral Leasing Waivers, Exceptions, and Modifications.

Response: Sage Grouse Winter Concentration areas were created by the Wyoming Game & Fish Department and are available here: https://wgfd.wyo.gov/wyoming-wildlife/sage-grouse-management/sage-grouse-data. BLM used habitat areas developed by the Wyoming Game & Fish Department in the development of PHMA and GHMA boundaries and may reference specific habitat areas in stipulations. As stated in the Draft RMPA/EIS Section 2.5.2, Priority Habitat Management Areas (PHMA) have the highest value to maintaining sustainable GRSG populations and can include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors.

Summary: Fluid mineral prioritization should be consistent with BLM's rule on onshore oil and gas development.

Response: In Section 1.8.1, Planning Criteria, of the Draft EIS, there is a criterion stating that all alternatives would comply with existing laws, regulations, and policies. The BLM has reviewed all actions in the Proposed Final EIS and found them to be consistent and within the bounds of all required laws, regulations, and policies.

Summary: The BLM should consider the impacts to development on existing federal oil and gas leases and the contracts that are in place including the BLM's continued decision to limit its and lessees' operational flexibility through NSO stipulations, Conditions of Approval (COAs) on new APDs and by only allowing

limited Waivers, Exceptions, and Modifications (WEMs) to certain restrictions within the GRSG DRMPA/EIS. BLM should recognize valid existing uses and rights for oil and gas production.

Response: As stated in the Draft RMPA/EIS Section 1.2 and throughout the document, all proposed actions will be subject to valid existing rights, including those associated with leases issued under the Mineral Leasing Act of 1920. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. For example, if the BLM previously issued an oil and gas lease with standard lease terms and conditions, and the lessee submits an application for permit to drill, the BLM will ensure that any management actions from the RMPA will be applied in a manner that is consistent with the terms and conditions of the underlying oil and gas lease. BLM could apply other mitigation efforts, such as COAs on new APDs and other required approvals in some situations.

Summary: The Proposed RMP Amendment limits states' abilities to manage state lands from development opportunities and leasing across different ownership patterns. More information on the impacts to state and private lands needs to be included. State concerns regarding state-specific issues need to be clarified.

Response: The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent…practical." In a situation where State and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. Thus, while State, county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. While the BLM is not obligated to seek consistency, the agency is should describe the inconsistencies between the proposed action and officially approved or adopted plans of State and local governments, so that the State and local governments have a complete understanding of the impacts of the Proposed RMP Amendment on State and local management options.

The BLM incorporated indirect impacts for checkerboard land patterns and other adjacent non-BLM managed lands into the Proposed RMP Amendment/Final EIS in Air Resources and Climate Change, Minerals, Lands and Realty, and Socioeconomic sections.

Summary: The process for evaluating WEMs is overly complicated and needs to be further refined. WEMs are too stringent. The effects of WEMs need to be analyzed.

Response: Under the Proposed RMP Amendment, waivers, exemptions, and modifications would be granted only when meeting specific criteria designed to advance the management goals and objectives in the RMPs. The Proposed RMP Amendment balances the risk of uncertainty against the benefits of management flexibility when considering whether to grant a WEM. Planning criteria identified for this amendment include consideration of how planning decisions may impact future listing determinations under the ESA. The Draft RMPA/EIS analyzes WEMs in Chapter 4 for GRSG, Vegetation, Fish and Wildlife, and Mineral Resources.

Confusion was expressed by commenters regarding an inconclusive causal factor analysis and when an exception could be issued, who would consider those exceptions, and how that exception would apply. The sentences referenced in the associated comment on Table 2-9, page 2-57, of the Draft RMPA/EIS indicate that if the required causal factor analysis is inconclusive, then exceptions could be considered. Without this

clarification, if the required causal factor analysis is inconclusive there would be confusion on if exceptions could be considered or not. No change was made as a result.

Summary: The BLM should explain why the Oil Shale and Tar Sands Record of Decision (ROD) removed GRSG HMAs in Utah from oil shale and tar sands leasing but not in Colorado and Wyoming.

Response: The Oil Shale and Tar Sands EIS and ROD was a separate planning process which was completed in 2013. The ROD for that process includes the rationale for those decisions. This GRSG planning effort is not revisiting those decisions.

22.2.16 General Consultation

Summary: BLM should address cooperating agencies comments and should improve its cooperating agency process. BLM should provide cooperators with better documents on a timely basis.

Response: All agencies participating as cooperating agencies have been given opportunities to participate during various steps of the planning process, including regular briefings, requests for input on draft alternatives and the administrative draft EIS, and identification of issues and data during public scoping and the Draft RMPA/EIS public comment period, as required by 40 CFR 1503.2 and 40 CFR 1506.10. Further, coordination with cooperating agencies continued through the development of the Proposed RMP Amendment/ Final EIS in order to identify consistency issues and to be compliant with the relevant laws and regulations. While the laws and regulations associated with cooperating agencies and coordination with other federal agencies and state, local, and tribal governments, state that coordination must occur; they do not prescribe the methods necessary to meet the legal or regulatory requirements. Based on the coordination efforts describe above, the BLM has met the legal and regulatory requirements for coordination to date.

Summary: The BLM should be more collaborative and continue working closely with states, tribes, and other stakeholders.

Response: Both the CEQ and BLM planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating agency relationships are limited to government entities, state agencies, local governments, tribal governments, and other federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The specific role of each cooperating agency is based on jurisdiction by law or special expertise, which is determined on an agency-by-agency basis and identified in the Memorandum of Understanding.

BLM sent letters to tribal governments inviting them to be cooperating agencies. The BLM also sent letters to local, state, and federal agencies inviting them to participate as cooperating agencies. These agencies are invited to participate because they have jurisdiction by law or can offer special expertise. Cooperating agency status provides a formal framework for these governments to engage in active collaboration with a lead federal agency in the planning process. Invitations were sent to potential cooperating agencies in December 2021 and January 2022. The list of cooperating agencies with signed Memorandum of Understandings is provided in Table 5-1. The BLM invited many other cooperators to engage in this effort who either did not reply or chose not to participate. In addition, the BLM engaged the U.S. Forest Service, U.S. Fish and Wildlife

Service, and Environmental Protection Agency at the national level to identify and receive feedback on specific issues under the jurisdiction of those agencies.

In addition to the BLM's invitations to a wide variety of agencies to participate as cooperating agencies, US Department of the Interior regulations (43 CFR 46.225(c)) also require the BLM, as lead agency, to consider any request by a government entity to participate as a cooperating agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 8-9). From the time that the Notice of Intent was published in the Federal Register and throughout the development of the EIS, an agency could notify the BLM requesting cooperating agency status.

In addition, the Western Governors' Association (WGA) Sage-Grouse Task Force was created by the State Governors and DOI was invited to participate. The Task Force is comprised of Governor designees who advocate for the interests of their state, including the interests of the counties. BLM met regularly with the WGA Task Force over the past two years, sometimes weekly, to discuss options for management decisions. Those fruitful discussions helped frame both the preferred alternative and the Proposed RMP Amendment, particularly relative to adaptive management mitigation, energy development, and transmission.

Summary: BLM should allow the counties to be involved with land use decisions.

Response: There are numerous counties participating as cooperating agencies in this land use planning process. See the prior response for details on the cooperating agency process for this project. A list of cooperating agencies is in the DEIS Section 5.3. In addition, there will likely be further opportunities to participate in decisions within GRSG habitat at the implementation level.

Summary: BLM should coordinate with the U.S. Fish and Wildlife Service to ensure the final RMPAs and RODs provide adequate regulatory measures to maintain the GRSG's not warranted status.

Response: BLM will continue to work closely with the USFWS. Chapter 5 of the Draft EIS outlines the consultation and coordination efforts undertaken in the development of the RMPA/EIS. In addition, the USFWS participated in this planning effort as a Cooperating Agency. See the prior response for details on the cooperating agency process for this project.

22.2.17 GIS Data and Analysis

Summary: Maps are unclear and based on incomplete data. The BLM should explain how mapping was completed. The GIS layers used have errors or are flawed. The BLM should use publicly available data.

Response: Before beginning the GRSG RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad-scale analyses required for land use planning. Data used in the Draft RMPA/EIS is available on the project website and upon request.

Clarification on some questions posed by commenters regarding the GIS data used in the EIS as well as the maps generated using that data is provided in the following locations. Chapter 1 of the DEIS states, "A planning area boundary includes all lands regardless of jurisdiction; however, the BLM can only make decisions on the public lands and federal mineral estate within the agency's jurisdiction." Appendix 5 provides data analysis and the resultant findings for ACEC relevance and importance criteria. Appendix 3 provides

descriptions of efforts in each state within the planning area to review new GRSG data and coordinate with state wildlife agencies to consider adjustments to the habitat management areas to enhance GRSG conservation.

The BLM has made changes to maps where applicable to address substantive comments received. In response to concerns raised by commenters regarding key habitat maps, Idaho-specific MDs pertaining to key habitat have been removed from the Proposed RMP Amendment. Additionally, in the Proposed RMPA/Final EIS text was added to the Locatable Mineral maps for Alternatives 4, 5, 6 and the Proposed RMP Amendment to clarify that all existing and recommended withdrawals displayed are due to efforts not associated with the GRSG plan amendment.

Summary: The BLM needs to have maps within the DEIS that are smaller scale, such as by state, county, or grazing allotment, rather than a rangewide scale. An online mapper should be available.

Response: The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The scale of the RMPA/EIS maps is sufficient to support the broad-scale analyses required for land use planning. A rangewide online mapper is not available, but the state-specific data used in the RMPA/EIS are available on the project's National NEPA Register eplanning page at https://eplanning.blm.gov/eplanning-ui/project/2016719/510. Under "Map Data" and, additionally, specific maps for areas within the planning area can be requested be contacting the associated BLM State Office or by contacting the GRSG headquarter planning team.

Summary: The BLM should display only field-verified HMA and peer-reviewed mapping data within the EIS map figures.

Response: The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information are sufficient to support the broad-scale analyses required for land use planning. There are provisions for ground-truthing mapping at a project level, such as non-habitat, or justifiable departures under lek buffers. However, there must be good documentation to demonstrate lack of GRSG use and/or impacts on adjacent habitats, for example in connectivity areas.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. The baseline data used in the Draft RMPA/EIS provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The BLM will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan. Project-specific analyses may utilize field-verified data as appropriate. The subsequent NEPA analyses for project-specific actions may tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1501.11, 40 CFR 1508.1). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Summary: The Draft RMPA/EIS associated maps (Volume 2: Appendix 1. Maps), and associated GIS data were first published March 14, 2024. However, on March 20, 2024, all GIS data for Alternatives 3, 4, 5, and 6 were overwritten. The BLM should have notified the public that data and mapping figures were being changed during the public comment period.

Response: The data and maps for the Draft RMPA/EIS were not changed during the public comment period. Early in the public comment period, which started on March 14, 2024, the BLM was notified that some states were experiencing technical issues when individuals attempted to download the datasets from the project website. The BLM reloaded the same dataset on March 20, 2024, as the commenter noted, to correct the glitches.

Summary: GIS data is not available online.

Response: State specific GIS data for each State in the planning area is available on the project's National NEPA Register eplanning website at https://eplanning.blm.gov/eplanning-ui/project/2016719/510 and has been there since the release of the Draft EIS. Some individuals had trouble downloading the data when they tried to download multiple Alternative datasets at the same time. If issues arise when downloading data, it is recommended that you delete all the GIS data that's not working from your ArcPro project, re-download the data from ePlanning, and pull these new data into your project. If that still doesn't work, try clearing the cache on your internet browser (e.g., cookies, etc.) and then downloading only one file at a time. BLM Wyoming staff assisted this commenter in successfully accessing the data in March 2024.

22.2.18 Greater Sage-grouse

Summary: The BLM should revise its analysis of GRSG to acknowledge additional impacts or revise the existing discussion of impacts., such as disturbance associated with GRSG dust bath locations along roads, impacts to specific species of sagebrush, or how the BLM disturbance cap should be considered when habitat loss associated with anthropogenic disturbance is less than 1% throughout the range.

Response: A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provide the necessary basis to make informed land use plan-level decisions. Impacts on GRSG under each alternative are described in Section 4.2 of the Draft RMPA/EIS to a level that would allow for an informed decision among management alternatives. The BLM has made several clarifying edits to the impacts analysis in Section 4.2 based on comments received on the Draft RMPA/EIS.

Disturbance caps in this planning effort are applied at scales important to GRSG. While disturbance from anthropogenic disturbance across the entire range of the species may be less than identified as concerning in the scientific literature, too much disturbance in the wrong place can have devastating impacts on GRSG. Additionally, anthropogenic disturbance in addition to habitat losses from wildfire can result in significant impacts to GRSG. The disturbance cap applies to cumulative disturbance, not simply one factor.

Summary: The BLM should modify management of GRSG to move away from the current ESA recovery-oriented management.

Response: While GRSG is not listed under the ESA, it is considered a BLM sensitive species. As such, the BLM complies with its sensitive species policy in Manual 6840, Special Status Species, which states that "...the BLM shall designate Bureau sensitive species and implement measures to conserve these species and their habitats ... to promote their conservation and reduce the likelihood and need for such species to be listed pursuant to the ESA."

Summary: The BLM should increase lek buffers in this EIS to provide greater protections for GRSG.

Response: The BLM reorganized the presentation of the management direction in the Proposed RMPA. This reorganization should allow the reader to more easily see where lek buffers are applied within the

rangewide management direction and where BLM state offices have applied state-specific lek buffers that differ from the rangewide management direction. For example, in the rangewide PHMA management direction Table 2-2; lek buffers are utilized in the fluid minerals, disturbance cap, and adaptive management rangewide management direction. In the fluid mineral section, multiple states also identify specific lek buffers that will apply in their states for fluid minerals that vary from the rangewide management direction. The BLM is not proposing rangewide changes to lek buffer in this RMPA. Management direction from the 2015 and 2019 plans. To ensure consistency with state wildlife management agencies BLM has adopted the lek buffers identified by individual state wildlife agencies for conformance with state wildlife agency management strategies for GRSG.

Summary: The BLM should statistically correlate GRSG declines with a specific cause such as annual precipitation and climate change and how historic baseline population numbers were determined.

Response: Annual precipitation does influence GRSG habitats and therefore population trends. However, the BLM does not have any authority over annual precipitation and therefore must focus on maintaining habitats. The BLM has considered climate change in identifying, with our state partners, habitats that are most resilient to change into the future. Most of these areas are PHMA and therefore subject to the limitations imposed on proposed activities for the conservation of GRSG and their habitats.

As identified by Schroeder et al., 2004, 1965 is when state wildlife agencies began to standardize lek surveys so they were repeatable and able to be analyzed with some statistical rigor. Therefore 1965 provided the most reliable baseline for comparisons.

Summary: The BLM should clarify or change the management related to GRSG such as clarifying "persistent, healthy populations," specifying how lek buffers are defined and used, and justifying the use of the HAF fine scale.

Response: BLM Special Status Species Management Manual (BLM-M-6840) directs the BLM to initiate proactive conservation measures that reduce or eliminate threats to Bureau sensitive species (including GRSG) to minimize the likelihood of and need for listing these species under the Endangered Species Act. Persistent and healthy populations are those that will survive throughout the course of this plan life without loss of abundance (independent of natural cyclic changes). Sustaining healthy, persistent populations requires sustaining the habitat which support the species. In the Draft RMPA/EIS Table 2-2, all the new alternatives list the overarching goal as: "Conserve, enhance, restore and manage GRSG habitats to support persistent, healthy populations, consistent with BLM's Special Status Species Management Policy (BLM-M- 6840) and in coordination and cooperation with state wildlife agencies. Habitat conservation and management should maintain existing connectivity between GRSG populations." Specific responses to certain comments received are presented below.

Lek buffers are one management tool to conserve GRSG nesting and brood-rearing habitat. Any appropriate adjustments to management within the buffer based on local conditions and allowable exceptions will be made at the implementation level. To ensure consistency with state wildlife management agencies BLM has adopted the lek buffers supported by the Western Association of Fish and Wildlife Agencies (WAFWA) and their state members. The differences in lek buffers are to allow for conformance with state wildlife agency management strategies for GRSG.

Lek definitions have changed since 2015. BLM has adopted new lek definitions developed by WAFWA, which are being used in all sage-grouse states that address this concern. The lek definitions developed by WAFWA

will be applied once the Proposed RMP Amendment/Final EIS and RODs are complete. They will not be applied to projects already approved and underway.

HAF is one tool used to assess habitat sufficiency. Other methods can be employed as appropriate. The BLM can and does collect habitat data at the fine-scale HAF and neighborhood cluster. The HAF fine scale is in general the level at which local populations of GRSG are most likely to be impacted by management decisions. It is one tool which is used with our partners to assess local habitat conditions and address any necessary flexibility.

Summary: The BLM should clarify definitions in the EIS, including those for different types of leks and neighborhood clusters.

Response: Intact habitat is not equivalent stable ecological state or desired ecological state. Intact habitat means sagebrush habitats that support GRSG that have not been fragmented or lost. BLM has adopted new lek definitions developed by WAFWA and being used in all sage-grouse states that address this concern. The lek definitions developed by WAFWA will be applied once the Proposed RMP Amendment/Final EIS and RODs are complete. Appendix 4 provides detailed definitions of leks, with comparisons to changes in the definitions used in 2015 and 2019. The DEIS Section 2.5.13 includes a description of neighborhood clusters:

"The BLM will use neighborhood clusters identified by USGS (Coates et al., 2021) to track habitat conditions, the same spatial scale used by USGS for population trend analyses. A neighborhood cluster generally represents a GRSG population unit and includes local aggregations of leks and seasonal habitats used by birds attending those leks based on state wildlife agency and research data."

22.2.19 Habitat Boundary/Habitat Management Area Designations

Summary: The EIS does not use correct or sufficient data to map HMAs.

Response: As described in Best Available Information and Baseline Data, of this comment report, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data and process used to identify HMA boundaries is described, in detail, in Appendix 3. Data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad-scale analyses required for land use planning. State-by-state habitat management area mapping strategies are described in detail in Appendix 3 of the Draft RMPA/EIS.

The BLM acknowledges that site-specific conditions on the ground may vary from the landscape scale modelling and those conditions on the ground change over time. As such, PHMA management would not be applied to non-habitat. The process for identifying non-habitat is described in Section 2.5.2 of the Draft RMPA/EIS. Such identification would occur at the project level, including associated project specific NEPA analysis.

Summary: HMA mapping would result in overly restrictive management.

Response: The BLM considered a reasonable range of alternatives during the planning process in full compliance with NEPA. This resulted in six alternatives analyzed in the Draft RMPA/EIS with different levels of restrictions on GRSG habitat to meet the purpose and need (Section 1.3). Multiple uses, including mineral, infrastructure, and renewable energy development, on BLM-administered lands would be retained per FLPMA, though the BLM's multiple-use and sustained yield mandate does not require that all uses be allowed

on all areas of the public lands. The effects of the alternatives on resources, resource uses, and socioeconomics are disclosed in Appendix 10, Appendix 14, and Chapter 4 of the Final RMPA/EIS.

Summary: The BLM should clarify state-specific management within HMAs and how HMAs were developed, including explanations for "key habitat" in Idaho and OHMA in Nevada.

Response: BLM has adopted state wildlife agency delineations of important GRSG habitats and worked closely with those agencies on adjustments. The Proposed RMP Amendment identifies state-specific management within these areas by activity type (e.g., oil and gas leasing, right-of-way management), and will complete additional state-specific step-down actions in the state specific Records of Decisions to follow. BLM has revised language in the Proposed RMP Amendment/Final EIS for clarity, including adding clarifying language regarding the role of validation/confirmation of HMA type. The data and process used to identify HMA boundaries and the definitions of each of the HMA types is described in detail in Appendix 3, Greater Sage-grouse Habitat Management Area State-by-State Mapping Strategies.

The BLM has clarified in the Proposed RMP Amendment that "key habitat" is no longer the applicable term. For example, MD SSS 8 and MD SSS 13 from the 2015 RMP Amendment would be replaced by the term "habitat" used in this Proposed RMP Amendment. (See Idaho - Additional Management Direction for more detail). Unless specifically noted, management of OHMA does not change. Also, see Appendix 2. section 2.12.

Summary: The BLM should implement a consistent prioritization strategy to prioritize new oil and gas leasing outside of PHMA and GHMA.

Response: To the extent appropriate, the RMPA/EIS identifies prioritization of management within PHMA and GHMA. However, sufficient flexibility in prioritization has been retained for the Authorized Officer during implementation, depending on District or Field Office specific conditions, such as staffing or budget.

Summary: BLM should use ground-truthing and other site-specific methods to accurately assess potential habitat areas and should ensure that areas can be de-classified in a timely manner if it is appropriate to do so.

Response: As described in Best Available Information and Baseline Data, of this comment report, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information is presented in map and table form and is sufficient to support the broad-scale analyses required for land use planning.

The BLM acknowledges that site-specific conditions on the ground may vary from the landscape scale modelling and those conditions on the ground change over time. As such, PHMA management would not be applied to non-habitat. The process for identifying non-habitat is described in Section 2.5.2 of the Draft RMPA/EIS and Table 2-4 in the Proposed RMP Amendment/Final EIS. Such identification would occur at the project level, including associated project specific NEPA analysis.

Summary: The BLM should update the analysis to recognize negative impacts of development on GRSG and should avoid any development in or near GRSG habitat.

Response: This DEIS includes analysis and consideration of a reasonable range of alternatives that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. This includes alternatives that provide a greater and lesser degree of restrictions in various use programs but would not eliminate or invalidate any valid existing development rights. The BLM analyzes effects on GRSG in Section 4.2 of the Draft RMPA/EIS. The EIS considers a range of alternatives that includes alternatives that are more restrictive to development, such as Alternative 3.

The separate EIS effort that is considering a withdrawal from location and entry under the Mining Law of 1872 of the 2015 sagebrush focal areas (SFAs) is independent of any SFA decisions associated with this planning process. The United States District Court for the District of Idaho ordered the BLM to "re-initiate" the NEPA process for the proposed withdrawal. This separate withdrawal EIS effort is analyzed in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4.

Summary: The BLM should retain/remove SFAs from the alternatives.

Response: The Draft and Final EISs include analysis and consideration of a reasonable range of alternatives that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. Alternative 1 includes designation of some areas of PHMA as Sagebrush Focal Areas (SFA) with a recommendation to withdraw them from mineral location and entry under the Mining Law of 1872 and prioritization for various other activities related to vegetation treatments, livestock grazing, and wild horses and burros. The separate EIS effort that is considering a withdrawal from location and entry under the Mining Law of 1872 of the 2015 SFAs is independent of any SFA decisions associated with this planning process. The United States District Court for the District of Idaho ordered the BLM to "re-initiate" the NEPA process for the proposed withdrawal. This separate withdrawal EIS effort is included in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4).

Summary: PHMA and ACEC management in Alternative 3 requires clarification.

In Alternative 3, all habitat is managed as PHMA and ACECs are identified for designation. The ACECs in Alternative 3 would receive the management proposed for PHMA under that Alternative with additional protections provided that relate to major rights of way and the development of a plan of operation for locatable minerals. In Alternative 3, there are 64,990,000 acres of PHMA (Final EIS, Table 2-14) and 8,732,000 acres of ACECs (Appendix 5, Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat). Clarification was made in the Proposed RMP Amendment/Final EIS that all PHMA is not managed as ACEC – but the reverse: All designated ACECs would have the same allocations as PHMA, with some additional protections.

Summary: The BLM should reconsider or clarify Habitat Management Area actions in Alternative 3, including compensatory mitigation requirements and ACEC management.

Response: The Draft RMPA/EIS includes analysis and consideration of a range of alternatives that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. This includes alternatives that provide a greater and lesser degree of restrictions in various use programs but would not eliminate or invalidate any valid existing development rights. The commenter is referencing language specific to Alternative 3, which includes the greatest measures to protect

and preserve GRSG and its habitat. The management direction required under Alternative 3 is described in Chapter 2 in the Draft EIS, and in the Final EIS this information is found in Appendix 21.

As described in Section 2.5.3 of the Draft EIS, in all GRSG habitat management areas and consistent with valid existing rights and applicable law, BLM will apply the mitigation hierarchy (avoidance first, then minimization, compensation last) when authorizing actions resulting in GRSG habitat loss and degradation. Table 2-5 of the Draft EIS clearly outlines the application of that mitigation hierarchy, including compensation.

In Alternative 3, all PHMA is not managed as ACEC – but the reverse: All designated ACECs would have the same allocations as PHMA. In Alternative 3, there are 69,199,000 acres of PHMA (Table 2-3) and 11,139,472 acres of ACECs (Table 2-14).

Summary: The BLM should consider actions which allow addition of acreage to PHMA/GHMA.

Response: The Proposed RMPA outlines a process and criteria for addressing areas of non-habitat in mapped GRSG Habitat Management Areas when non-habitat is identified (refer to Chapter 2, Table 2-4, Criteria Based Management for Non-Habitat). In accordance with existing law, regulation and policy, inventories will continue to be conducted to provide information on GRSG habitat and distribution (BLM Manual 6840 .04 D 3; BLM-M-6840 .04 E 2) and as part of that evaluation process, BLM will consider whether adjustments to HMA boundaries are necessary. Changes to HMA boundaries would need to be addressed through appropriate resource management planning procedures such as through an RMP amendment or revision.

Summary: The BLM should clarify direction that would apply in GHMA, such as coal management, locatable minerals management, management in Known Potash Leasing Areas (KPLAs), and the boundaries of where management would be applied. The BLM should make GHMA management less restrictive.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in the Draft RMPA/EIS in Chapter 2, sections 2.1- 2.5. Descriptions of management direction across alternatives for the resources mentioned can be found in Table 2-4. Boundaries for GHMA vary across the alternatives but are reflected in Maps 2.1 thru 2.6.

GHMA management would apply only within the boundaries of GHMA for each alternative. Regarding coal management, for Alternatives 4, 5 & 6 - Table 2-4 states that in PHMA & GHMA in CO, MT/DK, UT and WY at the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR Part 3461.5, unless a suitability process has already been conducted that considered GRSG HMAs. As outlined in 43 CFR Part 3461.5(o)(1), federal lands where the BLM and the state jointly agree are habitat for resident species of high interest to the state and which are essential for maintaining these priority wildlife species shall be considered unsuitable. However, a lease may be issued if, after consultation with the state, the surface management agency determines that all or certain stipulated methods of coal mining will not have a significant long-term impact on the species being protected. This process would be applied in both PHMA and GHMA, though there is no statement that acres in either of these areas would be unsuitable based on language in the RMP amendment.

Language regarding KPLA impacts has been revised in Chapter 4.

Summary: Language regarding HMAs is too vague. The BLM should clarify the acreage within the HMAs, where they would occur (such as within existing ACECs or lands with wilderness characteristics), and provide state specific maps.

Response: A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provide the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). As such, the specific location of all resources within HMAs is not presented but would be evaluated at the site-specific level as projects are proposed.

As a range-wide planning document, the BLM did not prepare site specific maps as a part of the analysis as that degree of localized information does not help differentiate between the impacts of the alternatives. However, GIS data used in the RMPA/EIS are available on the project's National NEPA Register website and upon request.

22.2.20 Habitat Objectives

Summary: The habitat objectives, including the use of the HAF, are too prescriptive and should be made more flexible.

Response: The HAF is a multi-scale habitat assessment approach, which provides a standardized, science-based methodology to assess GRSG habitat suitability at multiple scales (mid, fine, and site-scale). This is key, as addressing only a single scale in isolation misses the overall approach. While the HAF Technical Reference gives suggested indicators and thresholds, these are not prescriptions. GRSG management requires multi-scale assessments to focus conservation work where needed. Decisions based on the assessment should also factor in additional information, threats, etc. as part of broader processes, such as land health. The site-scale indicators are not standards nor should they be considered individually, and both the indicators and benchmarks are (as stated in the HAF and these management actions) adjusted based on local science and best available information. Site-scale HAF does not determine management. Management responses are not based on a single rating in a single plot. It is up to the BLM and partners at the implementation stage to determine adequate indicators and thresholds and conduct multi-scale assessments.

Habitat objectives provide a framework to guide management in areas where GRSG occur. The objectives identified in Appendix 8 have considered different ecological conditions across the planning areas. They serve as objectives but not mandates and local adjustments can be made as determined in the field by BLM staff and state wildlife agency members.

Summary: The BLM should not use HAF because it is too complex, hard to apply, and is a formal regulation not complying with APA.

Response: The Habitat Assessment Framework provides a standardized, scientifically based methodology to assess GRSG habitat suitability at multiple scales and helps further inform measurable habitat objectives. HAF is not a regulatory framework. Using multi-scale evaluations is important for assessing GRSG habitat by considering the entire suite of conditions that contribute to high quality habitat, the success of past conservation actions, and prioritizing future land uses and conservation actions. The indicators and benchmarks help inform the wildlife and/or sensitive species component of the Land Health Standards evaluation process but are not land health standards and do not replace land health assessments. Additional guidance on the use of these tools and the associated products are available in the Habitat Assessment

Framework (Stiver et al. 2015, BLM TR 6710-1, as revised) and BLM Sage-grouse HAF Implementation Guidelines. HAF complies with CEQ regulations that agencies shall make use of reliable existing data and resources (40 CFR 1502.23). The use of HAF in and of itself does not affect the rights of 3rd parties. However, project proponents can always challenge a decision the BLM makes based on HAF assessments.

Summary: Habitat objectives should be applied as a term of every livestock grazing lease.

Response: The suggested change is not a land use planning decision but a site-specific consideration at a grazing allotment level. The BLM can change the terms and conditions of grazing leases and permits during the renewal process.

Summary: The BLM should consider adjusting the habitat indicators used for habitat objectives, including using adequate residual nesting cover.

Response: As stated in Appendix 8 Section 8.2, as research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the habitat indicators will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies. BLM will continue to work with appropriate partners to evaluate the latest science and consider changes to habitat indicator tables. Edits should only be made if warranted by scientific evidence, in coordination with the applicable state agency.

The decision to not use the language 'adequate residual nesting cover' for a habitat indicator is because the term is 'adequate' is inherently subjective and lacks a standardized approach for consistent implementation or monitoring.

Summary: Habitat objectives should take into account current ecological potential according to the Ecological Site Description (ESD), associated State and Transition Model (STM), and existing ecological state.

Response: The Draft RMPA/EIS includes the concepts of ESD, STM, and ecological state as a part of Appendix 8, Habitat Indicators and Benchmarks. The BLM will continue to work with appropriate partners to evaluate the latest science and consider changes to habitat indicator tables. As stated in Appendix 8, Section 8.2, as research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the habitat indicators will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies. Edits should only be made if warranted by scientific evidence, in coordination with the applicable state agency.

Some comments received on habitat objectives were state-specific and not applicable to the range-wide planning effort. Those issues are more appropriate to consider during decision-making for implementation-level projects when more site-specific information is available.

Summary: The BLM should clarify the use of the HAF in assessing suitability of GRSG habitat, its applicability to grazing management, and clarify the terminology used.

Response: As described in Section 2.5.4 of the DEIS, habitat objectives identify the desired habitat outcome on BLM-administered lands in GRSG HMAs at multiple scales including seasonal habitats and connectivity within and between populations.

As described in Appendix 8 of the DEIS, habitat indicators are assessed following the methods described in the Sage-grouse Habitat Assessment Framework. The Habitat Indicators Tables provide a list of indicators

and benchmarks, derived from local and regional research on GRSG habitat selection, that collectively are used to inform habitat suitability. BLM will leverage the terrestrial Assessment, Inventory, and Monitoring (AIM) methods, additional monitoring approaches for wetland and riparian habitats, credible partner data, and supplemental long-term monitoring data and guidelines developed by the BLM to collect data on site-scale habitat condition.

As research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the Habitat Indicators Tables will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies. The addition or adjustment to indicators or benchmarks in the Habitat Indicators Table must include the reference or basis for which the changes are made. Edits should only be made if warranted by scientific evidence, in coordination with the applicable state agency.

The Proposed RMP Amendment/Final EIS was updated to clarify the variability within the habitat objectives by acknowledging that there are ecological differences across the GRSG range and to clarify HAF fine scale exceptions in specific circumstances.

Summary: The BLM should clarify what a "disturbance response group" is and justify its use.

Response: "Disturbance response group" is terminology specific to the Great Basin and the State of Nevada to describe ecological sites that occur at scales too small for application in planning large-scale vegetation treatments or post-fire rehabilitation. Disturbance Response Groups (DRGs) are used to scale up ecological sites by grouping ecological sites based on their responses to disturbances (Stringham et al 2016).

Summary: The BLM should update habitat indicators to resolve inconsistencies between states or to better reflect site-specific differences.

Response: As described in Appendix 8 of the Draft RMPA/EIS, habitat indicators are assessed following the methods described in the Sage-grouse Habitat Assessment Framework. BLM will leverage the terrestrial Assessment, Inventory, and Monitoring (AIM) methods, additional monitoring approaches for wetland and riparian habitats, credible partner data, and supplemental long-term monitoring data and guidelines developed by the BLM to collect data on site-scale habitat condition. Data will inherently vary between states as ecosystems are not uniform across the GRSG range.

As research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the Habitat Indicators Tables will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies.

The Proposed RMP Amendment/Final EIS was updated to clarify the variability within the habitat objectives by acknowledging that there are ecological differences across the GRSG range.

22.2.21 Lands and Realty

Summary: Closing ACECs to major ROWs would result in longer routes and increased costs and environmental impacts.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. In order to comply with BLM policies and FLPMA, all nominated areas in the planning area which meet the relevant and important criteria were

considered for potential designation as an ACEC in the DEIS, under Alternative 3 and 6 along with a range of potential management actions. The BLM analyzed a range of alternatives in Chapters 3 and 4 of the Draft RMPA/EIS and followed the procedural requirements for the consideration of designation of ACECs through the land use planning, revision, or amendment process in BLM planning regulations 43 CFR 1610.7-2. The Proposed RMP Amendment does not propose to designate any ACECs.

Summary: The BLM should clarify the terminology used for and discussion of impacts on lands and realty in the RMPA.

Response: The BLM has clarified the definitions of co-location, the different types of rights-of-ways, transmission lines, and transmission corridor in the Glossary of the Proposed RMP Amendment/Final EIS. In Chapter 2, the BLM specifies that management direction applies to RMP designated corridors. The BLM has clarified the analysis in Section 4.9 and Appendix 10 to reflect the impacts of the restriction on widening ROWs and to better analyze the effects of ROW burial. The BLM has searched the EIS to ensure the correct use of the terms "power line" and "transmission line" and clarified the definition of "Major ROW".

Summary: The BLM must recognize valid existing rights and that ROW exclusion areas conflict with valid existing rights, such as RS 2477 or RS 2339. In addition, there are cases of unpatented mining claims and unclaimed lands open to mineral entry, independent of the discovery status of these lands.

Response: As stated in the Draft RMPA/EIS in Section 1.5, the RMPA will recognize all valid existing rights. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

The BLM also recognizes that it has limited authority to impose conditions on certain uses related to the Mining Law of 1872 through land use planning decisions. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations.

In this planning process, the BLM is not making a determination regarding valid RS 2477 rights of way or RS 2339 ditches. Adjudicated RS 2477 and RS 2339 are considered valid existing rights.

The Proposed RMP Amendment/Final EIS Lands and Realty analysis in Chapter 4 and Appendix 10 has been revised to include an analysis of any potential indirect effects to valid existing rights as a result of the management alternatives.

Summary: The BLM should include language describing the RMPA's connection to the Solar PEIS. The BLM should also use the existing and planned transmission lines identified in the Solar PEIS to identify areas for co-location.

Response: The BLM analyzed a range of reasonable alternatives from ROW avoidance and exclusion areas for GRSG habitat management areas. Impacts associated with ROW development, such as disturbance and increased potential for predation, could occur in these areas if developed, but mitigation measures would help to lessen the impacts. The BLM would co-locate new ROWs with existing infrastructure when possible. as described in Nature and Types of Effects.

In a separate NEPA process, the BLM is currently updating the BLM RMPs for solar energy development in the Solar Programmatic Environmental Impact Statement (PEIS). In that analysis of impacts the Solar PEIS

considers existing management associated with the 2015 GRSG amendments as those direct current GRSG habitat management on BLM- administered lands. However, the Solar PEIS update defers to this GRSG planning effort to decide how solar energy development would be conducted in GRSG habitat management areas.

Summary: The BLM should eliminate ROW exclusions in KSLA.

Response: The BLM considered a range of reasonable alternatives during the planning process in full compliance with NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. In the Draft RMPA/EIS, ROW avoidance under Alternatives 1, 2, 4, 5, and 6 would not preclude development of major ROWs in PHMA where it overlaps with KSLA.

Summary: The BLM should work with state agencies to determine if additional mitigation for federally permitted projects would be needed to ensure future impacts on private lands would not occur once an easement or similar mechanism is lifted.

Response: BLM has worked and will continue to work with state agencies both as cooperators and stakeholders on this project, and on a continuing basis when analyzing actions at the Field Office level. This process will continue to inform if additional mitigation would be needed to ensure future impacts on private lands would not occur once an easement or similar mechanism is lifted.

Summary: The BLM should acknowledge that there are multiple requirements requiring reclamation be completed for project disturbances. Additionally, the EIS should clarify whether reclaimed land can be re-impacted.

Response: Section 4.2, Greater Sage-Grouse, has been updated acknowledging these effects. There is nothing proposed that states that PHMA cannot be disturbed. In the Draft RMPA/EIS, Section 2.5.5 states that a disturbed area is included in the disturbance cap calculation until it has been restored to provide equal or improved habitat function as was provided by the area before the disturbance.

Summary: The BLM should adopt an alternative with more stringent management to limit indirect impacts to adjacent high valuable habitat when co-locating major ROWs with existing disturbance.

Response: The BLM considered a range of reasonable alternatives during the planning process in full compliance with NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment.

Summary: New transmission lines should not be authorized outside of utility corridors and, for those locations where transmission lines already exist, or where valid existing rights necessitate construction of new gen-ties in GRSG habitat, BLM should apply the avoidance criteria and additional protections for breeding, nesting, and other high-value/limiting seasonal habitat.

Response: The BLM considered a range of reasonable alternatives during the planning process in full compliance with NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. PHMA would be ROW exclusion under Alternative 3, outside of RMP designated corridors, which could preclude development of major ROWs. Required design features would be applied as described in the 2015 ARMPAs.

Summary: Alternatives 3 and possibly 4 would seriously restrict the possibility for urban expansion and housing affordability, as well as limit necessary infrastructure development, including that required for emergency services.

Response: The BLM has clarified and acknowledged the impacts on lands and realty under Alternatives 3 and 4 in Section 4.9 and in Appendix 10.

Summary: The Draft RMPA/EIS lacks adequate analysis of the effects on neighboring state and private lands in the analysis area.

Response: The BLM has clarified and acknowledged the potential indirect impacts on adjacent state, tribal and private lands in Section 4.9 and in Appendix 10.

Summary: The BLM should allow for exceptions to the requirement to use utility corridors depending on site-specific conditions, in areas where corridors end, or exceptions to avoidance requirements.

Response: The BLM considered a range of reasonable alternatives during the planning process in full compliance with NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. The range of alternatives includes encouraging placement of major ROWs in designated utility corridors under Alternatives 1 and 2, requiring the use of utility corridors under Alternative 3, and exemption from the disturbance cap if major ROWs are sited in utility corridors under Alternatives 5 and 6. The Proposed RMP Amendment encourages the use of utility corridors through major ROW exception criteria and allows for deviations depending on site-specific conditions. The BLM is not proposing changes to any RMP designated corridors under this RMPA.

For BLM, ROW avoidance means that areas should be avoided but may be available for location of ROWs with special stipulations. For management direction which discusses micro-siting to avoid placement - the first step is overall avoidance, then micro-siting to avoid impacts to active leks or connectivity corridors, then application of minimization measures, and finally residual direct and indirect impacts would be mitigated through compensatory mitigation. There is an exception listed that Major ROWs that are located inside RMP designated utility/ROW corridors would not need to comply with disturbance cap (at either the HAF fine scale or project level) or compensatory mitigation requirements unless required by State regulations.

Summary: The BLM should consider designating additional future corridors or use the more general approach from the GRSG planning effort where designated utility corridors include locations of existing linear infrastructure.

Response: The BLM dataset for designated utility corridors is based on corridors designated through BLM resource management plans. While the BLM is not changing designated utility corridors through this effort, future RMPs can consider designating additional corridors as suggested by the commenter. The BLM is not proposing changes to any RMP designated corridors under this RMPA.

Summary: Location of major ROWs in PHMA/IHMA may be necessary to meet other resource needs, including but not limited to the need for protection of prime agricultural lands or major ROW transmission corridors.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. The BLM is not proposing changes to any RMP designated corridors under this RMPA.

22.2.22 Lands with Wilderness Characteristics

Summary: The BLM should consider suggested edits to lands with wilderness characteristics analysis in Chapters 3 and 4.

Response: This RMP amendment process is not proposing any changes to the management of lands with wilderness characteristics. The BLM appropriately inventoried lands for wilderness character and analyzed impacts of proposed management on lands with wilderness characteristics as required by law and BLM policy. BLM has revised language in the Proposed RMP Amendment/Final EIS for clarity and included edits to the analysis in Chapter 4 and Appendix 10 based on public comments.

22.2.23 Livestock Grazing

Summary: The BLM should update the analysis to recognize negative impacts of livestock grazing on GRSG habitat.

Response: As noted in the Best Available Information and Baseline Data section of this comment report, before beginning the GRSG Draft RMPA/EIS and throughout the planning effort the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM has incorporated the latest science into the discussion of impacts in Chapter 4, including an analysis of both the potential for beneficial and adverse effects on GRSG habitat. For instance, in Section 4.2.1 of the Draft RMPA/EIS, on page 4-7, the BLM describes the potential for the timing and amount of grazing to affect cover for nesting GRSG. The discussion of the potential effects of livestock grazing on GRSG continues through page 4-9.

Summary: The BLM should update and clarify the analysis to recognize benefits of livestock grazing to GRSG.

Response: As noted in Best Available Information and Baseline Data, of this comment report, before beginning the GRSG Draft RMPA/EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM has incorporated the latest, best available science into the discussion of impacts in Chapter 4, including a balanced analysis of both the potential for beneficial and adverse effects on GRSG habitat. For instance, in Section 4.2.1 of the Draft RMPA/EIS, on page 4-7, the BLM describes the potential for the timing and amount of grazing to affect cover for nesting GRSG. The discussion of the potential effects of livestock grazing on GRSG continues through page 4-9. The BLM has made several changes to Section 4.2 in the Proposed RMP Amendment/Final EIS to clarify the potential for beneficial effects from livestock grazing on GRSG.

Summary: The BLM has adequate processes in place to manage livestock grazing and does not need an RMP amendment with additional direction. The BLM cannot keep up with the existing workload.

Response: As noted in Section 2.5.10 and described further in Appendix 15, Alternatives 1 and 2 include many livestock grazing actions addressed by regulation, policy, or that duplicate management in the existing RMPs. The action alternatives focused on the threat to GRSG from improper livestock grazing. The BLM will continue to comply with all existing laws related to livestock grazing, including 43 CFR 4100 and the

Taylor Grazing Act. The workload associated with administered livestock grazing cannot be addressed through an RMPA.

Summary: The BLM should update the analysis to focus on the impacts of proper versus improper grazing practices. Additionally, comparisons of impacts between livestock grazing and wild horse and burro grazing should be clarified such that the comparison is made only with improper livestock grazing practices.

Response: The BLM has language throughout the Draft RMPA/EIS distinguishing between proper and improper grazing and acknowledging that negative effects to GRSG are often from improper grazing. See for instance, page 3-4 of the Draft RMPA/EIS: "Habitat loss is attributed to ... improper livestock grazing ..." and page 4-9, which states: "Under all alternatives, described in Section 2.9.7, livestock grazing would be managed to meet or make progress towards land health standards and improper grazing would be limited and addressed through implementation-level corrective actions." In addition, to the extent appropriate, the RMPA/EIS identifies prioritization of management within PHMA and GHMA. However, sufficient flexibility in prioritization has been retained for the Authorized Officer during implementation, depending on District or Field Office specific conditions, such as staffing or budget.

In addition, as analyzed in the Draft RMPA/EIS, wild horse presence, particularly when herds are at levels greater than appropriate management levels, can lead to impacts on the quality of GRSG habitat. The types of effects that different large herbivores can have on rangeland ecosystems can be similar, even while the specific magnitude and spatial distribution of those effects may vary from species to species. The analysis did not state that wild horses are the sole source of impacts to GRSG, nor did the analysis conclude that all such impacts are identical across all large herbivores. Reducing any of the uses or resources that impact GRSG has the potential to reduce the negative impacts.

Summary: The BLM should update and clarify the data, methods, or language in the analysis on livestock grazing.

Response: The BLM has made several clarifying edits to the Proposed RMP Amendment in Chapter 2, for instance to RM-3. The BLM has also made clarifying edits to Section 4.4, Livestock Grazing, and Appendix 10 in the Proposed RMP Amendment/Final EIS to better explain impacts on livestock grazing from the alternatives, such as by clarifying that livestock grazing is not a surface disturbing activity and that the BLM would comply with land health standards. Section 4.12.1 was also revised per a comment on the language used describing strain on ranches in the U.S.

One comment questioned a specific BMP regarding the location of livestock supplements, but this BMP deals with more mesic areas of the landscape commonly associated with brood-rearing habitat, not lekking habitats. In the sagebrush systems, areas with water provide critical resources for GRSG and other wildlife species. Encouraging the location of supplements outside such sensitive areas protects these sensitive areas. Additionally, while the relative higher uses of grazing that corresponds with supplement locations can provide clearings which the GRSG may use to lek, GRSG leks are located in areas where there is good nesting habitat and not just where there is a clearing in the sagebrush. As a BMP, historic use areas can be taken into account when local managers consider local landscape characteristics.

Another comment raised an issue with a BMP for grazing management as it pertains to the SSS land health standard, but this BMP specifically states action would be considered when "...current livestock management practices are determined to not be meeting or making progress towards meeting the SSS land health standard…" While not using the words "significant causal factor" there is an intent of direct relationship

between livestock grazing and the area not meeting the land health standard. The BMP and Chapter 2 actions are clear that the list of potential changes are suggestions ("could include, but are not limited to"), and should be coordinated with local permittees and consider local conditions.

As stated in the Draft RMPA/EIS in Section 1.5 and in the Proposed RMP Amendment/Final EIS in Section 1.4.1, all proposed actions will be subject to valid existing rights, which includes those associated with permits issued under the Taylor Grazing Act as amended. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts. The BLM complied with all applicable laws and agency regulations and policy in developing this Proposed RMP Amendment, including the BLM's LHS and SSS management.

Summary: The BLM should provide additional details regarding implementation of management practices, such as who is responsible for additional costs associated with actions like range improvements. Allotment Management Plans (AMPs) should be established as they are the most appropriate way to effectively manage livestock grazing at a site-specific scale to benefit Sage-grouse.

Response: The RMPA/EIS contains only land use planning decisions and does not include any implementation decisions. The BLM will address implementation decisions during future decision-making. Budget and agency resources issues are appropriately addressed during the budget appropriations process. AMPs are site-specific to each allotment. As such they are implementation level activities and out of scope for a land use planning document.

Summary: The BLM should change or clarify the livestock grazing management being considered.

Response: In preparing the GRSG RMPA/EIS, the BLM developed a range of alternatives. The range of alternatives in the Draft RMPA/EIS includes the no-action alternative, Alternative 3 under which PHMA would be unavailable for grazing, and three other action alternatives with varying grazing management. Additional alternatives related to livestock grazing that the BLM considered were described in Section 2.3 in the Draft RMPA/EIS, as alternatives considered but not analyzed in detail. Many suggestions made by commenters are included in the range of alternatives. Further, language in the RMPA is intended to allow for discretion of the authorized officer during implementation, depending on site-specific conditions. The RMPA/EIS contains only planning-level actions and does not include any implementation actions. The application of the livestock grazing BMPs, annual monitoring, and site-level mapping will occur during the implementation process and will take into account local ecological conditions at the time those applicable decisions are needed.

Lek buffers would not prevent livestock grazing but would be used to reduce the likelihood of disturbance to lekking grouse associated with certain livestock grazing activities, such as supplemental feeding and fence locations.

To the extent appropriate, the RMPA/EIS identifies prioritization of management within PHMA and GHMA. However, sufficient flexibility in prioritization has been retained for the Authorized Officer during implementation, depending on District or Field Office specific conditions, such as staffing or budget.

Establishing specific monitoring methodologies as an RMP decision could constrain the BLM's ability to adapt to new monitoring approaches and technologies without having to conduct a plan amendment. The BLM's Monitoring Framework is included as Appendix 7 and includes a description of several aspects of monitoring both habitat and disturbance in GRSG HMAs. However, monitoring of specific habitats due to concerns with various uses or changes in conditions are driven by those site-specific conditions, and therefore cannot be

identified and defined in an office-wide or range wide RMP decision. The RMP does establish several standards for monitoring and evaluation as components of the RMP decisions. For example, the proposed goal states the BLM's desired condition is to manage for healthy GRSG habitat that supports healthy, persistent GRSG populations. It also establishes the objective to managing for suitable GRSG habitat, considering the methodologies of the HAF. In other management actions it directs use of Land Health Assessments, tracking anthropogenic disturbance, or using approaches for tracking adaptive management thresholds. The BLM's planning process itself includes a regular evaluation to determine if the goals, objectives are still applicable and appropriate, and if the management actions present are effective at meeting those desired conditions. This is evident in the BLM's GRSG planning process through the completion RMP evaluations throughout the range of GRSG, as well as publication of the 2021 Monitoring Report referenced in the DEIS Section 1.2.2. Implementation of all these specific monitoring standards is dependent are available staff and budget; as such, development of a specific schedule for monitoring beyond those included in Appendix 7 is not reasonable.

In RM-7, which would apply to Alternatives 4, 5, 6, and the Proposed RMP Amendment, the BLM would "consider whether to offer the permit for re-authorization," which would not force retirement of grazing permits and leases.

As stated in Appendix 15, the BMPs or design features, which would apply only to livestock grazing activities, are not required in every instance but are useful to aid in proper livestock grazing management in GRSG habitats. The applicability and overall effectiveness of each BMP cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some BMPs may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations. Discretion would be allowed by the authorized officer in how and when the BMPs and design features would be applied.

Clarification requested by one commenter on how grazing could be returned if treatment objectives are not able to be met regardless of grazing deferment is not needed, as it can be decided at the implementation level. The ecological capabilities of an area are also specifically addressed in RM-2, the habitat objectives, and DEIS Appendix 8.

To respond to a request from a commenter for an explanation for why Nevada has specific BMPs that do not appear to be set up in coordination with the 2019 Nevada Greater Sage-grouse Conservation Plan, the Nevada-specific BMPs originated in the Nevada/California 2015 and 2019 GRSG ARMPAs as actions only present in the Nevada/California ARMPAs. After reviewing the language, they were moved from livestock grazing management decisions to be BMPs, but still applied to the state where that language originated.

One commenter expressed an urgent need for rest pastures that permittees can place their livestock in when their current allotment is burned or experiences a restoration treatment. Reserve pastures could be established, but this is not an RMP level decision.

Another comment received requested that the BLM remove any language recommending a reduction in AUMs. The language refers to adjustments in AUMs which is within the authority of the BLM to do. The BLM is not making adjustments in AUM in this process and will undergo additional decision-making prior to making any adjustments.

A further commenter stated that the BLM must not assume that the Standard for SSS has not been met and requested that associated language from Chapter 2 be changed. The language does not assume the SSS

standard is not met, but establishes a strategy for action "where the LHS for SSS habitat (including GRSG) is not being met." This commenter also requested another change to language in Chapter 2, stating that the BLM should not remove infrastructure of any kind if the removal will create additional disturbance or encourage the spread of annual grasses so any associated language calling for removal of infrastructure should be altered. Impacts must be considered in the NEPA process. This action is only applicable where impacts to GRSG from existing infrastructure is present based on the language "projects that negatively affect GRSG or GRSG habitat." If a project does not meet this definition, this management would not apply.

An additional comment received recommended that BLM incorporate the prioritization framework from the Gunnison Sage-grouse RMPA for grazing allotment reauthorizations in GRSG habitats because it was unclear when a causal factor analysis would be triggered. As described in the Draft RMPA/EIS in Chapter 2, Adaptive Management, the causal factor analysis is initiated when a soft or hard population trend threshold is identified. State wildlife agencies can alert the BLM when population thresholds (soft or hard) are met to initiate a causal factor analysis. The BLM will also review the annual results of TAWS in determining if population trends indicate potential habitat concerns.

Another comment received asserted that the EIS must take a hard look at BLM's authority to temporarily or permanently reduce or eliminate livestock grazing from the public lands in the HMAs pursuant to 43 C.F.R. 4710.5(a). This is existing regulation. Nothing in the Draft RMPA/EIS impacts the ability of the BLM to implement this should the situation arise. Temporarily reducing or eliminating livestock grazing if necessary to provide habitat for wild horses or burros is outside the scope of this land use planning process. Management related to livestock grazing and wild horses and burros are clearly separated in Chapter 2.

LHS are a standard part of the BLM livestock grazing program. The Draft RMPA/EIS simply applies the objective for grazing administration that addresses "restoring, maintaining, or enhancing habitats of...special status species to promote their conservation" (43 CFR Part 4180.2(e)(9)). Table 2-12, Management Action RM-2 in the Draft RMPA/EIS outlines how HAF would be incorporated. In addition, as described in Appendix 8 of the DEIS, habitat indicators are assessed following the methods described in the Sage-grouse Habitat Assessment Framework. BLM will leverage the terrestrial Assessment, Inventory, & Monitoring (AIM) methods, additional monitoring approaches for wetland & riparian habitats, credible partner data, and supplemental long-term monitoring data and guidelines developed by the BLM to collect data on site-scale habitat condition. Data will inherently vary between states as ecosystems as not uniform across the GRSG range. As research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the Habitat Indicators Tables will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies.

Summary: The BLM should change or clarify the livestock grazing management being considered for range improvements.

Response: As noted in prior responses, in preparing the GRSG RMPA/EIS, the BLM developed a range of alternatives, including alternatives considered but not analyzed in detail. Many suggestions made by commenters are included in the range of alternatives. Further, language in the RMPA is intended to allow for discretion of the authorized officer during implementation, depending on site-specific conditions. The RMPA/EIS contains only planning-level actions and does not include any implementation actions. The application of the livestock grazing BMPs, annual monitoring, and site-level mapping will occur during the implementation process and will take into account local ecological conditions at the time those applicable decisions are needed.

Water development, range improvements, and targeted grazing near water sources and intact sagebrush stands (when effective controls prevent detrimental impairment of riparian areas or sage-grouse habitat) are allowed under all alternatives except Alternative 3.

Another commenter requested that wording for an RFD in Appendix 15 stating that new livestock handling facilities must be located outside of nesting habitat should be removed and the requirement "around 1.2 miles from active leks" should be accompanied by a qualifier stating, "to the extent possible." The items noted in Appendix 15 are not RFDs but are clearly described as BMPs "to be considered during implementation of the RMP. These measures are not required in every instance but are useful to aid in proper livestock grazing management in GRSG habitats. The applicability and overall effectiveness of each BMP cannot be fully assessed until the project level when the project location and design are known." Given this explanation for all the BMPs in Appendix 15, additional language of "to the extent possible" is not necessary.

To respond to an objection raised by a commenter regarding the use of virtual fencing as a blanket solution for any lapses in fence maintenance, virtual fencing is used as an example in RM-6 but would not be required.

Some commenters expressed opposition to the BLM removing or modifying any water developments without thorough coordination with the affected permittee and following all applicable laws, disallowing grazing from May 15 - Sept. 15 in riparian areas and wet meadows, and making allotments unavailable to grazing. These actions are associated with management actions in the 2015 and 2019 planning efforts and are not being considered to be carried forward as management actions in the preferred alternative.

A comment was received requesting language from the DEIS regarding potential deferral of new infrastructure projects or permits in PHMA or IHMA where wildfire impacted GRSG populations be removed or modified so that other land uses are not punished for the damage of wildfire events. Since wildfire is a large cause of GRSG habitat destruction, many activities may be limited after wildfire events, not just livestock grazing. The language does not specify that grazing would be restricted. However, it is not uncommon for wildfire events to result in changes to livestock grazing due to the substantial changes in vegetation in the burned areas. Uses that were compatible with the vegetation conditions prior to a fire may not be compatible to the same area after a fire. This language notes that such changes must be taken into account when authorizing uses in such affected habitats.

Summary: The BLM should not prohibit grazing and should not eliminate grazing districts.

Response: All the alternatives comply with all applicable laws, including the Taylor Grazing Act. The BLM is not proposing to create nor eliminate designated grazing districts. The Proposed RMP Amendment does not make changes to specific grazing permits. The Taylor Grazing Act requires a separate process to close areas to grazing, which includes giving affected permittees two years' notice. The BLM continues to manage grazing in accordance with FLPMA and the TGA. The BLM will also comply with its own regulations when conducting land health evaluations.

One commenter asked about how the BLM intends to remove or modify water developments and what the mitigation plan is for the loss of these developments, which are implementation-level questions where the answer is likely different from allotment to allotment. These scenarios would be addressed at the permit level and thus this question is out of scope.

Summary: BLM should include grazing permittees in their decision making.

Response: BLM decision making is a collaborative process which involves general direction, policy and advice from HQ, and implementation decisions primarily at the field and district office level. BLM provides guidance that field and state managers incorporate as they make decisions, which allows for more local assessment of resources and impacts. Grazing permittees will work with Field Office specialists which will assure their concerns are heard and made available to inform the decision making process. In general, all proposed actions will be subject to valid existing rights, including those associated with grazing. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or permits.

One commenter specifically requested that language be incorporated to include coordination with permittees on fencing evaluations for GRSG, as fences are key to livestock distribution, which affects land health and GRSG conservation. Evaluation of if a fence is in a high-risk area for GRSG, as described in the first sentence of RM-6, is a wildlife issue. The second sentence deals with determining if the fence is needed. Permittees will be involved in decisions that affect their permits through the implementation process.

The BLM complies with the Taylor Grazing Act (TGA) and its own grazing regs to make implementation level decisions-this includes coordinating with affected permittees. If the terms and conditions of a permit need to be reconsidered in light of this RMPA, the BLM would still follow the TGA and its own grazing regs when renewing the permit.

22.2.24 Locatable Minerals

Summary: The BLM should conduct a more detailed and quantitative analysis of the impacts on locatable minerals; coordinate and develop a land management mineral classification plan and an updated mineral potential report in order meet the requirements of NEPA to take a hard look at the impacts to mineral resources.

Response: A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provide the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). A mineral potential report is not required for land use planning efforts. The BLM has collated sufficient information to support the analysis in this broadscale planning document.

The BLM analyzed a reasonable range of alternatives adequate to address the agency's purpose and need for considering these amendments, as described in Chapter 2. Further, BLM considered a number of alternatives and issues during scoping that the agency determined not to carry forward, as detailed in Section 2.3. Only Alternatives 1, 2 and 3 propose any withdrawal from location and entry under the Mining Law. Impacts to locatable minerals from management outlined in the alternatives are analyzed in Section 3.10.4 and 4.10.4, with additional information in Appendix 10 Section 10.10.4, to a level that would allow for an informed decision among alternatives. Social and economic impacts from the alternatives are analyzed in Sections 3.12 and 4.12, with additional detail in Appendix 18.

The Proposed RMP Amendment does not identify any areas to recommend for withdrawal from location and entry under the Mining Law.

The BLM will conduct subsequent site-specific NEPA analyses for projects proposed for implementation under the land use plan. The subsequent NEPA analyses for project-specific actions may tier to the land-use

planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1501.11, 40 CFR 1508.1). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

Summary: The EIS should consider the impacts of mineral withdrawal as a result of recommendation for withdrawal and provide basis for the statement that the withdrawal of all SFAs had no impact.

Response: As stated in Section 4.10.4 of the Draft RMPA/EIS: "Recommending areas for closure to the mining laws for locatable exploration or development does not restrict any activities and therefore, such recommendation does not have any impacts. However, the BLM could ask the Secretary of the Interior to propose and make a withdrawal of the land from location and entry under the Mining Law of 1872 pursuant to Section 204(a) of FLMPA. Proposing and making a withdrawal is not a land use planning decision. Should the Secretary propose a withdrawal, the proposal would require environmental and other analysis under NEPA and other applicable authorities before the land could be withdrawn. For purposes of this planning initiative, the alternatives analysis includes a description of the likely environmental effects should the Secretary propose and make a withdrawal in the future (e.g., reduced potential for behavioral disturbance and habitat loss/alterations)."

The separate EIS effort that is considering a mineral withdrawal of the 2015 sagebrush focal areas (SFAs) is independent of any SFA decisions associated with this planning process. As ordered by the United States District Court for the District of Idaho, the consideration of whether the withdrawal is needed for sage-grouse conservation has been remanded to the BLM, including the completion of that NEPA process. This separate mineral withdrawal EIS effort is considered in the GRSG Draft RMPA/EIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4).

Summary: The BLM should clarify that restrictions on motorized travel, including any temporary closures authorized under various other provisions in FLPMA, do not apply to locatable mineral operations.

Response: As stated in Chapter 2, Table 2-1, Alternatives Considered but Not Analyzed in Detail, this planning effort is not considering any travel and transportation management decisions. In addition, Section 1.5 of the Draft RMPA/EIS states "The RMPA will be completed in compliance with all relevant Federal laws and regulations, Executive Orders, and management policies of the BLM, including the Mining Law of 1872". The BLM recognizes it has limited authority to manage mining operations under the Mining Law of 1872.

Summary: BLM should include elevated protections within SFAs to limit impacts from locatable minerals.

Response: The Draft RMPA/EIS includes a consideration and analysis of Alternative 1, under which SFAs are considered. The separate EIS effort that is considering a mineral withdrawal of the 2015 sagebrush focal areas (SFAs) is independent of any SFA decisions associated with this planning process. As ordered by the United States District Court for the District of Idaho, the consideration of whether the withdrawal is needed for sage-grouse conservation has been remanded to the BLM, including the completion of that NEPA process. This separate mineral withdrawal EIS effort is included in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4).

Summary: The DEIS fails to demonstrate how the alternatives meet the stated goals and objectives and preclude listing of the GRSG without mineral withdrawal recommendation or maps and locations of mining claims relative to GRSG populations.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis. Alternatives 1 and 3 would recommend that certain areas are withdrawn from location and entry under the Mining Law of 1872. As noted in Section 3.2.1 of the Draft RMPA/EIS, there are numerous reasons for the decline of GRSG populations, locatable mineral development is one source of loss, fragmentation, and/or degradation of suitable sagebrush habitat.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provides the necessary basis to make informed land use plan-level decisions. Impacts on GRSG from locatable minerals management under each alternative are described in Section 4.2 of the Draft RMPA/EIS to a level that would allow for an informed decision among alternatives.

The BLM also recognizes that it has limited authority to impose conditions on certain uses related to the Mining Law of 1872 through land use planning decisions. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations.

Summary: The DEIS should demonstrate how avoidance or mitigation will be achieved for notice level mining operations and should address impacts from notice-level exploration disturbances across alternatives particularly the impacts from segmenting or stacking these activities to stay under the 5-acre mitigation threshold.

Response: The BLM's process for notice-level mining operations is an implementation level activity. Impacts from notice-level exploration disturbances are described at a broad level in the discussion of effects from locatable minerals. For instance, in Section 4.2, the types of impacts that result from locatable mineral development, including notice-level operations, are described in Section 4.2.1 under the header of Other Mineral Resource Management (Salable, Nonenergy Leasable, Locatable, and Coal). The impacts from segmenting or stacking activities are not addressed since that is not a reasonably foreseeable action with proper BLM management.

Summary: BLM needs to consistently describe their authority over operators exercising their rights under the Mining Law. BLM should better analyze effects of the alternatives on valid existing rights.

Response: Section 1.5 of the Draft RMPA/EIS states "The RMPA will be completed in compliance with all relevant Federal laws and regulations, Executive Orders, and management policies of the BLM, including the Mining Law of 1872" and " The RMPA will recognize valid existing rights."

Further, Section 4.10.4 of the Draft RMPA/EIS states "If lands are withdrawn by the Secretary, the only locatable mineral resources that may be developed on withdrawn lands during the term of the withdrawal are those associated with mining claims that the BLM has determined to be valid.'

Only management actions consistent with the Mining Law of 1872 will apply to mining operations. The BLM recognizes it has limited authority to manage mining under the Mining Law of 1872.

Summary: The Draft RMPA/EIS should clarify how not designating SFAs under the preferred alternative would affect the pending withdrawal of SFAs from locatable minerals.

Response: The separate EIS effort that is considering a withdrawal from location and entry under the Mining Law of 1872 of the 2015 sagebrush focal areas (SFAs) is independent of any decisions associated with this planning process. The United States District Court for the District of Idaho, ordered the BLM to "re-initiate" the NEPA analysis for that proposed withdrawal. This separate mineral withdrawal EIS effort is included in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4). The BLM cannot withdraw lands from location and entry through land use planning and has limited authority to manage mining under the Mining Law of 1872.

Since the withdrawal proposed in 2015 is a separate process, it does not matter whether SFAs are designated or not in this RMPA. If the proposed withdrawal recommendation were to occur, it would just be within the previous SFA boundaries as analyzed in the separate EIS effort.

Summary: BLM should clarify existing rights under the 1872 Mining Law and impacts of withdrawals to the supply of critical minerals.

Response: The BLM recognizes that it has limited authority to impose conditions on certain uses related to the Mining Law of 1872 through land use planning decisions. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations. Withdrawals are considered under a separate process by the Secretary consistent with FLPMA and applicable regulations.

Alternative 1 includes SFAs and the BLM recommended those areas to be withdrawn from location and entry under the Mining Law of 1872. That recommendation has no impact because it is a recommendation and the Secretary considers withdrawals under a separate process. The separate EIS effort that is considering a mineral withdrawal of the 2015 sagebrush focal areas (SFAs) is independent of any SFA decisions associated with this planning process. As ordered by the United States District Court for the District of Idaho, the consideration of whether the withdrawal is needed for sage-grouse conservation has been remanded to the BLM, including the completion of that NEPA process. This separate mineral withdrawal EIS effort is included in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4).

22.2.25 Mineral (Salable) Materials

Summary: BLM should not use Alternative 1 or Alternative 3 because it closes too much mineral estate.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis. In the Draft RMPA/EIS, impacts to salable minerals are analyzed in Sections 3.10.5, 4.10.5, and 4.21.8.

Summary: The BLM should update and clarify the data, methods, or language in the analysis on mineral (salable) materials, such as the impacts when expansion of existing gravel pits is not feasible.

Response: Section 4.10.5 was updated based on comments provided.

Summary: BLM should choose Alternative 3 for salable minerals, specifically that PHMA is closed to salable mineral material pits.

Response: BLM formulated a reasonable range of alternatives to analyze, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft RMPA/EIS was Alternative 5, but BLM can change the alternative selection and composition in accord with the results of analysis and comments.

Free use pits support maintenance needs for existing local roads to ensure public safety. Under the preferred alternative, the intention is to allow use and expansion of authorized free use pits that would not create significant impacts (i.e., upon completion of an Environmental Assessment, BLM determines that a FONSI is applicable) and where the applicable area has not met the disturbance cap, without further analysis or mitigation. Bear in mind that prior to the use being authorized for existing pits, the size of the authorized pit would have been analyzed in existing NEPA. There could be new information that wasn't analyzed initially; in that case, BLM would need to conduct another analysis that takes that information into account.

22.2.26 Mitigation

Summary: The BLM should clarify how compensatory mitigation would be applied, such as whether state boundaries could be crossed to obtain credits from mitigation banks; the meanings of "no net habitat loss" versus "net conservation gain"; and consequences if mitigation fails. The BLM should also provide information on the past success of mitigation. Mitigation requirements and commitments should be included in the ROD.

Response: Compensatory mitigation would be specifically targeted to areas where key resources would receive the greatest benefits. Compensatory mitigation may involve the use of mitigation banks and identifies the need to provide mitigation in the area of impact. However, in some areas mitigation would not necessarily be geographically bound to areas of impacts based on local situations. The terms "no net habitat loss" versus "net conservation gain" have been clarified in Chapter 2 in the Proposed RMP Amendment. The "net conservation gain" terminology is solely from the 2015 and 2019 plans, analyzed in the DEIS as Alternative 1 and Alternative 2, respectively. The Proposed RMP Amendment does not propose "net conservation gain." Although the BLM is not required to follow state programs or requirements that conflict with federal law and policy, all applicable state mitigation requirements will be met. While presenting detailed information on the past success of specific mitigation methods is not within the scope of the EIS, mitigation measures are selected based on peer-reviewed science and demonstrated efficacy.

Summary: Mitigation requirements should be changed, such as waiving mitigation requirements in certain instances, not requiring the mitigation completed prior to the disturbing activity, changing language to "no net loss" or "net conservation gain", and applying mitigation to other activities.

Response: The BLM has reviewed the suggested changes to the mitigation management direction and has incorporated some changes into the Proposed RMP Amendment (see Chapter 2). The Alternatives in the Draft RMPA/EIS provide a range on when the compensatory mitigation should be complete which aids in the analysis of the options.

Summary: The BLM should defer to state compensatory mitigation systems, such as Nevada's Conservation Credit System (CCS). The BLM should coordinate with state agencies regarding mitigation.

Response: The BLM will follow its own mitigation policy as outlined in BLM-MS-1794 but has deferred to state agencies regarding additional mitigation requirements. Operators are required to comply with other relevant laws which may include mitigation required by the state.

Summary: The BLM should limit or eliminate use of compensatory mitigation.

Response: As described under Range of Alternatives, the BLM considered a reasonable range of alternatives during the planning process in full compliance with NEPA. As a result, the BLM analyzed six alternatives in detail in the Draft RMPA/EIS that best addressed the purpose and need. The allowance for compensatory mitigation varies across alternatives, though all alternatives would follow the mitigation hierarchy which considers compensatory mitigation after avoidance and minimization.

Summary: State mitigation systems are not adequate to prevent project-level impacts.

Response: The BLM notes the state mitigation systems under Cumulative Impacts but does not rely on these systems for its compensatory mitigation nor does the Draft RMPA/EIS assert that state systems would eliminate all impacts.

Summary: The BLM should prevent unnecessary or undue degradation (UUD) that cannot be mitigated by refusing applications.

Response: BLM has both the authority and the measures in place to avoid UUD that cannot be mitigated by denying the application. In addition, if an impact cannot be mitigated and the circumstances support accepting the application, BLM will require an EIS for any substantial impacts.

Summary: The BLM should use terminology already defined and embedded in the HAF and not add terms like "habitat sufficiency" into the process. The BLM should consider alternative approaches, including remote sensing, to verify the effectiveness of compensatory mitigation actions, and supplement these with the HAF where available.

Response: There is only one location in the Draft RMPA/EIS that uses the term "habitat sufficiency" and it's in the introduction of Section 2.5.3 Mitigation. The sentence reads, "The principles of HAF can be used to measure habitat sufficiency in implementing mitigation." HAF is one tool used to assess habitat sufficiency. Other methods can be employed as appropriate. While presenting detailed information on the past success of specific mitigation methods is not within the scope of the EIS, mitigation measures are selected based on peer-reviewed science and demonstrated efficacy.

Summary: BLM should be consistent in the requirement to have compensatory mitigation completed prior to development occurring.

Response: Each alternative approaches mitigation in a different fashion. In accordance with NEPA and the input of cooperators and commenters, as well as the information from previous similar efforts, BLM sought to provide a wide range of alternatives, each incorporating different approaches and procedures. It is consistent with the requirements of NEPA to analyze a range of reasonable alternatives that result in an informed decision.

Summary: BLM should make the mitigation proximity requirement and net conservation gain/no net loss standard less difficult to implement and to be consistent with the BLM's Mitigation Handbook.

Response: Mitigation will be applied to implementation actions and decisions, consistent with valid existing rights and applicable law, that take place on BLM managed lands within GRSG habitat during the life of this plan amendment. The management direction for mitigation, Section 2.5.3, was developed to follow the BLM's Regional Mitigation Manual MS-1794 and CEQ 40 CFR 1508.20. The intent of requiring mitigation to be within the same area as the affected population is to ensure further range degradation and loss does not

occur, consistent with the objective of this planning effort. The BLM has clarified mitigation requirements in the Proposed RMP Amendment.

Summary: The BLM should reconsider the requirement that compensatory mitigation be completed prior to initiating habitat disturbances, since it ignores how existing mitigation systems function. Commenters suggested requiring periodic monitoring of mitigation activities to ensure compliance with durability standards and timely implementation of conservation actions.

Response: The BLM considered a reasonable range of alternatives during the planning process in full compliance with NEPA. As a result, the BLM analyzed six alternatives in detail in the Draft RMPA/EIS that best addressed the purpose and need. The intent of requiring mitigation being completed prior to project disturbance is to minimize impacts to affected populations and to ensure further range degradation and loss does not occur which is consistent with the objective of this planning effort. Alternatives 1 and 2 do not require compensatory mitigation to be completed prior to the disturbance. Mitigation monitoring would be conducted.

Summary: The BLM should provide more exceptions for locatable mining activities throughout the mitigation requirements.

Response: As stated in the DEIS in Section 1.5, all proposed actions will be subject to valid existing rights, including those associated with leases issued under the Mining Law of 1872 as amended. Accordingly, the BLM will apply management actions in the RMPA only to the extent that they are consistent with the Mining Law of 1872 and the BLM's regulations. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

Summary: The impacts of compensatory mitigation need to be analyzed in further detail. NSO provides much greater certainty and eliminates impacts from surface occupancy, if the proposed NSO waivers are changed to disallow modifications.

Response: If residual impacts to GRSG from implementation-level actions remain after applying avoidance or minimization measures, then compensatory mitigation projects will be used to offset the residual impacts in an effort to achieve the land use plan goals and objectives. As articulated in the Proposed RMP Amendment/Final EIS, compensatory mitigation will occur on sites that have the potential to yield the greatest conservation benefit to the GRSG, regardless of land ownership. These sites should be sufficiently "durable." According to BLM Manual 1794, durability is defined as "the administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist."

The GRSG planning process recognizes that continued coordination with state wildlife agencies is vital. The DEIS Table 2-9 states that Exception #1 for Alt 4 & 5 (emphasis added): "To approve this exception based on any of the above criteria, after coordination with the appropriate State agency, the Authorized Officer must document, that the proposed action satisfies at least one of the criteria listed above. If the State agency does not concur with granting the exception, the Authorized Officer must provide rationale for how the criteria are met considering the information the State provides." For Exception #2, the criteria for Exception #1 would still apply or for Alt 4 the compensation project must be completed and habitat functionality documented before the exception is granted to ensure the offset in impacts will occur. In addition, this exception would still require documentation in coordination with the appropriate State authority. For

Exception #2 the Proposed RMP Amendment outlines that the compensatory mitigation direction in the Mitigation section must be followed, though the compensation project must be completed and habitat functionality documented before the exception is granted. The compensation must also provide offsetting benefits to the population being impacted.

22.2.27 Monitoring

Summary: The final plan should include the qualifier that when monitoring identifies parcels of land within habitat management areas that are not capable of providing desired habitat characteristics due to ecological potential, they should be removed from PHMA/GHMA requirements.

Response: The BLM acknowledges that site-specific conditions on the ground may vary from the landscape scale modelling and those conditions on the ground change over time. As such, PHMA management would not be applied to non-habitat. The process for identifying non-habitat is described in Section 2.5.2 of the Draft RMPA/EIS. Such identification would occur at the project level, including associated project specific NEPA analysis.

Summary: The BLM uses incorrect methods for vegetation monitoring, specifically assessing perennial grass height and cover.

Response: Generally, there are many valid methods for measuring plant heights that the scientific community has used over time. The BLM AIM strategy standardized height measurements by adopting a method that was originally published almost two decades ago (https://www.blm.gov/sites/default/files/docs/2022-04/TR_1734_8_vol1_508.pdf) and is used by many different land managers including the NRCS National Resources Inventory. As the commenter notes, this measurement focuses on maximum plant heights for woody and herbaceous plants within a small area. Repeated measurements across a plot yield an average of the maximum height measurements. Plant height measured this way has been shown to relate to both wildlife habitat and wind erosion.

While there are other ways of calculating plant heights, there are pros and cons to each method. Plant height can be quite variable across an area. Maximum height per area captures information that is meaningful for many of the aspects of ecosystems that we are trying to measure including wildlife habitat.

Summary: The BLM should monitor annually.

Response: Monitoring is a key element of complex long-term conservation strategies, particularly where there is uncertainty (FWS 2015a). In the DEIS Table 2-15, there is a description of the annual monitoring requirements in adaptive management. With this annual monitoring, the BLM and state wildlife agencies should be aware of annual population fluctuations.

Summary: The BLM should include a specific timeline for each step of the monitoring implementation strategy in a chart.

Response: In the DEIS Table 2-15, there is a description of the annual monitoring requirements in adaptive management. With this annual monitoring, the BLM and state wildlife agencies should be aware of annual population fluctuations.

22.2.28 NEPA (National Environmental Policy Act)

Summary: The document and alternatives are unclear. The EIS is hard to understand and not written in plain language.

Response: The BLM has reviewed the EIS and reorganized both the layout and the language for improved readability and clarity. Changes have been made throughout the Proposed RMPS/Final EIS accordingly.

Summary: The BLM should adopt a standard form to be included in NEPA analyses across projects as an appendix or supplemental GRSG report that clarifies GRSG design and management decision obligations.

Response: The BLM appreciates the commenters providing considerations that could assist us in subsequent implementation level analysis and decisions.

Summary: BLM should use a state-specific GRSG plan instead of a West-wide one. The current RMPA covers too large of an area to be meaningful.

Response: The GRSG planning effort is consistent with the BLM's planning regulations. The BLM's existing land use planning regulations allow planning at any appropriate geographic scale. See 43 CFR 1610.1(b) ("A resource management plan shall be prepared and maintained on a resource or field office area basis, unless the State Director authorizes a more appropriate area.") (emphasis added). See also BLM Land Use Planning Handbook ("State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary."). The planning area here, defined in coordination with relevant BLM state directors, includes ten Western states to enhance GRSG conservation. This planning area facilitates consistency across states and updates the approach taken in the BLM's 2015 and 2019 planning efforts. Further, FLPMA (at 43 USC 1712(a)) directs the Secretary of the Interior to develop, maintain, and revise land use plans. While the Secretary has delegated land use planning authority to BLM Field Managers and State Directors through the planning regulations (43 CFR 1601.0-4), this delegation does not preclude a supervisor of the delegee (including the BLM Director) from exercising that authority. Programmatic environmental analysis is also appropriate under NEPA for actions that have common impacts, subject matter, and technology (40 CFR 1501.11).

The BLM has prepared this Draft RMPA/EIS and Proposed RMPA/Final EIS to analyze potential amendments to specific GRSG goals, objectives, and management actions contained in 77 existing RMPs to enhance GRSG conservation through management of GRSG habitats on BLM-administered lands. These amendments seek to continue providing the BLM with locally relevant decisions that achieve rangewide GRSG conservation goals consistent with the agency's multiple use and sustained yield mission, and GRSG management efforts with Federal, State, local, and Tribal partners. The ten-state planning area includes nearly 121 million acres of BLM-administered public land. GRSG habitat management areas occur on approximately 69 million acres and are the focus of this effort.

Summary: BLM should explain why it did not use the 2021 Record of Decision or the 2019 plan.

Response: This is described in Section 1.2.1 of the DEIS. The BLM amended or revised land use plans in 2014 and 2015 in the States of California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming (2015 Sage-Grouse Plan Amendments) to provide for GRSG conservation on public lands. Subsequently, the BLM amended several of those plans in 2019 in the States of California, Colorado, Idaho, Nevada, Oregon, Utah, and Wyoming (2019 Sage-Grouse Plan Amendments). On October 16, 2019, the United States District Court for the District of Idaho preliminarily enjoined the BLM from implementing the 2019 Sage-Grouse Plan Amendments (Case No. 1:16-CV-83-BLW).

Following the completion of the Sage-Grouse Plan Amendments, the BLM determined that the 2019 Sage-Grouse Plan Amendments (and for Montana, North Dakota, and South Dakota, the 2015 Sage-Grouse Plan Amendments) were potentially inconsistent with new science and rapid ecological changes affecting the

BLM's management of the public lands, including the effects of climate change (e.g., drought, loss of habitat, more frequent wildland fires, less riparian areas).

In November 2021, the BLM initiated this new land use planning process under the authority of Section 202 of FLPMA and its implementing regulations at 43 CFR1600, and in compliance with NEPA, to evaluate alternative management approaches to contribute to the conservation of GRSG and sagebrush habitats and to evaluate the impacts of any land use planning decisions directed toward GRSG and sagebrush habitat conservation. Pursuant to NEPA and the BLM's planning regulations, the BLM prepared a new EIS for this new planning process.

Summary: BLM should not use a separate mineral withdrawals EIS; they should be combined.

Response: As detailed in the Draft RMPA/EIS, proposing and making a withdrawal is not done through the land use planning process and is not a land use planning decision. During the planning process the BLM can make a recommendation that an area be proposed for withdrawal. However, a withdrawal is made by the Secretary of the Interior pursuant to a separate decision-making process. The BLM could ask the Secretary of the Interior to propose and make a withdrawal of the land from location and entry under the Mining Law of 1872 pursuant to Section 204(a) of FLMPA. Should the Secretary propose a withdrawal, the proposal would require environmental and other analysis under NEPA and other applicable authorities before the land could actually be withdrawn.

For purposes of this planning initiative, the alternatives analysis includes a description of the likely environmental effects should the Secretary propose and make a withdrawal in the future (e.g., reduced potential for behavioral disturbance and habitat loss/alterations). Simply recommending areas for closure to the mining laws for locatable exploration or development, through a withdrawal, does not restrict any activities and therefore, such recommendation does not have any impacts.

Summary: BLM should provide more baseline information, detail, and analysis to guide their assessment and satisfy NEPA requirements.

Response: The BLM coordinated with states, federal agencies and cooperating agencies to identify how the affected environment for sage-grouse management has changed. BLM specifically partnered with USGS to review the best available information and incorporate the management implications of that information into this EIS. The BLM places great import on the best available information, including new scientific studies and government reports that indicate a potential change in our assumptions or conditions related to a land use planning effort. The BLM has to balance reviewing new information with determining what information is relevant to a decision in light of the BLM's purpose and need. Many commenters highlighted information and studies to consider, and the BLM has reviewed each source submitted. Further, the BLM asked the USGS to participate in the review, and to verify if information was included in the USGS synthesis report that was developed for the Draft EIS. Many suggested articles were already included for analysis in the USGS report and may have been missed by commenters in the initial review of the synthesis report and Draft EIS.

Both known and new studies were reviewed by BLM staff, including scientists and NEPA specialists, and each BLM State Office reviewed each study specific to how it informed their planning decisions and environmental conditions. The BLM has included, where appropriate, updates to analysis. Overall, submitted studies did not offer information that changed the analysis and did not offer any new conditions or other information the BLM had not considered already. The BLM has reviewed all new information and suggested studies from comments received rangewide, and in specific states.

22.2.29 Nonenergy Leasable Minerals

Summary: The BLM should update the analysis, including impacts of alternatives on the Known Sodium Leasing Area (KSLA) and providing clarity on whether GRSG HMA overlaps with non-energy leasable (NEL) resources or not - including KSLAs, phosphate, and gilsonite areas.

Response: The BLM clarified language and updated the analysis for nonenergy leasable minerals in Chapter 3, Chapter 4 and Appendix 10 of the Proposed RMP Amendment/ Final EIS based on information provided by commenters.

Summary: BLM should define "key habitat."

Response: Idaho-specific actions pertaining to 'key habitat' have been removed from the Proposed RMP Amendment/Final EIS.

Summary: Closing PHMA to non-energy minerals under Alternative 3 would limit the ability to manage surface disturbances in a way that would minimize impacts to GRSG.

Response: The Draft RMPA/EIS includes analysis and consideration of a range of alternatives that identified and incorporated appropriate regulatory mechanisms to conserve, enhance, and restore GRSG habitat, and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. This includes alternatives that provide a greater and lesser degree of restrictions in various use programs but would not eliminate or invalidate any valid existing development rights. The range of alternatives in the Draft RMPA/EIS includes the no-action alternative, Alternative 3 under which PHMA would be closed to nonenergy leasable minerals, and three other action alternatives with varying nonenergy leasable minerals management. All alternatives would meet the purpose and need that is stated in Section 1.3 of the Draft RMPA/EIS. Impacts on GRSG from minerals management under all alternatives are disclosed in Section 4.2.

22.2.30 Other Laws, Regulations, Policies

Summary: BLM should re-assess the document and impacts due to the new Public Lands Rule.

Response: The recently promulgated Public Lands Rule implements the BLM's longstanding statutory authority to manage lands for conservation, including by taking account of certain resource values explicitly addressed in the rule. As a result, the management actions considered here are consistent with the Public Lands Rule, notwithstanding that they are within the BLM's discretion with or without the rule. The process used to evaluate ACEC nominations in this planning effort is consistent with the updated ACEC regulations included in the Public Lands Rule. Changes to ACEC guidance in the Public Lands Rule would not affect ACECs considered under Alternatives 3 and 6 in the Draft RMPA/EIS. Although the Notice of Availability for the GRSG plan amendment EIS was published prior to the effective date of the PLR and is, therefore, not expected to incorporate all elements of the PLR, the Proposed RMP Amendment/Final EIS is largely consistent with the PLR (BLM IB 2024-048).

Summary: The BLM should revise the EIS to be consistent with Section 363 of the Energy Policy Act of 2005.

Response: Section 363 of the Energy Policy Act specifically requires lease stipulations to be "only as restrictive as necessary" to protect the resource for which stipulations are applied, not land use plans. The BLM complied with all applicable laws in developing the alternatives considered and the Proposed RMP

Amendment and will comply with all applicable laws in implementing the RMPAs. The BLM develops lease stipulations at the implementation and project level.

Summary: BLM should follow a decentralized land use planning approach where Field Managers make plans and State Directors approve. BLM should not use an HQ level planning effort because Planning 2.0 was overturned by Congress.

Response: The regulation changes the BLM made in Planning 2.0 was disapproved under the Congressional Review Act and is not effective. The BLM's existing land use planning regulations allow planning at any appropriate geographic scale. See 43 CFR 1610.1(b) ("A resource management plan shall be prepared and maintained on a resource or field office area basis, unless the State Director authorizes a more appropriate area."). See also BLM Land Use Planning Handbook ("State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary."). The planning area here, defined in coordination with relevant BLM state directors, includes ten Western states to enhance GRSG conservation. This planning area facilitates consistency across states in the West and updates the approach taken in the BLM's 2015 planning effort. Further, FLPMA (at 43 USC 1712(a)) directs the Secretary of the Interior to develop, maintain, and revise land use plans. While the Secretary has delegated land use planning authority to BLM Field Managers and State Directors through the planning regulations (43 CFR 1601.0-4), this delegation does not preclude a supervisor of the delegee (including the BLM Director) from exercising that authority. Programmatic environmental analysis is also appropriate under NEPA for actions that have common impacts, subject matter, and technology (40 CFR 1501.11).

This amendment effort recognizes the importance of including RMP actions that address GRSG threats on BLM-administered public lands in context of the 2010 and 2015 USFWS GRSG listing decisions. This effort also recognizes the legal and functional imperative of coordinating management with state, federal, tribal, and local plans and policies. The purpose of this land use planning process is to amend a sub-set of the GRSG management actions to ensure management actions on BLM-administered lands support GRSG conservation goals, respond to changing land uses in GRSG habitats, improve the efficiency and effectiveness of GRSG management actions, provide for consistent conservation outcomes in GRSG habitat, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals. The purpose of this amendment is focused on cross-cutting management actions/topics that are applicable throughout the planning area with variations for local, state-specific variation. Records of Decision will be issued using a state-by-state approach that further accounts for site-specific variation.

Summary: BLM should recognize valid existing uses and rights and prioritize multiple use.

Response: The BLM complied with all applicable laws in developing this RMPA. Additionally, the BLM will continue to comply with all applicable laws in implementing this plan. As stated in the DEIS in Section 1.5, all proposed actions will be subject to valid existing rights. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts, as appropriate. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

Summary: BLM should explain and justify new policies.

Response: As outlined in Chapter 1, despite years of management from multiple state and federal agencies, including the unprecedented recent planning efforts across the species range, GRSG habitat continues to be impacted and lost by public land uses, and GRSG populations that depend on the habitat managed by the

BLM continue to decline. The BLM manages the largest amount of remaining GRSG habitat and is committed to the long-term conservation of habitat to support healthy state-managed GRSG populations, preventing the need for a future listing under the Endangered Species Act.

This amendment effort recognizes the importance of including RMP actions that address GRSG threats on BLM-administered public lands in context of the 2010 and 2015 USFWS GRSG listing decisions. This effort also recognizes the legal and functional imperative of coordinating management with state, federal, tribal, and local plans and policies. Many actions from the 2015 and 2019 efforts already accomplish this. As a result, the purpose of the current BLM RMPA is to amend a sub-set of the GRSG management actions to ensure management actions on BLM-administered lands support GRSG conservation goals, respond to changing land uses in GRSG habitats, improve the efficiency and effectiveness of GRSG management actions, provide for consistent conservation outcomes in GRSG habitat, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals.

Summary: The goals of the alternatives, especially Alternative 3, do not align with EO 14017 or the Inflation Reduction Act and conflicts with the statutory mandates including FLPMA's prioritization of domestic mineral development.

Response: Alternative 3 allows for the analysis of the effects of generally applying the most restrictive management to all GRSG habitat in the planning area, which complies with NEPA guidance to consider a wide range of alternatives. The range of alternatives developed is intended to meet the purpose and need, and address the issues; thereby, providing a basis for eventual selection of an alternative in a decision. Guidance in FLPMA designating mineral exploration and production as a principal or major use of public lands, as well as other guidance or goals, apply to the BLM resource management program as a whole. They do not prevent BLM from implementing management that would make certain areas unavailable to mineral leasing, sale or development where doing so is necessary to protect other resource values. FLPMA's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. Instead, it provides the BLM discretion to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses.

Summary: The BLM should update its instruction memorandum.

Response: This amendment effort considers changes language in the BLM's RMPs; it does not consider changes to instruction memoranda. The Draft EIS is clear that the No Action Alternative in this planning effort is the existing language contained in the BLM's RMPs. As described in the DEIS section 2.2.2, that is the 2019 ARMPAs. Prioritizing work associated with livestock grazing operations depends on staffing, budget, and the consideration of other resource issues that include, but are not limited to GRSG, other listed species, LHS, wildfire, or other resource concerns. Previous national level guidance for prioritization of renewals has always been to look at high resource value areas first. IM's such as WO 2009-018 and WO 2018-024 gave guidance on prioritization. Language regarding prioritization regarding livestock grazing and GRSG was retained in the BMP appendix. While it can help inform and guide prioritization during implementation, it is not an RMP-level decision.

22.2.31 Predation

Summary: The BLM should improve its predator management strategies, as they are currently inadequate, and adopt a more proactive approach. Predator control, particularly targeting ravens, should not be delayed for further evidence. Recommendations include developing a general response plan, reducing food and nesting substrates, and avoiding perch deterrents due to their inconsistent effectiveness. Enhanced planning

and collaboration are essential for timely and effective predator control. The analysis and management plans should include key predator species such as red foxes, ravens, eagles, and other raptors, whose introduction and increasing populations are contributing to the decline of Sage Grouse populations.

Response: Management actions specific to predator population management is outside the scope of the amendment, as state wildlife agencies have management authority and U.S. Fish and Wildlife Service has the management authority for ravens and other depredating migratory birds. However, the BLM has the authority to manage the habitat and has provided numerous management actions to address predation risk across the range of alternatives (see Section 2.5.9 of the Draft RMPA/EIS). Appendix 2 of the Draft RMPA/EIS identifies which predator management strategies from the 2015 RMPAs would continue to be implemented, along with the Required Design Features that would also be carried forward. The BLM will continue to implement the predator management strategies from the 2015 ARMPAs as well as the revised strategies included in this effort. Predator management actions are done proactively as best as possible. Additional collaboration could occur, and predation management plans could be developed at the implementation level. Section 3.2.1 has been revised to include a brief discussion of several additional GRSG predators.

Summary: The EIS should accurately represent the impact of predators on GRSG populations, acknowledging that predation remains a significant threat to egg and chick survival across all habitat types.

Response: Section 3.2.1 includes a discussion of predation as a threat to GRSG and relies on best available science to characterize the threat. That section has been revised to include additional discussion about the threat of predation on GRSG and a brief discussion of several additional GRSG predators.

Summary: The BLM should consider the provided information on raven/corvid populations and GRSG predation, including the association with livestock.

Response: We considered the references provided. While BLM has no management authority over predators, the Draft RMPA/EIS does include best management practices and Required Design Features (RDFs) for corvid minimization, requiring proponents/applicants to create predator management plans, and considers the FWS 2023 publication on raven conflict management. For corvid associations with livestock, BLM is aware of the issues presented in Coates et al 2016 and O'Neil et al 2018 - both studies utilized survey and modelling and are the best available science on the topic.

Summary: The EIS should include necessary clarifications and edits to the alternatives related to minimizing threats from predation.

Response: The BLM considered a reasonable range of alternatives during the planning process in full compliance with NEPA. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the Draft RMPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the Draft RMPA/EIS represented a full spectrum of options which address the issues of GRSG protection, including a no action alternative, up to a conservation of all PHMA (Alternative 3).

Adding management actions specifically to manage predators is outside the scope of the amendment as state wildlife agencies have management authority over many predators, and U.S. Fish and Wildlife Service has the management authority for ravens and other depredating migratory birds. Several comments were related to implementation activities, which are not included in the RMPA. Implementation of project BMPs is the

responsibility of the project proponent. While the BLM does not manage predators, the BLM has made several clarifying edits to the Chapter 2 discussion of predation in response to comments received.

22.2.32 Purpose and Need

Summary: Commenters requested clarification on what has changed since the 2015 and 2019 plan amendments that warrants this current effort. They state that this effort does not have the collaborative components included in the 2019 plan and that this plan is hard to understand.

Response: The BLM is not withdrawing a land use plan decision but is instead following its land use planning process under FLPMA and its land use planning regulations to amend existing land use planning decisions for sage grouse. Given continuing losses of habitat across all landownerships, and resulting long-term population declines, the BLM's purpose and need is to consider amending RMPs to update a sub-set of the GRSG goals, objectives, allocations, and management actions to ensure management on BLM-administered lands respond to changing land uses, improve efficiency and effectiveness of GRSG management, provide for consistent conservation based on ecological boundaries, and provide the BLM with locally relevant decisions that accord with rangewide GRSG conservation goals.

Section 1.2 describes the timeline for planning and changes since 2015 and 2019 that precipitated this current effort. Alternative 2 represents the 2019 plan and components of that alternative can be included in the decision. The EIS has been restructured to improve readability and to meet EIS page requirements. The manner in which this RMP Amendment amends the 2015 and 2019 RMP Amendment direction and the degree to which management direction from those plans remain in place, would be fully replaced by, or would be partially replaced by management direction and allocations in this RMP amendment has been clarified, by State, in Appendix 2. Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction.

Summary: The BLM should expand its purpose and need to include development**,** regulatory certainty, recognize county partners, and expressly clarify that RMP amendments only apply to BLM administered lands.

Response: The BLM has clarified the purpose and need in Section 1.4.2. The BLM's purpose and need is to consider amending RMPs to address a sub-set of the GRSG goals, objectives, allocations and management actions that need updates to ensure management on BLM-administered lands responds to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with locally relevant decisions that accord with range-wide GRSG conservation goals.

As stated in Section 1.6, the BLM develops land use plans through a planning and NEPA process that includes public involvement. Section 202 of FLPMA and its implementing regulations direct the BLM to develop and periodically revise or amend its RMPs, which guide management of BLM-administered public lands. (43 USC 1712, 43 CFR Part 1600). FLPMA further provides that the BLM "shall manage the public lands under principles of multiple use and sustained yield … except that where a tract of such public land has been dedicated to specific uses according to any other provisions of law it shall be managed in accordance with such law" (43 USC 1732(a)). FLPMA also directs the BLM to coordinate with other federal departments and agencies, state and local governments, and Tribal Nations to seek to promote consistency among land use plans across jurisdictions (43 CFR Subpart 1610.3-2). "Multiple use" does not mean every use on every acre.

In the DEIS, the preferred alternative, Alternative 5, considers other potential alignments of habitat management areas and associated management to try and balance GRSG conservation with public land uses.

Summary: BLM should only consider alternatives that are responsive to the purpose and need. Specifically, Alternatives 3 and 6 do not respond to the purpose and need.

Response: The BLM analyzed a reasonable range of alternatives that appropriately and adequately respond to the agency's purpose and need for considering these amendments, as described in Chapter 2. In accordance with NEPA, the BLM has discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "…shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM is required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The range of alternatives developed is intended to meet the purpose and need, and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision.

As described in Chapter 2 and Appendix 21, Alternative 3 includes the greatest measures to protect and preserve GRSG and its habitat. It is the most restrictive alternative analyzed, which provides for the greatest protections for GRSG - including management actions such as all HMAs managed as priority HMA (PHMA); closing PHMA to new fluid mineral leasing, saleable minerals/mineral materials permits, and nonenergy leasable minerals leasing; PHMA recommended for withdrawal from location and entry under the Mining Law of 1872, and PHMA being unavailable for livestock grazing. In addition, under Alternative 3 the BLM would designate 11,139,472 acres of ACECs specific to the management of GRSG; the ACECs would include portions of PHMA and would have the same allocations (i.e., allowable uses) as the rest of PHMA.

As described in Chapter 2, under Alternative 6 management for all habitat management areas and the topics being considered in the range of alternatives would be the same as described for Alternative 5, the preferred alternative, but with the addition of ACECs. ACEC boundaries would be the same as described for Alternative 3, but management would be less restrictive compared to Alternative 3, though generally more restrictive than the rest of Alternative 6 PHMA.

Summary: The purpose and need is too narrow. The BLM should expand it to include addressing threats to wildfire and invasive species and acknowledge its multiple-use mandate.

Response: The BLM has clarified the purpose and need in Section 1.4.2. Table 2-1, Alternatives Considered but Not Analyzed in Detail notes that wildfire and invasive species were considered but not analyzed in detail.

The 2015 GRSG planning efforts included many management actions addressing the threat of wildland fire in GRSG habitat management areas. This included prioritization of suppression efforts to limit loss of GRSG habitat, guidance for suppression efforts, the need for proactive efforts such as fuel breaks and fuel reduction projects, and considerations and commitments associated with reclamation and restoration after wildland fires in GRSG habitat management areas. The management included requirements for use of prescribed fire in GRSG habitat management areas, as well as the importance of coordinating all levels of fire management (suppression, pre-suppression, and restoration) with partners across the landscape.

There were few, if any changes to these wildland fire management actions in the 2019 RMPA effort, as they were already consistent with state strategies. Similarly, reviewing existing wildland fire and invasive species

RMP management actions, in context of the new literature, existing wildland fire and invasive species management action are sufficient for RMP-level decision-making, and no changes need to be considered. Any management changes necessary in wildland fire management to reduce wildland fire risk to GRSG would be made at the project/implementation level.

While changes to existing wildland and invasive species management actions will not be considered, changes to other management actions will be considered based on the threats from wildland fire and invasive species. For example, management actions that could limit the potential for ignition sources or the prevalence of or spread of fine fuels and invasives that contribute to uncharacteristically large and intense wildfires will be considered. Additionally, the effect of wildland fire on GRSG habitat quantity and quality will also be considered when evaluating habitat management areas. This includes the potential for habitat management areas to be durable in the face of changing conditions associated with climate change.

Analysis of the effects of the range of alternatives on Wildland Fire Ecology and Management can be found in Chapters 3 and 4 and Appendix 10. For instance, Section 3.2 discusses the threats to GRSG from increasing wildfire frequencies. Further, the potential effects of the alternatives on the number, size and intensity of wildfires and the spread of invasive species and their impacts on GRSG habitat quality and quantity will be considered in this EIS.

22.2.33 Range of Alternatives

Summary: The BLM should clarify how GRSG management would differ between SFAs, PHMAs, and ACECs and which designation would be the most protective.

Response: SFAS, ACECs and PHMAs are all different habitat designations. BLM made clarifying edits to Chapter 2 and in Appendix 2. Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction to clarify what is being addressed by the amendment and what the proposed changes to management direction are and how they dovetail with the management direction identified in 2015 and 2019 that is not being amended by this planning effort. Chapter 2 includes an updated comparison of alternatives that more clearly compares the alternatives. Appendix 2 has been updated to show how the management actions being addressed in the RMP Amendment would dovetail with the entire set of existing direction in the 2015 and 2019 amendments. This amendment only addresses a subset of the management allocations and management direction and the comparison of those changes are described in the comparison of the alternatives 3, 4, 5, 6, and Proposed RMP Amendment to alternative 1 which represents the corresponding management direction from the 2015 Plan Amendment and alternative 2 which displays the corresponding management direction from the 2019 Plan Amendment. This comparison of alternatives is appropriately carried out in Chapter 3 and Chapter 4. The effects analysis of the alternatives appropriately considered the ongoing implementation of the 2015 and 2019 amendments when comparing the alternatives. Appendix 2 is simply a guide to help the reader understand how the management actions being proposed by this amendment would dovetail with the full set of management direction in the 2015 and 2019 amendments. Additional analysis and the comparison of alternatives in this appendix would be duplicative of the analysis in Chapters 3 and 4 and at odds with the clarifying objective of the Appendix.

The effects of these different habitat designations described in Chapter 3, Chapter 4 and Appendix 10. The effects analysis of the management direction on the ACECs proposed in Alternatives 3 and 6 has been clarified and updated in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-grouse Habitat. Appendix 5 also details how SFAs were considered in the identification of potential ACECs for this planning effort. A map of the SFAs can be found in Appendix 1, Maps, (Part 1:Maps1.2a-2.41b).

Summary: The BLM should clarify the differences between the alternatives.

Response: The BLM has clarified the differences between the alternatives by adding a summary of the management direction and allocations for all of the alternatives in Table 2-14 in Chapter 2. The BLM has also updated the summary of alternatives in Chapter 2 section 2.2 and clarified the alternatives so they are more easily understood in Appendix 21, Detailed Description of Draft EIS Alternatives.

Summary: BLM should take a state-by-state approach rather than amend all the RMPs. The BLM should not allow so much state variation.

Response: The BLM's is amending a sub-set of the 2015 and 2019 GRSG RMP Amendment goals, objectives, allocations and management actions in order to respond to updated scientific information and changing land uses and provide for consistent and effective rangewide conservation based on biological information that is responsive to locally relevant habitat variability. The decision to amend a subset of the management direction is based on an internal review of the effectiveness of 2015 and 2019 RMP Amendment decisions and the degree to which those existing decisions sufficiently and appropriately addressed existing threats to GRSG habitat, continued population decline, and updated scientific findings; and was informed by feedback BLM received during the scoping period for this amendment effort from Tribal, Federal, State, and local agencies and the public. The goal is to provide all the BLM states with GRSG habitat management with consistent, updated management direction where it is needed while also allowing for state-specific differences and variation. The BLM believes this approach appropriately addresses our FLPMA requirements to promote consistency with Tribal, State, and local plans while also upholding our responsibilities to promote a consistent habitat conservation strategy for the GRSG which is a Bureau-identified sensitive species and was identified as "warranted but precluded" from Endangered Species Act listing by the US Fish and Wildlife Service in 2015. The management direction in the RMPA/EIS is based on updated GRSG science, population trends, and habitat data which provides the BLM with the necessary information to address rangewide needs of the species as well as the variances that occur across the habitat range.

Summary: The Draft EIS alternatives are difficult to understand.

Response: In developing the Proposed RMP Amendment/Final EIS the BLM has clarified language in order for the reader to better understand the alternatives being considered and how those alternatives would amend the 2015 and 2019 GRSG Amendment Decisions. These clarifications are found throughout the document including in the Chapter 1, Chapter 2, Appendix 2, and Appendix 21. The BLM has clarified the differences between the alternatives by adding a summary of the management direction and allocations for all of the alternatives in Table 2-14 in Chapter 2. The BLM has also updated the summary of alternatives in Chapter 2 section 2.2 and clarified the alternatives so they are more easily understood in Appendix 21, Detailed Description of Draft EIS Alternatives. The manner in which this RMP Amendment amends the 2015 and 2019 RMP Amendment direction and the degree to which management direction from those plans remain in place, would be fully replaced by, or would be partially replaced by management direction and allocations in this RMP amendment has also been clarified, by State, in Appendix 2, Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction.

Summary: The BLM should clarify the range of alternatives. The EIS should better articulate the entirety of GRSG management under all of the RMP amendments to date.

Response: The purpose and need in Chapter 1, Section 1.4.2 has been clarified to address why certain actions are rangewide and others are state specific. Chapter 2, Table 2-1, Alternatives Considered but Not

Analyzed in Detail has been updated with additional detail on the alternatives that were considered but not analyzed in detail. Appendix 2, Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction has been updated to identify the manner in which this RMP Amendment amends the 2015 and 2019 RMP Amendment direction and the degree to which management direction from those plans remain in place, would be fully replaced by, or would be partially replaced by management direction and allocations in this RMP amendment.

Summary: The BLM should address lek buffers in an alternative.

Response: Table 2-1, Alternatives Considered but Not Analyzed in Detail in Chapter 2 discusses the rationale for considering but not analyzing in detail lek buffers at the rangewide scale for this amendment. It is noted in Table 2-1 that there is no single buffer distance that would be appropriate for all populations and habitats across the range of GRSG (Manier et al. 2014). Lek buffers are generally used to conserve breeding and nesting habitats and are developed and applied as a uniform tool used in the lack of more accurate local information. As more specific data are collected on nesting habitats the applicability of generalized buffers across GRSG range will become less important to identifying and managing seasonal habitats. As described above, lek buffers are not the only or final conservation tool to avoid or minimize disturbance. The purpose and need was clarified to note that lek buffers were considered and addresses in State-specific circumstances. There is state-specific management direction for lek buffers for Colorado, Idaho, and Nevada/California (refer to Chapter 2, Section 2.5). Further the BLM is proposing to adopt the Western Association of Fish and Wildlife Agencies lek definitions (Cook et. al., 2022) (refer to Chapter 2, Table 2-4, and the Glossary). Appendix 4 provides a comparison of the lek buffer definitions for ease of reference.

The BLM reorganized the presentation of the management direction in the Proposed RMPA and is hopeful that this reorganization will allow the reader to more easily see where specific lek buffer distances are used in the rangewide management direction and also where BLM-states have applied state-specific lek buffers that differ from the rangewide management direction. For example, in the rangewide PHMA management direction Table 2-2; lek buffers are used regarding fluid mineral exceptions, applying the disturbance cap, or considering impacts from fences. In the fluid mineral section, multiple states also identify specific lek buffers that will apply in their states when considering fluid mineral exceptions to the broader PHMA no surface occupancy stipulation.

Further, throughout most of the GRSG range on public lands, lek buffers in PHMA have no additional conservation purpose because disturbance from most major uses is not allowed in all of PHMA, not just within buffers. In addition, buffers are only one conservation tool the BLM uses in managing GRSG habitat. Others include disturbance caps, managing uses to achieve habitat objectives, application of required design features, noise restrictions, and seasonal constraints. The BLM has a variety of conservation tools to manage the various threats to GRSG and does not rely on just one management tool to achieve its conservation goals and objectives.

In the Draft RMP Amendment and Final EIS, BLM Idaho considered adjusting their lek buffer definitions and how they are applied in that state. Appendix 19 describes the changes BLM Idaho considered making to their lek buffer definitions. In the Proposed RMP Amendment, Idaho would re-adopt the lek buffer definitions from the 2015 GRSG RMP Amendment. Refer to Chapter 1 and the rangewide and state specific management direction in Chapter 2.

Summary: The BLM should consider additional oil and gas development alternatives in detail.

Response: The BLM analyzed a reasonable range of alternatives to address the agency's purpose and need for considering these amendments, as described in Chapter 2. In Alternative 3, the BLM closes PHMAs to fluid mineral leasing. In the Proposed RMP Amendment, PHMAs is open with No Surface Occupancy. Under the Proposed RMP Amendment, the BLM identifies possible exceptions to this management direction within 0.6 miles of leks in PHMA if it can be demonstrated that development and surface occupancy would have no direct impacts to or disruption of GRSG or its habitat based on a series of criteria (refer to Chapter 2, Table 2-2). The BLM states of Colorado, Idaho, Montana/Dakotas, Oregon, and Nevada/California all apply state-specific differences in their application of this exception and increase the buffer distance that can be applied using this exception. In PHMA with limited exceptions, described in Chapter 2, Table 2-3, there is NSO allowed and there are no exceptions. The Proposed RMP Amendment revises the fluid mineral Objective. The Objective, described in Table 2-2 in Chapter 2 says, *Manage fluid mineral leasing and development (including geothermal) in GRSG habitat management areas to avoid, minimize, and compensate for adverse impacts to GRSG habitat to the extent practical under the law and BLM jurisdiction*. DEIS Alternatives 1, 2 (in some states), and 4 consider language to guide leasing. Alternative 3 closes all HMAs to leasing. Under the Proposed RMP Amendment, no specific objective or management action would specify a fluid mineral leasing strategy. However, its absence does not remove the desired condition to manage public lands to provide suitable GRSG habitat at the HAF mid-, fine- and site-scales.

Fluid mineral leasing would be considered in GRSG habitat management areas consistent with the Secretary's discretion under the Mineral Leasing Act (as amended), as well as applicable BLM regulations and policies, and in conformance with RMP goals, objectives, stipulations, and required design features to avoid, minimize, and compensate impacts to GRSG. Table 2-1, Alternatives Considered but Not Analyzed in Detail in Chapter 2 discusses the rationale for considering but not analyzing in detail oil & gas potential as criteria for addressing fluid mineral leases.

Summary: The Preferred Alternative in the Draft RMPA/EIS does not provide sufficient protections for GRSG in Oregon and did not sufficiently address threats to GRSG from climate change.

Response: In addition to the strengthened protections in PHMA and PHMA with Limited Exceptions which bring the Proposed RMP Amendment in alignment with Oregon GRSG plans and policies, the BLM has identified nine state-specific differences for rangewide management within the management direction for PHMA and GHMA (refer to Tables 2.2 and 2.4) as well as additional State specific management direction in Table 2.9). The rangewide and state-specific changes made in the Proposed RMP Amendment promote consistency with State of Oregon GRSG plans and policies. The BLM clarified in the Proposed RMP Amendment that State Director approval, rather than Authorized Officer approval, is needed in several of the management direction sections in Chapter 2, Table 2-2 including within the Disturbance Cap, Predation, Adaptive Management, and Criteria Based Management for Non-Habitat sections.

The BLM's purpose and need in Chapter 1 has been clarified to address the fact that one of BLM's primary needs in this RMP Amendment effort is to address updated science relative to drought and climate change (refer to Chapter 1, Section 1.4.2). This information on addressing drought and climate change previously preceded the Purpose and Need in Chapter 1. It has been moved to the Purpose and Need to clarify BLM's intent. The effects of drought on GRSG are also described in Chapters 3 and 4. The BLM believes the alternatives and Proposed RMP Amendment do address drought and provide for the ability for BLM to adapt to changing habitat conditions.

The BLM has identified an adaptive management approach in the Proposed RMP Amendment, refer to Chapter 2, Table 2-2, the Objective for which is to address unanticipated negative impacts to GRSG from

potential changes in habitat conditions before consequences become severe or irreversible. This includes addressing habitat conditions that result from the effects of climate change, including drought. The adaptive management strategy provides BLM with a process for addressing habitat loss or population anomalies and identifying the underlying cause. Then BLM may change management or preclude new activities depending on local data and conditions. In addition, the BLM will continue to implement the vegetation and invasive species management direction from the 2015 and 2019 RMP Amendments that address habitat conditions and where not proposed for amendment in this planning effort (refer to discussion of alternatives considered but not analyzed in detail regarding vegetation and ecosystem resilience in Chapter 2, Table 2-1).

Summary: The BLM did not consider a reasonable range of alternatives, including one that analyzes a lower disturbance cap.

Response: The BLM considered a reasonable range of alternatives during the planning process. in full compliance with NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. In light of the BLM's purpose and need, the BLM specifically partnered with USGS to review the best available information regarding GRSG since 2015 and incorporate the management implications of that information into this EIS. Citations are provided throughout the EIS to justify the management proposed and impacts stated.

As a result, six alternatives were analyzed in detail in the Draft RMPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the Draft RMPA/EIS represented a full spectrum of options which address the issues of GRSG protection, including a no action alternative, up to a conservation of all PHMA (Alternative 3). Suggested alternatives that fit within the range of alternatives are considered to have been adequately analyzed and were not addressed separately.

Summary: Alternative 1 must be removed from the range of alternatives as it has been determined to have failed and violates NEPA because it is not a reasonable alternative.

Response: Alternative 1 represents the 2015 RMP Amendment that BLM is currently implementing due to the court injunction of the 2019 Amendment. The BLM is analyzing Alternative 1 in order to provide an appropriate representation of both the management that has been developed in 2019 and is currently enjoined from being implemented (No Action, Alternative 2) and the 2015 management direction the BLM is currently implementing (Alternative 1). Analyzing both Alternative 1 and Alternative 2 are wholly appropriate and contribute to an appropriate range of alternatives analyzed in the Draft and Final EISs

Summary: Alternative 3 must be removed from the range of alternatives because it is not "economically feasible" alternative based on increases in costs to ranchers and farmers who would have to find alternatives for federal forage for livestock.

Response: All of the proposed management direction and designations identified in Alternative 3 comply with FLPMA. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives in compliance with NEPA. The range of alternatives in the Draft RMPA/EIS represent a full spectrum of options which

address the issues of GRSG protection, including a no action alternative, up to full conservation of all PHMA (Alternative 3).

Alternative 3 in the Draft EIS removes livestock grazing in PHMA and provides the BLM with the opportunity to analyze and compare effects to GRSG habitat in areas that are not grazed by livestock and those that are grazed under the other alternatives. Refer to Appendix 10, section 10.2 for a description of the effects of the alternatives on GRSG. While there are many possible alternatives or actions to manage public lands and GRSG in the planning area, the BLM fully considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives in compliance with NEPA. The range of alternatives in the Draft RMPA/EIS represent a full spectrum of options which address the issues of GRSG protection, including a no action alternative, up to full conservation of all PHMA (Alternative 3). The Proposed RMP Amendment does not propose the removal of livestock in PHMA. Please refer to Chapter 2, Table 2-2 for the livestock grazing management direction.

Summary: BLM should/should not select a particular alternative. The BLM should consider an alternative that achieves no further loss of GRSG habitat, a true conservation alternative, including no oil and gas development, wind or solar installations, grazing, and hard rock mining.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter1, Section 1.4.2. As described in the DEIS, Alternative 3 includes the greatest measures to protect and preserve GRSG and its habitat - including closing all PHMA to fluid mineral leasing, exclusion for wind and solar installations, unavailable for grazing, and consideration of withdrawal from location and entry under the Mining Law of 1872. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis.

Further, BLM considered a number of alternatives and issues during scoping that the agency determined not to carry forward, as detailed in Chapter 2, Table 2.1, Alternatives Considered but Not Analyzed in Detail. The BLM added further explanatory detail in Section 2.1 in response to public comments.

Regarding concerns raised by commenters on restrictions to mineral exploration under the project alternatives, only Alternative 1, 2 and 3 consider a recommendation for withdrawal from location and entry under the Mining Law of 1872.

Summary: The BLM should include the analysis of the alternative proposed by the State of Wyoming.

Response: As detailed in Section 2.1, Alternatives Considered but Not Analyzed in Detail, the BLM reviewed the alternative proposed by the State of Wyoming and determined most of the actions were already evaluated among other alternatives, were substantially similar to the language already being considered, would result in substantially similar effects, were not consistent with the BLM's purpose and need, included recommendations that were not consistent with BLM policy, or would be addressed during the implementation process.

Because the RMP-level actions in the Wyoming submission are already considered in the range of alternatives, developing a stand-alone state alternative is not necessary for consideration of effects. The BLM therefore did not separately analyze the alternative proposed by the State of Wyoming.

Summary: The BLM should consider exclusion areas for utility scale wind and solar.

Response: The BLM has included PHMA as exclusion for solar and wind in the Proposed RMP Amendment, with some exceptions and in PHMA with limited exceptions areas, solar and wind are exclusion with no exceptions (refer to Chapter 2, Tables 2-4 and 2-5. Exclusion of solar and wind is also proposed in PHMA in Alternatives 1, 2, 3, and 4.

Summary: The BLM should consider an alternative that closes wild horse and burro herd management areas to livestock grazing.

Response: The purpose and need of this land use planning effort is focused on a sub-set of the GRSG goals, objectives, allocations and management actions. There are no alternatives that specifically propose closing wild horse and burro herd management areas to livestock grazing, as that would not be in line with the purpose and need. The Draft RMPA/EIS does however include Alternative 3 which has similar results through all PHMA being identified as unavailable to grazing, although Alternative 3 also proposed removal of wild horses and burros in PHMA.

Summary: BLM should consider only actual, scientifically verifiable direct and indirect GRSG impacts when evaluating disturbance caps and assessing mitigation. The GRSG Table 2-7, page 2-31 of the Draft EIS arbitrarily states that the full corridor under the width of transmission line conductors would be considered disturbed for purposes of calculating disturbance caps.

Response: The text referenced in the Draft RMPA/EIS states: "Where such data are available, this disturbance is measured by the footprint of direct disturbance of the PHMA (and IHMA in ID) area where habitat is removed (including staging areas, dispersed structures, parking lots, equipment storage areas, etc.), or by the distance between the outermost lines."

If project specific disturbance footprint is available, that information could be used.

Summary: The BLM should incorporate additional information to assist in reviewing the alternatives, such as components of the previous RMP amendments that would be carried forward, which ones were implemented, and which ones were effective.

Response: The BLM has clarified the differences between the alternatives by adding a summary of the management direction and allocations for all of the alternatives in Table 2-14 in Chapter 2. The BLM has also updated the summary of alternatives in Chapter 2 section 2.2 and clarified the alternatives so they are more easily understood in Appendix 21, Detailed Description of Draft EIS Alternatives. The manner in which this RMP Amendment amends the 2015 and 2019 RMP Amendment direction and the degree to which management direction from those plans remain in place, would be fully replaced by, or would be partially replaced by management direction and allocations in this RMP amendment has also been clarified, by State, in Appendix 2, Comparison of Proposed RMP Amendment to Existing Greater Sage-Grouse RMP Management Direction.

Summary: Commenters requested that the BLM provide an explanation of the reasoning for amending the 2015 and 2019 RMPs, not following the 2021 ROD, updating the RMPA/EIS, particularly Alternatives 1 and 2, to use the best available science, and addressing why implementation of the 2015 plans has been ineffective in reversing declines in GRSG populations and habitat.

Response: This amendment effort recognizes the importance of including RMP actions that address GRSG threats on BLM-administered public lands in context of the 2010 and 2015 USFWS GRSG listing decisions. Refer to Chapter 1, Section 1.2of the Final EIS for a full overview of the GRSG planning background. Alternative 1 represents the 2015 GRSG planning process and Alternative 2 represents the 2019 GRSG

planning process. One of the primary purposes of this current RMPA/EIS is to update GRSG management using the best available science. In 2017, the BLM decided to amend the 2015 plans to better align with state plans, after discussions with governors in affected States. Those plans were enjoined in 2019. Because those plans remain enjoined, the BLM is implementing the 2015 plans in the interim. However, unless that temporary injunction is lifted, the BLM cannot implement the 2019 plans. Rather than continue with an interim implementation while waiting to resolve that litigation, the BLM decided to undergo land use planning for a third time, which it initiated in 2021.

The 2021 GRSG "RODs" did not actually include any final decisions. After conducting supplemental NEPA on the 2019 plans, the 2021 documents simply concluded that the analysis demonstrated no further process was necessary to support the 2019 decisions however, it was not an official planning decision and did not amend the 2019 plans. The 2019 Approved RMP Amendments remain under a temporary injunction and thus the BLM may not implement them. That injunction may only be lifted by a federal court decision. The Sagebrush Focal Area withdrawal EIS, initiated in 2015 and cancelled in 2017, was a completely separate process that addresses the recommendation in the 2015 RMP Amendment to withdraw Sagebrush Focal Areas from mineral development under the 1872 Mining Act. A separate court decision required the BLM to "re-initiate" the NEPA process for that proposal. That EIS process is ongoing.

Summary: The preferred alternative would weaken GRSG protections that are already insufficient. The BLM should modify the preferred alternative by changing lek buffers, the nonhabitat identification process, and renewable energy exclusion zones.

Response: The BLM analyzed a reasonable range of alternatives adequate to address the agency's purpose and need for considering these amendments, as described in Chapter 1, Section 1.4.2. The action alternatives, including the preferred alternative, were developed based on the best available data and the latest science in order to further GRSG conservation. The effects of the Proposed RMP Amendment on GRSG are described in Chapter 4, Section 4.2 and the effects of Alternatives 1 through 6 are described in Appendix 10. The analysis acknowledges when the preferred alternative from the Draft RMPA/EIS (Alternative 5) would result in greater effects on GRSG compared to existing management (Alternative 1).

The BLM developed the Proposed RMP Amendment in response to public and cooperating agency comments and in consideration of important habitat factors such as connectivity, population strongholds, and the potential for threats from development. The Proposed RMP Amendment proposed increased protections for GRSG in comparison to the preferred alternative (Alternative 5) in the Draft EIS. The BLM made adjustments to the Priority Habitat Management Areas (PHMA) allocation and made PHMA exclusion to solar and wind development with exceptions, No Surface Occupancy for oil and gas development with waivers, exceptions, and modifications, and avoidance areas for major rights of way with exceptions. The BLM has also identified areas within PHMA that will benefit from additional protection. These areas within PHMA will have more limited exceptions than the rest of PHMA. These areas will be called "PHMA with limited exceptions." The associated management direction provides strengthened protections by removing exceptions described in the PHMA exclusion language for Utility Scale Solar, Utility Scale Wind, and Fluid Mineral No Surface Occupancy direction. In addition, the management direction for Major Rights of Way is "exclusion with exceptions" rather than "avoidance with exceptions and conditions" as described in PHMA. Management of lek buffers and non-habitat remains unchanged to remain aligned with best available science.

Summary: BLM should not be pre-decisional by making Alternative 5 preferred.

Response: Pursuant to the requirements in the BLM's planning regulations, a preferred alternative was identified in the Draft RMPA/EIS (43 CFR 1610.4-7). The preferred alternative represents those goals, objectives, and management direction determined to be most effective at resolving planning issues and balancing resource uses and meeting the purpose and need. However, identification of a preferred alternative does not indicate any final decision or commitments from the BLM. The public was provided an opportunity to comment on all management alternatives presented in the Draft RMPA and Draft EIS during the public comment period.

22.2.34 Reasonably Foreseeable Development Scenario (RFD)

Summary: The data BLM is presenting for the number of wells drilled in Wyoming has issues and was not cleaned up sufficiently before analysis, it shows significant differences from data from WOGCC. BLM should examine and clarify data sources as problems with inputs can result in downstream issues for other parts of the document that depend on the RFD.

Response: BLM worked with the Wyoming Oil & Gas Conservation Commission (WOGCC) to update well information from Wyoming. To demonstrate the difference between the data sources, the document will clarify that the WOGCC data are considered more accurate but also note that activities such as workovers, recompletions, and wells which were spud but then abandoned, may have some impact on GRSG from the preparation of the drills site and mobilization of the workover or drill rig. BLM has clarified data sources and information used in the final Appendix 12.

Summary: The BLM should consider the impacts of the recommendation for withdrawal from minerals entry.

Response: As required by NEPA, BLM is analyzing the impacts of the proposed withdrawal from mineral entry under the Sagebrush Focal Area Withdrawal Environmental Impact Statement (NEPA # DOI-BLM-WO-WO3500-2016-0002-EIS, https://eplanning.blm.gov/eplanning-ui/project/70697/510). The recommendation for withdrawal in Alternatives 1, 2 and 3 are not management decisions and have no impact. Only the Secretary of the Interior may withdraw lands from location and entry under the Mining Law of 1872 through a separate process. BLM is correctly analyzing the impacts of a separate action under a separate NEPA analysis. This separate withdrawal EIS effort is included in this GRSG RMPA/DEIS in the Cumulative Effects analysis (Section 4.21 and Appendix 4).

Summary: The BLM should apply a decline curve to base production from existing wells, not doing so artificially reduces the negative economic impacts of reduced well development. The BLM should also clarify if RFD considers the entirety of the planning area (including state and private lands) or if the wells are projected solely on federal surface and minerals.

Response: BLM will examine ways to incorporate a decline curve while recognizing the difficulty of accurately declining production of wells across different areas of the state, differing formations, and different well ages. The BLM has clarified data sources and information used in the final Appendix 12 to clarify where production is from federal estate and where it reflects production from both federal and non-federal mineral estate.

Summary: The BLM should clarify how many of the existing leases in Wyoming are under litigation. Greater clarification of inputs should also be provided.

Response: BLM will examine if data are available to determine which leases are under litigation, however the fact that a lease is under litigation does not lay the basis to conclude and assess the outcome, or length

of time litigation may be ongoing. BLM has already clarified data sources and information used in the Proposed RMPA/Final EIS Appendix 12.

Summary: The lack of a list of pending projects and applications in the RFD is an omission that will be a problem for the cumulative effects analysis.

Response: The RFD is specific to the development of oil and gas and renewable energy resources. A list of reasonably foreseeable future actions can be included in the main body of the document where it can be more easily referenced for cumulative impacts. In addition, applications and actions pending a final decision are still uncertain in nature until a final decision or permit is rendered.

Summary: The RFD should include descriptions and map locations for high, medium, and low mineral potential in the planning area. This would help to inform the potential range of direct, indirect, and cumulative effects of mineral development to PHMAs in the next 20 years, whether there are regions/populations/leks that are particularly at risk, the potential cumulative effects of locatable mineral development in combination with other mineral development (fluid, solid, etc.), and their location with respect to proposed ACECs, and other considerations. The RFD should also detail existing information and projections about future locatable mineral development.

Response: The GRSG RMPA/EIS includes information about mineral potential for oil and gas and certain leasable minerals, potential for locatable minerals is very difficult to accurately determine due to the wide range of what falls into the locatable mineral category and the constant variability of values of various metals and gems. Information available about locatable mineral development is limited and it is not feasible to use to develop trends needed to project future locatable mineral development. As such, information on the number, location and size of existing locatable mining claims, notices and plans of operations are not included in the EIS.

Summary: The BLM may be understating potential surface disturbance because the level of development could be higher than GAO report 21-13844. The BLM should assume that all leases with medium and high oil and gas potential, and a percentage of low oil and gas potential will be developed at some point and incorporate those estimates into their baseline disturbance estimates. Failing to do so could result in exceeding disturbance caps with limited recourse to avoid further degradation of greater sage grouse habitat because too many use authorizations would have been approved.

Response: The reasonably foreseeable development scenario must rely on trends to develop estimates of potential future surface disturbance. GAO Report 21-13844 is based on existing conditions and trends. Because many leases expire before being developed, it is not reasonable to assume that all leases with medium and high oil and gas potential and a percentage of low oil and gas potential will be developed. Some leases are speculative. While some of the expired leases might be re-leased at a later date, management from this planning effort would apply and they might not be developed within the life of this document.

Summary: BLM should better describe sources used in the RFD, including sources from the previous planning effort.

Response: BLM has clarified data sources and information used in the final Appendix 12.

22.2.35 Recreation and Visitor Services

Summary: The BLM should update the analysis to include impacts to recreation.

Response: The Draft RMPA/EIS and the Proposed RMP Amendment/Final EIS both include analysis of the impacts to Recreation and Visitor Services (Chapter 4, Section 4.19 and Appendix 10, Section 10.9) and Travel and Transportation Management (Chapter 4, Section 4.20 and Appendix 10, Section 10.20). Additionally, Chapter 2, Table 2-1 explains why travel and recreation were not carried forward as topics for rangewide amendment. Furthermore, the DEIS in Section 4.19.2 states, "Under all alternatives, disturbance caps which restrict the construction of recreation infrastructure would decrease access for recreation experiences that depend on road and trail development and could inhibit management objectives where developments are part of the desired conditions." The recreation effects of each alternative are described.

Recommendations for recreation and travel management received during public scoping are either already in the existing RMP language from 2015 and 2019 or are not RMP-level decisions. Such actions would be consistent with existing management or are not applicable at the RMP-level so no changes in RMP management actions need to be considered. The BLM is only proposing to amend a subset of 2015 and 2019 GRSG RMP Amendment decisions that the BLM found were not sufficiently and appropriately addressed and that did not need to be updated based on new scientific information or changes in land use. The 2015 and 2019 travel and transportation management decisions were not identified as needing amendment.

To respond to a specific comment requesting that the BLM identify the importance of wildlife watching, wildlife viewing is specifically mentioned as a dispersed recreation activity on BLM-administered lands in Chapter 3, Section 3.19.

Summary: The BLM should update the analysis to reflect post-COVID recreation trends and the BLM's Blueprint for the 21st Century Outdoor Recreation.

Response: Chapter 3, Section 3.19.1 was updated with this information.

Summary: Restrictions on road and trail development may be inconsistent with state and local resource management plans, transportation plans, RS 2477 rights, and trail master plans. The BLM should avoid decreasing access to recreation experiences unless agreed to by state and local authorities.

Response: The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the DEIS. BLM is aware that there are State or local laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent…practical." In a situation where State and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. Thus, while State, county, and federal planning processes under FLPMA are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations.

22.2.36 Renewable Energy

Summary: The BLM should include more restrictions on renewable energy, since they have large impacts on GRSG and to improve consistency with fluid minerals management.

Response: The BLM analyzed a reasonable range of alternatives adequate to address the agency's purpose and need for considering these amendments, as described in Chapter 2. Further, BLM considered a number of alternatives and issues during scoping that the agency determined not to carry forward, as detailed in Section 2.3. As described under Best Available Information and Baseline Data of this comment report, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to

support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects.

Impacts from renewable energy on GRSG are described in Section 4.2 of the DEIS. While there are some similarities in impacts between renewable energy and fluid mineral development, these are separate uses permitted and managed under different laws and policies. The renewable energy and lands and realty sections are combined in many areas in the EIS, though impacts from renewable energy on GRSG are split into a separate section given the importance of this issue. In a separate NEPA process, the BLM is currently updating the BLM RMPs for solar energy development in the Solar Programmatic Environmental Impact Statement (PEIS). In that analysis of impacts the Solar PEIS considers existing management associated with the 2015 GRSG amendments as those direct current GRSG habitat management on BLM- administered lands. However, the Solar PEIS update defers to this GRSG planning effort to decide how solar energy development would be conducted in GRSG habitat management areas.

Summary: Restrictions on renewable energy would restrict the energy transition to renewable energy and would increase development pressure on adjacent lands. The BLM needs to include better science regarding adverse effects of renewable energy on GRSG.

Response: The DEIS analyzed a reasonable range of alternatives for renewable energy development and associated transmission adequate to address the agency's purpose and need for considering these amendments, as described in Chapter 2.5.8. Discussion of impacts of lands and realty decisions on adjacent and nonfederal lands has been added to the cumulative impacts analysis of the Proposed RMPA/Final EIS in Sections 4.21.1, Greater Sage-Grouse and 4.21.7, Lands and Realty.

As described under Best Available Information and Baseline Data of this comment report, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The RMPA/EIS data and information are presented in map and table form and are sufficient to support the broad-scale analyses required for land use planning.

Another commenter requested that the BLM should not exclude solar energy development in current and proposed utility corridors based on the presence of designated GRSG habitat. In the DEIS, Table 2-10 outlines the comparison of alternatives for wind and solar projects and Major ROWs. There is a reasonable range of management actions, with the preferred alternative identifying avoidance - not exclusion, as the commenter asserts.

Summary: The EIS should clarify restrictions in the RMPA compared with those in the Solar PEIS. These commenters also suggested that associated energy storage projects, such as pumped storage, should be addressed at the same level as wind and solar projects given their direct linkage and given they have very similar impacts, infrastructure, and function.

Response: In a separate planning and NEPA process, the BLM is currently analyzing potential land use plan amendments addressing solar energy development in the Solar Programmatic Environmental Impact Statement (PEIS), also known as the proposed Updated Western Solar Plan (DOI-BLM-HQ-3000-2023-0001-RMP-EIS). The Solar PEIS update defers to this GRSG planning effort to decide how solar energy development would be conducted in GRSG habitat management areas.

Summary: The Final EIS and RMPA should better explain what minimization measures and compensation would be used to maintain GRSG habitats consistent with state agency habitat designations and to preclude negative impacts to any adjacent PHMA habitats and describe how these would be protective of fish and wildlife.

Response: The prior GRSG amendment effort(s) included an appendix with a series of required design features (RDFs) to be considered and applied when considering authorizations. These RDFs were developed in coordination with state partners and cooperating agencies and were adjusted to the major issues associated with each BLM State Office's amendment effort. These RDFs have been considered as tools to avoid or minimize the effects of specific projects in each state. These existing RDF RMP decisions are not being considered for amendment in this process and therefore remain in the RMPs unchanged from the prior amendment(s). At the project level, the BLM will work with applicants to determine the needed minimization measures for GRSG and other fish and wildlife and ESA consultation would be conducted to ensure listed fish and wildlife are protected.

Summary: Geothermal resources should be considered a renewable resource, in the same category as wind and solar, and provided similar land use considerations in the EIS.

Response: While geothermal resources are renewable, they follow a leasing process very similar to fluid minerals. The regulations for geothermal are housed in 43 CFR 3000 – Minerals Management. Thus, it is addressed as such in the EIS.

Summary: The EIS should better characterize the beneficial impacts of renewable energy development on air quality and other resources.

Response: Sections 4.2.1, 4.12.2, and 4.13 have been revised to temper the discussion of adverse effects from renewable energy development and add discussion regarding the benefits.

Summary: The EIS should better characterize the adverse effects of renewable energy development, including associated storage projects, and present a discussion of projected energy demand associated with future renewable energy development, commensurate with the information provided for geothermal, oil, and gas.

Response: Renewable energy development is considered a right-of-way and is administered under the lands and realty program. As such, renewable energy is permitted differently than fluid minerals. However, Section 4.2.1 acknowledges the similar adverse impacts from renewable energy and fluid minerals on GRSG. The renewable energy and lands and realty sections are combined in many areas in the EIS, though impacts from renewable energy on GRSG are split into a separate section given the importance of this issue. The solar development RFD for this GRSG EIS incorporates and builds on the RFD from the 2023 Solar Programmatic EIS (PEIS), under concurrent development. Data to project the wind RFD were determined to be outdated, though an analysis of wind energy potential within HMAs by alternative is presented in Appendix 12.

Summary: The EIS should clarify whether BLM intends to apply stipulations to all transmission lines or just those associated with new renewable energy projects.

Response: Transmission lines will be considered major (greater than or equal to 100 kV transmission lines and greater than or equal to 24" pipeline) or minor (less than 100 kV transmission lines and less than 24" pipelines) ROWs, as defined in the EIS. Transmission lines would be covered under guidance for those ROWs.

Summary: State-specific mitigation measures should be presented explicitly in the EIS. For instance, commenters asked that the EIS state that protective lek buffers for GHMA specified in Appendix 19 will be implemented as exclusion areas in Idaho to provide GRSG conservation/minimization measures and protections from renewable energy development.

Response: State-specific management for renewable energy has been included in the EIS in Chapter 2 and in several appendices. The management included was determined to be needed for a given state. Other management would be applied rangewide and would be sufficient to protect GRSG habitat.

Summary: The BLM should reclassify some areas proposed for solar projects as open to renewable energy development.

Response: As informed by public input during scoping and review of the Draft RMPA/EIS, the BLM's purpose and need addresses a subset of the GRSG goals, objectives, allocations, and management actions. BLM considered a range of alternatives that respond to the purpose and need. The resulting Proposed RMPA/Final EIS includes updates to ensure management on BLM-administered lands responds to changing land uses; improves efficiency and effectiveness of GRSG habitat management; provides for consistent conservation across state lines; and provides the BLM with locally-relevant decisions that accord with range-wide GRSG conservation goals. BLM has identified that changes may be needed to address the continued GRSG habitat losses that are contributing to declines in GRSG populations; ensure habitat management areas and associated management incorporate recent relevant science to prioritize management where it will provide conservation benefit (including providing for durable planning decisions when considering the effects of climate change); provide continuity in managing GRSG habitats based on biological information versus political boundaries, while allowing for management flexibility to address different strategies in identifying habitat management areas with state agencies, as well as local habitat variability; and refine and clarify other aspects of RMPs.

Summary: The BLM should define valid existing rights related to renewable energy.

Response: As stated in the DEIS in Section 1.5, all proposed actions will be subject to valid existing rights. Accordingly, the BLM will ensure that its implementation of the management actions in the RMPA is consistent with the terms and conditions in existing leases or existing contracts, including those associated with FLPMA ROW grants. The definition of valid existing rights is included in the glossary of the Draft RMPA/EIS.

Summary: The BLM should update the affected environment related to renewable energy.

Response: The BLM has relied on the best available information in developing the RMPA/EIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive presentation of baseline data or impacts analysis. The baseline data and impacts analysis provide the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis.

In the DEIS, Chapter 3, Section 3.9 includes a discussion of the affected environment for Lands and Realty, including solar energy, wind energy, and ROW grants. Chapter 4 identifies and discloses environmental impacts resulting from selection of the alternatives presented in Chapter 2 - including an analysis of renewable energy options within those alternatives.

To respond to a comment stating that there is a complete lack of assumptions related to the exploding interest in Renewable Energy development, Section 10.9 of Appendix 10 in the DEIS outlines the indicators and assumptions associated with Lands and Realty, including wind and solar development, one of which states: Federal energy policies including (42 USC Section 13201 et seq. [2005], Executive Order 14008, and the Energy Act of 2020), would continue to support and promote domestic energy production, including renewable energy such as wind and solar.

22.2.37 Request Cooperating Agency Status

Summary: The BLM should ensure coordination with tribal authorities, as outlined by Council on Environmental Quality (CEQ) regulations, specifically 40 C.F.R. § 1508.5, which recognizes Indian tribes as cooperating agencies when impacts occur on or near their reservations. Given that BLM's management of Sage-Grouse populations and habitats on lands within and adjacent to these reservations will affect the reservations, the BLM is responsible for involving tribal authorities as cooperating agencies in the planning process.

Response: Both the CEQ and BLM planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating agency relationships are limited to government entities, state agencies, local governments, tribal governments, and other federal agencies that have jurisdiction by law or special expertise.

BLM sent letters to tribal governments inviting them to be cooperating agencies. The BLM also sent letters to local, state, and federal agencies inviting them to participate as cooperating agencies. Cooperating agency status provides a formal framework for these government units to engage in active collaboration with a lead federal agency in the planning process. Invitations were sent to potential cooperating agencies in December 2021 and January 2022. The BLM has set up MOUs with all tribes who have requested to be a cooperating agency. Cooperating agency relationships are described in Section 5.3 of the RMPA/EIS and formal consultation efforts with tribes are described in Section 5.2.1. The BLM invited many other cooperators to engage in this effort who either did not reply or chose not to participate.

22.2.38 Socioeconomics

Summary: The BLM should consider impacts on socioeconomic conditions from changes to private and state lands and minerals due to BLM decisions on ACECs.

Response: In Section 4.12.1, Nature and Type of Effects as well as Appendix 10, Section 10.12.4, Alternative 3, of the Final EIS, the BLM added a qualitative discussion on the potential for impacts on socioeconomic conditions on adjacent private lands and minerals due to restrictions that affect the development of federal lands and minerals, including restrictions related to ACEC designations. In the Final EIS, under the Proposed RMP Amendment, the BLM is not carrying forward ACECs, so there will be no impacts on socioeconomic conditions due to restrictions on activities and land use from ACEC designations.

Summary: The BLM should consider impacts on economic and social conditions from changes to private and state lands and minerals due to BLM decisions.

Response: In Section 4.10.1, of the Final EIS, the BLM added a discussion on the potential for impacts to adjacent private lands and minerals due to restrictions that affect the development of federal lands and minerals, and in Section 4.12.1, Nature and Type of Effects as well as Appendix 10, Section 10.12.4, Alternative 3, of the Final EIS, the BLM added a qualitative discussion on the potential for impacts on social and economic conditions on adjacent private lands and minerals due to restrictions that affect the development of federal lands and minerals, including development of pipelines and transmission lines. Additionally, in Section 4.12.3, Cumulative Effects, the BLM explained how these impacts on social and economic conditions could have cumulative impacts on the surrounding communities.

Summary: The BLM should consider the impacts on royalties, rents, bonus bids, severance taxes, ad valorum taxes, sales and use taxes, labor income, and employment from changes in mineral activity due to BLM-management decisions.

Response: Section 4.12 of the Draft EIS provides an analysis on the impacts on royalties, severance taxes, ad valorum taxes, employment income, and direct and indirect employment from changes in resources due to management decisions. In the Final EIS, the BLM added qualitative discussion on impacts on rents and bonus bids and sales and use tax. Due to data limitations, these impacts are not able to be quantitatively analyzed. Additionally, based on BLM guidance, the analysis was conducted commensurate with the level of decision making.

Summary: The BLM should analyze the impacts on the economy from adding ACECs in Alternatives 3 and 6.

Response: In the Final EIS, under the Proposed RMP Amendment, the BLM is not carrying forward ACECs, so there will be no impacts on socioeconomic conditions due to restrictions on activities and land use from ACEC designations, under this alternative. The impacts of closing lands on mineral development, under Alternative 3, is discussed and analyzed in Appendix 10, Section 10.10.1 and the RFD, Appendix 12 of the DEIS, and the impacts on economic and social conditions from changes in mineral exploration due to BLM-management decisions related to ACECs are discussed in Sections 4.12.1 and 4.12.4 of the DEIS. Under Alternative 6, the impacts on economic and social conditions from the requirement of plan of operations for exploration operations disturbing five acres or less in ACECs is discussed in Sections 4.12.1 and 4.12.7 of the DEIS.

Summary: Socioeconomic impacts must consider effects of the restriction on development of geothermal energy, particularly in Nevada.

Response: Section 4.12 of the Draft EIS, under the subheaders "Renewable Energy (Geothermal, Wind, and Solar) Management", provides analysis on the impacts on economic conditions, such as jobs, income, and economic output, due to potential changes in geothermal activity based on BLM decisions on GRSG.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making. Additionally, the BLM used the best available data at the time of preparing the Draft EIS for the baseline socioeconomic discussion and the impacts on social and economic conditions.

Summary: The BLM should analyze cumulative impacts on economic and social conditions, including impacts of recent rulemakings, such as the Renewable Energy Rule, Public Lands Rule, and the Utility-Scale Solar PEIS.

Response: Section 4.21.11, under the Economic Interest and Conditions subheader, of the DEIS, discusses the cumulative impacts on economic and social conditions due to changes that could be implemented from the Solar Programmatic EIS. The BLM added a discussion on cumulative impacts on economic and social conditions due to changes that could be implemented from the Public Lands Rule and the Renewable Energy Rule.

The recently promulgated Public Lands Rule implements the BLM's longstanding statutory authority to manage lands for conservation, including by taking account of certain resource values explicitly addressed in the rule. As a result, the management actions considered here are consistent with the Public Lands Rule, notwithstanding that they are within the BLM's discretion with or without the rule.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities. The BLM should use county-level data in the baseline discussion, such as the data provided in the Nevada Economic Assessment Project (NEAP) reports. Additionally, the BLM should analyze the cumulative impacts with other recent BLM rulemakings.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making. Additionally, the BLM used the best available data at the time of preparing the Draft EIS. Most of the data in the socioeconomic baseline report (Appendix 13) come from the same source as the data in the NEAP reports (i.e., population and housing availability data). Because the NEAP reports were published in 2022 and more recent data from the original sources are available, the BLM collected and used the most up-to-date data from these sources for the socioeconomic baseline discussions. In Appendix 13 Section 4.1, on page 13.4-1 of the DEIS, there is a footnote that refers readers to view the NEAP reports for more information on social and economic conditions in Nevada Counties in the analysis area. Additionally, Section 4.21.11, under the Economic Interest and Conditions subheader, of the DEIS, discusses the cumulative impacts on economic and social conditions due to changes that could be implemented from other recent BLM rulemakings.

Summary: The BLM should analyze cumulative impacts on economic and social conditions.

Response: Section 4.12.3, Cumulative Effects, of the Proposed RMP Amendment/Final EIS, discusses the cumulative impacts on economic and social conditions.

Summary: The BLM should clearly outline the methodology for calculating economic impacts from changes in recreation.

Response: Section 4.19, Recreation and Visitor Services, discusses the impacts on recreation due to BLM-management decisions. Management decisions related to GRSG are not expected to affect visitor use levels. Recreation related economic impacts would stem from changes in potential visitor use; however, since there are no expected changes in visitor use across the alternatives, there would be no expected change in visitor spending or economic activity supported by recreation on BLM-administered lands (see Section 10.12 in Appendix 10, for more information on assumptions used in the analysis on impacts on economic conditions related to recreation). See Appendix 18 for a detailed description of the technical methodology that was used to analyze impacts on economic conditions due to changes in other resources.

Summary: The commenters provided data and sources for the BLM's consideration regarding recreation on BLM lands and the importance of recreation.

Response: Management decisions related to GRSG are not expected to affect visitor use levels (see Section 4.19, Recreation and Visitor Services, for a discussion on the impacts on recreation due to BLM-management decisions). Recreation related economic impacts would stem from changes in potential visitor use; however, since there are no expected changes in visitor use across the alternatives, there would be no expected change in visitor spending or economic activity supported by recreation on BLM-administered lands (see Section 10.12 in Appendix 10, for more information on assumptions used in the analysis on impacts on economic conditions related to recreation). Because there would be no expected change in visitor spending or economic activity supported by recreation due to BLM decisions on GRSG, impacts on economic and social conditions due to potential changes in recreation were not carried forward to a detailed analysis.

Summary: The BLM should add statements that all mining jobs tend to be high paying in rural communities.

Response: The BLM revised the statements in the coal, nonenergy leasable, and locatable mineral sections to say, "jobs associated with mining, including [coal, nonenergy leasable minerals, locatable minerals] tend to be high paying compared with other types of employment in rural communities." This statement was also added to the fluid minerals and mineral materials sections.

Summary: One commenter expressed concerned with the impacts on economic conditions and the way of life of the local communities and individuals in these communities due to changes in oil and gas activity due to BLM decisions.

Response: Section 4.12.5 of the Draft EIS provides a detailed discussion on the impacts on economic and social conditions, such as jobs, income, tax revenue, access to public services, way of life, and quality of life, from potential changes in oil and gas activity due to BLM decisions under Alternative 5.

Summary: The BLM should add employment data for a typical wind or solar project.

Response: The BLM added language in Section 3.12.2 and Appendix 13 of the Final EIS pointing to the baseline data on jobs and labor income by industry. The BLM explained that renewable energy, such as wind and solar development, supports jobs in various industries, such as the construction industry, however, these jobs are not reported as a separate renewable energy sector.

Summary: The BLM should compare Payments in Lieu of Taxes (PILTs) across states in the analysis area or refer to a table that shows PILTs across states in the analysis area.

Response: In Section 3.12 of the Final EIS, the BLM added a reference to Table 3-15 in Appendix 13 that shows the PILTs by county and state.

Summary: The BLM should analyze impacts on environmental justice populations and economic conditions due to impacts on the cost of transportation and heating fuels, the energy market, and rising energy costs.

Response: The BLM focused the discussion of impacts on socioeconomic conditions and environmental justice due to increased costs for trona-related household products and did not include a discussion regarding the impacts on the cost of transportation and heating fuels, the energy market, and rising energy costs due to the unique geographical characteristics of trona that makes it different from other types of minerals or energy sources that may be used for transportation and heating fuels.

Trona is unique because trona deposits only exist in a handful of locations across the globe, and the largest known deposit is located in Green River, Wyoming, which is responsible for supplying 90% of U.S. soda ash used by domestic manufacturing, food, cosmetic, and pharmaceutical sectors. Trona from Southwest Wyoming is also exported to international markets around the world. Restrictions to limit surface disturbances within PHMA could significantly affect the feasibility of mining the Wyoming deposit and there is less likelihood of geographic substitution being able to offset production declines in PHMA due to the rarity of trona deposits. Therefore, there is a higher likelihood that restricting trona production in Southwest Wyoming would have a perceptible impact on the price for a wide range of household products.

In contrast, oil and gas deposits and other sources of minerals and energy that are used for transportation and heating fuels are located in many regions of the U.S. (both within and outside of GRSG PHMA) and across the world. While management actions considered under the alternatives could restrict production of these resources within PHMA (the impacts of these restrictions on economic conditions are discussed in Section 4.12 of the Draft EIS), there is a high likelihood that geographic substitution would mitigate some of the production losses discussed within the EIS. Since these resources exist outside of PHMA, production losses associated with new restrictions on leasing and developing minerals or energy supply in PHMA could be partially offset by increases in production from federal minerals on federal land outside PHMA, state and private minerals on non-federal land in the U.S. outside of PHMA, or from foreign sources. The degree to which geographic substitution would offset production declines within PHMA and the net price effects associated with geographic changes in mineral and energy production are not known.

Because the impacts on net price effects for transportation and heating fuels are not known for the general public, the BLM cannot determine that these impacts will have disproportionate effects on environmental justice populations.

Summary: The BLM underestimates the economic contributions from the oil and gas industry, and the BLM should use data from the Utah Petroleum Association.

Response: The economic analysis prepared for the Utah Petroleum Association that the commenters referenced analyzed the impact on the economy from the petroleum industry across the state of Utah, regardless of whether or not the petroleum extraction would be impacted by BLM decisions on GRSG management. Whereas, for the impact analysis in the Draft and Final EIS, the BLM focused on the impacts on economic conditions due to changes in oil and gas activity in GRSG habitat, which would be directly impacted by BLM decisions. The results from the study prepared for the Utah Petroleum Association project larger economic contributions from petroleum because they include petroleum that would not be impacted by the alternatives. If the BLM were to include these additional data, the comparison across alternatives of the change in economic contributions would not differ from the analysis in the Draft and Final EIS.

Summary: The BLM should consider the impacts on price increases due to restrictions in other nonenergy leasable minerals.

Response: The BLM focused the economic impacts analysis discussion on impacts associated with increased in price for trona-related consumer products since there are very few, if any, geographical substitutes for extracting trona other than in the KLSA in Wyoming (which is located in GRSG habitat), including globally. Because of the small amount of geographical substitutes, restricting leasing of trona in the KLSA could directly impact the regional supply of trona and trona-related products (i.e., baking soda). Other types of nonenergy minerals, such as phosphate, sodium, potassium, and sulfur do not have the geographical limitations that trona has. For example, Idaho and Utah are large producers of phosphate; however,

phosphate is also found in Florida, North Carolina, and other countries such as in China and Morocco. Gilsonite only occurs in the Uinta Basin in eastern Utah; however, as discussed in Section 3.10.2, gilsonite is used mostly for oilfields and printing ink industries, which have more substitutes and tend not to be direct consumer products.

Summary: The analysis on social and economic conditions due to changes in locatable minerals is insufficient. The BLM should make the analysis more adequate through actions such as quantifying the impacts from changes in locatable minerals, providing more detailed baseline information on locatable minerals, and using more concrete language to describe effects (i.e., use "will impact" rather than "might impact"). Additionally, the BLM should analyze impacts on state compensatory mitigation systems, the ability of mine operators to seek mitigation credits, mining operations due to changes in realty actions (i.e., transmission rights-of-way, access roads, etc.), and cumulative impacts to mining activities.

Response: As described in Sections 4.12.1, 4.12.2, and 4.12.4, recommending areas for withdrawal from the mining laws for locatable exploration or development does not restrict any activities and therefore, such recommendation does not have any impacts. The Secretary of the Interior makes a withdrawal of land from location and entry through a separate process pursuant to Section 204(a) of FLMPA. This process is separate from the BLM land-use planning process. Should there be a proposal for the Secretary to make a withdrawal, the proposal would require environmental and other analysis under NEPA and other applicable authorities before the land could be withdrawn. For purposes of this planning initiative, the alternatives analysis includes a discussion of the likely effects should the separate process be conducted, and the Secretary make a withdrawal in the future. These effects include impacts on economic and social conditions such as impact on employment, labor income, and taxes. The discussion of these impacts is included in Section 4.12 of the DEIS, under the Locatable Minerals Management sub-header.

Summary: The BLM should acknowledge in the analysis that restrictions on mineral materials disposal would push development to other areas, which would still cause climate effects, and often times these areas are more residential, so there would be more adverse impacts on environmental justice populations.

Response: The BLM added language that states if mineral materials operations shift to state or private lands, then impacts on social conditions and quality and access to nonmarket values could shift as well.

Summary: The BLM should use 2022 U.S. Census of Agriculture data in their analysis on economic impacts due to changes in livestock grazing.

Response: The BLM added language and updated data to explain the change in percentages of farms and ranches by type in each state. 2012 data were used for the baseline percentages of ranch types in the Draft EIS, because 2012 is the last year that USDA NASS data separated small family ranches into retirement ranch, off-ranch primary occupation, and ranch primary occupation categories. As explained in Section 3.5 of Appendix 13, the data from USDA NASS includes farms and ranches on all lands, regardless of whether they are in or outside of the analysis area, on or off BLM-managed lands, and regardless of whether they are impacted by BLM decisions. The data from USDA NASS were provided for illustrative purposes. In Appendix 18, a detailed description is provided of the input data that were used for the analysis of impacts on economic conditions by alternative. As a proxy for forage use, the BLM use billed AUMs on BLM-managed lands, where PHMA accounted for at least 15 percent of the acreage. Because the input data on billed AUMs was limited to the allotments where PHMA accounted for at least 15 percent of the acreage, the data used captures the allotments that would be directly impacted by BLM decisions.

Summary: The statement that explains that demand for renewable development on public lands will likely increase as fossil fuel use is transitioned away is concerning.

Response: The BLM revised the sentence in question to say, "As there continues to be an increased diversification of energy sources, there will likely be an increase in demand for renewable development on public lands."

Summary: The BLM should mention that renewable energy projects generate fewer jobs than mining projects.

Response: The BLM does not have sufficient evidence that renewable energy projects generate and support lower levels of overall regional employment than mining and power generation from other fuel sources in the long-term.

Summary: The statement that environmental justice communities, especially low-income households, often live closer to mineral developments is incorrect.

Response: In the Draft EIS, the BLM included citations for the statements that were made that environmental justice populations would likely be disproportionately impacted by changes in access to clean air due to mineral development because of where low-income populations tend to be located. The BLM was not provided any other sources or updated data for consideration to show how this statement is incorrect. In the Final EIS, the BLM added language that the specific impacts on environmental justice populations would likely depend on other site-specific factors that cannot be determined in this analysis and will be analyzed further during implementation-level NEPA analysis.

Summary: The BLM's analysis of impacts on social and economic conditions is inadequate and there are concerns with how the summary of environmental consequences in the Executive Summary for Social and Economic Conditions is phrased.

Response: The BLM quantitatively analyzed the impacts on economic conditions, including impacts on jobs, income, output, and tax revenue, due to changes in livestock grazing and mining in Section 4.12 of the Draft EIS. The analysis included a discussion on the magnitude of these impacts. Additionally, the BLM discussed the impacts on social conditions, access, and quality of nonmarket values associated with changes in livestock grazing and mining in Section 4.12 of the Draft EIS. In the Final EIS, the BLM revised the discussion in the Executive Summary to better reflect the analysis that was described in detail in Chapter 4 and Appendix 18.

Summary: The difference in economic data in the DEIS versus those reported by the USDA 2017 Census of Agriculture is concerning.

Response: Appendix 18 provides a detailed description on the input data that were used for the analysis of impacts on economic conditions due to potential changes in livestock grazing from BLM-management decisions by alternative. As a proxy for forage use, the BLM used billed AUMs on BLM-managed lands, where PHMA accounted for at least 15 percent of the acreage. This land would be directly impacted by BLM decisions. Data from the USDA Census of Agriculture can provide contextual information on ranching in the area, however, these data were not used in the modeling of impacts on economic conditions because it is not specific to the land that would be directly impacted by BLM-management decisions. Data from the USDA Census of Agriculture includes data on farms and ranches on all lands, regardless of whether they are in or outside of the analysis area, on or off BLM-managed lands, and regardless of whether they are impacted by BLM decisions.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities. Additionally, the BLM should use county-level data in the baseline discussion, such as the data provided in the Nevada Economic Assessment Project reports.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making. Additionally, the BLM used the best available data at the time of preparing the Draft EIS. Most of the data in the socioeconomic baseline report (Appendix 13) come from the same source as the data in the NEAP reports (i.e., population and housing availability data). Because the NEAP reports were published in 2022 and more recent data from the original sources are available, the BLM collected and used the most up-to-date data from these sources for the socioeconomic baseline discussions. In Section 4.1 of Appendix 13, on page 13.4-1 of the DEIS, there is a footnote that refers readers to view the NEAP reports for more information on social and economic conditions in Nevada Counties in the analysis area.

Summary: The BLM should include language that recognizes the impact of litigation on Wild Horses and Burros.

Response: The BLM cannot anticipate or project impacts due to potential future litigation. The BLM revised text on page 4-136 of the Draft EIS to say, "The timeline for implementation of any management changes, if approved, would be impacted by congressional funding and the associated wild horse management including gathers, storage capacity, and adoption rate."

Summary: The BLM should consider the impacts on increased costs for constructing power transmission lines, under Alternative 3.

Response: Section 4.12.4 in the Draft EIS, under the subheader "Renewable Energy (Geothermal, Wind, and Solar) Management," includes a discussion on the potential impacts on costs of constructing transmission lines due to BLM decisions under Alternative 3.

Summary: The BLM should add language to the cumulative impacts section stating that there is a higher potential for severe wildfire under Alternative 3.

Response: The BLM revised language to: "Potential for severe wildfire could result in damage to GRSG habitat, which could result in cumulative impacts on access to nonmarket values associated with GRSG and GRSG habitat, such as values from cultural and subsistence resources and nonuse values. The risk of wildfires could be higher under Alternative 3 due to the reduction lands available for livestock grazing, which would limit the ability to use livestock to reduce fine fuels on a large portion of the landscape (see Section 4.4 for further analysis on the impacts of grazing on wildfires)."

Summary: The analysis should include quantitative impacts on economic contributions due to changes in wind and solar energy production.

Response: As discussed in Appendix 12, Reasonably Foreseeable Development Scenario, due to data limitations, the BLM was not able to project the amount of wind and solar power plants on federal lands across alternatives, so they were also unable to provide a quantitative analysis on impacts on economic conditions, such as jobs, labor income, and economic output. Instead, these impacts were discussed qualitatively.

Summary: The BLM should consider the adverse impacts that ACECs have on public services as well as on the ability to develop infrastructure that is necessary for public health and safety.

Response: In Section 4.12.1 of the Draft EIS, under the "Fluid Minerals (Oil and Gas) Management" subheader, there is a discussion on the potential impacts on public services from BLM decisions that reduce mining opportunities on federal land. In Section 4.12.4, there is another discussion on impacts on public services due to BLM decisions under Alternative 3, including impacts on maintaining infrastructure that help provide access to educational opportunities, health care, and social safety net programs. There is also a discussion on impacts on public services in Wyoming, in Section 4.12.7, due to BLM decisions under Alternative 6. The Proposed RMP Amendment does not propose to designate any ACECs, so there will be no impacts on socioeconomic conditions due to restrictions on activities and land use from ACEC designations.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities. The BLM should use county-level data in the baseline discussion, such as the data provided in the Nevada Economic Assessment Project reports. Additionally, the BLM should consider the impacts on economic and social conditions due to management actions regarding ACECs.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making, and the BLM used the best available data at the time of preparing the Draft EIS. Most of the data in the socioeconomic baseline report (Appendix 13) come from the same source as the data in the NEAP reports (i.e., population and housing availability data). Because the NEAP reports were published in 2022 and more recent data from the original sources is available, the BLM collected and used the most up-to-date data from these sources for the socioeconomic baseline discussions. In Appendix 13 Section 4.1, on page 13.4-1 of the DEIS, there is a footnote that refers readers to view the NEAP reports for more information on social and economic conditions in Nevada Counties in the analysis area. Additionally, the BLM is not carrying forward ACECs in the Final EIS under the Proposed RMP Amendment, so there will be no impacts on socioeconomic conditions due to restrictions on activities and land use from ACEC designations under this alternative. The impacts of closing lands to mineral development under Alternative 3 are discussed and analyzed in Section 4.10.1, the RFD, and Appendix 12 of the DEIS. The impacts on economic and social conditions from changes in mineral exploration due to BLM-management decisions related to ACECs are discussed in Sections 4.12.1 and 4.12.4 of the DEIS. Sections 4.12.1 and 4.12.7 of the DEIS discuss the impacts on economic and social conditions due to changes that could occur from the BLM's decision regarding the requirement of plan of operations for exploration operations disturbing five acres or less in ACECs.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities. Additionally, the BLM should discuss social conditions and nonmarket values of livestock grazing, in addition to economic conditions of livestock grazing.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making. Additionally, the BLM used the best available data at the time of preparing the Draft EIS for the baseline socioeconomic discussion and the impacts on social and economic conditions. In Appendix 13 and Section 3.12 of the Final EIS, under the Livestock Grazing Management subheading, the BLM discusses baseline information on economic, nonmarket, and social conditions related to livestock grazing on BLM-administered lands. Section 4.12 and Appendix 18 of the Final EIS discuss impacts on economic conditions,

social conditions, and access and quality of nonmarket values associated with livestock grazing due to BLM-management decisions under each alternative.

Summary: The BLM did not provide adequate opportunity for meaningful involvement and fair treatment of environmental justice populations. Additionally, the BLM should consider the impacts on environmental justice populations due to mining workers leaving the areas due to changing economic conditions.

Response: In Section 3.12 and Section 5.3 of Appendix 13, the BLM added language to further highlight the meaningful, public engagement and outreach that has included and involved environmental justice (EJ) populations that the BLM has conducted and organized to date. Section 4.12.1 includes a detailed analysis on impacts on economic conditions—including those outlined by the commenters—that affect all communities, including those in rural towns across the analysis area. In Section 4.12.1, the BLM explains that additional screening and consideration of environmental justice populations and analysis of disproportionate and adverse impacts will occur at the implementation stage—at which point, the communities with EJ concerns may change, depending on the conditions at the time of implementation.

Summary: The analysis of impacts on economic and social conditions due to changes in livestock grazing is inadequate. In the socioeconomic section, the BLM should quantify the impacts on the costs from range improvement maintenance or installation incurred by permittees, the likely economic loss of restricting turnout and turn in dates, the loss or relocation of water developments or resources, and the proposed reductions in percent utilization. Additionally, the BLM should qualitatively evaluate how these alterations to livestock grazing on public lands would affect the culture of landowners and permittees, in addition to the surrounding communities.

Response: In Section 4.12 of the Draft EIS, under the Livestock Grazing Management subheader, the BLM provided a detailed analysis on the impacts on economic conditions as well as social conditions and nonmarket values, including impacts on the culture of the rural communities. Due to data limitations, the BLM is not able to quantify all of the costs incurred by permittees due to BLM decisions. However, the BLM added language qualitatively discussing the impacts on some of the costs highlighted by the commenters in Section 4.12.1, Nature and Types of Effects. As stated in Section 2.3, Alternatives Considered but Not Analyzed in Detail, decisions that limit livestock grazing utilization were not carried forward in any of the alternatives analyzed in detail. Additionally, the BLM added further discussion on the impacts on social condition and quality and access of nonmarket values of livestock grazing on the surrounding communities in Section 4.12.1 of the Proposed RMP Amendment/Final EIS.

Summary: For alternatives that are open to livestock grazing, the BLM should analyze the cost of restoring areas due to damage from livestock grazing.

Response: The BLM did not include management actions on required restoration management in any of the alternatives in the Draft RMPA/EIS and Proposed RMP Amendment/Final EIS, so there would be no impact on economic conditions from changes in BLM decisions regarding restoration requirements under alternatives that are open to livestock grazing.

Summary: The BLM should consider impacts on economic conditions from changes in on livestock grazing activity due to operators relocating transmission lines onto lands used for grazing due to BLM decisions on GRSG management. The impact analysis should include a discussion on changes in costs and burdens associated with construction and operation of transmission lines as well as impacts on economic conditions such as jobs and income, including low income and minority workers.

Response: The BLM added language in Section 4.12.1 stating that indirect impacts on economic and social conditions due to changes in livestock grazing could occur from BLM decisions regarding ROW exclusion and avoidance areas if development of ROWs is relocated to areas outside of GRSG habitat but still within a grazing allotment. These areas may see an increase in construction-related disturbance or displacement of livestock, which could lead to increased costs to ranchers. There are no transmission lines being proposed as part of this EIS, so there will be no impacts from BLM management decisions on GRSG on the issues specific to transmission line easements and construction. Section 4.12 discusses impacts of BLM management decisions regarding GRSG on economic conditions such as jobs and income, which includes impacts on all communities including those who identify as low income and minority.

Summary: Land use decisions that push transmission line development onto agricultural land will have negative impacts to food supply, which should be analyzed in the NEPA document.

Response: The degree to which transmission lines will move onto private agricultural lands due to BLM decisions on GRSG depends on several site-specific factors which are not known to the BLM, including value of the land for agriculture compared with the value of the land for transmission line development (which in turn depends on the demand, supply, and price of agricultural products compared with the demand, supply, and price of energy), existing contracts and rights, and availability and feasibility of other nearby land substitutions. Because the degree to which transmission lines will shift to private agricultural lands due to BLM decisions on GRSG is unknown, the BLM cannot determine the impacts on economic and social conditions from this change.

Summary: The section title "Social and Economic Conditions, including Environmental Justice" should be changed to "Social and Economic Conditions, including Environmental Justice and Agriculture."

Response: Agriculture as it relates to livestock grazing is discussed in Section 3.8 and 4.8, of the Draft EIS, rather than Sections 3.12 and 4.12, Social and Economic Conditions, including Environmental Justice. Section 4.12, Social and Economic Conditions, including Environmental Justice, discusses impacts on social and economic conditions that stem from changes in activity related to resources, such as livestock grazing, minerals, renewable energy.

Summary: The BLM's statement that there is no evidence that farming and ranching sectors employ a higher percentage of people who identify as minority or low income is concerning. The BLM should use data from the US Census, as reported in the Hispanic Profile Data Book, and the Idaho Department of Labor for baseline data on agricultural workers who identify as minority. Additionally, the BLM should consider impacts on environmental justice populations due to changes in economic conditions from relocating transmission lines onto agricultural lands due to BLM decisions on GRSG management.

Response: The BLM revised the language in Sections 3.12.2, 4.12.1, 10.12.4 of Appendix 10, and 5.3 of Appendix 13, to clarify that there is a lack of evidence that the types of operations (rather than the sectors as a whole) that are most likely to be impacted by BLM management decisions—such as small-family owned ranching and livestock operations—employ a higher level of individuals who identify as part of an environmental justice population. The data that the commenter provided are on the agricultural industry as a whole rather than ranching and livestock operations. While many agricultural and crop farms tend to hire a large percentage of wage workers—who tend to include higher levels of individuals who identify as part of an environment justice population—this is not the case for most small family-owned ranches and livestock operations, which tend to employ more family workers. The degree to which transmission lines will move onto private agricultural lands due to BLM decisions on GRSG depends on several site-specific factors which

are not known to the BLM, including value of the land for agriculture versus the value of the land for transmission line development—which are related to demand for and price of agricultural products versus energy—and availability and feasibility of other nearby land substitutions. Because the impacts on private agricultural lands from shifting transmission lines due to BLM decisions on GRSG are not known, the BLM cannot determine that these impacts will have disproportionate effects on environmental justice populations.

Summary: The BLM should consider the information to support the argument that the agriculture industry employs a higher percentage of people who identify as minority or low income. The BLM should use data from the US Census, as reported in the Hispanic Profile Data Book, and the Idaho Department of Labor for baseline data on agricultural workers who identify as minority.

Response: The BLM revised the language in Section 3.12.2, 4.12.1, and Appendix 13, to clarify that the impacts on economic conditions associated with changes in livestock grazing are focused on ranches and livestock operations, and the biggest impacts will occur on small family-owned ranches and livestock operations, which tend to employ lower levels of wage-workers, who include higher levels of individuals who identify as part of an environment justice population, than agricultural and crop farms. The data that the commenter provided are on the agricultural industry as a whole rather than ranching and livestock operations.

Summary: The BLM should consider the impacts on jobs in secondary industries that would be affected by changes in the oil and gas industry, especially due to BLM decisions on ACECs.

Response: In the Proposed RMP Amendment, the BLM is not carrying forward ACECs, so there will be no impacts on socioeconomic conditions due to restrictions on activities and land use from ACEC designations under this alternative. Impacts on secondary jobs are included in the numbers for indirect and induced impacts. Indirect impacts include impacts on jobs in industries that are needed to support an industry that was directly impacted (for example, manufacturing industries that sell supplies to the oil and gas sector). Induced impacts include impacts on jobs in industries that are affected by changes in household spending (for example, jobs in the service-related sectors such as those associated with restaurants and grocery stores). These impacts are discussed in detail in Section 4.12.2. See Appendix 18 for more details on the methodology for calculating impacts on economic conditions as well as for tables that break out the total impacts by state into direct, indirect, and induced impacts.

Summary: The BLM should revise the language in Section 3.10.4, Minerals, that says that the BLM has limited information regarding the existing conditions of locatable mineral development. Additionally, the BLM should revise the language in Appendix 13 that says that coal accounts for a small percentage of total economic contributions and employment.

Response: In Section 3.10.4 of the Proposed RMPA/Final EIS, the BLM revised the language to say, "Because locatable minerals are governed under the requirements of the Mining Law of 1872, as amended, the BLM has limited baseline data on the production and revenue associated with locatable minerals." In the Appendix 13 of the Final EIS, the BLM revised the language to say, "Coal production and development activities can be an important contributor to local jobs, labor income, and tax revenue, especially in rural communities. Additionally, the jobs associated with coal mining tend to be high paying compared with other types of employment in these rural communities."

Summary: The BLM should consider impacts on economic and social conditions from changes in funding to state educational systems due to impacts on state trust lands.

Response: In Section 4.12.1, Nature and Type of Effects, as well as Appendix 10, Section 10.12.4, Alternative 3, of the Final EIS, the BLM added a qualitative discussion on the potential for impacts to adjacent non-federal lands due to a change in development of non-federal minerals. The BLM also discussed that a change in development of non-federal minerals could impact public services, including education, which can be funded by mineral production on state trust lands.

Summary: The language in the impacts analysis needs to be revised to clarify that trona extraction cannot be moved to another location. Additionally, the BLM should analyze the impacts on lithium batteries and other infrastructure needed for renewable energy development due to changes in restrictions on nonenergy leasable minerals.

Response: The BLM added language to clarify that trona in the U.S. is located in the KSLA, and there is limited ability to shift large scale operations to deposits outside of the KSLA. Additionally, the BLM added that lithium batteries represent one of the uses for soda ash in Section 4.12.1 of the Final EIS.

Summary: The BLM needs to include the Net Proceeds of Minerals Taxes in Nevada in Table A-29 from the socioeconomic baseline appendix and analyze the impacts on economic conditions from changes in Net Proceeds of Minerals Taxes in Nevada.

Response: The BLM added Net Proceeds of Minerals Taxes in Nevada to Table A-29 from the socioeconomic baseline appendix. Net Proceeds of Minerals Taxes were analyzed in the Draft EIS but mislabeled as "severance tax". The BLM corrected the name of the tax revenue in the Final EIS. As described in Sections 4.12.1, 4.12.2, and 4.12.4, recommending areas for closure to the mining laws for locatable exploration or development does not restrict any activities and therefore, such recommendation does not have any impacts. Only the Secretary of the Interior may withdraw lands from location and entry under the Mining law of 1872 through a separate process. This process is separate from the BLM land use planning process. Should there be a proposal for the Secretary to make a withdrawal, the proposal would require environmental and other analysis under NEPA and other applicable authorities before the land could be withdrawn. For purposes of this planning initiative, the alternatives analysis includes a discussion of the likely effects should the separate process be conducted, and the Secretary make a withdrawal in the future. These effects include impacts on economic and social conditions such as impact on employment, labor income, and taxes. The discussion of these impacts is included in Section 4.12 of the DEIS, under the Locatable Minerals Management subheader.

Summary: The BLM should prepare a Supplemental Draft RMPA/DEIS that eliminates Alternative 3 from detailed consideration on the grounds that it is economically infeasible and that it is also inconsistent with FLPMA's multiple-use mandates.

Response: The BLM analyzed a reasonable range of alternatives, as required by the NEPA process, that are feasible for the BLM to implement and adequate to address the agency's purpose and need for considering these amendments, as described in Chapter 2. Further, BLM considered a number of alternatives and issues during scoping that the agency determined not to carry forward, as detailed in Section 2.3. Impacts on economic conditions under Alternative 3 were analyzed and discussed in detail in Appendix 10, Section 10.12.4. The Proposed RMP Amendment does not propose closing land to grazing or locatable mineral development.

Summary: The BLM should analyze the impacts on additional costs from increased risk of multiple system failures (e.g., network redundancy and service reliability) and construction costs due to the requirement of co-locating infrastructure in existing ROWs and corridors in certain alternatives.

Response: In Section 4.12.1, the BLM added that under alternatives that encourage co-locating infrastructure in existing ROWs and corridors, there could be impacts on economic conditions due to increased risk of multiple system failures and issues with service reliability as well as potential increased construction costs due added transmission line length to route the transmission line to existing corridors. Due to data limitations, the BLM is not able to quantify impacts on costs or economic risks associated with co-locating transmission lines.

Summary: The BLM should include an analysis of impacts on social and economic conditions at a more granular level, such as at the county level or for rural communities. Additionally, the BLM should consider impacts on economic conditions of changes in mineral development, especially for Native Americans and environmental justice populations.

Response: Based on BLM guidance, the analysis was conducted commensurate with the level of decision making. Additionally, the BLM used the best available data at the time of preparing the Draft EIS for the baseline socioeconomic discussion and the impacts on social and economic conditions. In Appendix 13 and Section 4.12, the BLM discusses the economic conditions and impacts on economic conditions under each alternative associated with mining throughout the analysis area, including impacts on employment and economic output. As discussed in these sections, these impacts on economic conditions affect many individuals in the surrounding communities, especially in communities that rely on mining for economic stability and growth. As stated in Section 5.3 of Appendix 13 and Section 3.12.4, of the DEIS, the BLM does not have evidence that individuals employed in the sectors that are most likely to be impacted by BLM management decisions (such as the mining sector) have a higher percentage of people who identify as a minority, low-income, or American Indian and Alaska Native, so the BLM did not determine there would be disproportionate and adverse impacts on environmental justice populations due to potential changes in economic conditions from BLM-management decisions that could affect mineral development.

Summary: The Executive Summary should include a discussion of impacts on social and economic conditions and environmental justice populations due to changes in livestock grazing across alternatives.

Response: In the Final EIS, BLM revised the discussion in the Executive Summary to better reflect the analysis that was described in detail in Chapter 4 and Appendix 18. As stated in Section 5.3 of Appendix 13 and Section 3.12.4, of the Draft EIS, the BLM does not have evidence that individuals employed in the sectors that are most likely to be impacted by BLM management decisions (such as the farming and ranching sector) have a higher percentage of people who identify as a minority, low-income, or American Indian and Alaska Native, so the BLM did not determine there would be disproportionate and adverse impacts on environmental justice populations due to potential changes in economic conditions from BLM-management decisions that could affect livestock grazing.

Summary: The BLM should update the baseline data on rights-of-way for wind and solar projects.

Response: In the Final EIS, the BLM updated data on rights-of-way for wind and solar projects based on data from Fiscal Year 2023, which is the most recent publicly available data at the time of the Final EIS.

Summary: The BLM should analyze the impacts on economic conditions due to changes in locatable mineral activity from BLM-management decisions under Alternatives 4, 5, and 6.

Response: As discussed in Sections 4.12.5 and 4.12.6 of the DEIS, there are no areas recommended for withdrawal from locatable mineral entry under Alternatives 4 and 5, so there would be no impact on jobs, income, economic output, and social conditions under these alternatives from locatable mineral activity. As discussed in Section 4.12.7, there are also no areas recommended for withdrawal from locatable mineral entry under Alternative 6, however, there would be a requirement for a plan of operation for exploration operations that disturb five acres or less in ACECs. The impacts on socioeconomic conditions from potential changes in locatable mineral activity due to this requirement are discussed in Section 4.12.7.

Summary: The impacts on economic conditions due to using HAF fine-scale delineation areas were not adequately analyzed.

Response: The impact analysis on economic conditions, as described in Section 4.12.2 and Appendix 18, uses data from the RFD on oil and gas activity, such as number of oil and gas wells produced in the area and production of oil and gas wells. Impacts on economic conditions due to changes associated with HAF fine-scale delineation areas are incorporated into the economic analysis through reduced potential development in the area.

Summary: The BLM should stop doing repetitive studies and helicopter gathers, and removals that result in costs to warehouse the animals. The BLM should compare costs of using helicopters for gathers with costs of doing bait and water trapping. The BLM should remove the incorrect statement that says that the FLPMA amended the WHBA.

Response: Thank you for your comment. The Federal Land Policy and Management Act amended the Wild Free-roaming Horses and Burros Act by allowing the Secretaries of the Interior and Agriculture to use or contract for the use of helicopters and motorized vehicles for the purpose of managing wild horses and burros on public lands. The commenter did not provide evidence for why the statement is incorrect, so this statement was not removed. BLM activities associated with wild horse and burros that were mentioned in the comment, such as research and use of helicopters for wild horse gathers, and funding for management of wild horse and burros are outside the scope of this project.

22.2.39 Soil Resources

Summary: The BLM should consider the provided science when analyzing indirect impacts of grazing/disturbance on biological soil crusts.

Response: Biological soil crusts are included in the analysis in the Draft RMPA/EIS in Sections 3.14, 4.2.2, and 4.14. The BLM revised Section 3.14 to consider additional science regarding impacts on biological soil crusts.

Summary: The BLM should consider the suggested edits to the soil resources analysis.

Response: In the Draft RMPA/EIS, Section 3.14 includes a description of the affected environment for soil resources and Section 4.14 includes the environmental consequences analysis for each alternative. The Draft RMPA/EIS does not propose any soil resource specific management actions. Sections 3.14, 4.14 and 4.2, and associated sections of Appendix 10 were updated with additional information regarding direct, indirect, and cumulative impacts to soil resources.

22.2.40 Travel and Transportation

Summary: The BLM cannot simply assume that the act of signing a travel management plan alone will be protective of sage-grouse. The plans must meet the BLM's minimization criteria and be followed up with

restoration of undesignated trails, increased trail maintenance, and adequate funding for outreach, education and enforcement.

Response: Area-specific travel and transportation management decisions are outside the scope of this document. However, committing adequate resources and staff to achieve the conservation goals and objectives remains a top priority for the BLM. BLM is committed to the continued implementation of sage-grouse habitat and sagebrush steppe management. Each Field Office is in charge of prioritizing staff time to accomplish their identified workload associated with implementation level projects. All implementation level travel and transportation plans will follow all applicable BLM handbooks and manuals for conducting travel and transportation planning.

Summary: The BLM should update the access analysis in areas that are closed or limited to OHV use to reflect safety and search and rescue concerns.

Response: Section 3.20.1 and 4.20 were updated to provide clarification. The BLM is not proposing to amend the 2015 GRSG RMP Amendment management direction for travel and transportation. The existing management direction that limits OHV use to existing roads in GHMA and PHMA remains in place. The effects of changes in HMA allocations across the alternatives and how that would change the manner of travel and transportation allocations has been added to the effects analysis in Chapter 4 and Appendix 10. The BLM's existing 2015 GRSG RMP Amendment management direction does not propose OHV closures and none are being proposed in this RMP Amendment.

Recommendations for recreation and travel management received during public scoping are either already in the existing RMP language from 2015 and 2019 or are not RMP-level decisions. Such actions would be consistent with existing management or are not applicable at the RMP-level so no changes in RMP management actions need to be considered. The BLM is only proposing to amend a subset of 2015 and 2019 GRSG RMP Amendment decisions that the BLM found were not sufficiently and appropriately addressed and that did not need to be updated based on new scientific information or changes in land use. The 2015 and 2019 travel and transportation management decisions were not identified as needing amendment.

As noted, the travel and transportation allocations of open, limited, and closed are not being addressed by this RMPA. Nor does the RMPA make any implementation level travel and transportation decisions and, as such, is not addressing any existing travel and transportation plans. However, changes in HMA boundaries in the alternatives and the Proposed RMP Amendment could potentially change areas where the 2015 and 2019 RMP Amendment allocations are applied. For example, an area that is currently open (and not designated as an open off-highway vehicle area) could become limited due to an area that was not previously identified as habitat (in 2015 or 2019) and is identified as either GHMA or PHMA in an alternative (including the Proposed RMP Amendment) in this RMPA. Areas that are identified as GHMA and PHMA follow the limited allocation and management direction identified in the 2015 and 2019 Amendments. The effects of the HMA boundaries on travel and transportation allocations, by state, are described in the Transportation and Travel Management sections in Appendix 10 and Chapter 4, and in Appendix 9, Tables 4-4 – 4-7.

Summary: The BLM should update and clarify the analysis on travel and transportation management, including how maintenance on existing roads would be considered, clarification of how RS2477 would be considered, and estimates of the number of GRSG vehicle collisions.

Response: BLM has revised language in the RMP Amendment and EIS affected environment and effects analysis for clarity including updates to sections 3.20 in Chapter 3 and 4.21.20 based on comments received.

Chapter 2, Table 2-1, Alternatives Considered but Not Analyzed in Detail explains why travel and recreation were not carried forward as issues for rangewide amendment (refer to comment response above). The BLM is not proposing to amend the 2015 GRSG RMP Amendment management direction for travel and transportation. The existing management direction that limits OHV use to existing roads in GHMA and PHMA remains in place. The effects of changes in HMA allocations across the alternatives and how that would change the manner of travel and transportation allocations has been added to the effects analysis in Chapter 4 and Appendix 10. The BLM's existing 2015 GRSG RMP Amendment management direction does not propose OHV closures and none are being proposed in this RMP Amendment. In the Draft RMPA/EIS Section 4.21.1 (Final EIS Appendix 10, Section 10.21.1 analyzes the potential for GRSG injury or mortality from vehicle collisions.

Summary: Road and transportation management in the RMPA is overly restrictive, not in compliance with several laws, and would have adverse effects on different types of developments.

Response: The BLM is not proposing to amend the 2015 GRSG RMP Amendment management direction for travel and transportation. The existing management direction that limits OHV use to existing roads in GHMA and PHMA remains in place. The effects of changes in HMA allocations across the alternatives and how that would change the manner of travel and transportation allocations has been added to the effects analysis in Chapter 4, Section 4.2 and Appendix 10, Section 10.2. The BLM's existing 2015 GRSG RMP Amendment management direction does not propose OHV closures and none are being proposed in this RMP Amendment. BLM's existing OHV management direction is fully compliant with existing laws, policies, and regulations. In the analysis the BLM recognizes that restrictions to major ROWs or other development could limit future creation of roads or ancillary facilities, however there is no proposal to close any current areas. There is nothing proposed that prohibits the maintenance of existing authorized roads.

Summary: The BLM should evaluate open OHV areas and unauthorized user-created routes to maintain recreation access.

Response: The BLM is not proposing to amend the 2015 GRSG RMP Amendment management direction for travel and transportation. The existing management direction that limits OHV use to existing roads in GHMA and PHMA remains in place. The effects of changes in HMA allocations across the alternatives and how that would change the manner of travel and transportation allocations has been added to the effects analysis in Chapter 4, Section 4.2, and Appendix 10, Section 10.2. The HMA allocations in Colorado, Idaho, Montana, and Wyoming would not change the OHV allocations currently in place under any of the alternatives, and, therefore, there are no anticipated effects by alternative and thus no effects are expected in those states (Refer to Appendix 9, Table 4-4).

In Nevada/California there is an increase in open areas when compared with the existing condition under Alternative 1 in all alternatives except Alternative 3, where there is a decrease in open areas (refer to Table 4-5 in Appendix 9). The increase in open areas is greatest under Alternative 4. Alternatives 5 and 6 both increase open areas by approximately two million acres (refer to Table 4-5 in Appendix 9). The fact that these areas are identified as open means they have moved from habitat to non-habitat, so there are no anticipated direct effects to GRSG or GRSG habitat by this increase in open areas and corresponding decrease in areas that are limited to existing routes. There could, however, be indirect effects to nearby habitat from potential increases in areas open to cross-country use.

In Oregon there is decrease in open areas and corresponding increase in limited areas from the existing acres in Alternative 1 in all of the alternatives except Alternative 2 (refer to Table 4-6). The largest decrease

in open areas occurs under Alternatives 5, 6, and the Proposed RMP Amendment with approximately 600,000 fewer acres identified as open. Under 4 and 5, there are approximately 500,000 fewer acres allocated as open. These decreases in open areas in what is identified as habitat under alternatives 3, 4, 5, 6, and the Proposed RMP Amendment would reduce impacts from cross country OHV use to GRSG and GRSG habitat from the potential noise and disturbance effects from cross-country travel. In Utah, like Oregon, there is a decrease in the amount of OHV areas that are open and a corresponding increase in areas that are limited as a result of changes in HMA allocations. The decrease in open areas is greatest under Alternative 3 followed by Alternative 4, and the Proposed RMP Amendment (refer to Table 4-7 in Appendix 9). These reductions in areas open to cross country OHV use would reduce negative impacts from noise and disturbance to GRSG and GRSG habitat.

22.2.41 Tribal Interests

Summary: The BLM should ensure that all relevant Tribes are engaged in the process, as they have previously requested inclusion in Sage-Grouse management efforts and have expressed concerns about the lack of consultation.

Response: Tribal consultation efforts are described in Section 5.2.1 of the Final EIS. As stated there, the BLM contacted Tribes in a variety of methods, twice mailing letters to 53 Federally recognized Tribes within or with cultural interest in the planning area notifying them of the effort. These letters provided a summary of the project and invited them to participation in government-to-government consultation and to be cooperating agencies in the planning effort. Subsequent outreach continued through emails, phone calls, and meetings with Tribal personnel, as they have expressed interest. Through these efforts, the BLM has and will continue to invite formal consultation on this process with interested Tribes. On September 4, 2024, the BLM held an online information session for Tribal governments to provide an update on the development of the Proposed RMPA/Final EIS.

In Colorado, the Ute Indian Tribe of the Uintah and Ouray Reservation expressed an interest in formal, government-to-government consultation and it was held during biannual consultation meetings in April 2023, August 2023, and April 2024. The Ute Mountain Ute Tribe was also present at these consultation meetings. In Nevada, formal, government-to-government consultation occurred with the following Tribes: Battle Mountain Band of the Te-Moak Tribe, Duckwater Shoshone Tribe, Lovelock Paiute Tribe, Modoc Nation, Reno-Sparks Indian Colony, Summit Lake Paiute Tribe, Timbisha Shoshone Tribe, Walker River Paiute Tribe, Yerington Paiute Tribe, and the Yomba Shoshone Tribe. In the other participating states, no formal, government-to-government consultation was requested.

Summary: The BLM should select Alternative 5, as it aligns with tribal land management goals and policies by balancing GRSG conservation with other land uses, including energy development.

Response: As described in Chapter 2, the BLM considered a reasonable range of alternatives for GRSG conservation during the planning process in full compliance with NEPA. The BLM analyzed six alternatives in detail in the Draft RMPA/EIS and identified Alternative 5 as the preferred alternative. In the Proposed RMP Amendment/Final EIS, the BLM has developed a seventh alternative, the Proposed RMP Amendment that draws on management direction from several of the alternatives analyzed in the Draft EIS including Alternative 5. As stated in Chapter 1, Section 1.6, the BLM will comply with all applicable laws and regulations, including Secretarial Order 3206. The BLM will continue to work collaboratively with Tribes as the RMPA is implemented.

Summary: The BLM should consider the suggested edits to the Tribal Interests section, such as adding Alternative 6 impacts and clarification that residential development does not occur on BLM administered lands.

Response: BLM has revised language in the RMP Amendment and EIS for clarity including updates to Appendix 10, Section 10.17 and Chapter 4, Section 4.21.17 based on comments received.

22.2.42 Vegetation

Summary: The BLM should incorporate and analyze conifer removal and incorporate more recent research about the effects of conifer encroachment.

Response: Vegetation treatments, including juniper removal, are not proposed rangewide in this RMPA/EIS. Chapter 2, Table 2-1, Alternatives Considered but Not Analyzed in Detail describes why vegetation management is not analyzed in detail during this RMPA. The 2015 GRSG RMPA included substantial vegetation/habitat management strategies in GRSG habitat. This included documentation before using sagebrush reduction treatment types and prescribed fire. Where pinyon/juniper encroachment is a concern management actions focused where treatments should be prioritized. Existing management also includes the critical need to coordinate treatments with partners, incorporate GRSG habitat objectives in monitoring treatments, and considers an array of treatment types to achieve GRSG habitat objectives, including the ability to consider the use of targeted livestock grazing. These actions were presented in the context of managing for GSRG habitat considering biological and ecological resistance and resilience when planning and applying treatments.

Because the 2015 management actions provided these sideboards, considerations, and desired conditions, few, if any changes to these actions were made in the 2019 RMPA effort. Similarly, after reviewing existing management actions, in context of new science, existing RMP management actions for vegetation/habitat management strategies are sufficient, and no changes need to be considered. The BLM is only proposing to amend a subset of 2015 and 2019 GRSG RMP Amendment decisions that the BLM found were not sufficiently and appropriately addressed and that did not need to be updated based on new scientific information or changes in land use. The 2015 and 2019 vegetation/habitat management decisions were not identified as needing amendment.

Summary: The BLM should consider provided GRSG data and management actions for vegetation treatments, including addressing site-specific potential and conditions when conducting vegetation treatments.

Response: Site-specific potential and conditions will be incorporated as decisions are implemented on a project-by-project or site-level basis. Please note that implementation level decisions - such as specific vegetation treatments for specific areas - are not part of this land use planning process. The 2015 GRSG RMPA included substantial vegetation/habitat management strategies in GRSG habitat. This included documentation before using sagebrush reduction treatment types and prescribed fire. Where pinyon/juniper encroachment is a concern management actions focused where treatments should be prioritized. Existing management also includes the critical need to coordinate treatments with partners, incorporate GRSG habitat objectives in monitoring treatments, and considers an array of treatment types to achieve GRSG habitat objectives, including the ability to consider the use of targeted livestock grazing. These actions were presented in the context of managing for GSRG habitat considering biological and ecological resistance and resilience when planning and applying treatments.

Because the 2015 management actions provided these sideboards, considerations, and desired conditions, few, if any changes to these actions were made in the 2019 RMPA effort. Similarly, after reviewing existing management actions, in context of new science, existing RMP management actions for vegetation/habitat management strategies are sufficient, and no changes need to be considered.

Summary: The EIS should incorporate citations and language changes related to vegetation impacts, including specific sub-species of big sagebrush and 3-tip sagebrush, and addition of ecological site descriptions, and associated state and transition models.

Response: Commenters asked for additional detail that is either not relevant to the current proposed management or not needed to make an informed plan-level decision. Such detail may be more appropriate for site-scale planning and decisions. Vegetation management wouldn't be restricted under Alternative 3. Vegetation management has been brought forward from the 2015 plans. Cheatgrass and other non-native invasive annual grasses are analyzed in Chapters 3 and 4 for GRSG, Vegetation, Wildland Fire Ecology and Management, Special Status Species, and Soil Resources. The BLM did make several revisions to Sections 4.3 and 4.21 of the EIS based on suggestions from commenters.

The DEIS is clear that GRSG are considered a sagebrush ecosystem-obligate species; they rely on sagebrush on a landscape level and on a micro-habitat scale for their survival. Throughout the document, Sagebrush ecosystems are described as comprised of sagebrush–steppe and Great Basin sagebrush which contain various plant species composition. And that GRSG distribution is strongly correlated with the distribution of sagebrush habitats (Schroeder et al. 2004; Connelly et al. 2011b; Doherty et al. 2016), especially with big sagebrush (e.g., Wyoming big sagebrush, mountain big sagebrush, and basin big sagebrush) (Braun et al. 1976; Connelly et al. 2000; Connelly et al. 2004; Miller et al. 2011). The DEIS does not list every plant species or subspecies which GRSG may use throughout its range or lifetime.

The Ecological Site Descriptions (ESDs) do not inform whether vegetation conditions are providing for GRSG needs. As described in the benchmarks and indicators appendix, ESDs and State and Transition Models s should help inform whether an area is capable of providing certain vegetation conditions, but not if the present conditions are providing for GRSG habitat needs.

Summary: The EIS should provide additional information about special status vegetation.

Response: Special status species are analyzed in the DEIS in Chapter 3, Section 3.6 and Chapter 4.6 and in the Proposed RMP Amendment/Final EIS in Appendix 10, Section 10.6 and Chapter 4, Section 4.6. Categories of special status species are the following:

- Federally listed threatened and endangered species and designated critical habitats
- Federally proposed species and proposed critical habitats
- Federal candidate species
- BLM sensitive species

The full list of all species included above can be found in Appendix 11 of the Draft RMPA/EIS and Proposed RMP Amendment/Final EIS.

Summary: The BLM should propose noxious weed management as a part of this process.

Response: Chapter 2, Table 2-1, Alternatives Considered but Not Analyzed in Detail addresses why these management actions are not addressed in this RMPA. Reviewing existing wildland fire and invasive species

RMP management action shows existing wildland fire and invasive species management action are sufficient for RMP-level decision-making, and no changes need to be considered.

While changes to existing wildland and invasive species management actions will not be considered, changes to other management actions will be considered based on the threats from wildland fire and invasive species. Management actions that could limit the potential for ignition sources or the prevalence of or spread of fine fuels and invasives that contribute to uncharacteristically large and intense wildfires will be considered. The effect of wildland fire on GRSG habitat quantity and quality will also be considered when evaluating habitat management areas. This includes the potential for habitat management areas to be durable in the face of changing conditions associated with climate change. The potential effects of the alternatives on the number, size and intensity of wildfires and the spread of invasive species and their impacts on GRSG habitat quality and quantity are considered in this EIS in Chapter 4 and Appendix 10.

Required design features for invasive weeds remain in place from existing 2015 and 2019 GRSG RMP Amendments Invasive species management is an implementation-level topic for the purposes of this RMPA/EIS process. Specific treatment techniques, target species, and restoration seed-mixes may vary across the range and would depend on local conditions and would be analyzed in a site-specific proposal.

Summary: BLM should establish range-wide requirements associated with vegetation and restoration plan components

Response: Chapter 2, Table 2-1, Alternatives Considered but Not Analyzed in Detail addresses why these management actions are not addressed in this RMPA. Refer to comment summary and response above.

Summary: The BLM should revise the BMP language in Appendix 15 language pertaining to implementation of livestock grazing rest periods for an undefined amount of time after vegetation treatments.

Response: For the Best Management Practice being referenced, the recommendation is not to rest areas for an undefined amount of time. The areas in question should be rested from livestock grazing until resource monitoring data verifies the treatment objectives specific to the purposes of the treatment are being met and an appropriate grazing regime has been developed.

Summary: The BLM should refine percent utilization to be determined by site condition, time of use, etc. rather than by species dominant habitat parameters. For example, it is a gross misjudgment to say that all Wyoming Basin big sage habitat only has an allowable percent utilization of 35% when some Wyoming Basin big stage stands pose the greatest wildfire risk and should be utilized more than 35% to mitigate that risk.

Response: While it is not clear what specifically the commenter is pointing to - a search of the Draft RMPA/EIS shows that the only reference to 35% utilization of Wyoming Basin big sage is in Appendix 2 - Section 2.12 which outlines Existing GRSG RMP Management in Nevada and Northeastern California. These references are pointing to current management decisions from the 2015 and 2019 GRSG RMP Amendments. By contrast, the associated Management Action in the current ARMP/EIS process is Management Action RM-2 which is described in the DEIS Draft Alternatives Table 2-12 and does not include specific utilization percentages. Instead, it outlines that the BLM should use criteria identified in the Sage-Grouse Habitat Assessment Framework and other BLM approved methodology to provide multiple lines of evidence for determining whether vegetation structure, condition, and composition are meeting or making significant progress towards meeting the Land Health Standards, referencing the appropriate ecological site description, associated State and Transition Model and existing ecological condition information.

22.2.43 Water Resources

Summary: The BLM should revise the discussion of existing conditions and impacts on water quality, such as the effects from woody invasive plants, impacts from non-motorized recreation, the potential to shift surface disturbance and associated impacts on water resources from BLM lands to state, tribal or private lands. In addition, the BLM should acknowledge that states manage water rights.

Response: As described under Best Available Information and Baseline Data, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

The BLM made several changes to Chapter 3, Sections 3.15, Appendix 10, Sections 10.15, and 10.21 in the Final EIS, including acknowledging additional sources of degradation and impacts and the potential to push impacts off BLM lands to other lands.

The BLM complies with state water law to the extent it does not conflict with federal law and honors existing water rights. The details for implementing water related design features will be made during implementation. The Proposed RMP Amendment/Final EIS Section 3.15.1 states: "States issue water rights for various beneficial uses for both groundwater and surface water. ... The BLM authorizes development of water-related infrastructure, such as ROWs, on BLM-administered lands, enabling applicants to apply water to beneficial use." Adjudicated RS2339 are considered valid existing rights.

22.2.44 Wild Horse and Burro Management

Summary: BLM should follow the 1971 Wild, Free-Roaming Horses and Burros Act.

Response: The BLM complied with all applicable laws in developing this Proposed RMP Amendment, including the Wild, Free-Roaming Horses and Burros Act of 1971.

Summary: The BLM should address identified issues with the analysis of GRSG interactions with wild horses and burros (WH&B) and provide additional science.

Response: The Draft RMPA/EEIS provides a range of WH&B management alternatives for analysis. The BLM strives to manage WH&B populations within AML because we are required to do so by the Wild Free-roaming Horses and Burros Act and by federal regulations. As analyzed in the EIS, wild horse presence, particularly when herds are at levels greater than appropriate management levels, can lead to impacts on the quality of GRSG habitat, and GRSG behavior and population demography. The types of effects that different large herbivores can have on rangeland ecosystems can be similar, even while the specific magnitude and spatial distribution of those effects may vary from species to species. The analysis did not in any way state that wild horses ana burros are the sole source of impacts to GRSG, nor did the analysis conclude that all such impacts are identical across all large herbivores. Reducing the magnitude of any of the uses or resources that impact GRSG has the potential to reduce the negative impacts.

The BLM utilized the best available science to analyze the impacts of WH&B populations on GRSG habitat - including research that documented overall reduction in time spent by other wild species at water sources where wild horses were present (Perry et al. 2015, Hall et al 2016); evidence that wild horses can cause behavioral disruptions to GRSG (Muñoz et al. 2020); and scientific summaries of effects such as wild horse influences on vegetation, water quality, and riparian areas (i.e., Beever and Aldridge 2011, Crist et al. 2019). One could speculate about what factors do or do not lead wild horses to limit water access for wildlife species (i.e., overall levels of water availability in the landscape), but such speculation does not mean that this type of negative interaction does not exist. Wild horses do have the capacity to travel long distances in

between watering, as noted in Crist et al. (2019). However, that does not mean that the impacts to riparian areas (or any other vicinity of water sources) are negligible. Such effects can reasonably be expected to increase at least in proportion to herd size.

Summary: There is not scientific evidence showing that wild horses and burros affect GRSG. The EIS overstates the adverse effects of wild horses and burros on GRSG and should acknowledge the beneficial effects. Wild horses and burros have legal protections and thus an alternative that removes them is not valid.

Response: As described under Best Available Information and Baseline Data, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

The DEIS provides a range of WH&B management alternatives for analysis. As analyzed in the EIS, wild horse presence, particularly when herds are at levels greater than appropriate management levels, can lead to impacts on the quality of GRSG habitat (i.e., Beever and Aldridge 2011), is associated with changes in GRSG behaviors (i.e., Muñoz et al. 2020), and can cause GRSG population-level declines (i.e., Coates et al 2021). Conversely, the BLM is not aware of any credible studies that have documented improved GRSG demographic rates as a function of increasing wild horse presence. The types of effects that different large herbivores can have on rangeland ecosystems can be similar, even while the specific magnitude and spatial distribution of those effects may vary from species to species. The analysis did not state that wild horses and burros are the sole source of impacts to GRSG, nor did the analysis conclude that all such impacts are identical across all large herbivores. Reducing any of the uses or resources that impact GRSG has the potential to reduce the negative impacts.

The BLM protects, manages, and controls wild horses in accordance with the Wild, Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), which requires the agency to "manage wild, free-roaming horses and burros in a manner that is designed to achieve and maintain a thriving natural ecological balance on the public lands." FLPMA further directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. Along with the Public Range Improvement Act (PRIA) of 1978, these laws allow for the reduction of wild horses and burros on BLM-administered lands, when appropriate. Regulatory and policy guidance to BLM management of wild horses and burros is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros, and BLM Handbook H-4700-1, Wild Horses and Burros Management Handbook.

Summary: The BLM should change management of wild horses and burros within GRSG habitat. How will the BLM implement the changes proposed in the RMPA/EIS? The BLM should acknowledge the applicable laws and regulations.

Response: As defined in the BLM's Land Use Planning Handbook (H-1601), BLM makes two types of decisions, Land Use Plan-level decisions, which establish desired outcomes and actions needed to achieve them, reached using the planning process in 43 CFR 1600, and implementation-level decisions, which are decisions that take action to implement land use plan decisions. No implementation-level decisions are under consideration as part of the RMP Amendment effort.

This comment pertains to an implementation-level decision and is therefore outside the scope of the RMP Amendment and EIS, such as designating ranges that contain both wild horses and burros and PHMA for sage grouse as "Wild Horse and/or Burro Ranges", revisiting the scientific basis for AMLs, developing local

drought contingency plans, and prioritizing horse removals focused on critical Sage grouse habitat. Details regarding implementation are not plan-level decisions. No change has been made.

Summary: The EIS should clarify impacts on and from wild horses and burros and acknowledge additional impacts caused by wild horses and burros, including how the BLM plans to provide water for free-roaming horses and burros.

Response: The BLM has revised language in the RMP Amendment and EIS for clarity, incorporating several suggestions from commenters. The Draft RMPA/EIS Section 3.7 does not say that that the Wild and Free-Roaming Horses Act of 1971, as amended by FLPMA and the Public Range Land Improvement, requires that BLM provide water for free-roaming horses and burros. The section states, "The BLM periodically evaluates each HA to determine if it has adequate food, water, cover, and space to sustain healthy and diverse wild horse and burro populations over the long-term. The BLM may designate an appropriate management level (AML) and specifies an allowable range in horse numbers for each WHB HMA based upon available forage and other resources necessary to sustain the horse or burro populations, as well as resource objectives and other designated uses of the BLM-administered lands."

Summary: The EIS should include an appendix for wild horse and burro management.

Response: An appendix for wild horse and burro management was determined unnecessary since the changes and rationale could be succinctly incorporated into Chapter 2 of the Draft RMPA/EIS. A livestock grazing appendix was needed to further explain the changes and management and this language could not fit in the body of the RMPA/EIS without exceeding page limitations.

Summary: Use of the GonaCon-Equine vaccine is not safe.

Response: This comment pertains to an implementation-level decision and is therefore outside the scope of this RMPA/EIS. The EIS does not propose any decisions regarding the use of the GonaCon-Equine vaccine. No change has been made.

Summary: A recent court decision may affect the BLM's ability to conduct wild horse and burro gathers.

Response: Wild horse gathers are an implementation decision and outside the scope of this land use planning process. The BLM will comply with applicable laws, policies, and court rulings regarding wild horse and burro gathers.

Summary: The BLM should consider alternative recommendations to manage effects on GRSG from wild horses and burros.

Response: NEPA directs the BLM to analyze a range of reasonable alternatives for management, based on the Purpose and Need, as outlined in Chapter 2, sections 2.1- 2.5. As noted, the preferred alternative in the Draft EIS was Alternative 5, but that is not the BLM's final decision about management of BLM lands. BLM retains the discretion to make a reasoned choice among the alternatives in a final decision for management based on public comments and the analysis. Furthermore, BLM considered alternatives and issues during scoping that the agency determined not to carry forward, as detailed in Section 2.3.

Some wild horse and burro management would be carried forward from the 2015 ARMPAs (see Appendix 2 of the RMPA/EIS). Further, the BLM has additional tools for wild horse and burro management outside of land use plan direction. As such, the alternatives in this EIS would adequately address impacts to GRSG from wild horses and burros.

22.2.45 Wildland Fire Ecology and Management

Summary: The alternatives do not address the threat of wildfire.

Response: The 2015 GRSG ARMPAs addressed wildfire management and collaboration to address that important issue. Those actions have not been changed through previous efforts or this RMPA and thus they would continue to be implemented regardless of which alternative is chosen in this RMPA.

Summary: The analysis mischaracterizes the magnitude of the threat of wildland fire on GRSG.

Response: The BLM has clarified the role of fire as suggested by several commenters. As noted in the previous comment response, the BLM's management of fire in GRSG habitats was addressed in the 2015 ARMPAs and remains unchanged.

Summary: The EIS lacks mention of fire and fuels management actions retained from 2015 and 2019 plans.

Response: Appendix 2 in the Draft RMPA/EIS lists the management actions from the 2015 and 2019 plans that would remain unchanged through this RMPA.

Summary: The BLM should reference litigation regarding efforts to establish fuel and fire breaks across the west.

Response: The EIS references existing considerations for fuels management within the planning area. Consideration of pending litigation is outside the scope of this analysis and a decision has not been issued in the referenced litigation, thus the BLM has not considered the litigation in the EIS. The BLM will comply with applicable laws, policies, and court rulings regarding fuels management.

22.3 STATE-SPECIFIC COMMENT RESPONSES

22.3.1 Idaho

Summary: The BLM should update and clarify the analysis, including how the BLM would address developed agriculture, a key driver of Idaho's economy.

Response: Several commenters' concerns have been addressed with the Proposed RMP Amendment under Idaho-Additional Management Direction. Since agriculture does not occur on BLM-administered lands, direct impacts on agriculture are not analyzed in the EIS. However, some socioeconomic impacts on the agricultural sector are described in Appendix 10, Section 10.12, Social and Economic Conditions (Including Environmental Justice) and Appendix 18. Impacts on environmental justice are described in Section 10.12, Social and Economic Conditions (Including Environmental Justice) and in Chapter 4, Section 4.12.

Summary: The BLM should exclude Caldwell Canyon Mine from conservation measures.

Response: In the Proposed RMPA/Final EIS Section 1.9 was added, which details how the BLM anticipates applying this RMPA to ongoing actions. To maintain the orderly administration and management of the public lands, the BLM will be consistent with the GRSG Approved Plan RMP Amendments RODs unless the BLM issues a Draft EIS or Environmental Assessment for the project before the publication of the GRSG Approved RMP Amendments RODs. In addition, Section 1.9 of the Proposed RMP Amendment/Final EIS includes a list of projects that will not be subject to the decisions made in the GRSG Approved RMP Amendment RODs. This list includes Caldwell Canyon Revised Mine and Reclamation Plan (DOI-BLM-I000-2024-00041-EIS).

Summary: The BLM should issue a standalone management decision for PHMA, IHMA, and GHMA to be open to free use permitting for road-maintenance related sand and gravel pits.

Response: BLM Idaho has considered this carefully and discussed on multiple occasions with BLM Idaho leadership, State of Idaho, and other Cooperating Agencies. The Proposed RMP Amendment incorporates some of these suggestions (or slightly modified) under the previous MD MR 11. There will not be a separate MD for this but under Saleable Minerals.

Summary: An exception should be provided to allow for new and expansion of free use permits in IHMA.

Response: BLM Idaho has been working closely with the State of Idaho and other cooperating agencies to clarify this language in the Proposed RMP Amendment.

Summary: Additional information should be provided for readers to understand how protective lek buffers in Idaho would be applied if the lek itself is not on BLM administered lands.

Response: Even if a lek is not on BLM lands, there is a chance that the associated buffer could be. Whether a lek is on BLM land or not, a buffer would be applied to active and pending active leks within HMA (regardless of land ownership). Therefore, if a buffer or part of a buffer falls on BLM lands, BLM management would apply within the buffer on BLM lands.

Summary: The BLM should recognize the importance of agriculture to Idaho's economy, culture, and identity.

Response: The BLM has discussed impacts on agriculture in Section 4.12, Social and Economic Conditions.

22.3.2 Montana

Summary: Limit or prohibit fluid mineral leasing and development in the Upper Missouri Headwaters.

Response: Sage-Grouse HMAs in the Upper Missouri Headwaters in Southwest Montana would be closed to fluid mineral leasing under Alternatives 3, and PHMA would be subject to a NSO stipulation in Alternative 4, 5, 6, and the Proposed RMP Amendment (along with other limitations on development). The GRSG Plan amendment does not cover all of the BLM identified Missouri Headwaters Restoration Landscape and addressing leasing for the whole area would be outside the scope of the analysis.

Summary: Previous efforts in Montana determined that ACECs were not required to protect GRSG habitat.

Response: As described under ACECs and RNAs, the BLM has evaluated ACECs as described in Appendix 5, Areas of Critical Environmental Concern for Greater Sage-grouse Habitat. Potential ACECs were evaluated for designation in Alternative 3 and 6if they met both the relevance and importance criteria described in 43 CFR 1610.7-2 and BLM Manual 1613. In order to be designated as an ACEC, special management must be necessary to protect and prevent irreparable damage to those values. The Proposed RMP Amendment does not propose to designate any ACECs.

Summary: The BLM should include additional areas as HMAs in Montana or adjust the designations of specific areas.

Response: The BLM has reviewed the HMAs considered under the alternatives in the Draft RMPA/EIS. HMAs have been revised in coordination with Montana Fish Wildlife and Parks (MTFWP), Montana Sage

Grouse Habitat Conservation Program, and other cooperating agencies to capture key limiting and important habitats for GRSG. In addition to PHMA and GHMA in the Montana/Dakotas, the following HMAs have been identified in the Montana/Dakotas and are described in detail in Chapter 2, Table 2-3:

Unique HMAs: Areas identified that need different objectives or management to address unique challenges. These include three areas:

- **Little Missouri HMA**: Identified core area by the states of Montana and North Dakota. This area contained high-quality GRSG habitat in Montana and encompasses the remaining GRSG habitat in North Dakota.
- **South Carter HMA:** Identified core area by the state of Montana. However, this area is primarily developed or existing bentonite claims. Unique management is needed to balance GRSG habitat and mineral development, in the short term, while planning for longer-term reclamation.
- **Connectivity HMA**: Areas that provide regions of connectivity important to facilitate the movement of GRSG and maintain ecological processes, including between priority populations, adjacent states, and across international borders, including but not limited to Montana Connectivity areas.

The Carter-Crook area is designated as PHMA and will receive the associated management direction and allocations for PHMA described in Chapter 2, Table 2-5. Due to existing development and valid existing rights the BLM is unable to apply any additional restrictions, but we commit to working with project proponents on any new proposals to conserve the connectivity, and to restore habitats in that area as possible.

Summary: Alternative 5 ROW restrictions for major and minor ROWs would be more restrictive in Montana than in other states.

Response: As described under Range of Alternatives, the BLM considered the management opportunities presented in the planning issues and criteria developed during the scoping process to determine a range of alternatives. Differing management would be applied under each alternative, with some alternatives being less restrictive to ROWs than other alternatives. What is included in the Proposed RMP Amendment for Lands and Realty management actions is consistent with the State of Montana requirements.

22.3.3 Nevada/California

Summary: There are potential conflicts in Nevada between the location of proposed ACECs and existing and potential mining projects.

Response: ACEC management identified in the DEIS does not prevent or preclude current or future mining projects. ACEC boundary delineations can include consideration of active or future disturbances, which can increase the importance of surrounding non-disturbed habitat. The Proposed RMP Amendment does not propose to designate any ACECs.

Summary: The Nevada Conservation Credit System (CCS) is inadequate and does not account for or mitigate many of the impacts on GRSG.

Response: The BLM does not administer the CCS. The EIS acknowledges in the cumulative impacts section (Section 4.21 of the Draft RMPA/EIS) that the CCS is another mitigation tool applied by the state which may reduce impacts on certain resources. The BLM will continue working with the state and counties to the

extent possible and appropriate as projects are proposed. The Proposed RMP Amendment does not propose to designate any ACECs.

Summary: The BLM should have consulted with the Nevada Sagebrush Ecosystem Council (SEC) as a part of the RMPA/EIS process.

Response: The Sagebrush Ecosystem Council does not meet the regulatory definition of a cooperating agency. The Governor's initial executive order that created the SEC, includes that the committee "shall provide the Governor recommendations on policies and action" and does not have the jurisdiction by law to apply specific policies. The SEC is represented by the Nevada Department of Conservation and Natural Resources, which is a Cooperating Agency. Nonetheless, BLM coordinated with the SEC on specific topics included in the DEIS, such as habitat mapping, and provided presentations to the SEC regarding the DEIS and soliciting review.

Summary: The BLM should publish a supplemental EIS for Nevada because of the changes in habitat data.

Response: As described in DEIS Appendix 3 Section 3.4, the BLM anticipated using the updated data in the development of the Proposed RMPA/Final EIS.

"In late 2022, the BLM worked with the USGS and other state, local, and federal partners to begin updating the 2016 HMA model. This update is consistent with the approach from the previous two efforts while also incorporating new data and information related to habitat selection and space use. It also includes survival rates during reproductive life stages and specific seasons (e.g., brood-rearing or winter) and identifies corridors that link seasonal habitats. This update allows areas of high importance to current population dynamics (i.e., source areas) to be mapped. The final version of the USGS HMA model was not published in time for inclusion in the BLM's 2024 Draft EIS. However, USGS provided BLM with unpublished results for use in preparing the Draft EIS range of alternatives and impact analyses. This ensured that the BLM was using the best science available at the time."

USGS published their report with the final model on March 22, 2024, and that data have been incorporated into the Proposed RMP Amendment/Final EIS. The acres from the final USGS model fall within the range of HMA acres analyzed across the alternatives in the DEIS. Updating HMAs with the now-published USGS data resulted in some areas becoming HMA that were not analyzed as such in the Draft RMPA/EIS. This is limited to 41,936 acres of PHMA (0.24% of PHMA identified on NV/CA BLM-administered lands only), 233,840 acres of GHMA (1.35%), and 1,142,018 acres of OHMA (6.58%). These changes reflect consideration and application of new GRSG information based on data received since publication of the Draft RMPA/EIS.

The BLM has determined that this updated information does not constitute a substantial change to the alternatives or the environmental effects analysis.

22.3.4 Oregon

Summary: The BLM should include an alternative that includes the following Oregon ACEC nominations received during either scoping or the comment period on the Draft EIS:

- All areas within PHMA
- McDermitt Caldera
- Firestone Basin
- Ibex Butte
- Packsaddle Draw-Horseshoe Ridge

- Coyote Hills
- Irish Hill-Big Lake
- Catlow Valley
- Beatys Butte
- Riddle Creek
- West Steens
- Grassy Ridge
- Oregon Canyon Mountains
- Hog Creek Ridge
- Star Mountain
- Louse Canyon
- Table Mountain
- Juniper Ridge
- aa-Tiipi Flat

The BLM should also include an alternative that includes nominations for ACECs in Oregon previously evaluated in the 2015 Oregon RMP Amendment:

- Willow
- Virtue Flat
- Trout Creek
- Star Mountain
- Red Hills
- Lone Mountain
- Jackass
- Goose
- Frederick Butte
- East Warner
- Diable Peak
- Cow Creek
- Corner
- Buck Creek
- Beatys Butte
- Antelope
- Abert Rim

Response: The BLM reviewed all of the nominations received during the scoping and during the Draft EIS comment period The BLM considered areas identified as PHMA in Oregon as well as previously identified Oregon Sagebrush Focal Areas and Priority Areas of Conservation in order to determine if any areas within Oregon that were either newly nominated or previously nominated and evaluated in the 2015 RMP Amendment met the relevance and importance criteria. BLM Oregon's ACEC review, assessment, and evaluation process focused on the new GRSG scientific information on key population (e.g., Doherty et al. 2016, Coates et al., 2021), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al.,

2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021) and coordinated with state authorities (such as wildlife agencies) to identify and update GRSG habitat management areas (HMA).

The BLM Oregon assessment considered all existing, designated ACECs and Research Natural Areas when located in PHMA (existing and new/proposed). This 2023 BLM Oregon review and assessment of all PHMA/PACs also included many of the proposed, analyzed, and not-designated ACEC areas from the 2014/2015 EIS alternatives (when located in existing or new PHMA and assessing based only on the new science information). During the assessment process BLM Oregon discussed and coordinated cross border issues and locations with the BLM Nevada and BLM Idaho. The BLM Oregon also discussed potential ACEC locations/areas using populations and habitat criteria with the Oregon Department of Fish and Wildlife during the assessment process. The BLM Oregon ACEC review, assessment, and evaluation process did not consider or consider in detail potential historic, cultural, scenic, or non-GRSG fish and wildlife values in accordance with the purpose and need for this planning effort. Nominations that addressed resource values beyond GRSG will be considered by the BLM during future planning efforts pursuant to 43 CFR 1610.7-2.

The BLM Oregon assessment process for all PHMA (existing and proposed) in Oregon resulted in identification of two areas as potentially meeting the relevance and importance criteria. After evaluating the two areas, the team concluded that both areas (Louse Canyon and Soldier Creek) met the relevance criteria for fish and wildlife resource (specific to GRSG and the new science), but that neither area met the importance criteria (more than locally significant). Because none of the nominated areas were identified as having relevance and importance, the BLM did not identify any of the nominated ACECs in Oregon as potential ACECs in the Draft EIS.

Summary: The BLM should keep ungrazed Key RNAs, exclosures, or rest pastures as reference areas to monitor the impacts of livestock grazing on GRSG and to facilitate habitat restoration. Additionally, grazing should not be allowed in areas previously designated as an ACEC since no justification for the removal of the ACEC designation has been provided by the BLM.

Response: As described in Appendix 17, the 2015 Oregon GRSG ARMPA allocated all or portions of 13 Key RNAs in Oregon as unavailable to livestock grazing. The 2019 RMPA reversed that decision and made all or portions of those 13 Key RNAs available to livestock grazing. These decisions affected approximately 22,000 acres within 13 existing, district designated, RNAs. The 2019 RMPA was and remains enjoined by the United States District Court for the District of Idaho and the 2015 ARMPA decision for these 13 Key RNAs remains in effect. In addition, two existing RNAs were designated as Key RNAs in the 2015 planning process. However, these two additional Key RNAs were previously excluded from livestock grazing and neither the 2015 nor 2019 RMP amendment processes proposed changing these underlying district-level land use plan decisions. Both the Foster Flat Key RNA in the Burns District and Guano Creek-Sink Lakes Key RNA in the Lakeview District were, and will remain, allocated as unavailable for livestock grazing. In addition, under the Proposed RMP Amendment, all or portions of the following Key RNAs would be unavailable for livestock grazing: East Fork Trout Creek (Burns District); Fish Creek Rim (Lakeview District); Foley Lake (Lakeview District); Lake Ridge (Vale District); Mahogany Ridge (Vale District); Rahilly-Gravelly (Lakeview District); South Bull Canyon (Vale District); and Toppin Creek Butte (Vale District). On BLM grazing allotments, grazing activities are managed through several mechanisms (permit terms and conditions, allotment management plans, annual pre-turnout authorization meetings, and ongoing monitoring) to ensure that grazing meets or move towards meeting Land Health Standards. Management for meeting land health standards avoids long-term and wide-spread improper grazing. In addition, the Proposed RMP Amendment/Final EIS includes three new 5-acre or less grazing exclosures that would remove livestock use

and other permitted activities to allow for nonmanipulative research and baseline data gathering within or in proximity to the North Ridge Bully Creek, South Ridge Bully Creek, and Spring Mountain key RNAs to acts as ungrazed comparison areas for evaluating effects of livestock on those vegetative communities identified as important for GRSG. This RMP Amendment does not remove nor discourage BLM districts from constructing exclosures, rest pastures, etc. for the purposes of allowing and managing for reference sites.

There is no law, policy, or regulation that prohibits grazing within ACECs or RNAs.

Summary: The BLM should publish a supplemental EIS for Oregon because of the changes in habitat data.

Response: As described in Draft RMPA/EIS Appendix 3 Section 3.5, the BLM anticipated using the updated data in the development of the Proposed RMPA/Final EIS and we did so. Oregon BLM uses the final ODFW habitat designation for PHMA and GHMA in the action alternatives and the Proposed RMP Amendment in the Proposed RMPA/Final EIS. The range of variance between the acres identified between the Draft EIS and the Final EIS were within the range of alternatives analyzed in the Draft EIS. The BLM has determined that this updated information does not constitute a substantial change to the alternatives or the environmental effects analysis.

22.3.5 Wyoming

Summary: Wyoming should be exempt from the 3% disturbance cap.

Response: The preferred alternative and Proposed RMP Amendment include a 5% disturbance cap at the project scale (equivalent to the DDCT assessment area) in Wyoming. Agriculture and fire are included in the calculation of disturbance at the project scale. The disturbance cap is 3% in PHMA at the HAF fine scale in Wyoming, but the calculation of disturbance at this scale does not include agriculture or fire. There is a provision in the Proposed RMP Amendment for addressing situations where the disturbance cap is reached at one scale but not the other.

GRSG are sensitive to increasing levels of anthropogenic disturbance. Recent studies indicate that GRSG will move out of an area when it reaches the 3% threshold (Kirol et al., 2020). Additionally, Knick identified a relationship between disturbance and leks being abandoned. The BLM does appreciate the concern identified, but if disturbance results in loss of greater than 3% of the functional habitat at the broad HAF fine scale, habitat function for GRSG in the area may be lost, and thus it may be difficult for BLM management to be responsive to changing land uses, improve efficiency and effectiveness of GRSG habitat management, provide for consistent conservation across state lines, and provide the BLM with regionally relevant decisions that accord with range-wide GRSG conservation goals.

The DEIS analyzes a range of alternatives for the disturbance cap process. The preferred alternative outlines the relationship between the disturbance cap at the project scale and the HAF Fine Scale habitat selection in Table 2-7.

Summary: The BLM did not evaluate the State of Wyoming's alternative language submitted for adaptive management. TAWS is not appropriate to rely on for adaptive management. The BLM should modify its reliance on TAWS.

Response: The current language explicitly states the BLM will collaborate with the State wildlife agency should a threshold be met considering data and analyses provided by the state (in addition to other available population trend information). TAWS provides a consistent, objective and quantitative tool that allows

comparisons across political boundaries. As stated in the current language, when TAWS demonstrates a population anomaly the State wildlife agency and the BLM will work together to confirm the results of the TAWS. Further, the TAWS itself is not a decision point, but rather a data-driven mechanism to start a conversation with the State wildlife agencies about population status and potential anomalies.

Summary: A Wyoming-specific plan should be developed.

Response: One aim of the RMPA is to ensure consistent GRSG management across the species range. The BLM does not intend to apply the management in the RMPA as a one-size-fits-all approach, but instead includes flexibility throughout the management direction to allow appropriate application of GRSG protections based on State-specific and site-specific conditions.

Summary: The WOGCC, the BLM Wyoming State Office, and the BLM Reservoir Management Group examined methodologies and suggested improvements to the Reasonably Foreseeable Development Scenario methodology for Wyoming. BLM should incorporate these suggestions.

Response: BLM worked with the Wyoming Oil & Gas Conservation Commission (WOGCC) to update well information from Wyoming, and it is important to highlight the difference between the data sources, so the document will clarify that the WOGCC data are considered more accurate but also note that activities such as workovers, recompletions, and wells which were spud but then abandoned, may have some impact on GRSG from the preparation of the drills site and mobilization of the workover or drill rig. BLM will clarify data sources and information used in the final EIS.

22.4 SUBMITTED CORRESPONDENCE

As described in **Section 22.1**, **Table 22-4** provides a list of all publics who submitted comments on the Draft RMPA/EIS and the topics addressed in their correspondence.

Table 22-4. Correspondence Submitted on the Draft RMPA/EIS Containing Unique Content

Organization(s)/ Commentor(s)	Correspondence ID Number	Topic(s) Addressed in Correspondence

Appendix 23

Consistency with State and Local Land Use Plans

This page intentionally left blank.

Appendix 23. Consistency with State and Local Land Use Plans

As required in Section 202(9) of the FLPMA, as amended, and BLM's RMP regulations at 43 CFR 1610.3-2 BLM RMPs must be consistent with officially approved or adopted resource-related plans of other Federal, State, local, and Tribal governments and policies and programs contained therein, to the extent that they are consistent with the purposes, policies, and programs of Federal laws and regulations applicable to public lands. This appendix details known inconsistencies between the Proposed RMPA and Federal, State, local, and Tribal plans.

23.1 FEDERAL PLANS

23.1.1 U.S. Forest Service

In September 2015, the BLM and USFS signed three Records of Decision and Approved RMPA/Land Management Plan Amendments, which amended 98 BLM and USFS land use plans to include goals, objectives, and management allocations and actions for managing greater sage-grouse (GRSG) habitat on BLM-administered Public Lands and USFS lands in ten Western states (California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, and Wyoming) (BLM, 2015a and 2015b; USFS, 2015). The USFS has not amended this rangewide direction, so the September 2015 *Greater Sage-grouse Record of Decision for Idaho and Southwest Montana, Nevada, and Utah, and Land Management Plan Amendments for the Ashley National Forest, Beaverhead-Deerlodge National Forest, Boise National Forest, Caribou National Forest, Challis National Forest, Curlew National Grassland, Dixie National Forest, Fishlake National Forest, Humboldt National Forest, Manti-La Sal National Forest, Salmon National Forest, Sawtooth National Forest, Targhee National Forest, Toiyabe National Forest, Uinta National Forest, Wasatch-Cache National Forest* continues to guide management of USFS lands with GRSG habitat.

Since the Proposed RMPA includes targeted amendments to planning direction established in the coordinated planning effort in 2015, management direction will no longer be consistent across the two agencies. Most notably, BLM's updated alignment of habitat management area boundaries and targeted allocations and management direction identified in the Proposed RMPA is inconsistent with the USFS' September 2015 Land Management Plan Amendments.

23.2 STATE, LOCAL, AND TRIBAL PLANS

23.2.1 Colorado

The BLM has considered the following state and local plans related to management of greater sage-grouse and GRSG habitat in Colorado.

State Plans

- Colorado Greater Sage-Grouse Conservation Plan (CPW 2008a)
- Greater Sage Grouse Stewardship Action Plan (SAP) (State Land Board 2016, renewed 2020)
- Middle Park Greater Sage-Grouse Conservation Plan (CPW 2000)
- Northern Eagle and Southern Routt Greater Sage-Grouse Conservation Plan (CPW 2004)
- North Park Greater Sage-Grouse Conservation Plan (CPW 2001)
- Parachute-Piceance-Roan Plateau Conservation Plan (CPW 2008b) Greater Sage-Grouse
- Parachute-Piceance-Roan Plateau Greater Sage-Grouse Work Group (CPW 2008c)

County Land Use Plans

- Eagle County Comprehensive Plan (Eagle County 2005)
- Garfield County Comprehensive Plan 2030
- Garfield County Land Use and Development Code (Garfield County 2008, revised 2023)
- Garfield County Greater Sage-Grouse Conservation Plan (Garfield County, amended 2021)
- Grand County Master Plan (Grand County 2011)
- Jackson County Master Plan (Jackson County 1998)
- Larimer County Master Plan (Larimer County 1997)
- Mesa County Master Plan (Mesa County 2023)
- Moffat County Land Use Plan (Moffat County 2001)
- Rio Blanco Land and Natural Resources Plan and Policies (Rio Blanco County 2022)
- Routt County Master Plan (Routt County 2022)
- Summit County Countywide Comprehensive Plan (Summit County 2009)

Inconsistencies with State Plans, Policies, and Procedures

Colorado Greater Sage-Grouse Conservation Plan

In 2008, the State of Colorado published the Colorado Greater Sage-Grouse Conservation Plan (CCP) which built on local conservation plans developed by local working groups. The CCP contains voluntary management guidelines that may be applied across land ownerships and many land uses (Colorado Greater Sage-grouse Steering Committee, 2008). The CCP includes guidelines for managing conversion to agriculture, use of the Conservation Reserve Program, and other aspects beyond the BLM's jurisdiction. Implementation of the CCP guidelines is not mandatory.

In 2015, Colorado's governor issued Executive Order 2015-004 to strengthen the CCP. Under the order, the state oil and gas permitting agency would evaluate its existing wildlife siting rules for potential improvement and consult with Colorado Parks and Wildlife when considering actions that impact GRSG or GRSG habitat. The order also prioritized the completion of the Colorado Habitat Exchange, a voluntary compensatory mitigation program. The Colorado Habitat Exchange has not been fully implemented largely due to changing market conditions that devalued the credit/debit system. There are no other statewide mitigation exchanges or banks currently in place.

Although the CCP guidelines are not mandatory, the guidelines were pivotal in developing each iteration of the BLM CO GRSG plans, including this Proposed RMPA. Several aspects of the State's plan and the BLM's Proposed RMPA are conceptually consistent, though each plan uses different wording. Known inconsistencies between the BLM's Proposed RMPA and the *Colorado Greater Sage-Grouse Conservation Plan* include the following:

- The CCP recommends various avoidance protocols within 4-miles of leks. Due to the updated habitat management area (HMA) mapping that has occurred since publication of the CCP and BLM's use of the HMAs for allocations, there are some areas within 4-miles of a lek that are not mapped as habitat and do not have BLM management applied.
- The CCP provides GRSG Habitat Structural Guidelines. The BLM Proposed RMPA provides habitat indicators, which are similar to the Habitat Structural Guidelines but provide some updates based on new information and as coordinated with Colorado Parks and Wildlife and the Colorado Department of Agriculture.

Oil and gas operations in Colorado, regardless of ownership, are subject to the rules and regulations overseen by the Colorado Energy & Carbon Management Commission (ECMC, formerly Oil and Gas Conservation Commission). In 2019, Colorado Senate Bill 19-181 was signed into law, amending the Oil and Gas Conservation Act. SB 19-181 ensures that oil and gas development including flowline operations in Colorado are regulated in a manner that protects public health, safety, welfare, the environment, and wildlife resources (§34-60-101 et seq.). Subsequent approved rulemaking for SB 19-181 included substantial updates to the 300 Series (consultations), 400 Series (Noise & Lighting Requirements), and 1200 Series regulations, which dictate the protection of wildlife resources. The 1200 Series regulations require wildlife mitigation plans for new or amended oil and gas locations, or for previously permitted locations that would cause the density of oil and gas locations to exceed 1 per square mile in PHMA. The wildlife mitigation plans must have written concurrence from CPW. New ground disturbance within 1 mile of GRSG lek sites, among other high priority habitats, is precluded except under certain circumstances outlined in the regulations. Any direct and/or indirect impacts resulting from development triggers compensatory mitigation requirements (monetary fees or operator-completed projects) which are intended to provide a conservation benefit for the population(s) impacted. Mitigation under the SB 19-181 is enforceable by ECMC but is limited to oil and gas development and flowline operations.

1200 Series Regulations

Several aspects of the 1200 series regulations and the BLM's Proposed are conceptually consistent, though are implemented through the respective agency regulatory authorities. Known inconsistencies between the BLM's Proposed RMPA and the *1200 Series regulations* include the following:

- ECMC precludes surface occupancy within 1 mile of all occupied leks, regardless of habitat management area designation within the buffer. The BLM Proposed RMPA precludes surface occupancy (No Surface Occupancy stipulation) in all of PHMA. The acreage of BLM NSO is 1,083,500 compared to 540,400 acres of NSO under the 1200 series regulations.
- ECMC tracks density (1 facility per 640 acres) on a per-project basis, whereas the BLM tracks by management zone.

State trust land represents approximately 10 percent of the GRSG habitat in Colorado. In 2016 the State Land Board issued the Greater Sage Grouse Stewardship Action Plan (SAP) for an original term of 4 years and re-issued the SAP in 2020 for an additional 5 years. The SAP describes the current uses of the state trust lands, the quality of these lands for GRSG habitat, sets prescriptions for both surface and mineral ownership, and clarifies GRSG habitat mitigation and adaptive management (Colorado State Land Board, 2016). Some management actions described in the SAP are required to hold leases on state trust lands, such as a set of required and voluntary grazing best management practices. In coordination with CPW, the State Land Board applies stipulations to fluid mineral leases including no surface occupancy in PHMA, no surface occupancy within 2 miles of a lek in GHMA, and timing limitations in all designated habitat. The State Land Board also applies the 3 percent disturbance cap and the average of one facility per 640-acre density cap by management zone, as described in the BLM 2015 ARMPA.

Greater Sage Grouse Stewardship Action Plan

The SAP incorporated many management practices of the 2015 GRSG ARMPA and is conceptually consistent with much of the BLM Proposed RMPA. Known inconsistencies between the BLM's Proposed RMPA and the *Greater Sage Grouse Stewardship Action Plan* include the following:

- The BLM Proposed RMPA applies controlled surface use stipulations in GHMA within 1-mile of PHMA and within 1-mile of occupied leks occurring in GHMA whereas the State Land Board applies a no surface occupancy stipulation within 2 miles of a lek in GHMA (which was consistent with the BLM 2015 ARMPA).
- The State Land Board applies timing limitations within All Designated Habitat, whereas the BLM Proposed RMPAonly applies timing limitations within PHMA and GHMA.
- The State Land Board applies the adaptive management triggers established in the 2015 GRSG ARMPA. The BLM Proposed RMPA adaptive management process differs from that in the 2015 GRSG ARMPA, but both processes rely on trend information from Colorado Parks and Wildlife.
- The State Land Board applies a "net conservation gain" standard for mitigation.

Inconsistencies with County Plans, Policies, and Procedures

Most of the counties that have GRSG populations address wildlife and wildlife habitat concerns within broad planning documents, such as county master plans (Eagle County Comprehensive Plan 2005, Garfield County Comprehensive Plan 2030, Grand County Master Plan 2011, Jackson County Master Plan 1998, Larimer County Master Plan 1997, Mesa County Master Plan 2023, Moffat County Land Use Plan 2001, Rio Blanco Land and Natural Resources Plan and Policies 2022, Routt County Master Plan 2022, Summit County Countywide Comprehensive Plan 2009). Some counties have incorporated wildlife management or even GRSG specifically into planning documents such as subdivision, development, or zoning regulations. Several plans require coordination with CPW to avoid and/or mitigate adverse impacts to wildlife habitat. While verbiage differs, the intent to avoid, minimize, mitigate, and restore land uses is consistent between county plans and the BLM Proposed RMPA. Plans also mention the importance of best available, credible scientific information.

Known inconsistencies between the BLM's Proposed RMP Amendment and *County Plans* include the following:

- Rio Blanco County Land and Natural Resources Plan and Policies 2022's policy direction states that management plans should not be created for a single species and should be consistent with multiple use mandates. The BLM Proposed RMPA is a species-specific proposed amendment to 77 of BLM's RMPs. The RMPs that are being amended address the wide spectrum of resource and resource uses BLM is responsible for managing in accordance with FLPMA.
- Rio Blanco County Land and Natural Resources Plan and Policies 2022's policy direction states that management of GRSG should be according to the Colorado Greater Sage-grouse Conservation Plan (CCP), or local plans where they exist. As the CCP provides guidelines for management but does not have a regulatory framework beyond State of Colorado lands (Executive Order 2015-004) this would not provide the assurance of management relied upon in the US Fish and Wildlife Services decision not to list the species.
- Garfield County Comprehensive Plan's policy direction would apply a 0.6-mile lek buffer of no surface occupancy for fluid mineral development. The BLM Proposed RMP Amendment incorporates no surface occupancy stipulations in PHMA and ECMC incorporates a 1-mile buffer of no surface occupancy.

- Garfield County plan which was signed prior to the 2015 GRSG ARMPA uses the habitat categories suitable, seasonal habitats, temporarily disturbed, and unoccupied seasonal habitats. Suitable habitat is most closely related to PHMA in definition. The Garfield County Comprehensive Plan was updated in 2021 to incorporate the HMA maps adopted by BLM (DOI-BLM-CO-0000-2020-0003-CX), though it is unclear if the county plan also adopted the habitat designations or if the plan uses "suitable habitat" in lieu of PHMA.

23.2.2 Idaho

Inconsistencies with State Plans, Policies, and Procedures

In 2015, Idaho's governor issued Executive Order 2015-04 to adopt Idaho's Sage-grouse Management Plan (2015 Idaho Plan) as the State's official policy for sage-grouse management in Idaho. This was updated and amended in 2022 with Executive Order 2022-03 and adopted the updated plan, Idaho 2021 Sage-grouse Management Plan (2021 Idaho Plan) and directed all executive agencies, to the extent consistent with existing state law, for relevant permits and policies, to adopt the updated 2021 Idaho Sage-grouse Management Plan. The State of Idaho Executive Order 2022-03 also directed that the 2021 Idaho Sage-steppe Mitigation Principles be used to provide guidance and recommendations on mitigation and use of the Habitat Quantification Tool consistent with the Memorandum of Agreement between the State of Idaho and BLM Idaho on matters pertaining to sage-grouse conservation.

With Executive Order 2022-03, the State of Idaho also adopted the Idaho State Board of Land Commissioner's Greater Sage-grouse Conservation Plan for State endowment lands. The 2021 Idaho Plan provides policy direction and recommendations for sage-grouse conservation and management on lands administered by the BLM and USFS, and for other actions with a federal nexus in Idaho's Sage-grouse Management Area which identified four Conservation Areas and three tiers of Habitat Management Areas in Idaho, i.e. PHMA, IHMA, and GHMA. The 2021 Sage-grouse Management Plan provides guidance for federally managed lands and State Endowment Lands. However, for State Endowment Lands, restrictions and decisions in the 2021 Idaho Plan would not apply unless otherwise decided by the Idaho Board of Land Commissioners.

Although guidance in the 2021 Idaho Plan is not mandatory for BLM, collaborative work between the State of Idaho and their stakeholders as well as the State of Idaho and BLM Idaho were pivotal in developing each iteration of the BLM ID GRSG plans, including the Proposed RMPA. Several aspects of the State's plan and the BLM's Proposed RMPA are conceptually consistent, such as goals and objectives to conserve and manage sage-grouse habitats, populations, and connectivity, though each plan uses different wording. Known inconsistencies between the BLM's RMPA and the 2021 Idaho Sage-Grouse Management Plan are:

- The 2021 Idaho Plan has management objectives to maintain sage-grouse populations and conserve, enhance and restore habitats in PHMA and IHMA but in GHMA the management focus is on multiple-use management. In contrast, one of the objectives of the BLM Proposed RMPA is to maintain habitat conditions in GHMA to support GRSG populations.
- The BLM Proposed RMPA mostly includes HMA as submitted by the State of Idaho in September 2023 for Alternative 5, except for polygons of GHMA (totaling approximately 50,00 acres) which under the Proposed RMPA would be IHMA because of documented connectivity between PHMA patches.
- The 2021 Idaho Plan has a table of indicators and desired condition for sage-grouse habitat, similar to the BLM Proposed RMP Amendment Habitat Objectives Table. However, the 2021 Idaho Plan

has a desired condition of 'adequate nesting cover' for perennial grass height while the BLM Proposed RMPA has a desired condition for perennial grass height of ≥ 7".

- Generally speaking, there are some management differences between the 2021 Idaho Plan and the BLM Proposed RMPA.
  - The 2021 Idaho Plan identifies PHMA as avoidance for utility scale wind and solar while the BLM Proposed RMPA identifies these areas as exclusion;
  - The 2021 Idaho Plan has reduced lek buffer distances in IHMA compared with PHMA for different types of anthropogenic disturbance whereas the BLM Proposed RMPA applies the same lek buffers for IHMA and PHMA ;
  - The 2021 Idaho Plan includes buffer exception criteria for projects within IHMA while the BLM proposed RMPA does not include exception criteria;
  - The 2021 Idaho Plan applies BMPs for infrastructure construction in GHMA rather than RDFs, as in the BLM RMPA;
  - The 2021 Idaho Plan identifies lek buffer distances which vary by HMA type (PHMA, IHMA, and GHMA) while the BLM Proposed RMPA uses the same lek buffer distances in all types of HMA;
  - The 2021 Idaho Plan does not include seasonal restrictions for anthropogenic disturbance in nesting and wintering habitat as in the BLM Proposed RMPA.
  - The 2021 Idaho Plan exempts operation and routine maintenance activities of utility companies from restrictions while the BLM RMPA does not include such an exemption.

The State of Idaho stated that the additional protections proposed for areas within PHMA- referred to as PHMA with limited exceptions- is inconsistent with their 2021 Idaho Plan's three tier habitat management area (PHMA, IHMA and GHMA) approach. The additional protections proposed for a subset of PHMA does not conflict with Idaho's three-tiered approach. In Idaho, the BLM proposes these additional protections to conserve habitat supporting an important population of GRSG shared between the States of Idaho and Nevada from potential renewable energy and rights of way development threats.

Inconsistencies with County Plans, Policies, and Procedures

In 2013, many counties with GRSG populations developed Sage Grouse Management Plans (Camas County, Custer County, Gooding County, Lincoln County, and Owyhee County) in addition to County Comprehensive Management Plans which include wildlife management and, in some cases, GRSG specific management.

These County Sage Grouse Management Plans supplemented local working group plans which were first developed as a result of the 1997 Idaho Department of Fish and Game first statewide sage-grouse conservation plan and further refined in accordance with subsequent State of Idaho EOs and plans.

In 2006, the Idaho Sage-grouse Advisory Committee (ISAC) published the Conservation Plan for the Greater Sage-Grouse in Idaho. It built the framework guidance, tools, and other resources for the Sage-grouse Local Working Groups (LWGs) to develop plans and maintain statewide consistency. The framework identified and prioritized local threats and identified appropriate conservation measures. Implementation of the conservation measures from the 2006 Conservation Plan for Greater Sage-grouse in Idaho was not mandatory.

Several Idaho counties provided comments on the Draft RMPA/EIS, though only a few included comments related to consistency with county Plans. Those comments noted inconsistencies with the management of Alternative 3, as well as consideration of ACECs under either Alternatives 3 or 6. The components of these

alternatives that were identified as inconsistent with county plans were not taken forward into the Proposed RMPA. The BLM has therefore not identified any inconsistencies with county plans.

23.2.3 Montana/Dakotas

There are many planning documents, strategies, or policies that guide management activities that affect public lands. Many of the state plans directly impact or otherwise affect BLM-administered public lands, agreements, or other partnership involvement opportunities. In addition to the BLM's cooperating agency relationship with several state agencies, ongoing coordination and communication will take place to ensure consistency in implementation. State and county plans most pertinent to the planning area are listed below.

North Dakota

- North Dakota Economic Development Strategic Plan: 2010-2020 (2010)
- State of North Dakota Multi-Hazard Mitigation Plan (2013)
- Management Plan and Conservation Strategies for GRSG in North Dakota (2014)
- Management Plan and Conservation Strategies for Greater Sage-Grouse in North Dakota (NDGFD 2014)
- North Dakota State Wildlife Action Plan (2015)

Montana

- Management Plan and Conservation Strategies for Sage Grouse in Montana-Final (2005)
- State of Montana Executive Order 10-2014: Executive Order Creating the Montana Sage Grouse Oversight Team and the Montana Sage Grouse Habitat Conservation Program
- State of Montana Executive Order 12-2015: Executive Order Amending and Providing for Implementation of the Montana Sage Grouse Conservation Strategy
- State of Montana Executive Order 21-2015: Executive Order 12/2015 *ERRATUM*
- Montana Greater Sage-Grouse Stewardship Act (2015)
- Montana Weed Management Plan (MWMP 2008)
- Conservation Plan for Black-tailed and White-tailed Prairie Dogs in Montana (2002)
- Montana Bald Eagle Management Plan (Second edition) (1994)
- Montana Bald Eagle Management Guidelines: An Addendum to Montana Bald Eagle Management Plan (2010)
- Montana Nonpoint Source Management Plan (2007)
- Montana Statewide Comprehensive Outdoor Recreation Plan 2008 to 2012 (2008)
- Montana State Wildlife Action Plan (2015)

South Dakota

- South Dakota Wildlife Action Plan (2015)
- South Dakota Department of Game, Fish, and Parks: Management of Sage-Grouse in South Dakota (2022)
- South Dakota Greater Sage Grouse Action Plan, 2022-2026
- South Dakota Statewide Forest Resource Strategy and Assessment (June 2010)

South Dakota Game, Fish and Parks develops and periodically updates management plans for various species. These plans are available at http://gfp.sd.gov/wildlife/management/plans/default.aspx.

County Plans

- Blaine County Master Plan (2017)
- Dawson County/Glendive Growth Policy (2022)
- The Chinook-Blaine County Comprehensive Plan (Chinook-Blaine Co. 1979)
- Fallon County Growth Policy (2015)
- Chouteau County Growth Policy Plan (2017)
- Growth Policy for Richland County (2015)
- Hill County Growth Policy - Preliminary
- Prairie County, Montana Growth Policy (2006)
- Phillips County Growth Policy 2013-2017
- Garfield County Policies (2010)
- The Valley County Resource Use Plan (Valley Co. 2006)
- Powder River County Growth Policy and Land Use Plan (2019 update)
- The Comprehensive Economic Development Strategy (North Central MT EDDI 2006)
- Custer County Growth Policy (2023)
- Big Horn County Growth Policy (2014)
- Sheridan County Growth Policy (2013)
- McCone County Comprehensive Economic Development Strategy Plan (2024)
- Richland County Community Wildfire Protection and Pre-Disaster Mitigation Plan (2005)
- Carter County Resource Use Plan (2006)
- Rosebud County Wildfire Protection Plan (2004)
- Dawson County Community Wildfire Protection and Pre-Disaster Mitigation Plan (2005)
- Final Carter County Community Wildfire Protection Plan (2005)
- Wibaux County Community Wildfire Protection and Pre-Disaster Mitigation Plan (2005)
- Custer County Community Wildfire Protection Plan (2005)
- McCone County Community Wildfire Protection and Pre-Disaster Mitigation Plan (2005)
- Treasure County Pre-Disaster Mitigation Plan Community Wildfire Protection Plan (2005)
- Prairie County Community Wildfire Protection and Pre-Disaster Mitigation Plan (2005)
- Community Wildfire Protection and Pre-Disaster Mitigation Plan, Fallon County (2005)
- Rosebud County Growth Policy (2013)
- Chouteau County Growth Policy (Chouteau County 2011b)
- Comprehensive Economic Development Strategy, North Central Montana Economic Development District, Inc. (EDDI 2006)
- Harding County – completed November 2006
- Pre-Disaster Mitigation Plans (Cascade County 2011; Fergus County 2007; Judith Basin County 2007; Pondera County 2011; Petroleum County and Town of Winnett 2008; Teton County 2013)
- Community Wildfire Protection Plans (Cascade County 2008; Chouteau County 2007; Meagher County 2008; Pondera County 2007; Teton County 2011)
- Wildland-Urban Interface Wildfire Mitigation Plans (Fergus County 2004; Judith Basin County 2004; Petroleum County 2004)
- Fergus County Land Use Policy, Revised June 2021
- Multi-Hazard Mitigation Plan 2010-2015 (Chouteau County 2010)
- Carbon County Montana Growth Policy (2020)

- Park County (2017)
- Cody Comprehensive Plan (1997)
- Stillwater County Growth Policy (2018)
- Bowman County Comprehensive Plan (2013)
- Beaverhead Growth Policy 2022
- Big Horn County, Wyoming, Community Assessment
- Yellowstone County Growth Policy – combined with Billings (Draft 2008)
- Deer Lodge Growth Policy December 12, 2005
- Gallatin Growth Policy April 15, 2021
- Madison Growth Policy September 2006
- Roosevelt County Growth Plan 2021
- Butte County Government Coordinating Ordinance for Actions Affecting Land and Natural Resources Use (Butte County 1995)
- Cascade County Growy Policy Update 2014
- Butte County – completed May 2007
- Custer County – completed October 2023
- Williams County Comprehensive Plan (2012)

Inconsistencies with State Plans, Policies, and Procedures

Montana Executive Orders and State Procedures

The Governor of the State of Montana issued Executive Order (EO) 10-2014, EO 12-2015 and EO 21-2015. The EOs, in addition to, the Montana Greater Sage-Grouse Stewardship Act of 2015, established the Montana Sage Grouse Oversight Team (MSGOT) and the Montana Sage Grouse Habitat Conservation Program. The combined state procedures, outline a number of conservation strategies for Montana state agencies to follow for land uses and activities in sage-grouse habitat. The State conservation efforts are complementary to the conservation measures proposed in the Proposed RMPA/FEIS and, when combined, will provide conservation efforts across land ownership boundaries.

The BLM's purpose and need is consistent with the goal of the Management Plan and Conservation Strategies for Greater Sage-Grouse in North Dakota (NDGFD 2014) which is to provide for long-term conservation and enhancement of sagebrush steppe/mixed-grass prairie habitats in North Dakota in a manner that will support a self-sustaining GRSG population, a diversity and abundance of other wildlife species, and human uses. This Proposed RMPA/Final EIS also addresses many of the threats and conservation strategies identified in the NDGFD GRSG Management Plan, with the exception of, items such as conversion of private lands to cropland, harvest management, and weather.

The South Dakota Sage-Grouse plan identifies core sage-grouse use areas in western South Dakota. This management plan is designed to provide biological information about sage-grouse, identifies factors that influence sage-grouse in South Dakota, and guides future management direction and actions by establishing objectives to:

- Maintain or increase/improve the existing status and range of sage/steppe habitat in SD
- Annually monitor sage-grouse population status and distribution;
- Use results from lek counts and inference from past hunting seasons to guide recommendations for the annual hunting season;

- Develop a public outreach and educational plan that informs the public, landowners, stakeholders, and wildlife/conservation agencies on sage grouse management and the issues of highest concern;
- Support local, interstate and interagency sage-grouse research projects and collaborative conservation planning efforts; and
- Document disease outbreaks and develop management responses.

The South Dakota Wildlife Action Plan was last updated in 2015 and is revised every 10 years. State wildlife agencies receive federal funding for rare species work. In exchange, each state drafted a plan to address the needs of all fish and wildlife species, with priority on species of greatest conservation need. The South Dakota Wildlife Action Plan guides the state agency's priorities, but more importantly, serves as a framework for potential cooperators to work together to benefit wildlife and healthy habitats. While much of the focus of this plan is to work to avoid future endangered species listings, plans also help maintain common species in the face of known and likely future challenges. An important component of a state Wildlife Action Plan is a list of species of greatest conservation need. The species list is intended to represent declining species and species that can help indicate the effectiveness of habitat management and conservation. The list is not intended to include all rare species. Lists of South Dakota rare species that are found on or near BLM-administered lands are found in the Special Status Species section of Chapter 3. The South Dakota Wildlife Action plan is available at http://gfp.sd.gov/wildlife/management/plans/species-list.aspx.

South Dakota's forest resource strategy provides a long-term, comprehensive, coordinated strategy for investing state, federal, and partner resources. The purpose of this strategy is to provide a comprehensive management plan for priority areas identified in the assessment. The resource strategy details threats, strategies, existing resources, needs, and partners. The threats and strategies described here were assembled with input from the South Dakota Forest Stewardship Coordinating Committee and the Community Forestry Advisory Council.

Known inconsistencies between the BLM and state sage-grouse management exist in both mapping of habitat and habitat types, as well as management approaches. Overall, the BLM used core sage-grouse areas identified by each of the three states and general habitat from Montana as a starting point to identify HMAs. BLM designated Priority and General HMAs, along with three unique HMA types. (PHMA, GHMA, and UHMA). Primarily PHMA is equivalent to the state identified core areas. Two main differences exist, first small adjustments were made during the planning process based on cooperating agency and public input to identify PHMA in some areas. Second, the BLM designated some core areas as other HMA types, where there were ongoing or imminent impacts to these high-quality habitats to emphasize the long-term restoration needs. The objectives for these areas include restoring habitat in order to provide the ability for establishing or enhancing GRSG populations. Specific areas of difference include:

- The Saco Hills area southeast of Malta is included as PHMA by the BLM but is general habitat in the State of Montana approach.
- An area north of the UMRBNM is identified as PHMA by the BLM but is general habitat in the State of Montana approach.
- The Cedar Creek anticline (on the ND Border) is a core area in the State of Montana habitat mapping approach, but has been identified as part of the unique Little Missouri HMA.

- A portion in south Carter County (on the Wyoming border) is a core area in the State of Montana habitat mapping approach, but has been identified as part of the unique South Carter HMA due to ongoing bentonite development in the area.
- In the SW portion of the state (Dillon Field Office) refinements of PHMA from recent research and monitoring efforts created differences with the state core areas.

In Montana the EO general habitat was used as a starting point to identify GHMA, and individual plans worked with local experts and stakeholders to refine these areas as needed. Additional inconsistencies were identified beyond the PHMA vs. GHMA areas above. Namely some areas of GHMA are larger than general habitat based on new bird use information (e.g., Carbon County), while others have reduced GHMA vs. Montana general habitat (especially in the HiLine). Due to the unique behavior of GRSG in silver sage habitat (in the Havre, Malta, and Glasgow Field Offices under the HiLine RMP) the BLM mapped and designated Connectivity habitat (CHMA). These areas included state connectivity habitat as well as additional areas that may also provide for GRSG movement between known populations (areas identified as general habitat by Montana).

To identify general habitat in North and South Dakota the BLM used the current occupied range, along with local vegetation mapping and biologists' opinion, to account for areas where there is limited evidence of breeding habitat but known seasonal or sporadic use by GRSG.

While no known inconsistencies between BLM and state core areas were identified from North or South Dakota, the BLM did not call the North Dakota core are PHMA. Due to the unique habitat found on the periphery of the GRSG range in North Dakota, and to acknowledge the connection to habitat in Montana, the ND core area was included as part of the Little Missouri HMA. The LMHMA allows for better consistency with state management direction, objectives pertinent to challenges of the area, and cross-boundary coordination, relative to PHMA.

In this planning effort, PHMA was expanded in South Dakota because the SD Game, Fish and Parks (SDGFP) recently adjusted core areas for sage-grouse based on newer research. South Dakota GFP recommended the core areas be considered for special management emphasis. Sage-grouse Priority Habitat Management Areas (PHMAs) in the Proposed were expanded to match the SDGFP core areas.

The Proposed RMPA adjusted NSO stipulations, seasonal restrictions, disturbance caps and renewable energy restrictions to best align with EO 12-2015 to facilitate a uniform approach across all land ownerships.

Consistency reviews were limited to areas where the State plans provide management direction for uses/areas where the BLM has management authority. There are aspects of the State plans that are out of the BLM's jurisdiction, such as recommendations related to hunting, predator control, agricultural conversions and other management of state and privately-managed lands. Similarly, BLM's Proposed RMPA may have conservation measures unique to BLM management that are not contained in the State plans, such as leasing processes, habitat indicators, application of disturbance caps, and vegetation objectives. The GRSG approach is implemented through respective agency regulatory authorities. Even though there may be differences in specific management direction and regulatory approach, the overarching goals align. Other aspects of the State plans and the BLM's Proposed RMPA are conceptually consistent, though each plan may use different wording or use of planning terminology (such as "corridors", "exclusion" and specific HMA types).

Inconsistencies with County Plans, Policies, and Procedures

There are numerous planning documents, strategies, or policies that guide county management plans and policies. Many of these policies affect BLM-administered public lands, agreements, or other partnership involvement opportunities. In addition to the BLM's cooperating agency relationship with several counties, ongoing coordination and communication will take place to ensure consistency as appropriate.

Numerous counties in the planning area have approved Growth Plans or policies that guides and direct a county's land use planning tools in regard to subdivision regulations, park plans, infrastructure plans, transportation plans, trail plans, natural resource plans, public facility plans and housing plans. Some federal and state grants require a county to have a Growth Policy to guide development of infrastructure and public facilities in accordance with Section 76-1-605(1), MCA. Some County Growth Policies can be used as a local planning tool for purposes of establishing coordination or cooperating agency status with a federal land management agency, pursuant to Section 76-1-607, MCA which was adopted by the Montana Legislature in 2013. One county Growth Plan encourages federal and state agencies to manage wildlife populations taking into consideration of local economics, heritage, cultures, and private property rights and supports no net loss of livestock grazing AUM's for any permit due to increasing wildlife population and habitats policy which would not be consistent with Alternative 3. However, growth policies are not a regulatory document and do not confer authority to regulate land uses that are not otherwise specifically authorized by law or regulations.

Within the Montana/Dakotas planning area, there are also a number of Community Wildfire Protection Plans (CWPP) that influence how land is managed on federal and state lands for wildfire risk reduction and map/identify hazards and offer wildfire risk mitigation strategies.

In their consistency evaluation of the range of alternatives for the Draft RMPA/EIS, as well as in cooperating agency comments on the review of the Administrative and Draft LUPA/EIS, the majority of the responding counties noted that county plans were least consistent with Alternative 3 and portions of management actions, specifically ACECs described under Alternative 6. Some counties have ordinances related to federal land use planning and federal actions regarding natural resource management. However, there are no known direct inconsistencies between the BLM's Proposed RMPA and any county plans, policies, or procedures.

Inconsistencies with Tribal Plans, Policies, and Procedures

There are numerous treaties, Tribal constitutions, planning documents, strategies, or policies that guide the exercise of treaty rights, land uses, and development of planning documents that protect opportunities for traditional cultural practices and guide coordination with federal agencies. Many of these policies affect BLM-administered public lands and management, government-to-government relationships, agreements, co-stewardship opportunities or other partnerships.

Tribal natural resources management and environmental programs and policies focus on all aspects of natural resources (i.e., hydrology/water, soils, grasslands, forests, agriculture, fish/wildlife etc.) as they pertain to Indigenous peoples, tribal natural resources management, and traditional ecological knowledge.

This planning effort aligns with overarching goals and Tribal ordinances to protect and preserve wildlife and natural resources. The Fort Peck Tribes have identified management specific to maintain or increase populations of Greater Sage-Grouse. In 2015, The Crow Tribe enacted a bill entitled "Cooperative Conservation Plan for Greater Sage-Grouse on the Crow Nation". The bill establishes a plan that recognizes the importance of preservation and conservation of Greater Sage-Grouse and sets conservation objectives

in coordination with federal agencies The Fort Belknap Indian Community also identifies specific actions related to Greater Sage-Grouse management. Those actions include in part:

- Create an electronic database for sage grouse and sharp-tailed grouse breeding ground information;
- Monitor all Greater sage grouse leks (dance grounds) and every two years;
- Coordinate with Montana Fish, Wildlife, and Parks on status of Greater sage grouse in north central Montana;
- Develop a comprehensive assessment of suitable nesting and brood rearing habitat; and work to minimize or mitigate fragmentation or deterioration of upland game bird habitats.

There are no known inconsistencies with Tribal plans policies and procedures resulting from this Proposed RMPA. No actions have been identified that may adversely affect rights of Tribal nations that have been reserved through treaties, statutes or Executive Orders.

23.2.4 Nevada/California

The BLM has considered the following state and local plans related to management of greater sage-grouse and GRSG habitat in Nevada and California:

State Plans

- 2019 Nevada Greater Sage-grouse Conservation Plan

County Land Use Plans

California

- Lassen County General Plan (2000)
- Modoc County General Plan (1988)
- Plumas County 2035 General Plan (2013)
- Sierra County General Plan (2012)

Nevada

- Churchill County Master Plan (2020)
- County Code of Elko County, Nevada (Ord 2023-11, passed 8/16/1023)
- Elko County Sage Grouse Management and Conservation Strategy Plan (2012)
- Stewardship Alliance of Northeast Elko County: SANE Sagebrush Ecosystem Conservation Plan (2014)
- Eureka County Master Plan (2010)
- Humboldt County Public Land Resource Management Policy Plan: Greater Sage Grouse (02/07/2022)
- Lander County Policy Plan for Federally Administered Lands (2005)
- Lincoln County Public Lands Policy Plan (2010)
- Lyon County Comprehensive Master Plan (2020)
- Mineral County Master Plan (2022)
- Nye County Comprehensive Master Plan (2011)
- Pershing County Master Plan (2012)
- Storey County Master Plan (2016)
- Washoe County Master Plan: Land Use and Transportation element (2020)
- White Pine County Public Lands Policy Plan (2007)

Inconsistencies with State Plans, Policies, and Procedures

The State of Nevada finalized the 2014 Nevada Greater Sage-grouse Conservation Plan Sagebrush Ecosystem Program State of Nevada in October 1, 2014. They designed their plan to "eliminate the threats facing [GRSG] while balancing the economic and social needs of the residents of Nevada through the use of 'avoid, minimize and mitigate' with additional offsite mitigation being accomplished by the use of the Nevada Conservation Credit System". In 2019, the State of Nevada updated the Nevada Greater Sage-Grouse Conservation Plan. The goals of the 2019 plan include stopping population decline and habitat loss, implementing habitat management and restoration, and developing conservation strategies. The 2019 plan aimed to update sage-grouse and sagebrush management strategies to align with new science and rapid changes to sagebrush ecosystems.

There are many aspects of the State's plan and the BLM's Proposed RMPA that are conceptually consistent, though each plan uses different wording.

There are aspects of the State's plan that are out of the BLM's jurisdiction, such as the recommendation for management dealing with predator control and hunting. However, they are not identified as inconsistencies because the BLM does not permit hunting or predator control. Inconsistencies will be limited to areas where the State's plan provides management direction for uses/areas for which the BLM has jurisdiction.

Known inconsistencies between the BLM's Proposed RMPA and the Conservation Plan for Greater Sage-Grouse in Nevada include the following:

- The State of Nevada does not identify specific resource allocations, such as open or closed for mineral materials or exclusion, avoidance, or open for ROWs. Rather the State of Nevada's plan applies the concept of 'Avoid, Minimize, Mitigate' to reduce the threat of anthropogenic disturbances. The BLM Proposed RMP Amendment does identify specific allocations for each appropriate resource as a method to reduce the threats to GRSG.
- The BLM's Proposed RMPA identifies a disturbance cap of 3 percent with exceptions. The Authorized Officer may grant an exception to the disturbance cap at the HAF fine scale if the project meets criteria associated with the project-scale assessment (including requirements for exceptions and conditions), is in compliance with the Nevada Greater Sage-grouse Conservation Plan and Conservation Credit System (CCS) as required by Nevada regulation (Nevada Revised Statutes (NRS) Chapter 232.16 and Nevada Administrative Code (NAC) 232.162-232.480), and the offsetting compensatory mitigation (or credits per the Nevada CCS Manual) occur within the HAF fine scale where the project occurs.

  The CCS was developed to meet regulatory requirements established by NRS Chapter 232.162 to fulfill compensatory mitigation requirements for anthropogenic disturbances and to achieve a net conservation gain to Greater Sage-grouse (GRSG) habitat on public lands in Nevada. The use of the CCS to offset impacts to GRSG became mandatory in Nevada with the adoption of NAC 232.400-232.480 in 2019.
- The Nevada State plan does not have a disturbance cap.
- The BLM's Proposed RMPA includes strategies to be implemented to manage livestock grazing in a manner that minimize the risk of improper livestock grazing. While the State's plan identifies Livestock Grazing Conservation Goal, Objective, and Management Actions (refer to State's plan 7.5 Livestock Grazing), those actions are largely voluntary, while the BLM plan does require changes to be made if an area is not meeting land health standards. The specific changes would be determined

at the implementation level and consistent with BLM's livestock grazing regulations (43 CFR Part 4180.2(e)(9)).

Inconsistencies with County Plans, Policies, and Procedures

In their consistency evaluation of the range of alternatives for the Draft RMPA/EIS and in subsequent comments on the public review of the Draft RMPA/EIS, Counties noted that Alternatives from the Draft RMPA/EIS are inconsistent with county plans, primarily because BLM is not adopting in full the State of Nevada's Greater Sage-grouse Conservation Plan (2019) and that it is perceived that BLM's proposed management would restrict resource uses such as minerals and infrastructure development and would introduce the potential for road or grazing closures. The Proposed RMPA/Final EIS discloses that the preservation of valid existing rights is a planning criterion and all the programs acknowledge those rights. The Proposed RMPA would preserve valid existing rights but future solar, wind, fluid mineral, saleable mineral, and rights of way development will likely be affected in areas identified as Priority Habitat Management Areas (PHMA) and areas within PHMA with limited exceptions. Development could also be restricted for some uses in General Habitat Management Areas (GHMA) and Other Habitat Management Areas (OHMA).

Counties with adopted county land use plans identified additional inconsistencies with the BLM's alternatives that are procedural in nature. Several counties have land use planning documents that require all federal actions comply with local law. The Proposed RMPA is inconsistent with these types of local county policies.

Inconsistencies with Tribal Plans, Policies, and Procedures

The BLM invited the Alturas Rancheria, Battle Mountain Band of the Te-Moak Tribe, Big Pine Paiute Tribe of the Owens Valley, Bishop Paiute Tribe, Cedarville Indian Rancheria, Duckwater Shoshone Tribe, Elko Band of the Te-Moak Tribe, Ely Shoshone, Fort Bidwell Tribe, Fort McDermitt Paiute and Shoshone Tribes, Klamath Tribes, Lovelock Paiute Tribe, Modoc Nation, Pit River Tribe, Paiute-Shoshone Tribe of the Fallon Reservation and Colony, Pyramid Lake Paiute Tribe, Reno-Sparks Indian Colony, South Fork Band of the Te-Moak Tribe, Summit Lake Paiute Tribe, Susanville Indian Rancheria, Timbisha Shoshone Tribe, Utu Utu Gwaitu Paiute Tribe of the Benton Reservation, Walker River Paiute Tribe, Washoe Tribe of Nevada and California, Wells Band of the Te-Moak Tribe, Winnemucca Indian Colony, Yerington Paiute Tribe, and the Yomba Shoshone Tribe to enter into formal government to government consultation and also invited these Tribes to become formal Cooperating Agencies. The following Tribes entered into formal Government-to-Government consultation: Battle Mountain Band of the Te-Moak Tribe, Duckwater Shoshone Tribe, Lovelock Paiute Tribe, Modoc Nation, Reno-Sparks Indian Colony, Summit Lake Paiute Tribe, Timbisha Shoshone Tribe, Walker River Paiute Tribe, Yerington Paiute Tribe, and the Yomba Shoshone Tribe. None of the Tribes became cooperating agencies. During the February 14, 2024 Government-to-Government consultation meeting with the Tribes, they expressed concern over some issues (e.g. vegetation treatments that removed Pinyon and Juniper trees). The BLM is not aware of any inconsistencies between the Proposed RMP Amendment and Tribal plans.

23.2.5 Oregon

Inconsistencies with State Plans, Policies, and Procedures

The BLM consistently met with and received comments from the Oregon Department of Fish and Wildlife (ODFW), a formal cooperating agency in the planning process, to discuss the Oregon's Greater Sage-grouse Plan and its consistency with the RMP Amendment. During their review of the Draft EIS, ODFW identified numerous inconsistencies with the Preferred Alternative and other alternatives in the Draft EIS. The BLM

coordinated closely with ODFW on the development of the Proposed RMPA and has resolved all of the known inconsistencies, with these exceptions:

- The State of Oregon finalized the Greater Sage-Grouse Conservation Assessment and Strategy for Oregon (or "CAAS") in 2011. As part of updating the CAAS, ODFW recently updated their mapping of core and low-density sage-grouse habitat in Oregon. This was completed and accepted by the Oregon Fish and Wildlife Commission in December 2023. The BLM has used the Oregon core habitat to identify new PHMA (refer to Appendix 3). The Oregon low density habitat is used in addition to Habitat Assessment Framework (HAF) mapped seasonal habitats to identify new GHMA. As was the case in the BLM's 2015 and 2019 planning, there is a small area in Grant County identified by the State of Oregon as sage-grouse habitat that is outside of the BLM sage-grouse planning area.
- BLM is adopting the WAFWA lek count guidelines and status definitions (refer to Appendix 4), which all states have technically agreed to, but ODFW has not yet implemented, A delay in switching lek counting methods may impact BLM Oregon's adaptive management calculations.

Inconsistencies with County Plans, Policies, and Procedures

Deschutes, Harney, Lake, Malheur, and Umatilla Counties are formal cooperating agencies. The BLM received comments from Baker County on the Draft EIS which identified Areas of Critical Environmental Concern (ACECs) as inconsistent with their county plan. The BLM did not propose any ACECs for designation in Oregon in the Draft EIS alternatives and is not proposing any ACECs for designation in the Proposed RMP Amendment. No other consistency issues were raised by any other county including the formal, cooperating agency counties. The BLM is not aware of any inconsistencies between the Proposed RMP Amendment and any county plan.

Inconsistencies with Tribal Plans, Policies, and Procedures

The BLM invited the Burns Paiute Tribe, Confederated Tribes and Bands of the Yakama Nation, Confederated Tribes of the Colville Reservation, Confederated Tribes of the Umatilla Indian Reservation, Confederated Tribes of the Warm Springs Reservation, Fort Bidwell Indian Community of the Fort Bidwell Reservation of California, Klamath Tribes, Modoc Nation, Spokane Tribe of the Spokane Reservation, and Fort McDermitt Paiute and Shoshone Tribes of the Fort McDermitt Indian Reservation to enter into formal government to government consultation and also invited these Tribes to become formal Cooperating Agencies. None of the Tribes entered into formal government to government consultation and none became cooperating agencies. The BLM did not receive any comments from the Tribes during the development of the Draft EIS or on the Draft EIS. The BLM is not aware of any inconsistencies between the Proposed RMPA and Tribal plans.

23.2.6 Utah

State, local, and Tribal plans and strategies associated with management of GRSG populations and their habitats include the following:

- **State of Utah Resource Management Plan** (adopted in 2018, updated in 2024) - The State Resource Management Plan is a legislatively approved planning document that highlights the State's goals, objectives, and policies for each resource section.
- **State of Utah Administrative Code – R-634-003 – Compensatory Mitigation Program (2018)**
- **State of Utah Executive Order 2015/002 – Implementing the Utah Conservation Plan for Greater Sage-Grouse (2015)**

- **Conservation Plan for Greater Sage-Grouse in Utah** (adopted in 2019) – The goal of this Plan is to protect, maintain and increase sage-grouse populations and habitats within Sage-Grouse Management Areas (SGMAs). The State's goal was to be accomplished by meeting the two primary objectives, which are 1) to maintain and increase GRSG populations statewide, and within each SGMA and 2) to maintain, protect and increase sage-grouse seasonal habitats within SGMAs.

In 2015 the Utah Legislature adopted HB 323 requiring each Utah County to develop a Resource Management Plan as part of the county's general plan. These documents were intended to be used to define the county's policy, goals, and objectives for managing natural resources on public lands (Utah Code 63L-6-103) for the BLM to consider in planning processes that affect the use of public lands[1].

- Beaver County Utah Resource Management Plan (2017, as amended)
- Box Elder County Resource Management Plan (2017)
- Cache County Resource Management Plan (adopted 2017, amended in 2023)
- Carbon County Resource Management Plan, an Addendum to the Carbon County General Plan (2017)
- Daggett County General Plan (2022)
- Duchesne County General Plan & Resource Management Plan (2022)
- Emery County General Plan, as amended, Emery County, Utah (1996)
- Garfield County, Utah, General Management Plan Resource Management Section (2019)
- Grand County Resource Management Plan (2017)
- Iron County General Plan (2009), as amended by the Iron County Greater Sage-Grouse Resource Management Plan (2017)
- Juab County General Plan (2023)
- Kane County, Utah, Resource Management Plan (2017, as amended)
- Morgan County Utah Resource Management Plan (2017)
- Millard County Resource Management Plan (2017)
- Piute County Resource Management Plan (2016)
- Rich County Resource Management Plan (Adopted 2017, updated 2022)
- Sanpete County Resource Management Plan, an Addendum to the General Plan (2017)
- Sevier County Resource Management Plan 2017 General Plan Update (Updated 2022)
- Summit County Resource Management Plan (2017)
- Tooele County Resource Management Plan (2017)
- Uintah County Resource Management Plan (2017)
- Utah County Resource Management Plan (2017)
- Wasatch County Public Lands Resource Management Plan (2017)
- Wayne County Public Lands Resource Management Plan (2017)
- Western Weber County Resource Management Plan (2017)

The Ute Indian Tribe—Uintah and Ouray Reservation is the only Tribe that has provided the BLM a GRSG management document for consideration. Adopted by ordinance in May 2013, the Greater Sage-Grouse Conservation Ordinance was developed to preclude a listing under the Endangered Species Act while protecting the economic well-being of the tribe. The ordinance includes requirements for oil and gas and

[1] These plans are available at: https://utah-resource-management-planning-plpco.hub.arcgis.com/pages/county-management-plans

other surface-disturbing operations to minimize direct impacts on leks during breeding and nesting season for the conservation and preservation of GRSG within the boundaries of the Uintah and Ouray Reservation.

Inconsistencies with State Plans, Policies, and Procedures

The State of Utah finalized the *Utah Conservation Plan for Greater Sage-Grouse* in January 2019 with a goal to "protect, maintain and increase sage-grouse populations and habitats within Sage-Grouse Management Areas (SGMAs)." The State's officially adopted plan outlines the following objectives to meet the goal as stated above:

- Maintain and increase sage-grouse populations statewide, and within each SGMA.
- Maintain, protect and increase sage-grouse seasonal habitats within SGMAs.

The State's plan also identifies strategies to address localized threats to sage-grouse populations in Utah (State of Utah, 2019). The State of Utah is currently in the process of updating their greater sage-grouse (GRSG) plan; consistent with the BLM's planning regulations this evaluation focuses on the officially approved or adopted resource-related plans (43 CFR 1610.3-2(b)).

Several aspects of the State's GRSG plan and the BLM's Proposed RMP Amendment are conceptually consistent, though each plan uses different wording based on statutory and regulatory authorities. For example, while the BLM and state each seek to avoid impacts as the first strategy in the mitigation hierarchy, the BLM applies the avoidance measures using the various allocations and action associated with the different land uses (e.g., no surface occupancy for oil and gas, disturbance cap, avoidance for rights-of-way, etc.). Such differences in planning language are not identified as inconsistencies where there is a shared intent/outcome.

There are also aspects of the State's plan that are outside of BLM's jurisdiction, such as recommendation for management of private, local government, Trust Land Administration, and state lands and language dealing with predator control. Though these concepts are absent from the BLM's Proposed RMP Amendment, they are not identified as inconsistencies because the BLM cannot prescribe management on private, local government, Trust Lands and state lands, and does not have the authority to permit hunting or predator control. Inconsistencies will be limited to areas where the State's plan provides management direction for uses/areas the BLM has jurisdiction.

Known inconsistencies between the BLM's Proposed RMP Amendment and the 2019 *Utah Conservation Plan for Greater Sage-Grouse* include the following:

- There are several inconsistencies between the habitat management areas in the State's plan and the BLM's Proposed RMP Amendment.
  - While nearly 94% of the BLM's PHMA are within a State SGMA, the BLM's Proposed RMP Amendment includes portions of the following areas as PHMA outside the State's SGMAs: West Tavaputs and Anthro Mountain portions of the Carbon area, the SE portion of the Sheeprocks area (Tintic area), and small extensions in the Halfway Hollow portion of the Uinta area and on the west side of the Rich area.
  - The BLM's Proposed RMP Amendment includes some areas as GHMA that the State's plan doesn't include in any SGMAs: several portions of the Uinta area south of Highway 40, areas contiguous to but north of the Ibapah SGMA, high mountain valleys on the southwest side of the Rich area, and the habitat associated with the South Slope of the Uintas. The Proposed RMP Amendment acknowledges habitat in these areas and would apply the minimal management associated with GHMA, where the BLM has surface or mineral management jurisdiction.

  - The BLM's Proposed RMP Amendment also identifies areas as GHMA-Connectivity that the State's plan doesn't include. While nearly 98% of these areas are in an SGMA, the state doesn't include this concept in their SGMA approach of habitat, non-habitat, and opportunity areas.
  - While the Proposed RMP Amendment includes some HMA type on over 89% of the State's SGMAs, some portions of the SGMAs do not include any Proposed RMP Amendment HMA types. These areas are associated with vegetation types not conducive to being managed as GRSG habitat.
- The BLM's Proposed RMP Amendment places fewer conservation measures on GHMA than PHMA, but still has more conservation measures for these areas than the state's plan. The State's current GRSG plan notes that "Sage-grouse habitats outside the SGMAs are not required for long-term conservation of the species. Much of this habitat has already been heavily disturbed by human and natural causes, and it is not suitable for enhancement or improvement. Therefore, sage-grouse populations in these areas are not considered essential to perpetuate the species in Utah, and no specific management actions for this habitat are recommended." As such, BLM management of areas outside the State's SGMAs is inconsistent with their current approved plan. However, the State is in the process of updating their plan and has been coordinating with the BLM as the HMA boundaries have been reconsidered as part of this planning effort.
- The State's principle conservation measure for habitat in SGMAs is to avoid the action. This is conceptually consistent with the BLM's Proposed RMPA allocations (e.g., lands and realty actions are avoided; fluid minerals are managed as NSO, with two exceptions; mineral materials are managed as closed unless expansion of existing sites or new free-use site). The State's plan notes that if avoidance is not possible, minimization and mitigation would occur. However, in many instances if avoidance was not possible the BLM's Proposed RMP Amendment would preclude such actions (e.g., only two exceptions for fluid minerals; no new mineral material sites that are not free-use; no new non-energy leasable mineral leases, exception for wind/solar ROWs if specific conditions are not met).
- Both the BLM Proposed RMP Amendment and State plan include mitigation strategies in which avoidance of disturbing actions are the first step, followed by minimization, then compensatory mitigation if permanent disturbance to GRSG habitats cannot be avoided. Under the State's plan any necessary compensatory mitigation is encouraged to offset habitat loss but is voluntary for the applicant/permittee. Under the BLM's Proposed RMPA, mitigation is required to achieve, at a minimum, a no net loss of habitat. However, the BLM Proposed RMPA provides for using the State tools for compensatory mitigation, so long as it achieves the BLM's plans mitigation standard.
- Both the BLM Proposed RMP Amendment and State plan have a 3% disturbance cap; the state changed their 2013 plan to increase consistency with the BLM approach so the processes align on BLM and non-BLM administered lands. However, the BLM's cap is 3 percent of total disturbance, while the State's cap is 3% of new disturbance based on a 2013 baseline.
- The BLM's Proposed RMP Amendment includes strategies to be implemented to manage livestock grazing in a manner that minimize the risk of improper livestock grazing. While the State's plan identifies Grazing Practices for Greater Sage-Grouse Conservation (refer to State's plan Conservation Strategies #7), those actions are largely voluntary, while the BLM plan does require changes to be made if an area is not meeting land health standards – though the specific changes would be determined at the implementation level.
- Both the BLM Proposed RMP Amendment and the State's plan include adaptive management strategies. Each tracks different indicators for when a potential change in management may be

needed. While this is an inconsistency, both plans also include the option to consider other data sources to identify when management changes may be needed and rely on interagency groups to determine the cause of the declines and recommend potential changes in management.

Inconsistencies with County Plans, Policies, and Procedures

Several Utah counties provided comments on the Draft RMPA/EIS, though only a few included comments related to consistency with county plans. Most frequently those comments noted inconsistencies with the management of Alternative 3, as well as consideration of ACECs under either Alternatives 3 or 6. The BLM is only required to identify known inconsistencies with the Proposed RMP Amendment, and there are no ACECs considered in the Proposed RMPA.

One county noted in their comment that the livestock grazing management action RM-7 (regarding permit voluntary relinquishment) was inconsistent with state and county plans. The commentor noted action was stated as potentially inconsistency because the action (RM-7) would "call for reallocation and reauthorization of grazing permits that have been voluntarily relinquished." The BLM does not find this inconsistent because the action does not call for reallocation and reauthorization, but only requires the AO to "consider whether to offer the permit for re-authorization" or to "consider conversion of the allotment to a reserve common allotment…" Consideration of uses associated with potential future voluntary uses does not commit or decide to change the nature of the use.

Another county comment noted that the BLM needs to be consistent with the resource management plans developed by the State of Utah and the counties in Utah. However, no counties notified the BLM, in writing, of an apparent inconsistency beyond those noted above (refer to 43 CFR 1610.3.2(c)).

Inconsistencies with Tribal Plans, Policies, and Procedures

The Ute Indian Tribe—Uintah and Ouray Reservation in the only Tribe that has specifically identified a plan related to GRSG management. Adopted by ordinance in May 2013, the GRSG Conservation Ordinance was developed to preclude listing of GRSG while protecting the economic well-being of the Tribe. The rules specify requirements that oil and gas operators must follow to minimize direct impacts to suitable habitat and eliminate direct impacts to individual birds during the nesting and mating season. Known inconsistencies between the BLM's Proposed RMP Amendment and the Ute Indian Tribe GRSG Conservation Ordinance include the following:

- The BLM Proposed RMP Amendment includes management that addresses GRSG threats beyond fluid mineral leasing and development (e.g., non-energy leasable minerals, mineral materials, transmission lines and pipelines, and improper livestock grazing).
- The BLM Proposed RMP Amendment's management for fluid mineral includes more restrictions (e.g., NSO in all PHMA and disturbance caps).

23.2.7 Wyoming

The BLM has considered the following state and local plans related to management of greater sage-grouse and GRSG habitat in Wyoming.

State Plans

- Wyoming Greater Sage-Grouse Core Area Protection Executive Order 2019-3
- Bates Hole/Shirley Basin Sage-Grouse Conservation Plan (2014)
- Big Horn Basin Sage-Grouse Conservation Plan (2014)
- Northeast Wyoming Sage-Grouse Conservation Plan (2014)

- South-Central Sage-Grouse Conservation Plan (2014)
- Southwest Sage-Grouse Conservation Plan (2014)
- Upper Green River Basin Sage-Grouse Conservation Plan (2014)
- Upper Snake River Basin Sage-Grouse Conservation Plan (2014)
- Wind River/Sweetwater River Sage-Grouse Conservation Plan (2014)

County Land Use Plans

- Albany County Natural Resource Land Use Plan (2022)
- Big Horn County Natural Resource Management Plan (2020)
- Campbell County Natural Resource Land Use Plan (2022)
- Carbon County Natural Resource Management Plan (2021)
- Converse County Natural Resource Management Plan (2022)
- Crook County Natural Resource Management Plan (2020)
- Fremont County Natural Resource Management Plan (2021)
- Hot Springs County Natural Resource Management Plan (2022)
- Johnson County Natural Resource Management Plan (2020)
- Lincoln County Natural Resource Management Plan (2021)
- Natrona County Development Plan, Chapter 7 Update (2021)
- Niobrara County Natural Resource Management Plan (2021)
- Park County Natural Resource Management Plan (2021)
- Sheridan County Comprehensive Plan (2020)
- Sublette County Federal & State Land Use Policy (2021)
- Sweetwater County Federal Lands and Resources Plan (2022)
- Teton County Comprehensive Plan (2020)
- Uinta County Land Use Plan (2023)
- Washakie County Natural Resource Management Plan (2020)
- Weston County Natural Resource Management Plan (2022)

Inconsistencies with State Plans, Policies, and Procedures

Sage Grouse Executive Order 2019-3

Wyoming manages GRSG through Executive Order. The Executive Order establishes a conservation framework implemented at the scale of the State. Governor Freudenthal signed the first Greater Sage-Grouse Core Area Protection Executive Order (SGEO) in 2008 (SGEO 2008-2) which he updated in 2010 (SGEO 2010-4). Each successive administration has updated and signed a new SGEO (Governor Mead SGEO 2011-5 and 2015-4; Governor Gordon SGEO 2019-3). The SGEO details an approach to prioritize the maintenance and enhancement of GRSG habitats and populations inside Core Population Areas, Connectivity Areas, and Winter Concentration Areas with the goal of maintaining habitat and minimizing future disturbance in these designated areas by limiting surface disturbance and by locating proposed disturbances within already disturbed or naturally unsuitable locations.

The Sage-grouse Implementation Team (SGIT) was formed in 2007 to serve as the oversight team developing and implementing the SGEO. The SGIT is comprised of 24 representatives by statute (WY-9-19-101): not less than 2 members from agriculture, mining, oil and gas, and conservation/sportsmen and not less than 1 member from county government, wind generation and transmission, Wyoming Game and Fish Department, Wyoming Department of Agriculture, Wyoming Department of Environmental Quality, Wyoming Wildlife

and Natural Resource Trust, Wyoming Oil and Gas Commission, Wyoming State Lands, Wyoming Senate, and Wyoming House, with cooperation and participation by BLM, USFWS, and USFS. SGIT members were appointed originally by Governor Freudenthal. Replacements and individuals to represent emerging stakeholders (for example, wind energy development) are identified and appointed by the current administration. The SGIT was legislatively codified by the State of Wyoming in 2014. The governance structure of the SGIT is at the discretion of the Governor.

The SGEOs in effect at time of planning were critical in developing each iteration of the BLM WY GRSG plans, including SGEO 2019-3 in the Proposed RMP Amendment. Most of SGEO 2019-3 and the BLM's Proposed RMP Amendment are conceptually consistent, though wording differs in situations. Known inconsistencies between BLM's Proposed RMP Amendment and SGEO 2019-3 include:

- Core area maps in SGEO 2019-3 differ from PHMA in BLM's Proposed RMP Amendment. The HMAs adopted by the BLM inthe Proposed RMP Amendment match the current State of Wyoming draft (03/22/2024) revised core areas (the State's proposed core area revisions can be found here Sage-Grouse Executive Order | Wyoming Game & Fish Department).
- The BLM's Proposed RMP Amendment includes approximately 273,000 acres of BLM surface and/or mineral estate in Southwest Wyoming (The Golden Triangle) where increased protections include No Surface Occupancy (NSO) stipulations for new fluid mineral leases. SGEO 2019-3 allows surface occupancy in this area with density and surface disturbance restrictions.
- Adaptive management metrics, quantification approaches, and threshold levels differ in the BLM's Proposed RMP Amendment compared to those established in SGEO 2019-3 Appendix I. Since SGEO 2019-3 went into effect the State has modified their adaptive management approach to identifying anomalies in GRSG population trends. The BLM Proposed RMPA establishes that the State's adaptive management analyses must be considered by the BLM when determining if GRSG habitat and population adaptive management thresholds have been met.

Regional Sage-Grouse Conservation Plans

As established in SGEO 2019-3, Local Sage-Grouse Working Groups (LWG) in Wyoming are responsible for developing and facilitating the implementation of local conservation plans for the benefit of GRSG and their habitats. By charter, LWG members are expected to communicate and engage with state and federal agencies, landowners, and other interested parties to identify issues affecting GRSG in their LWG region and prioritize management actions that address those issues.

- No inconsistencies between BLM's Proposed RMPA and the eight regional Conservation Plans developed by the LWGs in Wyoming were identified.

Inconsistencies with County Plans, Policies, and Procedures

County planning and policy documents, including Natural Resource Management Plans, Development Plans, Comprehensive Plans, and Land Use Plans, are documents prepared and adopted by County governments that federal agencies are required to review and consider when making decisions that may affect the local area. County plans establish local policies relating to the management of federal and public land at the County level and reflect the local government's position on federal decisions concerning those lands. Wyoming's Counties participated as Cooperating Agencies and were consulted and coordinated within the current GRSG planning effort.

BLM reviewed pertinent Plans of all the Counties in Wyoming that included PHMA in BLM's Proposed RMP Amendment. This included all Counties in the State except Goshen, Laramie, and Platte Counties. Many of

the Wyoming County Plans reviewed establish that Counties oppose developing management plans for single-species management. Although the BLM Proposed RMP Amendment is a land use plan amendment developed specifically for the management of GRSG habitats, management established in BLM's Proposed RMP Amendment will influence many species of wildlife in Wyoming that use GRSG habitats. Known inconsistencies between BLM's Proposed RMP Amendment and the 20 County Natural Resource Management and Land Use Plans, Policies, and Procedures reviewed include:

- Many of the County Plans establish opposition to changes in management area designations including the expansions or reductions of PHMA. The BLM Proposed RMP Amendment modifies the boundaries of PHMA to match the State's core areas as proposed for revision. Most of the County Plans establish support for Wyoming's sage-grouse core area strategy and support for establishing PHMA the same as the GRSG core areas identified by the State.
