MD LR 6: In PHMA, if a higher voltage transmission line is required adjacent to an existing line (i.e. the project is an incremental upgrade/capacity increase of existing development (i.e. power line capacity upgrade): • the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized; and • the new line must be constructed in the same alignment as the existing line unless an alternate route will benefit GRSG or GRSG habitat.	Completely Revised – revised by rangewide direction
MD LR 7: Process unauthorized use. If the unauthorized use is subsequently authorized, it will be authorized consistent with direction from this plan including RDFs and buffers. If the use is not subsequently authorized the site will be reclaimed by removing these unauthorized (trespass) features and rehabilitating the habitat.	No change (same as 2015)
MD LR 8: Land use authorizations that are temporary (less than 3 years) in nature and are not otherwise excluded or restricted will be subject to seasonal or timing restrictions (Appendix C) and mitigation requirements regarding habitat loss as needed.	Completely Revised – revised by rangewide direction
MD LR 9: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) will be allowed on a case-by-case basis subject to RDFs to reduce impacts on GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.	Completely Revised – revised by rangewide direction
MD LR 10: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder will be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove power line and communication facilities no longer in service).	No change (same as 2015)
MD LR 11: As opportunities and priorities indicate work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix C.	No change (same as 2015)
MD LR 12: PHMA (Idaho and Montana) and IHMA (Idaho), and GHMA (Montana only) are designated as avoidance areas for high voltage transmission line and large pipeline ROWs, except for Gateway West and Boardman to Hemingway Transmission Projects. All authorizations in these areas, other than the following identified projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in MD SSS 29 and MD SSS 30 of this document. The BLM is currently processing an application for Gateway West and Boardman to Hemingway Transmission Projects and the NEPA review for this project is well underway. Conservation measures for GRSG are being analyzed through the project's NEPA review process, which should achieve a net conservation benefit for the GRSG.	Completely Revised – revised by rangewide direction

GRSG Management from Dillon RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
MD LR 13: Consider the likelihood of development of not-yet-constructed surface disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D) – under valid existing rights.	Partially Revised – Updated monitoring framework as part of rangewide direction
Land Tenure	
MD LR 14: Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG. Land tenure adjustments will be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG will reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that will remove sagebrush habitat and potentially impact sensitive plants. Criteria: Acquire habitat within PHMA and IHMA, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if disposal will allow for additional or more contiguous federal ownership patterns. Lands within PHMA, IHMA and GHMA will be retained unless disposal of those lands will increase the extent or provide for connectivity of PHMA, IHMA or GHMA. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PHMA. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within PHMA currently in public ownership. Lower priority will be given to other lands that will promote enhancement in the PHMA and IHMA (i.e., areas with fragmented or less in-tact sagebrush). Identify lands for acquisition that increase the extent of or provide for connectivity of PHMA.	Partially Revised: Update HMA types, i.e., Remove IHMA for clarity
Withdrawals	
See MD SS 10 regarding Sagebrush Focal Areas (SFA).	Completely Revised - revised by rangewide direction
Recreation and Visitor Services (REC)	
REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.	No change (same as 2015)
REC-2: In PHMA and IHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised: Remove IHMA and clarify mitigation standard

GRSG Management from Dillon RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Travel and Transportation (TTM)	
MD TTM 1: Limit off-highway vehicle travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices.	Completely Revised - revised by state specific direction
MD TTM 2: In PHMA, IHMA, and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use) and other applicable law and policy.	Partially Revised: Remove IHMA
MD TTM 3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix L of FEIS).	Partially Revised: Remove App Ref
MD TTM 4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize disturbance of GRSG and/or to have a neural or positive effect on GRSG habitat and populations. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, timing restrictions, seasonal closures, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning within PHMA will be placed on having a neutral or positive effect on GRSG habitat. Individual route designations will occur during subsequent travel management planning efforts.	No change (same as 2015)
MD TTM 5: Conduct road construction, upgrades, and maintenance activities to avoid disturbance during the lekking season – see Appendix C.	Partially Revised
Mitigation (Montana)	
(Also see Appendix F and J)	Completely Revised - revised by rangewide and state specific direction
Montana 1: BLM will establish an inter-agency State GRSG Conservation Team at the state level (both Idaho and Montana) to help guide conservation of GRSG through compensatory mitigation, within 90 days of the issuance of the Record of Decision.	Completely Revised - revised by rangewide and state specific direction
Montana 2: The BLM, in coordination with the GRSG Conservation Team will develop a Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy will be consistent with the Idaho Mitigation Framework (Appendix F).	Completely Revised - revised by rangewide and state specific direction

GRSG Management from Dillon RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Montana 3: In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation (Appendix E, Table E-1), the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	Completely Revised - revised by rangewide and state specific direction
Montana 4: Mitigate anthropogenic development (Appendix E, Table E-1) impacts on GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix F and L).	Completely Revised - revised by rangewide and state specific direction
Montana 5: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 2-2.	Partially Revised – Update Table 2.2 reference to habitat objectives.
Coordination (CC)	
MD CC 1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts can include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non- governmental organizations.	Completely Revised - revised by state specific direction
MD CC 2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU will identify responsibilities, role and interaction of the BLM, Forest Service and State of Idaho. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's Executive Order No. 10-2014.	Completely Revised - revised by state specific direction
MD CC 3: The BLM will consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.	Completely Revised - revised by state specific direction
MD CC 4: Idaho: The BLM will coordinate with the State of Idaho and the Idaho Sage-Grouse Implementation Task Force regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management, anthropogenic disturbance and livestock grazing.	Completely Revised - revised by state specific direction
MD CC 5: Montana: The BLM will coordinate with the State of Montana and the Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and anthropogenic disturbance.	Completely Revised - revised by state specific direction

GRSG Management from Dillon RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
MD CC 6: Upon completion of the Record of Decision the BLM will develop an initial Implementation Guide for BLM District and Field Offices within a year of issuance of the Record of Decision. This Guide will define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan and will be updated and expanded as needed to respond to issues and concerns.	Completely Revised - revised by state specific direction
MD CC 7: At the state level, BLM will coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate regional recommendations for GRSG conservation at broader scales.	Completely Revised - revised by state specific direction
MD CC 8: At the state level, BLM will coordinate with the appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.	Completely Revised - revised by state specific direction
MD CC 9: All prescribed burning will be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM activities.	Completely Revised - revised by state specific direction
RDFs Defined	
RDFs are means, measures, or practices intended to reduce or avoid adverse environmental impacts. This LUPA/EIS proposes a suite of design features that will establish the minimum specifications for water developments, certain mineral development, and fire and fuels management and will mitigate adverse impacts. These design features will be required to provide a greater level of regulatory certainty than through implementing BMPs. In general, the design features are accepted practices that are known to be effective when implemented properly at the project level. However, their applicability and overall effectiveness cannot be fully assessed except at the project-specific level when the project location and design are known. Because of site-specific circumstances, some features may not apply to some projects (e.g., when a resource is not present on a given site) or may require slight variations from what is described in the LUPA/EIS (e.g., a larger or smaller protective area). All variations in design features will require appropriate analysis and disclosure as part of future project authorizations. Additional mitigation measures may be identified and required during individual project development and environmental review. The proposed RDFs are presented in Appendix C.	Completely Revised - revised by rangewide and state specific direction

Table 2-2: Dillon Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicator	Desired Conditions	Reference
LEK HABITAT (Seasonal Use Period March 1 – May 15)1			
Lek Security	Proximity of trees	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old-growth juniper, pinyon pine and mountain mahogany; in Montana mainly Douglas-fir) absent or uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.	Baruch-Mordo et al.2013 Stiver et al. 2015
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. 2015
NESTING/EARLY BROOD REARING (Seasonal Use Period May 1 – June 30) 1			
Cover and Food	Sagebrush cover [2]	15-25%	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007
	Sagebrush height Arid sites[3] Mesic sites[4]	 12-31 inches (30-80cm) 16-31 inches (40-80cm)	Connelly et al. 2000
	Predominant sagebrush shape	Predominantly spreading shape[5]	Stiver et al. 2015
	Perennial grass cover (such as native bunchgrasses) [2] Arid sites[3] Mesic sites[4]	 >10% >15%	Connelly et al. 2000 Stiver et al. 2015
	Perennial grass (and forb) height (includes residual grasses)	≥ 7 inches	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007 Stiver et al. 2015
	Perennial forb cover [2] Arid sites[3] Mesic sites[4]	 >5% >10%	Connelly et al. 2000
	Perennial forb availability	Preferred forbs are common with several species present6	Stiver et al. 2015
LATE BROOD-REARING/SUMMER (July-October)1 Late brood-rearing areas, such as riparia			
Cover and Food	Sagebrush cover[2]	Uplands 10-25% Riparian/Meadow: Sagebrush cover within 100 m	Connelly et al. 2000
	Sagebrush height	16 to 32 inches (40-80cm)	Connelly et al. 2000
	Perennial grass and forb cover [2]	>15%	
	Upland and riparian perennial forb availability [2]	Preferred forbs are common with appropriate numbers of species present,6	Stiver et al. 2015
	Riparian and/or meadow habitat condition	Proper Functioning Condition	Stiver et al. 2015
WINTER November-March1 (Apply to areas of known or likely winter-use)			
Cover and Food	Sagebrush cover and height above snow,	Sagebrush is at least 10 inches (25 cm) above snow and ≥10% cover[16]	Connelly et al. 2000 Stiver et al. 2015

Notes:

[1] Seasonal dates can be adjusted by local unit according to geographic region.

[2] Since plant species and/or life forms may overlap, total vegetative cover, inclusive of shrubs, forbs and grasses may exceed 100%.
[3] Arid corresponds to the 10 – 12 inch precipitation zone; Artemisia tridentata wyomingensis is a common big sagebrush subspecies for this type site (Stiver et al. 2015).
[4] Mesic corresponds to the >12 inch precipitation zone; Artemisia tridentata vaseyana is a common big sagebrush sub-species for this type site (Stiver et al. 2015).
[5] Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. 2015. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.
[6] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[15] Some late brood habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.
[16] Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.

2.5.2 Relevant Appendices

The following table shows which appendices from the 2015 plan have management direction that may change through the Proposed RMPA. The appendices can be found on the Idaho and Southwestern Montana GRSG ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	Completely Revised – See new maps in Appendix 1
B: Buffers	Completely revised – see state-specific language
C: Required Design Features	Partially updated – see state-specific language
D: Monitoring Framework	Completely revised –see new rangewide management direction
E: Anthropogenic Disturbance and Adaptive Management	Removed, see new rangewide management direction
F: Greater Sage-Grouse - Mitigation	Removed, see new rangewide management direction
G: Fluid Mineral Lease Stipulations, Waivers, Modifications, and Exceptions	Completely revised, see rangewide and state-specific language for GRSG stipulations (see Appendix 16)
H: Fire and Invasives Assessment Tool (FIAT)	Removed
J: Montana Action Screen and Mitigation Process	Removed

This page intentionally left blank.

Appendix 2.6
HiLine RMP

This page intentionally left blank.

2.6 HILINE RMP

This appendix presents the approved RMP revision language from the record of decision for the 2015 HiLine RMP that relate to GRSG management. The HiLine RMP was not amended in 2019. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.6.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.6.1 HiLine RMP (Montana)

Table 1. Comparison of the Proposed RMP Amendment to Existing GRSG RMP Management Direction in HiLine RMP

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Fire Management and Ecology	
The BLM will protect sensitive status species habitat (such as sage-grouse) during suppression and prescribed fire activities as described in this document and consistent with BLM Policy. Fire management-related activities, including prescribed fire, should preserve or enhance the habitat quality for sage-grouse and other sensitive status species, especially in priority habitat areas. Where applicable, the BLM will use BMPs (Appendix H) to design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which benefit sage-grouse habitat (Appendix I). The use of heavy equipment during wildfire suppression and rehabilitation is allowable in sage-grouse habitat although cross-country travel should be limited through these areas. Wildfire suppression facilities shall be located to the extent possible in areas that minimize disturbance to high quality sage-grouse habitat.	No change (same as 2015)
If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as viable options; • how Greater Sage-Grouse goals and objectives would be met by its use; • how the COT Report objectives would be addressed and met; • a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMA (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).	No change (same as 2015)

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	
Fluid Minerals (oil, gas and geothermal)	
Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).	Completely Revised – revised by rangewide direction
Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, minimize and apply compensatory mitigation to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an application for permit to drill (APD) for the lease to avoid and minimize impacts on sage- grouse or its habitat and will ensure that the best information about the Greater Sage- Grouse and its habitat informs and helps to guide development of such federal leases.	Completely Revised – revised by rangewide direction
Where the federal government owns the mineral estate in PHMA and GHMA, and the surface is in non-federal ownership, apply the same stipulations, conditions of approval (COA), and/or conservation measures and RDFs (Appendix C) applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	Partially Revised - revised by state specific direction to clarify HMA language.
Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	Partially Revised - revised by state specific direction to clarify HMA language.

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
No waivers or modifications to a fluid mineral lease NSO stipulation will be granted in PHMA. The authorized officer may grant an exception to a fluid mineral lease NSO stipulation only where the proposed action: • would not have direct, indirect, or cumulative effects on Greater Sage-Grouse or its habitat; or • is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to Greater Sage-Grouse. Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid federal fluid mineral lease existing as of the date of this RMP revision. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the authorized officer only with the concurrence of the State Director. The authorized officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other Greater Sage-Grouse expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.	Completely Revised - revised by rangewide and state specific direction
The SFA are open to leasing with NSO with no waivers, exceptions, or modifications (WEMs).	Completely Revised – revised by rangewide direction
Lands and Realty	
Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No change (same as 2015)
Land Tenure	
Lands classified as priority habitat and general habitat (or habitat classification appropriate for the sub-region) for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the Greater Sage-Grouse; or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse.	No change (same as 2015)
Solar and Wind	
PHMA will be exclusion areas for solar and wind energy rights-of-way. GHMA will be avoidance areas for solar and wind energy rights-of-way.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Livestock Grazing	
If monitoring data demonstrate that livestock use on an allotment in a priority Greater Sage- Grouse area is adversely affecting Greater Sage-Grouse or their habitat, the terms and conditions of grazing permits may be modified, or changes in active use could be considered in order to meet the standards for rangeland health as described in 43 CFR, Part 4180 and the Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Appendix L) or to otherwise manage, maintain, or improve sage-grouse habitat.	Completely Revised – revised by rangewide direction
Appropriate indicators and measurements specific to habitat for Greater Sage-Grouse, or any other wildlife species of concern, will be evaluated as part of standards and guidelines assessment and any necessary and appropriate habitat objectives specific to meeting the wildlife health standard for the site will be identified and incorporated into allotment management plans (AMPs) or the terms and conditions of livestock grazing permits	Completely Revised – revised by rangewide direction
Processing Grazing Permits/Leases: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in SFA followed by PHMA outside of the SFA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations.	Completely Revised – revised by rangewide direction
The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFA and PHMA will include specific management thresholds based on the Greater Sage-Grouse habitat objectives Table 2.2, Desired Conditions for Greater Sage-Grouse Habitat, Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Completely Revised – revised by rangewide direction
Allotments within SFA, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	Completely Revised – revised by rangewide direction
At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	Completely Revised – revised by rangewide direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Off-Highway Vehicle Use and Travel and Transportation Management	
The BLM will pursue opportunities to conduct restoration of roads, primitive roads and trails not designated during travel management planning, with priority given to areas with special management concerns. This includes primitive routes that have not been designated as "primitive routes" within wilderness study areas (WSAs) and those that have been closed within areas that are being managed to protect or enhance wilderness characteristics or special status species such as the Greater Sage-Grouse. Restoration activities will be done in accordance with guidelines described in Appendix M, Reclamation. Applicable requirements such as specific seed mixes or transplanting recommendations will also be applied where special status species or issues are a concern (e.g., mitigation for Greater Sage-Grouse).	No change (same as 2015)
In PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).	No change (same as 2015)
Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off- highway vehicles (OHV) are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence (43 CFR, Part 8341.2). A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No change (same as 2015)
Recreation and Visitor Services	
In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development would have a net conservation gain to Greater Sage- Grouse habitat (such as concentrating recreation, diverting use away from sensitive areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised - revised by state specific direction, see mitigation and SSS sections.
Salable (Mineral Materials)	
PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: • the activity is within the BSU and project area disturbance cap; • the activity is subject to the provisions set forth in the mitigation framework (Appendix F); and • all applicable RDFs are applied and the activity is permissible under the specific subregional screening criteria (Appendix C).	Completely Revised - revised by rangewide and state specific direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Solid Minerals – Leasable	
At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	Completely Revised – revised by rangewide direction
Solid Minerals – Locatable	
Within the limits of the Mining Laws, the BLM will apply COAs (Appendix I) to Plans of Operations to prevent undue and unnecessary degradation to Greater Sage-Grouse habitat.	No change (same as 2015)
A recommended withdrawal for 927,074 acres from locatable mineral entry to protect the SFA.	Completely Revised – revised by rangewide direction
Vegetation – Rangeland	
In all SFA and PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (such as big sagebrush) (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2015)
The BLM will consult with MFWP and seek concurrence regarding the anticipated benefits and/or impacts of any vegetation treatments that may impact wildlife habitat including priority sage-grouse habitat.	No change (same as 2015)
Quantifiable vegetation objectives for sage-grouse habitat are presented in Table 2.3-2. The actions needed to meet or progress toward meeting these objectives will be incorporated into the respective AMPs or livestock grazing permits as appropriate.	Completely Revised – revised by rangewide direction
Water developments will be installed and/or maintained to facilitate control of livestock use of vegetation, support other uses, and protect resource values. In order to minimize surface disturbance, have reliable water of better quality and not alter normal surface flow of water, alternative water developments will be emphasized before constructing new pits and reservoirs. The BLM will manage water developments within Greater Sage-Grouse habitat to reduce the spread of West Nile virus (Appendix I).	Partially Revised - revised by rangewide and state specific direction to clarify
The BLM will use land treatments to achieve and maintain fire regimes, and watershed, grazing management, and wildlife objectives. Within the Greater Sage-Grouse PHMA and the Grassland Bird/Greater Sage-Grouse PHMA, treatments that conserve, enhance or restore Greater Sage-Grouse habitat will be allowed as well as treatments that benefit other resources and do not adversely affect sage-grouse or their habitat.	No change (same as 2015)
Rangeland health monitoring and assessments will be conducted within current staffing capabilities. The allotments within the Greater Sage-Grouse PHMA and the Grassland Bird/Greater Sage-Grouse PHMA will be high priority for reassessment of land health standards and processing grazing permits as detailed in Appendix I. Rangeland health monitoring plans will be developed and implemented at the field office level.	Completely Revised – revised by rangewide direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Conifers encroaching into sagebrush habitats will be removed, in a manner that considers tribal cultural values. Treatments will be prioritized closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site- specific analysis and principles like those included in the Fire and Invasives Assessment Tool (FIAT) report (Chambers, et al. 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated.	Completely Revised - revised by state specific direction
Vegetation – Riparian and Wetland	
The BLM will enhance or restore riparian composition and structure beyond proper functioning condition (PFC) in riparian areas where and when appropriate for other resource values.	No change (same as 2015)
Riparian areas with unique values (e.g., where water quality habitat for special status species is an issue) will be treated as avoidance areas for rights-of-way (installation of infrastructure that requires surface disturbance and/or permanent surface occupancy).	No change (same as 2015)
Grazing techniques and practices detailed in Appendix I will be implemented to reduce hot season (summer) grazing on riparian and meadow complexes within the PHMA. Alternative water facilities will be installed to relieve grazing impacts on riparian areas inside of priority sage-grouse habitat.	Partially Revised - revised by rangewide and state specific direction to clarify
Wildlife	
Identify, conserve, enhance and monitor rare, vulnerable, and representative habitats, communities, and ecosystems to ensure self-sustaining persistence of special status species.	No change (same as 2015)
Ensure that proposed land uses initiated or authorized by the BLM minimize damage to wildlife habitat and populations of special status species.	No change (same as 2015)
Maintain and/or increase Greater Sage-Grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	Completely Revised – revised by rangewide direction
Manage priority wildlife habitat, special status species habitat, and populations using multi- scale assessments to identify current conditions, risks, and opportunities.	No change (same as 2015)
Maintain, enhance, or restore habitat availability and condition for special status species, and minimize habitat loss.	No change (same as 2015)
Protect priority Greater Sage-Grouse habitats from anthropogenic disturbances that would reduce distribution or abundance of sage-grouse.	No change (same as 2015)
Minimize fragmentation of large intact blocks of important wildlife habitat, particularly habitat areas for Greater Sage-Grouse and grassland birds. The BLM will initiate proactive conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of and need for listing of these species under the Endangered Species Act (ESA).	No change (same as 2015)
The BLM will ensure habitat is provided for special status species (BLM 2015, Tables 3.58 and 3.59). Proposed actions will not jeopardize the continued existence of a threatened or endangered species, or cause its habitat to be adversely modified or destroyed.	No change (same as 2015)
The BLM will continue cooperative participation in recovery plans, management plans and conservation strategies for special status species.	No change (same as 2015)

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Fragmentation of large intact blocks of important wildlife habitat will be minimized, particularly in PHMA for Greater Sage-Grouse and grassland birds.	No change (same as 2015)
Consider the likelihood of development of not-yet-constructed surface-disturbing activities−as defined in Table 2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	Partially Revised – updated Appendix Reference as needed
New: rangewide predation management	Added by rangewide direction
New: state-specific sensitive status species, including HMA, management	Added by state specific direction
Greater Sage-Grouse Priority Habitat Management Areas	
The area will include a NSO stipulation, without modifications or waivers, for oil and gas leasing unless there is a more restrictive stipulation in place to protect other resource values (e.g., no lease in the Mountain Plover ACEC).	Completely Revised - revised by rangewide and state specific direction
Exploration and development activities for existing oil and gas leases will be managed according to BMPs (Appendix N), or other mitigation measures, through COA in authorizing APDs or plans of development. Consistent with surface use rights granted, the existing lease may be subject to "restrictions deriving from specific, nondiscretionary statutes; and such reasonable measures as may be required by the authorized officer to minimize adverse impacts on other resource values, land uses or users not addressed in the lease stipulations at the time operations are proposed" (43 CFR, Part 3101.1-2). Overall consideration shall be given to minimizing the impact on sage-grouse through a project design that avoids, minimizes, and applies compensatory mitigation for direct and indirect impacts on sage-grouse habitat or use and includes applicable and technically feasible COA (Appendix I). Selection and application of these measures shall be based on current science and research on the impacts on important breeding, nesting, brood-rearing, and wintering areas.	Completely Revised – revised by rangewide direction
The area will be an avoidance area for the issuance of rights-of-way except within designated corridors. Rights-of-way and similar facilities will be located adjacent to other facilities in a corridor where practical. The BLM will consider opportunities to remove, bury, or modify existing power lines (e.g., burying, anti-perching devices or line location).	Completely Revised - revised by rangewide and state specific direction
Where leases or rights-of-way have some level of development (e.g., road, fence, well, etc.) that are no longer in use, the site will be reclaimed by removing the features and restoring the habitat. Upon project completion or right-of-way (ROW) expiration, roads built and maintained for commercial use across BLM land will be reclaimed, unless based on site-specific analysis, the route provides specific benefits to the public and the continued public use does not contribute to resource conflicts.	No change (same as 2015)
The area will remain available for livestock grazing. Site-specific Greater Sage-Grouse habitat and management objectives will be developed for BLM land and incorporated into the respective AMPs or livestock grazing permits as appropriate. Third order (fine-scale) and fourth order (site-scale) habitat indicators and characteristics for sage-grouse habitat seasonal use areas as described in the Sage-Grouse Habitat Assessment Framework (Stiver, et al. 2015) will be used to quantify habitat objectives.	Completely Revised - revised by rangewide and state specific direction
Existing range improvements, including the location of supplements, will be evaluated and if necessary modified to conserve, enhance or restore sage-grouse habitat.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
If prescribed fire is to be used for vegetation treatments, the burn plan will clearly indicate how COT objectives will be addressed and met by its use, and why alternative techniques were not selected. A Fire Risk Assessment will be completed for implementation of prescribed fire in relation to sage-grouse goals and objectives.	Completely Revised - revised by state specific direction
The area will be an exclusion area for solar and wind energy rights-of-way.	Completely Revised – revised by rangewide direction
The area will be closed to solid leasable minerals, including non-energy leasable minerals.	Completely Revised – revised by rangewide direction
PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: • the activity is within the BSU and project area disturbance cap; • the activity is subject to the provisions set forth in the mitigation framework (Appendix I); and • all applicable RDFs are applied (Appendix C).	Completely Revised - revised by rangewide and state specific direction
New road construction will be limited to realignments of existing roads, if that realignment has a minimal impact on Greater Sage-Grouse habitat, eliminates the need to construct a new road, or is necessary for public safety. New road construction will include appropriate BMPs and mitigation (Appendices H and I).	Partially Revised - revised by rangewide and state specific direction to clarify (new mitigation guidance)
Existing roads, or realignments, will be used to access valid existing rights. If valid existing rights cannot be accessed via existing roads, then any new road would be constructed to the absolute minimum standard necessary with appropriate BMPs and mitigation (Appendices H and I).	Partially Revised - revised by rangewide and state specific direction to clarify
Greater Sage-Grouse General Habitat Management Areas	
Sagebrush habitats will be managed so that mid-scale (i.e. landscape level) shrub cover should include a mix of height classes with herbaceous understory adequate for meeting Greater Sage-Grouse requirements as well as habitat requirements for other sage- associated species such as mule deer and pronghorn.	No change (same as 2015)
Consideration will be given to incorporating fine-scale and site-specific Greater Sage-Grouse habitat and management objectives as appropriate to the area into AMPs or livestock grazing permits.	Completely Revised – revised by rangewide direction
GHMA will be an avoidance area for solar and wind energy rights-of-way.	Completely Revised - revised by rangewide and state specific direction
GHMA are open to minor ROWs and avoidance for major ROWs (high voltage transmission lines of 100 kilovolts or greater and pipelines 24 inches or greater in diameter).	Completely Revised - revised by rangewide and state specific direction
GHMA are open to fluid mineral leasing with moderate and standard constraints.	Completely Revised - revised by rangewide and state specific direction
Greater Sage-Grouse habitat suitability determinations will be based upon existing guidelines modified with data from recent habitat inventories and assessments in the planning area. Relevant range-wide research findings will also be included in habitat suitability determinations.	Completely Revised – revised by rangewide direction
The BLM will emphasize restoration and rehabilitation of sagebrush in areas that are capable of, but no longer support sagebrush to contribute to the distribution and connectivity of habitat patches.	No change (same as 2015)

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Greater Sage-Grouse habitats associated with silver sagebrush north of the Milk River will be enhanced to improve habitat conditions for nesting and brood rearing. Specific management actions will be derived from the results of ongoing research and best available science.	No change (same as 2015)
New distribution power lines on BLM land within 1 mile of Greater Sage-Grouse leks will be buried.	No change (same as 2015)
Fragmentation of large intact blocks of habitat for special status species will be minimized, particularly in habitat protection areas for Greater Sage-Grouse and grassland birds.	No change (same as 2015)
Adaptive Management Strategy for Greater Sage-Grouse Management	
Follow the adaptive management strategy outlined in Appendix J.	Completely Revised – revised by rangewide direction
Mitigation	
Mitigation measures for all resources are included in Appendices H and I. The BLM may add additional mitigation measures as deemed necessary by further environmental analysis and as developed through consultation with other federal, state, and local regulatory and resource agencies.	Completely Revised - revised by rangewide and state specific direction
In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	Completely Revised - revised by rangewide and state specific direction
Application of Lek Buffers	
In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the U.S. Geological Survey (USGS) Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix B.	Completely Revised - revised by state specific direction
Development in Highly Important Landscapes	
The BLM will designate SFA as shown in Figure 2.3-1 (927,074 acres). All BLM-administered lands within the SFA boundary will be managed as PHMA with the following additional management:	Completely Revised – revised by rangewide direction
Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.	Completely Revised – revised by rangewide direction
Managed as NSO, without WEMs, for fluid mineral leasing.	Completely Revised – revised by rangewide direction
Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	Completely Revised – revised by rangewide direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Disturbance	
[Plan Maintenance Action in 2018 conducted to acknowledge adoption of the State of Montana Habitat Conservation Program Density Disturbance Calculation Tool, changed Montana BLM Field Offices to a 5% cap. See DOI-BLM-MT-2018-0005-CX.] The Montana/Dakotas BLM will use a 3% disturbance cap at the BSU and project scale, until the State strategy, similar to Wyoming's Core Strategy of 5% for all lands and all disturbances, is fully implemented. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the General Mining Act of 1872; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded.	Completely Revised - revised by rangewide and state specific direction Density cap retained.
If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of landownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the General Mining Act of 1872, valid existing rights, etc.) will be permitted by the BLM within a project analysis area until the disturbance has been reduced to less than the cap. Within existing designated utility corridors, the 3% disturbance cap may be exceeded at the project scale if the site-specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location. If the BLM determines that the State of Montana has adopted a Greater Sage-Grouse Habitat Conservation Program that contains comparable components to those found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational density disturbance calculation tool, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within a project analysis area.	Completely Revised - revised by rangewide and state specific direction
Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of landownership) in the PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from HiLine RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Greater Sage-Grouse	
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Deleted habitat objective language and replace with the text below.] The habitat objectives for GRSG (Table 2.3-2) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-6 vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and ● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	Completely Revised – revised by rangewide direction. Table 2.3-2 removed, see Appendix 8 for Habitat Indicators

Table 2. HiLine Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Habitat Indicators	Dominant Sagebrush, Soil Type and/or Ecological Site				
	Sagebrush on Saline and/or Sodic Soils	**Sagebrush on Acid Shale Parent Materials**	**Silver Sagebrush on Overflow Sites**	**Silver Sagebrush on All Other Soils/Sites**	**Wyoming Big Sagebrush on All Other Soils/Sites Sage-Grouse Breeding Habitat**
Sagebrush Canopy Cover	> 5%	> 5%	10-25%	> 2%	15-25%
Sagebrush Height	> 6 inches	> 6 inches	> 12 inches	> 12 inches	> 12 inches
Perennial Grass Heights (includes residual grasses)	> 5 inches	> 7 inches	> 7 inches	> 7 inches	> 7 inches
Perennial Grass Canopy Cover (such as green needlegrass)	> 10%	> 10%	> 15%	> 15%	> 10%
Perennial Forb Canopy Cover	> 3%	> 3%	> 10%	> 5%	> 5%
Perennial Forb Availability	> 3 species	> 3 species	> 5 species	> 5 species	> 5 species
Riparian Areas & Wet Meadows	Proper Functioning Condition				
Lek Security	Rocky Mountain juniper and/or Ponderosa pine with less than 1% canopy cover on shrub/grassland ecological sites within 3 kilometers (1.86 miles) of occupied leks Sage-Grouse				
Winter Habitat					
Sagebrush Availability	>10% canopy and >10 inches visible above snow				

2.6.2 Relevant Appendices

The following table shows which appendices from the 2015 plan have management direction that may change through the Proposed RMPA. The appendices can be found on the HiLine RMP ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	Completely Revised – Update maps in Appendix 1
B: Applying Lek Buffer Distances when Approving Actions in Greater Sage-Grouse Habitat Management Areas	Completely revised – see state-specific
C: Required Design Features for Greater Sage-Grouse Habitat	Partially updated – see state specific language
D: The Greater Sage-Grouse Monitoring Framework	Completely revised –see new rangewide management direction
E: Greater Sage-Grouse Disturbance Caps	Removed, see new rangewide management direction
F: Greater Sage-Grouse Mitigation	Removed, see new rangewide management direction
G: Oil and Gas Lease Stipulations and Exception, Modification, and Waiver Criteria	Partially revised, revised by rangewide and state-specific, see Appendix 16
H: Best Management Practices	Partially revised – addition of livestock grazing best management practices
I: Mitigation Measures and Conservation Actions for Greater Sage-Grouse Habitat	Removed, see new rangewide management direction
J: Adaptive Management Strategy for Greater Sage-Grouse Habitat Management	Removed, see new rangewide management direction
L: Standards for Rangeland Health and Guidelines for Livestock Grazing Management	No change (same as 2015)
M: Reclamation	No change (same as 2015)
N: Oil and Gas Best Management Practices (General Conditions of Approval)	No change (same as 2015)
O: Fire and Emergency Stabilization and Rehabilitation	No change (same as 2015)
P: Recreation Sites and Management Areas	No change (same as 2015)

Appendix 2.7
Lewistown RMP

This page intentionally left blank.

2.7 LEWISTOWN RMP

This appendix presents the approved RMP language from the record of decision for the 2015 Lewistown RMP amendment and the 2021 Lewistown RMP revision (which brought forward much of the 2015 language) that related to GRSG management. The Lewistown RMP was not part of a 2019 GRSG amendment. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 or 2021 RMP appendices that are listed in **Section 2.7.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.7.1 Lewistown RMP (Montana)

Table 1. Comparison of the Proposed RMP Amendment to Existing GRSG RMP Management Direction in Lewistown RMP

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Special Status Species (SSS)	
Goal SSS-1: Goal SS-1. Maintain and/or increase GRSG abundance and distribution by conserving, enhancing, or restoring the sagebrush ecosystem upon which populations depend, in cooperation with other conservation partners.	Completely Revised - revised by rangewide direction
Objective SSS-1.1: Protect PHMA from anthropogenic disturbances that will reduce distribution or abundance of GRSG.	No change (same as 2015)
Objective SSS-1.2: Habitat Delineation: Delineate PHMA to encompass the 75% breeding bird density map: 233,219 BLM surface acres (19% of total PHMA acres). See Figure 2-1, Lewistown Habitat Management Areas (Appendix A, Approved RMP Amendment Maps).	Completely Revised - revised by rangewide direction
Objective SSS-1.3: Habitat Delineation: Delineate GHMA to encompass the remainder of the habitat presented in the 100% breeding bird density map: 112,341 BLM surface acres (11% of total GHMA acres). See Figure 2-1, (Appendix A).	Completely Revised - revised by rangewide direction
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Updated the language Objective SSS-1.4. This objective is deleted and replace with the text below.] The habitat objectives for GRSG (Table 2-2) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-2 vary across the range of sage-	Completely Revised - revised by rangewide direction. Table 2-2 removed, indicators now in new appendix.

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and ● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	
Action SSS-1.1: In undertaking BLM management actions in PHMA and GHMA, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239) in accordance with Appendix B, Applying Lek Buffer Distances When Approving Actions.	Completely Revised - revised by rangewide and state specific direction
[Plan Maintenance Action in 2018 conducted to acknowledge adoption of the State of Montana Habitat Conservation Program Density Disturbance Calculation Tool, changed Montana BLM Field Offices to a 5% cap. See DOI-BLM-MT-2018-0005-CX.] Action SSS-1.2: Disturbance: If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG PHMA in any given BSU (see Figure 2-2, Lewistown GRSG Biologically Significant Units and Priority Habitat Management Areas [PHMA] [Appendix A]), then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG PHMA in any given BSU until the disturbance has been reduced to less than the cap. (BSU for this RMPA is the summary of all the PHMA within a GRSG	Completely Revised - revised by rangewide and state specific direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
population as delineated in the COT report.) If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership), or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area in PHMA, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, as amended, valid existing rights, etc.) will be permitted by BLM within a project analysis area until the disturbance has been reduced to less than the cap. Action SSS-1.4: Disturbance: Protect PHMA from anthropogenic disturbances that will reduce distribution or abundance of GRSG. See Appendix E, Greater Sage-Grouse Disturbance Caps. If the BLM determines that the State of Montana has adopted a GRSG Habitat Conservation Program that contains comparable components to those found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational density and (DDCT, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within a project analysis area.	
Action SSS-1.3: Development Density: Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in the PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area.	No change (same as 2015)
Action SSS-1.5: Designate SFA as shown on Figure 2-1 (Appendix A) (53,440 acres). SFA will be managed as PHMA, with the following additional management: Recommended for withdrawal from the General Mining Act of 1872 (as amended), subject to valid existing rights. Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	Completely Revised - revised by rangewide direction
Action SSS-1.6: Implement Adaptive Management Plan (Appendix I).	Completely Revised - revised by rangewide direction
Action SSS-1.7: Implement Regional Mitigation Strategy (Appendix F).	Completely Revised - revised by rangewide and state specific direction
New Objectives and Management Actions such as SSS direction, surface disturbing activity guidance, predation, and non-habitat criteria.	New: Added by rangewide and state specific direction
Habitat Restoration/Vegetation Management (VEG)	
Objective VEG-1.1: In all SFA and PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Objective VEG-1.2: Within the analysis area, vegetation treatments can continue to be used to meet or support resource management objectives, given special consideration for the protection and maintenance of sagebrush ecosystems is incorporated into the design and implementation of treatments. The BLM will continue to cooperate with the Montana Fish, Wildlife, and Parks (MFWP) to determine wildlife habitat needs.	No change (same as 2015)
Action VEG-1.1: In PHMA, prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit GRSG.	No change (same as 2015)
Action VEG-1.2: In PHMA and GHMA, prioritize restoration in seasonal habitats that are thought to be limiting GRSG distribution or abundance.	No change (same as 2015)
Action VEG-1.3: In PHMA and GHMA, consideration for other threatened, endangered, or sensitive species will be evaluated in addition to GRSG when prioritizing restoration projects.	No change (same as 2015)
Action VEG-1.4: Manage for suitable GRSG habitat within PHMA.	No change (same as 2015)
Action VEG-1.5: In PHMA, require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Nonnative species will be considered when determined to be necessary for emergency stabilization and where required to facilitate natural succession of desired native vegetative communities.	No change (same as 2015)
Action VEG-1.6: In PHMA, design post-restoration management to ensure long-term persistence. This can include changes in current resource management to achieve and maintain the desired condition of the restoration that benefits GRSG. Modifications to livestock grazing will be made in accordance with BLM grazing regulation 43 CFR, Part 4130.3-3, and after consultation, cooperation, and coordination with owners or lessees having lands or managing resources within the affected allotment(s), affected cooperative state grazing districts and the interested public, if the grazing permit is being modified to make these adjustments. Temporary or long-term adjustments in post-restoration livestock use will be implemented by documented agreement or by the decision of the authorized officer in accordance with BLM grazing regulation 43 CFR, Part 4160.	Partially Revised - revised by rangewide state specific direction to clarify and be consistent with rangeland management section
Action VEG-1.7: In PHMA, consider potential changes in climate when proposing restoration seeding of native plants. Consider collection from the warmer component of the species' current range when selecting native seed.	No change (same as 2015)
Action VEG-1.8: Choose appropriate seed mix for the location.	No change (same as 2015)
Action VEG-1.9: In PHMA, restore native (or desirable) plants and create landscape patterns that most benefit GRSG. Consideration for other threatened, endangered, or sensitive species will be evaluated, in addition to GRSG, when creating landscape habitat patterns.	No change (same as 2015)
Action VEG-1.10: Make reestablishment of suitable GRSG habitat a high priority for restoration. Other restoration efforts within the field office may take precedence over sagebrush habitat projects, based on future threatened and endangered species listing decisions, funding sources and requirements, access to sites, landowner, and other agency cooperation, potential project success, as well as others. Decisions regarding restoration of habitats within the field office will remain at the discretion of the authorized officer.	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action VEG-1.11: In PHMA with higher fire frequency, where sagebrush seed is required for GRSG habitat restoration, consider establishing seed harvest areas that are managed for seed production that receive a priority for protection from outside disturbances.	No change (same as 2015)
Action VG-1.12: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and principles like those included in the FIAT report (Chambers et. al., 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated.	Partially Revised - revised by state specific direction to clarify and remove FIAT reference.
Fire and Fuels Management (FIRE)	
Fuels Management	
Objective FIRE-1.1: Design fuel treatments to protect, restore, enhance, or maintain GRSG habitat, consistent with vegetation and wildlife habitat objectives.	No change (same as 2015)
Action FIRE-1.1: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plans will address: • why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT report objectives will be addressed and met; and • a risk assessment to address how potential threats to GRSG habitat will be minimized. Prescribed fire as vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	No change (same as 2015)
Action FIRE-1.2: Design fuels management projects in PHMA to strategically and effectively reduce wildfire threats in the greatest area. This may require fuels treatments implemented in a more linear versus block design.	No change (same as 2015)
Action FIRE-1.3: During fuels management project design, consider the utility of using livestock to strategically reduce fine fuels and implement grazing management that will accomplish this. Consult with an interdisciplinary team of resource specialists, as appropriate, to minimize impacts on native perennial grasses.	No change (same as 2015)
Action FIRE-1.4: Follow the most current RDFs for fire and fuels (Appendix C, Required Design Features).	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action FIRE-1.5: If prescribed fire is used, the burn plan will clearly indicate how COT objectives will be addressed and met, and why alternative techniques are not applicable. A fire risk assessment will be completed for implementation of prescribed fire used to meet the GRSG goals and objectives in PHMA (see Appendix H, GRSG Wildfire and Invasive Species Habitat Assessment).	Completely Revised – revised by state specific direction
Fire Operations	
Objective FIRE-1.2: Manage wildfires to minimize loss of sage-brush and protect GRSG habitat.	No change (same as 2015)
Action FIRE-1.6: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. In PHMA, prioritize suppression, after life and property, to conserve the habitat. See Appendix H, which will be completed to help further refine fire management actions once this plan is completed.	Partially Revised - revised by state specific direction
Action FIRE-1.7: In GHMA, prioritize suppression where wildfires threaten PHMA. Action FIRE-1.8: Follow the most current RDFs for fire and fuels (Appendix C). *Emergency Stabilization and Rehabilitation*	No change (same as 2015)
Action FIRE-1.9: In PHMA, prioritize native seed allocation for use in GRSG habitat in years when preferred native seed is in short supply. This may require reallocating native seed from emergency stabilization and rehabilitation (ES&R) projects outside of PHMA to those inside it. Use of native plant seeds for ES&R seedings is required, based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low, nonnative seeds may be used, as long as they meet GRSG habitat conservation objectives. Reestablishing appropriate sagebrush species/subspecies and important understory plants, relative to site potential, should be the highest priority for rehabilitation.	No change (same as 2015)
Action FIRE-1.10: In PHMA, design post ES&R management to ensure long-term persistence of seeded or pre-burn native plants. This can include changes in current resource management to achieve and maintain the desired condition of the restoration effort that benefits GRSG. Modifications to livestock grazing will be made in accordance with BLM grazing regulation 43 CFR, Part 4130.3-3 and after consultation, cooperation and coordination with owners or lessees having lands or managing resources within the affected allotment(s), affected cooperative state grazing districts and the interested public, if the grazing permit is being modified to make these adjustments. Temporary or long-term adjustments in post-restoration livestock use will be implemented by documented agreement or by the decision of the authorized officer in accordance with BLM grazing regulation 43 CFR, Part 4160.	Partially Revised - revised by rangewide state specific direction to clarify and be consistent with rangeland management section
Action FIRE-1.11: In PHMA, consider potential changes in climate when proposing restoration seeding of native plants. Consider collection from the warmer component of the species' current range when selecting native seed.	No change (same as 2015)
Action FIRE-1.12: Develop an appropriate seed mix for the location, based on current climatic data as well as soils/ecological site descriptions.	No change (same as 2015)
Action FIRE-1.13: Appropriate pre and post treatment monitoring will be established to document impacts and success of the treatments.	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action FIRE-1.14: Requirements for resting or deferring areas from livestock grazing following fire will depend on a variety of factors including resource objectives, the type of fuel, time and intensity of burn, accessibility of the burned area to livestock, and post-burn climatic factors. Compliance with land health standards (see Appendix F in the Lewistown Field Office Proposed RMPA/Final EIS).	No change (same as 2015)
Livestock Grazing (LG)	
Action LG-1.1: GRSG habitat objectives will be considered when evaluating an allotment's conformance with land health standards (see Appendix F in the Lewistown Field Office Proposed RMPA/Final EIS) prior to renewing a grazing authorization.	Completely Revised – revised by rangewide direction
Action LG-1.2: In PHMA and GHMA, conduct land health evaluations and determinations that include (at a minimum) indicators and/or measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Management actions will be developed and implemented within one year if land health determinations indicate that an allotment is not meeting standards due to current livestock grazing. Appendix D addresses mid-scale monitoring.	Completely Revised – revised by rangewide direction
Action LG-1.3: Livestock grazing will be allowed on all areas not specifically closed to grazing (570,112 acres will be open to grazing and 103,806 animal unit months available). See Figure 2-3, Lewistown Livestock Grazing (Appendix A).	Completely Revised – revised by rangewide direction
Action LG-1.4: In PHMA, cooperate with ranchers and other agencies on integrated ranch planning so operations with intermingled land ownerships within BLM allotments can be planned as single units.	Completely Revised – revised by rangewide direction
Action LG-1.5: The BLM will prioritize (1) the review of grazing permits/leases in particular to determine if modification is necessary prior to renewal): and (2) the processing of grazing permits/leases in in SFA, followed by PHMA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations. The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMA will include specific management thresholds, based on GRSG Habitat Objectives (Table 2-2), Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis. Allotments within SFA, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks can include monitoring for actual use, utilization, and use supervision. At the time a permittee or lessee voluntarily relinquishes a grazing permit or lease, the BLM will consider whether the public lands where that permitted use was authorized shall remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, 4110.2-3. Ecological site descriptions, riparian PFC protocols, water quality data,	Completely Revised – revised by rangewide direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
and various types of appropriate vegetative, riparian, habitat, and any other applicable data will continue to be used as the basis in allotment evaluations to determine conformance to Standards for Land Health and Guidelines for Livestock Grazing Management (see Appendix F, in the Lewistown Field Office Proposed RMPA/Final EIS).	
Action LG-1.6: Allotments that have the best opportunities for conserving, enhancing, or restoring habitat for GRSG will receive high priority for monitoring, evaluation, and management.	Completely Revised – revised by rangewide direction
Action LG-1.7: In PHMA, conduct land health evaluations and determinations that include (at a minimum) indicators and/or measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Management actions will be developed if land health determinations indicate that an allotment is not meeting standards due to current livestock grazing. Appendix D addresses mid-scale monitoring.	Completely Revised – revised by rangewide direction
Action LG-1.8: The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFA, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data: • Vegetation Condition • Actual Use • Utilization • Use Supervision	Completely Revised – revised by rangewide direction
Implementation Management Action After Land Health Evaluations	
Action LG-1.9: In PHMA and GHMA, conduct land health evaluations and determinations that include (at a minimum) indicators and/or measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Management actions will be developed if land health determinations indicate that an allotment is not meeting standards due to livestock grazing in accordance with BLM grazing regulations 43 CFR, Part 4100. Appendix D addresses mid-scale monitoring.	Completely Revised – revised by rangewide direction
Action LG-1.10: Conserve, enhance, or restore PHMA based on ecological site descriptions (including wetlands and riparian areas). If an effective grazing system that meets GRSG habitat objectives is not already in place, analyze at least one allotment-specific alternative within the planning unit/permit renewal process that conserves, restores, or enhances PHMA.	Partially Revised - revised by rangewide direction to clarify
Action LG-1.11: In PHMA, manage for vegetation composition and structure consistent with ecological site potential within the reference state to achieve GRSG seasonal habitat objectives. Natural ecological processes that impede localized site potential and that create a mosaic of habitat successional patterns will continue to occur.	Completely Revised – revised by rangewide direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LG-1.12: In PHMA, implement management actions within or outside of the watershed planning/permit renewal process to modify grazing management and to meet seasonal GRSG habitat objectives. Consider singly, or in combination, for changes in: Season or timing of use Numbers of livestock (includes temporary non-use or livestock removal) Distribution of livestock use Intensity of use Type of livestock	Completely Revised – revised by rangewide direction
Action LG-1.13: During drought periods, prioritize evaluating effects of the drought in PHMA, relative to their needs for food and cover. Drought management will continue to be in accordance with the Montana/Dakotas drought policy (see Appendix I, Drought Policy, in the Lewistown Field Office Proposed RMPA/Final EIS). Since there is a lag in vegetation recovery following drought, post-drought management will be implemented to allow for vegetation recovery that meets GRSG needs in PHMA. In accordance with BLM grazing regulation 43 CFR, Part 4130.3-3, consultation, cooperation, and coordination with owners or lessees having lands or managing resources within the area, the affected cooperative state grazing district, and interested public will be completed prior to adjusting post- drought livestock management if the grazing permit is being modified to make these adjustments. Implementation of adjustments will be initiated through documented agreement or by decision of the authorized officer in accordance with BLM grazing regulation 43 CFR, Part 4160.	Completely Revised – revised by rangewide direction
Riparian Areas and Wet Meadows	
Action LG-1.14: Riparian-wetland areas will be managed for PFC within the LFO. Within PHMA and GHMA, manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes.	Completely Revised – revised by rangewide direction
Action LG-1.15: Riparian-wetland areas currently achieving PFC will be managed for desired future condition and the desired plant community, based on ecological site potential. Other values to be considered include important wildlife habitat, water quality impaired streams, fisheries, riparian woodland forest, and habitat for currently listed threatened, endangered, and sensitive species.	Partially Revised - revised by rangewide direction to clarify
Action LG-1.16: Riparian-wetland areas with altered potential (i.e., those riparian-wetland areas that are incapable of reaching potential because of causes that are outside of the control of the BLM) will be managed for their capability.	Partially Revised - revised by rangewide direction to clarify
Action LG-1.17: Human-made water developments, such as reservoirs and stock ponds, can develop riparian-wetland characteristics. Those that have the capability to support important wildlife values (such as GRSG habitats and fisheries) will be managed for such to the extent practical, with greater consideration given to the purpose of the development. When constructing or modifying water developments in PHMA, use RDFs (Appendix C) to reduce potential impacts from West Nile virus.	Partially Revised - revised by rangewide direction to clarify

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LG-1.18: Within PHMA, reduce hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Use fencing/herding techniques or seasonal use or livestock distribution changes to reduce pressure on riparian or wet meadow vegetation used by GRSG in summer. Hot season use of riparian and wet meadow complexes may be authorized where consistent with overall GRSG habitat objectives and where use is currently resulting in vegetative conditions that are in conformance with land health standards.	Partially Revised - revised by rangewide direction to clarify
Action LG-1.19: In PHMA, management emphasis will be placed on riparian and wetland potential associated with springs and seeps. Water from other sources will be prioritized to develop grazing management infrastructure. New water development for diversion from spring or seeps will be authorized only when no other sources are available and where such considerations will be neutral or beneficial to GRSG.	Partially Revised - revised by rangewide direction to clarify
Action LG-1.20: Analyze springs, seeps, and associated pipelines during the land health evaluation and determination process to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within PHMA. Make modifications, where necessary, in accordance with Montana water law, considering impacts on other water uses, when such considerations are neutral or beneficial to GRSG.	Partially Revised - revised by rangewide direction to clarify
Treatments to Increase Forage for Livestock/Wild Ungulates	
Objective LG-1.1: Develop and implement (as budgets and workloads allow) methods for prioritizing and restoring sagebrush steppe invaded by nonnative plants.	Completely Revised – revised by rangewide direction
Action LG-1.21: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PHMA to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of a grazing management plan that is providing value in conserving or enhancing native rangelands in PHMA and other priority wildlife habitats, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat or as a component of a grazing system during the land health evaluation and determination process.	Completely Revised – revised by rangewide direction
Action LG-1.22: Integrated vegetation management will be used to control, suppress, and eradicate, where possible, noxious and invasive species, in accordance with Chapter 6, sections II and III of BLM Handbook H-1740-2. Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	Completely Revised – revised by rangewide direction
Action LG-1.23: Noxious weed control on affected grazing allotments will be implemented through Weed Control Cooperative Range Improvement Project Agreements, which requires as a term and condition of a grazing authorization that the operator control noxious weeds on the grazing allotment(s) they are authorized to use.	Completely Revised – revised by rangewide direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Structural Range Improvement and Livestock Management Tools	
Action LG-1.24: In PHMA, site and design new structural range improvements and location of supplements (salt or protein blocks) to conserve, enhance, or restore said habitat through an improved grazing management system relative to GRSG habitat objectives. Structural range improvements, in this context, include cattle guards, fences, exclosures, corrals, or other livestock handling structures; pipelines, troughs, storage tanks (including movable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels, and spring developments).	Completely Revised – revised by rangewide direction
Action LG-1.25: Potential for invasive species establishment or increase following construction will be considered in the project planning process and monitored and treated post-construction. Projects will be designed to the extent practical to reduce or eliminate the establishment of new two-track roads and trails that may be created during construction and maintenance.	Completely Revised – revised by rangewide direction
Action LG-1.26: When developing or modifying water developments in PHMA and GHMA, use applicable RDFs (Appendix C) to reduce potential impacts from West Nile virus.	Completely Revised – revised by rangewide direction
Action LG-1.27: During the land health evaluation and determination and grazing authorization renewal process (typically every 10 years), examine existing structural range improvements and location of supplements (salt or protein blocks) to ensure they conserve, enhance or restore PHMA. Identify and mark fences in high and moderate risk areas, as identified by the use of "The Fence Collision Risk Tool" (http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/) within PHMA, based on proximity to lek, lek size, and topography (Stevens 2011, Stevens et al. 2013). During the allotment evaluation and determination and grazing authorization renewal process, examine existing structural range improvements to ensure they conserve, enhance, or restore PHMA. In PHMA and GHMA, monitor for and treat invasive and noxious weed species associated with existing range improvement projects.	Completely Revised – revised by rangewide direction
Mineral Resources (MR)	
Leased Federal Fluid Mineral Estate	
Action MR-1.1: Allow geophysical exploration within PHMA to obtain exploratory information for areas outside of and adjacent to PHMA areas. Allow only geophysical operations by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and other restrictions that may apply (see Appendix C).	Completely Revised - revised by state specific direction
Action MR-1.2: During implementation level review and decisions, (e.g., approval of an application for permit to drill or Sundry Notice) and on completion of the environmental record of review (43 CFR, Part 3162.5), include appropriate documentation of compliance with NEPA. In this process evaluate, among other things: Whether the conservation measure is reasonable (43 CFR, Part 3101.1-2) with the valid existing rights; and Whether the action is in conformance with the ARMPA. The following operating constraints will be applied to existing leases as COAs in PHMA and GHMA. Exceptions may be granted by the authorized officer if an environmental review demonstrates that effects can be mitigated to an acceptable level, if habitat for the species is not present in the area, or if portions of the area can be occupied without	Completely Revised – revised by rangewide direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
affecting GRSG. Exceptions may also be granted where the short-term effects on GRSG within PHMA and GHMA are mitigated by the long-term benefits. Permanent (longer than two months) structures that create movement must be designed or sited to minimize impacts on GRSG. As reasonable (43 CFR, Part 3101.1-2), in consideration of valid existing rights, and to achieve a net conservation gain, the BLM will require compensatory mitigation when impacts cannot be adequately avoided and minimized, and residual impacts will result in habitat loss and degradation. Compensatory mitigation actions will align with the recommendations in the Regional Mitigation Strategy (see Appendix F), as appropriate. A priority may be given to compensatory mitigation actions in the same PHMA as is being impacted, unless a greater benefit can be achieved elsewhere. Compensatory mitigation will be considered when no feasible options remain to adequately avoid and minimize impacts within and immediately adjacent to the impacted site. Make applicable RDFs (Appendix C) mandatory as COAs within PHMA and GHMA. RDFs provided in Appendix C will be site-specific restrictions applied to permits to drill as COAs after the completion of site- specific NEPA analysis. Standard stipulations (see Appendix G, Oil and Gas Lease Stipulations) apply to existing leases. See Figure 2-4, Lewistown Fluid Minerals (Oil and Gas) (Appendix A). Applied RDFs will have to be reasonable (43 CFR, Part 3101.1-2) with the valid existing rights and in conformance with the approved Judith and Headwaters RMPs.	
Unleased Federal Fluid Mineral (Oil and Gas and Geothermal) Estate: 2021 Revision	
FW–AU-01: Apply NSO stipulations to greater sage-grouse PHMA.	Completely Revised - revised by rangewide and state specific direction
FW–AU-02: Apply NSO stipulations within 0.6 miles of a lek within GHMA.	Completely Revised - revised by rangewide and state specific direction
FW-AU-03: Apply CSU stipulations within 2 miles of a lek within GHMA.	Completely Revised - revised by rangewide and state specific direction
MD-1: No waivers or modifications to a fluid mineral lease NSO stipulation will be granted in PHMA. The authorized officer may grant an exception to a fluid mineral lease NSO stipulation only where the proposed action: (i) would not have direct, indirect, or cumulative effects on Greater Sage-Grouse or its habitat; or (ii) is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to Greater Sage-Grouse. *Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid federal fluid mineral lease existing as of the date of this RMP revision. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will	Completely Revised - revised by rangewide and state specific direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
endure for the duration of the proposed action's impacts. *Any exceptions to this lease stipulation may be approved by the authorized officer only with the concurrence of the State Director. The authorized officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other Greater Sage-Grouse expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publicly available at least quarterly.	
Solid Minerals	
Coal	
Action MR-1.3: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	Completely Revised - revised by rangewide direction
Locatable Minerals	
Action MR-1.4: Recommend SFA (53,440 acres) for withdrawal from the General Mining Act of 1872 (as amended), subject to valid existing rights. Analyze proposed action in Plan of Operations and apply mitigating measures needed to prevent unnecessary or undue degradation, as appropriate and in accordance with applicable law.	Completely Revised - revised by rangewide and state specific direction
Action MR-1.5: Locatable minerals exploration and development under the mining laws are not authorized under the discretion of the field manager but are reviewed (Notice and Plan of Operations) and approved (Plan of Operations) to prevent unnecessary or undue degradation. Proposed actions under Plan of Operations will be analyzed on a case-by-case basis in coordination with Montana Department of Environmental Quality, and RDFs apply to locatables to the extent consistent with applicable law (Appendix C).	No change (same as 2015)
Action MR-1.6: See Figure 2-5, Lewistown Locatable Minerals (Appendix A). At a minimum, annual compliance inspections will be conducted on each active Notice or Plan of Operations.	No change (same as 2015)
Nonenergy Leasable Minerals	
Action MR-1.7: Close PHMA to nonenergy leasable mineral leasing. This includes not permitting any new leases to expand an existing mine. See Figure 2-7, Lewistown Non-Energy Leasable Minerals (Appendix A).	Completely Revised – revised by rangewide direction
Action MR-1.8: For existing nonenergy leasable mineral leases in PHMA, apply all appropriate RDFs from Appendix C, whether traditional or solution mining is used to extract resources.	Completely Revised – revised by rangewide direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Salable Minerals	
2021 Revision Changed Management: MM-AU-02: Federal mineral estate (including HMAs) open to mineral materials disposal. 2015 Action was: Action MR-1.9: PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: • the activity is within the BSU and project area disturbance cap; • the activity is subject to the provisions set forth in the mitigation framework (Appendix F); and • all applicable RDFs are applied; and [if applicable] the activity is permissible under the specific subregional screening criteria. In GHMA, the BLM will issue permits for salable minerals, where disposal is deemed to be in the public interest (Figure 2-6, Appendix A), while providing for reclamation of mined lands and preventing unnecessary or undue degradation, and meeting goals and objectives for PHMA, surface disturbance limits (applies only to PHMA), mitigation and other measures through the application of appropriate RDFs (Appendix C). Salable mineral permits are considered on a case-by-case basis and are issued at the discretion of the field manager. If activity under the permit application cannot be mitigated based on appropriate RDFs and strategies outlined in Appendix F to achieve net conservation gain and prevent unnecessary or undue degradation to GRSG habitat.	Completely Revised - revised by rangewide and state specific direction
Action MR-1.10: In PHMA, restore salable mineral pits no longer in use to meet GRSG habitat conservation objectives.	No change (same as 2015)
Mineral Split Estate	
Action MR-1.11: Where the federal government owns the surface and the mineral estate is in non- federal ownership in PHMA and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee (Appendix C).	Partially Revised - revised by state specific direction to clarify HMA language
Action MR-1.12: Where the federal government owns the mineral estate in PHMA and GHMA, and the surface estate is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs (Appendix C) applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	Partially Revised - revised by state specific direction to clarify HMA language
Lands and Realty (LR)	
Objective LR-1.1: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No change (same as 2015)
Rights-of-Way	
Action LR-1.1: PHMA and GHMA will be managed as ROW avoidance areas for high voltage transmission lines (100 kilovolt [kV] and over) and large pipelines (24 inches in width and over) (345,560 acres) with limited exceptions, which must be based on an explicit rationale that biological impacts on GRSG are being avoided with the exception. See Figure 2-10a, Major Rights-of-Way (Appendix A).	Completely Revised - revised by rangewide and state specific direction

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
PHMA will also be managed as a minor ROW avoidance area (233,219 acres). See Figure 2-10b, Lewistown Minor Rights-of-Way (Appendix A).	Completely Revised - revised by rangewide and state specific direction
GMHA will be open to minor ROWs (112,341 acres). Where new ROWs are required, collocate new ROWs within existing ROWs or where it best minimizes impacts on GRSG and GRSG habitat. Appropriate RDFs identified within the terms of the authorization to minimize surface- disturbing and disruptive activities. See Appendix C for RDFs that may be applied based on site-specific project level NEPA analysis.	Completely Revised - revised by rangewide and state specific direction
Action LR-1.2: PHMA will be managed as a ROW exclusion area for wind and solar energy (233,219 acres) and GHMA will be managed as a ROW avoidance area for wind and solar energy (112,341 acres). See Figure 2-8, Lewistown Wind, and Figure 2-9, Lewistown Solar (Appendix A).	Completely Revised - revised by rangewide and state specific direction
Action LR-1.3: When addressing ROW authorizations in PHMA, identify and evaluate opportunities to remove, bury, or modify power lines within PHMA. Financial and technical feasibility will be evaluated during the environmental analysis process.	No change (same as 2015)
Action LR-1.4: Current FLPMA ROWs have a stipulation that when the ROW terminates, the site must be remediated and restored by the grant holder to BLM's satisfaction (43 CFR, Part 2807.19).	No change (same as 2015)
Action LR-1.5: Many pre-FLPMA grant authorizations are for water, or electricity, to large areas and most of these grants are perpetual or non-expiring. If an amendment is needed the grant will be renewed/reauthorized under current authority with additional stipulations and/or mitigation requirements. If the pre-FLPMA authorizations are no longer needed, grantees will be required to reclaim sites by removing features/fixtures and restoring habitat. Grant authorizations under the Mineral Leasing Act will be renewed if they are still being used for their original purposes.	No change (same as 2015)
Action LR-1.6: Leases and permits (other than for cabin site leasing), which may be for occupancy, and film production, will be considered on a case-by-case basis; however, PHMA will be lease and permit avoidance areas. Leases and permits will be allowed in GHMA with appropriate stipulations and conservation measures identified within the terms of the authorization to minimize surface-disturbing and disruptive activities. Avoidance areas within GHMA may be identified.	No change (same as 2015
Action LR-1.7: The holder of a ROW shall be responsible for weed control on disturbed areas within the limits of the ROW. The holder shall be responsible for invasive weed control for the life of the ROW. ROW holder is responsible for weed control and monitoring for three years after reclamation has been completed. The holder will be responsible for consultation with the authorized officer and/or local authorities for acceptable weed control methods.	No change (same as 2015)
Action LR-1.8: No utility corridors designated within the planning area.	No change (same as 2015)
Action LR-1.9: Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table D.2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	Partially Revised – updated Appendix Reference as needed

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Land Tenure Adjustment	
Action LR-1.9: Lands classified as PHMA and GHMA will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG. See Figure 2-11, Lewistown Land Tenure (Appendix A).	No change (same as 2015)
Action LR-1.10: Land tenure adjustments in the Headwaters planning area will be subject to disposal/acquisition criteria identified (BLM 1984, page 20).	No change (same as 2015)
Action LR-1.11: Retain important wildlife habitat (one of the three main criteria for land tenure adjustments outlined in the Judith Resource Area RMP) (BLM 1994).	No change (same as 2015)
Action LR-1.12: Headwaters RMP land ownership adjustment criteria include nesting/breeding habitat for game animals (BLM 1984, page 20).	No change (same as 2015)
Action LR-1.13: When offered, PHMA will be a priority in consideration of land acquisitions (refer to Appendix H, Land Pattern Review and Land Adjustment, in Lewistown Field Office Proposed RMPA/Final EIS). Consider GRSG for all land tenure actions.	No change (same as 2015)
Recommend Land Withdrawals	
Action LR-1.14: Withdrawals from minerals on BLM surface (2,686 acres).	No change (same as 2015)
Action LR-1.15: SFA (53,440 acres) will be recommended for withdrawal from the General Mining Act of 1872 (as amended), subject to valid existing rights.	Completely Revised – revised by rangewide direction
Recreation and Visitor Services (REC)	
Action REC-1.1: Special recreation permits in PHMA may be allowed if they are neutral or beneficial for GRSG habitat.	No change (same as 2015)
Action REC-1.2: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, and staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from important areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised - revised by state specific direction, see mitigation and SSS sections
Travel and Transportation (TRM)	
Action TTM-1.1: BLM-administered lands are designated limited to existing roads, primitive roads, and trails yearlong for off-highway vehicle use (OHVs; OHVs are restricted to existing roads, primitive roads, and trails). Implement a comprehensive travel and transportation management (CTTM) plan to designate roads and trails (when travel management plan is complete). Administrative off-road use for BLM personnel and BLM authorized activities will be allowed. BLM-implemented CTTM will not apply to private or other state or federal lands within the LFO.	No change (same as 2015)
Action TTM-1.2: On completion of site-specific projects, roads used for commercial or administrative access on BLM-administered lands will be reclaimed, unless the route will provide specific benefits for public access, will minimize impacts on the resources, and will be considered on a case-by-case basis.	No change (same as 2015)
Action TTM-1.3: The BLM will close or restore unauthorized, user created roads and trails to prevent resource damage, including impacts on GRSG.	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action TTM-1.4: During route designation and travel planning in PHMA, travel management will evaluate the need for permanent or seasonal route or area closures where vehicle use is causing or will cause considerable adverse effects on habitat.	No change (same as 2015)
Action TTM-1.5: Through site-specific planning, the BLM will designate roads, primitive roads, and trails for motorized use. Roads, primitive roads, and trails will be inventoried, mapped, and analyzed to the degree necessary to evaluate and designate the roads, primitive roads, and trails as open, seasonally open, or closed (BLM 2003). All CTTM planning shall be completed within 5 years of the signing of the ROD. The CTTM planning will be conducted using an interdisciplinary team approach to address all resource uses, including administrative, recreation, commercial, and associated modes of travel (motorized, mechanized, and nonmotorized types; BLM—Travel and Transportation Handbook [H- 8342]).	No change (same as 2015)
Action TTM-1.6: In PHMA, during site-specific travel and transportation management planning, limit route construction to realignment of existing routes if that realignment has a minimal impact on GRSG habitat, if it eliminates the need to construct a new road, or if it is necessary for motorist safety.	No change (same as 2015)
Action TTM-1.7: In PHMA, during site-specific travel and transportation management planning, use existing routes or realignments, as described above, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing routes, then build any new route to the absolute minimum standard necessary.	No change (same as 2015)
Action TTM-1.8: In PHMA, during site-specific travel and transportation management planning, the upgrading of existing routes that will change route category (road, primitive road, or trail) or capacity may be allowed when there are minimal impacts on GRSG and GRSG habitat, if it is necessary for motorist safety, or if it eliminates the need to construct a new road. All upgrades to existing routes will be evaluated on a case-by-case basis and will be subject to valid existing rights (e.g., existing ROWs or easements).	No change (same as 2015)
Action TTM-1.9: When travel plans are complete, restore roads, primitive roads and trails in PHMA that are not designated in travel management plans. This also includes primitive routes/roads that were not designated in wilderness study areas (WSA) that have been selected for protection in previous RMPs.	No change (same as 2015)
Action TTM-1.10: When reseeding roads, primitive roads, and trails in PHMA, use appropriate seed mixes and consider the use of transplanted sagebrush.	No change (same as 2015)
Action TTM-1.11: In PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR, subpart 8364 (Closures and Restrictions); 43 CFR, subpart 8351 (Designated National Area); 43 CFR, subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR, subpart 8341 (Conditions of Use).	No change (same as 2015)
Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse	No change (same as 2015)

GRSG Management from Lewistown RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
effect until the adverse effects are eliminated and measures implemented to prevent recurrence (43 CFR, Part 8341.2). A closure or restriction order shall be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders shall be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	

Table 1. Lewistown Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicator	Desired Condition	Reference
BREEDING, NESTING, AND EARLY BROOD REARING (Seasonal Use Period: March 1 to June 30)			
Lek Security	Proximity of trees	Trees or other tall structures are not within line of sight of lek and absent or uncommon within 3 kilometers (km) (1.9 miles) of the lek.	Connelly et al. 2000
	Collision Risks	Fences and other structures that pose a high collision risk are absent or mitigated with visual markers.	Connelly et al. 2000. Stevens 2011
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 100 meters (m; 328 feet [ft.]) of an active lek.	Stiver et al. 2015
Cover	Sagebrush cover	10-25%	Berkeley et al. 2013 Connelly et al. 2000 Doherty et al. 2010 Lane 2005 Hagen et al. 2007 Sant et al. 2014
	Sagebrush height	40-80 centimeters (cm) (15.7-31.5 inches) individual sagebrush available within stand (for nesting) with a variety of heights (including those <40 cm [<15.7 inches]).	Connelly et al. 2000 Lane 2005
	Predominant sagebrush shape	Spreading	Stiver et al. 2015
	Perennial grass cover (such as bluebunch wheatgrass, green needlegrass and western wheatgrass)	≥15%	Connelly et al. 2000 Lane 2005 Sant et al. 2014
	Perennial grass and forb height (includes residual grasses)	≥18 cm (≥7.1 inches)	Berkeley et al. 2013 Connelly et al. 2000 Doherty et al. 2014 Hagen et al. 2007 Taylor et al. 2012
	Perennial forb cover	≥10%	Connelly et al. 2000 Sant et al. 2014

Attribute	Indicator	Desired Condition	Reference
LATE BROOD-REARING/SUMMER (Seasonal Use Period: July 1 to October 31)			
Cover	Sagebrush cover	5-25%	Connelly et al. 2000 Lane 2005 Hagen et al. 2007 Sant et al. 2014
	Sagebrush height	40-80 cm (15.7-31.5 inches) individual sagebrush available within stand (for nesting) with a variety of heights (including those <40 cm [<15.7 inches]).	Connelly et al. 2000 Lane 2005
	Perennial grass and forb cover	≥25%	Connelly et al. 2000 Hagen et al. 2007 Sant et al. 2014
	Riparian areas/mesic meadows	80% or more of PHMA in Proper Functioning Condition (PFC) or higher.	Prichard et al. 1999 Schroeder et al. 1999 USDI BLM 1997
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present	Connelly et al. 2000 Stiver et al. 2015
WINTER (Seasonal Use Period: November 1 to February 28)			
Cover and Food	Sagebrush cover	≥10%	Wallestad 1975 Connelly et al. 2000 Sant et al. 2014
	Sagebrush height	≥25cm (≥9.8 inches)	Connelly et al. 2000.

2.7.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2021 plans have management direction that may change through the Proposed RMPA. The 2015 Appendices can be found on the Lewistown GRSG ePlanning website. The 2021 Appendices can be found on the Lewistown RMP ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Figures	2021	Completely Revised – see new maps in Appendix 1
B: Collaboration and Coordination	2021	No change (same as 2021)
D: Implementation and Monitoring	2021	No change (same as 2021)
F: Design Features and Best Management Practices	2021	Partially revised – revised to add livestock grazing BMPs
G: Reclamation	2021	No change (same as 2021)
H: Draft Air Resource Management Plan: Adaptive Management Strategy for Oil and Gas Resources	2021	No change (same as 2021)
I: Fire and Emergency Stabilization and Rehabilitation	2021	No change (same as 2021)
J: Impoundments	2021	No change (same as 2021)
K: North Continental Divide Ecosystem Grizzly Bear Conservation Strategy	2021	No change (same as 2021)
L: Stipulations and Allocations Applicable to Fluid Minerals Leasing	2021	Partially revised, GRSG stipulations changed, see Appendix 16
M: Summary of the Lewistown Field Office Wilderness Characteristics: 2014 Update	2021	No change (same as 2021)
N: BLM Standards for Rangeland Health and Guidelines for Livestock Grazing Management Grazing	2021	No change (same as 2021)
O: Allotments	2021	No change (same as 2021)

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
P: Drought Policy	2021	No change (same as 2021)
Q: Recreation Management Areas	2021	No change (same as 2021)
R: Land Ownership Adjustment Categories	2021	No change (same as 2021)
S: Withdrawal Segregations	2021	No change (same as 2021)
U: Land Management Allocations	2021	No change (same as 2021)
A - Approved RMP Amendment Maps	2015	Completely Revised – See new maps in Appendix 1
B - Applying Lek Buffer Distances When Approving Actions	2015	Completely revised – see state-specific language
C - Required Design Features	2015	Partially revised – added livestock grazing BMPs, See also 2021 appendix
D - The Greater Sage-Grouse Monitoring Framework	2015	Completely revised – see new rangewide version
E - Greater Sage-Grouse Disturbance Caps	2015	Removed, see new rangewide management direction
F - Regional Mitigation Strategy	2015	Removed, see new rangewide management direction
G - Oil and Gas Stipulations	2015	N/A – See 2021
H - GRSG Wildfire and Invasive Species Habitat Assessment	2015	Removed
I - Adaptive Management Strategy for Greater Sage-Grouse Habitat Management	2015	Removed, see new rangewide management direction

Appendix 2.8
Miles City RMP

This page intentionally left blank.

2.8 MILES CITY RMP

This appendix presents the approved RMP revision language from the 2015 record of decision for the Miles City RMP that relate to GRSG management. The Miles City RMP was not amended in 2019. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.8.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.8.1 Miles City RMP (Montana)

Table 1. Comparison of the Proposed RMP Amendment to Existing GRSG RMP Management Direction in Miles City RMP

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Special Status Species: *GRSG Habitat*	
Goal 1: Provide for the conservation, enhancement, restoration, and connectivity of the Northern Great Plains mixed grass prairie and shrubland, capable of supporting sustainable populations of GRSG and other wildlife species.	Partially Revised: Clarified to a general sagebrush goal, and rangewide goal added.
Objective 1: Maintain, improve and increase sagebrush habitats to sustain sagebrush obligates and other sagebrush dependent species.	No change (same as 2015)
Objective 2: Conserve GRSG habitat while promoting movement and genetic diversity	No change (same as 2015)
Objective 3: Priority will be given to leasing and development of fluid minerals outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources in PHMA and GHMA, and subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 United States Code (U.S.C.) 226(p) and 43 CFR, Part 3162.3- 1(h).	Completely Revised – revised by rangewide direction
Objective 4: Where a proposed fluid mineral development on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other proponents to avoid, minimize and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessees, operators, or other proponent in developing an application for permit to drill (APD) for the lease to avoid and minimize impacts on GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.	Completely Revised – revised by rangewide direction

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD 1: In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	Completely Revised - revised by rangewide and state specific direction
MD 2: Will follow the adaptive management strategy outlined in Appendix H, GRSG Adaptive Management Strategy. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	Completely Revised – revised by rangewide direction
New: state-specific sensitive status species management	Added by state specific direction
New: rangewide predation management	Added by rangewide direction
Sage Grouse Habitat – General Habitat Management Areas	
Goal 1: Maintain or increase habitat needed for GRSG through the management of surface disturbing and disruptive activities, including the loss and distribution of sagebrush habitat.	No change (same as 2015)
Objective 1: Conserve GRSG habitat while promoting movement and genetic diversity.	No change (same as 2015)
MD 1: Major ROWs (100 kv and over for high voltage transmission lines and 24 inch in width and over for large pipelines) and renewable energy ROWs will avoid GRSG GHMA (1,395,000 acres).	Completely Revised - revised by rangewide and state specific direction
Minor ROWs will be allowed with design features to protect breeding, nesting and brood rearing in GRSG GHMA (1,365,000 acres).	Completely Revised - revised by rangewide and state specific direction
Other surface-disturbing and disruptive activities (including Mineral Material Sales) will be allowed with design features to protect breeding, nesting, and brood-rearing GRSG habitat (1,365,000 acres).	Completely Revised - revised by rangewide and state specific direction
Oil and gas leasing is open and surface occupancy and use is prohibited within 0.6 miles of the perimeter of leks (NSO) (61,000 acres).	Completely Revised - revised by rangewide and state specific direction
In addition, surface occupancy and use within 2 miles of leks is restricted or prohibited. Prior to such activities, a plan to mitigate impacts on nesting GRSG or their habitat will be prepared by the proponent and implemented upon approval, by the Authorized Officer (AO) (CSU) (652,000 acres).	Completely Revised - revised by rangewide and state specific direction
In undertaking BLM management actions and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the United States geological Survey (USGS) Report (see Appendix B, GRSG Conservation Buffer).	Completely Revised - revised by state specific direction
Sage Grouse Habitat – Priority Habitat Management Areas	
Objective 1: Maintain or increase GRSG habitat over the long-term, recognizing valid existing rights.	No change (same as 2015)
Objective 2: Restore degraded GRSG habitat.	No change (same as 2015)
Objective 3: Manage permitted uses while providing GRSG habitat for the long-term.	No change (same as 2015)
MD 1: Where deemed effective, water developments will be managed to reduce the spread of West Nile virus (see Appendix C, GRSG Required Design Features).	Completely Revised - revised by state specific direction

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD 2: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	Completely Revised - revised by rangewide direction
MD 3: PHMA is managed according to the following prescriptions:	Completely Revised - revised by state specific direction
• Renewable Energy ROWs will be excluded within GRSG priority areas (817,000 acres).	Completely Revised - revised by state specific direction
• PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met:	Completely Revised - revised by state specific direction
• The activity is within the PHMA BSU and area disturbance cap.	Completely Revised - revised by state specific direction
• The activity is subject to the provisions set forth in the mitigation framework (Appendix F, GRSG Regional Mitigation Strategy).	Completely Revised - revised by state specific direction
• All applicable required design features are applied; and (if applicable) the activity is permissible under the specific subregional screening criteria.	Completely Revised - revised by state specific direction
• Oil and gas leasing is open and surface occupancy and use is prohibited within sage grouse priority areas (NSO (1,329,000 acres).	Completely Revised - revised by state specific direction
• No waivers or modifications to a fluid mineral lease no-surface occupancy stipulation will be granted. The AO may grant an exception to a fluid mineral lease no-surface occupancy stipulation only where the proposed action: • Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or, • Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and will provide a clear conservation gain to GRSG. • Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP revision. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. • Any exceptions to this lease stipulation may be approved by the AO only with the concurrence of the State Director. The AO may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfied (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.	Completely Revised - revised by state specific direction

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
• Major (high voltage transmission lines and large pipelines) and minor ROWs will avoid GRSG priority areas (817,000 acres).	Completely Revised - revised by state specific direction
• In undertaking BLM management actions, and consistent with valid and existing rights and law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-grouse – A Review (Open File Report 2014-1239)*, in accordance with Appendix B, GRSG Conservation Buffer.	Completely Revised - revised by state specific direction
[Plan Maintenance Action in 2018 conducted to acknowledge adoption of the State of Montana Habitat Conservation Program Density Disturbance Calculation Tool, changed Montana BLM Field Offices to a 5% cap. See DOI-BLM-MT-2018-0005-CX.] • If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG PHMA in any given BSU, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the Mining Law of 1872, as amended, valid existing rights, etc.) will be permitted by BLM within GRSG PHMA in any given BSU until the disturbance has been reduced to less than the cap. • If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a analysis area in PHMA, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the Mining Law of 1872, valid existing rights, etc.) will be permitted by BLM within PHMA in a analysis area until the disturbance has been reduced to less than the cap. • If the BLM determines that the State of Montana has adopted a GRSG Habitat Conservation Program that contains comparable components to those found in the State of Wyoming's Core Area Strategy including an all lands approach for calculating anthropogenic disturbances, a clear methodology for measuring the density of operations, and a fully operational Density Disturbance Calculation Tool, the 3% disturbance cap will be converted to a 5% cap for all sources of habitat alteration within an analysis area.	Completely Revised - revised by state specific direction
MD 4: Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	Partially Revised – updated Appendix Reference as needed
GRSG Habitat – Restoration Areas	
Objective 1: Strive for proponents to develop area-wide Habitat Recovery Plans.	Completely Revised - revised by rangewide and state specific direction
Objective 2: Strive for no net loss of GRSG habitat.	Completely Revised - revised by rangewide and state specific direction
Objective 3: Strive for the restoration of previously disturbed landscapes in a manner which increases or improves the quality and quantity of GRSG habitat.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD 1: Surface-disturbing and disruptive activities will be allowed with required design features to minimize disturbance to GRSG habitat (87,000 acres). Oil and gas leasing is open and surface occupancy and use is subject to design features, to minimize disturbance to GRSG habitat in the Cedar Creek Area (CSU) (22,000 acres). In the West Decker (11,000 acres) and South Carter Area (164,000 acres) oil and gas leasing is open and surface occupancy and use is prohibited (NSO). Renewable Energy ROWs will be excluded within all Restoration Areas. Major ROWs will be avoided and minor ROWs will be allowed with design features.	Completely Revised - revised by rangewide and state specific direction
Vegetation	
Objective 5: In all PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2015)
MD 2: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and principles like those included in the Fire and Invasive Species Team (FIAT) report (Chambers et. al., 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated.	Partially Revised - revised by state specific direction for clarity
MD 4: Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No change (same as 2015)
Wildland Fire Management and Ecology	
Fuels Management/Prescribed Fire	
MD 3: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT Report objectives will be addressed and met; • a risk assessment to address how potential threats to GRSG habitat will be minimized. Prescribed fire as vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	No change (same as 2015)

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Wildfire Management	
MD 1: The BLM will prioritize fire management activities according to potential risks to life and property across the planning area. Wildfires adjacent to or near wildland urban or industrial interface will have the highest priority for fire suppression. In PHMA, prioritize suppression, after life and property, to conserve the habitat. In GHMA, prioritize suppression where wildfires threaten PHMA.	No change (same as 2015)
Livestock Grazing	
MD 3: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.	Completely Revised – revised by rangewide direction
MD 4: The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMA will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR, Part 4180.2) and ecological site potential and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Completely Revised – revised by rangewide direction
MD 5: Allotments within PHMA, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	Completely Revised – revised by rangewide direction
MD 6: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments (RCAs) or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	Completely Revised – revised by rangewide direction
Lands and Realty	
Land Tenure	
MD 5: Lands classified as PHMA and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG.	No change (same as 2015)
Minerals	
Fluid Minerals (oil and gas)	
Geothermal managed as a fluid mineral (e.g., same stipulations as oil and gas)	Partially Revised to clarify fluid minerals is O&G and geothermal

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD 8: Where the federal government owns the mineral estate in PHMA and GHMA, and the surface is in non-federal ownership, apply the same stipulations, conditions of approval (COAs), and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	Partially Revised - revised by state specific direction to clarify HMA language.
Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	Partially Revised - revised by state specific direction to clarify HMA language.
Coal	
MD 3: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	Completely Revised - revised by rangewide direction
Non-Energy Leasable	
New: rangewide nonenergy minerals management	Added by rangewide direction
Comprehensive Trails and Travel Management	
Objective 7: The BLM will strive to complete travel management planning using a developed strategy that sets time frames and prioritizes Travel Management Areas (TMAs). TMAs within the priority GRSG habitat area will strive to be prioritized and completed as funding and staffing allows.	No change (same as 2015)
Objective 8: The BLM will create a developed strategy based on information found in the BLM Handbook H-8342, Travel and Transportation. Areas receiving focus and a higher priority will be based on priority GRSG habitat areas, heavily used areas, social conflict concerns, resource concerns, consideration of primary travelers, valid existing rights, visitor recreation experiences, and development for administrative or public access.	No change (same as 2015)
MD 1: On BLM administered surface, including PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).	No change (same as 2015)
Temporary closure or restriction orders under these authorities are enacted at the discretion of the AO to resolve management conflicts and protect persons, property, and public lands and resources. Where an AO determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR, Part 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No change (same as 2015)

GRSG Management from Miles City RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Recreation and Visitor Services (SRMAs)	
MD 1: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised - revised by state specific direction, see mitigation and SSS sections.
GRSG Habitat Objectives	
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Habitat objective language was deleted and replaced with the text below.] The habitat objectives for GRSG (Table 2-6) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-6 vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and ● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	Completely Revised – revised by rangewide direction. Table 2-6 removed, indicators now in new appendix.

Table 2. Miles City Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicator	Desired Condition	References
BREEDING, NESTING AND EARLY BROOD-REARING (Seasonal Use Period March 1-June 15)			
Lek Security	Proximity of trees	.65–Km^2 (.388 miles) avoidance of coniferous habitats	Doherty 2008
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. 2015
Cover	Sagebrush canopy cover	5-25%	Herman–Brunson 2007 Swanson 2009 Doherty et al. 2010 Hagen et al. 2007 Doherty et al. 2011 Foster et al. 2014 Wright and Wegner 2008
	Sagebrush height	6-31 inches (15-50cm)	Swanson 2009 Doherty et al. 2011 Schroeder et al. 1999 Holloran et al. 2005
	Predominant sagebrush shape	Predominately spreading shape	Stiver et al. 2015
	Perennial grass cover (such as western wheatgrass)	≥10%	Doherty et al. 2010 Hagen et al. 2007 Doherty et al. 2011 Holloran et al. 2005
	Perennial grass and forb height (includes residual grasses)	Adequate nest cover based on ecological site potential and seasonal precipitation; 4.4-11.3 inches (11.4-29 cm)	Doherty et al. 2014
	Perennial forb canopy cover	≥3%	Doherty et al. 2010 Hagen et al. 2007 Doherty et al. 2011 Holloran et al. 2005
BROOD-REARING/SUMMER (Seasonal Use Period June 16-October 31)			
Cover	Sagebrush canopy cover	5-25%	Herman–Brunson 2007 Swanson 2009 Doherty et al. 2010 Hagen et al. 2007 Doherty et al. 2011 Foster et al. 2014
	Sagebrush height	6-31 inches (15-50cm)	Doherty et al. 2011 Foster et al. 2014 Schroeder et al. 1999 Holloran et al. 2005
	Perennial grass canopy cover and forbs	≥10%	Doherty et al. 2010 Hagen et al. 2007 Doherty et al. 2011 Holloran et al. 2005
	Riparian areas/mesic meadows	Proper Functioning Condition	BLM 1997 Prichard et al. 1999 Prichard 1998
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present.	Stiver et al. 2015 Doherty et al. 2011

Attribute	Indicator	Desired Condition	References
WINTER (Seasonal Use Period November 1-February 28)			
Cover and Food	Sagebrush canopy cover above snow	>10%	Swanson 2009 Foster et al. 2014 Schroeder et al. 1999
	Sagebrush height above snow	6-31 inches (15-50cm)	Doherty et al. 2011 Schroeder et al. 1999

2.8.2 Relevant Appendices

The following table shows which appendices from the 2015 plan have management direction that may change through the Proposed RMPA. The 2015 Appendices can be found on the Miles City RMP ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Maps	Completely Revised – see Appendix 1 for new maps
B: GRSG Conservation Buffer	Completely revised – see state-specific language
C: GRSG Required Design Features	Partially revised – updates and additions per rangewide and state specific management
D: GRSG Monitoring Framework	Completely revised –see new rangewide management direction
E: GRSG Disturbance Cap	Removed, replaced by rangewide direction
F: GRSG Regional Mitigation Strategy	Removed, replaced by rangewide direction
G: Minerals Stipulations	Partially revised – updated for GRSG stipulations (see Appendix 16)
H: Adaptive Management Strategy for GRSG Habitat Management	Removed, replaced by rangewide direction
I: Air Resources and Climate	No change (same as 2015)
J: Fish, Aquatic and Wildlife Habitat Including Special Status Species	No change (same as 2015)
K: Livestock Grazing	No change (same as 2015)
L: Mitigation Measures and Conservation Actions	No change (same as 2015)
M: Monitoring	No change (same as 2015)
N: Reclamation	No change (same as 2015)
O: Recreation	No change (same as 2015)
P: Special Designation Areas	No change (same as 2015)

Appendix 2.9

Upper Missouri River Breaks National Monument RMP

This page intentionally left blank.

2.9 UPPER MISSOURI RIVER BREAKS NATIONAL MONUMENT RMP

This appendix presents the approved RMP language from the 2009 record of decision for the Upper Missouri River Breaks National Monument (UMRBNM) RMP that relate to GRSG management. The UMRBNM RMP was not part of either 2015 or 2019 GRSG amendment process. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.9.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.9.1 UMRBNM RMP (Montana)

Table 1. Comparison of the Proposed RMP Amendment to Existing GRSG RMP Management Direction in UMRBNM RMP

GRSG Management from UMRBNM RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Management Decisions: Vegetation Communities	
The BLM will consider mechanical treatment as the primary method and prescribed fire as a secondary method to remove conifers encroaching on sage-grouse habitat, except where forested habitat is limited.	No change (same as 2009)
The BLM will promote sage planting, where appropriate, on project areas (such as sites where sagebrush has been removed for crested wheat grass conversions) occurring within sage-grouse habitats and will reclaim and/or reseed areas disturbed by treatments.	No change (same as 2009)
New: state-specific vegetation management	Added by state specific direction
Management Decisions: Terrestrial and Aquatic Wildlife Resources	
Sage-grouse management will utilize the 2005 Management Plan and Conservation Strategies for Sage-Grouse in Montana – Final for overall guidance and direction.	Completely Revised - revised by state specific direction
New: rangewide predation, adaptive management, mitigation, disturbance, and HMA, management	Added by rangewide direction
New: state-specific sensitive status species, including HMA, management	Added by state specific direction
Management Decisions: Habitat Objectives	
The BLM will manage for a healthy diverse vegetative community with a variety of forbs, and maintain big sagebrush and silver sage on sage-grouse wintering and nesting areas with a canopy cover of 15-30% and an average height of 12 inches.	Completely Revised - revised by rangewide direction
New: rangewide habitat objectives	Added by rangewide direction
Management Decisions: Disturbance	
Greater Sage-Grouse – The BLM will not authorize new surface-disturbing or disruptive activities within 1/4 mile of active leks, nor will it allow new surface-disturbing or disruptive activities within nesting areas (a 2-mile radius of an active lek) from March 1 to June 15. The BLM will not authorize any new surface-disturbing or disruptive activities in active sage-grouse winter habitat from December 1 to March 31.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from UMRBNM RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
The following mitigating measures will be applied to new surface-disturbing or disruptive activities for identified/important wildlife habitat in the Monument. Mitigating measures will be applied on a case-by-case basis during activity level planning after an on-site evaluation of the project area indicates the presence of a species. Exceptions to these mitigation measures may be granted by the authorized officer if an environmental review demonstrates there would be no adverse impacts, habitat for the species is not present in the area, or portions of the area can be occupied without affecting a particular species. Exceptions will also be considered for interim and final reclamation.	Partially Revised - revised by rangewide and state specific direction to specify GRSG mitigation approach (refer to GRSG mitigation section)
Management Decisions: Wildland Fire Ecology and Management	
The appropriate management response to all wildland fires will be based on firefighter and public safety and resource values on BLM, state, and private land while considering the natural role of fire. Fires could be managed with less than full suppression efforts and, in most cases, allowed to burn to natural barriers or roads. The cost of suppression will also be considered. Resource values, such as sage-grouse habitat, will be protected during wildland fire suppression through the knowledge of resource advisors assigned to wildland fire incidents and/or information on the location of critical resource areas available to incident commanders; however, protection for resource values will be secondary to life safety and property values.	No change (same as 2009)
New: state-specific fire and fuels management	Added by state specific direction
Management Decisions: Lands and Realty	
The BLM's goal is to provide reasonable access for the public and for private landowners, as well as for the administrative needs and authorized uses of industry and government agencies. Under the Proclamation, all federal lands and interests in lands are "hereby appropriated and withdrawn from all forms of entry, location, selection, sale, or leasing or other disposition under the public land laws . . . and from disposition under all laws relating to mineral and geothermal leasing, other than by exchange that furthers the protective purposes of the monument. The establishment of this monument is subject to valid existing rights. . . . Lands and interests in lands within the proposed monument not owned by the United States shall be reserved as a part of the monument upon acquisition of title thereto by the United States." In addition to the seven utility and transportation corridors that cross the Missouri River, the Klabzuba pipeline on the south side of the river will also be a designated corridor (Table 2.5). The corridor for the Klabzuba pipeline will only be on the south side of the river. The pipeline follows the McClelland/Stafford Ferry corridor on the north side of the river. [Language about corridors is general, but included here for reference. RMP goes forward with specifics about each corridor.]	No change (same as 2009)
Avoidance areas for ROWs include the scenic sections of the UMNWSR, the Bodmer Landscapes, the Cow Creek ACEC, cultural/historic sites, riparian and wetland areas, areas containing unique geologic formations, areas considered unsuitable due to erosion and slope, and sage-grouse seasonal habitat where impacts could not be mitigated or effectively controlled.	Completely Revised - revised by rangewide direction [Amendment applies to GRSG Only]

GRSG Management from UMRBNM RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Applications for commercial wind energy systems, solar energy systems and communication sites will not be considered.	No change (same as 2009) Rangewide exceptions to exclusion not applicable in UMRBNM
New: rangewide and state-specific ROW management	Added by rangewide and state specific direction
Management Decisions: Fluid Mineral Resources	
The BLM's goal is to provide reasonable oil and gas exploration and development on existing leased land without diminishing the objects of the Monument. The Proclamation does not allow new oil and gas leases in the Monument. The 43 federal oil and gas leases in the Monument are considered to have valid existing rights based upon the Proclamation, wherein it states "The establishment of this monument is subject to valid existing rights. The Secretary of Interior shall manage development on existing oil and gas leases within the monument, subject to valid existing rights, so as not to create any new impacts that would interfere with the proper care and management of the objects protected by this proclamation." The existing leases are also in compliance with their lease terms and conditions.	No change (same as 2009)
[RMP includes language about managing O&G leases in general with consideration for the objects of the monument: Through the environmental review process, the BLM will determine the potential impacts of oil and gas operations and mitigation measures to avoid interference with the proper care and management of the objects protected by the Monument. If the analysis and documentation indicate that a proposal may have impacts that are not in conformance with the Proclamation, regulation, BMPs or existing resource management plans, the BLM will work with the applicant to find alternatives or modifications to the proposal that will minimize such impacts through special permit conditions, consistent with the applicant's rights under applicable laws, regulations and stipulations. See the RMP for specific language.]	No change (same as 2009)
Conditions of Approval In addition to the oil and gas lease stipulations (Appendix H), reasonable conditions of approval, under BLM's authority to protect the objects in the Monument, will be applied to APDs. The conditions of approval will apply to all the oil and gas lease acreage (42,805 acres) in the Monument. The conditions of approval will be applied to the APD after an onsite evaluation indicates the presence of the specific resource and after considering the waivers, exceptions and modifications listed in Appendix H. The current APD review process will be utilized, which includes a 30-day posting period for public review of the proposal. The current stipulations (Form 3109-1) will apply to the portions of five of the 12 West HiLine leases that are outside the Monument (2,454 acres). Seasonal or distance restrictions will be placed on oil and gas activities to protect sage-grouse nesting areas and winter habitat, active ferruginous hawk nests, big game winter range, and bighorn sheep distribution and bighorn sheep lambing areas.	No change (same as 2009)
New: state-specific and rangewide fluid mineral management	Added by rangewide and state specific direction

GRSG Management from UMRBNM RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Greater Sage-Grouse Nesting Zone – Surface-disturbing or disruptive activities will be prohibited from March 1 to June 15 in sage-grouse nesting habitat within 2 miles of a lek. Travel on identified designated roads may include these timing restrictions or limited site visits. *Greater Sage-Grouse Winter Habitat* – Surface-disturbing or disruptive activities will be prohibited from December 1 to March 31 within winter habitat for sage-grouse. This condition will not apply to the operation and maintenance of production facilities. Travel on identified designated roads may include these timing restrictions or limited site visits. *Greater Sage-Grouse Leks* – Surface-disturbing or disruptive activities will be prohibited within 1/4 mile of active sage-grouse leks.	Completely Revised - revised by rangewide and state specific direction
Travel on identified designated roads will be restricted to the minimal vehicle size and type needed for the job. Due to resource issues, timing restrictions may be applied to site visits. For construction and heavy trucks related to production, equipment that exceeds 49dB will be restricted from being within 2 miles of sage-grouse leks between 4:00 a.m. and 8:00 a.m. and from 7:00 p.m. to 10:00 p.m. between March 1 and June 15.	No change (same as 2009)
Management Decisions: Livestock Grazing	
Grazing permittees will avoid the placement of salt or mineral supplements near leks during the breeding season (March 1 to June 15). The placement of salt or mineral supplements by other entities will not be allowed. Supplemental winter feeding will not be allowed on sage-grouse winter habitat and around leks. Concentrations of livestock near leks or winter habitat can disturb or displace sage-grouse. Therefore, concentrations of livestock on leks or other key sage-grouse habitats could be avoided by using conservative stocking levels*, locating salt or other supplements away from leks or winter habitat, adjusting grazing seasons and locating water facilities where they would not jeopardize habitat. ***Conservative Stocking Level** Conservative stocking level is a stocking rate that will result in a moderate utilization level (or less) by livestock at the end of the grazing period for the year. A conservative stocking level will be established based on resource management goals including maintaining healthy vegetation; acceptable livestock performance; expected normal weather; and annual plant production consistent with the Standards for Rangeland Health and Guidelines for Livestock Grazing Management.	Partially revised - revised by rangewide and state specific direction to clarify
New: rangewide livestock grazing management	Added by rangewide direction
Management Decisions: Other Resources	
New: rangewide minerals management	Added by rangewide direction, NM withdrawn as part of the proclamation, current management will apply to these resources with clarifications for GRSG

Table 2. UMRBNM Habitat Objectives for GRSG

[Note: Table from 2015 LFO Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicator	Desired Condition	Reference
BREEDING, NESTING, AND EARLY BROOD REARING (Seasonal Use Period: March 1 to June 30)			
Lek Security	Proximity of trees	Trees or other tall structures are not within line of sight of lek and absent or uncommon within 3 kilometers (km) (1.9 miles) of the lek.	Connelly et al. 2000
	Collision Risks	Fences and other structures that pose a high collision risk are absent or mitigated with visual markers.	Connelly et al. 2000. Stevens 2011
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 100 meters (m; 328 feet [ft.]) of an active lek.	Stiver et al. 2015
Cover	Sagebrush cover	10-25%	Berkeley et al. 2013 Connelly et al. 2000 Doherty et al. 2010 Lane 2005 Hagen et al. 2007 Sant et al. 2014
	Sagebrush height	40-80 centimeters (cm) (15.7-31.5 inches) individual sagebrush available within stand (for nesting) with a variety of heights (including those <40 cm [<15.7 inches]).	Connelly et al. 2000 Lane 2005
	Predominant sagebrush shape	Spreading	Stiver et al. 2015
	Perennial grass cover (such as bluebunch wheatgrass, green needlegrass and western wheatgrass)	≥15%	Connelly et al. 2000 Lane 2005 Sant et al. 2014
	Perennial grass and forb height (includes residual grasses)	≥18 cm (≥7.1 inches)	Berkeley et al. 2013 Connelly et al. 2000 Doherty et al. 2014 Hagen et al. 2007 Taylor et al. 2012
	Perennial forb cover	≥10%	Connelly et al. 2000 Sant et al. 2014
LATE BROOD-REARING/SUMMER (Seasonal Use Period: July 1 to October 31)			
Cover	Sagebrush cover	5-25%	Connelly et al. 2000 Lane 2005 Hagen et al. 2007 Sant et al. 2014
	Sagebrush height	40-80 cm (15.7-31.5 inches) individual sagebrush available within stand (for nesting) with a variety of heights (including those <40 cm [<15.7 inches]).	Connelly et al. 2000 Lane 2005
	Perennial grass and forb cover	≥25%	Connelly et al. 2000 Hagen et al. 2007 Sant et al. 2014
	Riparian areas/mesic meadows	80% or more of PHMA in Proper Functioning Condition (PFC) or higher.	Prichard et al. 1999 Schroeder et al. 1999 USDI BLM 1997
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present	Connelly et al. 2000 Stiver et al. 2015

Attribute	Indicator	Desired Condition	Reference
WINTER (Seasonal Use Period: November 1 to February 28)			
Cover and Food	Sagebrush cover	≥10%	Wallestad 1975 Connelly et al. 2000 Sant et al. 2014
	Sagebrush height	≥25cm (≥9.8 inches)	Connelly et al. 2000.

2.9.2 Relevant Appendices

The following table shows which appendices from the 2009 plan have management direction that may change through the Proposed RMPA. The appendices can be found on the Upper Missouri River Breaks National Monument RMP ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Federal and Montana Ambient Air Quality Standards	No change (same as 2009)
B: Standards for Rangeland Health and Guidelines for Livestock Grazing Management	No change (same as 2009)
C: Best Management Practices	New livestock grazing BMPs to be added based on amendment
D: Cultural Resource Use Categories	No change (same as 2009)
E: Watershed Planning Process	No change (same as 2009)
F: Grazing Allotments	No change (same as 2009)
G: Visitor Use Standards and Indicators	No change (same as 2009)
H: Oil and Gas	Partial revision – addition of new GRSG approach
I: Wildlife Mitigation Noise Levels	No change (same as 2009)
NEW: Rangewide and State-Specific Appendices	New appendices added such as, RDF, Monitoring Framework, Habitat Objectives, and Map appendices

Appendix 2.10

Montana and Dakotas Alternative 1 and 2 Oil and Gas Lease Stipulations

This page intentionally left blank.

2.10 MONTANA AND DAKOTAS OIL AND GAS LEASE STIPULATIONS (ALTERNATIVES 1 AND 2)

The table below presents the oil and gas lease stipulations for Montana and the Dakotas current RMPs that apply to GRSG, including their ID number, stipulation text, and office in which the stipulation applies. All stipulations are completely revised by rangewide and state specific direction in the Alternatives 4, 5, and 6, and the Proposed RMP Amendment (RMPA). See Appendix 16 for stipulations for Alternatives 4, 5, and 6 and the Proposed RMPA and Chapter 2, Table 2-7 for the additional state-specific Montana/Dakotas management direction for the Proposed RMPA.

ID #	Stipulation	Office
LN 14-11	**GREATER SAGE-GROUSE HABITAT** The lease may, in part or in total, contain important greater sage grouse habitats as identified by the BLM, either currently or prospectively. The operator may be required to implement specific measures to reduce impacts of oil and gas operations on the greater sage grouse populations and habitat quality. Such measures shall be developed during the application for permit to drill on-site and environmental review process and will be consistent with the lease rights granted.	All
LN 14-37	**GREATER SAGE-GROUSE HABITAT CONSERVATION** The lessee/operator is given notice that prior to project-specific approval, the authorized officer may consider compensatory mitigation measures proffered by a project proponent, or compensatory mitigation requested or required by a state plan, program, or authorization. Any state required mitigation may be incorporated as a proposed design feature for a proposed project (Instructional Memorandum No. 2019-018). For projects in Montana, lessee/operators may be required to demonstrate they have submitted their project to the Montana Sage-Grouse Habitat Conservation Program for review, and have incorporated any State program requirements into their project proposal in any designated sage-grouse habitat. The objectives of these requirements are to avoid, minimize, or compensate for unavoidable impacts associated with oil and gas development in order to provide a net conservation gain, which is a benefit or gain above baseline conditions when the development occurs within Greater Sage-Grouse habitat as specified in the Record of Decision for the Field Office's Approved Resource Management Plan (Sept, 2015). Site-specific GRSG habitat conservation, mitigation, or compensation requirements would be identified during the BLM environmental review process and would be developed into the project proposal or as terms and conditions of the subsequent approval.	Billings HiLine Miles City South Dakota North Dakota
LN 14-44	**GREATER SAGE-GROUSE** The lease may in part, or in total contain important Greater Sage-Grouse habitats as identified by the BLM, either currently or prospectively. The operator may be required to implement specific measures to reduce effects of oil and gas operations on the Greater Sage-Grouse populations and habitat quality. Such measures shall be developed during the application for permit to drill on-site and environmental review process and will be consistent with the lease rights granted.	Lewistown
CSU 12-30	**SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREAS** Surface occupancy and use within 2 miles of the perimeter of a lek active within the past 5 years may be restricted or prohibited. Prior to such activities, a plan to mitigate impacts to breeding or nesting sage- grouse; or breeding, nesting, or brood rearing habitat will be prepared by the proponent and implemented upon approval by the AO.	Miles City

ID #	Stipulation	Office
CSU 12-31	**SAGE-GROUSE HABITAT – CEDAR CREEK RESTORATION HABITAT MANAGEMENT AREA** Surface occupancy and use would be allowed with design features to minimize disturbance to sage- grouse habitat.	Miles City
CSU 12-40	**GREATER SAGE-GROUSE GENERAL HABITAT** Surface use prohibited within 2 miles of a lek. Surface disturbing and disruptive activities within 2 miles of a lek will be avoided unless the project proponent can clearly demonstrate that the impacts can be adequately mitigated and conservation actions or needed design features are included and the goals of this plan not compromised.	South Dakota
CSU 12-41	**GREATER SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREAS (GHMAs) – UNDERGROUND UTILITY (POWER AND TRANSMISSION) LINES** All new utility and power lines that can be safely buried will be buried within 2 miles of sage-grouse leks and within sage-grouse winter range. When burial of power lines is not possible, above ground lines will be located and designed to minimize impacts of predation, collision, and other associated stressors to sage-grouse. Existing overhead lines within 2 miles of leks and within sage-grouse winter range will be evaluated for threats to sage-grouse and if necessary, modified to reduce the threat. If modification will not likely be effective, the overhead line may be relocated. Any requirements for modification or relocation of existing overhead lines will be subject to valid existing rights.	South Dakota
CSU 12-46	**GREATER SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREA (GHMA)** All identified Greater Sage-Grouse habitat within GHMA is subject to the following operating constraints: Maintain Greater Sage-Grouse habitat to promote movement and genetic diversity of Greater Sage- Grouse populations To minimize the impacts of surface disturbing/disruptive activities and ensure maintenance of habitat for sustainable populations of Greater Sage-Grouse within GHMA, surface disturbing and disruptive activities are subject to the following requirements. a) Surface disturbing/disruptive activities will prevent or minimize disturbance to Greater Sage-Grouse or their habitat. Except as identified above or during emergency situations, activities will not compromise the habitat. b) Continuous noise (related to long-term operations and/or activities) will be no greater than 49 decibels at 1/4 miles from the perimeter of the lek. c) Temporary noise (related to installation, maintenance, one-time use, emergency operations, etc.) exceeding 49 decibels at 1/4 miles from the perimeter of a lek or surface disturbing/disruptive activities may be allowed, but only from 10 a.m. to 4 p.m. between March 15 and May15. d) Manage water developments to reduce the spread of West Nile virus within sage-grouse habitat areas. e) Site and/or minimize linear ROW to reduce disturbance to sagebrush habitats. f) Maximize placement of new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors. g) Power lines will be buried, eliminated, designed, or sited in a manner which does not impact sage- grouse. h) Placement of other high profile structures, exceeding 10 feet in height, will be eliminated, designed, or sited in a manner which does not impact sage-grouse. i) Remote monitoring of production facilities must be utilized, and all permit applications must contain a plan to reduce the frequency of vehicle use.	North Dakota

ID #	Stipulation	Office
	J) Maximize the area of interim reclamation on long-term access roads and well pads including reshaping, topsoiling and revegetating cut and fill slopes. k) Restore disturbed areas at final reclamation to pre-disturbance conditions or desired plant community. l) Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts to sage-grouse. m) Consider use of off-site mitigation, (e.g. creation of sagebrush habitat, purchase conservation easements, or buying down grazing) with proponent dollars to offset habitat losses. n) Consider creation of a "Mitigation Trust Account" when impacts cannot be avoided, minimized, or effectively mitigated through other means. If approved by the BLM, the proponent may contribute funding to maintain habitat function based on the estimated cost of habitat treatments or other mitigation needed to maintain the functions of impacted habitats. Off-site mitigation should only be considered when no feasible options are available to adequately mitigate within and immediately adjacent to the impacted site, or when the off- site location will provide more effective mitigation of the impact than can be achieved on-site	
CSU 12-66	**CRUCIAL WINTER RANGE – BIG GAME AND/OR SAGE-GROUSE** Prior to surface-disturbing or disruptive activities a plan to maintain functionality of crucial winter range for big game and/or Greater Sage-Grouse will be prepared by the proponent and implemented upon approval by the authorized officer. Within crucial winter range surface-disturbing or disruptive activities will be restricted or prohibited within 6/10 of a mile from any existing surface-disturbing or disruptive activity. The plan shall address how short-term and long-term direct and indirect effects to crucial winter range will be mitigated based on current science and research (Appendix E.5).	HiLine
CSU 12-67	**GREATER SAGE-GROUSE NESTING HABITAT (GENERAL HABITAT MANAGEMENT AREAS)** Within Greater Sage-Grouse general habitat surface-disturbing or disruptive activities may be restricted or prohibited within 2 miles of Greater Sage-Grouse leks. Prior to surface-disturbing or disruptive activities a plan to maintain functionality of Greater Sage-Grouse habitat will be prepared by the proponent and implemented upon approval by the authorized officer. This plan shall address how short- term and long-term direct and indirect effects to nesting and brood-rearing areas will be mitigated based on current science and research (Appendix E.5).	HiLine
CSU 12-69	**GREATER SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREAS (GHMA)** In General Habitat Management Areas (GHMA), parcels would be offered for lease subject to Controlled Surface Use restrictions (including RDFs). Activities will be avoided within the following distances from a sage-grouse lek: • linear features (roads) within 3.1 miles of leks. • infrastructure related to energy development within 3.1 miles of leks. • tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks. • low structures (e.g., fences, rangeland structures) within 1.2 miles of leks. • surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks. • noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.	Dillon

ID #	Stipulation	Office
CSU 12-73	**GREATER SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREAS (GHMAs)** Within Greater Sage-Grouse general habitat surface-disturbing or disruptive activities may be restricted or prohibited within 2 miles of Greater Sage-Grouse leks. Prior to surface-disturbing or disruptive activities, a plan to maintain functionality of Greater Sage-Grouse habitat will be prepared by the proponent and implemented upon approval by the authorized officer. This plan shall address how short-term and long-term direct and indirect effects to nesting and brood-rearing areas will be mitigated based on current science and research.	Lewistown
NSO 11-4	**GROUSE LEKS** No surface occupancy or use is allowed within one-quarter mile of grouse leks.	Butte Dillon
NSO 11-35	**SAGE GROUSE STRUTTING GROUNDS** No surface occupancy or use is allowed within one-quarter mile of active sage grouse strutting grounds.	North Dakota
NSO 11-79	**SAGE-GROUSE HABITAT – PRIORITY ARES, WEST DECKER RESTORATION AREA, SOUTH CARTER RESTORATION AREA** Surface occupancy and use is prohibited within sage-grouse priority areas, West Decker Restoration area, and South Carter Restoration Area.	Miles City
NSO 11-80	**SAGE-GROUSE HABITAT – GENERAL HABITAT MANAGEMENT AREA** Surface occupancy and use is prohibited within 6/10 mile of the perimeter of sage-grouse leks.	Miles City
NSO 11-96	**GREATER SAGE-GROUSE GENERAL HABITAT LEKS** No surface occupancy or use within 6/10 mile from leks.	South Dakota
NSO 11-97	**GREATER SAGE-GROUSE CRUCIAL WINTER RANGE** Sage-grouse crucial winter range will be managed as a No Surface Occupancy for oil and gas development and exploration.	South Dakota
NSO 11-98	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREAS (PHMAs)** Greater Sage-Grouse PHMAs will be managed as No Surface Occupancy and Use (127,735 surface and 412,822 oil and gas subsurface mineral acres.) These areas will be open to oil and gas leasing with no surface occupancy stipulation. All sage-grouse habitat that is not part of PHMAs will be managed as GHMA as noted in Figure 1-2.	South Dakota
NSO 11-99	**GREATER SAGE-GROUSE WINTER RANGE IN PRIORITY HABITAT MANAGEMENT AREAS (PHMAs)** Sage-grouse crucial winter range will be managed as a No Surface Occupancy for oil and gas development and exploration.	South Dakota
NSO 11-111	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREA (PHMA)** Surface occupancy and use is prohibited within Greater Sage-Grouse PHMA.	North Dakota
NSO 11-127	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREAS (PHMAs)** To protect Greater Sage-grouse, a priority species for management, surface occupancy and use is prohibited for oil and gas exploration and development within Greater Sage-grouse Priority Habitat Management Areas (PHMAs).	Billings
NSO 11-128	**GREATER SAGE-GROUSE GENERAL HABITAT MANAGEMENT AREAS** To protect general habitat areas for Greater Sage-grouse breeding activities, surface occupancy and use is prohibited for oil and gas exploration and development within 0.6 mile of the perimeter of Greater Sage-grouse leks.	Billings

ID #	Stipulation	Office
NSO 11-129	**GREATER SAGE-GROUSE RESTORATION AREAS** To protect restoration areas for Greater Sage-grouse breeding activities, surface occupancy and use is prohibited for oil and gas exploration and development within 0.6 mile of the perimeter of Greater Sage- grouse leks.	Billings
NSO 11-136	**CRUCIAL WINTER RANGE** Surface occupancy and use is prohibited for oil and gas exploration and development in crucial winter range for antelope, elk, moose, bighorn sheep, mule deer, white-tailed deer, and Greater Sage-grouse.	Billings
NSO 11-141	**SAGEBRUSH FOCAL AREA** Surface occupancy and use is prohibited within the Sagebrush Focal Area.	HiLine
NSO 11-151	**GREATER SAGE-GROUSE LEKS (GENERAL HABITAT AREAS)** Surface occupancy and use is prohibited within 0.6 miles of Greater Sage-Grouse leks. This stipulation does not apply within the boundaries of the Greater Sage-Grouse Priority Habitat Management Area.	HiLine
NSO 11-152	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREAS (PHMA)** Surface occupancy and use is prohibited within Greater Sage-Grouse Priority Habitat Management Area and the Grassland Bird/Greater Sage-Grouse Priority Habitat Management Area.	HiLine
NSO 11-159	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREAS (PHMA)** Priority Habitat Management Areas (PHMA) outside of Sagebrush Focal Areas would be open to mineral leasing and development subject to NSO with a limited **Exception**.	Dillon
NSO 11-171	**CRUCIAL WINTER RANGE** Surface occupancy and use is prohibited in crucial winter range for the following BLM priority species for management: • bighorn sheep • elk • greater sage-grouse • moose • mule deer • pronghorn • whitetail deer	Lewistown
NSO 11-181	**SAGEBRUSH FOCAL AREA** Surface occupancy and use is prohibited within the Sagebrush Focal Area (SFA)	Lewistown
NSO 11-182	**GREATER SAGE-GROUSE PRIORITY HABITAT MANAGEMENT AREAS (PHMAs)** To protect greater sage-grouse, a priority species for management, surface occupancy and use is prohibited for oil and gas exploration and development within greater sage-grouse Priority Habitat Management Areas (PHMAs).	Lewistown
NSO 11-183	**GREATER SAGE-GROUSE LEKS IN GENERAL HABITAT MANAGEMENT AREAS (GHMAs)** Surface occupancy and use is prohibited within 0.6 miles of the perimeter of greater sage-grouse leks in general habitat management areas.	Lewistown
TL 13-6	**BROOD-BEARING HABITAT** No surface use is allowed in nesting and early brood-rearing habitat (defined as within three miles of Leks) during the following time period: March 1 through June 30	Dillon

ID #	Stipulation	Office
TL 13-14	**SAGE GROUSE WINTER AND SPRING RANGE** No surface use is allowed from December 1 through May 15 within winter and spring range for Sage Grouse. This stipulation does not apply to operation and maintenance of production facilities.	Butte Dillon
TL 13-17	**STRUTTING GROUNDS** No surface use is allowed within two miles of active strutting grounds during the following time period: March 1 to June 15. This stipulation does not apply to the operation and maintenance of production facilities.	North Dakota
TL 13-30	**EARLY BROOD REARING HABITAT** No surface use is allowed from March 1 through June 30 in nesting and early brood rearing habitat (defined as within three miles of Leks). This stipulation does not apply to operation and maintenance of production facilities unless the findings of analysis demonstrate the continued need for such mitigation and that less stringent project- specific mitigation measures would be insufficient.	Butte
TL 13-40	**SAGE-GROUSE NEST AREAS (RESTORATION AREAS AND GENERAL HABITAT MANAGEMENT AREAS)** Surface use is prohibited from March 1 through June 30 within 3 miles of sage grouse leks. This stipulation does not apply to operation and maintenance of production facilities.	Billings
TL 13-43	**GREATER SAGE-GROUSE WINTER RANGE** Surface occupancy and use is prohibited from December 1 through March 31 in Greater Sage-Grouse winter range.	HiLine
TL 13-48	**WINTER RANGE – BIG GAME AND GREATER SAGE-GROUSE** Surface occupancy and use is prohibited from December 1 through May 15 in big game winter range.	HiLine

Appendix 2.11
North Dakota RMP

This page intentionally left blank.

2.11 NORTH DAKOTA RMP

This appendix presents the GRSG approved RMP amendment language from the 2015 record of decision for the North Dakota RMP Amendment. The North Dakota RMP was not amended in 2019. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 appendices that are listed in **Section 2.11.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.11.1 North Dakota RMP

Table 1. Comparison of the Proposed RMP Amendment to Existing GRSG RMP Management Direction in North Dakota RMP

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Special Status Species (SSS)	
Goal SSS-1: Maintain and/or increase GRSG abundance and distribution by conserving, enhancing, or restoring the sagebrush ecosystem upon which populations depend, in cooperation with other conservation partners.	Completely Revised – revised by rangewide direction
Objective SSS-1.1: Protect PHMA from anthropogenic disturbances that will reduce distribution or abundance of GRSG. Manage PHMA so that discrete anthropogenic disturbances cover less than 3% of the total GRSG habitat.	Completely Revised - revised by rangewide and state specific direction
Objective SSS-1.2: Habitat Delineation: Delineate PHMA to encompass the 100% Breeding Bird Density map: 32,900 BLM surface acres (7% of total PHMA acres). Since mapping 75% of breeding bird density map misses the majority of GRSG habitat in North Dakota, 100% was used. See Figure 2-1, North Dakota Habitat Management Areas (Appendix A, Approved RMP Amendment Maps).	Completely Revised - revised by rangewide and state specific direction
Objective SSS-1.3: Habitat Delineation: Delineate GHMA to encompass the remainder of the habitat: 80 BLM surface acres. See Figure 2-1 (Appendix A).	Completely Revised - revised by rangewide and state specific direction
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Updated the language for Objective SSS 1-4. These two MDs are deleted and replace with the text below.] The habitat objectives for GRSG (Table 2-2) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-2 vary across the range of sage-	Completely Revised – revised by rangewide direction. Table 2-2 removed, indicators now in new appendix.

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and ● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	
Action SSS-1.1: Protect PHMA from anthropogenic disturbances that will reduce distribution or abundance of GRSG. See Appendix E, Greater Sage-Grouse Disturbance Caps. In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third- party actions, the BLM will apply the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review (Open File Report 2014- 1239) in accordance with Appendix B, Applying Lek Buffer Distances When Approving Actions.	Completely Revised - revised by rangewide and state specific direction
Action SSS-1.2: If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of landownership) within GRSG PHMA in any given BSU (see Figure 2-2, North Dakota and South Dakota GRSG Biologically Significant Unit and Priority Habitat Management Areas [Appendix A]), then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG PHMA in any given BSU until the disturbance has been reduced to less than the cap. (BSU for this ARMPA is the summary of all the PHMA within the Dakotas GRSG population as delineated by USFWS.)	Completely Revised - revised by rangewide and state specific direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action SSS-1.3: If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of landownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area in PHMA, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.) will be permitted by BLM within PHMA in a project analysis area until the disturbance has been reduced to less than the cap.	Completely Revised - revised by rangewide and state specific direction
Action SSS-1.4: Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of landownership) in the PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area.	No change (same as 2015)
Action SSS-1.5: Implement Regional Mitigation Strategy (Appendix F, Regional Mitigation Strategy).	Completely Revised - revised by rangewide and state specific direction
New: rangewide predation management	Added by rangewide direction
Habitat Restoration/Vegetation Management (VEG)	
Objective VEG-1.1: In all PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2015)
Action VEG-1.1: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and principles like those included in RMRS-GTR-326: Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and GRSG: A strategic multi-scale approach (Chambers et al., 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated.	Partially Revised - revised by state specific direction to clarify and remove FIAT reference.
Action VEG -1.2: Consideration for other threatened, endangered or sensitive species will be evaluated in addition to GRSG when prioritizing restoration projects.	No change (same as 2015)
Action VEG -1.3: Include GRSG habitat parameters as defined by State of North Dakota Sage-Grouse conservation plans and appropriate local information in habitat restoration objectives. Make meeting these objectives within PHMA the highest restoration priority, along with other priority species habitat.	Completely Revised – revised by rangewide direction
Action VEG -1.4: In PHMA, require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Where probability of success or adapted seed availability is low, non-native seeds may be used as long as they support GRSG habitat objectives.	No change (same as 2015)

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action VEG -1.5: Design post restoration management to ensure long-term persistence in PHMA. This could include changes in livestock grazing management, travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits GRSG.	No change (same as 2015)
Action VEG -1.6: In PHMA, consider potential changes in climate when proposing restoration seedings when using native plants. Consider collection from the warmer component of the species current range when selecting native species.	No change (same as 2015)
Action VEG -1.7: In PHMA, restore native (or desirable) plants and create landscape patterns which most benefit GRSG, as well as other priority species.	No change (same as 2015)
Action VEG -1.8: Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) a high priority for restoration efforts in PHMA. Prioritize areas for juniper removal to benefit GRSG habitat.	No change (same as 2015)
Action VEG -1.9: In PHMA fire prone areas, where sagebrush seed is required for GRSG habitat restoration, consider establishing seed harvest areas that are managed for seed production and are a priority for protection from outside disturbances.	No change (same as 2015)
Action VEG - 1.10: Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No change (same as 2015)
Fire and Fuels Management (FIRE)	
Fuels Management	
Action FIRE-1.1: In PHMA, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems.	No change (same as 2015)
Do not reduce sagebrush cover to less than 15% unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of PHMA and conserve habitat quality for the species. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover in future NEPA documents.	No change (same as 2015)
Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in a priority area.	No change (same as 2015)
If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT report objectives will be addressed and met; • a risk assessment to address how potential threats to GRSG habitat will be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined	No change (same as 2015)

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	
Monitor and control invasive vegetation post-treatment.	No change (same as 2015)
Rest treated areas from grazing for two full growing seasons unless vegetation recovery dictates otherwise.	No change (same as 2015)
Require use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low, non-native seeds may be used as long as they meet GRSG habitat objectives.	No change (same as 2015)
Design post fuels management projects to ensure long-term persistence of seeded or pre- treatment native plants. This may require temporary or long-term changes in livestock grazing management, travel management, or other activities to achieve and maintain the desired condition of the fuels management project.	No change (same as 2015)
Action FIRE -1.2: Design fuels management projects in PHMA to strategically and effectively reduce wildfire threats in the greatest area.	No change (same as 2015)
Action FIRE -1.3: In PHMA, during fuels management project design, consider the utility of using livestock to strategically reduce fine fuels, and implement grazing management that will accomplish this objective. Consult with ecologists to minimize impacts on native perennial grasses.	No change (same as 2015)
Action FIRE -1.4: If prescribed fire is used, the Burn Plan will clearly indicate how COT objectives will be addressed and met, and why alternative techniques are not applicable. A fire risk assessment will be completed for implementation of prescribed fire used to meet the GRSG goals and objectives in PHMA (see Appendix H, GRSG Wildfire and Invasive Species Habitat Assessment).	Completely Revised - revised by state specific direction
Fire Operations	
Action FIRE -1.5: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. In PHMA, prioritize suppression, immediately after life and property, to conserve the habitat. See Appendix H, which will be completed to help further refine fire management actions once this plan is completed.	No change (same as 2015)
Action FIRE -1.6: In GHMA, prioritize suppression where wildfires threaten PHMA.	No change (same as 2015)
Action FIRE -1.7: Follow the most current BMPs/RDFs for fire and fuels (Appendix C, Required Design Features).	No change (same as 2015)
Emergency Stabilization and Rehabilitation	
Action FIRE -1.8: In PHMA, prioritize native seed allocation for use in GRSG habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from emergency stabilization and rehabilitation (ES&R) projects outside of PHMA to those inside it. Use of native plant seeds for ES&R seedings is required based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low, non-native seeds may be used as long as they meet GRSG habitat conservation objectives. Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.	No change (same as 2015)

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action FIRE -1.9: In PHMA, design post ES&R management to ensure long-term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, and travel management, etc., to achieve and maintain the desired condition of ES&R projects to benefit GRSG.	No change (same as 2015)
Action FIRE -1.10: In PHMA, consider potential changes in climate when proposing post-fire seedings using native plants. Consider seed collections from the warmer component within a species' current range for selection of native seed.	No change (same as 2015)
Livestock Grazing (LG)	
Action LG-1.1: Grazing will be allowed on all lands identified as suitable (approximately 32,945 acres). See Figure 2-3, North Dakota Livestock Grazing (Appendix A).	Completely Revised – revised by rangewide direction
Action LG-1.2: Allocate up to an estimated 5,780 animal unit months to livestock in the long term (livestock use set at 25% of average annual forage production).	Completely Revised – revised by rangewide direction
Action LG-1.3: Within PHMA, incorporate GRSG habitat objectives and management considerations into all BLM grazing allotments through allotment management plans (AMP) or permit renewals. Develop standards with State of North Dakota and USFWS.	Completely Revised – revised by rangewide direction
Action LG-1.4: In PHMA, work cooperatively on integrated ranch planning within GRSG habitat so operations with deeded/BLM allotments can be planned as single units.	Completely Revised – revised by rangewide direction
Action LG-1.5: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (such as fire) and legal obligations.	Completely Revised – revised by rangewide direction
The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMA will include specific management thresholds, based on GRSG Habitat Objectives (Table 2-2), Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Completely Revised – revised by rangewide direction
Allotments within PHMA, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks can include monitoring for actual use, utilization, and use supervision.	Completely Revised – revised by rangewide direction
Action LG-1.6: In PHMA, conduct land health assessments that include (at a minimum) indicators and measurements of structure/condition/composition of vegetation specific to achieving GRSG habitat objectives. Local objectives will be developed at the field office level in partnership with North Dakota Game and Fish Department and USFWS, and incorporated into AMPs or livestock grazing permits as appropriate incorporating best available science.	Completely Revised – revised by rangewide direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LG-1.7: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	Completely Revised – revised by rangewide direction
Implementation Management Action after Land Health Evaluations	
Action LG-1.8: Develop specific objectives to conserve, enhance or restore PHMA based on ecological site descriptions (ESD) and assessments (including within wetlands and riparian areas). If an effective grazing system that meets GRSG habitat requirements is not already in place, analyze at least one alternative that conserves, restores or enhances GRSG habitat in the NEPA document prepared for the permit renewal.	Completely Revised – revised by rangewide direction
Action LG-1.9: In PHMA, manage for vegetation composition and structure consistent with GRSG seasonal habitat objectives. ESDs can help determine whether or not the GRSG seasonal habitat objectives are consistent with the ecological site potential within the reference state. GRSG seasonal habitat objectives and ecological site potential within reference states are not always going to be the same.	Completely Revised – revised by rangewide direction
Action LG-1.10: In PHMA, implement management actions (grazing decisions, AMP/Conservation Plan development, or other agreements) to modify grazing management to meet State of North Dakota seasonal GRSG habitat requirements, where allotment evaluations indicate land health assessments are not being met due to livestock. Consider singly, or in combination, changes in: • Season or timing of use; • Numbers of livestock (includes temporary non-use or livestock removal); • Distribution of livestock use; • Intensity of use; and • Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas, and goats).	Completely Revised – revised by rangewide direction
Action LG-1.11: During drought periods, prioritize evaluating effects of the drought in PHMA relative to their needs for food and cover. Management will continue to be in accordance with the Montana- Dakotas Drought Policy (see Appendix H, Drought Policy, in North Dakota Greater Sage-Grouse Proposed RMPA/Final EIS).	Completely Revised – revised by rangewide direction
Riparian Areas and Wet Meadows	
Action LG-1.12: Where riparian and wetland areas are already meeting standards, they will be maintained in that condition or better. Where a site's capability is less than proper functioning condition (PFC), BLM will manage to achieve or move towards capability. Within PHMA and GHMA, manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing.	Partially Revised - revised by rangewide and state specific direction to clarify

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LG-1.13: In PHMA, where riparian areas and wet meadows meet PFC, strive to move towards GRSG habitat objectives within capabilities of the reference state vegetation relative to the ESD. Example: Within PHMA reduce, where necessary, hot season grazing on riparian and meadow complexes to promote recovery or maintenance of appropriate vegetation and water quality. Utilize fencing/herding techniques, seasonal use, or livestock distribution changes where necessary to reduce pressure on riparian or wet meadow vegetation used by GRSG in the hot season (summer).	Partially Revised - revised by rangewide and state specific direction to clarify
Action LG-1.14: Authorize new water development for diversion from spring or seep source only when PHMA will be maintained or benefit from the development. This includes developing new water sources for livestock as part of an AMP/Conservation Plan to improve GRSG habitat.	Partially Revised - revised by rangewide and state specific direction to clarify
Action LG-1.15: Analyze springs, seeps and associated pipelines at time of grazing lease renewal to determine if modifications are necessary to maintain the continuity of the predevelopment riparian area within PHMA. Make modifications where necessary, considering impacts on other water uses when such considerations are neutral or beneficial to GRSG.	Partially Revised - revised by rangewide and state specific direction to clarify
Treatments to Increase Forage for Livestock/Wild Ungulates	
Action LG-1.16: In PHMA, allow treatments that conserve, enhance or restore GRSG habitat as well as other priority species habitat (this includes treatments that benefit livestock as part of an AMP/Conservation Plan to improve GRSG habitat).	Partially Revised - revised by rangewide and state specific direction to clarify
Action LG-1.17: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to PHMA to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If these seedings are part of an AMP/Conservation Plan or if they provide value in conserving or enhancing the rest of the PHMA, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat or as a component of a grazing system during the land health assessments.	Partially Revised - revised by rangewide and state specific direction to clarify
Structural Range Improvement and Livestock Management Tools	
Action LG-1.18: In PHMA, design any new structural range improvements and location of supplements (salt or protein blocks) to conserve, enhance, or restore GRSG habitat through an improved grazing management system relative to GRSG objectives. Structural range improvements, in this context, include but are not limited to: cattle guards, fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments. Potential for invasive species establishment or increase following construction must be considered in the project planning process and monitored and treated post-construction.	Completely Revised – revised by rangewide direction
Action LG-1.19: When developing or modifying water developments in PHMA, use applicable RDFs (Appendix C) to mitigate potential impacts from West Nile virus.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LG-1.20: In PHMA, evaluate existing structural range improvements and location of supplements (salt or protein blocks) during grazing lease renewal process to make sure they conserve, enhance or restore GRSG habitat. To reduce outright GRSG strikes and mortality, remove, modify or mark fences in high risk areas within PHMA based on proximity to lek, lek size, and topography. Monitor for, and treat invasive species associated with existing range improvements.	Completely Revised - revised by rangewide direction
Mineral Resources (MR)	
Fluid Minerals	
Objective MR-1.1: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non- habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 US Code 226(p) and 43 CFR, Part 3162.3-1(h).	Completely Revised – revised by rangewide direction
Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, minimize, and apply compensatory mitigation for adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an application for permit to drill for the lease to avoid and minimize impacts on GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.	Completely Revised – revised by rangewide direction
Unleased Federal Fluid Mineral Estate	
Action MR-1.1: Open to oil and gas leasing and development; however, surface occupancy and use will be prohibited within PHMA (NSO). Upon expiration or termination of existing leases, apply NSO. See Figure 2-4, North Dakota Fluid Minerals (Oil, Gas, and Geothermal) (Appendix A).	Completely Revised - revised by rangewide and state specific direction
No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The BLM Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action: Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or, Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and will provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMPA. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the	Completely Revised - revised by rangewide and state specific direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the BLM Authorized Officer only with the concurrence of the State Director. The BLM Authorized Officer may not grant an exception unless the state wildlife agency (NDGF), the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and NDGF Director for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.	
Action MR-1.2: In GHMA, surface occupancy and use will be subject to special operating constraints (CSU) (Appendix G, Oil and Gas Stipulations).	Completely Revised - revised by rangewide and state specific direction
Action MR-1.3: Allow geophysical exploration within PHMA to obtain exploratory information for areas outside of and adjacent to PHMA.	Completely Revised - revised by state specific direction
Action MR-1.4: Allow geophysical operations by existing roads and trails, or helicopter-portable drilling methods, and in accordance with seasonal timing restrictions and/or other restrictions that may apply.	Completely Revised - revised by state specific direction
Leased Federal Fluid Mineral Estate	
Action MR-1.5: During implementation level review and decisions (e.g., approval of an application for permit to drill and Sundry Notice) and upon completion of the environmental record of review (43 CFR, Part 3162.5), include appropriate documentation of compliance with NEPA. In this process evaluate, among other things: (1) Whether the conservation measure is "reasonable" (43 CFR, Part 3101.1-2) with the valid existing rights; and (2) Whether the action is in conformance with the approved ARMPA.	Completely Revised - revised by rangewide direction
Conservation Measure #1: The following operating constraints will be applied to existing leases as conditions of approval (COAs) in PHMA and GHMA. Exceptions may be granted by the BLM Authorized Officer if an environmental review demonstrates that effects can be mitigated to an acceptable level, habitat for the species is not present in the area, or portions of the area can be occupied without affecting a particular species. Exceptions may also be granted where the short-term effects are mitigated by the long-term benefits. The BLM may add additional site-specific restrictions as deemed necessary by further environmental analysis and as developed through coordination with other federal, state, and local regulatory and resource agencies. • Surface disturbing/disruptive activities will prevent or minimize disturbance to GRSG or their habitat. Except as identified above or during emergency situations, activities will not compromise the functionality of the habitat. • Manage water developments to reduce the spread of West Nile virus within GRSG habitat areas. • Site and/or minimize linear ROW to reduce disturbance to sagebrush habitats. • Maximize placement of new utility developments (power lines, pipelines, etc.) and transportation routes in existing ROWs.	Completely Revised - revised by rangewide direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
• Power lines will be buried, eliminated, designed or sited in a manner which does not impact GRSG. • Placement of other high profile structures, exceeding 10 feet in height, will be eliminated, designed or sited in a manner which does not impact GRSG. • Remote monitoring of production facilities must be utilized and all permit applications must contain a plan to reduce the frequency of vehicle use. • Maximize the area of interim reclamation on long-term access roads and well pads including reshaping, top-soiling and re-vegetating cut and fill slopes. Utilize native grass species mix which includes sagebrush and forbs. • Restore disturbed areas at final reclamation to pre-disturbance conditions or desired plant community. Utilize native grass species mix which includes sagebrush and forbs. • Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts on GRSG. • As reasonable (43 CFR, Part 3101.1-2), in consideration of valid existing rights, and to achieve a net conservation gain, the BLM will require compensatory mitigation when impacts cannot be adequately avoided and minimized, and residual impacts will result in habitat loss and degradation. Compensatory mitigation actions will align with the recommendations in the Regional Mitigation Strategy (see Appendix F), as appropriate. A priority may be given to compensatory mitigation actions in the same PHMA as is being impacted, unless a greater benefit can be achieved elsewhere. Compensatory mitigation will be considered when no feasible options remain to adequately avoid and minimize impacts within and immediately adjacent to the impacted site.	
Conservation Measure #2: Make applicable RDFs (Appendix C) mandatory as COA within PHMA.	Completely Revised - revised by rangewide direction
Solid Minerals	
Coal	
Action MR-1.6: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1). See Figure 2-13, North Dakota Coal (Appendix A).	Completely Revised – revised by rangewide direction
Action MR-1.7: Subsurface mines - Grant no new mining leases unless all surface disturbances (appurtenant facilities) are placed outside of PHMA.	No change (same as 2015)
Action MR-1.8: In GHMA, apply minimization of surface-disturbing or disrupting activities (including operations and maintenance) where needed to reduce the impacts of human activities on important seasonal GRSG habitats. Apply these measures during activity level planning. Use additional, effective mitigation to offset impacts as appropriate (determined by local options/needs).	No change (same as 2015)

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Locatable Minerals	
Action MR-1.9: In PHMA, proposed actions under Plan of Operations and Notices will be analyzed on a case-by-case basis in cooperation with the State of North Dakota, and RDFs (Appendix C) will be applied to the extent consistent with applicable law. See Figure 2-5, North Dakota Locatable Minerals (Appendix A).	No change (same as 2015)
Mineral Materials	
Action MR-1.10: Close PHMA to mineral material sales. See Figure 2-6, North Dakota Salable Minerals (Mineral Materials) (Appendix A).	Completely Revised - revised by rangewide and state specific direction
Action MR-1.11: In PHMA, restore salable mineral pits no longer in use to meet GRSG habitat conservation objectives. Note: Although there are no authorized mineral pits in the planning area, any trespass pits found in the planning area will be subject to restoration.	No change (same as 2015)
Nonenergy Leasable Minerals	
Action MR-1.12: Close PHMA to nonenergy leasable mineral leasing. See Figure 2-7, North Dakota Nonenergy Leasables (Appendix A). This includes not permitting any new leases to expand an existing mine.	Completely Revised – revised by rangewide direction
Action MR-1.13: For existing nonenergy leasable mineral leases in PHMA, follow the same RDFs applied to fluid minerals (Appendix C), when wells are used for solution mining.	No change (same as 2015)
Mineral Split Estate	
Action MR-1.14: Where the federal government owns the mineral estate in PHMA and GHMA, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	Partially Revised - revised by state specific direction to clarify HMA language
Action MR-1.15: Where the federal government owns the surface and the mineral estate is in non- federal ownership in PHMA and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	Partially Revised - revised by state specific direction to clarify HMA language
Lands and Realty (LR)	
Objective LR-1.1: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No change (same as 2015)
Rights-of-Way	
Action LR-1.1: PHMA will be managed as ROW avoidance area for high-voltage transmission lines (100 kilovolt [kV] and over) and large pipelines (24 inches in width and over). See Figure 2-10a, North Dakota Major Rights-of-Way (Appendix A).	Completely Revised - revised by rangewide and state specific direction
Where new ROWs are required, co-locate new ROW within existing ROWs or where it best minimizes impacts on GRSG and GRSG habitat.	Completely Revised - revised by rangewide and state specific direction
Action LR-1.2: PHMA will be managed as ROW avoidance area for minor ROWs (including communication sites and towers). See Figure 2-10b, North Dakota Minor Rights-of-Way (Appendix A).	Completely Revised - revised by rangewide and state specific direction
Action LR-1.3: Make PHMA exclusion area for new ROW wind and solar energy authorizations. See Figure 2-8, North Dakota Wind, and Figure 2-9, North Dakota Solar (Appendix A).	Completely Revised - revised by rangewide and state specific direction

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Action LR-1.4: When addressing ROW authorizations in PHMA identify and evaluate opportunities to remove, bury or modify existing power lines within PHMA.	No change (same as 2015)
Action LR-1.5: In PHMA, where existing leases or ROWs have had some level of development (road, fence, well, etc.) and are no longer in use, reclaim the site by removing these features and restoring the habitat.	No change (same as 2015)
Action LR-1.6: GHMA will be managed as ROW avoidance area for high-voltage transmission lines (100kV and over) and large pipelines (24 inches in width and over).	Completely Revised - revised by rangewide and state specific direction
Action LR-1.7: Minor ROWs will be allowed in GHMA with appropriate mitigation and conservation measures identified within the terms of the authorization to minimize surface disturbing and disruptive activities.	Completely Revised - revised by rangewide and state specific direction
Action LR-1.8: Make GHMA avoidance area for new wind and solar energy authorizations. See Figure 2-8 and Figure 2-9 (Appendix A).	Completely Revised - revised by rangewide and state specific direction
Action LR-1.9: Where new ROWs are necessary in GHMA, co-locate new ROWs within existing ROWs where possible.	No change (same as 2015)
Action LR-1.10: PHMA will be avoidance areas for leases/land use authorizations, which can be for agricultural, occupancy, or filming. Leases/land use authorizations will be allowed in GHMA with appropriate mitigation and conservation measures identified within the terms of the authorization to minimize surface disturbing and disruptive activities.	No change (same as 2015)
Action LR-1.11: Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	Partially revised (move to PHMA section, update MF ref)
Land Tenure Adjustment	
Action LR-1.12: Lands classified as PHMA and GHMA for GRSG will be retained in federal management unless: (1) the BLM can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to GRSG or (2) the BLM can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of GRSG. See Figure 2-11, North Dakota Land Tenure (Appendix A).	No change (same as 2015)
Action LR-1.13: PHMA will be a priority in consideration of land acquisitions. Consider GRSG for all land tenure actions.	No change (same as 2015)
Recommend Land Withdrawals	
Action LR-1.14: No areas are currently withdrawn from minerals on BLM surface.	No change (same as 2015)
Action LR-1.15: In PHMA, do not recommend lands withdrawals (i.e., those not associated with mineral activity) unless the land management is consistent with GRSG conservation measures. (For example, in a proposed withdrawal for a military training range buffer area, manage the buffer area with GRSG conservation measures.)	No change (same as 2015)
Recreation (REC)	
Action REC-1.1: Only allow Special Recreation Permits that will have neutral or beneficial effects on PHMA.	No change (same as 2015)
Action REC-1.2: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, and staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from important areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised - revised by state specific direction, see mitigation and SSS sections.

GRSG Management from North Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Travel and Transportation (TTM)	
Action TTM-1.1: In PHMA and GHMA, limit off-high vehicle (OHV) travel to existing roads, primitive roads, and trails at a minimum, until such time as travel management planning is complete and routes are either designated or closed. See Figure 2-12, North Dakota Trails and Travel Management (Appendix A).	No change (same as 2015)
Action TTM-1.2: In PHMA, travel management will evaluate the need for permanent, or seasonal, road or area closures where vehicle use is causing or will cause adverse effects upon habitat.	No change (same as 2015)
Action TTM-1.3: In PHMA and GHMA, complete activity level travel plans within 5 years of the ROD. During activity level planning, where appropriate, designate routes in PHMA and GHMA with current administrative/agency purpose or need to administrative access only.	No change (same as 2015)
Action TTM-1.4: In PHMA, limit route construction to realignments of existing designated routes if that realignment has a minimal impact on GRSG habitat, eliminates the need to construct a new road, or is necessary for motorist safety. Allow new routes/realignments in PHMA and GHMA during site-specific travel planning if it improves GRSG habitat and resource conditions.	No change (same as 2015)
Action TTM-1.5: In PHMA, use existing routes, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing routes, then build any new route constructed to the absolute minimum standard necessary.	No change (same as 2015)
Action TTM-1.6: In PHMA and GHMA, allow no upgrading of existing routes that will change route category (road, primitive road, or trail) or capacity unless the upgrading will have minimal impact on GRSG habitat, is necessary for motorist safety, or eliminates the need to construct a new road.	No change (same as 2015)
Action TTM-1.7: When travel management plans are complete, conduct restoration of roads, primitive roads and trails in PHMA and GHMA.	No change (same as 2015)
Action TTM-1.8: When reseeding roads, primitive roads and trails in PHMA and GHMA, use appropriate seed mixes and consider the use of transplanted sagebrush.	No change (same as 2015)
Action TTM-1.9: In PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR, subpart 8364 (Closures and Restrictions); 43 CFR, subpart 8351 (Designated National Area); 43 CFR, subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR, subpart 8341 (Conditions of Use).	No change (same as 2015)
Temporary closure or restriction orders under these authorities are enacted at the discretion of the BLM Authorized Officer to resolve management conflicts and protect persons, property, and public lands and resources. Where a BLM Authorized Officer determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR, Part 8341.2) A closure or restriction order shall be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders shall be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas**.**	No change (same as 2015)

Table 2. North Dakota Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicators	Desired Conditions	Reference
BREEDING AND NESTING (Seasonal Use Period March 1 - June 15)			
Lek Security	Proximity of trees	0.388 miles avoidance of coniferous habitats	Doherty 2008
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 feet (ft.) (100 meters [m]) of an occupied lek	Stiver et al. 2015
Cover	Sagebrush cover	≥5-25%	Herman-Brunson 2007 Doherty et al. 2010
	Sagebrush height	7-30 inches	Swanson 2009 Holloran et al. 2005 Herman-Brunson 2007
	Predominant sage brush shape	Predominately spreading shape	Stiver et al. 2015
	Perennial grass cover	≥10% Not Continuous	Doherty et al. 2010 Doherty et al. 2011 Holloran et al. 2005 Hagen et al. 2007
	Perennial grass and forb height	Adequate nest cover based on ecological site potential and seasonal precipitation; 4.4-11.3 inches[1]	Doherty et al. 2014
	Perennial forb cover	≥5% Not Continuous	Doherty et al. 2010 Doherty et al. 2011 Hagen et al. 2007 Holloran et al. 2005
BROOD-REARING/SUMMER (Seasonal Use Period June 16-October 31			
Cover	Sagebrush cover	≥5 %	Herman-Brunson 2007 Swanson 2009 Doherty et al. 2010 Doherty et al. 2011 Hagen et al. 2007
	Sagebrush height	7-30 inches	Herman-Brunson 2007 Doherty et al. 2011 Holloran et al. 2005 Schroeder et al. 1999
	Perennial grass and forbs	≥20% Forbs 6-16%	Doherty et al. 2010 Doherty et al. 2011 Holloran et al. 2005 Herman-Brunson 2007
	Riparian areas/mesic meadows	Proper Functioning Condition	BLM 1997c Prichard et al. 1999 Dickard et al. 2015
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present.	Stiver et al. 2015 Doherty et al. 2011

Attribute	Indicators	Desired Conditions	Reference
WINTER (Seasonal Use Period November 1-February 28)			
Cover and Food	Sagebrush cover above snow	≥10%	Schroeder et al. 1999 Swanson 2009
	Sagebrush height above snow	≥ 6 inches	Schroeder et al. 1999 Doherty et al. 2011 Swanson 2009

[1]Specific height requirements needed to meet the objective will be set at the time of watershed assessments.

2.11.2 Relevant Appendices

The following table shows which appendices from the 2015 plan have management direction that may change through the Proposed RMPA. The appendices can be found on the North Dakota GRSG ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	Completely Revised – See new maps in Appendix 1
B: Applying Lek Buffer Distances When Approving Actions	Completely revised – see state-specific language
C: Required Design Features	Partially updated – see state specific and new livestock grazing BMPs
D: The Greater Sage-Grouse Monitoring Framework	Completely revised –see new rangewide management direction
E: Greater Sage-Grouse Disturbance Caps	Removed, see new rangewide management direction
F: Regional Mitigation Strategy	Removed, see new rangewide management direction
G: Oil and Gas Stipulations	Completely revised – revised by rangewide and state-specific, see Appendix 16
H: GRSG Wildfire and Invasive Species Habitat Assessment	Removed

Appendix 2.12
Nevada and Northeastern California RMPs

This page intentionally left blank.

2.12 NEVADA AND NORTHEASTERN CALIFORNIA RMPS

This appendix presents the GRSG approved RMP amendment language from the 2015 and 2019 records of decision for Nevada and northeastern California. Changes between 2015 and 2019 are noted. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment, either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMP Amendment include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 and 2019 appendices that are listed in **Section 2.12.2** of this appendix. For the additional state-specific Nevada/California management direction for the Proposed RMP Amendment, see Chapter 2, Table 2-9.

2.12.1 Nevada and Northeastern California

Table 1. Comparison of Proposed RMP Amendment to Existing GSRG RMP Management Direction in Nevada/California

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
SPECIAL STATUS SPECIES (SSS)	***SPECIAL STATUS SPECIES (SSS)***	—
GOAL:	**GOAL:**	—
Goal SSS 1: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners.	No changes made.	Completely Revised-revised by rangewide.
Objectives	—	—
Objective SSS 1: Manage land resource uses to meet GRSG habitat objectives, as described in Table 2-2. The habitat objectives will be used to evaluate management actions that are proposed in GRSG habitat. Managing for habitat objectives will ensure that habitat conditions are maintained if they are currently meeting objectives or if habitat conditions move toward these objectives in the event that current conditions do not meet these objectives.	No changes made.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective SSS 2: Maintain or improve connectivity between, to, and in PHMAs and GHMAs to promote movement and genetic diversity for GRSG population persistence and expansion.	No changes made.	No change (same as 2015).
Objective SSS 3: Identify and implement GRSG conservation actions that can augment, enhance, or integrate program conservation measures established in agency and state land use and policy plans, to the extent consistent with applicable law.	No changes made.	No change (same as 2015).
Objective SSS 4: In PHMAs and GHMAs, apply the concept of "avoid, minimize, and compensatory mitigation" for all human disturbance in areas not already excluded or closed, so as to avoid adverse effects on GRSG and its habitat. The first priority will be to avoid new disturbance; where this is not feasible, the second priority will be to minimize and mitigate any new disturbance (Appendices F and I).	**Objective SSS 4:** When authorizing third-party actions in designated GRSG HMAs, the BLM will apply avoidance and minimization measures to reduce impacts, while seeking to achieve the planning-level goals and objectives for GRSG and its habitat, consistent with valid existing rights and applicable law. Management will be consistent with the GRSG goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. Specifically, the BLM will authorize uses of the public lands that are consistent with the policy in BLM Manual 6840 and therefore "minimize or eliminate threats affecting the status of [GRSG]" or "improve the condition of [GRSG] habitat."	Completely Revised-revised by rangewide.
Management Decisions (MD):	**Management Decisions (MD):**	—
MD SSS 1: In PHMAs and GHMAs, work with the proponent/applicant, whether in accordance with a valid existing right or not, and use the following screening criteria to avoid effects of the proposed human activity on GRSG habitat[l] A. First priority—locate project/activity outside PHMAs and GHMAs B. Second priority—if the project/activity cannot be placed outside PHMAs and GHMAs, locate the surface-disturbing activities in non-habitat	**MD SSS 1:** In PHMAs and GHMAs, work with the proponent/applicant, whether in accordance with a valid existing right or not, and use the following screening criteria to avoid effects of the proposed human activity on GRSG habitat[l]: A. First priority—locate project/activity outside PHMAs and GHMAs; B. Second priority—if the project/activity cannot be placed outside PHMAs and GHMAs, locate the surface-disturbing activities in non-habitat	Partially Revised-revised by state specific.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
areas first, then in the least suitable habitat for GRSG I. In non-habitat, ensure the project/activity will not create a barrier to movement or connectivity between seasonal habitats and populations C. Third priority—collocate the project/activity next to or in the footprint of existing infrastructure	areas first, then in the least suitable habitat for GRSG. I-In non-habitat, ensure the project/activity will not create a barrier to movement or connectivity between GRSG seasonal habitats and populations; C. Third priority—collocate the project/activity next to or in the footprint of existing infrastructure.	
MD SSS 2: In PHMAs, the following conditions will be met in order to avoid, minimize, and mitigate any effects on GRSG and its habitat from the project/activity:[2] A. Manage discrete anthropogenic disturbances, whether temporary or permanent, so they cover less than 3 percent of 1) biologically significant units (BSUs; total PHMA area associated with a GRSG population area (see Appendix A; Figure 2-2)) and 2) in a proposed project analysis area. See Appendix E (Disturbance Cap Guidance) for additional information on implementing the disturbance cap, including what is and is not considered disturbance and how to calculate the proposed project analysis area, as follows: 1. If the 3 percent human disturbance cap is exceeded on all lands (regardless of ownership) in PHMAs in any given BSU, then no further discrete human disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, as amended, and valid existing rights) will be permitted, by BLM within GRSG PHMA in any given BSU until the disturbance has been reduced to less than the cap (see Nevada exception under MD SSS 2 a. 3. Appendix E).	**MD SSS 2:** In PHMAs, the following conditions will be met in order to avoid and minimize impacts to GRSG and its habitat. The BLM will consider compensatory mitigation actions only when offered voluntarily by a project proponent; when required by law other than FLPMA or as a component of compliance with a States' mitigation plan, program, or authority, such as required by the State of Nevada Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). A. Manage discrete anthropogenic disturbances, whether temporary or permanent, so they cover less than 3 percent of: 1) biologically significant units (BSUs; total PHMA associated with a GRSG population area [see Appendix A; Figure 2-2]) and 2) in a proposed project analysis area. See Appendix F (Disturbance Cap Guidance) for additional information on implementing the disturbance cap, including what is and is not considered disturbance and how to calculate the proposed project analysis area, as follows: 1. If the 3 percent human disturbance cap is exceeded on all lands (regardless of ownership) in PHMAs in any given BSU, then no further discrete human disturbances	**MD SSS 2A:** Completely Revised-revised by rangewide and state specific.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
2. If the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a PHMA, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 Mining Law, as amended, valid existing rights; see Nevada exception under MD SSS 2 a. 3. Appendix E). a. For BLM land in the state of Nevada only, the following disturbance management protocol (DMP) is intended to provide for a 3 percent limitation on disturbance, except in situations where a biological analysis indicates a net conservation gain to the species. • Such discretionary activities that would cause disturbances in excess of 3 percent at the project or BSU scale (see Appendix E) will be prohibited, unless a technical team described below determines that new or site-specific information indicates the project can be modified to result in a net conservation gain at the BSU level. Factors considered by the team will include GRSG abundance and trends, habitat amount and quality, extent of project disturbance, location and density of existing disturbance, project design options and other biological factors. • Any exceptions to the 3 percent disturbance limitation may be approved by the Authorized Officer only with the	(subject to applicable laws and regulations, such as the 1872 Mining Law, as amended, and valid existing rights) will be permitted, by the BLM within PHMA in any given BSU until the disturbance has been reduced to less than the cap (see Nevada exception under MD SSS 2 A. 2a). 2. If the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in PHMA, then no further anthropogenic disturbance will be permitted by the BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 Mining Law, as amended, valid existing rights; see Nevada exception under MD SSS 2 A. 2a.). a. For BLM land in the state of Nevada only, the following disturbance management protocol is intended to provide for a 3 percent limitation on disturbance, except in situations where a net conservation gain to the species is achieved as a component of compliance with a state mitigation plan, program, or authority, such as required by the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). 3. For BLM land in the state of California only, subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
concurrence of the State Director. The Authorized Officer may not grant an exception unless the NDOW, the USFWS, and the BLM unanimously find that the proposed action satisfies the conditions stated in the above paragraph. Such finding shall initially be made by the technical team, which consists of a field biologist or other GRSG experts from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the BLM State Director, USFWS State Ecological Services Director and NDOW Director for final resolution. In the event their finding is not unanimous, the exception will not be granted (Appendix E). 3. For BLM land in the state of California only, subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in the PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area. Energy and mining facilities to which this action applies are: • Oil and gas wells and development facilities. • Wind towers	PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by the BLM: 1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or 2) unless the energy or mining facility is co-located into an existing disturbed area. Energy and mining facilities to which this action applies are: • Oil and gas wells and development facilities. • Wind towers • Geothermal wells/developments, and • Active locatable, leasable, and salable developments. 4. For proposed projects to be located, within existing designated utility corridors, the 3 percent disturbance cap may be exceeded at the project scale if a net conservation gain to the species will be achieved, as a component of compliance with a State's mitigation plan, program, or authority, such as required by the State of Nevada Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). This exception is limited to projects which fulfill the use for which the corridors were designated (e.g., transmission lines, pipelines, etc.) and the designated width of a corridor will not be exceeded as a result of any project co-location.	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Geothermal wells/developments, and • Active locatable, leasable, and salable developments. 4. For proposed projects to be located, within existing designated utility corridors, the 3% disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location.		
B. In PHMA, in undertaking BLM management actions, and consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. The project/activity with associated mitigation (such as the use of the State of Nevada Conservation Credit System) will result in an overall net conservation gain to GRSG (see Appendix F).	B. See **MD MIT 1**.	**MD SSS 2B:** Completely Revised-revised by rangewide.
C. Authorized/permitted activities are implemented by adhering to the RDFs described in Appendix C, consistent with applicable law. At the site-specific scale, if an RDF is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:	C. Authorized/permitted activities are implemented by adhering to the Required Design Features (RDFs) described in Appendix C, consistent with applicable law. At the site-specific scale, if an RDF is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:	**MD SSS 2C:** No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
1. A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to the site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable. 2. An alternative RDF is determined to provide equal or better protection for GRSG or its habitat. 3. A specific RDF will provide no additional protection to GRSG or its habitat.	1. A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to the site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable. 2. An alternative RDF is determined to provide equal or better protection for GRSG or its habitat. 3. A specific RDF will provide no additional protection to GRSG or its habitat.	
D. In management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS report, Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review Open File-Report 2014-1239 (Manier et al. 2014), in accordance with Appendix B.	D. In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will utilize the lower end of the interpreted range of lek buffer-distances and guidance identified in Mainer et al. (2014) to establish the evaluation area around leks that will be used to analyze impacts during project-specific NEPA, including scientifically justifiable departures based on local data, topography, and other factors, in accordance with **Appendix B**.	**MD SSS 2D:** No change (same as 2019).
E. Seasonal restrictions will be applied during the periods specified below to manage discretionary surface-disturbing activities and uses on public lands (i.e., anthropogenic disturbances) that are disruptive to GRSG, to prevent disturbances to GRSG during seasonal life-cycle periods: 1. In breeding habitat within 4 miles of active and pending GRSG leks from March 1 through June 30: a. Lek—March 1 to May 15 b. Lek hourly restrictions—6 p.m. to 9 a.m. c. Nesting—April 1 to June 30 2. Brood-rearing habitat from May 15 to September 15	E. Seasonal restrictions will be applied during the period specified below to manage discretionary surface-disturbing activities and uses on public lands (i.e., anthropogenic disturbances) that are disruptive to GRSG, to prevent disturbances to GRSG during seasonal life-cycle periods: 1. In breeding habitat within 4 miles of active and pending GRSG leks from March 1 through June 30 a. Lek—March 1 to May 15 b. Lek hourly restrictions—6 p.m. to 9 a.m. c. Nesting—April 1 to June 30 2. Brood-rearing habitat from May 15 to September 15	**MD SSS 2E:** No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
a. Early—May 15 to June 15 b. Late—June 15 to September 15 3. Winter habitat from November 1 to February 28 • The seasonal dates may be modified due to documented local variations (e.g., higher/lower elevations) or annual climatic fluctuations (e.g., early/late spring, long/heavy winter), in coordination with NDOW and California Department of Fish and Wildlife (CDFW), in orderto better protect GRSG and its habitat.	a. Early—May 15 to June 15 b. Late—June 15 to September 15 3. Winter habitat from November 1 to February 28. The seasonal dates could be modified or waived (in coordination with NDOW and/or CDFW) based on site-specific information that indicates: i. A project proposal's NEPA document and/or project record, and correspondence from NDOW and/or CDFW demonstrates that any modification (shortening/extending seasonal timeframes or waiving the seasonal timing restrictions altogether) is justified on the basis that it serves to better protect or enhance GRSG and its habitat than if the seasonal timing restrictions are implemented. Under this scenario modifications can occur if: a. A proposed activity will have beneficial or neutral impacts on GRSG. b. Topography or other factors eliminate direct and indirect impacts from visibility and audibility to GRSG and its habitat c. There are documented local variations (e.g., higher/lower elevations) and/or annual climatic fluctuations (e.g., early/late spring, long/heavy winter) that indicate the seasonal Life cycle periods are different than presented, or that GRSG are not using the area during a given seasonal life cycle period. ii. Modifications are needed to address an immediate public health and safety concern in a timely manner (e.g., maintaining a road impacted by flooding).	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	iii. The proposed action is determined to be a routine administrative function conducted by federal, state or local governments, including prior existing uses, authorized uses, valid existing rights and existing infrastructure (i.e., rights-of-way for roads) that serve a public purpose and will have no adverse impacts on GRSG or its habitat.	
F. Authorizations and permits will limit noise from discretionary activities (during construction, operation, and maintenance) to not exceed 10 decibels above ambient sound levels at least 0.25 mile from active and pending leks, from 2 hours before to 2 hours after sunrise and sunset during the breeding season. See Appendix M, Greater Sage-Grouse Noise Protocol.	F. Authorizations and permits will limit noise from discretionary activities (during construction, operation, and maintenance) to not exceed 10 decibels above ambient sound levels at least 0.25 mile from active and pending leks, from 2 hours before to 2 hours after sunrise and sunset during the breeding season. See **Appendix G**, Greater Sage-Grouse Noise Protocol.	**MD SSS 2F:** No change (same as 2019).
MD SSS 3: In GHMAs, the following conditions will be met in order to avoid, minimize, and mitigate any effects on GRSG or its habitat from the project/activity: A. In GHMAs, in undertaking BLM management actions, and consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. The project/activity with associated mitigation (such as the use of the State of Nevada Conservation Credit System) in GHMAs will result in an overall net conservation gain to GRSG (see Appendix F, Regional Mitigation Strategy).	**MD SSS 3**: In GHMAs, the following conditions will be met: A. See MD MIT 1.	**MD SSS 3A:** Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
B. Authorized/permitted activities are implemented adhering to the RDFs described in Appendix C, consistent with applicable law. At the site-specific scale, if an RDF is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity: 1. A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to the site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable. 2. An alternative RDF is determined to provide equal or better protection for GRSG or its habitat. 3. A specific RDF will provide no additional protection to GRSG or its habitat.	B. Authorized/permitted activities are implemented adhering to the RDFs described in Appendix C, consistent with applicable law. At the site-specific scale, if an RDF is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity: 1. A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to the site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable. 2. An alternative RDF is determined to provide equal or better protection for GRSG or its habitat. 3. A specific RDF will provide no additional protection to GRSG or its habitat.	**MD SSS 3B:** No change (same as 2019).
C. In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS report, Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review Open File Report 2014-1239 (Manier et.al 2014]), in accordance with Appendix B.	C. In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will utilize the lower end of the interpreted range of lek buffer-distances and guidance identified in Mainer et al. (2014) to establish the evaluation area around leks that will be used to analyze impacts during project-specific NEPA, including scientifically justifiable departures based on local data, topography, and other factors, in accordance with Appendix B.	**MD SSS 3C:** No change (same as 2019).
D. See Appendix G, Greater Sage-Grouse Noise Protocol.	**MD SSS 3E:** No change (same as 2019).
MD SSS 4: In OHMAs, authorized/permitted activities are implemented adhering to the RDFs described in Appendix C, consistent with applicable law. At the site-specific scale, if an RDF is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to the site limitations or engineering considerations). Economic	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable. • An alternative RDF is determined to provide equal or better protection for GRSG or its habitat. • A specific RDF will provide no additional protection to GRSG or its habitat.		
MD SSS 5: Designate SFA, as shown on Figure 1-3 (2,797,400 acres). SFA will be managed as PHMAs, with the following additional management: • Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights • Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing • Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	**MD SSS 5 (Allocation Exception Criteria):** In PHMA, GHMA, and OHMA, the State Director may grant an exception to the allocations and stipulations described in **Table 2-1**: Comparative Summary of Alternatives if one of the following applies (in coordination with NDOW, SETT, and/or CDFW): i. The location of the proposed activity is determined to be unsuitable (by a biologist with GRSG experience using methods such as Stiver et. al. 2015) and lacks the ecological potential to become marginal or suitable habitat; and will not result in direct, indirect, or cumulative impacts on GRSG and its habitat. Management allocation decisions will not apply to those areas determined to be unsuitable if the area has passed a threshold and lacks the ecological potential to become marginal or suitable habitat. ii. The proposed activities impacts will be offset to result in no adverse impacts on GRSG or its habitat, through use of the mitigation hierarchy and the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). In cases where exceptions may be granted for projects with a residual impact, voluntary compensatory mitigation consistent with the State's mitigation policies and programs, such as the State of	Completely Revised-revised by rangewide for mitigation (ii), and state specific for the rest of the bullets.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law) will be one mechanism by which a proponent achieves the Approved RMPA goals, objectives, and exception criteria. When a proponent volunteers compensatory mitigation as their chosen approach to address residual impacts, the BLM will incorporate those actions into the rationale used to grant an exception. The final decision to grant a waiver, exception, or modification will be based, in part, on criteria consistent with the State's GRSG management plans and policies. iii. The proposed activity will be authorized to address public health and safety concerns, specifically as they relate to federal, state, local government and national priorities. iv. Renewals or re-authorizations of existing infrastructure in previously disturbed sites or expansions of existing infrastructure that do not result in direct, indirect, or cumulative impacts on GRSG and its habitat. v. The proposed activity is determined to be a routine administrative function conducted by federal, state or local governments, including prior existing uses, authorized uses, valid existing rights and existing infrastructure (i.e., rights-of-way for roads) that serve a public purpose and will have no adverse impacts on GRSG and its habitat, consistent with the State's mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law).	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	vi. Exceptions to non-disposal or exchange of lands that are identified for retention in **Appendix A, Figure 2-12** could be considered if (a) they are identified for disposal through previous planning efforts or address a Congressional Act (e.g., the respective Lincoln and White Pine County Conservation, Recreation, and Development Acts), (b) the agency can demonstrate that the disposal, including land exchanges, will have no adverse direct, indirect or cumulative impacts on GRSG and its habitat, or (c) adverse impacts on GRSG or its habitat will be offset, through use of voluntary compensatory mitigation, consistent with the States' mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law).	
MD SSS 6: Cooperate with federal and state agencies, universities, and other organizations to establish and maintain a GRSG telemetry database.	No changes made.	No change (same as 2015).
MD SSS 7: Work with project proponents to limit project-related noise, seasonally or annually (see MDs SSS 2 and SSS 3), in GRSG habitat where it would be expected to reduce functionality of habitats that support associated GRSG populations. Support the establishment of ambient baseline noise levels for leks in PHMAs and GHMAs. • As additional noise-related research and information emerge, specific new limitations appropriate to the type of projects being considered will be evaluated and appropriate measures will be implemented where necessary to minimize the potential for noise impacts on GRSG populations.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 8: As determined by BLM in coordination with NDOW or CDFW, for any surface-disturbing activities involving mineral activities (to the extent possible under existing law) and rights-of-way actions proposed in PHMAs and GHMAs, the proponent will use the services of a qualified biologist approved by the BLM to conduct surveys for GRSG breeding activity during the GRSG breeding season before project activities begin. The surveys must encompass all suitable GRSG habitats within a minimum of 4 miles of the proposed activities. Surveys will be conducted following protocols established by state fish and wildlife agencies during planning operations and during project activities. GRSG seasonal habitat delineations will also be required within a minimum of 4 miles of project activities.	No changes made.	No change (same as 2015).
MD SSS 9a: In Nevada only, the BLM will consult with the Sagebrush Ecosystem Technical Team (SETT) for application of the "avoid, minimize, and compensate" mitigation strategy and the Conservation Credit System developed by the Nevada Natural Heritage Program and the SETT (2014a, 2014b) or other applicable mitigation system such as outlined in Appendix I. This will be to ensure that a net conservation gain of GRSG habitat is achieved in mitigating human disturbances in PHMAs and GHMAs (see Appendix F) on all agency-authorized activities. The specifics of the coordination will be identified in an MOU between the agencies.	See **MD MIT 1**	Partially Revised- updates to align with rangewide mitigation language.
MD SSS 9b: In California only, the BLM will follow the BLM mitigation strategy outlined in Appendix F.	See **MD MIT 1**	Partially Revised- updates to align with rangewide mitigation language.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 10: When necessary or as new data becomes available, site-specific NEPA analysis on use authorizations in PHMA and GHMA will include project level adaptive management responses to address changed conditions in GRSG habitat and population trends (see Appendix J, Adaptive Management Plan).	No changes made.	No change (same as 2015).
MD SSS 11: Design and construct fences consistent with BLM H-1741-1, Fencing Standards Manual (BLM 1990), and apply the Sage-Grouse Fence Collision Risk Tool to Reduce Bird Strikes (NRCS 2012). Bring existing fencing into compliance as opportunities arise.	No changes made.	No change (same as 2015).
2015 BLM GRSG Approved RMP Amendment	**2019 BLM GRSG Approved RMP Amendment**	**Proposed Plan**
Disease	**Disease**	—
Objective SSS 5: Coordinate with state agencies to monitor trends of diseases, such as West Nile virus, in the subregion to determine if mitigation or additional RDFs need to be applied (consistent with applicable law) to use authorizations.	No changes made.	No change (same as 2015).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD SSS 12: When developing or modifying water developments on BLM-administered lands in PHMAs, GHMAs, and OHMAs and in accordance with state water law and subject to valid existing rights, use applicable RDFs consistent with applicable law to mitigate potential impacts from West Nile virus. Bring existing water developments into compliance as opportunities arise.	No changes made.	No change (same as 2015).
Predation	**Predation**	—
Objective SSS 6: Manage human uses on public lands to reduce the effects of predation on GRSG.	No changes made.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Management Decisions (MD):	**Management Decisions (MD):**	—
MD SSS 13: Require authorizations to include stipulations and RDFs consistent with applicable law to reduce or eliminate opportunities to attract and provide nesting, cover, or perches for predators in PHMAs and GHMAs.	No changes made.	Completely Revised-revised by rangewide.
MD SSS 14: Coordinate with other federal, state, county, and tribal governments and local working groups to reduce GRSG deaths due to predation where it is determined to be additive or is a limiting factor influencing GRSG populations.		Completely Revised-revised by rangewide.
MD SSS 15: Reduce and eliminate artificial hunting perches and nesting surfaces for aerial predators (e.g., remove fences, nonworking fences, and power lines and install anti-perch devices on existing and new power lines).	No changes made.	Completely Revised-revised by rangewide.
Adaptive Management (Also see Appendix J)	—	—
Management Decisions (MD):	**Management Decisions (MD):**	—
No similar action.	**MD SSS 16:** PHMA, GHMA, and OHMA boundaries are based on composite management categories contained within USGS's *Spatially Explicit Modeling of Annual and Seasonal Habitat for Greater Sage-Grouse (Centrocercus urophasianus) in Nevada and Northeastern California—an updated decision-support tool for management* (Coates et al. 2016), (see **Appendix A: Maps**). • Manage 9,265,800 acres as PHMA • Manage 5,748,000 acres as GHMA • Manage 4,868,900 acres as OHMA BLM recognizes that landscape level mapping may not accurately reflect on-the-ground conditions. Therefore, the HMAs (**Figure 2-1**) do not constitute a land use plan decision but rather a landscape level reference of relative habitat suitability. When a proposed project is thought to be in an area that is unsuitable for GRSG	Partially Revised – update acreages and references to new published model results; update non-habitat text based on rangewide and state-specific language.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	within PHMA, GHMA, and/or OHMA, habitat assessments of the project site and its surrounding areas will be conducted by a biologist with GRSG experience using BLM-approved methods such as Stiver et al. 2015 and compliant with current BLM policy, to identify suitable, marginal, or unsuitable GRSG habitats at multiple scales. This habitat assessment process will inform criteria (i) under Issue: Allocation Exception Process, Management Alignment Alternative and Proposed Plan Amendment. The BLM will track all on-the-ground assessments and share this information with USGS and the States of Nevada and California to consider when updating HMA maps in the future.	
MD SSS 17: As site-specific GRSG data (habitat assessments, lek counts, telemetry, etc.) is collected, the information will be included into future modeling efforts using the "*Spatially Explicit Modeling of Greater Sage-Grouse Habitat in Nevada and Northeastern California*" (Coates et al. 2014) to reflect the most up-to-date spatial representation of GRSG habitat categories. Through plan maintenance or plan amendment/revision, as appropriate, and in consultation with the Nevada Department of Wildlife and USFWS, based on the best scientific information, the updated modeling efforts may be adopted and appropriate allocation decisions and management actions will be applied to PHMA, GHMA, and OHMA. Future modeling efforts to incorporate site-specific GRSG data will utilize the same modeling methods (as described under *Methods and Results* in Coates et al. 2014) used to develop the current Nevada and Northeastern California Subregions' GRSG habitat management categories. The addition of site-specific GRSG data will allow for the refinement of	**MD SSS 17:** Consistent with the State of Nevada's Greater Sage-Grouse Conservation Plan (2014, as amended) and CDFW's management recommendations, the HMA mapping process will be reviewed and refined every 3 to 5 years, or when new data are incorporated in the model. New or improved spatial data (e.g., additional GRSG telemetry data, updated or improved vegetation community data) will be incorporated during the refinement process. The review and refinement process will be scientifically based and include review and input from the Sagebrush Ecosystem Technical Team (SETT), NDOW, BLM, USFS, USFWS, and local agencies as appropriate. For refinements on California BLM managed lands, this process will also include CDFW. Other stakeholders will be encouraged to participate in the process by submitting relevant information to the listed agencies. The USGS' habitat suitability modeling processes (Coates et al. 2016) will be the basis for future refinements, which may include results of BLM habitat suitability determinations shared with the USGS for their consideration. As	Completely Revised-adopt language from 2015, but updated to reference to new published model

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
the spatial representation of the GRSG habitat management categories.	these HMAs boundaries are adjusted and approved by the States of Nevada and California, adjustments to the BLM's PHMA, GHMA, and/or OHMA boundaries (along with the existing allocation decisions and management actions tied to these areas) will be made by the BLM through plan maintenance or amendment, as appropriate.	
MD SSS 18: A BSU (see Appendix A; Figure 2-2) that has hit a soft trigger due to vegetation disturbance will be a priority for restoration treatments consistent with Fire and Invasives Assessment Tool (FIAT) (Appendix J).	**MD SSS 18:** The BLM will implement the Adaptive Management Strategy as described in **Appendix D**. The revised soft and hard population triggers, warnings, and new BSU and lek cluster boundaries were derived from USGS's *Hierarchical Population Monitoring of Greater Sage-Grouse (Centrocercus urophasianus) in Nevada and California— Identifying Populations for Management at the Appropriate Spatial Scale: U.S. Geological Survey Open-File Report 2017– 1089* (Coates et al. 2017). These triggers, warnings, BSU boundaries, and lek cluster boundaries can be found in **Appendix D**. Soft and hard trigger responses will be removed when the criteria for recovery have been met (see **Appendix D**, Longevity of Responses). Removal of the soft and hard trigger responses returns management direction in the affected lek cluster and/or BSU to the management directions that were in place prior to reaching a trigger.	Completely Revised-revised by rangewide.
MD SSS 19: If a soft trigger is reached, the BLM will identify the causal factor and apply additional project-level adaptive management and/or mitigation measures contained in the authorization (and for future similar authorizations), to alleviate the specific or presumptive causes in the decline of GRSG populations or its habitats and include the following: • The adjustment in management would be based on the causal factor and would affect only the area being impacted in the lek cluster or other appropriate scale (e.g., BSU)	No similar action. (MD SSS 19 was removed)	No change (same as 2019).MD SSS 19 Remains Removed

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• GRSG populations and habitat would continue to be monitored annually • If the causal factor were not readily discernable, then an interdisciplinary team, including the BLM, Forest Service (as applicable), and state wildlife agency representatives, would identify the appropriate mitigation or adjusted management actions in a timely manner		
MD SSS 20: Once a hard trigger has been reached, all responses in Table J-1 and Table J-2 in Appendix J will be implemented. This includes where soft triggers have been reached for both population and habitat.	No similar action. (MD SSS 20 was removed)	No change (same as 2019).MD SSS 20 Remains Removed
MD SSS 21: When a hard trigger is hit in a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone GRSG Conservation Team will convene to determine the cause, will put project level responses in place, as appropriate, and will discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs in the PAC and will invoke the appropriate plan response. Adopting any further actions at the plan level may require initiating a plan amendment process.	No similar action. (MD SSS 21 was removed)	No change (same as 2019).MD SSS 21 Remains Removed
MD SSS 22: As determined by BLM in coordination with NDOW, for any surface-disturbing activities involving mineral activities and rights-of-way actions (with the possible exception of short duration activities outside of seasonal GRSG habitats) BLM will require that active and pending leks be monitored annually within 4 miles of disturbance until the use terminates and all disturbances have been restored. The proponent will fund the services of an independent qualified biologist approved by the BLM, in coordination with NDOW or CDFW, consistent with applicable law.	**MD SSS 22:** As determined by the BLM in coordination with the state wildlife agencies, for any surface-disturbing activities involving mineral activities and rights-of-way actions (with the possible exception of short duration activities outside of seasonal GRSG habitats) BLM will require that active and pending leks be monitored annually within 4 miles of disturbance until the use terminates and all disturbances have been restored. The proponent will fund the services of an independent qualified biologist approved by the BLM, in coordination with NDOW or CDFW, consistent with applicable law.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 23: In making amendments to this plan, the BLM will coordinate with the FWS as BLM continues to meet its objective of conserving, enhancing and restoring GRSG habitat by reducing, minimizing or eliminating threats to GRSG and its habitat.	No changes made.	No change (same as 2019).
MD SSS 24: The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	No similar action. (MD SSS 24 was removed)	No change (same as 2019).MD SSS 24 Remains Removed
No similar action.	No similar action.	Completely Revised-State Specific - New state-specific MD
VEGETATION (VEG) ***SAGEBRUSH-STEPPE***	***VEGETATION (VEG)***	—
Objectives:	**Objectives:**	—
Objective VEG 1: In all SFA and PHMAs, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	**Objective VEG 1**: In PHMAs, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2019).
Objective VEG 2: On public lands, establish, maintain, and enhance a resistant and resilient sagebrush vegetative community and restore sagebrush vegetation communities to reduce GRSG habitat fragmentation and maintain or reestablish GRSG habitat connectivity over the long term (Chambers et al. 2014).	No changes made.	No change (same as 2015).
Objective VEG 3: Manage PHMAs and GHMAs for vegetation composition and structure, consistent with ecological site potential and to achieve GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised, state specific circumstance and remove reference to Table 2-2.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Management Decisions (MD):	**Management Decisions (MD):**	—
MD VEG 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD VEG 2: Incorporate GRSG habitat objectives (**Table 2-2**) in the design of habitat restoration projects and manage treated areas to meet GRSG habitat objectives.	No changes made.	Partially Revised (remove reference to Table 2-2).
MD VEG 3: Use BLM GRSG habitat maps, habitat objectives (see Table 2-2 for GRSG habitat objectives), ecological site potential, state and transition models, and concepts of resistance and resilience (Appendix H) to prioritize habitat restoration projects, including those following wildfire, to address the most limiting GRSG habitat vegetation components and to connect seasonal ranges. Habitat restoration includes the following: i. Restoring sagebrush canopy in PHMAs and GHMAs to meet GRSG habitat objectives (Table 2-2) ii. Reestablishing perennial grasses and native forbs in PHMAs and GHMAs iii. Reducing or removing pinyon or juniper in PHMAs and GHMAs to enhance seasonal range connectivity and to maintain sagebrush canopy and understory integrity iv. Restore areas affected by wildfire and the continuing invasive annual fire cycle to meet GRSG habitat objectives (Table 2-2) iv. Prioritize restoration in areas that have not crossed an ecological threshold	No changes made.	Partially Revised (remove reference to Table 2-2).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 4: Plan vegetation treatments (including GRSG habitat treatments) in a landscape-scale context to address habitat fragmentation, effective patch size, invasive species presence, and intact sagebrush community protection, consistent with the GRSG habitat objectives identified in **Table 2-2**.	No changes made.	Partially Revised (remove reference to Table 2-2).
MD VEG 5: For Wyoming, mountain, and basin big sagebrush communities in PHMAs and GHMAs: i. Prioritize treatments that focus on enhancing, reestablishing, or maintaining the most limiting GRSG habitat component ii. Reestablish sagebrush to meet GRSG habitat objectives (Table 2-2) iii. Manage sagebrush communities to achieve age-class, structure, cover, and species composition objectives in GRSG habitat (Table 2-2) iv. Restore herbaceous understory in brush-dominated areas to meet GRSG habitat objectives (Table 2-2) iv. Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species (Table 2-2) v. Treat disturbed areas in accordance with FIAT (see Appendix H), including implementation-level assessments	No changes made.	Partially Revised (remove reference to Table 2-2).
MD VEG 6: Manage for establishment of sagebrush in unmaintained nonnative seedings (e.g., crested wheatgrass seedings) in or next to GRSG habitat to meet habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2).
MD VEG 7: In PHMAs and GHMAs, give preference to native seeds for restoration, based on availability, adaptation (ecological site potential), and probability of success. Where the probability of success or adapted seed availability is low, nonnative seeds may be used, as long as they support GRSG habitat objectives. Choose native	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
plant species outlined in Ecological Site Descriptions (ESDs), where available, to revegetate sites. Emphasize use of local seed collected from intact stands or greenhouse cultivation. If the commercial supply of appropriate native seeds and plants is limited, work with the BLM Native Plant Materials Development Program, Natural Resource Conservation Service (NRCS) Plant Material Program, or State Plant Material Programs. If currently available supplies are limited, use the materials that provide the greatest benefit for GRSG. In all cases, seed must be certified as weed free.		
MD VEG 8: To increase seeding success and to ensure effective soil and seed contact, consider the use of specialized seed drills or other proven and effective methods that may become available based on new science.	No changes made.	No change (same as 2015).
MD VEG 9a: For Nevada BLM-managed lands, before implementation, establish project monitoring sites where vegetation treatment is planned. Treatment areas will be monitored both pre- and post- treatment on a multiple-year basis to ensure that project objectives are achieved.	No changes made.	No change (same as 2015).
MD VEG 9b: For California BLM-managed lands, before implementation, establish project monitoring sites where vegetation treatment is planned. Treatment areas will be monitored both pre- and post- treatment on a multiple-year basis to ensure that project objectives are achieved. Juniper treatments will be monitored in accordance with the Sage Steppe Ecosystem Restoration FEIS (BLM 2008).	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 10: On public lands, where the attributes, quality, or lack of GRSG winter habitat has been identified as a limiting factor, emphasize vegetation treatments in known winter habitat to enhance quality or reduce wildfire risk around or in winter habitat.	No changes made.	No change (same as 2015).
MD VEG 11: In perennial grass, invasive annual grass, and conifer-invaded cover types, restore sagebrush steppe with local sagebrush seedings or planted seedlings where feasible.	No changes made.	No change (same as 2015).
MD VEG 12: Continue to coordinate with NDOW, CDFW, and NRCS for all development or habitat restoration proposals in PHMAs and GHMAs. Also, coordinate with the Nevada SETT, tribes, and local working groups on projects proposed in sagebrush ecosystems.	No changes made.	No change (same as 2015).
VEGETATION (VEG)	***VEGETATION (VEG)***	—
Conifer Encroachment	***Conifer Encroachment***	—
Objectives:	**Objectives:**	—
Objective VEG 4: In accordance with the vegetation dynamic development tool (VDDT; Appendix L), improve GRSG habitat by removing invading conifers in the number of acres shown in **Table 2-2** by decade for the next 50 years.	No changes made.	Partially Revised- minor update reference from Table 2-2 to Habitat Objectives
Management Decisions (MD):	**Management Decisions (MD):**	—
MD VEG 13: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. Prioritize treatments closest to occupied GRSG habitats and near occupied leks and where juniper encroachment is phase 1 and phase 2. Use of site-specific analysis and tools like VDDT and FIAT (see Appendix L for VDDT and Appendix H for FIAT) will help refine the location for specific areas to be treated.	No changes made.	Partially Revised- update lek terminology and state specific circumstances.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 14: Do not construct or create new roads (temporary or permanent), skid trails, or landings in phase I pinyon or juniper removal areas during project implementation for vegetation treatments. Administrative access, including off-road travel with heavy equipment and vehicles, will be allowed during implementation.	No changes made.	No change (same as 2015).
MD VEG 15: Only treat habitats in late phase II or phase III pinyon or juniper condition to create movement corridors, connect habitats, or reduce the potential for catastrophic fire (see **Table 2-3**).	No changes made.	No change (same as 2015).
Vegetation (VEG)	***Vegetation (VEG)***	—
Invasive Species	***Invasive Species***	—
Objectives:	**Objectives:**	—
Objective VEG 5: Reduce the amount of GRSG habitat loss due to wide-spread wildfires and invasion by nonnative species.	No changes made.	No change (same as 2015).
Objective VEG 6: Control invasive species infestations in GRSG habitat already compromised by invasion.	No changes made.	No change (same as 2015).
Objective VEG 7: In accordance with the VDDT (Appendix L), improve GRSG habitat by treating annual grasses in the number of acres shown in **Table 2-4** by decade using the FIAT (Appendix H).	No changes made.	No change (same as 2015).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD VEG 16: Prevent the establishment of invasive species into uninvaded areas in PHMAs and GHMAs through properly managed grazing and by conducting systematic and strategic detection surveys, collecting data, mapping these areas, and engaging in early response to contain and eradicate invasion if it occurs.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 17: Control the spread and introduction of noxious weeds listed by the Nevada Department of Agriculture and California Department of Food and Agriculture (NAC 555.010, Classes A through C, inclusive and 3 CCR 4500, Noxious Weed Species Pest Rating A, B, C, and Q) and undesirable nonnative plant species (Gelbard and Belnap 2003; Bergquist et al. 2007). Work with federal, state, local, and tribal groups, such as Weed Control Districts, Cooperative Weed Management Areas, and Conservation Districts, in detecting and treating nonnative species.	No changes made.	No change (same as 2015).
MD VEG 18: Where scientific support is lacking, carefully construct treatments to rigorously assess the value or detriment of untested methods to determine their value for future application to GRSG habitats.	No changes made.	No change (same as 2015).
MD VEG 19: The BLM will cooperate with other federal, state, tribal and local agencies along with academia in researching the development of biological control agents and deploying emerging technologies as they become available.	No changes made.	No change (same as 2015).
MD VEG 20: Monitor and adjust treatment sites and methods as needed to ensure effectiveness of efforts to prevent and control invasive species and restore GRSG habitat.	No changes made.	No change (same as 2015).
MD VEG 21: Assess invasive annual grass presence and distribution before implementing vegetation restoration projects to determine if treatments are required to treat invasive annual grasses.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 22: Treat sites in PHMAs and GHMAs that contain invasive species infestations through an integrated pest management (IPM) approach, using fire, chemical, mechanical, and biological (e.g., targeted grazing) methods, based on site potential and in accordance with FIAT (Appendix H). Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No changes made.	No change (same as 2015).
No similar action	No similar action	New: refer to state specific MD VEG (new MD)

Objectives:	**Objectives:**	—
Objective VEG 8: Manage riparian areas in PHMAs and GHMAs for vegetation composition and structure, consistent with ecological site potential and to achieve GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2).
Objective VEG 9: Manage upland habitat associated with riparian areas to promote cover relative to site potential to facilitate brood-rearing habitat (**Table 2-2**).	No changes made.	Partially Revised- update reference from Table 2-2 to Habitat Objectives
Objective VEG 10: Where riparian function has been compromised or lost, manage to restore riparian function and meet GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2)
Objective VEG 11: In riparian and wet meadow areas, inventory, monitor, and control invasive species in PHMAs and GHMAs.	No changes made.	No change (same as 2015).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD VEG 23: Design and implement vegetation treatments in PHMAs and GHMAs to restore, enhance, and maintain riparian areas (**Table 2-2**).	No changes made.	Partially Revised- update reference from Table 2-2 to Habitat Objectives
MD VEG 24: Consider an array of vegetation treatments to increase edge and expand mesic areas in PHMAs and GHMAs where riparian extent is limited by shrub encroachment (**Table 2-2**).	No changes made.	Partially Revised- update reference from Table 2-2 to Habitat Objectives

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 25: Manage lotic riparian habitats in conjunction with adjacent terraces and valley bottoms as natural fuel breaks to reduce the size and frequency of wildfires in PHMAs and GHMAs.	No changes made.	No change (same as 2015).
Vegetation (VEG) ***Climate Change***	***Vegetation (VEG)*** ***Climate Change***	—
Objectives:	**Objectives:**	—
Objective VEG 12: Use the landscape approach and promote landscape-scale, ecosystem-based actions to enhance resiliency and sustainability of PHMAs and GHMAs to climate stress.	No changes made.	No change (same as 2015).
Objective VEG 13: In PHMAs and GHMAs, manage risks of GRSG habitat degradation or loss from landscape stressors of drought, invasive species, and wildfire exacerbated by climate change to maintain existing GRSG populations and habitats.	No changes made.	No change (same as 2015).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD VEG 26: As climate change data become available through Rapid Ecoregional Assessments or other ecological studies, identify areas of unfragmented GRSG habitat and corridors that provide the life-cycle and genetic transfer needs for GRSG and adjust resource management practices, as needed.	No changes made.	No change (same as 2015).
MD VEG 27: Cooperate with multiple agencies and stakeholders to establish and maintain a network of climate monitoring sites and stations.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
FIRE AND FUELS MANAGEMENT (FIRE) ***WILDFIRE MANAGEMENT***	***FIRE AND FUELS MANAGEMENT (FIRE)*** ***WILDFIRE MANAGEMENT***	—
OBJECTIVE	***OBJECTIVE***	—
Objective FIRE 1: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. GRSG habitat will be prioritized commensurate with property values and other critical or sensitive habitats to be protected, with the goal to restore, enhance, and maintain areas suitable for GRSG.	No changes made.	No change (same as 2015).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD FIRE 1: Support the conservation of GRSG habitat objectives (**Table 2-2**) through appropriate wildfire management planning, coordination, staffing, resource allocations, training, equipment, and management oversight.	No changes made.	Partially Revised (remove reference to Table 2-2).
MD FIRE 2: Prioritize fire operations and fuels management decisions in SFA first, followed by PHMAs outside of SFA in accordance with the implementation-level FIAT assessments, and then GHMAs for conservation and protection during fire operations and fuels management decision-making. When suppression resources are widely available, place maximum efforts on limiting fire growth in GHMAs as well.	**MD FIRE 2:** Prioritize fire operations and fuels management decisions in PHMA in accordance with the implementation-level FIAT assessments, and then GHMAs for conservation and protection during fire operations and fuels management decision-making. When suppression resources are widely available, place maximum efforts on limiting fire growth in GHMAs as well.	No change (same as 2019).
MD FIRE 3: BLM planning units, in coordination with the USFWS and relevant state agencies, will annually review the GRSG landscape wildfire and invasive species habitat assessments (FIAT). Based on this review, revised actions to ameliorate invasive species must be incorporated into the assessment.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 4: Compile relevant field office- and district-level information into the statewide GRSG Annual Operating Handbook for use by resource advisors, wildfire crews, and agency administrators. The handbook will contain GRSG maps (including habitat and fuels treatment maps) and lists of state and local GRSG resource advisors and their contact information, local guidance, and other relevant information for each field office and district, aggregated into a statewide document.	No changes made.	No change (same as 2015).
MD FIRE 5: Coordinate and collaborate with federal, tribal, state, and local governments and associations sanctioned through either California or Nevada that meet fire standards for effective and efficient wildfire response.	No changes made.	No change (same as 2015).
MD FIRE 6: Strengthen and improve interagency wildfire prevention statewide through targeted wildfire prevention messages, including providing education on GRSG habitat loss, updating interagency agreements, and conducting wildfire prevention workshops and demonstration projects.	No changes made.	No change (same as 2015).
FIRE AND FUELS MANAGEMENT (FIRE) ***Pre-Suppression***	***FIRE AND FUELS MANAGEMENT (FIRE)*** ***Pre-Suppression***	—
OBJECTIVE		—
Objective FIRE 2: Use pre-suppression efforts to reduce the size and impact of wildfires in SFA, PHMAs, and GHMAs.	**Objective FIRE 2:** Use pre-suppression efforts to reduce the size and impact of wildfires in PHMAs and GHMAs.	No change (same as 2019).
Objective FIRE 3: Protect post-fire treatments in SFA first, followed by PHMAs outside of SFA, and then GHMAs from subsequent wildfires.	**Objective FIRE 3:** Protect post-fire treatments in PHMAs first, followed by GHMAs from subsequent wildfires.	Completely Revised-revised by state specific.
Management Decisions (MD):	**Management Decisions (MD):**	—
MD FIRE 7: Identify and prioritize areas that are vulnerable to wildfires and prescribe actions important for GRSG protection, in accordance with FIAT (see Appendix H, USDI 2015) and further refined in the implementation-level FIAT assessments.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 8: Create fire management plans to guide wildfire suppression in order to protect PHMAs and GHMAs.	No changes made.	No change (same as 2015).
MD FIRE 9: Before the fire season, train GRSG resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency experts in fire operations through the following: • Instruction of resource advisors during preseason trainings • Qualification as resource advisors • Coordination with resource advisors before fire season • Contribution to incident planning with information, such as habitat features or other key data useful in fire decision-making	No changes made.	No change (same as 2015).
FIRE AND FUELS MANAGEMENT (FIRE) ***Suppression***	***FIRE AND FUELS MANAGEMENT (FIRE)*** ***Suppression***	—
OBJECTIVE	***OBJECTIVE***	—
Objective FIRE 4: Use suppression to reduce the size and impact of wildfires in SFA, PHMAs, and GHMAs.	**Objective FIRE 4:** Use suppression to reduce the size and impact of wildfires in PHMAs and GHMAs.	No change (same as 2019).
Management Decisions (MD):	**Management Decisions (MD):**	—
MD FIRE 10: Provide local GRSG habitat maps to dispatch offices and extend attack incident commanders to prioritize wildfire suppression resources and design suppression tactics. Ensure GRSG habitat maps and suppression strategies are uploaded and updated in WFDSs.	No changes made.	No change (same as 2015).
MD FIRE 11: Assign a resource advisor with GRSG habitat expertise or with access to GRSG habitat expertise to all extended attack fires in or near SFA, PHMAs, and GHMAs.	**MD FIRE 11:** Assign a resource advisor with GRSG habitat expertise or with access to GRSG habitat expertise to all extended attack fires in or near PHMAs and GHMAs.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 12: In advance of critical fire weather, station additional federal fire suppression resources to optimize a quick and efficient response in SFA, PHMAs, and GHMAs.	**MD FIRE 12:** In advance of critical fire weather, station additional federal fire suppression resources to optimize a quick and efficient response in PHMAs and GHMAs.	No change (same as 2019).
MD FIRE 13: During periods of multiple fires, ensure line officers prioritize decisions by coordinating with resource advisors.	No changes made.	No change (same as 2015).
MD FIRE 14: To the extent possible, locate wildfire suppression facilities (e.g., base camps, spike camps, drop points, staging areas, and helicopter bases) in areas to avoid disturbing PHMAs and GHMAs. These include disturbed areas, grasslands, roads and trails, or in other areas with existing disturbance or minimal sagebrush cover.	No changes made.	No change (same as 2015).
MD FIRE 15: Document fire operations (e.g., disturbance) in PHMAs and GHMAs for potential follow- up coordination and restoration.	No changes made.	No change (same as 2015).
MD FIRE 16: Use indirect attack tactics (including burn-out operations) when: Direct attack is not effective in stopping fires with the potential of becoming significantly larger due to fuel loading, weather conditions, and fire behavior. If firefighter and public safety would be threatened or compromised	No changes made.	No change (same as 2015).
MD FIRE 17: Use retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.	No changes made.	No change (same as 2015).
MD FIRE 18: Minimize unnecessary cross-country vehicle travel during fire operations in GRSG habitat.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
FIRE AND FUELS MANAGEMENT (FIRE) ***Fuels Management***	***FIRE AND FUELS MANAGEMENT (FIRE)*** ***Fuels Management***	—
OBJECTIVE	***OBJECTIVE***	—
Objective FIRE 5: Protect and enhance PHMAs and GHMAs and areas of connectivity that support GRSG populations, including large contiguous blocks of sagebrush, through fuels management and incorporation of the FIAT assessment (Appendix H).	No changes made.	No change (same as 2015).
MANAGEMENT DECISIONS (MD):	***MANAGEMENT DECISIONS (MD):***	—
MD FIRE 19: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD FIRE 20: In PHMAs and GHMAs, apply fuels treatments on a landscape level to modify fire behavior, intensity, complexity (fire patchiness), size, and effects in which fire management efforts are enhanced.	No changes made.	No change (same as 2015).
MD FIRE 21: Establish and maintain fuel breaks to protect GRSG and its habitat to limit fire size and mitigate fire behavior to increase suppression effectiveness. When possible, establish fuel breaks next to roads or other previously disturbed areas.	No changes made.	No change (same as 2015).
MD FIRE 22: Use a full range of fuels management strategies and tactics within acceptable risk levels across the range of GRSG habitat consistent with land use plan direction.	No changes made.	No change (same as 2015).
MD FIRE 23: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • Why alternative techniques were not selected as a viable option • How GRSG goals and objectives will be met by its use • How the COT report objectives will be addressed and met	No changes made.	Completely Revised-revised by state specific.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• A risk assessment to address how potential threats to GRSG habitat will be minimized. Allow prescribed fire as a vegetation or fuels treatment, and it shall only be considered after the NEPA analysis for the burn plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that will protect GRSG habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Allow prescribed fire in known winter range, and it shall only be considered after the NEPA analysis for the burn plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.		
MD FIRE 24: In coordination with the USFWS and relevant state agencies and in accordance with FIAT (see Appendix H), develop a fuels management strategy for the BLM with large blocks of GRSG habitat. The strategy shall include an up-to-date fuels profile, land use plan direction, current and potential habitat fragmentation, sagebrush and GRSG ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity. When developing this strategy, consider the risk of increased habitat fragmentation from a proposed action versus the risk of large-scale fragmentation posed by wildfires if the action were not taken.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 25: Design fuels treatments through an interdisciplinary team process to expand, enhance, maintain, and protect PHMAs and GHMAs. Fuel reduction techniques, such as prescribed fire and chemical, biological (including targeted grazing), and mechanical treatments, are acceptable. Use green strips and fuel breaks, where appropriate, to protect seeding from subsequent fires.	No changes made.	Completely Revised-revised by state specific.
MD FIRE 26: In coordination with the USFWS and relevant state agencies and in accordance with FIAT (see Appendix H), BLM will identify treatment needs for wildfire and invasive species management. Ongoing treatment needs will be coordinated on state and regional scales and across jurisdictional boundaries for long-term conservation of GRSG and its habitat.	No changes made.	No change (same as 2015).
MD FIRE 27: On project completion, monitor and manage fuels projects to ensure long-term success, including persistence of seeded species and other treatment components. Control invasive vegetation post-treatment.	No changes made.	No change (same as 2015).
MD FIRE 28: Design fuels treatments to protect sagebrush ecosystems, modify fire behavior, restore ecological function, and create landscape patterns that most benefit PHMAs and GHMAs and promote use by GRSG.	No changes made.	No change (same as 2015).
MD FIRE 29: Train fuels treatment personnel on GRSG biology, habitat requirements, and identification of areas used locally.	No changes made.	No change (same as 2015).
MD FIRE 30: Use burning prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize killing desirable perennial plant species and reduce risk of annual grass invasion) and incorporate FIAT assessment (Chambers et. al 2014) in PHMAs and GHMAs.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 31: Ensure proposed sagebrush treatments are planned with interdisciplinary input from the BLM and coordinated with USFWS and state fish and wildlife agencies to meet GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2).
MD FIRE 32: Design vegetation treatments in areas of high fire frequency to facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to GRSG habitat.	No changes made.	No change (same as 2015).
MD FIRE 33a: For Nevada BLM-administered lands, before implementation, establish project monitoring sites where fuels management projects are planned. Monitor treatment areas both pre- and post-treatment on a multiple-year basis to ensure that project objectives are achieved.	No changes made.	No change (same as 2015).
MD FIRE 33b: For California BLM-managed lands, before implementation, establish project monitoring sites where fuels management projects are planned. Monitor treatment areas both pre- and post- treatment on a multiple-year basis to ensure that project objectives are achieved. Juniper treatments will be monitored in accordance with the Sage Steppe Ecosystem Restoration FEIS (BLM 2008).	No changes made.	No change (same as 2015).
FIRE AND FUELS MANAGEMENT (FIRE) ***Post Fire Management***	***FIRE AND FUELS MANAGEMENT (FIRE)*** ***Post Fire Management***	—
OBJECTIVE	***OBJECTIVE***	—
Objective FIRE 6: Retain, protect, and improve intact unburned sagebrush communities in burned areas by incorporating the FIAT assessment (Chambers et. al 2014).	No changes made.	No change (same as 2015).
Management Decisions (MD):	***Management Decisions (MD):***	—
MD FIRE 34: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 35: Prioritize post-fire treatments in PHMAs and GHMAs to maximize benefits to GRSG and its habitat. Focus post-fire treatments on replacing or reestablishing burned sagebrush habitat with the appropriate cover and structure to support GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2).
MD FIRE 36: In post-fire rehabilitation plans in PHMAs and GHMAs, design revegetation projects to accomplish the following: • Maintain and enhance unburned intact sagebrush communities when at risk from adjacent threats • Stabilize soils • Reestablish hydrologic function • Maintain and enhance biological integrity • Promote plant resiliency • Limit expansion or dominance or invasive species • Reestablish native species	No changes made.	No change (same as 2015).
MD FIRE 37: Implement post-fire treatments in PHMAs and GHMAs that emphasize stabilizing, rehabilitating, and restoring sagebrush ecosystems damaged by wildfires, including controlling invasive species.	No changes made.	No change (same as 2015).
MD FIRE 38: Increase post-fire treatment activities in PHMAs and GHMAs through the use of integrated funding opportunities with other resource programs and partners.	No changes made.	No change (same as 2015).
MD FIRE 39: Following post-fire treatments, monitor and implement management actions in PHMAs and GHMAs that promote healthy perennial grass, shrub and forb communities, and lentic (slow-moving freshwater) and lotic (rapid freshwater) riparian habitats so as to further restoration and ensure long- term persistence of seeded or pre-burn native plants, in accordance with GRSG habitat objectives (**Table 2-2**).	No changes made.	Partially Revised (remove reference to Table 2-2).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 40: Evaluate the potential for sagebrush island plantings based on ESDs in large burn areas that may lack sufficient sagebrush seed sources in order to ensure the reestablishment of sagebrush in GRSG habitat.	No changes made.	No change (same as 2015).
MD FIRE 41: Monitor post-fire rehabilitation treatments on a multiple-year basis to ensure that project objectives are achieved.	No changes made.	No change (same as 2015).
MD FIRE 42: Use GRSG habitat objectives (**Table 2-2**) and emphasize the use of native plant species in post-fire rehabilitation (e.g., reseeding), recognizing that nonnative species may be necessary, depending on the availability of native seed and prevailing site conditions. Selected species shall maintain site ecological function based on pre-burn conditions and anticipated threat of invasive and noxious weed establishment. Use ESDs and state and transition models if available.	No changes made.	Partially Revised (remove reference to Table 2-2).
No similar action.	No similar action.	New: refer to state specific MD FIRE (new MD).
LIVESTOCK GRAZING (LG)	***LIVESTOCK GRAZING (LG)***	***LIVESTOCK GRAZING (LG)***
OBJECTIVE	***OBJECTIVE***	—
Objective LG 1: Manage permitted livestock grazing to maintain and/or enhance PHMAs and GHMAs to meet or make progress towards meeting all GRSG life-cycle requirements and habitat objectives (**Table 2-2**), based on site potential.	No changes made.	Completely Revised-revised by rangewide.
Management Decisions (MD):	***Management Decisions (MD):***	—
MD LG 1: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperation and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential	**MD LG 1:** When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperation and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation and consistent with 43 CFR 4160.1 and IM-2018-023. Potential	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); • Grazing schedules (including rest or deferment); • Class of livestock; • Grazing schedules (including rest or deferment) • Making allotment unavailable to grazing • *Not in priority order	modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); • Grazing schedules (including rest or deferment); • Class of livestock; • Grazing schedules (including rest or deferment) • Making allotment unavailable to grazing • *Not in priority order	
MD LG 2: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in SFA followed by PHMAs outside of the SFA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting land health standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations.	**MD LG 2:** The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting land health standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations.	Completely Revised-revised by rangewide.
MD LG 3: The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFA and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table (**Table 2-2**), Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	**MD LG 3:** The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table (**Table 2-2**), Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 4: Complete land health assessments in PHMAs and GHMAs to identify whether or not GRSG habitat objectives (**Table 2-2**) are being met. The priority order for completing land health assessments in GRSG habitat is: • Allotments containing SFA that have never been evaluated; • Allotments containing SFA that have not been re-evaluated in 10 or more years; • Allotments containing PHMAs that have never been evaluated; • Allotments containing PHMAs that have not been re-evaluated in 10 or more years; • Allotments containing GHMAs that have never been evaluated; • Allotments containing GHMAs that have not been re-evaluated in 10 or more years.	**MD LG 4:** Complete land health assessments in PHMAs and GHMAs to identify whether or not GRSG habitat objectives (**Table 2-2**) are being met. The priority order for completing land health assessments in GRSG habitat is: • Allotments containing PHMAs that have never been evaluated; • Allotments containing PHMAs that have not been re-evaluated in 10 or more years; • Allotments containing GHMAs that have never been evaluated; • Allotments containing GHMAs that have not been re-evaluated in 10 or more years.	Completely Revised-revised by rangewide.
MD LG 5: If results from a land health assessment indicate that GRSG habitat objectives (**Table 2-2**) are not met in SFA, PHMAs, or GHMAs and grazing is a causal factor, and until appropriate modifications (MD LG 1) are incorporated through the permit renewal process, implement management strategies that may include, but are not limited to, the following: • Provide periods of rest or deferment during critical growth periods of key vegetation species • Limit grazing duration and intensity to allow plant growth sufficient to meet GRSG habitat objectives (**Table 2-2**) • Employ herd management techniques to minimize impacts of livestock on breeding, nesting, and brood-rearing habitat during the breeding season (March 1 to June 30; Lek—March 1 to May 15, and Nesting—April 1 to June 30)	**MD LG 5:** If results from a land health assessment indicate that GRSG habitat objectives (**Table 2-2**) are not met in PHMAs or GHMAs and grazing is a causal factor, and until appropriate modifications (MD LG 1) are incorporated through the permit renewal process, then, consistent with applicable law and regulations, implement management strategies that may include, but are not limited to, the following: • Provide periods of rest or deferment during critical growth periods of key vegetation species • Limit grazing duration and intensity to allow plant growth sufficient to meet GRSG habitat objectives (**Table 2-2**) • Employ herd management techniques to minimize impacts of livestock on breeding, nesting, and brood-rearing habitat during the breeding season (March 1 to June 30; Lek—	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Consider any temporary projects that can mitigate livestock impacts (e.g., temporary fencing or temporary water hauling locations; • Work with permittees to avoid concentrated turn-out locations for livestock within 4 miles of active and pending leks from March 1 to June 30 • Avoid domestic sheep use and bedding areas and herder camps within 2 miles of active and pending leks from March 1 to June 30 • Utilizing land features and roads on maps provided to the permittee to help delineate livestock use avoidance areas • Considering no grazing from May 15 – Sept. 15 in riparian areas and wet meadows. • Removing livestock within 3-7 days for the remainder of the grazing year once the allowable use levels are reached (BLM 1996, Burton et. al 2011, Cagney et. al, 2010, Connelly et. al 2000, France et. al 2008, Hagen et. al 2007, Holechek 1988, Platts 1990, and Tanaka et. al 2014): ▪ In riparian areas and wet meadows the allowable percent utilization is 35% woody species, and a minimum stubble height of 4-6 inches (10-15 cm) for herbaceous riparian vegetation based on site. ▪ In mountain big sage habitat, the allowable percent utilization is 40 % herbaceous key species and/or 35 % shrub key species. ▪ In Wyoming Basin big sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species. ▪ In black sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species.	March 1 to May 15, and Nesting—April 1 to June 30) • Consider any temporary projects that can mitigate livestock impacts (e.g., temporary fencing or temporary water hauling locations; • Work with permittees to avoid concentrated turn-out locations for livestock within 4 miles of active and pending leks from March 1 to June 30 • Avoid domestic sheep use and bedding areas and herder camps within 2 miles of active and pending leks from March 1 to June 30 • Utilizing land features and roads on maps provided to the permittee to help delineate livestock use avoidance areas • Considering no grazing from May 15 – Sept. 15 in riparian areas and wet meadows. • Removing livestock within 3-7 days for the remainder of the grazing year once the allowable use levels are reached (BLM 1996, Burton et. al 2011, Cagney et. al, 2010, Connelly et. al 2000, France et. al 2008, Hagen et. al 2007, Holechek 1988, Platts 1990, and Tanaka et. al 2014): ▪ In riparian areas and wet meadows, the allowable percent utilization is 35% woody species, and a minimum stubble height of 4-6 inches (10-15 cm) for herbaceous riparian vegetation based on site. ▪ In mountain big sage habitat, the allowable percent utilization is 40 % herbaceous key species and/or 35 % shrub key species. ▪ In Wyoming Basin big sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species. ▪ In black sage habitat, the allowable percent utilization is 35% herbaceous key species and/or 35 % shrub key species.	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	To the extent that the implementation of these strategies would be in conflict with the terms and conditions of any applicable livestock grazing permit or lease, then the BLM would complete a new decision-making process before implementing the strategies.	
MD LG 6: Appropriate allowable utilization levels will be defined through the grazing permit renewal process. At least one alternative in the NEPA process will consider the utilization levels identified in MD LG 5.	No changes made.	Completely Revised-revised by rangewide.
MD LG 7: In pastures where post livestock removal use monitoring results in utilization levels that exceed allowable use levels and livestock are identified as a causal factor, reduce animal unit months (AUMs) grazed the following year accordingly. AUMs cannot be applied to another pasture that is already being used by livestock or is being purposefully rested.	**MD LG 7:** In pastures where post livestock removal use monitoring results in utilization levels that exceed allowable use levels and livestock are identified as a causal factor, reduce animal unit months (AUMs) grazed the following year in accordance with 43 CFR 4160.1 and IM 2018-023. AUMs cannot be applied to another pasture that is already being used by livestock or is being purposefully rested.	Completely Revised-revised by rangewide.
MD LG 8: Within PHMAs and GHMAs, incorporate terms and conditions into grazing permits to meet GRSG habitat objectives (**Table 2-2**), specific terms and conditions will be based on rangeland health assessments (and subsequent monitoring data).	No changes made.	Completely Revised-revised by rangewide.
MD LG 9: When a transfer application is received for preference on an allotment within GRSG habitat: • Transfer of Preference: A transfer of preference will be approved unless the applicant does not meet qualifications (43 CFR, Part 4110.1 and 4110.2). A transfer will be approved to an unqualified applicant if 4110.2-3(e) applies. • Issuing the permit: In accordance with Section 402(c)(2) of FLPMA, a new permit will be issued to the new preference holder with the same	No changes made.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
terms and conditions as the terminated permit unless: ▪ A NEPA analysis of alternative terms and conditions has been completed. If changes in terms and conditions are needed to meet sage-grouse habitat needs or otherwise make progress toward meeting land health standards, issue a decision offering a permit with the new terms and conditions • If a new permit is issued as required by Section 402(c)(2) of FLPMA, then determine priority for completing land health evaluations, habitat assessments and NEPA analysis as described in MD LG 1.		
MD LG 10: In any allotment where land health standards were not met and livestock grazing was found to be a significant causal factor, compliance monitoring will be conducted annually until GRSG habitat objectives (**Table 2-2**) are met. If compliance monitoring finds that the implemented management strategies identified in MD LG 5 are not achieving the desired results, a change in action will be required.	**MD LG 10:** In any allotment where land health standards were not met and livestock grazing was found to be a significant causal factor, compliance monitoring will be conducted annually until GRSG habitat objectives (**Table 2-2**) are met or making progress towards meeting habitat objectives. If compliance monitoring finds that the implemented management strategies identified in MD LG 5 are not achieving the desired results, a change in action will be required in compliance with CFR 43 CFR 4160.1 and IM 2018-023.	Completely Revised-revised by rangewide.
MD LG 11: Allotments within SFA, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	**MD LG 11:** Allotments within PHMAs, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 12: Grazing management strategies for riparian areas and wet meadows will, at a minimum, maintain or achieve proper functioning condition (PFC) and promote GRSG brood-rearing habitat objectives (**Table 2-2**) within PHMAs and GHMAs.	No changes made.	Completely Revised-revised by rangewide.
MD LG 13: For range improvement projects, review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	Completely Revised-revised by rangewide.
MD LG 14: Build or modify livestock exclosures so that they are large enough to provide hiding cover to GRSG and other wildlife and to reduce the possibility of wildlife collisions with fences (Christiansen 2009; Stevens 2011; NRCS 2012).	No changes made.	Completely Revised-revised by rangewide.
MD LG 15: In accordance with state water law and subject to valid existing rights, remove or modify water developments that are negatively impacting GRSG habitats.	No changes made.	Completely Revised-revised by rangewide.
MD LG 16: Authorize new water developments for diversion from spring or seep source, in accordance with state water law and subject to valid existing rights when PHMAs and GHMAs will benefit from or not be negatively impacted by the new development. This includes developing new water sources for livestock as part of a grazing management plan to improve GRSG habitat.	No changes made.	Completely Revised-revised by rangewide.
MD LG 17: Modify water development projects to ensure riparian habitats in PHMAs and GHMAs are being maintained or improved in compliance with valid existing rights and in accordance with state water law.	No changes made.	Completely Revised-revised by rangewide.
MD LG 18: Locate salting and supplemental feeding locations, temporary or mobile watering, and new handling facilities (e.g., corrals and chutes) at least 1 mile from riparian areas, springs, and meadows. The distance can be greater based on site-specific conditions.	No changes made.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 19: In PHMAs and GHMAs, remove livestock ponds built in perennial channels that are negatively impacting riparian habitats, either directly or indirectly, unless riparian access is able to be controlled and negative impacts effectively mitigated (e.g.; water gap fence to pond), and do not permit new ones to be built in these areas subject to valid existing rights. Prior to pond removal, offsite watering options will be examined and considered.	No changes made.	Completely Revised-revised by rangewide.
MD LG 20: In PHMA and GHMA, rest areas that have received vegetative treatments from livestock grazing until resource monitoring data verifies the treatment objectives are being met and an appropriate grazing regime has been developed. Any livestock grazing temporary suspended use or other management changes per 43 CFR, Part 4110.3-2a for the purpose of a vegetation treatment will be done through the grazing decision, prior to treatment.	No changes made.	Completely Revised-revised by rangewide.
MD LG 21: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized shall remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments and fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	No changes made.	Completely Revised-revised by rangewide.
MD LG 22: After grazing rest associated with vegetation treatments in PHMAs and GHMAs, monitor annually for a minimum of 5 years to ensure project objectives are being maintained.	No changes made.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 23: Fences shall not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, and design).	No changes made.	Completely Revised-revised by rangewide.
WILD HORSES AND BURROS (WHB)	***WILD HORSES AND BURROS (WHB)***	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD WHB 1: For WHB management activities (e.g., gathers), review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD WHB 2: Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (**Table 2-2**).	No changes made.	Completely Revised-revised by rangewide.
MD WHB 3: Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g., range, wildlife, and riparian). The priorities for conducting assessments are: 1. HMAs containing SFA; 2. HMAs containing PHMAs, which include riparian areas; 3. HMAs containing only GHMAs; 4. HMAs containing sagebrush habitat outside of PHMAs and GHMAs mapped habitat; 5. HMAs without GRSG habitat.	**MD WHB 3:** Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g., range, wildlife, and riparian). The priorities for conducting assessments are: 1. HMAs containing PHMAs, which include riparian areas; 2. HMAs containing only GHMAs; 3. HMAs containing sagebrush habitat outside of PHMAs and GHMAs mapped habitat; 4. HMAs without GRSG habitat.	Completely Revised-revised by rangewide.
MD WHB 4: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on herd areas not allocated as HMAs and occupied by wild horses and burros in SFA, followed by PHMAs.	**MD WHB 4:** Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on herd areas not allocated as HMAs and occupied by wild horses and burros in PHMAs.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD WHB 5: In SFA and PHMAs outside SFA, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting rangeland health standards, even if current AML is not being exceeded.	**MD WHB 5:** In PHMAs, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting rangeland health standards, even if current AML is not being exceeded.	Completely Revised-revised by rangewide.
MD WHB 6: In SFA and PHMAs outside of SFA, monitor the effects of WHB use in relation to GRSG habitat objectives (**Table 2-2**) on an annual basis to help determine future management actions.	**MD WHB 6:** In PHMAs, monitor the effects of WHB use in relation to GRSG habitat objectives (**Table 2-2**) on an annual basis to help determine future management actions.	Completely Revised-revised by rangewide.
MD WHB 7: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives (**Table 2-2**) and management considerations for all HMAs within GRSG habitat, with emphasis placed on SFA and PHMAs outside of SFA.	**MD WHB 7:** Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives (**Table 2-2**) and management considerations for all HMAs within GRSG habitat, with emphasis placed on PHMAs.	Partially Revised (remove reference to Table 2-2).
MD WHB 8: Consider removals or exclusion of WHB during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives (**Table 2-2**) where HMAs overlap with GRSG habitat.	No changes made.	Partially Revised (remove reference to Table 2-2).
MD WHB 9: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.	No changes made.	No change (same as 2015).
MD WHB 10: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the WHB program.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MINERALS RESOURCES (MR)	***MINERALS RESOURCES (MR)***	—
Leasable Minerals	***Leasable Minerals***	—
Objectives	***Objectives***	—
Objective MR 1: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMAs and GHMAs. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMAs and GHMAs, that are subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).	**Objective MR 1 Removed**	Completely Revised-revised by rangewide.
Objective MR 2: Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an application for permit to drill (APD) for the lease to avoid and minimize impacts on GRSG or its habitat and will ensure that the best information about GRSG and its habitat informs and helps to guide development of such federal leases.	No changes made.	Completely Revised-revised by rangewide.
Management Decisions (MD): ***Unleased Fluid Minerals***	***Management Decisions (MD):*** ***Unleased Fluid Minerals***	—
MD MR 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 2: Manage SFA as NSO without waivers, exceptions, or modifications (see Appendix A; Figure 2-4).	**MD MR 2 Removed**	No change (same as 2019).
MD MR 3: In PHMAs outside of SFA, no waivers or modifications to an oil and gas lease no-surface-occupancy stipulation will be granted. In PHMAs, the Authorized Officer may grant an exception to an oil and gas lease no-surface-occupancy stipulation only where the proposed action: MD MR 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat. i. Will not have direct, indirect, or cumulative effects on GRSG or its habitat; or, ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and will provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) Areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid federal oil and gas lease existing as of the date of this RMP amendment. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts (see Appendix G). Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the	**MD MR 3:** In PHMAs, manage oil and gas with major constraints (no-surface occupancy) and timing limitations. See **MD SSS 5 (Allocation Exceptions)** and **Appendix E** regarding waivers, exceptions, and modifications for oil and gas lease stipulations.	No text changes (same as 2019), but MD SSS 5 and Appendix E are completely revised.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publicly available at least quarterly.		
MD MR 4a: For BLM land in the state of Nevada only, in the portions of the PHMAs outside of SFA, geothermal projects may be considered for authorization if all of the following conditions are met: • A team comprised of BLM, FWS, and NDOW specialists advises the BLM State Director on appropriate mitigation measures for the project and its ancillary facilities, including lek buffer distances using the best available science; • Mitigation actions are consistent with this Plan's mitigation strategy such as the Nevada Conservation Credit System, and; • The footprint of the project is consistent with the disturbance management protocols identified in this plan (see MD SSS 2 and Appendix E)	**MD MR 4a:** In PHMAs, manage geothermal fluid minerals with major constraints (no-surface occupancy) and timing limitations. See **MD SSS 5 (Allocation Exceptions)** and **Appendix E** regarding waivers, exceptions, and modifications for oil and gas lease stipulations.	No text changes (same as 2019), but MD SSS 5 and Appendix E are completely revised.
MD MR 4b: For BLM lands in California only, manage geothermal leasing in PHMAs in accordance with MD MR 3 (see Appendix G).	**MD MR 4b Removed**	Completely Revised-revised by rangewide.
MD MR 5: In GHMAs, manage oil and gas and geothermal fluid minerals with moderate constraints, timing limitations, and controlled surface use stipulations (see Appendix A; Figure 2-4).	No changes made.	Partially Revised- minor updates to language.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 6: In PHMAs and GHMAs, allow only geophysical exploration that does not crush sagebrush or create new or additional surface disturbance. Examples of technologies that may meet this requirement are drilling methods using helicopters, articulated rubber-tired vehicles that leave no trace, and vibroseis geophysical operations on roads and bladed shoulders.	No changes made.	No change (same as 2015).
MD MR 7: Prohibit surface shot methods in PHMAs.	No changes made.	No change (same as 2015).
Leased Federal Fluid Mineral Estate Actions	***Leased Federal Fluid Mineral Estate Actions***	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD MR 8: Review Objective SSS 4, and to the extent allowed by law, apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD MR 9: Use directional and horizontal drilling to reduce surface disturbance.	No changes made.	No change (same as 2015).
MD MR 10: On leased federal fluid mineral estate, where no APD or geothermal drilling permit (GDP) has been issued, apply RDFs consistent with applicable law and other conditions of approval (COAs) that conserve GRSG. Manage existing fluid mineral leases through COAs applied at the time APD or GDP is approved.	No changes made.	Completely Revised-revised by rangewide.
MD MR 11: On leased federal fluid mineral estate in PHMAs, complete master development plans for oil and gas in lieu of APD-by-APD, or operations/utilization plans for geothermal processing for all but exploration wells.	No changes made.	No change (same as 2015).
MD MR 12: On leased, federal, fluid mineral estate in PHMAs, require a full reclamation bond specific to the site. Ensure bonds are sufficient for reclamation costs for full restoration. Base the reclamation costs on the assumption that BLM contractors will perform the work.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 13: In PHMAs and GHMAs, place infrastructure in already disturbed locations to the extent feasible.	No changes made.	Completely Revised-revised by rangewide.
MD MR 14: Locate new compressor stations outside PHMAs and GHMAs and design them to reduce noise that may be directed toward PHMAs and GHMAs (see MDs SSS 2 and SSS 3 and Appendix M).	No changes made.	No change (same as 2015).
Locatable Minerals	***Locatable Minerals***	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD MR 15: Review Objective SSS 4, and to the extent allowed by law, apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD MR 16: Recommend for withdrawal SFA under the General Mining Act of 1872, as amended, subject to valid existing rights (see Appendix A; Figures 2-1 and 2-4).	**MD MR 16 Removed**	No change (same as 2019).
MD MR 17: On public lands, manage disturbances associated with notice-level activity in GRSG habitat on a landscape basis to avoid segmenting a project. Do this by encouraging operators and claimants to consolidate exploration into a plan of operations to reduce the proliferation of mining notices, in accordance with 43 CFR, Part 3809.21(b).	No changes made.	No change (same as 2015).
MD MR 18: Subject to valid existing rights and applicable law, authorize locatable mineral development activity, by approving plans of operation and apply mitigation and best management practices that minimize the loss of PHMAs and GHMAs or that enhance GRSG habitat by applying the "avoid, minimize and compensatory mitigation" process through an applicable mitigation system, such as the Nevada Conservation Credit System and exemplified in the Barrick Nevada Sage-Grouse Bank Enabling Agreement (March 2015).	**MD MR 18:** Subject to valid existing rights and applicable law, authorize locatable mineral development activity, by approving plans of operation and apply mitigation and best management practices that minimize the loss of PHMAs and GHMAs or that enhance GRSG habitat by applying the mitigation strategy outlined in **MD MIT 1** and exemplified in the Barrick Nevada Sage-Grouse Bank Enabling Agreement (March 2015).	No text changes (same as 2019), but MD MIT 1is completely revised.

MD LR 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD LR 2: Only utility corridors identified in Appendix A, Figure 2-10 remain as designated corridors in PHMAs and GHMAs. All previously designated corridors in PHMAs and GHMAs not shown on the map that were designated through past land use planning efforts have been evaluated and undesignated.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 3: On public lands, keep the designated corridors identified in Appendix A, Figure 2-10 in PHMAs and GHMAs available to new uses, subject to a maximum corridor width of 3,500 feet, unless a narrower width is specified in an existing plan, or a different width is specified for congressionally designated corridors.	No changes made.	No change (same as 2015).
MD LR 4: When issuing new communication site management plans or amending existing plans, include GRSG habitat objectives (**Table 2-2**). Current authorizations will then be amended to reflect the updated communication site management plans.	No changes made.	Partially Revised (remove reference to Table 2-2).
Management Decisions (MD): ***Land Use Authorizations***	***Management Decisions (MD):*** ***Land Use Authorizations***	—
MD LR 5: PHMAs and GHMAs are designated as avoidance areas for high voltage transmission line ROWs (>100 kV) (see Appendix A; Figure 2-11a), except for the transmission projects specifically identified below. All authorizations in these areas, other than the identified projects, must comply with the conservation measures outlined in this proposed plan amendment, including all of the requirements presented in MDs SSS 1 – SSS 4. The BLM is currently processing an application for the TransWest Express transmission line and the NEPA review for this project is well underway. Conservation measures for GRSG are being analyzed through the project's NEPA review process, which should achieve a net conservation benefit for the GRSG.	**MD LR 5:** PHMAs and GHMAs are designated as avoidance areas for high voltage transmission line ROWs (>100 kV) (see **Appendix A; Figure 2-11**), unless the high voltage transmission line meets one of the allocation exception criteria outlined in **MD SSS 5.** Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat. In OHMAs, apply MD SSS 4.	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 6: PHMAs and GHMAs are designated as major pipeline (≥24-inch diameter) ROW avoidance areas (see Appendix A; Figure 2-11a). Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat. In OHMAs, apply MD SSS 4.	**MD LR 6:** PHMAs and GHMAs are designated as major pipeline (≥24-inch diameter) ROW avoidance areas (see **Appendix A; Figure 2-11**), unless the major pipeline line meets one of the allocation exception criteria outlined in **MD SSS 5.** Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat. In OHMAs, apply MD SSS 4.	Completely Revised-revised by rangewide.
MD LR 7: Issue ROWs only after documenting that they will not adversely affect or disrupt GRSG habitat (independent of disturbance cap), except where such limitation will make accessing valid existing rights impracticable in PHMAs and GHMAs.	No changes made.	Completely Revised-revised by rangewide.
MD LR 8: Manage PHMAs as avoidance areas for ROWs (including permits and leases) (see Appendix A; Figure 2-11b). These do not include the wind, solar, or high-voltage transmission line and major pipeline ROW actions, above.	**MD LR 8:** Manage PHMAs as avoidance areas for ROWs (including permits and leases) (see **Appendix A; Figure 2-11)**, unless the ROW meets one of the allocation exception criteria outlined in **MD SSS 5.** These ROWs do not include the wind, solar, or high-voltage transmission line and major pipeline ROW actions, above.	No change (same as 2019).
MD LR 9: Manage GHMAs as open to ROWs (including for permits and leases) (see Appendix A; Figure 2-11b). These do not include the wind, solar, or high-voltage transmission line and major pipeline ROW actions, above.	No changes made.	No change (same as 2015).
MD LR 10: In PHMAs, bury new distribution power and communication lines in existing disturbed areas, unless it would not be technically feasible, or the cost would prohibit the proponent from providing the service. Where burying transmission lines is not feasible, locate new transmission lines next to existing linear disturbances, when possible; additional mitigation will be required.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 11: When renewing or amending ROWs (including permits and leases), assess the impacts of ongoing use of the ROW on GRSGs and their habitat and minimize such impacts to the extent allowed by law.	No changes made.	No change (same as 2015).
MD LR 12: When renewing or amending ROWs that are undeveloped, work with ROW holders to bury or relocate authorized but undeveloped lines to minimize impacts on PHMAs, unless this would not be technically feasible or would be contrary to policy. Where burying transmission lines is not feasible, locate new transmission lines next to existing linear disturbances, when possible.	No changes made.	No change (same as 2015).
MD LR 13: In PHMAs and GHMAs where existing ROWs, permits, or leases are no longer in use, coordinate with the authorized holder to relinquish the authorization and reclaim the site by removing the infrastructure.	No changes made.	No change (same as 2015).
MD LR 14: Stipulate site relinquishment and reclamation in all new, amended or renewed ROWs, permits, and leases.	No changes made.	No change (same as 2015).
MD LR 15: In PHMAs and GHMAs, site new linear features in designated corridors, as identified in Appendix A, Figure 2-10, or at a minimum, collocate with existing linear features. Construct new ROWs in designated corridors as close as technically feasible to existing linear ROW infrastructure to limit disturbance to the smallest footprint.	No changes made.	Completely Revised-revised by rangewide.
MD LR 16: Manage landfills and transfer stations on public lands to eliminate opportunities to attract and provide nesting, cover, or perches for predators.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 17: Within 4 miles of active and pending leks in GRSG habitat, require ROW, permit, and lease holders to retrofit those portions of power lines and other utility structures with nesting and perch- deterring devices. Do this during the renewal and amendment process if adverse effects, such as increased nest predation, on GRSG populations have been documented. This requirement shall be predicated on research and monitoring studies specific to power lines or other utility structures.	No changes made.	Completely Revised-revised by state specific.
MD LR 18: In PHMAs and subject to valid existing rights, authorize new road ROWs only when necessary for public safety or administrative access, or if it will create no new surface disturbance.	No changes made.	No change (same as 2015).
MD LR 19: In PHMAs and GHMAs, address access to valid existing rights to provide the minimum access necessary to exercise the right and maintain or enhance PHMAs and GHMAs.	No changes made.	No change (same as 2015).
MD LR 20: Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	No changes made.	No text changes (same as 2015), but Appendix D has been completely revised.
No similar action.	No similar action.	New: refer to state specific MD LR (new MD)
Management Decisions (MD): ***Land Tenure***	***Management Decisions (MD):*** ***Land Tenure***	—
MD LR 21: Lands classified as PHMAs and GHMAs for GRSG will be retained in federal management, unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG (see Appendix A; Figure 2-12).	**MD LR 21:** Exceptions to non-disposal or exchange of lands that are identified for retention in Appendix A, Figure 2-12 could be considered if (a) they are identified for disposal through previous planning efforts or address a Congressional Act (e.g., the respective Lincoln and White Pine County Conservation, Recreation, and Development Acts), (b) the agency can demonstrate that the disposal, including land exchanges, will have no adverse	Completely Revised-revised by state specific (MD SSS 5).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	direct, indirect or cumulative impacts on GRSG and its habitat, or (c) adverse impacts on GRSG or its habitat will be offset, through use of voluntary compensatory mitigation, consistent with the States' mitigation policies and programs, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). Also see allocation exception criteria in MD SSS 5.	
MD LR 22: Where significant conservation actions can be achieved in PHMAs and GHMAs, seek to acquire lands with intact subsurface mineral estate by donation, purchase, or exchange in order to best conserve, enhance, or restore GRSG habitat.	No changes made.	No change (same as 2015).
MD LR 23: Manage lands acquired by exchange, purchase or easement as either PHMAs or GHMAs, in consideration of surrounding habitat.	No changes made.	No change (same as 2015).
Management Decisions (MD): ***Withdrawals***	***Management Decisions (MD):*** ***Withdrawals***	—
MD LR 24: Recommend SFA for withdrawal from the General Mining Act of 1872, as amended; subject to valid existing rights (see Appendix A; Figure 2-5).	**MD LR 24 Removed**	No change (same as 2019).
Recreation and Visitor Services (REC)	***Recreation and Visitor Services (REC)***	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD REC 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD REC 2: Allow special recreation permits in PHMAs and GHMAs only if their effects on GRSG and its habitat are neutral or result in a net conservation gain.	**MD REC 2:** Allow special recreation permits in PHMAs and GHMAs only if their effects on GRSG and its habitat are neutral or beneficial.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD REC 3: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development will have a net conservation gain to GRSG and its habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.	**MD REC 3:** In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the facility meets one of the criteria outlined in **MD SSS 5.**	No change (same as 2019).
MD REC 4: Develop trail mapping and educational campaigns in PHMAs and GHMAs to reduce recreational impacts on GRSG and their habitat, including the effects of cross-country travel.	No changes made.	No change (same as 2015).
TRAVEL AND TRANSPORTATION MANAGEMENT (TTM)	***TRAVEL AND TRANSPORTATION MANAGEMENT (TTM)***	—
OBJECTIVE	***OBJECTIVE***	—
Objective TTM 1: Prioritize and complete transportation planning in PHMAs and GHMAs that provides for reasonable access to public lands for administration and recreation and that minimizes proliferation of user-created routes (e.g., roads, primitive roads, and trails).	No changes made.	No change (same as 2015).
Management Decisions (MD):	***Management Decisions (MD):***	—
MD TTM 1: Review Objective SSS 4 and apply MDs SSS 1 through SSS 4 when reviewing and analyzing projects and activities proposed in GRSG habitat.	No changes made.	No change (same as 2015).
MD TTM 2: In areas where travel planning has not been completed, limit off-highway vehicle (OHV) travel to existing routes in PHMAs and GHMAs (subject to valid existing rights, such as for a mine under a plan of operations) until subsequent implementation-level travel planning is completed and a designated route system is established. In travel management plans that have been completed and are being implemented (e.g., northeastern California plans), continue to limit OHV travel to designated routes in PHMAs and GHMAs (see Appendix A; Figure 2-13).	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD TTM 3: Allow the goals, objectives, and actions in relevant national OHV guidance to guide subsequent implementation-level travel planning efforts. In addition, the following guidelines will be considered when undertaking future implementation-level travel planning: • Identify, prioritize, and update annually a timeline to complete travel planning in all relevant planning areas to accelerate data collection, route evaluation and selection, and on-the-ground implementation, including signing, monitoring, and rehabilitation. • Consult with interested user groups, federal, state, county, and local agencies, local landowners, and other parties to provide an opportunity for the public to express itself and have its views considered. Consequently, incorporate a public outreach plan to fully engage all interested stakeholders into future travel management plans. • Among other route evaluation criteria, incorporate criteria from 43 CFR, Part 8342.1, and specifically section (b), "areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats." • Evaluate all routes to determine the purpose and need and the potential resource or user conflicts from motorized travel. Where resource or user conflicts outweigh the purpose and need for the route, consider closing the route or relocating it outside of PHMAs and GHMAs. Evaluate for administrative access only routes not required for public access or recreation against current administrative/agency purpose or need.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Consider closing routes that are duplicative, parallel, or redundant. • Consider seasonal restrictions (see Actions SSS 2 and SSS 3) on motorized travel use PHMAs and GHMAs where motorized vehicle use is a threat. Consider limiting over snow vehicles (OSVs) designed for use on a track or tracks or a ski or skis, while in use to designated routes or consider seasonal closures in GRSG wintering areas from November 1 through February 28. • Consider the need for restricting motorized vehicles, including their sound levels (Actions SSS 2 and SSS 3), speed and design (e.g., motorcycles, ATVs, and UTVs). • Consider scheduling road maintenance to avoid disturbance during sensitive GRSG life-cycle periods to the extent practicable. Consider using time of day, seasonal, and noise restrictions (see Actions SSS 2 and SSS 3) to reduce impacts on GRSG seasonal habitat. • In PHMAs and GHMAs, close to motorized travel those roads, primitive roads, and trails not designated in travel management plans. • In PHMAs and GHMAs, prioritize restoring routes not designated in a travel management plan. Obliterate and seed roads, primitive roads, and trails not designated in travel management plans, with appropriate seed mixes and transplanted sagebrush when applicable. Use fire-resistant species as fuel breaks where appropriate. Seed must be certified weed free.		
MD TTM 4: In PHMAs and GHMAs, where new roads are necessary for public safety, administration, or public need, consider limiting route construction to realignments of existing routes where possible.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD TTM 5: In PHMAs and GHMAs, work with local governments to minimize upgrading existing routes that will change route category (e.g., road, primitive road, or trail) or capacity, unless the upgrade will maintain or enhance GRSG habitat, provide a fuel break to protect native vegetation, will be necessary for public safety, or will eliminate the need to construct a new road.	No changes made.	No change (same as 2015)..
MD TTM 6: In PHMAs and GHMAs, temporary closures will be considered in accordance with 43 CFR, Subpart 8364 (Closures and Restrictions), 43 CFR, Subpart 8351 (Designated National Area), 43 CFR, Subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties), and 43 CFR, Subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence (43 CFR, Part 8341.2). A closure or restriction order shall be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders shall be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Cultural Resources (CUL)	**Cultural Resources (CUL)**	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD CUL 1: Do not restrict tribal access to view GRSG breeding behavior for a tribe's traditional lifeways.	No changes made.	No change (same as 2015).
MD CUL 2: Do not prohibit tribal access to traditional locations for cultural practices in PHMAs and GHMAs.	No changes made.	No change (same as 2015).
MD CUL 3: Do not prohibit tribal collection of seeds, vegetation, or medicinal plants related to traditional cultural practices in PHMAs and GHMAs.	No changes made.	No change (same as 2015).
Mitigation (MI)	**Mitigation (MI)**	—
Management Decisions (MD):	***Management Decisions (MD):***	—
MD MIT 1: In Nevada, coordinate with the SETT on the application of a compensatory mitigation program, such as the Nevada Conservation Credit System (CCS) (**Appendix N**) for mitigating activities that result in habitat loss and degradation of GRSG habitat in Nevada, where the application of compensatory mitigation will occur on, or the credit will be applied to disturbance on BLM-administered lands.	**MD MIT 1:** When authorizing third-party actions in GRSG HMAs, the BLM will seek to achieve the planning-level GRSG management goals and objectives through implementation of mitigation and management actions, consistent with valid existing rights and applicable law. Management will be consistent with the GRSG goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [GRSG] or to improve the condition of [GRSG] habitat" across the planning area. The BLM has determined that FLPMA does not explicitly mandate or authorize the BLM to require public land users to implement compensatory mitigation as a condition of obtaining authorization for the use of BLM-administered lands (IM 2019-018, Compensatory Mitigation, December 6, 2018). Consistent with that determination, compensatory mitigation must be voluntary unless required by other applicable laws, but the BLM recognizes that	Completely Revised-revised by rangewide.

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	state authorities may also require compensatory mitigation. To align this planning effort with the BLM's compensatory mitigation policy, IM 2019-018, the amended plans clarify that the BLM will consider compensatory mitigation only when offered voluntarily by a project proponent, when required by a law other than FLPMA; or as a component of compliance with a state mitigation plan, program, or authority, such as required by State of Nevada Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). In accordance with the State's goals for managing Greater Sage-Grouse, the plans modify the net conservation gain standard for compensatory mitigation to clarify that the BLM would pursue net benefit/net conservation gain as a broader planning goal and objective. This means that the BLM would continue to require avoidance, minimization, and other onsite mitigation to adequately conserve Greater Sage-Grouse and its habitat, while remaining committed to implementing beneficial habitat management actions to reduce the threats of fire and invasive species. In fiscal year 2018, the BLM funded approximately $29 million in sage-grouse management actions resulting in approximately 500,000 acres of treated sage-grouse habitat and expects to invest another $22.5 million of habitat management projects in fiscal year 2019 in the Great Basin Region. The BLM would continue to apply the mitigation hierarchy as described in the CEQ regulations at 40 CFR 1508.20; however, the BLM would focus on avoiding, minimizing, rectifying, and reducing impacts over time. Compensation, which involves	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	replacing or providing substitute resources for the impacts (including through payments to fund such work), would be considered only when voluntarily offered by a proponent, required by a law other than FLPMA, or to meet a State requirement. The BLM commits to cooperating with the State to analyze applicant-proposed or state-imposed compensatory mitigation to offset residual impacts. The BLM remains committed to achieving the planning-level management goals and objectives identified in this ROD and the 2015 ARMPA by ensuring Greater Sage-Grouse habitat impacts are addressed through implementing mitigating actions consistent with the governing RMP. In all GRSG habitat, before authorizing third-party actions that result in habitat loss and degradation within the State of Nevada, the BLM will complete the following steps, in alignment with the State of Nevada's Greater Sage-Grouse Conservation Plan (2014, as amended), including avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions: 1. Notify the State of Nevada's Sagebrush Ecosystem Technical Team to determine if the State requires or recommends any mitigation – including avoidance, minimization, or compensatory mitigation – under the States' regulations, policies, or programs, such as required by the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law), related to the conservation of GRSG. 2. Incorporate the States' required or recommended mitigation into the BLM's NEPA decision-making process, if the State of Nevada's Sagebrush Ecosystem Technical Team	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	determines that there are unacceptable residual impacts on GRSG or its habitat and compensatory mitigation is required as a part of the State's policy or authorization, such as required by the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law), or if a proponent voluntarily offers mitigation. 3. Verify that the project proponent has coordinated with the State of Nevada's Sagebrush Ecosystem Technical Team to ensure it complies with the State of Nevada's Greater Sage-Grouse Conservation Plan (2014, as amended) and all applicable State requirements relating to its proposal. The BLM will cooperate with the States to determine appropriate project design and alignment with the States' policies and requirements, including those regarding compensatory mitigation, such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a requirement of or recommendation from the States, the BLM's NEPA analysis will evaluate the need to avoid or minimize impacts of the proposed project and achieve the goals and objectives of this Approved RMPA. With respect to any State compensatory mitigation requirements, the BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action.	

2015 BLM GRSG Approved RMP Amendment (as maintained)	2019 BLM GRSG Approved RMP Amendment (as maintained)	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	The BLM will not deny a proposed authorization in GRSG habitat solely on the grounds that the proponent has not proposed or agreed to undertake voluntary compensatory mitigation, unless required by an existing States' authority such as the State of Nevada's Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law). The BLM will ensure project design is aligned with the States' requirements—including compensatory mitigation—that may be necessary to comply with State's policies and programs for the conservation of GRSG. Where compensatory mitigation is required as part of a States' plan, program, or authority, such as Nevada State Executive Order 2018-32 (and any future regulations adopted by the State of Nevada regarding compensatory mitigation, consistent with federal law), the BLM will include the required mitigation in all of its action alternatives in a NEPA analysis.	
MD MIT 2: Identify compensatory mitigation areas in PHMAs and GHMAs with the potential to achieve GRSG habitat objectives (**Table 2-2**), in accordance with FIAT, the SFA prioritization, and the State of Nevada Strategic Action Plan.	**MD MIT 2:** On BLM-administered lands within Nevada and California, when authorizing third-party actions that will result in direct, indirect, or cumulative impacts on GRSG or their habitat, the BLM will defer to the State of Nevada's most current version of the Habitat Quantification Tool (HQT) to quantify those impacts to ensure consistency in tracking and reporting changes to GRSG habitat quality and quantity.	Completely Revised-revised by rangewide.

2.12.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that would change by the Proposed RMP Amendment. If 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The 2015 and 2019 Appendices can be found on the Nevada and Northeastern California GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	2015, 2019	Completely Revised-revised by rangewide.
B: Applying Lek Buffer-Distances When Approving Actions	2015, 2019	Partially Revised – Same as 2019 with updated mitigation reference
C: Required Design Features	2015, 2019	No change (same as 2019).
D: Greater Sage-Grouse Monitoring Framework	2015, 2019	Completely Revised-revised by rangewide.
E: Greater Sage-Grouse Disturbance Cap Guidance	2015, 2019	Partially Revised – disturbance cap section of the Proposed Plan
F: Regional Mitigation Strategy; (*Removed in 2019)*	2015	No change (still removed) - appendix not carried forward and is described in the mitigation section of the Proposed Plan
G: Fluid Mineral Stipulations, Waivers, Modifications, and Exceptions	2015, 2019	Partially Revised – updated rangewide exceptions, modifications, and waivers
H: Fire and Invasives Assessment Tool	2015	No change (same as 2015).

Oregon RMPs

This page intentionally left blank.

2.13 OREGON RMPS

This appendix presents the GRSG approved RMP amendment language from the 2015 and 2019 records of decision for Oregon. Changes between 2015 and 2019 are noted. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment, either partially or completely, and which existing decisions would not be amended at all. The types of changes to existing management direction from the Proposed RMP Amendment include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 and 2019 appendices that are listed in **Section 2.13.2** of this appendix. For additional state-specific Oregon management direction for the Proposed RMP Amendment, see Chapter 2, Table 2-11.

2.13.1 Oregon

Note that in 2015 and 2019 Oregon used the ODFW definitions for leks with management directions that used a combination of "occupied" and "pending" leks. In the 2024 Proposed RMP Amendment Oregon BLM is adopting the WAFWA lek definitions (Cook et. al., 2022). In addition to using the WAFWA "active leks" Oregon has a state-specific difference (refer to Chapter 2 Table 2-9) to also use "pending active lek" and continue to be in coordination with ODFW. All management directions in the 2015 and 2019 Approved ARMPAs referring to occupied and pending leks are replaced with active and pending active leks.

Table 1: Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Direction in Oregon

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Special Status Species (SSS)	**Special Status Species (SSS)**	
Goal	**Goal**	
Goal SSS 1: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners.	No changes made.	Completely Revised-revised by rangewide.
Objective	**Objective**	
Objective SSS 1: Protect PHMA necessary to conserve 90 percent of Oregon's Greater Sage-grouse population with emphasis on highest density and important use areas that provide for breeding, wintering, and connectivity corridors. Protect GHMA necessary to conserve occupied seasonal or year-round habitat outside of PHMA.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective SSS 2: Maintain or improve habitat connectivity between PHMA within Oregon and adjoining states to promote Greater Sage-grouse movement and genetic diversity.	No changes made.	No change (same as 2015)
Objective SSS 3: In addition to the net conservation gain mitigation requirement, manage Oregon PACs so that discrete anthropogenic disturbances, whether temporary or permanent, cover less than 3 percent of the total available Greater Sage-grouse habitat, regardless of ownership.	No changes made.	Partially Revised-revised by rangewide (Net conservation gain replaced by "minimum standard of no net loss" except where state of Oregon rules apply.)
Per Oregon Maintenance Action 2: Objective SSS 4: The habitat objectives for GRSG (Table 2-2) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-2 vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sage-grouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: • To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments • To evaluate land use plan effectiveness for sage-grouse conservation, and		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential, and local information. References: U.S. Department of the Interior, Bureau of Land Management. 2001. Rangeland health standards handbook H-4180-1. https://www.blm.gov/sites/blm.gov/files/uploads/Media_Library_BLM_Policy_h4180-1.pdf		
Objective SSS 5: Manage anthropogenic uses and GRSG predator subsidies on public lands (landfills, transfer stations, predator perches and nest sites) to reduce the effects of predation on GRSG.	No changes made.	No change (same as 2015)
Objective SSS 6: The BLM will coordinate with the State of Oregon regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring related to adaptive management and anthropogenic disturbance.	No changes made.	No change (same as 2015)
Management Direction	**Management Direction**	
MD SSS 1: Designate PHMA on 4,578,518 acres and designate GHMA on 5,628,628 acres.	No changes made.	Partially Revised- updated acres
MD SSS 2: Designate Sagebrush Focal Areas (SFA) (1,929,580 acres) as shown on Figure 1-2: Oregon Decision Area, Greater Sage-Grouse Habitat Management Areas for BLM-Administered Lands (with SFA). SFAs will be managed as PHMA, with the following additional management:A. Recommended for withdrawal from the General Mining Law of 1872, as amended, subject to valid existing rights. B. Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.C. Prioritized for vegetation management and conservation actions in these	No changes made.	Completely Revised-revised by rangewide (SFA's not carried forward)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).		
MD SSS 3: If the 3% anthropogenic disturbance cap, not to exceed 1% increase per decade, is exceeded on lands (regardless of landownership) within GRSG Priority Habitat Management Areas in the affected Oregon PAC, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the General Mining Law of 1872, as amended, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in the affected Oregon PAC until the disturbance has been reduced to less than the cap.	No changes made.	Completely Revised-rangewide and state specific direction (Oregon keeps decadal disturbance cap)
MD SSS 4: If the 3% disturbance cap, not to exceed 1% increase per decade, is exceeded on all lands (regardless of landownership) within a proposed project analysis area in Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as General Mining Law of 1872, as amended, valid existing rights, etc.). Within existing designated utility corridors, the 3% disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location.	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 5: Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in the Priority Habitat Management Area within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is co-located into an existing disturbed area, as described in Appendix E.	No changes made.	No change (same as 2015)
MD SSS-6: Using the habitat disturbance cap calculation methodology (Appendix E), in cooperation with ODFW, measure the direct area of influence of infrastructure, facilities, energy, and mining within Oregon PACs (Figure 2-2 in Appendix A) and maintain a current database of anthropogenic disturbance.	No changes made.	Completely Revised-rangewide
MD SSS 7: Verify the accuracy of Greater Sage-grouse habitat data layers at the site/project scale. Consider ecological site potential when assessing habitat suitability for Greater Sage-grouse. Periodically update PHMA and GHMA in cooperation with ODFW using the best available information.	No changes made.	No change (same as 2015)
MD SSS 8: When fine and site-scale Greater Sage-grouse habitat assessment and monitoring is needed or required, (e.g., as a component of a rangeland health assessment), measure the Greater Sage-grouse habitat suitability indicators for seasonal habitats identified in Table 2-2. Site suitability values may be adjusted regionally where there is scientific justification for doing so. When using the indicators to guide management actions or during land health assessments, consider that	No changes made.	Completely Revised-rangewide (new Application of Habitat Objectives section; also Table 2-2 replaced by Appendix 8, inclusive of Table 8-1.E. Oregon GRSG Habitat Indicators)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale.		
MD SSS 9: Apply buffers and seasonal restrictions in Table 2-4 to all occupied or pending leks in PHMA and GHMA to avoid direct disturbance to Greater Sage-grouse. In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review (Open File Report 2014-1239) (Manier et al. 2014; Appendix B).	No changes made.	No change (same as 2015)
See Table 2-3 Greater Sage-Grouse Buffers (text included in table 2-3 after this comparison table)	No changes made.	No change (same as 2015)
MD SSS 10: In undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	No changes made.	Completely Revised-revised by rangewide (new Mitigation section; Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 11: Anthropogenic disturbances or activities disruptive to GRSG (including scheduled maintenance activities) shall not occur in seasonal GRSG habitats unless the project plan and NEPA document demonstrate the project will not impair the life-cycle or behavioral needs of GRSG populations. Seasonal avoidance periods vary by GRSG seasonal habitat as follows: • In breeding habitat within four (4) miles of occupied and pending leks from March 1 through June 30. Lek hourly restrictions are from two hours before sunset to two hours after sunrise at the perimeter of an occupied or pending lek. • Brood-rearing habitat from July 1 to October 31 • Winter habitat from November 1-February 28 The seasonal dates may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) in coordination with ODFW, in order to better protect GRSG.	No changes made.	No change (same as 2015)
MD SSS 12: Identify Greater Sage-grouse habitat outside of PHMA that can function as connecting habitat. Consider the habitat connectivity map developed by The Nature Conservancy and BLM for Oregon (Jones and Schindel, 2015). When conducting analysis for project level NEPA, include Greater Sage-grouse habitat and populations in adjoining states within 4 miles of leks in Oregon.	No changes made.	No change (same as 2015)
MD SSS 13: All authorized actions in Greater Sage-grouse habitat are subject to RDFs and BMPs in Appendix C and these disturbance screening criteria:	No changes made.	Partially Revised-revised by rangewide (Revised calculation method to disturbance cap. Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Where avoidance is not possible, disturbance will be allowed under the following conditions: • Development in each Oregon PAC and PHMA does not exceed the disturbance cap at either the Oregon PAC scale or the project scale (Appendix E). • New anthropogenic disturbance does not occur within 1.0 mile of an occupied or pending lek in PHMA or GHMA. • Development meets noise restrictions in PHMA and GHMA. • Analyze through implementation level NEPA seasonal protection and timing limitations of occupied and pending leks in PHMA and GHMA. • All disturbance is subject to net conservation gain mitigation to Greater Sage-grouse and its habitat (see Appendix F, Mitigation) in PHMA and GHMA. • All new permitted activities will follow Required Design Features (Appendix C) in PHMA and GHMA. • To the extent feasible, development should only occur in non-habitat areas. If this is not possible, then development must occur in the least suitable habitat for Greater Sage-grouse. • Apply buffers and seasonal restrictions in Table 2-4 to all occupied or pending leks in PHMA and GHMA to avoid direct disturbance to Greater Sage-grouse. Screening criteria and conditions will not be applicable to vegetation treatments being conducted to enhance GRSG habitat, except noise and seasonal restrictions will apply.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 14: Assist ODFW and other partners with surveillance and, where appropriate, control of West Nile virus. Report observations of dead or sick Greater Sage-grouse or other bird deaths that could be attributed to disease or parasites.	No changes made.	No change (same as 2015)
MD SSS 15: Implement adaptive management responses to hard and soft triggers established in the Adaptive Management Strategy (Appendix J). Hard trigger responses will be removed, either through a plan amendment or when the criteria for recovery have been met (see Appendix J - Longevity of Responses). Removal of the hard trigger responses returns management direction in the affected Oregon PAC to the plan decisions that are in force within those Oregon PACs that have not tripped a hard trigger.	No changes made.	Completely Revised-revised by rangewide (new Adaptive Management section)
Predation		
No similar action	No similar action	New: rangewide predation actions added
Vegetation (VEG)	**Vegetation (VEG)**	
Goal	**Goal**	
Goal VEG 1: Increase the resistance of Greater Sage-grouse habitat to invasive annual grasses and the resiliency of Greater Sage-grouse habitat to disturbances such as fire and climate change to reduce habitat loss and fragmentation.	No changes made.	No change (same as 2015)
Goal VEG 2: Within Greater Sage-grouse habitat, re-establish sagebrush cover, native grasses, and forbs in areas where they have been reduced below desired levels or lost. Use ecological site descriptions to determine appropriate levels of sagebrush cover and appropriate native grasses and forbs.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Goal VEG 3: Use integrated vegetation management to control, suppress, and eradicate invasive plant species per BLM Handbook H-1740-2. Apply ecologically based invasive plant management principles in developing responses to invasive plant species.	No changes made.	No change (same as 2015)
Objective	**Objective**	
Objective VEG 1: Within the boundaries of each Field Office establish a mix of sagebrush classes as identified in Table 2-4, Desired Mix of Sagebrush Classes by Sagebrush Type on BLM-administered lands in Greater Sage-grouse habitat. Evaluate progress toward the objective every 10 years.	No changes made.	No change (same as 2015)
Table 2-4 Desired Mix of Sagebrush Classes by Sage Brush Type (text included in table 2-4 after this comparison table)	No changes made.	No change (same as 2015)
Objective VEG 2: Reduce encroaching conifer cover to zero within 1.0 mile of all occupied or pending leks and to less than 5 percent within 4.0 miles of such leks at a rate at least equal to the rate of encroachment. Priorities for treatment are phase I and phase II juniper, and phase III juniper with a grass-forb understory. Retain all old trees, culturally significant trees, and trees in active use by special status species (e.g. nest, den, and roost trees) and all old growth stands of juniper within 4.0 miles of occupied or pending leks. See OSU Technical Bulletin 152, or its successor, for the key characteristics of old trees. Old growth stands are those where the dominant trees in the stand meet the key characteristics for old trees. Pending occupied leks and pending unoccupied leks are hereafter collectively referred to as "pending leks" (see Glossary).	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective VEG 3: Reduce the area dominated by invasive annual grasses to no more than 5 percent within 4.0 miles of all occupied or pending leks. Manage vegetation to retain resistance to invasion where invasive annual grasses dominate less than 5 percent of the area within 4.0 miles of such leks.	No changes made.	No change (same as 2015)
Objective VEG 4: Thin sagebrush stands that exceed 30 percent cover in cool-moist sagebrush and 25 percent cover warm-dry sagebrush to no less than 15 percent cover within 4.0 miles of all occupied or pending leks.	No changes made.	No change (same as 2015)
Objective VEG 5: Increase native plant diversity (number of species) to at least 50 percent of the potential diversity listed for the relevant ecological site description and sagebrush cover where it is less than 15 percent in half of crested wheatgrass seedings in PHMA. If existing diversity equals or exceeds 50 percent of the potential diversity, no forb restoration is needed.	No changes made.	No change (same as 2015)
Objective VEG 6: Conduct vegetation treatments based on the following 10-year (decadal) acreage objectives within four miles of occupied and pending leks, using results of the fire and invasives assessment tool (FIAT; Fire and Invasive Assessment Team 2014) to establish the priority PACs and treatments within PACs:	No changes made.	No change (same as 2015)
Objective VEG 7: Each Oregon PAC has at least 5 percent sagebrush cover on a minimum of 70 percent of the area within the Oregon PAC that is capable of supporting sagebrush plant communities. Use ecological site descriptions to determine which sites are capable of supporting sagebrush plant communities.	No changes made.	No change (same as 2015)
Objective VEG 8: Coordinate vegetation management activities with adjoining landowners.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective VEG 9: In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6) and in Table 2-5.	No changes made.	Partially Revised- SFA's not carried forward
Table 2-5 Decadal Treatment Objectives for GRSG Habitat (text included in table 2-5 after this comparison table)	No changes made.	No change (same as 2015)
Management Direction	**Management Direction**	
Habitat Restoration:	—	
MD VEG 1: Priority areas for Greater Sage-grouse habitat restoration and maintenance projects are*: • Sites with a higher probability of success. • Seasonal habitats thought to be limiting to Greater Sage-grouse populations. • Connectivity corridors between Greater Sage-grouse populations and subpopulations. • Following stand-replacing events at least 100 acres in size. *Not in priority order. Incorporate these priorities in the assessments conducted using the FIAT process detailed in Appendix H.	No changes made.	No change (same as 2015)
MD VEG 2: Base species composition, function, and structure of sagebrush communities on ecological site descriptions. Use climate change science concerning projected changes in species ranges and changes in site capability to adjust expected and desired native species compositions as that information becomes available.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 3: Do not treat sagebrush during nesting and early brood-rearing within 4.0 miles of occupied or pending leks. Conduct pre-treatment lek surveys to determine if the lek is active. Breeding and brood-rearing typically occur from March 1 to June 30; use local information to further refine this period.	No changes made.	No change (same as 2015)
MD VEG 4: Cutting of juniper can occur within 4.0 miles of an occupied or pending lek during the breeding season from two hours after sunrise and two hours before sunset.	No changes made.	No change (same as 2015)
MD VEG 5: Vegetation management activities that are timing-sensitive for maximum effectiveness, such as herbicide application or seeding operations, can occur during the breeding season within 4.0 miles of occupied or pending leks. Limit operations to no more than 5 days and to the period beginning two hours after sunrise and ending two hours before sunset during the breeding and early brood rearing period. Conduct pre-treatment surveys for nests and do not damage or destroy identified nests during treatment operations. Conduct operations so as to minimize the risk of accidentally killing chicks. Breeding and early-brood-rearing typically occur from March 1 through June 30; use local information to further refine this period.	No changes made.	No change (same as 2015)
MD VEG 6: Use adaptive management principles (for example, monitoring and adjusting seed mixes, planting methods or timing of planting to increase success rates) to provide for persistence of seeded or planted species important to Greater Sage-grouse.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 7: Do not use non-specific insecticides in brood-rearing habitat during the brood-rearing period. Use instar-specific insecticides to limit impacts on Greater Sage-grouse chick food sources.	No changes made.	No change (same as 2015)
MD VEG 8: Use native plant materials for restoration and rehabilitation based on availability, adaptive capacity, and probability of successful establishment (see Appendix I). Where native plant material availability or probability of successful establishment is low, use desirable non-native plant materials that are of a similar functional/structural group as native plant species (e.g. deep-rooted, tall perennial bunchgrass, tap-rooted perennial forb).	No changes made.	No change (same as 2015)
MD VEG 9: When sufficient native plant materials are available, use native plant materials unless the area is immediately threatened by invasive plant species spread or dominance. Use non-native plant materials as necessary to: 1. Limit or control invasive plant species spread or dominance. 2. Create fuel breaks along roads and ROWs. 3. Create defensible space within 0.5 mile of human residences.	No changes made.	No change (same as 2015)
MD VEG 10: When seedings include non-native plant materials, evaluate post-planting within 10 years to determine the need to increase native species populations or compositions to be more representative of the ecological site description and capability. When existing native herbaceous diversity is less than 50 percent of the potential diversity for the applicable ecological site description, conduct treatments to increase the diversity.	No changes made.	No change (same as 2015)
MD VEG 11: Do not conduct forage enhancement solely for domestic livestock in PHMA.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 12: Adjust discretionary land uses, such as active use for livestock grazing or recreational uses or seasons, as needed to facilitate attainment and persistence of vegetation restoration objectives.	No changes made.	No change (same as 2015)
MD VEG 13: Use provisional and established seed zones identified by the Great Basin Native Plant Project (http://www.fs.fed.us/rm/grassland-shrubland-desert/research/projects/gbnpsip/) to determine appropriate seed sources for grasses, forbs, and shrubs. Identify sagebrush seed collection areas to provide locally adapted sagebrush seed sources.	No changes made.	No change (same as 2015)
MD VEG 14: Allowable methods for vegetation treatment include mechanical, biological (including targeted grazing), chemical, or wildland fire or combinations of these general treatment categories.	No changes made.	No change (same as 2015)
MD VEG 15: Create mosaics of varying sagebrush density using spot treatments within the treatment area. Sagebrush density shall be equivalent to Classes 1 through 4 in cool-moist sagebrush and Classes 1 through 3 in warm-dry sagebrush (see Table 2-4). Maximum stand-replacement patch size shall not exceed 25 acres and total stand-replacement patches shall not exceed 15 percent of the treatment block. See Required Design Features for additional details.	No changes made.	No change (same as 2015)
MD VEG 16: Test new potential restoration methods in areas with a sagebrush overstory and an annual grass understory.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 17: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use site-specific analysis and tools such as VDDT and the FIAT process (Appendix H), or their successors, to refine the specific locations to be treated.	No changes made.	No change (same as 2015)
MD VEG 18: Apply additional restoration treatments, such as seeding or planting, in conjunction with juniper removal in areas with more than trace amounts of invasive annual grasses or where the pre-treatment understory has less than 2 healthy bunchgrass plants per 10 square feet in cool-moist sagebrush or less than 4 healthy bunchgrass plants per 10 square feet in warm-dry sagebrush.	No changes made.	No change (same as 2015)
MD VEG 19: Conduct jackpot burning of cut juniper when soils are frozen or snow-covered and moisture content of felled trees is low enough to promote complete or near complete consumption of branches. Leaving the bole portion is acceptable.	No changes made.	No change (same as 2015)
Integrated Invasive Species:	—	
MD VEG 20: In priority treatment areas for invasive annual grasses, apply early detection-rapid response principles on*: • New infestations. • Satellite populations. • Isolated populations. • Where invasive annual grasses are still sub-dominant. • Edges of large infestations • Where sites are frequently or commonly used for temporary infrastructure such as incident	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
base camps, spike camps, staging areas, and helicopter landing areas. *Not in priority order. Incorporate these priorities in the assessments conducted using the process detailed in Appendix H (FIAT process).		
MD VEG 21: Allowable methods of invasive plant control include mechanical, chemical, biological (including targeted grazing, biocides, and bio-controls), or prescribed fire or combinations of these methods. Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No changes made.	No change (same as 2015)
MD VEG 22: Use of approved herbicides, biocides, and bio-controls is allowed on all land allocations currently providing or reasonably expected to provide Greater Sage-grouse habitat. Follow the guidance in the 2010 Record of Decision for Vegetation Treatments Using Herbicides on BLM Lands in Oregon and subsequent step-down decision records, when complete, or successor/subsequent decisions governing the use of additional herbicides and biocides.	No changes made.	No change (same as 2015) (2024 Record of Decision for Programmatic Approval Addressing Vegetation Treatments Using Herbicides; still requires state or district-level step-down NEPA)
MD VEG 23: On Type I through Type III wildfires provide and require the use of weed washing stations and acceptable disposal of subsequent waste water and material to minimize the risk of further spread. Wash all vehicles and equipment arriving from outside the local area before initial use in the fire area and during post-fire emergency stabilization and rehabilitation operations. Wash all vehicles and equipment prior to release from the incident to reduce the probability of transporting invasive plant materials to other locations.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 24: Wash vehicles and equipment used in field operations prior to use in areas without known infestations of invasive plants. Wash vehicles and equipment used in areas with known infestations prior to use in another area to limit the further spread of invasive species to other locations.	No changes made.	No change (same as 2015)
MD VEG 25: Locate base camps, spike camps, coyote camps, or other temporary infrastructure in areas that lack invasive plant populations. Where no such options are available provide for post-operation invasive plant treatments.	No changes made.	No change (same as 2015)
Fire and Fuels Management (FIRE)	**Fire and Fuels Management (FIRE)**	
Objective	**Objective**	
Objective FIRE 1: Manage wildland fire and hazardous fuels to protect, enhance, and restore Greater Sage-grouse habitat.	No changes made.	No change (same as 2015)
Objective FIRE 2: Use a combination of vegetation management and wildfire response to minimize the probability of a wildfire tripping an adaptive management trigger for habitat within an Oregon PAC. (See Appendix J for adaptive management triggers).	No changes made.	No change (same as 2015)
Objective FIRE 3: Within 4.0 miles of occupied or pending leks, maintain or develop a mosaic of structure and species of sagebrush consistent with site potential and vegetation management objectives. See Vegetation Objectives section for desired outcomes and conditions.	No changes made.	No change (same as 2015)
Management Direction	**Management Direction**	
MD FIRE 1: Complete an interagency landscape-scale assessment (Appendix H) to prioritize at-risk habitats and identify fuels management, preparedness, suppression, and restoration priorities based on the quality of habitat at risk as directed in the Secretarial Order for Rangeland	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Fire SO3336. Update these assessments as necessary or when major disturbances occur. Within Greater Sage-grouse habitat, prioritize suppression and fuels management activities based on an assessment of the quality of habitat at risk.		
MD FIRE 2: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. Prioritize Greater Sage-grouse habitat commensurate with property values and other habitat to be protected, with the goal to restore, enhance, and maintain these areas.	No changes made.	No change (same as 2015)
MD FIRE 3: Within PHMA and GHMA, prioritize fire management activities in order to protect and restore Greater Sage-grouse habitat and reduce the impacts of large wildfires as follows: 1. Habitat within 4.0 miles of an occupied or pending lek. 2. Greater Sage-grouse winter range.	No changes made.	No change (same as 2015)
MD FIRE 4: Incorporate locations of priority Greater Sage-grouse protection areas into the dispatch system. Provide local Greater Sage-grouse habitat maps to dispatch offices and initial attack Incident Commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.	No changes made.	No change (same as 2015)
MD FIRE 5: During fire management operations, retain unburned areas of sagebrush, including interior islands and patches between roads and the fire perimeter unless there is a compelling safety, resource protection, or wildfire management objective at risk.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 6: Follow established direction in the current Interagency Standards for Fire Operations (Red Book) with respect to use of resource advisors, annual review of fire management plans for updates relevant to Greater Sage-grouse habitat, and contents of the Delegation of Authority letters.	No changes made.	No change (same as 2015)
MD FIRE 7: Allow retardant and other fire suppressant chemicals use on all land allocations except where expressly prohibited by land allocation direction. Use of retardant and other fire suppressant chemicals can be specifically allowed by the authorized official when prohibited by land allocation direction. Allow retardant use on all land allocations regardless of management direction when there is imminent threat to human life.	No changes made.	No change (same as 2015)
MD FIRE 8: Allow mechanical fire line except: • Where prohibited by other resource direction (e.g., wilderness, soils, hydrology, and riparian management) • Where inconsistent with direction for specific land allocations The authorized official may approve exceptions.	No changes made.	No change (same as 2015)
MD FIRE 9: Allow use of naturally ignited wildfires to meet resource management objectives to improve Greater Sage-grouse habitat such as reducing juniper encroachment and creating mosaics of sagebrush classes. When natural ignitions occur, utilize an interdisciplinary process (including a wildlife biologist familiar with GRSG habitat requirements) to determine if the fire could be managed to meet GRSG and vegetation objectives.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 10: Locate base camps, spike camps, drop points, staging areas, helicopter landing areas, and other temporary wildfire infrastructure in areas where physical disturbance to Greater Sage-grouse habitat can be minimized, to the extent feasible.	No changes made.	No change (same as 2015)
MD FIRE 11: Develop a system of fuel breaks to protect larger intact blocks of Greater Sage-grouse habitat. Locate these fuel breaks along existing roads and ROWs, where possible.	No changes made.	No change (same as 2015)
MD FIRE 12: In Greater Sage-grouse habitat, reduce hazardous fuels created by other management actions, such as establishment of new roads, trails, or ROWs within 3 years of project completion. The reduction should be sufficient to limit fire spread or undesirable fire behavior or fire effects in sagebrush ecosystems.	No changes made.	No change (same as 2015)
MD FIRE 13: Use interagency- coordinated fire restrictions and public service announcements to reduce the number of human starts in or near Greater Sage-grouse habitat during periods of elevated fire danger.	No changes made.	No change (same as 2015)
MD FIRE 14: Develop annual treatment and fire management programs in coordination with interagency partners and across jurisdictional boundaries based on priorities identified in the local District Landscape Wildfire and Invasive Species Assessment.	No changes made.	No change (same as 2015)
MD FIRE 15: Complete an annual review of landscape assessment implementation efforts with interagency partners.	No changes made.	No change (same as 2015)
MD FIRE 16: Implement appropriate fire operations and fuels management RDFs identified in Appendix C.	No changes made.	No change (same as 2015)
MD FIRE 17: Include information on the resource value of Greater Sage-grouse habitat in existing prevention plans.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 18: If prescribed fire is used in Greater Sage-grouse habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how Greater Sage-grouse goals and objectives would be met by its use; • how the COT Report objectives would be addressed and met; • a risk assessment to address how potential threats to Greater Sage-grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-grouse habitat in PHMA (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Livestock Grazing/Range Management (LG)	**Livestock Grazing/Range Management (LG)**	
Objective	**Objective**	
Objective LG 1: Manage livestock grazing to maintain or improve Greater Sage-grouse habitat by achieving Standards for Rangeland Health (SRH).	No changes made.	Completely Revised-revised by rangewide. (minor wording changes from 2015)
Objective LG 2: On BLM-managed lands, 12,083,622 acres will continue to be available for livestock grazing in Greater Sage-grouse habitat. In key RNAs, 22,765 acres will be unavailable to livestock grazing. See Table 2-6, Key ACECs and RNAs for ARMPA.	Objective LG2: On BLM-managed lands, 12,105,581 acres will continue to be available for livestock grazing in Greater Sage-Grouse habitat. Table 2-6 is no longer applicable and is therefore deleted.	Completely Revised-revised by state specific direction
Table 2-6 Key ACECs and RNAs (text included in table 2-5 after this comparison table)	Table 2-6 is no longer applicable and is therefore deleted.	Completely Revised-revised by state specific direction
Objective LG 3: Complete rangeland health assessments for grazing permits/leases that have not been renewed and prioritized by Allotment Categories I, M, and C. The priority order for completing rangeland health assessments in Greater Sage-grouse habitat is: 1. Allotments containing SFA that have never been evaluated. 2. Allotments containing SFA that have not been re-evaluated in 10 or more years. 3. Allotments containing PHMA that have never been evaluated. 4. Allotments containing PHMA that have not been re-evaluated in 10 or more years. 5. Allotments containing GHMA that have never been evaluated. 6. Allotments containing GHMA that have not been re-evaluated in 10 or more years.	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Management Direction	**Management Direction**	
MD LG 1: All or portions of key RNAs will be unavailable to grazing (Table 2-6). Determine whether to remove fences, corrals, or water storage facilities (e.g. reservoirs, catchments, ponds).	MD LG 1 is deleted. Livestock grazing management in the 13 key RNAs returns to being governed by applicable district RMPs as amended by the 2015 Oregon Greater Sage-Grouse ROD/ARMPA goals, objectives, and management decisions.	Completely Revised-revised by state specific direction
MD LG 2: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in: 1. Season or timing of use; 2. Numbers of livestock; 3. Distribution of livestock use; 4. Duration and/or level of use; 5. Locations of bed grounds, sheep camps, trail routes, and the like; 6. Extended rest or temporary closure from grazing through BLM administrative actions; 7. Make allotment unavailable to grazing; 8. Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011); and 9. Grazing schedules (including rest or deferment). *Not in Priority Order When SRH are being met no changes in current management or activity plans or permits/leases are required, but could occur to meet other resource management objectives.	No changes made.	Completely Revised-revised by rangewide (RM-1 and Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information completely replaces Oregon's 2015 Appendix C Livestock Grazing RDFs and BMPs)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 3: The timing and location of livestock turnout and trailing shall not contribute to livestock congregation on occupied or pending leks during the Greater Sage-grouse breeding season of March 1 through June 30.	No changes made.	Completely Revised-revised by rangewide (Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information)
MD LG 4: When fine and site-scale Greater Sage-grouse habitat assessment and monitoring is needed or required, (e.g., as a component of a rangeland health assessment), measure the Greater Sage-grouse habitat suitability indicators for seasonal habitats identified in Table 2-2. Site suitability values may be adjusted regionally where there is scientific justification for doing so. When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale.	No changes made.	Completely Revised-revised by rangewide (RM-1; also refer to the Application of Habitat Objectives section)
MD LG 5: During drought conditions use a recognized drought indicator, such as the Drought Monitor or Palmer Drought Severity Index, to determine when abnormally dry or drought conditions are developing, present, or easing. When such conditions are developing or present: 1. Conduct pre-season assessments prior to livestock turn out. 2. Monitor vegetation conditions during authorized livestock use periods to determine need for early removal or other changes to meet seasonal PHMA and GHMA objectives. If livestock grazing is deferred due to drought, reevaluate vegetation and Greater Sage-grouse habitat indicators that measure Greater Sage-grouse habitat prior to reauthorization of grazing.	No changes made.	Completely Revised-revised by rangewide (Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 6: Authorize new, relocate, or modify existing range improvements that use seeps or springs as a water source to enhance their year round functionality. Install or retrofit wildlife escape ramps in all livestock water troughs or water storage facilities (e.g., catchments, storage tanks). Maintain, enhance, or reestablish riparian areas in PHMA and GHMA	No changes made.	Completely Revised-revised by rangewide (Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information)
MD LG 7: Identify playas, wetlands, and springs that have been modified for livestock watering within PHMA and GHMA. Identify those water improvements that have Greater Sage-grouse population limiting implications, and develop projects for rehabilitation. Further actions should be instigated for development of water off site; new water should be available before existing water is eliminated.	No changes made.	Completely Revised-revised by rangewide
MD LG 8: Design new and maintain existing water projects to avoid standing pools of shallow water that would spread West Nile Virus.	No changes made.	Completely Revised-revised by rangewide (Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information)
MD LG 9: Remove, modify, or mark fences identified as high risk for collisions, generally within 1.2 miles of occupied or pending leks.	No changes made.	Completely Revised-revised by rangewide (RM-5)
MD LG 10: Avoid construction of livestock facilities and supplemental feeding of livestock within 1.2 mile of occupied or pending leks in Greater Sage-grouse habitat unless it is part of an approved habitat improvement project or approved by the authorized officer to improve ecological health or to create mosaics in dense sagebrush stands that are needed for optimum Greater Sage-grouse habitat. Supplemental feeding in Greater Sage-grouse habitat must be part of an approved habitat improvement plan or approved by the authorized officer.	No changes made.	Completely Revised-revised by rangewide (Appendix 15. Livestock Grazing Management Best Management Practices and Design Features and Supplemental Information)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 11: Sagebrush Focal Areas will be prioritized for management and conservation actions, including, but not limited to review of livestock grazing permits/leases.	No changes made.	Completely Revised-revised by rangewide (SFA's not carried forward)
MD LG 12: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFA) followed by PHMA outside of the SFA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g. fire) and legal obligations.	No changes made.	Completely Revised-revised by rangewide
MD LG 13: The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFA and PHMA will include specific management thresholds based on GRSG Habitat Objectives Table 2-2, Land Health Standards (43 CFR, Part 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	No changes made.	Completely Revised-revised by rangewide (RM-3; Also Table 2-2 replaced by Appendix 8, Table 8-1.E. Oregon GRSG Habitat Indicators)
MD LG 14: Allotments within SFA, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 15: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	No changes made.	Completely Revised-revised by rangewide (RM-7)
Wild Horses and Burros (WHB)	**Wild Horses and Burros (WHB)**	
Objective	**Objective**	
Objective WHB 1: Manage wild horses and burros as components of BLM-administered lands in a manner that preserves and maintains a thriving natural ecological balance in a multiple use relationship.	No changes made.	Completely Revised-revised by rangewide
Objective WHB 2: Manage wild horse and burro population levels within established appropriate management levels (AML).	No changes made.	Completely Revised-revised by rangewide (Management Action 1)
Objective 3: Complete assessments of Greater Sage-grouse habitat indicators for HMAs containing PHMA and GHMA. The priorities for conducting evaluations are:1. HMAs containing SFA.2. HMAs containing PHMA. 3. HMAs containing GHMA. 4. HMAs without GRSG Habitat.	No changes made.	Completely Revised-revised by rangewide
Management Direction	**Management Direction**	
MD WHB 1: Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (Table 2-2).	No changes made.	Completely Revised-revised by rangewide (Table 2-2 replaced by Appendix 8, Table 8-1.E. Oregon GRSG Habitat Indicators)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD WHB 2: Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are: 1. HMAs containing SFA; 2. HMAs containing PHMA; 3. HMAs containing only GHMA; 4. HMAs containing sagebrush habitat outside of PHMA and GHMA mapped habitat; 5. HMAs without GRSG habitat.	No changes made.	Partially Revised- SFAs not carried forward
MD WHB 3: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on Herd Areas not allocated as Herd Management Areas and occupied by wild horses and burros in SFA followed by PHMA.	No changes made.	Completely Revised-revised by rangewide
MD WHB 4: In SFA and PHMA outside of SFA, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current AML is not being exceeded.	No changes made.	Completely Revised-revised by rangewide
MD WHB 5: In SFA and PHMA outside of SFA, monitor the effects of WHB use in relation to GRSG seasonal habitat objectives on an annual basis to help determine future management actions.	No changes made.	Partially Revised- SFAs not carried forward
MD WHB 6: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all HMAs within GRSG habitat, with emphasis placed on SFA and other PHMA.	No changes made.	Partially Revised- SFAs not carried forward

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD WHB 7: Consider removals or exclusion of WHB during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.	No changes made.	No change (same as 2015)
MD WHB 8: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects on GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.	No changes made.	No change (same as 2015)
MD WHB 9: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the WHB program.	No changes made.	No change (same as 2015)
MD WHB 10: When WHB are a factor in not meeting Greater Sage-grouse habitat objectives or influence declining Greater Sage-grouse populations in PHMA, Oregon's gather priority for consideration by the Washington Office is as follows: 1. Response to an emergency. (e.g., fire, insect infestation, disease or other events of unanticipated nature). 2. Greater Sage-grouse habitat. 3. Maintain a thriving natural ecological balance.	No changes made.	Completely Revised-revised by rangewide
MD WHB 11: In PHMA, design any new and modify existing structural WHB improvements to conserve, enhance, or restore Greater Sage-grouse habitat.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Mineral Resources (MR)	—	
Objective	—	
Leasable Minerals	—	
Objective MR 1: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 USC 226(p) and 43 CFR 3162.3-1(h).	No changes made.	Completely Revised-revised by rangewide.
Objective MR 2: Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, minimize, and provide compensatory mitigation to reduce adverse impacts on GRSG to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an Application for Permit to Drill (APD) or Geothermal Drilling Permit (GDP) on the lease to avoid and minimize impacts on GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Management Direction	**Management Direction**	
Unleased Fluid Minerals:	—	
MD MR 1: Stipulate all leases within PHMA as NSO. No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The authorized officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action: i. Would not have direct, indirect, or cumulative effects on Greater Sage-grouse or its habitat; or ii. Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP amendment. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field	No changes made.	Completely Revised-revised by rangewide and state-specific direction for NSO exception Oregon-specific: No modifications to the PHMA NSO within 3.1 miles of active or pending active leks; exceptions and waivers may be granted.

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publicly available at least quarterly.		
MD MR 2: Stipulate all leases within Sagebrush Focal Areas as NSO, without waiver, exception, or modification.	No changes made.	Completely Revised-revised by rangewide (SFA's not carried forward)
MD MR 3: GHMA is considered open for unleased fluid minerals with moderate constraints, including CSU and TL. Areas within 1.0 mile of an occupied or pending lek within GHMA will be open to leasing fluid minerals subject to NSO stipulations. Apply Fluid Mineral Stipulations, identified in Appendix G.	No changes made.	Partially Revised- revised by rangewide and state specific (Appendix G to be updated) Oregon-specific: No modifications to the GHMA NSO within 3.1 miles of active or pending active leks; exceptions and waivers may be granted.
MD MR 4: Allow geophysical exploration within PHMA and GHMA subject to seasonal restrictions, see Appendix G.	No changes made.	Partially Revised- Appendix G to be updated
Leased Fluid Minerals:	—	
MD MR 5: In PHMA, apply the conservation measures through RMP implementation decisions (e.g., approval of a Geothermal Drilling Permit (GDP)) and upon completion of the environmental record of review (43 CFR, Part 3162.5), including appropriate documentation of compliance with NEPA. In this process evaluate, among other things: 1. Whether the conservation measure is "reasonable" (43 CFR, Part 3101.1-2) with the valid existing rights. 2. Whether the action is in conformance with the approved RMP.	No changes made.	Completely Revised-revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Additionally, apply the 3 percent disturbance cap for development within Oregon PACs and PHMA (see Appendix E). Issue written orders of the authorized office requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize impacts on Greater Sage-grouse populations and its habitat in accordance with the project habitat mitigation plan.		
MD MR 6: Implement RDFs in PHMA and GHMA as detailed in Appendix C, as allowed by law for existing leases.	No changes made.	No Change (same as 2015)
MD MR 7: Complete Master Leasing Plans in lieu of APD/GDP by APD/GDP or Operations/Utilization plans for fluid mineral lease development processing within PHMA.	No changes made.	No Change (same as 2015)
MD MR 8: Within an Oregon PAC, when permitting APDs or GDPs on existing leases that are not yet developed, the proposed anthropogenic disturbance must be under the 3 percent cap for that area, to the extent allowed by law.	No changes made.	No Change (same as 2015)
MD MR 9: Require unitization when the BLM determines it is necessary for proper development and operation of an area according to the Federal Lease Form, 3100-11 Sections 4 and 6. Where 10 percent or less of the land is federal, encourage rather than require unitization to minimize adverse impacts on Greater sage-grouse.	No changes made.	No Change (same as 2015)
MD MR 10: Identify areas where land acquisitions including mineral rights or conservation easements would benefit Greater Sage-grouse habitat. Proceed with acquisition process where appropriate.	No changes made.	No Change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Locatable Minerals:	—	
MD MR 11: To the extent consistent with the rights of a mining claimant under existing laws and regulations, limit surface disturbance, and provide recommendations for net conservation gain of Greater Sage-grouse habitat.	No changes made.	Partially Revised-revised rangewide (Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)
MD MR 12: If a 3809 Plan of Operation is filed on mining claims in PHMA or GHMA, identify and evaluate mitigation measures to avoid or minimize adverse effects on PHMA and GHMA, through the Plan of Operation NEPA process, as appropriate and to the extent allowable by law. For notice and casual use levels of activity, apply RDFs (to the extent consistent with applicable law) in Appendix C.	No changes made.	No Change (same as 2015)
MD MR 13: ~~Sagebrush Focal Areas are recommended for withdrawal from the General Mining Law of 1872, as amended, subject to valid existing rights.~~ Per Oregon maintenance action 3 of May 2018: The recommendation for withdrawal of Sagebrush Focal Areas was analyzed and removed. It was determined through an assessment process that the BLM proposal to withdraw 10 million acres was unreasonable in light of data that showed that current and 20 years of anticipated mining would affect less than 0. I percent of occupied sage-grouse range."	No changes made.	Completely Revised-revised by rangewide (SFAs not carried forward)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Salable Minerals:	—	
MD MR 14: PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: • The activity is within the Oregon PAC (also called BSU, and is the same footprint as PHMA) and project area disturbance cap. • The activity is subject to the provisions set forth in the mitigation framework in Appendix F. • All applicable required design features are applied and the activity is permissible under screening criteria (see SSS 13). Federal Highway Act material sites are a ROW and not subject to mineral sale requirements. See ROW section for management (MD LR 7).	No changes made.	Partially Revised-revised by rangewide and state-specific
MD MR 15: GHMA remains open subject to stipulations that will protect Greater Sage-grouse and its habitat; see RDFs and BMPs in Appendix C.	No changes made.	No Change (same as 2015)
Nonenergy Leasable Minerals:	—	
MD MR 16: Close PHMA to new leases and permits. Consider expansion of existing operations if the disturbance is within the cap and subject to compensatory mitigation.	No changes made.	Partially revised; revised by rangewide (minor wording change)
MD MR 17: GHMA remains open to new leases subject to stipulations that would protect Greater Sage-grouse and its habitat; see RDFs and BMPs in Appendix C.	No changes made.	Partially revised; revised by rangewide (minor wording change)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Mineral Split Estate:	—	
MD MR 18: Where the federal government owns the mineral estate in PHMA and GHMA, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs as applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	No changes made.	No Change (same as 2015)
MD MR 19: Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	No changes made.	No Change (same as 2015)
Renewable Energy (Wind and Solar) (RE)	**Renewable Energy (Wind and Solar) (RE)**	
Management Direction	**Management Direction**	
MD RE 1: Designate PHMA as an exclusion area for new utility/commercial scale development of wind or solar ROWs, except in Lake, Harney, and Malheur Counties.	No changes made.	Completely Revised-revised by rangewide and state specific (Oregon PHMA is exclusion with exceptions)
MD RE 2: Designate PHMA outside of sagebrush focal areas (SFA) in Lake, Harney, and Malheur Counties as an avoidance area for new utility/commercial scale wind or solar ROWs. In Harney, Lake and Malheur counties, priority would be placed on locating commercial scale wind and solar energy development in non-habitat areas first (i.e., outside of PHMA and GHMA) before approving development in PHMA. Where an Oregon PAC (PHMA) occurs in more than one county, the allocation for each Oregon PAC is determined by the county in which it occurs. For	No changes made.	Completely Revised-revised by rangewide and state specific (Oregon PHMA is exclusion with exceptions)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
example, the Cow Valley PAC is located in Malheur and Baker Counties; the Baker County portion would be exclusion, and the Malheur portion would be avoidance.		
MD RE 3: Designate Sagebrush Focal Areas as exclusion areas for new utility/commercial scale wind or solar ROWs development.	No changes made.	Completely Revised-revised by rangewide (SFAs not carried forward)
MD RE 4: Designate GHMA as an avoidance area for new utility/commercial scale wind or solar rights-of-way. If new utility/commercial scale wind or solar development in GHMA is unavoidable apply the following measures: 1. If possible, construct meteorological towers without guy wires. 2. If guy wires are necessary, mark with anti-strike devices. 3. Analyze potential alternative site locations with known wind or solar potential outside of Greater Sage-grouse habitat in NEPA documents for ROW applications.	No changes made.	Completely Revised-revised by rangewide and state specific (Oregon GHMA is avoidance with exceptions)
Lands and Realty (LR)	**Lands and Realty (LR)**	
Objective	**Objective**	
Objective LR 1: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
Management Direction	**Management Direction**	
Utility Corridors and Communications Sites:	—	
MD LR 1: All Lands and Realty actions shall comport with SSS 13 disturbance screening criteria.	No changes made.	No change (same as 2015)
MD LR 2: Designated existing utility corridors will remain open in PHMA and GHMA to utility rights-of-way.	No changes made.	Completely Revised-revised by rangewide (Major and Minor ROWs are avoidance with exceptions)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 3: Designate other ROWs (including permits and leases) in PHMA as avoidance areas: Road ROWs: • New road ROWs will be authorized only when necessary for public safety, administrative access, or subject to valid existing rights. If the new ROW is necessary for public safety, administrative access, or subject to valid existing rights and creates new surface disturbance, mitigate the impacts on protect the Greater Sage-grouse or their habitat. New road ROWs will be allowed if the ROW applicant is pursuing a Title V FLPMA ROW grant and will create no new surface disturbance. • Only allow use of existing roads, or realignment of existing roads, when renewing or amending existing authorizations. • Co-locate new ROWs as close as technically possible to existing ROWs or where the ROW best minimize Greater Sage-grouse impacts. Use existing roads, or realignments, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then construct any new road to the minimum standard necessary. • Existing Federal Highway Act (FHWA) appropriation ROWs are valid existing rights and new FHWA ROWs will continue to be considered subject to all disturbance screening criteria. See disturbance screening criteria in SSS 13. New proposals for power lines, access roads, pump storage, and other hydroelectric facilities licensed by FERC will be subject to all Greater Sage-grouse ROW screening criteria.	No changes made.	No Change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Communication Sites: Locate new communication towers within an existing communication site where technically feasible. If not feasible, new sites will be considered where necessary for public safety but shall adhere to the ROW disturbance screening criteria as listed in SSS 13.		
MD LR 4: Renewing, Amending or Terminating ROW Grants in PHMA and GHMA: • Conduct rehabilitation when FLPMA ROW grant expires, is relinquished, or terminated, rehabilitation is required in compliance with 43 CFR, Part 2805.12(i). • Remove overhead lines and other infrastructure to eliminate existing avian predator nesting opportunities (e.g. remove power line and communication facilities no longer in service) when a ROW grant expires or is relinquished or terminated. • Add additional stipulations, if necessary, when renewal or amendment of existing ROW grants. Mitigate impacts on GRSG or their habitats during amendment of an existing ROW grant. Mitigation could include the disturbance screening criteria.	No changes made.	No change (same as 2015)
MD LR 5: Designated ROW Corridors in PHMA and GHMA: • Manage existing designated ROW corridors as open. • Allow placement of new ROWs in existing designated corridors. Construct new ROWs as close as technically feasible to existing linear ROW infrastructure to limit disturbance to the smallest footprint. • Within existing designated utility corridors, the 3% disturbance cap may be exceeded at the	No changes made.	Partially Revised – revised by Rangewide (Major and Minor ROWs are avoidance with exceptions. Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
project scale if the site specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location.		
MD LR 10: Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D) − under valid existing rights prior to authorizing new projects in PHMA.	No changes made.	No change (same as 2015)
Land Use Authorizations:	—	
MD LR 6: Priority Habitat Management Areas (PHMA) and General Habitat Management Areas (GHMA) are designated as avoidance areas for high voltage (100kV or greater) transmission lines and major pipelines (24" or greater in diameter) ROWs (including permits and leases). All authorizations in these areas, other than the following identified projects, shall comply with the conservation measures outlined in this Approved Plan, including the RDFs (Appendix C) and screening criteria (see SSS 13) of this document. The BLM is currently processing an application for Boardman to Hemingway Transmission Line Project and the NEPA review for this project is well underway. Conservation measures for GRSG are being analyzed through the project's NEPA review process, which should achieve a net conservation benefit for the GRSG. Place new high voltage transmission lines in designated utility corridors where technically	No changes made.	Completed Revised- revised by rangewide and state specific

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
feasible; where not technically feasible, locate lines adjacent to existing infrastructure. If an existing transmission line is upgraded to a higher voltage the following is required: • The existing transmission line shall be removed within a reasonable amount of time after the new line is installed and energized. • The new line shall be constructed in the same alignment (ROW boundary) as the existing line unless an alternate route would benefit Greater Sage-grouse or its habitat. Outside of designated corridors, bury new transmission lines where technically and financially feasible. • Where burying transmission lines is not technically and financially feasible, locate new transmission lines adjacent to existing transmission lines, and would be subject to Greater Sage-grouse ROW screening criteria. • Where determined to have a negative impact on Greater Sage-grouse or its habitat, remove existing guy wires or mark with bird flight diverters to make them more visible to Greater Sage-grouse in flight. Outside of designated corridors, bury new pipelines where technically and financially feasible. Pipelines should be located adjacent to existing infrastructure.		
MD LR 7: GHMA is open to other ROWs/Land Use Authorization/Permits but must adhere to screening criteria in SSS 13. • Existing Federal Highway Act (FHWA) Appropriation ROWs are valid existing rights. New FHWA ROWs will be subject to all Greater Sage-grouse screening criteria.	No changes made.	Completely Revised- revised by rangewide and state specific (Oregon state specific direction; GHMA is avoidance). Retain language associated with FHWA ROWs.

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Construct new high-voltage transmission lines and new pipelines in GHMA as close as technically feasible to existing infrastructure (e.g. roads, distribution/transmission lines and pipelines) to limit disturbance to the smallest footprint.		
Land Tenure:	—	
MD LR 8: Designate PHMA and GHMA as Z-1 and retain public ownership. Lands classified as priority habitat and general habitat for Greater Sage-grouse will be retained in federal management. Exception: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the Greater Sage-grouse or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-grouse.	No changes made.	Partially revised- Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)
Withdrawals:	—	
Per Oregon maintenance action 3 in May of 2018 MD LR 9 from the 2015 plan was deleted. (MD LR 9: Recommend SFAs for withdrawal from the General Mining Act of 1872, as amended; subject to valid existing rights.)	No changes made.	Completely Revised-revised by rangewide (SFAs not carried forward)
Recreation and Visitor Services (REC)	**Recreation and Visitor Services (REC)**	
Management Direction	**Management Direction**	
MD REC 1: Do not issue new non-motorized special recreation permits (SRPs) in PHMA or GHMA within 3.0 miles of occupied or pending leks from March 1 to June 30. Limited exceptions (e.g. river permits) are allowed and shall be based on site-specific rationale that biological impacts on Greater Sage-grouse are being avoided. Evaluate and modify existing SRPs lacking Greater Sage-grouse stipulations in PHMA.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD REC 2: Do not issue motorized and/or race SRPs or competitive SRPs within 4.0 miles of occupied or pending leks during breeding season from March 1 to June 30.	No changes made.	No change (same as 2015)
MD REC 3: Evaluate and modify, if necessary, recreation sites in PHMA and GHMA to reduce avian predator perch sites.	No changes made.	No change (same as 2015)
MD REC 4: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from important areas, etc.), or unless the development is required for visitor health and safety or resource protection.	No changes made.	Partially revised- Net conservation gain replaced by "a minimum standard of no net loss" except where state of Oregon rules apply.)
MD REC 5: Evaluate recreation SRMAs for consistency with the Adaptive Management Strategy (Appendix J). For existing SRMAs, recreation facilities or sites in all PHMA and GHMA, apply one or more of the following to get a neutral or positive response from Greater Sage-grouse populations using the adaptive management actions. Potential actions include, but are not limited to: • Seasonally close areas from March 1 to June 30 annually, and limit to existing roads, primitive roads, and trails, then designated routes upon completion of travel management plans. • Re-locate SRMAs in whole or in part, through land use plan amendments, in order to reduce negative effects on GRSG.	No changes made.	No change (same as 2015)
MD REC 6: Promote and encourage education and outreach regarding Greater Sage-grouse at kiosks and other public education sites. Promote, publish and engage public regarding the American Birding Association Principles of Birding Ethics.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Travel and Transportation (TTM)	**Travel and Transportation (TTM)**	
Objective	**Objective**	
Objective TTM 1: Manage OHV/ORV designations (open, limited, and closed) to conserve Greater Sage-grouse habitat and populations by taking actions that create neutral or positive responses.	No changes made.	No change (same as 2015)
Objective TTM 2: Reduce disturbance to Greater Sage-grouse by evaluating or modifying OHV/ORV designations and route selection in accordance with minimization criteria.	No changes made.	No change (same as 2015)
Management Direction	**Management Direction**	
MD TTM 1: Unless already designated limited or closed all PHMA and GHMA shall be designated as limited to existing roads, primitive roads, and trails, including existing SRMAs. Where areas are currently designated "closed" under existing applicable RMPs the closed designations shall be maintained. Travel management planning will be deferred to future implementation/activity level planning or concurrent with future RMP planning. In addition to the minimization criteria, districts will adopt the following Greater Sage-grouse specific planning elements only for BLM administered roads during implementation level planning. • During travel management planning, avoid designating roads, primitive roads, and motorized trails within 1.0 mile of occupied or pending leks when road traffic volume is greater than 8 vehicle trips per 24 hour period in accordance with the ODFW mitigation framework. • When existing high traffic roads and primitive roads are closer than 1.0 mile to an occupied or	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
pending lek, and are the only access, consider a seasonal restriction from March 1 to June 30. • When an existing road or primitive road is found to have an effect on Greater		
Sage-grouse population trends, work with the interdisciplinary team and ODFW to determine the best reroute or closure point for a section of an existing road. In addition, implementation level travel planning efforts will be guided by the goals, objectives and guidelines outlined in the SSS section, relevant National and Oregon specific guidance, and the following: • A timeline to complete travel planning efforts will be identified, prioritized and updated annually in all relevant planning areas to accelerate the accomplishment of: data collection, route evaluation and selection, and on the ground implementation efforts including signing, monitoring and rehabilitation. • During subsequent travel management planning, consultation "with interested user groups, Federal, State, county and local agencies, local landowners, and other parties in a manner that provides an opportunity for the public to express itself and have its views given consideration." Consequently, a public outreach plan to fully engage all interested stakeholders will be incorporated into future travel management plans. • Among other designation criteria from "areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention would be given to protect endangered or threatened species and their habitats."	*(See above.)*	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• During subsequent travel management planning, all routes will undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route will be considered for closure or considered for relocation outside of sensitive GRSG habitat. • During subsequent travel planning, threats to GRSG and their habitat will be considered when evaluating route designations and/or closures.		
• During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure. • During subsequent travel management planning, routes that are duplicative, parallel, or redundant will be considered for closure. • During subsequent travel management planning, seasonal restrictions on OHV use will be considered in important seasonal habitats where OHV use is a threat. During subsequent travel management planning, consider limiting over snow vehicles (OSV) designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow to designated routes or consider seasonal closures in GRSG wintering areas from November 1 through March 31. • During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need will be evaluated for administrative access only.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan. • During subsequent travel management plan implementation, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances. During subsequent travel management plan implementation, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (exclude activities from 2 hours before sunset to 2 hours after sunrise) to reduce impacts on GRSG during breeding periods.		
MD TTM 2: ORV-OHV designations that are "closed" will be maintained as closed to motorized vehicles. OHV Areas designated as "limited to existing" within PHMA and GHMA will be managed as "limited to existing roads, primitive roads, and trails" until the completion of an implementation level travel planning (travel management planning). Individual route designations will occur during subsequent implementation level travel management planning efforts. Upon the completion of implementation level travel management plans OHV areas designated as "Limited" will transition to "limited to designated roads, primitive roads and trails."	No changes made.	No change (same as 2015)
MD TTM 3: Avoid upgrading existing roads or construction of new roads that are found to contribute to Greater Sage-grouse mortality or lek abandonment.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD TTM 4: In PHMA and GHMA complete transportation plans in accordance with National BLM Travel Management guidance, requiring the BLM to maintain a current action plan and planning schedule to most effectively target available resources. The following GRSG population areas are Oregon's top priority areas to designate comprehensive travel management plans: 1. In Oregon PACs with declining population trends. 2. In all other Oregon PACs. 3. In all GHMA. In PHMA and GHMA, travel systems will be managed with an emphasis on improving the sustainability of the travel network in a comprehensive manner to minimize impacts on GRSG, maintain motorist safety, and prevent unauthorized cross country travel while meeting access needs. To do so, it may be necessary to improve portions of existing routes, close existing routes or create new routes that meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning will be placed on having a neutral or positive effect on GRSG habitat.	No changes made.	No change (same as 2015)
MD TTM 5: Initiate travel management planning within 5 years of RMP revisions.	No changes made.	No change (same as 2015)
MD TTM 6: In PHMA and GHMA, limit route construction or realignment of existing designated routes to result in net conservation gain for PHMA and GHMA.	No changes made.	Partially Revised- rangewide (change to "a minimum standard of no net loss" mitigation, but state of Oregon "net conservation gain" still applies)
MD TTM 7: Eliminate parallel roads travelling to the same destination when the destination can be accessed from the same direction and topography in PHMA and GHMA.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD TTM 8: Within 4.0 miles of occupied or pending leks, do not allow any upgrading of primitive roads that would change the maintenance level except for public safety, administrative use, and valid existing rights.	No changes made.	No change (same as 2015)
MD TTM 9: Use proactive methods when necessary to reclaim roads. See BMPs in Appendix C.	No changes made.	No change (same as 2015)
MD TTM 10: In PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR, Part 8364 (Closures and Restrictions); 43 CFR, Part 8351 (Designated National Area); 43 CFR, Part 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR, Part 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR, Part 8341.2) A closure or restriction order shall be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders shall be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Special Designations - Areas of Critical Environmental Concern (SD)	**Special Designations - Areas of Critical Environmental Concern (SD)**	
Objective	**Objective**	
Objective SD 1: Provide for Conservation of Greater Sage-grouse within Key Existing Areas of Critical Environmental Concern (ACECs) (Table 2-6) and Research Natural Areas (RNAs).	No changes made.	Completely Revised- State-specific direction (refer to Appendix 17)
Objective SD 2: Manage all ACECs and RNAs for the values for which they were designated, per district resource management plans, following existing management actions, and consistent with proposed actions for PHMA and GHMA.	No changes made.	No change (same as 2015)
Objective SD 3: Manage habitat maintenance and restoration, and conservation actions in key ACECs for Greater Sage-grouse consistent with the values the areas were designated.	No changes made.	No change (same as 2015)
Objective SD 4: Manage key RNAs, or large areas within the RNAs, as undisturbed baseline reference areas for the sagebrush plant communities they represent that are important for Greater Sage-grouse. Manage key RNAs for minimum human disturbance allowing natural succession to proceed.	Objective SD 4: Manage the Foster Flat and Guano Creek–Sink Lakes RNAs as undisturbed baseline reference areas for the sagebrush plant communities they represent that are important for Greater Sage Grouse. Minimize human disturbance in all 15 key RNAs, allowing natural ecological processes to proceed.	Completely Revised- State-specific direction (refer to Appendix 17)

Note for **Tables 3, 4, 5,** and **6** below: Text did not change between 2015 ARMPA and 2019 RMPA.

Table 2. Habitat Objectives for Greater Sage-grouse (based on 2015 Table 2-2)

Attribute	Indicators	Desired Condition (Habitat Objectives)	Reference
Breeding Including Lekking, Pre-nesting, Nesting, and Early Brood Rearing (Seasonal Use Period March 1 – June 30			
Lek Security	Proximity of trees or other tall structures	No conifers or tall structures within 1.0 mile of lek center, and conifer cover less than 5% within 4.0 miles of lek, excluding old trees, culturally significant, actively used by special status species, and old growth juniper stands.	Connelly et al. 2000; Fresse 2009; Baruch-Mordo et al. 2013; Knick et al. 2013

[1]Perennial grass and forb minimum height may not be achievable in years with below normal precipitation. Other indicators of desired condition may still render the site suitable, however.
[2] In very dry years, forb cover and availability may not be at the desired condition, and in certain plant associations such as Wyoming big sagebrush/Needle and Thread, these indicators may rarely be achieved even in years with normal precipitation.
[3] Riparian includes swales, wet meadows, and intermittent/ephemeral streams.
[4]Sage-grouse preferred forbs are listed in Appendix I.

Table 3. Greater Sage-Grouse Buffers (based on Oregon 2015 Table 2-3)

Resource Program	Activity	Temporal Buffer	Spatial Buffer Miles from Lek PHMA	GHMA	Proposed Plan
Vegetation - Habitat Restoration MD Veg 3	Sagebrush cutting or removal	Nesting and early brood-rearing (March 1 through June 30)	4	4	No change (same as 2015)
Vegetation - Habitat Restoration MD Veg 4	Juniper cutting	Breeding season (March 1 through June 30) - two hours before and after sunrise and sunset.	4	4	No change (same as 2015)
Vegetation – Habitat Restoration MD Veg 5	Vegetation management activities that are timing- sensitive for maximum effectiveness	No more than 5 days during the breeding and early brood-rearing period (Mar 1 –June 30; use local information to further refine this period)	4	4	No change (same as 2015)
Livestock Grazing and Range Management MD LG 9	Reduce collision risk through fence removal, modification, or marking in areas with "high" collision risk	NA	1.2	1.2	Partially revised-revised by rangewide) (refer to RM-6 for further clarification)

Resource Program	Activity	Temporal Buffer	Spatial Buffer Miles from Lek PHMA	GHMA	Proposed Plan
Livestock Grazing and Range Management MD LG 10	Livestock facilities and placement of livestock supplements	NA	1.2	1.2	Partially revised-revised by rangewide (Moved to BMPs in Appendix 8, Table 8-1 E)
Special Status Species MD SSS 13	Infrastructure: New anthropogenic disturbance	NA	1	1	No change (same as 2015)
Leasable Minerals – Unleased Federal Fluid Mineral Estate (MLS) MD MR 3	Fluid minerals development in GHMA	NA	NA	1	Partially revised-revised by rangewide (refer to Table 2-9 for state-specific direction) Oregon: Same as 2015/2019. Appendix G to be updated.
Recreation MD REC 1	New non-motorized SRPs	Breeding season (March 1 to June 30)	3	3	No change (same as 2015)
Recreation MD REC2	Motorized and/or race SRPs, or competitive SRPs	Breeding season (March 1 to June 30)	4	4	No change (same as 2015)
Travel Management MD TM 8	Upgrading primitive roads	NA	4	4	No change (same as 2015)

Table 4. Desired Mix of Sagebrush Classes by Sagebrush Type (based on Oregon 2015 Table 2-4)

Sagebrush Type	General Description	Characteristic Plant Community	Class 1(A)[2]	Class 2(A)[2]	Class 3 (A, B)[2]	Class 4 (A, B)[2]	Class 5(A)[2]
Shallow-Dry	Very shallow soils and very dry sites not capable of producing at least 600 lb/ac of grass on any sites or in any type of year[1].	Low sagebrush/ Sandberg's bluegrass. Includes the driest Wyoming big sagebrush types.	15% (0-25%)	15% (0-25%)	70% (50-90%)	N/A3	N/A[3]
Warm-Dry	Shallow to moderately deep soils and dry sites capable of producing at least 600 lb/ac of grass only on best sites or wet years[1].	Wyoming big sagebrush/bluebunch wheatgrass-Thurber's needlegrass. Includes some moderately productive low sagebrush sites and dry mountain big sagebrush sites.	15% (0-25%)	15% (0-25%)	25% (10-40%)	45% (25-70%)	N/A[3]
Cool-Moist	Moderately deep to deep soils and moist sites capable of producing at least 600 lb/ac of grass on average and high productivity sites or average and wet years[1].	Mountain big sagebrush-Idaho fescue. Includes productive low sagebrush communities and highly productive Wyoming big sagebrush sites. May include antelope bitterbrush as a co-dominant with big sagebrush.	15% (0-25%)	15% (0-25%)	20% (10-30%)	35% (20-60%)	15% (5-25%)

[1]Based on Ecological Site Descriptions

[2]Median value and range

[3] Site not capable of producing this class

Table 5. Decadal Treatment Objectives for Greater Sage-grouse Habitat (based on Oregon 2015 Table 2-5)

Treatment Objective	Average Annual Acres	Average Decadal Acres
Conifer reduction	40,250	402,500
Sagebrush thinning	53,217	532,170
Invasive plant control*	12,700	127,000
Crested wheatgrass restoration	1,844	18,440

*Principally annual grasses

These acreage estimates represent an objective for treatment over a ten-year (decadal) period to support achievement or progress toward GRSG habitat objectives. These estimates account for variability in funding and do not reflect a maximum or minimum acreage for any one treatment objective should funding and site-specific conditions allow for more or less treatment acreage than described in order to meet habitat objectives.

Table 2. From 2015 ARMPA - Key ACECs and RNAs for ARMPA (based on Oregon 2015 Table 2-6)

Completely revised- Refer to Appendix 17

ACEC/RNA Name	Type	District	ACEC/RNA		
			ACEC/RNA Acres	RNA Acres Unavailable to Grazing	Estimated Reduction of AUMs
Abert Rim	ACEC	Lakeview	18,039	0	0
High Lakes	ACEC	Lakeview	38,952	0	0
Red Knoll	ACEC	Lakeview	11,119	0	0
TOTAL KEY ACEC	—	—	**68,110**	**0**	**0**
Black Canyon	RNA	Vale	2,639	2,640	225
Dry Creek Bench	RNA	Vale	1,637	622	101

Toppin Creek Butte	RNA	Vale	3,998	2,865	504
TOTAL KEY RNA	—	—	**60,652**	**21,957**	**2,388**

(NOTE: The 2019 FEIS and RMPA showed 21,959 acres in 13 key RNAs (corrected math error in the 2015 ARMPA)

2.13.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 have management direction that may change through this RMP amendment. Note that if 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The appendices can be found on the Oregon GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	2015	Completely Revised- updated allocations and HMA boundaries
B: Lek Buffer Distances	2015	No Change (same as 2015)
C: Required Design Features and Best Management Practices	2015	Partially Revised- revised by addition of livestock grazing language in FEIS Appendix 15
D: Greater Sage-Grouse Monitoring Framework	2015	Completely Revised- revised by rangewide (refer to Appendix 7)
E: Disturbance Cap Calculation Method	2015	Completely Revised- revised by rangewide and state specific
F: Mitigation	2015	Partially Revised – incorporate new mitigation language
G: Fluid Mineral Leasing Stipulations	2015	Partially Revised – incorporate updated exceptions, modifications, and waivers
H: Fire and Invasives Assessment Tool	2015	No Change (same as 2015)
I: Sage-grouse Plant List	2015	No Change (same as 2015)
J: Adaptive Management Strategy	2015	Completely Revised- revised by rangewide and state specific
L: Greater Sage-Grouse Noise Protocol	2015	No Change (same as 2015)

Appendix 2.14
South Dakota RMP

This page intentionally left blank.

2.14 SOUTH DAKOTA RMP

This appendix presents the GRSG approved RMP language from the 2015 record of decision for the South Dakota RMP Revision. The South Dakota RMP was not amended in 2019. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 appendices that are listed in **Section 2.14.2** of this appendix. For the additional state-specific Montana/Dakotas management direction for the Proposed RMPA, see Chapter 2, Table 2-7.

2.14.1 South Dakota RMP

Table 1. Summary of Goals, Objectives, and Management Actions in South Dakota RMP

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
GRSG and SSS Goals	
Ensure the long-term and self-sustaining persistence of special status species in South Dakota.	No change (same as 2015)
Protect/maintain populations of special status species by minimizing direct mortality and impacts on habitat.	No change (same as 2015)
Provide suitable habitat condition to allow for movement between large blocks of habitat and seasonal and specialized habitats on a local and landscape scale.	No change (same as 2015)
Maintain or improve specialized habitats on a local and landscape scale.	No change (same as 2015)
Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	Completely Revised – revised by rangewide direction
Within GRSG habitat areas, the BLM will maintain habitat for viable GRSG populations.	Completely Revised – revised by rangewide direction
Manage for the biological integrity and habitat suitability to facilitate the conservation, recovery, and maintenance of populations of fish and wildlife to avoid contributing to the listing of or jeopardizing the continued existence or recovery of special status species and their habitats.	No change (same as 2015)
Maintain or enhance areas of ecological importance for special status wildlife species.	No change (same as 2015)
Conserve and recover special status wildlife species by determining and implementing conservation strategies including restoration opportunities, use restrictions, and management decisions.	No change (same as 2015)
Manage specific environmental hazards, risks, and impacts in a manner compatible with special status wildlife species health.	No change (same as 2015)
Identify habitat thresholds necessary to sustain well-distributed healthy populations of special status wildlife species to avoid future listings under the ESA.	No change (same as 2015)
Develop and implement the BMPs, activity plans, or use other mechanisms to protect high priority special status wildlife species.	No change (same as 2015)
Manage special status fish and wildlife species in consideration of the working landscape and the intermingled land ownership pattern that is present.	No change (same as 2015)

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Across the planning area, maintain greater sagebrush cover at levels at or near the full potential for each ecological site.	No change (same as 2015)
Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA.	Completely Revised – revised by rangewide direction
In all PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush canopy cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734- 6).	No change (same as 2015)
Manage wildfire and fuels for the protection of public health, safety, property, and resource values, emphasizing firefighter and public safety as the single overriding priority. The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection.	No change (same as 2015)
Improve the resilience of wildlife habitats to protect wildlife communities from stressors and events such as severe wildfire and climate change.	No change (same as 2015)
Manage PHMA so that discrete anthropogenic (human-caused) disturbances do not adversely impact GRSG distribution or abundance.	No change (same as 2015)
New: rangewide predation management	Added by rangewide direction
New: state-specific sensitive status species management	Added by state specific direction
GRSG GHMA Management	
MD-10 Greater Sage-Grouse GHMA: includes 23,684 surface and 247,771 subsurface oil and gas minerals acres.	Completely Revised – revised by rangewide direction
MD-11 Surface Disturbing and Disruptive Activities and Fluid Minerals: Surface disturbing and disruptive activities will be avoided within 6/10 of a mile of sage-grouse leks. BLM will apply the lek buffer-distances in the US Geological Survey (USGS) Report "Conservation Buffer Distance Estimates for Greater Sage-Grouse-A Review (Open File Report 2014-1239)" in both GHMA and PHMA as detailed in Appendix B, Applying Lek Buffer-Distances When Approving Actions.	Completely Revised - revised by rangewide and state specific direction
Fluid Minerals - NSO: NSO or use within 6/10 of a mile from leks. The Authorized Officer (AO) ay waive this stipulation if no portion of the leasehold is within 6/10 mile of the perimeter of an active lek.	Completely Revised - revised by rangewide and state specific direction
MD-12 Renewable Energy ROWs: Renewable Energy ROWs: 1 mile from leks will be an exclusion area, the rest of the GHMA will be an avoidance area.	Completely Revised - revised by rangewide and state specific direction
Other types of ROWs: Major ROWs (power lines 100 kilovolt (kV) and pipelines 24 inches and over) will be avoided. Minor ROWs within 2 miles of a lek will be avoidance, the rest of the GHMA will be open.	Completely Revised - revised by rangewide and state specific direction
Where new ROWs are necessary, ROWs will be co-located within existing ROWs where possible.	No change (same as 2015)
GHMA and PHMA within the Center of the Nation will be Class 2 land retention areas (Appendix A1: Figure 2-10).	No change (same as 2015)

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD-13 Land Disposals: Any land disposals will be limited and subject to specialist review. Refer to the Land Tenure subsection of the Lands section of this table for additional details about Class 2 retention criteria. BLM could also dispose of land in PHMA and GHMA within the Center of the Nation areas in cases where there is mixed ownership, and land exchanges will allow for additional or more contiguous federal ownership patterns and the criteria below are met. Under GRSG habitat areas with minority federal ownership, BLM will develop an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure, consideration will be given to pursuing a permanent conservation easement. Lands classified as PHMA and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG.	No change (same as 2015)
MD-14 Surface Disturbing and Disruptive Activities and Fluid Minerals: Surface disturbing and disruptive activities will be avoided in winter range for sage-grouse unless the project proponent can clearly demonstrate that the impacts can be adequately mitigated, Conservation Actions, Guidelines or needed design features (Appendices C and F) are included and the goals for sage-grouse are not compromised. Prior to approving any surface disturbance and disruptive activities, the project proponent will be required to provide a plan approved by BLM to maintain suitability of habitat and avoid or minimize habitat loss and disturbance.	Completely Revised - revised by rangewide and state specific direction
Fluid Minerals - NSO: GRSG crucial winter range will be managed as a NSO for oil and gas development and exploration.	Completely Revised - revised by rangewide and state specific direction
MD-15 Renewable Energy/Winter Range: GRSG winter range will be an exclusion area.	Completely Revised - revised by rangewide and state specific direction
Within GHMA, major ROWs are avoidance and minor ROWs are avoidance within two miles of leks with GHMA. The rest of the GHMA is open to minor ROWs. GRSG winter range will be an avoidance area. In cases where avoidance is not possible, BLM may require design features to mitigate impacts or co-location of new ROWs with existing ROWs where possible.	Completely Revised - revised by rangewide and state specific direction
MD-16 Surface Disturbing and Disruptive Activities and Fluid Minerals: Fluid Minerals - A CSU stipulation will apply within 2 miles of leks. The AO may waive this stipulation if no portion of the leasehold is within 2 miles of the perimeter of an active lek. Fluid Minerals: A CSU stipulation will apply within 2 miles of leks. The AO may waive this stipulation if no portion of the leasehold is within 2 miles of the perimeter of an active lek.	Completely Revised - revised by rangewide and state specific direction
MD-17 Greater Sage-Grouse GHMA: Same as MD-12.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD-18 Utility and Power lines: All new utility and power lines (overhead lines) that can be safely buried will be buried within 2 miles of GRSG leks and within GRSG winter range. When burial of power lines is not possible, above ground lines will be located and designed to minimize impacts of predation, collision and other associated stressors to GRSG. Existing overhead lines within 2 miles of leks and within GRSG winter range will be evaluated for threats to GRSG and if necessary, modified to reduce the threat. If modification is not likely to be effective, the overhead line may be relocated. Any requirements for modification or relocation of existing overhead lines will be subject to valid existing rights.	Partially Revised - revised by rangewide and state specific direction to clarify
Oil and Gas (O&G) - CSU: All new utility and power lines that can be safely buried will be buried within 2 miles of sage-grouse leks and within sage-grouse winter range. When burial of power lines is not possible, above ground lines will be located and designed to minimize impacts of predation, collision and other associated stressors to sage-grouse. Existing overhead lines within 2 miles of leks and within sage-grouse winter range will be evaluated for threats to sage-grouse and if necessary, modified to reduce the threat. If modification will not likely be effective, the overhead line may be relocated. Any requirements for modification or relocation of existing overhead lines will be subject to valid existing rights.	Completely Revised - revised by rangewide and state specific direction
MD-19 Weed Treatments: Timing Limit (TL): Herbicide treatments limited to spot weed treatments only within a 3 mile buffer zone, of known sage-grouse leks from March 1-June 30. Exceptions to treatment types and dates of treatments may be allowed to address aggressively spreading weeds or invasive plants that require aggressive and timely treatment during this period following consultation with necessary specialists to minimize impacts on sage-grouse.	No change (same as 2015)
MD-20 Temporary Travel Closures: Temporary travel closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); and 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the AO to resolve management conflicts and protect persons, property, and public lands and resources.	No change (same as 2015)
Where an AO determines that off-highway vehicles (OHV) are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures are implemented to prevent recurrence (43 CFR, Part 8341.2).	No change (same as 2015)

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
A closure or restriction order will be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders will be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No change (same as 2015)
Management Decisions for Greater Sage-Grouse Priority Habitat Management Areas	
MD-20 Greater Sage-Grouse PHMA: Manage PHMA so that discrete anthropogenic (human- caused) disturbances do not adversely impact GRSG distribution or abundance.	No change (same as 2015)
MD-21 Greater Sage-Grouse PHMA: PHMA will be the same as the State of South Dakota Sage- grouse Core Areas (SDGFP 2014); which includes 127,735 surface and 412,822 subsurface oil and gas minerals acres. See Figure 1-2 and 1-3. Adaptive management for sage-grouse is described in Chapter 2 Narrative section under Greater Sage-Grouse. BLM will apply the lek buffer-distances in the USGS Report "Conservation Buffer Distance Estimates for Greater Sage-Grouse-A Review (Open File Report 2014-1239)" in both GHMA and PHMA as detailed in Appendix B, Applying Lek Buffer-Distances When Approving Actions.	Completely Revised – revised by rangewide direction
MD-22 Surface Disturbing and Disruptive Activities and Fluid Minerals: Surface disturbing and disruptive activities may be allowed if the project proponent can clearly demonstrate that adverse impacts on sage-grouse can be adequately mitigated through BMPs, guidelines (Appendix J), disturbance is within the 3% disturbance cap limit (Appendix E) and RDFs (Appendix C) are included and the goals for sage-grouse not compromised. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG PHMA in any given BSU, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within PHMA in any given BSU until the disturbance has been reduced to less than the cap.	Completely Revised - revised by rangewide and state specific direction
If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) or if anthropogenic disturbance and habitat loss associated with conversion to agricultural tillage or fire exceed 5% within a project analysis area in PHMA, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.) will be permitted by BLM within PHMA in a project analysis area until the disturbance has been reduced to less than the cap. Within existing designated utility corridors, the 3% disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location.	Completely Revised - revised by rangewide and state specific direction
Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining	No change (same as 2015)

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
facility is co-located into an existing disturbed area. This direction applies to the following: oil and gas wells and development facilities, coal mines, wind towers, solar fields, geothermal, and mining (active locatable, leasable, and saleable developments). Appendix E provides specific details about how calculations are determined for disturbance caps. Prior to approving any surface disturbance and disruptive activities, the project proponent will be required to provide a plan approved by BLM to maintain suitability of habitat and avoid or minimize habitat loss and disturbance.	
Fluid Minerals - NSO: PHMA will be managed as NSO and Use (127,735 surface and 412,822 oil and gas subsurface minerals acres). These areas will be open to oil and gas leasing with a NSO stipulation. All sage-grouse habitat that is not part of PHMA will be managed as GHMA as noted in Figure 1-2.	Completely Revised - revised by rangewide and state specific direction
Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA.	Completely Revised - revised by rangewide and state specific direction
Waivers or modifications to a fluid minerals lease NSO stipulation will not be granted. The AO may grant an exception to a fluid mineral lease NSO stipulation in certain cases. Exceptions based on conservation gain (ii) may only be considered in (A) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) area of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP. See Appendix G.	Completely Revised - revised by rangewide and state specific direction
Oil and gas stipulations will also apply to geothermal resources. Locatable minerals will be open. RDFs (Appendix C) and other applicable BMPs and Guidelines (Appendix J) will be applied as BMPs or Guidelines for locatable minerals, subject to valid existing rights and the mining laws. Non-energy leasable minerals and salable minerals will be closed except for the following exception: PHMA are closed to new mineral material sales. However, these areas remain "open" to free use permits and the expansion of existing active pits, only if the following criteria are met: The activity is within the BSU and project area disturbance cap; the activity is subject to the provisions set forth in the mitigation measures (Appendix F) BMPs and Guidelines (Appendix J), and RDFs for Greater Sage-Grouse Habitat (Appendix C) are applied, and the activity is permissible under the subregional screening criteria.	Completely Revised - revised by rangewide and state specific direction
Required Design Features: RDFs are required for certain activities in all GRSG habitat. RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects (e.g., a resource is not present on a given site) or may require slight variations (e.g., a larger or smaller protective area). All variations in RDFs would require that at least one of the following be demonstrated in the NEPA analysis associated with the project or activity: A specific RDF is documented to not be applicable to the site-specific conditions of the project or activity (e.g., due to site limitations or engineering considerations). Economic considerations, such as increased	Completely Revised - revised by state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
costs, do not necessarily require that an RDF be varied or rendered inapplicable. An alternative RDF, a state-implemented conservation measure or plan-level protection is determined to provide equal or better protection for GRSG or its habitat. A specific RDF would provide no additional protection to GRSG or its habitat.	
Where the federal government owns the mineral estate in PHMA and GHMA, and the surface is in non- federal ownership, the federal government will apply the same stipulations, Conditions of Approval (COAs), and/or conservation measures and mineral RDFs if the mineral estate is developed on BLM- administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.	Partially Revised - revised by state specific direction to clarify HMA language
Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA and GHMA, the federal government will apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	Partially Revised - revised by state specific direction to clarify HMA language
At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	Completely Revised – revised by rangewide direction
MD-23 Grazing Permits and Leases: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments (RCA) or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	Completely Revised – revised by rangewide direction
MD-24 Other Resources Uses: Other resource uses within PHMA may be allowed pending project level environmental review provided that Mitigation, BMPs Guidelines, standard operating procedures (SOP), and RDFs are implemented, Impacts are evaluated as described in the GRSG Effects Analysis Process (Appendix I) and the project does not exceed the disturbance cap (Appendix E) and the goals for sage-grouse and sage-grouse habitat are not compromised. Categorical Exclusions (CXs) including those under the Energy Policy Act of 2005, Section 390 will not be used in priority sage-grouse habitats due to resource conflicts.	Completely Revised - revised by state specific direction
MD-25 Renewable Energy ROWs: PHMA will be exclusion areas. Other types of ROWs: PHMA will be avoidance areas. Winter range is an exclusion areas for renewable energy ROWs.	Completely Revised - revised by rangewide and state specific direction
MD-26 General ROWs: PHMA are defined as avoidance areas for all General ROWs (major and minor). Renewable ROWs are addressed in MD-25 above. Sage-Grouse winter range is treated the same in PHMA and GHMA: These areas are avoidance areas for general ROWs. If a proposed project cannot be avoided, the following actions will apply: Within PHMA all new power and utility lines (overhead lines) that can be safely buried will be buried.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
When burial of power lines is not possible, above ground lines will be located and designed to minimize impacts of predation, collision and other associated stressors to sage-grouse. Existing overhead lines within PHMA and within sage-grouse winter range will be evaluated for threats to sage-grouse and if necessary, modified to reduce the threat. If modification is not likely to be effective, the overhead line may be relocated. Any requirements for modification or relocation of existing overhead lines will be subject to valid existing rights.	
Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table 2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	Partially revised – Updated monitoring framework as part of rangewide direction
MD-27 Lands and Realty: PHMA and GHMA within the Center of the Nation will be Class 2 land retention areas (Appendix A2, Map E and Figure 1-3). Any land disposals will be limited and subject to specialist review. Refer to the Land Tenure subsection of the Lands section of this table for additional details about Class 2 retention criteria. BLM could also dispose of land in PHMA and GHMA within the Center of the Nation areas in cases where there is mixed ownership, and land exchanges will allow for additional or more contiguous federal ownership patterns. Under sage-grouse habitat areas with minority federal ownership, BLM will develop an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure, consideration will be given to pursuing a permanent conservation easement. Lands classified as PHMA and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the GRSG. The agency can demonstrate that disposal of the lands will provide a net conservation gain to Greater Sage-Grouse; or the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of Greater Sage-Grouse.	No change (same as 2015)
MD-28 Weed Treatments: TL: Spot weed treatments only, using IPM methods within all suitable nesting or brood rearing habitat of known sage-grouse leks from March 1-June 30.	No change (same as 2015)
MD-29 Surface Disturbance and Disruptive Activities and Fluid Minerals in Winter Range: Winter range in PHMA will be treated the same as winter range in GHMA: Surface disturbing and disruptive activities will not be allowed in winter range for sage-grouse unless the project proponent can clearly demonstrate that the impacts can be adequately mitigated, conservation actions or needed design features are included and the goals of this plan are not compromised. Prior to approving any surface disturbance and disruptive activities, the project proponent will be required to provide a plan approved by BLM to maintain suitability of habitat and avoid or minimize habitat loss and disturbance.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Fluid Minerals - NSO: Sage-grouse winter range will be managed as a NSO for oil and gas development and exploration. Waivers or modifications to a fluid minerals lease no-surface-occupancy stipulation will not be granted for NSO stipulations in PHMA.	Completely Revised - revised by rangewide and state specific direction
MD-30 Rights of Ways (ROWs): Winter range in PHMA will be treated the same as winter range in GHMA: Renewable Energy ROWs in sage-grouse winter range will be an exclusion area. Other types of ROWs in sage-grouse winter range will be an avoidance area. In cases where avoidance is not possible, BLM may require co-location of new ROWs with existing ROWs where possible. ROWs are defined for sage-grouse management in terms of major and minor ROWs. Major ROWs include transmission lines 100kV and greater and pipelines 24 inches in width and greater. Minor ROWs include utilities under these design descriptions, as well as communication sites and towers. Greater Sage-Grouse PHMA are avoidance areas for major and minor ROWs. Within GHMA, major ROWs are avoidance and minor ROWs are avoidance within two miles of leks with GHMA. The rest of the GHMA is open to minor ROWs. Sage-Grouse winter range is treated the same in PHMA and GHMA: These areas are avoidance areas for general ROWs and exclusion areas for renewable energy ROWs.	Completely Revised - revised by rangewide and state specific direction
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Updated the language in MD-31. This MD was deleted and replaced with the text below.] The habitat objectives for GRSG (Table 2-5) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-5 vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area.	Completely Revised – revised by rangewide direction. Table 2-5 removed, see Appendix 8 for habitat indicators

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and ● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	
MD-32 Land Health Standards: BLM will prioritize grazing leases in PHMA to determine if modifications are necessary prior to renewals or if the allotment does not meet Land Health Standards.	Completely Revised – revised by rangewide direction
MD-33 Prescribed Fire: Prescribed fire may be allowed in PHMA and general habitat if it is done solely for the purposes of improving or maintaining sage-grouse habitat. If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address the following: • Why alternative techniques were not selected as a viable options; • How Greater Sage-Grouse goals and objectives would be met by its use; • How the COT report objectives would be addressed and met; • Develop a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMA (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, and burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality. Secretarial order SO3336 will be applied to protect GRSG habitat from fire: http://www.forestsandrangelands.gov/rangeland/index.shtml.	Partially Revised - revised by state specific direction to clarify

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
MD-34 Grazing Permits/Leases: The NEPA analysis for renewals and modifications of livestock grazing permits/leases within PHMA will include specific management thresholds based on GRSG Habitat Objectives Table and Land Health Standards (43 CFR, Part 4180.2) and ecological site potential and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Completely Revised – revised by rangewide direction
MD 35 – Grazing Allotments: Allotments within PHMA, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	Completely Revised – revised by rangewide direction
MD 36 – Review and prioritization of Grazing Leases/Permits: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.	Completely Revised – revised by rangewide direction
MD-37: Range Improvements: Range improvements in PHMA would be allowed if the improvements would not impact GRSG, improvements would provide a conservation benefit to GRSG such as fences for protecting important seasonal habitats, or if improvements would meet the lek buffer requirement. Refer to Appendix B for a discussion about GRSG lek buffers.	Completely Revised – revised by rangewide direction
MD-38 Recreation: In PHMA, BLM will not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) unless the development would have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.	Partially Revised - revised by state specific direction, see mitigation and SSS sections
MD-39: Travel: Temporary travel closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); and 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the AO to resolve management conflicts and protect persons, property, and public lands and resources.	No change (same as 2015)
Where an AO determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures are implemented to prevent recurrence (43 CFR, Part 8341.2).	No change (same as 2015)

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
A closure or restriction order will be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders will be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	No change (same as 2015)
Habitat Objectives	
[Plan Maintenance Action in 2018 (February 2, 2018) clarified the use and application of the habitat objectives. Updated the language in MD-31 and here in the Habitat Objectives section. Most of this section was deleted and replaced with the text below.] The habitat objectives for GRSG (Table 2-5) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. The seasonal habitat descriptions in Table 2-5 vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sagegrouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area. The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards. The Habitat Objectives Tables are to be used: ● To assess habitat suitability for sage-grouse following the BLM policy on sage-grouse habitat assessments ● To evaluate land use plan effectiveness for sage-grouse conservation, and	Completely Revised - revised by rangewide direction. Table 2-5 removed, indicators now in new appendix.

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
● As a basis to develop measurable project objectives for actions in BLM-designated GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	
In all PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush canopy cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2015)
Adaptive Management Strategy for Greater Sage-Grouse Habitat Management	
Adaptive Management is a decision process that promotes flexible resource management decision- making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. Careful monitoring of these outcomes both advances scientific understanding and helps with adjusting resource management directions as part of an iterative learning process. Adaptive management also recognizes the importance of natural variability in contributing to ecological resilience and productivity. Adaptive management does not represent an end in itself, but rather a means to more effective decisions and enhanced benefits. On February 1, 2008, the USDI published its Adaptive Management Implementation Policy (522 DM 1). The adaptive management strategy presented within this EIS complies with this policy and direction. The GRSG Monitoring Framework will be used to inform adaptive management; the GRSG Monitoring Framework can be found in Appendix D. The following provides the BLM adaptive management strategy for the South Dakota ARMP.	Completely Revised - revised by rangewide direction
Adaptive Management and Monitoring	
This EIS contains a monitoring framework plan (Appendix D) that includes an effectiveness monitoring component. The agencies intend to use the data collected from the effectiveness monitoring to identify any changes in habitat conditions related to the goals and objectives of the plan and other range-wide conservation strategies BLM 2004; Stiver et al. 2006; USFWS 2013). The information collected through the Monitoring Framework Plan (Appendix D) will be used by the BLM to determine when adaptive management hard and soft triggers (discussed below) are met. Adaptive management responses at the RMP level were included as part of the assumptions when impacts were analyzed in Chapter 4 of the Proposed RMP. In making amendments to this plan, the BLM will coordinate with the FWS as BLM continues to meet its objective of conserving, enhancing and restoring GRSG habitat by reducing, minimizing or eliminating threats to that habitat. The GRSG adaptive management plan provides a means of addressing and responding to unintended negative impacts on GRSG and its habitat before consequences become severe or irreversible.	Completely Revised - revised by rangewide direction
The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	Completely Revised - revised by rangewide direction
Adaptive Management Triggers	
Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. The BLM will use soft and hard triggers.	Completely Revised - revised by rangewide direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Soft Triggers	
Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation actions. The soft trigger is any negative deviation from normal trends in habitat or population in any given year, or if observed across two to three consecutive years. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and Density and Disturbance Calculation Tool (DDCT) evaluations. BLM field offices, local SDGFP offices, and sage-grouse working groups will evaluate the metrics. The purpose of these strategies is to address localized Greater Sage-Grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population trends and habitat anomalies.	Completely Revised - revised by rangewide direction
Each major project (EIS level) will include adaptive management strategies in support of the population management objectives for Greater Sage-Grouse set by the State of South Dakota, and will be consistent with this Greater Sage-Grouse Adaptive Management Plan. These adaptive management strategies will be developed in partnership with the State of South Dakota, project proponents, partners, and stakeholders, incorporating the best available science.	Completely Revised - revised by rangewide direction
Soft Triggers Response	
Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short or long term, as allowed by law. The project-level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency and the adaptive management group will implement an appropriate response strategy to address causal factors not addressed by specific project adaptive management strategies, not attributable to a specific project, or to make adjustments at a larger regional or state-wide level.	Completely Revised - revised by rangewide direction
Hard Triggers	
Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers would be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact is having a negative effect. Hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. Within the context of normal population variables, hard triggers shall be determined to take effect when two of the three metrics exceeds 60% of normal variability for the BSU in a single year, or when any of the three metrics exceeds 40% of normal variability for a three-year time period within a five-year range of analysis. A minimum of three years is used to determine trends, with a five-year period preferred to allow determination of three actual time periods (i.e., Y1-2-3, Y2-3-4, Y3-4-5). Baseline population estimates are established by pre-disturbance surveys, reference surveys, and account for regional and statewide trends in population levels. Population count data in South Dakota are maintained by SDGFP. Estimates of population are determined based upon survey protocols determined by SDGFP, and are implemented consistently throughout the state. Population counts are tracked for individual leks and are then summarized by county and for the state.	Completely Revised - revised by rangewide direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Hard Trigger Response	
Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from Greater Sage-Grouse conservation objectives set forth in the BLM plans. As such, the ARMP includes a "hard-wired" plan-level response; that is, it provides that, upon reaching the trigger, a more restrictive alternative, or an appropriate component of a more restrictive alternative analyzed in the Proposed RMP and Final EIS, will be implemented without further action by the BLM. Specific "hard- wired" changes in management are identified in Table 2-7, Specific Management Responses, below. In addition to the specific changes identified in Table 2-7, the BLM will review available and pertinent data, in coordination with Greater Sage-Grouse biologists and managers from multiple agencies, including the USFWS, NRCS, and the State of South Dakota, to determine the causal factor(s) and implement a corrective strategy. The corrective strategy would include the changes identified in Table 2-7 and could also include the need to amend or revise the ARMP to address the situation and modify management accordingly.	Completely Revised - revised by rangewide direction
Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the BSU for a period of 90 days. When a hard trigger is hit in a BSU, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the casual factor(s), put project level responses in place, as appropriate, and discuss further appropriate actions to be applied.	Completely Revised - revised by rangewide direction
In addition to implementing the hard wired plan-level response, in the event that new scientific information becomes available demonstrating that the hard-wired response would be insufficient to stop a severe deviation from sage-grouse conservation objectives set forth in the BLM plans, the BLM will immediately implement a formal directive to protect GRSG and its habitat and to ensure that conservation options are not foreclosed. To the extent that it is supported scientifically, this formal directive will be drawn from the range of alternatives analyzed in the RMP Amendments/Revisions.	Completely Revised - revised by rangewide direction
Mitigation for Sage-Grouse Management	
Consistent with the Plan's goal, the intent of the South Dakota ARMP is to provide a net conservation gain to the species. In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in sage-grouse habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Actions that result in habitat loss and degradation including those identified as threats which contribute to Greater Sage-Grouse disturbance as identified by the USFWS in its 2010 listing decision (75 FR 13910) and shown in Table 2 in the attached Monitoring Framework (Appendix D). This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which directs BLM "to initiate proactive conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA."	Completely Revised - revised by rangewide and state specific direction
Mitigation Standards. In undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing-third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the CEQ (40 CFR, Part 1508.20; e.g., avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM management actions and authorized third-party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e., residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.	Completely Revised - revised by rangewide and state specific direction
Greater Sage-Grouse Conservation Team. The BLM will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of Greater Sage- Grouse, within 90 days of the issuance of the ROD. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section). The BLM will invite governmental and Tribal partners to participate in this Team, including the SDGFP and USFWS, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM will strive for a collaborative and unified approach between Federal agencies, Tribal governments, state and local government(s), and other stakeholders for Greater Sage-Grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM will remain responsible for making decisions that affect Federal lands.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Developing a Regional Mitigation Strategy. The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM management actions and third-party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the ROD. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices within the WAFWA Management Zone's boundaries. Regional mitigation is a landscape-scale approach to mitigating impacts on resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e., avoidance, minimization, and compensation; additionality, timeliness, and durability). In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.	Completely Revised - revised by rangewide and state specific direction
Incorporating the Regional Mitigation Strategy into NEPA Analyses. The BLM will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM management actions and third-party actions that result in habitat loss and degradation, and the appropriate mitigation actions will be carried forward into the decision.	Completely Revised - revised by rangewide and state specific direction
Implementing a Compensatory Mitigation Program. Consistent with the principles identified above, the BLM needs to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. To align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g., Federal, Tribal, and State agencies). To ensure transparent and effective management of the compensatory mitigation funds, the BLM will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the ROD. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM will remain responsible for making decisions that affect Federal lands. Information on BMPs, Guidelines and SOPs can be found in Appendix J. RDFs are described in Appendix C.	Completely Revised - revised by rangewide and state specific direction

GRSG Management from South Dakota RMP	Types of Change to Existing Management Direction in the Proposed RMP Amendment
Monitoring Framework for Greater Sage-Grouse Habitat Management	
The BLM's planning regulations, specifically 43 CFR, Part 1610.4-9, require that land use plans establish intervals and standards for monitoring based on the sensitivity of the resource decisions. Land use plan monitoring is the process of tracking the implementation of land use plan decisions (implementation monitoring) and collecting data/information necessary to evaluate the effectiveness of land use plan decisions (effectiveness monitoring). For GRSG, these types of monitoring are also described in the criteria found in the Policy for Evaluation of Conservation Efforts When Making Listing Decisions (50 CFR Vol. 68, No. 60). One of the Policy for Evaluation of Conservation Efforts When Making Listing Decisions criteria evaluates whether provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided. The Monitoring Framework is located in Appendix D.	Completely Revised – revised by rangewide direction

Table 2. South Dakota Habitat Objectives for GRSG

[Note: Table from 2015 Plan, see Appendix 8 for Indicator Tables for Proposed Plan]

Attribute	Indicators	Habitat Conditions	Reference
BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)			
Lek Security	Proximity of trees	Trees absent or rare. When present trees consist of rocky mountain juniper and ponderosa pine >328 feet (100 meters) from lek.	Baruch-Mordo et al. 2013 Stiver et al. 2015
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 feet (100 m) of an occupied lek	Stiver et al. 2015
NESTING/EARLY BROOD REARING			
Cover	Sagebrush canopy cover [2]	2-20%	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2011
	Sagebrush height	4-12 inches (10.16-30.48 cm)	Connelly et al. 2000
	Predominant sagebrush shape	Predominantly spreading shape5	Stiver et al. 2015
	Perennial grass cover (such as native rhizomatous and bunchgrasses) 2	>10%	Stiver et al. 2015 Connelly et al. 2000
	Perennial grass height (includes residual grasses)	Adequate nest cover based on ecological site potential and seasonal precipitation.[15]	Connelly et al. 2000 Stiver et al. 2015 Connelly et al. 2003 Hagen et al. 2011
	Perennial forb cover [2]	>3%, Based on ecological site potential and seasonal precipitation	Connelly et al. 2000
	Perennial forb availability	Preferred forbs are common with several species present[6]	Stiver et al. 2015

Attribute	Indicators	Habitat Conditions	Reference
LATE BROOD-REARING/SUMMER1 (July-October) (Apply to all habitat outside of nesting/breeding and winter)			
Cover	Sagebrush canopy cover[2]	2-20%	Connelly et al. 2000
	Sagebrush height	4 - 12 inches (10.16-30.48 cm)	Connelly et al. 2000
	Perennial grass canopy cover [2]	>10%	Connelly et al. 2000
	Upland and riparian perennial forb availability [2]	Preferred forbs are common with several preferred species present,6,	Stiver et al. 2015
	Riparian meadow habitat condition	Proper Functioning Condition (PFC)13	
WINTER1 November-March1 (Apply to areas of known or likely winter-use)			
Cover and Food	Seasonal habitat extent	Winter habitat is managed to optimize its potential within the constraints of ecological site potential	Connelly et al. 2000 Stiver et al. 2015
	Sagebrush canopy cover	2-20%	Connelly et al. 2000 Stiver et al. 2015
	Sagebrush height above snow	Winter habitat is managed to optimize its potential within the constraints of ecological site potential	Connelly et al. 2000

NOTES

1 Seasonal dates can be adjusted by local unit according to geographic region.

2 Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present. Percent cover refers to foliar cover, measured using the HAF protocol line-point intercept method.

3 Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush subspecies for this type site (Stiver et al. 2015 In press).

4 Mesic corresponds to the >12 inch precipitation zone.

5 Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. 2015 In press. Sagebrush plants that are more tree or columnar shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015 In press). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

6 Preferred forbs are listed in Stiver et al. 2015 In press. Overall total forb cover may be greater than that of preferred for cover since not all forb species are listed as preferred.

15 Specific height requirements needed to meet the objective will be set when project level planning is completed.

2.14.2 Relevant Appendices

The following table shows which appendices from the 2015 plan amendment have management direction that may change through the Proposed RMPA. The appendices can be found on the South Dakota RMP ePlanning website.

ARMPA Appendix Name	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	Completely Revised – See new maps in Appendix 1
B: Applying GRSG Lek Buffer-Distances When Approving Decisions	Completely revised – see state-specific language
C: GRSG Required Design Features	Partially updated – see state-specific language
D: GRSG Monitoring Framework	Completely revised –see new rangewide management direction
E: GRSG Disturbance Caps	Removed, see new rangewide management direction
F: GRSG Regional Mitigation Strategy	Removed, see new rangewide management direction
G: Fluid Mineral Stipulations	Partially revised, GRSG stipulations changed, see Appendix 16
I: Greater Sage-Grouse Effects Analysis Process	Removed
J: Summary of Mitigation Measures, Best Management Practices (BMPs), Standards, Guidelines, and Standard Operating Procedures (SOPs)	Partially revised with new direction (livestock grazing BMPs)

Appendix 2.15
Utah RMPs

This page intentionally left blank.

2.15 UTAH RMPS

This appendix presents the GRSG approved RMP amendment language from the 2015 and 2019 records of decision for Utah. Changes between 2015 and 2019 are noted. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 and 2019 appendices that are listed in **Section 2.15.2** of this appendix. For the additional state-specific Utah management direction for the Proposed RMPA, see Chapter 2, Table 2-11.

2.15.1 Utah

Table 1: Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Direction in Utah

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
SPECIAL STATUS SPECIES (SSS)	***SPECIAL STATUS SPECIES (SSS)***	—
GOAL:	**GOAL:**	—
Goal SSS-1: Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in collaboration with other conservation partners.	No changes made.	Completely Revised - revised by rangewide.
Objectives:	**Objectives:**	—
Objective SSS-1: Designate PHMA that are large enough to stabilize populations in the short-term and enhance populations over the long-term. Protect PHMA from anthropogenic disturbances that will reduce distribution or abundance of GRSG. Enhance or improve GRSG habitat (e.g., through restoration or rehabilitation activities) within PHMA that has been impaired or altered.	No changes made.	No change (same as 2015).
Objective SSS-2: In all GRSG habitat, manage activities that result in habitat loss and degradation to provide a net conservation gain of GRSG habitat. Exceptions to net conservation gain for GRSG shall be made for vegetation treatments to benefit Utah prairie dog.	**Objective SSS-2:** In PHMA, manage activities that result in habitat loss and degradation to improve the condition of GRSG habitat across the planning area. Exceptions to this mitigation standard for GRSG shall be made for vegetation treatments to benefit Utah prairie dog.	Completely Revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective SSS-3: In all GRSG habitat, where sagebrush is the current or potential dominant vegetation type or is a primary species within the various states of the ecological site description, maintain or restore vegetation to provide habitat for lekking, nesting, brood rearing, and winter habitats. The habitat objectives for GRSG (**Table 2**) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. When permitting land use activities, BLM should consider the ecological site potential within designated habitat management areas to validate the habitat conditions achievable for a specific site. In addition, areas where PHMA and GHMA overlap mapped Utah prairie dog habitat will be managed for both species; accomplishing this shall include coordination with species specific experts to develop conservation and recovery objectives that will benefit both species. The seasonal habitat descriptions in **Table 2** vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse	**Objective SSS-3:** In PHMA, where sagebrush is the current or potential dominant vegetation type or is a primary species within the various states of the ecological site description, maintain or restore vegetation to provide habitat for lekking, nesting, brood rearing, and winter habitats. The habitat objectives for GRSG (**Table 3**) is a list of indicators, characteristics, and values that describe GRSG seasonal habitat use areas. The BLM used indicator values derived from a synthesis of local and regional GRSG habitat research and data to describe the typical vegetation communities that sage-grouse select. While the habitat objectives are not attainable on every site or every acre within designated GRSG habitat management areas, the values reflect a range of habitat conditions that generally lead to greater survival of individuals within a population. In addition, areas where PHMA and GHMA overlap mapped Utah prairie dog habitat will be managed for both species; accomplishing this shall include coordination with species specific experts to develop conservation and recovery objectives that will benefit both species. The seasonal habitat descriptions in **Table 3** vary across the range of sage-grouse, within a subregion, and between sites. They are not land health standards but are quantitative measures that inform the Special Status Species Habitat Land Health Standard for sage-grouse. These measurable values reflect ecological potential, and may be adjusted based on local factors influencing sage-grouse habitat selection. Local data or recent	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
habitat selection. Local data or recent science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sage-grouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area.	science may indicate that sage-grouse select for vegetation structure and composition in seasonal habitats not characterized by the values in the habitat objectives table. In these cases, it may be appropriate to adjust the values. Habitat objectives should be evaluated in the context of annual variability in ecological conditions and should not be used singly to determine habitat suitability for sage-grouse. They may be used to demonstrate trends over time, during plan evaluations for effectiveness of sage-grouse conservation, or when identify limiting habitat characteristics for a given area.	
The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. Results from the LHS evaluation should be used to support BLM in land use authorization processes and during development of objectives for management actions such as vegetation treatments. BLM land use authorizations will contain terms and conditions regarding the actions needed to achieve or make progress toward achieving habitat objectives and land health standards.	The indicators, characteristics, values and desired seasonal habitat conditions in the GRSG Plan Habitat Objectives Table are meant to inform the wildlife habitat component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2), but do not replace rangeland health assessments. GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	GRSG Habitat Management areas when considered alongside land health standards, ecological potential and local information.	
Objective SSS-4: Within PHMA, increase the amount and functionality of seasonal habitats by: • Maintaining or increasing sagebrush in perennial grasslands, where needed to meet the Habitat Objectives for Greater Sage-Grouse (**Table 2**), unless there is a conflict with Utah prairie dog. • Reducing conifer (e.g., pinyon/juniper) from areas that are most likely to support GRSG at a rate that is at least equal to the rate of encroachment. • Reducing the extent of annual grasslands. • Maintaining or improving corridors for migration or movement between seasonal habitats, as well as for long-term genetic connections between populations. • Maintaining or improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. • Conducting vegetation treatments based on the following 10-year (decadal) acreage objectives:	**Objective SSS-4:** Within PHMA, increase the amount and functionality of seasonal habitats by: • Maintaining or increasing sagebrush in perennial grasslands, where needed to meet the Habitat Objectives for Greater Sage-Grouse (**Table 3**), unless there is a conflict with Utah prairie dog. • Reducing conifer (e.g., pinyon/juniper) from areas that are most likely to support GRSG at a rate that is at least equal to the rate of encroachment. • Reducing the extent of invasive annual grasslands. • Maintaining or improving corridors for migration or movement between seasonal habitats, as well as for long-term genetic connections between populations. • Maintaining or improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. • Conducting vegetation treatments based on the following 10-year (decadal) acreage objectives:	Partially revised- remove parenthetical reference to habitat objectives table.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment

Table 1a. Vegetation Treatments per 10-year (decadal) Acreage Objectives (2015)

Population Areas	Mechanical Treatment[1]	Annual Grass Treatment[1]
Box Elder	9,300	17,800
Ibapah; Hamlin Valley	17,900	2,100
Rich; Uintah	40,700	6,800
Carbon	2,600	200
Bald Hills; Panguitch	43,900	8,900
Parker Mountain	32,800	2,200
Sheeprocks	33,700	10,000
Statewide	*180,900*	*48,000*

[1] These acreage figures, based on Vegetation Dynamics Development Tool modeling, represent an objective for treatment on BLM-administered lands over a 10-year (decadal) time frame to support achievement or progress toward GRSG habitat objectives (see Final EIS Appendix V, Great Basin Vegetation Modeling using Vegetation Dynamics Development Tool). This accounts for variations in yearly funding availability and does not reflect a maximum or minimum acreage for any one treatment type or total treatment acreage, should funding and site specific conditions allow for more or less treatment acreage than described in order to meet habitat objectives.

Table 1b. Vegetation Treatments per 10-year (decadal) Acreage Objectives (2019)

Population Areas	Mechanical Treatment[1]	Annual Grass Treatment[1]
Box Elder	9,300	17,800
Ibapah; Hamlin Valley	17,900	2,100
Rich; Uintah	40,700	6,800
Carbon	2,600	200
Bald Hills; Panguitch	43,900	8,900
Parker Mountain	32,800	2,200
Sheeprocks	33,700	10,000
Statewide	*180,900*	*48,000*

[1] These acreage figures, based on Vegetation Dynamics Development Tool modeling, represent an objective for treatment on BLM-administered lands over a 10-year (decadal) time frame to support achievement or progress toward GRSG habitat objectives (see Final EIS Appendix V, Great Basin Vegetation Modeling using Vegetation Dynamics Development Tool). This accounts for variations in yearly funding availability and does not reflect a maximum or minimum acreage for any one treatment type or total treatment acreage, should funding and site specific conditions allow for more or less treatment acreage than described in order to meet habitat objectives.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Outside PHMA (in adjacent opportunity areas) improve and restore historical GRSG habitat to support GRSG populations and to maintain or enhance connectivity. Statewide, complete a decadal average of 170,200 acres of mechanical treatments and 33,000 acres of annual grass treatments. Prioritization is for completion of treatments within PHMA before treating areas outside.	Outside PHMA (in adjacent opportunity areas) improve and restore historical GRSG habitat to support GRSG populations and to maintain or enhance connectivity. Statewide, complete a decadal average of 170,200 acres of mechanical treatments and 33,000 acres of annual grass treatments. Prioritization is for completion of treatments within PHMA before treating areas outside.	
Objective SSS-5: Participate in local GRSG conservation efforts (e.g., the appropriate State of Utah agency, Natural Resources Conservation Service (NRCS), and local working groups) to implement landscape-scale habitat conservation, to implement consistent management to benefit GRSG, and to gather and use local research and monitoring to promote the conservation of GRSG.	No changes made.	No change (same as 2015).
Management Actions (MA):	**Management Actions (MA):**	—
MA-SSS-1: Identify PHMA and GHMA as identified in **Table 4** below (Figure 2-1, Habitat Management Areas [Appendix A, Approved RMP Amendment Maps]): The BLM will apply these the goals, objectives, and management actions where the agency has discretion to implement them; the actions do not apply in areas where the BLM does not administer the surface or mineral estate. Minor adjustments to PHMA/GHMA external boundaries can be made if BLM biologists, in coordination with the appropriate State of Utah agency, determine site-specific conditions warrant such changes to more accurately depict existing or potential GRSG habitat. The appropriate planning process (i.e., plan maintenance or plan amendment) will be used, as determined on a case-by-case basis considering site-specific issues. See additional	Identify PHMA as follows in **Table 5** below (Figure 2-1, Habitat Management Areas [Appendix A, 2015 ROD/ Approved RMPA Maps]): The BLM will apply these the goals, objectives, and management actions where the agency has discretion to implement them; the actions do not apply in areas where the BLM does not administer the surface or mineral estate. The PHMA boundaries are not intended to represent a survey-grade boundary and are not expected to be used exclusively at a project-level. In accordance with the adaptive management framework and existing law, regulation and policy, inventories will continue to be conducted to provide information on GRSG habitat and distribution (FLPMA, 43 USC 1701 Sec. 201 (a), BLM Manual 6840 .04 D 3; BLM-M-6840 .04 E 2). Prior to considering proposed actions within	Partially revised – updated HMA boundaries, non-habitat criteria.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
information and protocol on adjusting occupied habitat and PHMA/GHMA boundaries in Appendix K, Greater Sage-Grouse Habitat Baseline and Habitat Update Protocol. The PHMA and GHMA objectives and management actions would apply to existing sagebrush areas and areas with ecological sagebrush potential within the respective PHMA and GHMA polygons. In the mapped PHMA and GHMA there may be areas that lack the principle habitat components necessary for GRSG, including but not limited to rock outcrops, alkaline flats, and pinyon-juniper ecological sites. These are areas that do not have existing sagebrush or ecological potential to contain sagebrush. These areas of non-habitat may be identified during site-specific project review by agency biologists, in discussion with the appropriate State of Utah agency. Because of the importance of PHMA to conserve, enhance and restore GRSG and its habitat, objectives and management actions will apply to all the areas within the respective PHMA polygons. The GHMA objectives and management actions will apply to the areas of identified non-habitat within the GHMA polygons unless **all** the following conditions are met: • the non-habitat does not provide important connectivity between areas with existing or potential habitat; • all direct and indirect impacts that impair the function of adjacent seasonal habitats or the life-history or behavioral needs of the GRSG population are eliminated through project design (e.g., minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document.	PHMA, a field investigation should be conducted by a qualified biologist in collaboration with federal and state biologists. To this end, additional site-specific information associated with local surveys could result in a more precise delineation of habitat management areas. If in the review of a proposed action, there are discrepancies between the PHMA maps and the on-the-ground conditions, the on-the-ground information should be used to determine where the management would be applied. Minor adjustments to PHMA external boundaries (increases or decreases) can be made if BLM biologists, in coordination with the appropriate State of Utah agency, determine site-specific conditions warrant such changes to more accurately depict existing or potential GRSG habitat. The appropriate planning process (i.e., plan maintenance or plan amendment) will be used, as determined on a case-by-case basis considering site-specific issues. See additional information and protocol on adjusting seasonal habitat and PHMA boundaries in Appendix K, Greater Sage-Grouse Habitat Baseline and Habitat Update Protocol. The PHMA objectives and management actions apply to ecological sites that currently provide GRSG habitat within the respective PHMA polygons, as well as areas with ecological potential for GRSG habitat that have not cross an ecological threshold to a different stable non-GRSG habitat vegetation community. Mapped PHMA may also include areas that lack the principle habitat components necessary for GRSG, including but not limited to rock outcrops, alkaline flats, pinyon-juniper ecological sites, and areas that have crossed an ecological threshold to a different stable non-GRSG habitat vegetation	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Exceptions in non-habitat may be approved by the Authorized Officer, but only with the concurrence of one level of delegated authority above the Authorized Officer. Any exception granted based on the above criteria would only apply to the specific project-level authorization. Proposed projects in the same area would need to undergo individual analysis to confirm the criteria are met prior to subsequent authorizations. Excepting a site-specific project from compliance with GRSG management in an area of non-habitat would not change the boundaries of PHMA or GHMA.	community, such as cheatgrass monocultures or pinyon/juniper woodlands (phase 3, absent sagebrush understory) (Chambers et al. 2014; Bestelmeyer et al. 2010; Bestelmeyer, et al. 2011). These are areas that do not contain sagebrush or other vegetation necessary for the various GRSG seasonal habitats. These areas of non-habitat may be identified during site-specific project review by agency biologists, in discussion with the appropriate State of Utah agency. The PHMA objectives and management actions will apply to the areas identified as habitat, as well as non-habitat within the PHMA polygons unless **both** of the following conditions are met: • the non-habitat does not provide important connectivity between seasonal habitats; and • direct and indirect impacts on adjacent seasonal habitats (disturbance to or disruption of) that would impair their biological function of providing the life-history or behavioral needs of the GRSG population are eliminated through project design (e.g., minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document. Any exception granted based on the above criteria would only apply to the specific project-level authorization. Proposed projects in the same area would need to undergo individual analysis to confirm the criteria are met prior to subsequent authorizations. Excepting a site-specific project from compliance with GRSG management in an area of non-habitat would not change the boundaries of PHMA.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-2: Designate SFA as shown on Figure 2-1 (181,100 acres of BLM surface estate; 52,200 acres split-estate federal minerals). SFA will be managed as PHMA, with the following additional management: • Recommended for withdrawal from the Mining Law of 1872 (as amended), subject to valid existing rights. • Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing. • Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	No similar action.	No change (same as 2019).
MA-SSS-3: In PHMA, apply the following management to discretionary disturbances or activities that are not otherwise excluded or closed to minimize and mitigate effects on GRSG and its habitat from the project/activity:	**MA-SSS-3:** In PHMA, apply the following management to discretionary disturbances or activities that are not otherwise excluded or closed to minimize and mitigate effects on GRSG and its habitat from the project/activity:	Various revisions – see section specific revisions below
MA-SSS-3: <u>A- Net Conservation Gain:</u> In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Exceptions to	**MA-SSS-3:** <u>A- Mitigation Strategy:</u> In PHMA, when undertaking BLM management actions, and, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and degradation, the BLM will achieve the planning-level GRSG management goals and objectives through implementation of mitigation and management actions. Under this Proposed Plan Amendment, management would be consistent with the GRSG goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
net conservation gain for GRSG shall be made for vegetation treatments to benefit Utah prairie dog. Mitigation will be conducted according to the mitigation framework contained in Appendix F, Mitigation Strategy: Utah Greater Sage-Grouse RMPA. Consider the likelihood of development of not-yet-constructed surface-disturbing activities – as defined in Table D.2 of the Monitoring Framework (Appendix D)−under valid existing rights prior to authorizing new projects in PHMA.	In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [GRSG] or to improve the condition of [GRSG] habitat" across the planning area. Exceptions to this mitigation strategy for GRSG shall be made for vegetation treatments to benefit Utah prairie dog. 1) Compensation, which involves replacing or providing substitute resources for the impacts (including through payments to fund such work), would be considered only when voluntarily offered by a proponent, required by a law other than FLPMA, or to meet a State recommendation or requirement. Therefore, consistent with valid existing rights and applicable law, when considering third-party actions that result in habitat loss and degradation, the BLM will consider compensatory mitigation actions only as a component of compliance with a State mitigation plan, program, or authority; when required by a federal law other than FLPMA; or when offered voluntarily by a project proponent. Accordingly, before authorizing third-party actions that result in habitat loss and degradation in PHMA or State of Utah SGMAs, the BLM will complete the following steps: Notify the appropriate State of Utah agency to determine if the State of Utah requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of GRSG; 2) Recommend to the project proponent that it coordinate with the appropriate State of Utah	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	agency to ensure it complies with all applicable State requirements relating to its proposal; 3) Consider the State's recommendations – if the State of Utah determines that there are unacceptable residual impacts on GRSG or its habitat and compensatory mitigation is required as a part of State policy or authorization, or if a proponent voluntarily offers mitigation, the BLM will incorporate that mitigation into the BLM's NEPA and decision-making process; 4) The BLM will ensure mitigation outcomes are consistent with the State of Utah's mitigation strategy and principles outlined in the State's Conservation Plan for Greater Sage-Grouse, including, but not limited to: a) Creating, restoring and/or protecting functional habitat or habitat corridors to offset the impacts of unavoidable disturbance to GRSG habitat, b) In most cases, compensatory mitigation projects should be completed before the project triggering mitigation occurs, c) Compensatory mitigation projects should account for the risk that the mitigation may fail or not persist for the full duration of the project it is intended to offset, d) Compensatory mitigation projects should provide habitat that is in place for at least the duration of the project it is intended to offset. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	alignment with State policies and requirements, including those regarding compensatory mitigation. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action. The BLM will not deny a proposed authorization in GRSG habitat solely on the grounds that the proponent has not proposed or agreed to undertake voluntary compensatory mitigation. In cases where waivers, exceptions, or modification may be granted for projects with a residual impact, voluntary compensatory mitigation consistent with the State's management goals can be one mechanism by which a proponent achieves the RMPA goals, objectives, and waiver, exception, or modification criteria. When a proponent volunteers compensatory mitigation as their chosen approach to address residual impacts, the BLM can incorporate those actions into the rationale used to grant a waiver, exception, or modification. The final decision to grant a waiver, exception, or modification will be based, in part, on criteria consistent with the State's GRSG management plans and policies. In short, the BLM would continue to apply the mitigation hierarchy as described in the CEQ regulations at 40 CFR 1508.20; however, the BLM would focus on avoiding, minimizing, rectifying, and reducing impacts over time. Compensation would be considered only when voluntarily offered by a proponent, required by a law other than FLPMA, or to meet a State recommendation or requirement. The BLM commits to cooperating with the State to analyze applicant-proposed, state-recommended, or state-imposed compensatory mitigation to offset residual	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	impacts. The BLM remains committed to achieving the planning-level management goals and objectives identified in this ROD and the 2015 ARMPA by ensuring GRSG habitat impacts are addressed through implementing mitigating actions consistent with the governing RMP.	
MA-SSS-3: B- Disturbance Cap In PHMA, manage discrete anthropogenic disturbances, whether temporary or permanent, so they cover less than 3 percent of 1) PHMA associated with a GRSG population area and 2) within a proposed project analysis area. See Appendix E, Greater Sage-Grouse Disturbance Cap Guidance, for additional information on implementing the disturbance cap, including what is and is not considered disturbance and how to calculate the proposed project analysis area. If the 3 percent anthropogenic disturbance cap is exceeded on all lands (regardless of land ownership) within GRSG PHMA in any given population area (BSU), then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the Mining Law of 1872 [as amended], valid existing rights, etc.) will be permitted by the BLM within GRSG PHMA in any given population area (BSU) until the disturbance has been reduced to less than the cap. If the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in PHMA, then no further anthropogenic disturbance will be permitted by the BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the Mining	**MA-SSS-3:** B- Disturbance Cap In PHMA, manage discrete anthropogenic disturbances so they cover less than 3 percent of 1) PHMA associated with a GRSG population area and 2) within a proposed project analysis area. See Appendix E, Greater Sage-Grouse Disturbance Cap Guidance, for additional information on implementing the disturbance cap, including what is and is not considered disturbance and how to calculate the proposed project analysis area. If the 3 percent disturbance cap is exceeded on all lands (regardless of land ownership) within GRSG PHMA in any given population area (BSU) or within a proposed project analysis area in PHMA, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the Mining Law of 1872 [as amended], valid existing rights, etc.) will be permitted by the BLM within GRSG PHMA in any given population area (BSU) or the proposed project analysis area until the disturbance has been reduced to less than the cap. However, the 3 percent cap may be exceeded at either scale if a technical team determines that site-specific Greater Sage-Grouse habitat and population information, combined with project design elements indicates the project will improve the condition of Greater Sage-Grouse habitat within the proposed project analysis area or within	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Law of 1872 [as amended], valid existing rights, etc.). Within designated utility corridors, the 3 percent disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that a net conservation gain to the species will be achieved. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location. An area with disturbance is not excluded from the 3 percent until it has been restored to provide GRSG habitat. The objective of successful restoration is to provide for the needs of GRSG, as evidenced by one of the following: • Vegetative cover is consistent with the GRSG habitat objectives and the ecological site description (Objective SSS-3), or • Monitoring indicates the area is regularly used by GRSG to sustain one or more seasonal habitat requirements (nesting, brood-rearing, winter). Final restoration success and approval for abandonment for disturbances will be subject to an interdisciplinary review of available monitoring data and final monitoring reports.	the PHMA in the population area where the project is located. Factors considered by the team will include Greater Sage-Grouse abundance and trends, movement patterns, habitat amount and quality, extent and alignment of project disturbance, location and density of existing disturbance, project design options and other biological factors. Such exceptions to the 3 percent disturbance cap may only be approved by the BLM Authorized Officer with the concurrence of the State Director. The finding and recommendation shall be made by the technical team, which should consist of, at least, a BLM field biologist, other local Greater Sage-Grouse experts, and biologists and other representatives from the appropriate State of Utah agency. Within designated utility corridors, the 3 percent disturbance cap may be exceeded at the project scale if the site specific NEPA analysis indicates that doing so will improve the condition of Greater Sage-Grouse habitat in comparison to siting a project outside the designated corridor. This exception is limited to projects which fulfill the use for which the corridors were designated (ex., transmission lines, pipelines) and the designated width of a corridor will not be exceeded as a result of any project co-location. An area with disturbance within GRSG habitat is not excluded from the 3 percent cap until it provides GRSG habitat. The objective of successful restoration of disturbed GRSG seasonal habitats is to provide for the needs of GRSG, which could be evidenced by one of the following:	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	• Vegetative cover is consistent with the GRSG habitat objectives and the ecological site description (Objective SSS-3), or • Monitoring indicates the area is regularly used by GRSG to sustain one or more seasonal habitat requirements (nesting, brood-rearing, winter). Include a schedule in project authorizations for monitoring the status of restoration efforts (e.g., areas of disturbance that meet the restoration criteria). Areas where disturbance would exceed 3 percent after project construction should include annual assessments to prioritize restoration efforts and determine what areas have been restored. Areas of PHMA that were not Greater Sage-Grouse habitat at project initiation would be excluded from the 3 percent cap calculation upon project completion and reclamation, as outlined in the applicable lease or permit. Final restoration success and approval for abandonment for disturbances will be subject to an interdisciplinary review of available monitoring data and final monitoring reports. Consider the likelihood of development of not-yet-constructed surface-disturbing activities—as defined in Table D.2 of the Monitoring Framework (Appendix D of the 2015 ROD/ Approved RMPA)—under valid existing rights prior to authorizing new projects in PHMA.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-3: C- Density of Energy/Mining Facilities Subject to applicable laws and regulations and valid existing rights, if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is collocated into an existing disturbed area (subject to applicable laws and regulations, such as the Mining Law of 1872 [as amended], valid existing rights, etc.). Energy and mining facilities to which this action applies are: • Oil and gas wells and development facilities, • Coal mines, • Wind towers, • Solar fields, • Geothermal wells/developments, and • Active locatable, leasable, and saleable developments.	**MA-SSS-3:** C- Density of Energy/Mining Facilities Subject to applicable laws, including the Mining Law of 1872, and applicable regulations, and valid existing rights , if the average density of one energy and mining facility per 640 acres (the density cap) is exceeded on all lands (regardless of land ownership) in PHMA within a proposed project analysis area, then no further disturbance from energy or mining facilities will be permitted by BLM: (1) until disturbance in the proposed project analysis area has been reduced to maintain the limit under the cap; or (2) unless the energy or mining facility is collocated into an existing disturbed area (subject to applicable laws and regulations, such as the Mining Law of 1872 [as amended], valid existing rights, etc.); however, the density cap may be exceeded if a project is on non-habitat (see MA-SSS-1 language related to placement of development in non-habitat portions of PHMA), or if the process identified in MA-SSS-3B determines the project will improve the condition of GRSG habitat at the proposed project analysis area or within the PHMA where the project is located through analysis of site-specific GRSG habitat and population information and project design elements. Energy and mining facilities to which this action applies are: • Oil and gas wells and development facilities, • Coal mines, • Wind towers, • Solar fields, • Geothermal wells/developments, and • Active locatable, leasable, and saleable developments.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-3: D- Predation In PHMA, eliminate or minimize external food sources for corvids, particularly dumps, or waste transfer facilities. Apply best management practices (BMP) to development activities to reduce opportunities for GRSG predators (e.g., limiting food sources, nest/perches deterrents, and road kill). Apply habitat management practices (e.g. grazing management and vegetation treatments) that decrease the effectiveness of predators. Collaborate with applicable government entities to implement programs to control predator populations of GRSG (e.g., ravens, red fox, badgers, and raccoons).	**MA-SSS-3:** D- Predation In PHMA, eliminate or minimize external food sources for corvids, particularly dumps, or waste transfer facilities. Apply best management practices (BMP) to development activities to reduce opportunities for GRSG predators (e.g., limiting food sources, nest/perches deterrents, and road kill). Apply habitat management practices (e.g. grazing management and vegetation treatments) that decrease the effectiveness of predators. When conducting habitat treatments, remove trees that have corvid nests that could impact PHMA nesting and brood-rearing habitat when in compliance with the Migratory Bird Treaty Act (e.g., when the nest is unoccupied and outside of migratory bird nesting season). Efforts by other agencies to minimize impacts from predators on the GRSG should be supported and encouraged where needs have been documented. Collaborate with applicable government entities to implement programs to control predator populations of GRSG (e.g., ravens, red fox, badgers, and raccoons).	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-3: E- Noise Restrictions: In PHMA, limit noise from discrete anthropogenic disturbances, whether during construction, operation, or maintenance, to not exceed 10 decibels above ambient sound levels (as available at the signing of the GRSG RMPA ROD or as first measured thereafter) at occupied leks from 2 hours before to 2 hours after official sunrise and sunset during breeding season (e.g., while males are strutting). Support the establishment of ambient baseline noise levels for PHMA habitat area leks. Limit project related noise in other PHMA habitats and seasons where it will be expected to reduce functionality of habitats that support associated GRSG populations. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered will be evaluated and appropriate measures will be implemented where necessary to minimize potential for noise impacts on PHMA GRSG population behavioral cycles.	**MA-SSS-3:** E- Noise Restrictions: No changes made.	No change (same as 2015).
MA-SSS-3: F- Tall Structure Restrictions: In PHMA, limit the placement of permanent tall structures within GRSG breeding and nesting habitats. For the purposes of this restriction, a tall structure is any man-made structure that provides for perching/nesting opportunities for predators (e.g., raptors and ravens) that are naturally absent, or that decreases the use of an area by GRSG. A determination as to whether something is considered a tall structure will be made based on local conditions such as existing vegetation or topography.	**MA-SSS-3:** F- Tall Structure Restrictions: No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-3: G- Seasonal Restrictions: In PHMA, in coordination with the appropriate State of Utah agency, apply seasonal restrictions during the period specified below to manage discretionary discrete anthropogenic disturbances and uses on public lands to prevent disturbance to GRSG populations and habitat during seasonal life cycle periods as follows: • In breeding (leks), nesting and early brood-rearing habitat from Feb 15 – Jun 15 • In brood rearing habitat from Apr 15 – Aug 15 • In winter habitat from Nov 15 – Mar 15 Specific time and distance determinations will be based on site-specific conditions and may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring and long and/or heavy winter) in order to better protect GRSG, in coordination with the appropriate State of Utah agency.	**MA-SSS-3:** G- Seasonal Restrictions: No changes made.	No change (same as 2015).
MA-SSS-3: H- Buffers: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239; Manier et al. 2014) in accordance with Appendix B, Applying Lek-Buffer Distances.	**MA-SSS-3:** H- Buffers: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will assess and address impacts within the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239; Manier et al. 2014) in accordance with Appendix B, Applying Lek-Buffer Distances.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-3: I- Required Design Features/Best Management Practices: In PHMA, apply the RDFs from the applicable sections identified in Appendix C, Required Design Features, when authorizing/permitting site-specific activities/projects for wildland fire management actions, travel and transportation, lands and realty, fluid minerals, nonenergy leasable minerals, coal, mineral materials, and locatable minerals (consistent with applicable law). The applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects and/or may require slight variations. All variations in RDFs will require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g. due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable; An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat.	**MA-SSS-3:** I- Required Design Features/Best Management Practices: No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-4: In PHMA and in adjacent opportunity areas, maintain, improve and restore GRSG habitat to support GRSG populations and to maintain or enhance connectivity. Vegetation treatments will be applied to meet GRSG habitat objectives and provide additional GRSG habitat, unless there is a conflict with Utah prairie dog, where the landscape will be managed for both species. • PHMA boundaries may be adjusted to include additional restored GRSG habitat and habitat identified during survey or inventory work. Changes to maps and associated management will occur through the appropriate BLM planning processes (e.g., plan maintenance or plan amendment), as described in Appendix K.	No changes made.	No change (same as 2015).
MA-SSS-5: In GHMA, apply the following management to meet the objective of a net conservation gain for discretionary actions that can result in habitat loss and degradation:	No similar action.	Completely revised –See rows below.
MA-SSS-5: <u>A- Existing Management</u>: Implement GRSG management actions included in the existing RMPs and project-specific mitigation measures associated with existing decisions.	No similar action.	Completely revised – revised by statewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-SSS-5: B- Net Conservation Gain: In all GRSG habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species, including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Exceptions to net conservation gain for GRSG may be made for vegetation treatments to benefit Utah prairie dog. Mitigation will be conducted according to the mitigation framework contained in Appendix F.	No similar action.	Completely revised – revised by rangewide and statewide.
MA-SSS-5: C- Buffers: In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the US Geological Survey Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review (Open File Report 2014-1239; Manier et al. 2014) in accordance with Appendix B.	No similar action.	Completely revised – revised by statewide (update to 2019 buffer appendix).
D- Required Design Features/Best Management In GHMA, apply the fluid mineral RDFs that are associated with GHMA identified in Appendix C when authorizing/permitting site-specific fluid mineral development activities/projects. The applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances,	No similar action.	Completely revised – revised by statewide (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
some RDFs may not apply to some projects and/or may require slight variations. All variations in RDFs will require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g. due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat.		
MA-SSS-6 <u>Sage-Grouse Management Outside PHMA/GHMA</u> Proposed projects within State of Utah Sage-Grouse Management Areas (SGMA) and USFWS priority areas for conservation (PAC), as well as adjacent to PHMA outside these areas, will consider impacts on GRSG and implement measures to mitigate impacts when preparing site-specific planning and environmental compliance documents. • Outside of PHMA, prior to site-specific authorizations, the BLM will evaluate habitat conditions and may require surveys to determine if the project area contains GRSG habitat (FLPMA, 43 United States Code (USC) 1701 Sec. 201 (a); BLM Manual 6840.04 D3; BLM-M-6840.04 E2).	**MA-SSS-6** <u>Sage-Grouse Management Outside PHMA</u> Outside PHMA, implement Greater Sage-Grouse management actions included in the RMPs and project-specific mitigation measures associated with decisions that pre-dated the 2015 amendments. Proposed projects within State of Utah Sage-Grouse Management Areas (SGMA) and USFWS priority areas for conservation (PAC), as well as adjacent to PHMA outside these areas, will consider impacts on GRSG and may implement measures to mitigate impacts on GRSG populations within adjacent PHMA when preparing site-specific planning and environmental compliance documents.	Partially revised – revised by state specific (See new actions in state specific tables – GHMA in UT).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Surveys will be required prior to authorizing discrete anthropogenic disturbances within 4 miles of an occupied lek that is located in PHMA, but only in existing sagebrush. If an area is determined to be GRSG habitat (e.g., nesting, brood-rearing, winter, transition), mitigation will be considered as part of the project level NEPA analysis and will be attached as conditions of approval to new discretionary actions, if deemed necessary to protect the habitat (BLM Manual 6840.04 D 5). Measures that may be considered include those identified in Appendix C. Outside of PHMA, but within SGMAs and PACs, avoid removal of sagebrush and minimize development that creates a physical barrier to GRSG movement; these areas may be used by GRSG to connect to other populations or seasonal habitat areas. Exceptions shall be made for vegetation treatments to benefit Utah prairie dog, where the landscape will be managed for both species. Outside of PHMA, but within SGMAs and PACs, consider noise and permanent structure stipulations around leks. Outside PHMA, portions of State of Utah opportunity areas (see Final EIS Map 2.4) within 4 miles of a lek that is located in PHMA will be managed with the following allocations: • Fluid minerals will be open for leasing with CSU stipulations (noise and tall structures). • Lands ROWs, permits, and leases will be avoided, applying avoidance criteria for noise and tall structures. Do not site wind energy development in	Outside of PHMA, but within SGMAs and PACs, avoid removal of sagebrush and minimize development that creates a physical barrier to GRSG movement; these areas may be used by GRSG to connect to other populations or seasonal habitat areas. Exceptions shall be made for vegetation treatments to benefit Utah prairie dog, where the landscape will be managed for both species. Outside of PHMA, but within SGMAs and PACs, consider noise and permanent structure stipulations around leks. Outside PHMA, after analyzing the impacts using the buffer distances identified in Appendix B from a lek that is located in PHMA, portions of State of Utah opportunity areas will be managed with the following allocations: • Fluid minerals will be open for leasing with CSU stipulations (noise and tall structures). • Lands ROWs, permits, and leases will be avoided, applying avoidance criteria for noise and tall structures. Avoid siting wind energy development in opportunity areas within the buffer distances identified in Appendix B from occupied GRSG leks that are in PHMA, if the lek buffer analysis as identified in Appendix B shows that siting wind energy development in opportunities areas will impact lek persistence within PHMA. Outside of PHMA, avoid and minimize effects from discrete anthropogenic disturbances in areas that have been treated with the intent of improving or creating new GRSG habitat. Evaluate conditions in the treated area to determine if it is providing	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
opportunity areas within 5 miles from occupied GRSG leks that are in PHMA. Outside of PHMA, avoid and minimize effects from discrete anthropogenic disturbances in areas that have been treated with the intent of improving or creating new GRSG habitat. Evaluate conditions in the treated area to determine if it is providing habitat for GRSG and if additional measures are necessary to protect the habitat.	habitat for GRSG and if additional measures are necessary to protect the habitat. Outside of PHMA, provide that acres of GRSG seasonal habitat (based on best available maps, then confirmed to be regularly used by Greater Sage-Grouse to sustain one or more seasonal habitat requirements through coordination with the appropriate State of Utah agency and through on-the-ground information) that is lost to habitat degradation actions (Appendix C, Table C.2 of the 2015 ROD/Approved RMPA) are replaced by creating/improving Greater Sage-Grouse habitat within PHMA.	
MA-SSS-7 Adaptive Management This plan establishes soft and hard triggers for both GRSG populations and habitat. The specific triggers and additional detail on the management responses are identified in Appendix I, Adaptive Management. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter. If monitoring indicates the soft-trigger is met, the BLM will determine if there is a specific cause or causes that are contributing to the decline. If it is determined that the decline is related to a natural population variation, no specific management actions will be required. However, if BLM management actions are determined to cause or contribute to the decline, the BLM manager will apply measures within their implementation-level discretion to mitigate the decline of populations and/or habitats to the area where the trigger has been met. These measures will apply more conservative or restrictive implementation conservation conditions, terms, or	**MA-SSS-7** Adaptive Management This plan establishes soft and hard triggers for both GRSG populations and habitat. The specific triggers and additional detail on the management responses are identified in Appendix I, Adaptive Management. The hard and soft trigger data will be analyzed annually. If monitoring indicates the soft-trigger is met, the BLM will review available and pertinent data, in coordination with GRSG biologists from multiple agencies including the appropriate State of Utah agency, USFS, USFWS, and/or NRCS, to determine the causal factor(s) for the declines within 6 months of identifying that a trigger has been met. If it is determined that the decline is related to a natural population variation, no specific management actions will be required; however, if BLM management actions are determined to cause or contribute to the decline, the BLM will work with the appropriate State of Utah agency and public land users to identify and apply management to slow down or stop the population decline. Such measures would be applied by the BLM manager within their implementation-	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
decisions within the agencies' discretion to mitigate the decline of populations and/or habitats. If monitoring indicates the hard trigger is met, a set of specific management actions from the BLM Proposed Plan will immediately be replaced with or adjusted by different management actions in the area where the trigger has been met. Table I.1 of Appendix I identifies the management actions from the BLM Proposed Plan, and the corresponding new management actions that will be immediately implemented to the specific area in the event a hard trigger is met. In addition to these specific changes, the BLM will review available and pertinent data for the area, in coordination GRSG biologists from multiple agencies including the appropriate State of Utah agency, USFWS, and NRCS, to determine the causal factor(s) and implement a corrective strategy. The final strategy associated with a hard trigger being met will be the changes identified in Table I.1 of Appendix I, and may also include the need to further amend or revise the RMP to address the situation and modify management accordingly, for the area where the trigger was met.	level discretion to mitigate the decline of populations and/or habitats to the area where the trigger has been met. These measures will apply more conservative or restrictive implementation conservation conditions, terms, or decisions within the agencies' discretion to mitigate the decline of populations and/or habitats. Such measures could also include other management actions which may require the need to amend the RMP to address the situation and modify management. If monitoring indicates the hard trigger is met, the BLM will review available and pertinent data, in coordination with GRSG biologists from multiple agencies including the appropriate State of Utah agency, USFS, USFWS, and/or NRCS, to determine the causal factor(s) for the declines. The BLM and the team will also identify measures needed to address the causal factor(s) and develop a corrective strategy for the area where the trigger has been met. The corrective strategy would include the applicable changes identified in Table I.1 of Appendix I that address the causal factor, and could also include other management actions, which may be require the need to amend the RMP to address the situation and modify management. If determining the causal factor and development of the corrective strategy is not completed within 6 months of documenting that the trigger has been met, all the plan level responses identified in Table I.1 will be applied until the causal factor analysis is complete. Upon completion of the causal factor analysis any responses that do not address the causal factor(s) would be removed. In developing a corrective strategy, managers may select changes in management that are identified in Table I.1, Specific Management Responses that have already been analyzed for implementation. This table also	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	identifies which decision from the BLM RMPA would be changed. The management identified in the corrective strategy would be implemented until ten-year population trends reflect natural fluctuations anticipated for the area. The BLM would determine the area reflects natural fluctuations in coordination with GRSG biologists from multiple agencies including Forest Service, UDWR, USFWS, and/or NRCS. Upon determination, the management would revert to the RMPA. If all the leks in an area that has met a hard trigger are not active for ten years, becoming unoccupied by definition, the PHMA designation and all its associated management would be removed since there is no longer a GRSG population for which management should be prioritized. For any area that has met a soft or hard trigger, the BLM, the appropriate State of Utah agency, and other members of the technical team will annually review monitoring data regarding population and habitat trends to verify that management actions implemented to mitigate declines are being successful. If monitoring indicates continued declines, the causal factor analysis will be reviewed, updated if needed, and applicable additional management would be identified and implemented.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
VEGETATION (VEG)	***VEGETATION (VEG)***	—
Objectives:	**Objectives:**	—
Objective VEG-1: In SFA and PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions; exceptions to this objective shall be made where GRSG habitat and Utah prairie dog occur on the same landscape, which will be managed for both species. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	**Objective VEG-1:** In PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions; exceptions to this objective shall be made where GRSG habitat and Utah prairie dog occur on the same landscape, which will be managed for both species. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No change (same as 2019).
Management Actions (MA):	**Management Actions (MA):**	—
MA-VEG-1: In PHMA, where necessary to meet GRSG habitat objectives, treat areas to maintain and expand healthy GRSG habitat (e.g., conifer encroachment areas and annual grasslands). In PHMA, prioritize implementation of restoration/treatment projects based on environmental variables that improve chances for project success in areas most likely to benefit GRSG (e.g., proximity to existing GRSG populations, ecological site potential, and resistance and resilience), documented in Appendix H, Fire and Invasives Assessment Tool. In PHMA, prioritize restoration in seasonal habitats that are identified as the limiting factor for GRSG distribution and/or abundance. Apply seasonal restrictions to avoid treating areas during seasons of use, as needed, when implementing vegetation treatments (see MA-SSS-3G).	**MA-VEG-1**: In PHMA, where necessary to meet GRSG habitat objectives, treat areas to maintain and expand healthy GRSG habitat (e.g., conifer encroachment areas and invasive annual grasslands). In PHMA, prioritize implementation of restoration/treatment projects based on environmental variables that improve chances for project success in areas most likely to benefit GRSG (e.g., proximity to existing GRSG populations, ecological site potential, and resistance and resilience), documented in Appendix H, Fire and Invasives Assessment Tool. In PHMA, prioritize restoration in seasonal habitats that are identified as the limiting factor for GRSG distribution and/or abundance. Apply seasonal restrictions to avoid treating areas during seasons of use, as needed, when implementing vegetation treatments (see MA-SSS-3G).	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
In PHMA, avoid sagebrush reduction treatments within GRSG nesting and winter habitat unless the project plan and associated NEPA document demonstrate a biological need for the treatment to maintain or improve habitat for the GRSG population, or unless the treatment is for Utah prairie dog recovery where the needs of both species will be addressed on the landscape. Coordinate with the appropriate State of Utah agency and the USFWS prior to conducting sagebrush treatment projects within nesting and winter habitat. Use collaborative planning efforts to develop and implement habitat restoration projects. Expertise and ideas from entities such as local landowners, local GRSG working groups, and other federal, state, county, and private organizations shall be solicited and considered in development of restoration projects. In PHMA, implement project design features that will contribute to the most favorable conditions for success when planning and implementing restoration/vegetation treatment projects. Examples include, but are not limited to the following: • Review of available plant species and their adaptation to the site when developing seed mixes. • The need to reduce non-native annual grass densities and competition through herbicide, targeted grazing, tillage, etc. • Assessment of on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider the use of passive restoration techniques.	In PHMA, avoid sagebrush reduction treatments within GRSG nesting and winter habitat unless the project plan and associated NEPA document demonstrate a biological need for the treatment to maintain or improve habitat for the GRSG population, or unless the treatment is for Utah prairie dog recovery where the needs of both species will be addressed on the landscape. Coordinate with the appropriate State of Utah agency and the USFWS prior to conducting sagebrush treatment projects within nesting and winter habitat. Use collaborative planning efforts to develop and implement habitat restoration projects. Examples include, but are not limited to the following: • Review of available plant species and their adaptation to the site when developing seed mixes. • The need to reduce non-native annual grass densities and competition through herbicide, targeted grazing, tillage, etc. • Assessment of on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider the use of passive restoration techniques.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Use of site preparation techniques that retain existing desirable vegetation. • Use of "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources. • The need for post-treatment control of non-native annual grass and other invasive species. Upon completion of vegetation treatments, monitor and manage the project area to ensure long-term success, including persistence of seeded species and/or other treatment components, such as implementing maintenance treatments.	• Use of site preparation techniques that retain existing desirable vegetation. • Use of "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources. • The need for post-treatment control of non-native annual grass and other invasive species. Upon completion of vegetation treatments, monitor and manage the project area to ensure long-term success, including persistence of seeded species and/or other treatment components, such as implementing maintenance treatments.	
MA-VEG-2: Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. When conducting conifer treatments: • Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase I or phase II. • Treat areas in late Phase II or Phase III condition to create movement corridors, connect habitats, or to break up continuous, hazardous fuels and reduce the potential for catastrophic fire. • Prioritize methods to reduce conifer canopy cover to those that maintain the understory vegetation as the preferred treatment methods (e.g., mechanical, lop and scatter). • Require that vegetation treatments conducted within 0.6 miles of a lek include an objective of reducing conifer, where technically feasible, to less than 5 percent canopy cover, with preference for complete removal.	**MA-VEG-2:** Remove conifers encroaching into sagebrush habitats, in a manner that considers tribal cultural values. When conducting conifer treatments: • Prioritize treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase I or phase II. • Treat areas in late Phase II or Phase III condition to create movement corridors, connect habitats, or to break up continuous, hazardous fuels and reduce the potential for catastrophic fire. • Prioritize methods to reduce conifer canopy cover to those that maintain the understory vegetation as the preferred treatment methods (e.g., mechanical, lop and scatter). • When conducting habitat treatments, remove trees that have corvid nests that could impact PHMA nesting and brood-rearing habitat when in compliance with the Migratory Bird Treaty Act (e.g., when the nest is unoccupied and outside of	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Include stipulations to avoid removing old-growth pinyon/juniper stands (e.g., Tausch et al. 2009; Miller et al. 1999). Use of site-specific analysis and tools like the Vegetation Dynamics Development Tool and the fire and invasives assessment tool report (Chambers et al. 2014) will help refine the location for specific areas to be treated.	migratory bird nesting season). • Require that vegetation treatments conducted within 0.6 miles of a lek include an objective of reducing conifer, where technically feasible, to less than 5 percent canopy cover, with preference for complete removal. • Include stipulations to avoid removing old-growth pinyon/juniper stands (e.g., Tausch et al. 2009; Miller et al. 1999). Use of site-specific analysis and tools like the Vegetation Dynamics Development Tool and the fire and invasives assessment tool report (Chambers et al. 2014) will help refine the location for specific areas to be treated.	
MA-VEG-3: In PHMA manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase amount of edge and cover within that edge.	**MA-VEG-3:** In PHMA manage riparian areas for proper functioning condition. In PHMA manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. Also conserve or enhance these wet meadow complexes to maintain or increase amount of edge and cover within that edge.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-VEG-4: In PHMA, include GRSG habitat objectives in restoration/treatment projects. Include short-term and long-term habitat conditions in treatment objectives, including specific objectives for the establishment of sagebrush cover and height, as well as cover and heights for understory perennial grasses and forbs necessary for GRSG seasonal habitats (see Objective SSS-3). Make meeting the GRSG objectives for the restoration/treatment project one of the primary priorities for the project and subsequent land uses, recognizing that managing for other special status species may result in treatment objectives that may not meet GRSG seasonal habitat objectives (e.g., winter habitat cover requirements versus creation of Utah prairie dog habitat). Where GRSG habitat overlaps with that of federally listed threatened or endangered species (e.g., Utah prairie dogs), coordinate with species-specific experts to develop conservation and recovery objectives and allow habitat treatments that will benefit both species.	No changes made.	No change (same as 2015).
MA-VEG-5: In PHMA, prioritize the use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Where probability of success or adapted seed availability is low, desirable non-native seeds may be used as long as they support GRSG habitat objectives. Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, should be the principle objective for rehabilitation efforts.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-VEG-6: In PHMA, design post restoration management to ensure long term persistence. This could include changes in livestock grazing management, wild horse and burro management and travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits GRSG, as well as monitoring and maintaining the treated area.	No changes made.	No change (same as 2015).
MA-VEG-7: In PHMA, limit commercial seed or live plant collection to levels that ensure long-term maintenance of the GRSG habitat objectives. Locations, species allowed for collection, and limits on the amounts to be collected will be developed on a case-by-case basis following environmental review of annual site-specific conditions. Commercial collection during sensitive seasonal periods (see MA-SSS-3G) will include mitigation, developed to reflect the site-specific conditions on the ground, that could include, but is not necessarily limited to, restrictions on the timing and method of collection activities, limiting the number of individuals collecting, providing portions of collected seeds for use in local restoration projects, etc.	No changes made.	No change (same as 2015).
MA-VEG-8: In PHMA, allow for seed collection and use in restoration/reclamation activities. Prioritize use of seed from areas as close as possible to where the seed will be used to capture local adaptations.	No changes made.	No change (same as 2015).
MA-VEG-9: In PHMA, diversify the perennial grass and forb components through additional seeding in areas where historical seedings (e.g., crested wheatgrass) have been recolonized by sagebrush.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-VEG-10: Follow the applicable and technically feasible RDFs in Appendix C for vegetation projects/activities (fuels management) at the site-level unless at least one of the following can be demonstrated in the NEPA analyses associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat.	• No changes made.	No change (same as 2015).
MA-VEG-11: In PHMA, design post Emergency Stabilization and Rehabilitation/Burn Area Emergency Rehabilitation management to ensure long term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse and burro, and travel management, etc., to achieve and maintain the desired condition of Emergency Stabilization and Rehabilitation projects to benefit GRSG (Eiswerth and Shonkwiler 2006). Monitor and control invasive vegetation post-wildfire for at least 3 years.	No changes made.	No change (same as 2015).
<u>Integrated Invasive Species Management</u> **MA-VEG-12**: In PHMA, integrated Vegetation Management will be used to control, suppress, and eradicate noxious and invasive species per BLM Handbook H-1740-2.	No changes made.	No change (same as 2015).
MA-VEG-13: In PHMA, treatments of Mormon cricket outbreaks will be collaborated with partners at the federal, state, and local levels to maintain and enhance GRSG habitats.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-VEG-14: Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No changes made.	No change (same as 2015).
FIRE AND FUELS MANAGEMENT (FIRE)	***FIRE AND FUELS MANAGEMENT (FIRE)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-FIRE-1: In collaboration with the USFWS and relevant state agencies, complete and maintain GRSG Landscape Wildland Fire and Invasive Species Habitat Assessments to prioritize at risk habitats, and identify fuels management, preparedness, suppression and restoration priorities necessary to maintain sagebrush habitat to support interconnecting GRSG populations. These assessments and subsequent assessment updates will also be a collaborative effort to take into account other GRSG priorities identified in this plan. Appendix H describes a minimal framework example and suggested approach for this assessment. Implementation actions will be tiered to the local GRSG Landscape Wildland Fire and Invasive Species Assessment, using best available science related to the conservation of GRSG. In collaboration with USFWS and relevant state agencies, BLM planning units will identify annual treatment needs for wildfire and invasive species management as identified in local unit level Landscape Wildfire and Invasive Species Assessments. Annual treatment needs will be coordinated across state/regional scales and across jurisdictional boundaries for long-term conservation of GRSG. Annually complete a review of landscape assessment implementation efforts with appropriate USFWS and state agency personnel.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Fuels Management **MA-FIRE-2**: Follow the applicable and technically feasible RDFs in Appendix C for fuels management at the site-level unless at least one of the following can be demonstrated in the NEPA analyses associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat.	No changes made.	No change (same as 2015).
MA-FIRE-3: In PHMA, fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, or protect GRSG habitat. • In collaboration with USFWS and relevant state agencies, BLM planning units with large blocks of GRSG habitat will develop, using the assessment process described in Appendix H, a fuels management strategy which considers an up-to-date fuels profile, land use plan direction, current and potential habitat fragmentation, sagebrush and GRSG ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity, where appropriate. When developing this strategy, planning units will consider the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation	**MA-FIRE-3:** In PHMA, fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, or protect GRSG habitat. • In collaboration with USFWS and relevant state agencies, BLM planning units with large blocks of GRSG habitat will develop, using the assessment process described in Appendix H, a fuels management strategy which considers an up-to-date fuels profile, land use plan direction, current and potential habitat fragmentation, sagebrush and GRSG ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity, where appropriate. When developing this strategy, planning units will consider the risk of increased habitat fragmentation from a proposed action versus the risk of large scale	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
posed by wildfires if the action is not taken. • Use green strips and/or fuel breaks to protect GRSG habitat from fire events. • When possible, locate fuel breaks along existing roads, ROWs, and other suitable topographic or natural features (e.g., areas devoid of vegetation, rock outcrops). • Avoid constructing fuel breaks through large areas of intact GRSG habitat, unless the associated NEPA document demonstrates a biological need for the fuel break to maintain or protect habitat for the GRSG population. Coordinate with the appropriate State of Utah agency and the USFWS prior to constructing fuel breaks within nesting and winter habitat. • Using an interdisciplinary approach, a full range of fuel reduction techniques will be available. Fuel reduction techniques such as conifer reduction, grazing, prescribed fire, chemical, biological, and mechanical treatments may be acceptable, given site-specific variables. • Remove encroaching conifer stands as a fuels management tool, where environmental review documents it protects or improves GRSG habitat. • Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success for native seed availability is low, desirable non-native seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native	fragmentation posed by wildfires if the action is not taken. • Use green strips and/or fuel breaks to protect GRSG habitat from fire events. • When possible, locate fuel breaks along existing roads, ROWs, and other suitable topographic or natural features (e.g., areas devoid of vegetation, rock outcrops). • Avoid constructing fuel breaks through large areas of intact GRSG habitat, unless the associated NEPA document demonstrates a biological need for the fuel break to maintain or protect habitat for the GRSG population. Coordinate with the appropriate State of Utah agency and the USFWS prior to constructing fuel breaks within nesting and winter habitat. • Using an interdisciplinary approach, a full range of fuel reduction techniques will be available. Fuel reduction techniques such as conifer reduction, targeted livestock grazing, prescribed fire, chemical, biological, and mechanical treatments may be acceptable, given site-specific variables. • Remove encroaching conifer stands as a fuels management tool, where environmental review documents it protects or improves GRSG habitat. • Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success for native seed availability is low, desirable non-native seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
and desirable non-native species, as appropriate, to provide for fire breaks. • Upon project completion, monitor and manage fuels projects to ensure long-term success, including persistence of seeded species and/or other treatment components, such as implementing maintenance actions. Control invasive vegetation post-treatment. • Apply seasonal restrictions, as needed, for implementing fuels management treatments according to the type of seasonal habitats present (see MA-SSS-3G). In PHMA, avoid sagebrush reduction fuels treatments within GRSG nesting and winter habitat unless the project plan and associated NEPA document demonstrate a biological need for the treatment to maintain or improve habitat for the GRSG population, or unless the treatment is for Utah prairie dog recovery where the needs of both species will be addressed on the landscape. Treatments in winter habitat should be designed to maintain sagebrush, especially tall sagebrush (sagebrush capable of standing above heavier than normal snowfall), which will be available to GRSG above snow during a severe winter, considering the needs of Utah prairie dog recovery. Prior to conducting fuels treatments in winter habitat, coordinate with the appropriate State of Utah agency and the USFWS to design the treatment to strategically reduce wildfire risk around or in the winter habitat.	When reseeding, use fire resistant native and desirable non-native species, as appropriate, to provide for fire breaks. • Upon project completion, monitor and manage fuels projects to ensure long-term success, including persistence of seeded species and/or other treatment components, such as implementing maintenance actions. Control invasive vegetation post-treatment. • Apply seasonal restrictions, as needed, for implementing fuels management treatments according to the type of seasonal habitats present (see MA-SSS-3G). In PHMA, avoid sagebrush reduction fuels treatments within GRSG nesting and winter habitat unless the project plan and associated NEPA document demonstrate a biological need for the treatment to maintain or improve habitat for the GRSG population, or unless the treatment is for Utah prairie dog recovery where the needs of both species will be addressed on the landscape. Treatments in winter habitat should be designed to maintain sagebrush, especially tall sagebrush (sagebrush capable of standing above heavier than normal snowfall), which will be available to GRSG above snow during a severe winter, considering the needs of Utah prairie dog recovery. Prior to conducting fuels treatments in winter habitat, coordinate with the appropriate State of Utah agency and the USFWS to design the treatment to strategically reduce wildfire risk around or in the winter habitat.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-FIRE-4: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how GRSG goals and objectives will be met by its use; • how the COT Report objectives will be addressed and met; • a risk assessment to address how potential threats to GRSG habitat will be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire may be used to meet specific fuels objectives that will protect GRSG habitat in PHMA (e.g., creation of fuel breaks that will disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities), as well as managing the landscape for GRSG in concert with Utah prairie dog. Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-FIRE-5: In PHMA, during fuels management project design, consider the use of targeted livestock grazing to strategically reduce fine fuels and, if used, implement grazing management that will accomplish this objective. If implementing targeted grazing, implement measures to minimize impacts on native perennial grasses.	No similar action.	No change (same as 2015).
Pre-Suppression **MA-FIRE-6**: Follow the applicable and technically feasible RDFs in Appendix C for fire and fuels management at the site-level unless at least one of the following can be demonstrated in the NEPA analyses associated with the project/activity: • A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; • A specific RDF will provide no additional protection to GRSG or its habitat. Implement a coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions and predicted weather patterns) for GRSG habitat. Develop wildfire prevention plans that explain the resource value of GRSG habitat and include fire prevention messages and actions to reduce human-caused ignitions.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Suppression **MA-FIRE-7:** Follow the applicable and technically feasible RDFs in Appendix C for fire and fuels management at the site-level unless at least one of the following can be demonstrated in the NEPA analyses associated with the project/activity: • A RDF is documented to not be applicable to the site-specific conditions of the project/activity; • An alternative RDF, state-implemented conservation measure, or plan-level protection is determined to provide equal or better protection for GRSG or its habitat; A specific RDF will provide no additional protection to GRSG or its habitat.	No changes made.	No change (same as 2015).
MA-FIRE-8: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. GRSG habitat in PHMA will be prioritized commensurate with property values and other critical habitat to be protected, with the goal to restore, enhance, and maintain areas suitable for GRSG across the range of GRSG habitat consistent with LUP direction. PHMA will be viewed as more valuable than GHMA when priorities are established. When suppression resources are widely available, maximum efforts will be placed on limiting fire growth in GHMA polygons as well. These priority areas will be further refined following completion of the GRSG Landscape Wildland Fire Invasive Species Habitat Assessments described in Appendix H.	**MA-FIRE-8**: The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. GRSG habitat in PHMA will be prioritized commensurate with property values and other critical habitat to be protected, with the goal to restore, enhance, and maintain areas suitable for GRSG across the range of GRSG habitat consistent with LUP direction. PHMA will be viewed as more valuable than non-PHMA when priorities are established. When suppression resources are widely available, maximum efforts will be placed on limiting fire growth outside and adjacent to PHMA polygons as well. These priority areas will be further refined following completion of the GRSG Landscape Wildland Fire Invasive Species Habitat	Partially revised – revised to state specific.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
In GHMA or areas where treatment/seeding has occurred to improve habitat, prioritize suppression where wildfires threaten adjacent PHMA.	Assessments described in Appendix H. Outside PHMA or areas where treatment/seeding has occurred to improve habitat, prioritize suppression where wildfires threaten adjacent PHMA.	
MA-FIRE-9: Within acceptable risk levels use a full range of fire management strategies and tactics, including the management of wildfires to achieve resource objectives, across the range of GRSG habitat consistent with LUP direction. In PHMA, burnout operations areas should be avoided by constructing direct fire lines, whenever safe and practical to do so.	No changes made.	No change (same as 2015).
LIVESTOCK GRAZING/RANGE MANAGEMENT (LG)	***LIVESTOCK GRAZING/RANGE MANAGEMENT (LG)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-LG-1: PHMA and GHMA will be available for livestock grazing (Figure 2-3, Livestock Grazing [Appendix A]). Active animal unit months (AUMs) for livestock grazing will be 329,521 on BLM lands. Make adjustments to permitted AUMs consistent with regulation and the remaining grazing direction. In addition, on an annual basis livestock numbers and the season of use can be adjusted within the terms and conditions of the permit. Make adjustments to permitted use and annual adjustments to levels of livestock use consistent with regulation and the direction identified below where livestock grazing is identified as a causal factor to not meeting standards or habitat objectives.	No similar action. [Meaning the presence of GRSG habitat management areas does not affect the determination of whether or not an area is available for livestock grazing or the active AUMs.]	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LG-2: The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in SFA first followed by PHMA outside SFA. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.	No similar action.	Completely revised – revised by rangewide.
MA-LG-3: In PHMA, consult, cooperate, and collaborate with other land owners and management agencies (e.g., private and SITLA) to develop plans which provide for landscape level approaches to habitat improvement. Manage unfenced private and SITLA lands within a grazing allotment that are under exchange of use agreements or percent public land use as a single unit that will have the same management as the public lands.	No similar action.	Completely revised – revised by rangewide.
MA-LG-4: Evaluate Utah's Rangeland Health Standards and process grazing permits. Focus monitoring and management activities on allotments found not to be achieving Utah's Rangeland Health Standards where livestock grazing is identified as a causal factor and that have the best opportunities for conserving, enhancing or restoring habitat for GRSG. • Use ecological site descriptions and/or other appropriate information to determine the desired plant community within proper functioning ecological processes for conducting land health assessments to evaluate the achievement or non-achievement of rangeland health standards.	No similar action.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LG-5: In PHMA and GHMA, conduct land health assessments that include indicators and measurements of structure, condition, composition, etc., of vegetation specific to achieving GRSG habitat objectives (Objective SSS-3), including within wetlands and riparian areas. Prioritize land health assessments in SFA, followed by PHMA outside of the SFA. Conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.	No similar action.	Completely revised – revised by rangewide.
MA-LG-6: In PHMA, when livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats); and • Grazing schedules (including rest or deferment). *Not in priority order The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFA and PHMA will include specific management thresholds based on **Table 2**, Land Health Standards (43 CFR, Part 4180.2), and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have	**MA-LG-6:** In PHMA, when an area is not meeting or making progress towards achievable habitat objectives and Land Health Standards, and the causal factor is livestock grazing (i.e., improper livestock grazing), implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in: • Season or timing of use; • Numbers of livestock; • Distribution of livestock use; • Duration and/or level of use; • Kind of livestock (e.g., cattle, sheep, horses, or goats); and • Grazing schedules (including rest or deferment). *Not in priority order When improper livestock grazing is the causal factor for not meeting or making progress towards achievable habitat objectives and Land Health Standards, the NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMA will analyze multiple potential modifications (e.g., alternatives from the list above) that address the reasons for not meeting,	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
already been subjected to NEPA analysis. Adjustments to meet seasonal GRSG habitat requirements could include those items identified in the list above.	allowing the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis. Adjustments to meet seasonal GRSG habitat requirements could include those items identified in the list above.	
MA-LG-7: In PHMA, during drought periods, prioritize evaluating effects of the drought relative to GRSG needs for food and cover. Initiate emergency management measures (e.g. delaying turnout, adjusting the amount and/or duration of livestock grazing, implement other terms of the permit) during times of drought to protect GRSG habitat, in accordance with Instruction Memorandum 2013-094 (Resource Management During Drought), or other agency policies. Implement post-drought management to allow for vegetation recovery that meets GRSG needs.	No similar action.	Completely revised – revised by rangewide.
MA-LG-8: In PHMA, manage riparian areas and wet meadows for proper functioning condition.	No similar action.	Completely revised – revised by rangewide.
MA-LG-9: In PHMA, assess livestock grazing in riparian and meadow complexes and ensure recovery or maintenance of appropriate vegetation and water quality. Where recovery or maintenance is not occurring and the causal factor is livestock grazing, reduce pressure on riparian or wet meadow vegetation used by GRSG in the summer by adjusting grazing management practices (e.g., use fencing/herding techniques, or changes in seasonal use or livestock distribution). Allotments within SFA, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	No similar action.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LG-10: In PHMA, limit authorization of new water developments to projects that have a neutral effect or are beneficial to GRSG habitat (such as by shifting livestock use away from critical areas). New developments that divert surface water must be designed to maintain riparian or wet meadow vegetation and hydrology to meet GRSG needs.	**MA-LG-10:** In PHMA, manage existing and new water developments to have a neutral or beneficial effect to GRSG habitat.	Completely revised – revised by rangewide.
MA-LG-11: In PHMA, evaluate existing water developments (springs, seeps, etc., and their associated pipelines) to determine if modifications are necessary to maintain or improve riparian areas and GRSG habitat. Make modifications where necessary, considering impacts on other water uses when such considerations are neutral or beneficial to GRSG.	No similar action.	Completely revised – revised by rangewide.
MA-LG-12: In PHMA, ensure that vegetation treatments conserve, enhance or restore GRSG habitat (this includes treatments that benefit livestock).	No similar action.	Completely revised – revised by rangewide.
MA-LG-13: In PHMA, evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses to determine if they should be restored to sagebrush or habitat of higher quality for GRSG. If existing seedings provide value in conserving or enhancing GRSG habitats, then no restoration will be necessary. Assess the compatibility of these seedings for GRSG habitat during the land health assessments.	No similar action.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LG-14: In PHMA, design new structural range improvements to have a neutral effect or conserve, enhance, or restore GRSG habitat through an improved grazing management system relative to GRSG objectives. Structural range improvements, in this context, include but are not limited to: cattle guards, fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments. Potential for invasive species establishment or increase following construction must be considered in the project planning process and monitored and treated post-construction.	No similar action.	Completely revised – revised by rangewide.
MA-LG-15: In PHMA, evaluate existing structural range improvements to make sure they have a neutral effect or conserve, enhance or restore GRSG habitat.	No similar action.	Completely revised – revised by rangewide.
MA-LG-16: To reduce outright GRSG strikes and mortality, remove, modify or mark fences in high risk areas (Stevens et al. 2012) based on proximity to lek (e.g., within 1.2 miles of a lek), lek size, and topography, or as latest science indicates. Prioritize actions in SFA first, then PHMA. Employ NRCS fence collision risk tool (NRCS/CEAP Conservation Insight Publication "Applying the Sage Grouse Fence Collision Risk Tool to Reduce Bird Strikes").	**MA-LG-16:** To reduce outright GRSG strikes and mortality, remove, modify or mark fences in high risk areas (Stevens et al. 2012) based on proximity to lek (e.g., within 1.2 miles of a lek), lek size, and topography, or as latest science indicates. Employ NRCS fence collision risk tool (NRCS/CEAP Conservation Insight Publication "Applying the Sage Grouse Fence Collision Risk Tool to Reduce Bird Strikes").	Completely revised – revised by rangewide.
MA-LG-17: In PHMA, monitor for and treat noxious weeds and treat invasive species where needed, associated with existing range improvements.	No similar action.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LG-18: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR, Part 4110.2-3.	No similar action.	Completely revised – revised by rangewide.
WILD HORSES AND BURROS (WHB)	***WILD HORSES AND BURROS (WHB)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-WHB-1: Manage HMAs in GRSG habitat within established appropriate management level ranges to achieve and maintain GRSG habitat objectives (Objective SSS-3).	No changes made.	Completely revised – revised by rangewide.
MA-WHB-2: Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are: 1. HMAs containing PHMA; 2. HMAs containing only GHMA; 3. HMAs containing sagebrush habitat outside of PHMA and GHMA mapped habitat; and HMAs without GRSG habitat.	**MA-WHB-2:** Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are: 1. HMAs containing PHMA; 2. HMAs containing sagebrush habitat outside of PHMA mapped habitat; and HMAs without GRSG habitat.	Partially revised – refer to state specific (WHB 2015 GHMA).
MA-WHB-3: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts.	No changes made.	Completely revised – revised by rangewide.
MA-WHB-4: In PHMA, assess and adjust appropriate management levels through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current appropriate management levels are not being exceeded.	No changes made.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-WHB-5: In PHMA, monitor the effects of WHB use in relation to GRSG seasonal habitat objectives on an annual basis to help determine future management actions.	No changes made.	No change (same as 2015).
MA-WHB-6: Develop or amend herd management plans to incorporate GRSG habitat objectives and management considerations for all HMAs within GRSG habitat, with an emphasis placed on PHMA.	No changes made.	No change (same as 2015).
MA-WHB-7: Consider removals or exclusion of wild horses/burros during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.	No changes made.	No change (same as 2015).
MA-WHB-8: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effect on GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.	No changes made.	No change (same as 2015).
MA-WHB-9: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the wild horse and burro program.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MINERALS RESOURCES (MR)	***MINERALS RESOURCES (MR)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-MR-1: Allow exploration for all minerals (e.g., geophysical, trenching, drilling, etc.) within mapped occupied GRSG habitat areas that are not closed to leasing, permitting, etc., to obtain exploratory information. In areas where leasing, permitting, etc. is still available, minerals exploration shall be subject to the pertinent management for discretionary activities in PHMA (MA-SSS-3) and GHMA (MA-SSS-5).	No changes made.	No change (same as 2015).
Fluid Minerals	***Fluid Minerals***	—
Objectives:	**Objectives:**	—
Objective MR-1: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of GRSG, priority will be given to development in non-habitat areas first and then in the least suitable habitat for GRSG. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 USC 226(p) and 43 CFR, Part 3162.3-1(h).	No similar objective.	Completely revised – revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Objective MR-2: Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, minimize, and compensate for adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an application for permit to drill for the lease to avoid, minimize, and compensate for impacts on GRSG or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such federal leases.	No changes made.	Completely revised – revised by rangewide.
Management Actions (MA):	**Management Actions (MA):**	—
MA-MR-2: Manage fluid mineral leasing in PHMA as follows (Figure 2-4, Fluid Minerals [Oil and Gas] [Appendix A]) (Appendix G, Stipulations Associated with Fluid Mineral Leasing): • open to leasing, subject to standard stipulations: 0 acres • open to leasing, subject to CSU and/or TL stipulations: 23,600 acres • open to leasing, subject to NSO stipulations: 3,229,600 acres closed to leasing: 111,900 acres	No changes made.	Partially revised -revised by editorial updates to acres.
Unleased Federal Fluid Mineral Estate	***Unleased Federal Fluid Mineral Estate***	—
MA-MR-3: <u>Unleased Areas within PHMA</u> PHMA will be designated as open to leasing fluid minerals, subject to NSO stipulations. In SFA, there will be no waivers, exceptions, or modifications. In the remainder of PHMA, no waivers or modifications to a fluid mineral lease NSO stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral	**MA-MR-3:** <u>Unleased Areas within PHMA</u> PHMA will be designated as open to leasing fluid minerals, subject to NSO stipulations. Within PHMA, the Authorized Officer may grant an exception to a fluid mineral lease NSO stipulation where the proposed action: • Occurs in non-habitat that does not provide important connectivity between	Completely revised -revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
lease no-surface-occupancy stipulation only where the proposed action: • Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or, • Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG. Exceptions based on conservation gain (ii) may only be considered in (a) PHMA of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid federal fluid mineral lease existing as of the date of this Approved RMPA. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception	habitat areas and the development would not cause indirect disturbance to or disruption of adjacent seasonal habitats that would impair their biological function of providing the life-history or behavioral needs of the Greater Sage-Grouse population due to project design (e.g., minimize sound, preclude tall structures, require perch deterrents), as demonstrated in the project's NEPA document; or • Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and development on the parcel in question would have less of an impact on Greater Sage-Grouse or its habitat than on the nearby parcel; this exception must also include measures sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action's impacts. The BLM Authorized Officer may grant a modification to a fluid mineral lease no surface occupancy stipulation only where an exception is granted, as described above, for the primary disturbance (e.g., well pad, compressor station). A modification to the no surface occupancy stipulation could be considered for the associated infrastructure related to the development that are not individually precluded by other Greater Sage-Grouse actions (e.g., roads, pipelines, power lines). While the no surface occupancy stipulation could be modified for this infrastructure, it must still comply with other Greater Sage-Grouse management contained in MA-SSS-3.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
will not be granted. Approved exceptions will be made publically available at least quarterly. In addition, any lease activities will apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, buffers, seasonal restrictions, and RDFs). Outside PHMA, portions of opportunity areas within 4 miles of a lek that is located in PHMA will be open for leasing with CSU stipulations (avoiding noise and tall structures that could affect adjacent GRSG use of PHMA).	The BLM Authorized Officer may grant a waiver to a fluid mineral lease no surface occupancy stipulation if, through the appropriate planning process (i.e., plan maintenance, amendment) the area is no longer within PHMA. Approved exceptions will be made publicly available at least quarterly. In addition, any lease activities will apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, seasonal restrictions, and RDFs), including if an exception to the NSO is granted. Outside PHMA, portions of opportunity areas within the buffer distances identified in Appendix B of a lek that is located in PHMA will be open for leasing with CSU stipulations (avoiding noise and tall structures that could affect adjacent GRSG use of PHMA).	
MA-MR-4: <u>Unleased Areas within GHMA</u> Manage fluid mineral leasing in GHMA as follows (Figure 2-4): • open to leasing, subject to standard stipulations: 238,700 acres • open to leasing, subject to CSU and/or TL stipulations: 294,200 acres • open to leasing, subject to NSO stipulations: 32,700 acres • closed to leasing: 28,400 acres • planning decision not mapped: 133,400 acres In GHMA, new development of fluid mineral leases could be considered if they apply the pertinent management for discretionary activities in GHMA identified in MA-SSS-5.	No similar action.	Partially revised - Revised by updating acres, adding new rangewide WEMs to existing GHMA allocations.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Leased Federal Fluid Mineral Estate	***Leased Federal Fluid Mineral Estate***	—
MA-MR-5: Apply the following conservation measures through implementation decisions (e.g., approval of an application for permit to drill, geothermal drilling permit, Sundry Notice, Master Development Plans, etc.) and upon completion of the environmental record of review (43 CFR, Part 3162.5). In this process, evaluate whether the conservation measures are "reasonable" (43 CFR, Part 3101.1-2) with the valid existing rights.	No changes made.	Completely revised -revised by rangewide.
MA-MR-6: In PHMA, avoid, minimize, and compensate for impacts on GRSG and their habitat (e.g., habitat loss, fragmentation, indirect impacts, etc.) from new oil and gas development on existing leases. Where possible, place development outside of PHMA. If it is determined that this restriction renders the recovery of fluid minerals infeasible or uneconomic, considering the lease as a whole, or where development of existing leases requires that disturbance density exceeds 1 per 640, and/or 3 percent disturbance cap, apply other measures to site proposed lease activities to meet GRSG habitat objectives and require mitigation as described in Appendix F. If the lease is entirely within PHMA, if feasible, apply the lek buffers from MA-SSS-3H. If this is not technically feasible, locate infrastructure in areas that will minimize habitat loss. Require any development to be placed at the most distal part of the lease from the lek or in areas least harmful to GRSG populations and habitat (e.g., areas where local terrain features such as ridges and ravines may reduce habitat importance or shield nearby habitat from disruptive factors). For geophysical exploration activities, include seasonal TLs and RDFs as permit conditions of approval to eliminate or minimize surface-	**MA-MR-6:** In PHMA, avoid, minimize, and compensate for impacts on GRSG and their habitat (e.g., habitat loss, fragmentation, indirect impacts, etc.) from new oil and gas development on existing leases (see MA-SSS-1 language related to placement of development in non-habitat portions of PHMA). Where possible, place development outside of PHMA. If it is determined that this restriction renders the recovery of fluid minerals infeasible or uneconomic, considering the lease as a whole, or where development of existing leases requires that disturbance density exceeds 1 per 640, and/or 3 percent disturbance cap, apply other measures to site proposed lease activities to meet GRSG habitat objectives and require mitigation as described in Appendix F. If the lease is entirely within PHMA, if technically feasible, apply the lek buffers from MA-SSS-3H. If this is not technically feasible, locate infrastructure in areas that will minimize habitat loss. Require any development to be placed at the most distal part of the lease from the lek or in areas least harmful to GRSG populations and habitat (e.g., areas where local terrain features such as ridges and ravines may reduce habitat importance or shield nearby habitat from disruptive factors).	Completely revised - revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
disturbing and disruptive activities within nesting and brood-rearing habitat and winter concentration areas.	For geophysical exploration activities, include seasonal TLs and RDFs as permit conditions of approval to eliminate or minimize surface-disturbing and disruptive activities within nesting and brood-rearing habitat and winter concentration areas.	
MA-MR-7: To the extent consistent with existing lease-rights, apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, buffers, seasonal restrictions, and RDFs) and in GHMA identified in MA-SSS-5 (i.e., mitigation, buffers, and RDFs).	**MA-MR-7:** To the extent consistent with existing lease-rights, apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, buffers, seasonal restrictions, and RDFs).	Partially revised - revised by state specific.
MA-MR-8: In PHMA, operators must submit a master development plan with site-specific plans of development for roads, wells, pipelines and other infrastructure prior to any development being authorized. The BLM will evaluate the plan through the NEPA process.	No changes made.	Completely revised -revised by rangewide.
MA-MR-9: In PHMA, encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring) to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.	No changes made.	No change (same as 2015).
MA-MR-10: In PHMA, identify areas where acquisitions (including federal mineral rights) or conservation easements, will benefit GRSG habitat.	No similar action.	No change (same as 2015).
MA-MR-11: In PHMA, require a full reclamation bond specific to the site in accordance with 43 CFR, Parts 3104.2, 3104.3, 3104.5, and 36 CFR, Part 228.109. Insure bonds are sufficient for costs relative to reclamation that will result in full restoration of the lands to the condition it was found prior to disturbance. Base the reclamation costs on the assumption that contractors will perform the work.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Locatable Minerals	***Locatable Minerals***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-MR-12: SFA will be recommended for withdrawal from the Mining Law of 1872 (as amended), subject to valid existing rights (Figure 2-5, Locatable Minerals [Appendix A]). Other federal lands or non-federal lands with federal mineral interests within PHMA or GHMA that are not already withdrawn will be available for locatable mineral entry. Areas that are recommended for withdrawal will continue to be managed as they are currently managed. In PHMA, to the extent consistent with the rights of a mining claimant under existing laws and regulations, limit surface disturbance from locatable mineral development and apply management to minimize and mitigate impacts. To the extent allowable by law, work with claimants to voluntarily apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, buffers, seasonal restrictions, and RDFs) and in GHMA identified in MA-SSS-5 (i.e., mitigation and buffers). Regardless of whether agreements with the claimant incorporates the 3 percent disturbance cap (MA-SSS-3B), disturbance from locatable mineral development will be included as disturbance when calculating disturbance for other land uses.	**MA-MR-12:** Federal lands or non-federal lands with federal mineral interests within PHMA that are not already withdrawn will be available for locatable mineral entry. Partially revised – revised by editorial updates to acres.
MA-MR-16: In GHMA, manage nonenergy leasable minerals on federal lands and non-federal lands with federal mineral interests as follows (Figure 2-7): • Open to Leasing Consideration – 699,300 acres • Closed to Leasing – 28,200 acres New leasing and development in GHMA can be considered if consistent with the pertinent management for discretionary activities described in MA-SSS-5.	No similar action.	Completely revised – revised by state specific.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-MR-17: In PHMA, exploration and prospecting activities associated with nonenergy leasable minerals will be required to comply with the same stipulations identified for leasing and development, above. In addition: • The exploration/prospecting activity does not occur during sensitive seasonal periods (i.e., breeding and nesting, brood rearing, winter) (MA-SSS-3G). • Facilities associated with exploration/prospecting activities will be removed before the next breeding season. Disturbances will be restored.	No changes made.	No change (same as 2015).
Coal	***Coal***	—
• **Management Actions (MA):**	**Management Actions (MA):**	—
MA-MR-18: <u>Leases Associated with Surface Mining</u> At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. PHMA is essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1).	**MA-MR-18:** <u>Leases Associated with Surface Mining</u> At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR, Part 3461.5. Coordination with the appropriate State of Utah agency and the determination of essential habitat for maintaining GRSG for purposes of the suitability criteria set forth at 43 CFR, Part 3461.5(o)(1) will consider site-specific information associated with potential lease nomination areas as part of the unsuitability process identified above.	Completely revised -revised by rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-MR-19: Leases Associated with Underground Mining Consider leasing PHMA for coal that will be extracted through underground mining. Require the following stipulations as part of any new lease or lease modification: • In PHMA, appurtenant facilities will not be placed in GRSG habitat, where technically feasible. • In PHMA, if placement of facilities outside of GRSG habitat is not technically feasible, disturbances associated with the lease (construction, operation, or maintenance) can be allowed if they are consistent with the pertinent management for discretionary activities identified in MA-SSS-3 (e.g., mitigation, disturbance cap, minerals/energy density, buffers, noise restrictions, seasonal restrictions, etc.). If the above criteria cannot be met, do not grant new leases or modifications.	No changes made.	No change (same as 2015).
MA-MR-20: New leasing for underground mining of coal in GHMA can be considered if consistent with the pertinent management for discretionary activities described in MA-SSS-5.	No similar action.	Completely revised -revised by statewide.
MA-MR-21: In PHMA, exploration activities needed to meet data adequacy standards associated with potential coal leasing will be required to comply with the pertinent management for discretionary activities identified in MA-SSS-3 (e.g., mitigation, disturbance cap, buffers, noise restrictions, seasonal restrictions, etc.).	No similar action.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-MR-22: For underground coal mining operations on existing leases: In PHMA, unless required for technical or safety reasons, do not authorize new appurtenant surface facilities for existing underground mining. If new appurtenant surface facilities associated the existing mine leases cannot be located outside of PHMA, collocate them with any existing disturbed areas, if possible. If collocation is not possible, then construct new facilities to minimize disturbed areas while meeting mine safety standards/requirements, as identified by Mine Safety and Health Administration mine-plan approval process, and locate the facilities in an area least harmful to GRSG habitat based on vegetation, topography, or other habitat features.	No changes made.	No change (same as 2015).
MA-MR-23: For coal mining operations on existing leases: In GHMA, new disturbances could be considered if consistent with the pertinent management for discretionary activities described in MA-SSS-5.	No changes made.	Completed revised – revised by state specific.
Mineral Split-Estate	***Mineral Split-Estate***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-MR-24: Where the federal government manages the mineral estate in PHMA and GHMA, and the surface is in non-federal ownership, apply the same stipulations, conditions of approval, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner. Where the federal government manages the surface and the mineral estate is in non-federal ownership in PHMA and GHMA, apply appropriate surface use conditions of approval, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	**MA-MR-24:** Where the federal government manages the mineral estate in PHMA, and the surface is in non-federal ownership, apply the same stipulations, conditions of approval, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner. Where the federal government manages the surface and the mineral estate is in non-federal ownership in PHMA, apply appropriate surface use conditions of approval, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee. RENEWABLE ENERGY (WIND AND SOLAR) (RE)	***RENEWABLE ENERGY (WIND AND SOLAR) (RE)***	—
Management Actions (MA):	**Management Actions (MA):**	—
Wind Energy Development **MA-RE-1:** PHMA will be designated as exclusion areas for wind energy development (2,026,400 acres) (Figure 2-8, Wind [Appendix A]). Do not site wind energy development in opportunity areas within 5 miles from occupied GRSG leks that are in PHMA. Manage wind energy development in GHMA as follows: • Open – 484,900 acres • Avoided – 0 acres • Excluded – 17,600 acres New wind ROW authorizations can be allowed in GHMA if they apply the pertinent management for discretionary activities identified in MA-SSS-5. *Solar Energy Development* The BLM's Approved Resource Management Plan Amendments/ROD for Solar Energy Development in Six Southwestern States (October 2012) excluded all GRSG occupied habitat to new utility-scale solar development. Because the existing land use plans already exclude solar development in GRSG habitat; this plan amendment process does not need to make additional decisions related to solar development (Figure 2-9, Solar [Appendix A]).	*Wind Energy Development* **MA-RE-1:** PHMA will be designated as exclusion areas for wind energy development (2,026,400 acres) (Figure 2-8, Wind [Appendix A]). Avoid siting wind energy development in opportunity areas within the buffer distances identified in Appendix B from occupied GRSG leks that are in PHMA, if the lek buffer analysis as identified in Appendix B shows that siting wind energy development in opportunities areas will impact lek persistence within PHMA. *Solar Energy Development* The BLM's Approved Resource Management Plan Amendments/ROD for Solar Energy Development in Six Southwestern States (October 2012) excluded all GRSG occupied habitat to new utility-scale solar development. Because the existing land use plans already exclude solar development in GRSG habitat; this plan amendment process does not need to make additional decisions related to solar development (Figure 2-9, Solar [Appendix A]).	Completely revised – revised by rangewide.
LANDS AND REALTY (LR)	***LANDS AND REALTY (LR)***	—
Objectives:	**Objectives:**	—
Objective LR-1: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Management Actions (MA):	**Management Actions (MA):**	—
MA-LR-1: In PHMA, manage lands ROWs, permits, and leases as follows (Figure 2-11, Rights-of-Way [Appendix A]): • Open: 18,900 acres (associated with designated above-ground ROW corridors) • Avoided: 1,997,000 acres Excluded: 10,500 acres	No changes made.	Partially revised -editorial updates to acres.
MA-LR-2: <u>Linear and Site-Type ROWs, Permits, and Leases (excluding wind and solar)</u> PHMA will be avoidance areas for new linear and site type ROWs, permits, and leases except for within ROW corridors designated for aboveground use. Placement of new ROWs, permits, and leases in PHMA shall be avoided if at all possible. Where avoidance is not possible in PHMA, placement of a new ROW/permit/lease can be allowed if it applies the management for discretionary activities in PHMA identified in MA-SSS-3 (e.g., mitigation, disturbance cap, buffers, tall structure restrictions, seasonal restrictions, and applicable RDFs). In PHMA, lands ROWs, permits and leases that cannot be avoided shall be located in areas that minimize the effect on the GRSG population (e.g., non-habitat areas, least suitable habitat, collocated with existing disturbances). In PHMA, new proposals for power lines, access roads, pump storage, and other hydroelectric facilities licensed by Federal Energy Regulatory Commission will be subject to all GRSG ROW avoidance allocations and pertinent management for discretionary activities in MA-SSS-3. Outside PHMA, portions of opportunity areas within 4-miles of a lek that is located in PHMA will be	**MA-LR-2:** <u>Linear and Site-Type ROWs, Permits, and Leases (excluding wind and solar)</u> PHMA will be avoidance areas for new linear and site type ROWs, permits, and leases except for within ROW corridors designated for aboveground use. Outside PHMA, portions of opportunity areas within 4-miles of a lek that is located in PHMA will be	Partially revised- retain general language from 2019; but replace with specific language related to major transmission and pipelines to rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
avoidance areas for new ROWs, permits and leases, applying stipulations for noise and tall structures. In addition to the above requirements, the subsequent conditions will apply to specific types of ROW authorizations: <u>Transmission Lines</u> PHMA are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the following identified projects, must comply with the conservation measures outlined in this plan, including the RDFs and avoidance criteria presented in MA-SSS-03. The BLM is currently processing an application for TransWest Express (including those portions of Energy Gateway South that are collocated) and the NEPA review for this project is well underway. Conservation measures for GRSG are being analyzed through the project's NEPA review process, which should achieve a net conservation benefit for the GRSG. In PHMA, high voltage transmission lines (100 kilovolt or greater) will be avoided if possible. If avoidance is not possible, they will be placed in designated corridors where technically feasible. Where not technically feasible, lines should be located adjacent to existing infrastructure, unless using a different alignment better minimizes impacts on GRSG. New ROWs constructed adjacent to existing infrastructure will be constructed as close as technically feasible to existing infrastructure to limit disturbance to the smallest footprint. In PHMA outside of designated corridors, new transmission lines must be buried where technically feasible. Where burying transmission lines is not technically feasible:	avoidance areas for new ROWs, permits and leases, applying stipulations for noise and tall structures. In addition to the above requirements, the subsequent conditions will apply to specific types of ROW authorizations: <u>Transmission Lines</u> PHMA are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the following identified projects, must comply with the conservation measures outlined in this plan, including the RDFs and avoidance criteria presented in MA-SSS-03. New sites will be considered where necessary for public safety.	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LR-3: Road ROWs In PHMA, new road ROWs will be authorized when necessary for public safety, administrative access, or subject to valid existing rights. If the new ROW is necessary for public safety, administrative access, or subject to valid existing rights and creates new surface disturbance, then avoid, minimize, and compensate for the impacts. In PHMA, limit route construction to realignments of existing ROWs if the realignment maintains or enhances GRSG habitat, eliminates the need to authorize a new ROW to construct a new road, or is necessary for public safety or public need. In PHMA, subject to valid existing rights, new road ROWs/easements will be authorized only when necessary for public safety or administrative access or, if it creates no new or de minimis new surface disturbance. In PHMA, collocate new ROWs as close as technically possible to existing ROWs or where it best minimizes GRSG impacts. Use existing roads, or realignments, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary. In PHMA, existing Federal Highway Act Appropriation ROWs will be managed as valid existing rights, and new Federal Highway Act ROWs will continue to be considered and subject to all GRSG ROW plan restrictions.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LR-4: In PHMA, designate ROW corridors as identified on Figure 2-10, Designated Utility Corridors [Appendix A]: • Retain 17,600 acres of existing designated ROW corridor • Retain 44,300 acres of existing designated ROW corridor, but stipulate new developments be limited to underground use only • Undesignate 18,200 acres of existing designated ROW corridor In PHMA, placement of new ROWs in corridors should be avoided if at all possible. Where avoidance is not possible: • Allow new linear ROWs in designated corridors. • New ROWs constructed in designated corridors will be constructed as close as technically feasible to existing linear ROW infrastructure to limit disturbance to the smallest footprint, unless using a different alignment better minimizes impacts on GRSG. Apply the pertinent management for discretionary activities in PHMA identified in MA-SSS-3.	No changes made.	Partially revised – revised to update acres and align conditions with rangewide.

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LR-5: In PHMA, when a ROW grant expires, is relinquished, or terminated, required rehabilitation as a term and condition of the FLPMA ROW grant, in compliance with 43 CFR, Part 2805.12(i). • the lease holder will be required to restore the site by removing overhead lines and other infrastructure, and; • eliminate existing raven nesting opportunities created by anthropogenic development on public lands (e.g., remove power line and communication facilities no longer in service). In PHMA, during renewal, amendment or reauthorization of existing permits, work with existing ROW holders to mitigate impacts of existing ROW infrastructure. Where technically feasible, require ROW holders to bury or relocate existing power lines to minimize long-term impacts on GRSG habitat. Where the potential long-term impacts of relocating or burying the line will be greater than the existing impacts, do not pursue the mitigation. If relocation or burying is not feasible or will result in severe short-term or greater long-term impacts on GRSG habitat, incorporate additional terms and conditions in the ROW authorization for protection of GRSG habitat. Work with ROW holders to retrofit existing towers with perch deterrents or other anti-perching devices, where appropriate, to limit GRSG predation.	**MA-LR-5:** In PHMA, when a ROW grant expires, is relinquished, or terminated, required rehabilitation as a term and condition of the FLPMA ROW grant, in compliance with 43 CFR, Part 2805.12(i). • the lease holder will be required to restore the site by removing overhead lines and other infrastructure, and; • eliminate existing raven nesting opportunities created by anthropogenic development on public lands (e.g., remove power line and communication facilities no longer in service). In PHMA, during renewal, amendment or reauthorization of existing permits, work with existing ROW holders to mitigate impacts of existing ROW infrastructure on GRSG (e.g., predator deterrents, maintenance schedules, relocation, burial, etc.). Where the potential long-term impacts of mitigation will be greater than the existing impacts, do not pursue the mitigation. If relocation or burying is not feasible or will result in severe short-term or greater long-term impacts on GRSG habitat, incorporate additional terms and conditions in the ROW authorization for protection of GRSG habitat. Work with ROW holders to retrofit existing towers with perch deterrents or other anti-perching devices, where appropriate, to limit GRSG predation.	No change (same as 2019).
MA-LR-6: In PHMA, where existing leases or ROWs have had some level of development (road, fence, well, etc.) and are no longer in use, remove the features and restore the habitat.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-LR-7: In GHMA, manage ROWs, permits, and leases as follows (Figure 2-11): • Open: 484,900 acres • Avoided: 0 acres • Excluded: 17,600 acres • New ROWs (including permits and leases) authorizations will be allowed if they apply the pertinent management for discretionary activities in GHMA identified in MA-SSS-5.	No similar action.	Completely revised – revised by state specific.
MA-LR-8: In GHMA, retain 74,700 acres of designated ROW corridors as identified on Figure 2-10.	No similar action.	Partially revised – revised by sate specific, updates to acres.
Land Tenure	***Land Tenure***	—
MA-LR-9: Lands classified as PHMA and GHMA for GRSG will be retained in federal management (Figure 2-12, Land Tenure [Appendix A]) unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will have no direct or indirect adverse impact on conservation of the GRSG.	**MA-LR-9:** Lands classified as PHMA for GRSG will be retained in federal management (Figure 2-12, Land Tenure [Appendix A]) unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will improve the condition of GRSG habitat or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will not compromise the persistence of GRSG populations within a PHMA.	Partially revised - reference to GHMA – Connectivity.
MA-LR-10: In PHMA, where suitable conservation actions cannot be achieved, seek to acquire state and private lands with intact federal mineral estate by donation, purchase or exchange in order to best conserve, enhance or restore GRSG habitat.	No changes made.	No change (same as 2015).
• ***Recommended Withdrawals***	***Recommended Withdrawals***	—
MA-LR-11: SFA will be recommended for withdrawal from the Mining Law of 1872 (as amended), subject to valid existing rights. Other federal lands or non-federal lands with federal mineral interests within PHMA or GHMA that are not already withdrawn or recommended for withdrawal will be available for locatable mineral entry (Figure 2-5).	**MA-LR-11:** Federal lands or non-federal lands with federal mineral interests within PHMA that are not already withdrawn or recommended for withdrawal will be available for locatable mineral entry (Figure 2-5).	Partially revised (same as 2019 with addition of GHMA and refer to state specific).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
RECREATION (REC)	***RECREATION (REC)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-REC-1: In PHMA, only allow BLM SRPs that have neutral or beneficial effect on GRSG and their habitat. Evaluate existing SRPs for adverse effect on GRSG and their habitat. Modify or cancel the permit, as appropriate and where possible to avoid or mitigate effects of habitat alterations or other physical disturbances to GRSG (e.g., breeding, brood-rearing, migration patterns, or winter survival). Identify permit stipulations that require the permittee to implement any necessary habitat restoration activities after SRP events. Restoration activities must be consistent with GRSG habitat objectives.	No changes made.	No change (same as 2015).
MA-REC-2: In PHMA, do not construct new recreation facilities (e.g., campgrounds, trailheads, staging areas) unless the development will have a net conservation gain to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.), or unless the development is required for visitor health and safety or resource protection.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
TRAVEL AND TRANSPORTATION MANAGEMENT (TTM)	***TRAVEL AND TRANSPORTATION MANAGEMENT (TTM)***	—
Management Actions (MA):	**Management Actions (MA):**	—
MA-TTM-1: Manage off-highway vehicle (OHV) use in GRSG habitat as follows (Figure 2-13, Trails and Travel Management [Appendix A]): • Open to cross-country use: 525 acres (one area each in Parker Mountain and Uintah Population Areas) • Limited to existing routes: 1,274,700 acres • Limited to designated routes: 1,220,500 acres • Closed: 33,200 acres	**MA-TTM-1:** Manage off-highway vehicle (OHV) use in GRSG habitat as follows (Figure 2-13, Trails and Travel Management [Appendix A]): • Open to cross-country use: 525 acres (one area each in Parker Mountain and Uintah Population Areas); two areas outside of PHMA in the Sheeprocks Population Area, associated with 5-Mile Pass (6,320 acres) and Little Sahara Sand Dunes (7,900 acres) • Limited to existing routes: 1,260,500 acres • Limited to designated routes: 1,220,500 acres • Closed: 33,200 acres	No change (same as 2019).
MA-TTM-2: PHMA and GHMA that do not have designated routes in a Travel Management Plan will be managed as limited to existing routes until a Travel Management Plan designates routes (unless they are already designated as limited to designated routes or closed to OHV use). OHV Areas designated as "closed" will be managed as areas closed to motorized vehicles. OHV Areas designated as "limited existing" within PHMA will be managed as "limited to existing roads, primitive roads, and trails" until the completion of an implementation level travel plan. Individual route designations will occur during subsequent implementation level travel management planning efforts. Upon the completion of implementation level travel management plans OHV areas designated as "Limited" will automatically transition to "limited to designated roads, primitive roads and trails."	**MA-TTM-2:** PHMA that does not have designated routes in a Travel Management Plan will be managed as limited to existing routes until a Travel Management Plan designates routes (unless they are already designated as limited to designated routes or closed to OHV use). Two areas that were GHMA previously will remain limited to existing routes, though they would no longer be GHMA: 7,400 acres in the Bald Hills area and 13,500 acres in the Fillmore Field Office portions of Sheeprocks area, east of Highway 6. The other two areas of former GHMA (6,320 acres in the 5-Mile Pass area and 7,900 acres in the Little Sahara Recreation Area) will also remain limited until the BLM completes the Section 106 OHV area designation process found in the *Programmatic Agreement among the Advisory Council on Historic Preservation, The Bureau of Land Management – Utah and the Utah State Historic*	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	Preservation Office regarding National Historic Preservation Act Responsibilities for Travel and Transportation Management Undertakings. Under the Programmatic Agreement the BLM will identify an Area of Potential Effect, conduct an identification process, make a finding of effect, and if necessary, develop a historic properties treatment plan. Once these procedures are completed, the applicable portions of these areas will revert to being open to cross-country use, consistent with prior RMP OHV allocations. OHV Areas designated as "closed" will be managed as areas closed to motorized vehicles. OHV Areas designated as "limited existing" within PHMA will be managed as "limited to existing roads, primitive roads, and trails" until the completion of an implementation level travel plan. Individual route designations will occur during subsequent implementation level travel management planning efforts. Upon the completion of implementation level travel management plans OHV areas designated as "Limited" will automatically transition to "limited to designated roads, primitive roads and trails."	
MA-TTM-3: Implementation level travel planning efforts will be guided by the goals, objectives and guidelines outlined in the GRSG section, relevant national and Utah specific guidance as well as the following: • A timeline to complete travel planning efforts will be identified, prioritized and updated annually in all relevant planning areas to accelerate the accomplishment of: data collection, route evaluation and selection, and on the ground implementation efforts including signing, monitoring and rehabilitation.	**MA-TTM-3:** Implementation level travel planning efforts will be guided by the goals, objectives and guidelines outlined in the GRSG section, relevant national and Utah specific guidance as well as the following: • A timeline to complete travel planning efforts will be identified, prioritized and updated annually in all relevant planning areas to accelerate the accomplishment of: data collection, route evaluation and selection, and on the ground implementation efforts including signing, monitoring and rehabilitation.	No change (same as 2019).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• During subsequent travel management planning, consultation "with interested user groups, federal, state, county, and local agencies, local landowners, and other parties in a manner that provides an opportunity for the public to express itself and have its views given consideration." Consequently, a public outreach plan to fully engage all interested stakeholders will be incorporated into future travel management plans. • Among other designation criteria from 43 CFR, Part 8342.1(b), "areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats." • During subsequent travel management planning, all routes will undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route will be considered for closure or considered for relocation outside of sensitive GRSG habitat. • During subsequent travel planning, threats to GRSG and their habitat will be considered when evaluating route designations and/or closures. • During subsequent travel management planning, routes that do not have a purpose or need will be considered for closure. • During subsequent travel management, planning, routes that are duplicative, parallel, or redundant will be considered for closure.	• During subsequent travel management planning, consultation "with interested user groups, federal, state, county, and local agencies, local landowners, and other parties in a manner that provides an opportunity for the public to express itself and have its views given consideration." Consequently, an outreach plan to fully engage all interested stakeholders, including state, local, and tribal governments, will be incorporated into future travel management plans. • Among other designation criteria from 43 CFR, Part 8342.1(b), "areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats."	

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• During subsequent travel management planning, seasonal restrictions on OHV use will be considered in important seasonal habitats where OHV use is a threat. During subsequent travel management planning, consider limiting over snow vehicles designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow to designated routes or consider seasonal closures in GRSG wintering areas from November 1 through March 31. • During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need will be evaluated for administrative access only. • During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan. • During subsequent travel management plan implementation, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances. During subsequent travel management plan implementation, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (e.g., no use between 6:00 pm and 9:00 am) to reduce impacts on GRSG during breeding periods.		

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-TTM-4: In PHMA, complete transportation plans in accordance with National BLM Travel Management guidance, requiring the BLM to maintain a current action plan and planning schedule to most effectively target available resources. The following GRSG population areas are Utah's top priority areas to designate comprehensive travel plans: • Sheeprocks • Box Elder • Ibapah • Bald Hills • Rich • Hamlin Valley	No changes made.	No change (same as 2015).
MA-TTM-5: In PHMA, travel systems will be managed with an emphasis on improving the sustainability of the travel network in a comprehensive manner to minimize impacts on GRSG, maintain motorist safety, and prevent unauthorized cross country travel while meeting access needs. To do so, it may be necessary to improve portions of existing routes, close existing routes or create new routes that meet user group needs, thereby reducing the potential for pioneering unauthorized routes. The emphasis of the comprehensive travel and transportation planning will be placed on having a neutral or positive effect on GRSG habitat.	No changes made.	No change (same as 2015).
MA-TTM-6: In PHMA, when considering upgrade of existing routes that will change route category (BLM route categories: road, primitive road, or trail) or capacity, consider the larger transportation network while providing for protection of GRSG habitat.	No similar action.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-TTM-7: In PHMA, use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance. Apply additional effective mitigation necessary to offset the resulting loss of GRSG habitat. Plan for new routes in consideration of the larger transportation network objectives and needs while providing for protection of GRSG habitat.	No changes made.	No change (same as 2015).
MA-TTM-8: In PHMA, when reseeding roads, primitive roads and trails, use appropriate seed mixes and consider the use of transplanted sagebrush.	No similar action.	No change (same as 2019).
MA-TTM-9: Develop an educational process to advise OHV users of the potential for conflict with GRSG.	No changes made.	No change (same as 2015).

2015 BLM GRSG Approved RMP Amendment	Changes between 2015 and 2019 GRSG Management	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MA-TTM-10: In PHMA and GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR, subpart 8351 (Designated National Area); 43 CFR, subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR, subpart 8341 (Conditions of Use) and any applicable policies. • Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR, Part 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	**MA-TTM-10:** In PHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR, subpart 8351 (Designated National Area); 43 CFR, subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR, subpart 8341 (Conditions of Use) and any applicable policies. • Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.	Partially revised – revised to state specific.

Table 2. 2015 Habitat Objectives for Greater Sage-Grouse

Attribute	Indicators	Desired Condition
Breeding and Nesting (February 15-June 15)[1, 2, 3, 4, 5, 6]		
Lek Security	Proximity of trees	Trees absent or uncommon on shrub/grassland ecological sites within 1.8 miles (approx. 3 kilometers) of occupied leks.[6, 7, 8]
	Proximity of sagebrush to leks	Has adjacent sagebrush cover.[6]
Cover	% of seasonal habitat meeting desired conditions	>80% of the mapped nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).[8]
	Sagebrush cover	≥15%[6, 8, 9]
	Total shrub cover[6, 8, 9]	15-30%: Box Elder, Parker Mountain, Bald Hills, Hamlin Valley, Panguitch, Uintah south of Hwy 40 15-35%: Rich, Carbon, Emery, Sheeprocks, Ibapah, Uintah north of Highway 40
	Sagebrush height[6, 8, 9]	>12 inches (30 cm): Box Elder, Bald Hills, Hamlin Valley, Sheeprocks, Ibapah >10 inches (25 cm): Rich, Carbon, Emery, Uintah north of Highway 40 >8 inches (20 cm): Parker Mountain, Panguitch, Uintah south of Highway 40
	Predominant sagebrush shape[10]	>50% in spreading (applicable to the specific sagebrush types prone to columnar vs. spreading shape e.g., Wyoming, not black sage)[6]
	Perennial grass cover (such as native bunchgrasses, rhizomatous grasses called for on applicable ecological site descriptions, or other perennial grasses that provide similar functionality)[6, 8, 9]	>10%: Box Elder, Bald Hills, Hamlin Valley, Rich, Carbon, Emery, Sheeprocks, Ibapah, Uintah north of Highway 40 >5%:Parker Mountain, Panguitch, Uintah south of Highway 40
	Perennial grass and forb height (includes residual grasses)[6, 8, 9]	Provide overhead and lateral concealment from predators.[11]
	Perennial forb canopy cover[6, 8, 9]	>5%: Box Elder, Bald Hills, Hamlin Valley, Rich, Carbon, Emery, Sheeprocks, Ibapah, Uintah north of Highway 40 >3%: Parker Mountain, Panguitch, Uintah south of Highway 40

Attribute	Indicators	Desired Condition
Brood-Rearing/Summer (April 15-August 15)[1]		
Cover	% of Seasonal habitat meeting desired condition	>40% of the mapped brood-rearing/summer habitat meets recommended habitat characteristics where appropriate (relative to ecological site potential, etc.)[8]
	Sagebrush cover[6, 8, 9]	>10%
	Total shrub cover[6, 8, 9]	10-25%: Box Elder, Bald Hills, Hamlin Valley, Panguitch, Rich, Parker Mountain, Uintah 10-30%: Carbon, Emery, Sheeprocks, Ibapah,
	Sagebrush height[6, 8, 9]	>12 inches (30 cm): Box Elder, Bald Hills, Hamlin Valley, Sheeprocks, Ibapah >10 inches (25 cm): Rich, Carbon, Emery, Uintah north of Highway 40 >8 inches (20 cm): Parker Mountain, Panguitch, Uintah south of Highway 40
	Perennial grass cover and forbs[6, 8, 9]	>15% (Grass: >10%; Forb: >5%): Box Elder, Rich, Sheeprocks, Ibapah, Parker Mountain, Panguitch, Uintah, Carbon, Emery >15% (Grass: >8%; Forb: >7%): Bald Hills, Hamlin Valley,
	Riparian areas/mesic meadows	Proper Functioning Condition
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present[6, 12]
Winter (November 15-March 15)[1]		
Cover and Food	% of seasonal habitat meeting desired conditions	>80% of the mapped wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.). [8]
	Sagebrush cover above snow[6, 8,]	>10%
	Sagebrush height above snow[6, 8, 9, 13]	>10 inches (25 cm): Box Elder, Bald Hills, Hamlin Valley, Rich, Carbon, Emery, Sheeprocks, Ibapah, Uintah north of Highway 40 >8 inches (20 cm): Parker Mountain, Panguitch, Uintah south of Highway 40

[1] Specific dates will be based on site-specific conditions and may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, and long and/or heavy winter), in coordination with the appropriate State of Utah agency.

[5] Holloran and Anderson 2005
[6] Stiver et al. 2015 *In Press*
[7] Baruch-Mordo et al. 2013
[8] Connelly et al. 2000
[9] Unpublished data, Utah Community-Based Conservation Program Greater Sage-Grouse Statewide Database, Utah State University, Logan, Utah and Brigham Young University, Provo, Utah. Summarization and analysis of nesting and brood-rearing habitat characteristics from data collected through Utah State University and Brigham Young University research efforts. Researchers located the nest and brood sites using radio-marked telemetry methods. Shortly after the site was used by the marked bird (after hatch or use by a brood), vegetation characteristics on the site were measured using the line intercept method for shrub canopy cover and Daubenmire frames for herbaceous cover. Researchers across the various study areas used methods that followed the guidelines identified in Connelly et al. (2003).
[10] Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015 *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.
[11] Specific height requirements needed to meet the objective will be set at the time of watershed assessments.
[12] Preferred forbs are listed in Stiver et al. 2015 *In Press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[13] The height of sagebrush remaining above the snow depends upon snow depth in a particular year. Intent is to manage for tall, healthy, sagebrush stands.

Table 3. 2019 Habitat Objectives for Greater Sage-Grouse (see Figure 3-1 for the Low, Mid, and High Habitat Objective Zones)

Attribute	Indicators	Desired Condition
Breeding and Nesting (February 15-June 15)[1, 2, 3, 4, 5, 6]		
Lek Security	Proximity to conifers	Conifers are absent or uncommon on shrub/grassland ecological sites within 1.8 miles (approx. 3 kilometers) of occupied leks. [6, 7, 8]
	Proximity of sagebrush to leks	Has adjacent sagebrush cover.[6]
Cover	% of seasonal habitat meeting desired conditions	>80% of the mapped nesting habitat meets the recommended vegetation characteristics[8], where appropriate (relative to ecological site potential, etc.).
	Sagebrush cover[9]	Low: ≥ 7% Mid: ≥ 18% High: ≥ 14%
	Total shrub cover[6, 8, 9]	Low: ≥ 17% Mid: ≥ 22% High: ≥ 19%
	Sagebrush Composition[9]	Low: ≥ 36% Mid: ≥ 71% High: ≥ 83%
	Shrub height[6, 8, 9]	Low: ≥ 12 inches (30 cm) Mid: ≥ 5.9 inches (15 cm) High: ≥ 9 inches (23 cm)
	Perennial grass cover (such as native bunchgrasses, rhizomatous grasses called for on applicable ecological site descriptions, or other perennial grasses that provide similar functionality)[6, 8, 9]	Low: ≥ 5% Mid: ≥ 4% High: ≥ 8%
	Perennial grass and forb height (includes residual grasses)[6, 8, 9]	Provide overhead and lateral concealment from predators.[11]
	Perennial forb canopy cover[6, 8, 9]	Low: ≥ 2% Mid: ≥ 1% High: ≥ 4%

Attribute	Indicators	Desired Condition
Brood-Rearing/Summer (April 15-August 15)[1]		
Cover	% of Seasonal habitat meeting desired condition	>40% of the mapped brood-rearing/summer habitat meets recommended habitat characteristics[8] where appropriate (relative to ecological site potential, etc.)
	Sagebrush cover[6, 8, 9]	Low: ≥ 4% Mid: ≥ 16% High: ≥ 17%
	Total shrub cover[6, 8, 9]	Low: ≥ 10% Mid: ≥ 19% High: ≥ 17%
	Sagebrush Composition[9]	Low: ≥ 28% Mid: ≥ 77% High: ≥ 77%
	Shrub height[6, 8, 9]	Low: ≥ 10.25 inches (26 cm) Mid: ≥ 4.3 inches (11 cm) High: ≥ 8 inches (20 cm)
	Perennial grass cover[9]	Low: ≥ 5% Mid: ≥ 6% High: ≥ 8%
	Perennial forb cover[9]	Low: ≥ 2% Mid: ≥ 2% High: ≥ 6%
	Riparian areas/mesic meadows	Proper Functioning Condition
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present[6, 12]
Winter (November 15-March 15)[1]		
Cover and Food	% of seasonal habitat meeting desired conditions	>80% of the mapped wintering habitat meets winter habitat characteristics[8] where appropriate (relative to ecological site, etc.).
	Sagebrush cover above snow[6, 8,]	≥10%
	Shrub height[9]	Low: ≥ 12 inches (30 cm) Mid: ≥ 5.9 inches (15 cm) High: ≥ 9 inches (23 cm)

[1] Specific dates will be based on site-specific conditions and may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, and long and/or heavy winter), in coordination with the appropriate State of Utah agency.

[11] Specific height requirements needed to meet the objective will be set at the time of watershed assessments.
[12] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover, since not all forb species are listed as preferred.

Table 4. PHMA and GHMA in the 2015 BLM GRSG Approved RMPA

Population Area	Acres					
	PHMA			GHMA		
	Total Surface[1]	BLM Surface[2]	Split Estate[3]	Total Surface[1]	BLM Surface[2]	Split Estate[3]
Uintah	566,800	263,200	140,800	991,500	294,200	81,700
Carbon[4]	260,100	43,500	124,200	198,700	82,800	19,200
Emery	85,500	100	84,000	11,400	0	9,700
Parker Mtn.	741,300	214,200	378,300	12,900	0	7,400
Panguitch	343,900	163,200	91,000	0	0	0
Bald Hills	326,400	259,400	5,200	21,200	8,300	1,200
Hamlin Valley	143,700	101,500	6,600	0	0	0
Sheeprocks	534,600	381,100	111,200	296,500	52,800	15,300
Ibapah	88,800	48,000	700	10,800	10,100	0
Box Elder	1,227,800	439,200	112,000	0	0	0
Rich	1,051,000	167,000	178,400	197,900	300	20,600
Lucerne	0	0	0	37,500	0	11,500
Strawberry	161,500	0	40,900	20,600	0	500
Statewide	*5,531,400*	*2,080,400*	*1,273,300*	*1,799,000*	*448,500*	*167,100*
% PHMA/ GHMA	*75%*	*80%*	*85%*	*25%*	*20%*	*15%*

[1] Acreage associated with total PHMA polygon, regardless of land ownership.
[2] Acreage within PHMA where the BLM has managerial authority on the surface estate.
[3] Acreage where the surface and mineral estates are owned or administered by separate entities. These acres show where the surface estate is not BLM (e.g., private, state, tribal, and Forest Service), but that have a federal mineral estate administered by the BLM. Most minerals decisions apply to the combination of the BLM surface and mineral estates.
[4] The 41,200 acres of National Forest System lands in the Anthro Mountain area would be managed as neither PHMA nor GHMA. These areas would be identified as "Anthro Mountain." In the BLM's RMPPA, these areas are considered split-estate, where the BLM administers the mineral estate.

Table 5. PHMA in the 2019 BLM GRSG Approved RMPA

Population Area	Acres		
	PHMA		
	Total Surface[1]	BLM Surface[2]	Split Estate[3]
Uintah	566,800	263,200	140,800
Carbon [4]	260,100	43,500	124,200
Emery	85,500	100	84,000
Parker Mtn.	741,300	214,200	378,300
Panguitch	343,900	163,200	91,000
Bald Hills	326,400	259,400	5,200
Hamlin Valley	143,700	101,500	6,600
Sheeprocks	534,600	381,100	111,200
Ibapah	88,800	48,000	700
Box Elder	1,227,800	439,200	195,800
Rich	1,015,400	167,000	153,700
Lucerne	0	0	0
Strawberry	161,500	0	40,900
Statewide[5]	*5,495,800*	*2,080,400*	*1,332,400*

[1] Acreage associated with total PHMA polygon, regardless of land ownership.
[2] Acreage within PHMA where the BLM has managerial authority on the surface estate.
[3] Acreage where the surface and mineral estates are owned or administered by separate entities. These acres show where the surface estate is not BLM (e.g., private, state, tribal, and Forest Service), but that have a federal mineral estate administered by the BLM. Most minerals decisions apply to the combination of the BLM surface and mineral estates.
[4] The 41,200 acres of National Forest System lands in the Anthro Mountain area would not be managed PHMA. These areas would be identified as "Anthro Mountain." In the BLM's RMPPA, these areas are considered split-estate, where the BLM administers the mineral estate.
[5] PHMA were mapped to exclude all incorporated towns/cities.

2.15.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that may change through this RMP amendment. If 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The appendices can be found on the Utah GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	2015, 2019	Completely revised - refer to Appendix 1 for updated maps
B: Applying Lek Buffer Distances	2015, 2019	No change (same as 2019)
C: Required Design Features	2015	No change (same as 2015)

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
D: Greater Sage-Grouse Monitoring Framework	2015	Completely revised – revised by rangewide Appendix 7
E: Greater Sage-Grouse Disturbance Cap Guidance	2015, 2019	Partially revised – revised by rangewide updates to disturbance cap
F: Mitigation Strategy: Utah Greater Sage-Grouse RMPA	2015	Delete Appendix - follow rangewide mitigation policy
G: Stipulations Associated with Fluid Mineral Leasing	2015, 2019	Partially revised – Applies rangewide exceptions, modifications, and waivers
H: Fire and Invasives Assessment Tool	2015	No change (same as 2015)
I: Adaptive Management	2015, 2019	Completely revised – revised by rangewide
K: Greater Sage Grouse Habitat Baseline and Habitat Update Protocol	2015, 2019	No change (same as 2019)
L: Livestock Grazing BMPs	New	New appendix

Appendix 2.16
Wyoming RMP 2015 Amendments

This page intentionally left blank.

2.16 WYOMING RMP 2015 AMENDMENTS

This appendix presents the GRSG approved RMP amendment language from the 2015 and 2019 records of decision for the RMP Amendments for Casper, Kemmerer, Newcastle, Pinedale, Rawlins, and Rock Springs RMPs. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable 2015 and 2019 appendices that are listed in **Section 2.16.2** of this appendix. For the additional state-specific Wyoming management direction for the Proposed RMPA, see Chapter 2, Table 2-13.

2.16.1 Casper, Kemmerer, Newcastle, Pinedale, Rawlins, and Rock Springs RMPs (Wyoming)

Table 1. Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Direction in Applicable Wyoming RMPs

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Management Goal 1: Conserve, restore, and enhance Greater Sage-Grouse habitat on a landscape scale consistent with local, state, and federal management plans and policies, as practical, while providing for multiple use of BLM-administered lands.	No changes made.	Completely revised – revised by rangewide
Management Objective (MO) 1: In cooperation with the State of Wyoming and its agencies, local governments, private landowners, local Greater Sage-Grouse working groups, partners, and stakeholders, develop site-specific conservation strategies to maintain or enhance Greater Sage-Grouse habitats and habitat connectivity.	No changes made.	No change (same as 2015)
MO 2: Maintain and enhance quality/suitable habitat to support the expansion of Greater Sage-Grouse populations on federally administered lands within the planning area.	No changes made.	No change (same as 2015)
MO 3: Manage Greater Sage-Grouse seasonal habitats and maintain habitat connectivity to support population objectives set by the State of Wyoming in cooperation with the agencies.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO 4: Identify and prioritize opportunities for habitat enhancement and conservation within Greater Sage-Grouse core habitat areas based on threats and the ability to manage Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MO 5: Restore native (or desirable) plants and create landscape patterns that most benefit Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO 6: Develop specific habitat objectives to protect, enhance, or restore Greater Sage-Grouse priority habitat based on ESDs and BLM land health evaluations (including within wetlands and riparian areas) taking into account site history (historic treatments or habitat manipulations) that have changed the soil chemistry, possibly altering the ESD. If an effective grazing system that meets sage-grouse habitat requirements is not already in place, analyze at least one alternative that conserves, restores, or enhances sage-grouse habitat in the NEPA document prepared for grazing management (Doherty et al. 2011, Williams et al. 2011).	Develop specific habitat objectives to protect, enhance, or restore Greater Sage-Grouse priority habitat based on ESDs and BLM land health evaluations (including within wetlands and riparian areas) taking into account site history (historic treatments or habitat manipulations) that have changed the soil chemistry, possibly altering the ESD.	No change (same as 2019)
MO 7: Establish measurable objectives related to Greater Sage-Grouse habitat from baseline monitoring data, ESDs, or land health assessments/evaluations.	No changes made.	No change (same as 2015)
MO 8: Manage for vegetation composition and structure consistent with ecological site potential to achieve Greater Sage-Grouse seasonal habitat objectives.	No changes made.	No change (same as 2015)
MO 9: Incorporate available site information collected using the Sage-Grouse Habitat Assessment Framework or similar methods to evaluate existing resource conditions and to develop any necessary resource solutions in cooperation with the State of Wyoming and its agencies, the local governments, private landowners, project proponents, partners, and stakeholders.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO 10: Incorporate management practices that will provide for maintenance and/or enhancement of Greater Sage-Grouse habitats, including specific attention to maintenance of desired understories of sagebrush plant communities. When developing objectives for residual cover and species diversity, identify the ecological site types within the planning area and refer to the appropriate ESDs.	No changes made.	No change (same as 2015)
MO 11: In determining appropriate management actions that will be considered, refer to the document, *Grazing Influence, Management, and Objective Development in Wyoming's Greater Sage-Grouse Habitat* (Cagney et al. 2010) for guidance.	No changes made.	No change (same as 2015)
MO 12: Identify PHMA and GHMA for each WAFWA MZ across the current geographic range of Greater Sage-Grouse that are large enough to stabilize populations in the short term and enhance populations over the long term. Greater Sage-Grouse habitat in this planning area overlaps two WAFWA MZs: (1) MZ I - Great Plains and (2) MZ II - Wyoming Basin.	No changes made.	Completely revised – revised by rangewide and state-specific
MO 13: Protect PHMA and GHMA from anthropogenic disturbance that will reduce distribution or abundance of Greater Sage-Grouse.	No changes made.	Partially revised – to include SHMA
MO 14: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority would be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The	Leasing is allowed in PHMA. Where the BLM has a backlog of Expressions of Interest for leasing, the BLM will prioritize its work first in non-habitat management areas, followed by lower priority habitat management areas (e.g., GHMA) and then higher priority habitat management areas (i.e., PHMA). To the extent consistent with federal regulation, law, and policy, priority would be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA. When analyzing	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts on Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority would be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. To incentivize development to locate outside of PHMA, the BLM would work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts on Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	
MO 15: In all SFAs and PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in *Interpreting Indicators of Rangeland Health* (BLM Tech Ref 1734-6).	In PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in *Interpreting Indicators of Rangeland Health* (BLM Tech Ref 1734-6).	No change (same as 2019)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO 16: The habitat objectives (see Tables 2-2 and 2-3) will be part of the Greater Sage-Grouse habitat assessment to be used during land health evaluations (see Monitoring Framework in Appendix D). These habitat objectives are not obtainable on every acre within the designated Greater Sage-Grouse habitat management areas. Therefore, the determination on whether the objectives have been met will be based on the specific site's ecological ability to meet the desired condition identified in the table.	No changes made.	Completely revised – revised by rangewide habitat objectives and Appendix referenced
MO 17: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
MD GMD 1: Continue to support the development of statewide Greater Sage-Grouse seasonal habitat models for the State of Wyoming.	No changes made.	No change (same as 2015)
MD GMD 2: Field offices will work with project proponents, partners, and stakeholders to avoid or minimize impacts and/or implement direct mitigation (e.g., relocating disturbance, timing restrictions, etc.), and utilize best management practices (BMPs).	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 3: Utilize the Wyoming SGIT and LWG plans or other state plans, analyses, and other sources of information to guide development of conservation objectives for local management of Greater Sage-Grouse habitats. The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under Governor Executive Order 2013-3, to: (1) develop appropriate conservation objectives; (2) define a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and (3) identify appropriate site-based action to achieve Greater Sage-Grouse conservation objectives within the framework.	No changes made.	Partially revised – to update Executive Order referenced
MD GMD 4: Include the collection of baseline data and outline post-project monitoring components in project planning, as appropriate and necessary.	No changes made.	No change (same as 2015)
MD GMD 5: The BLM will coordinate new recommendations, mitigation, habitat objectives, and management considerations applied for Greater Sage-Grouse with the WGFD and other appropriate agencies, local government cooperators, and the Wyoming SGIT. These measures will be analyzed in site-specific NEPA documents, and planning-level documents, as necessary.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 6: Apply appropriate seasonal restrictions for implementing vegetation management treatments according to the type of seasonal habitats present within Greater Sage-Grouse habitat. Vegetation treatments must include monitoring to determine achievement of objectives and their long-term success.	No changes made.	No change (same as 2015)
MD GMD 7: Ensure site-specific, measurable conservation and mitigation objectives are included in project planning within Greater Sage-Grouse habitats.	No changes made.	No change (same as 2015)
MD GMD 8: Each BLM field office will develop landscape-scale restoration, conservation, and maintenance strategies, including special management of seasonal habitats and identified connectivity zones outside of PHMA, working with voluntary partners and cooperating agencies. These strategies and habitat designations must be coordinated and reconciled with Wyoming's Greater Sage-Grouse Core Area Protection strategy (EO 2015-4), and where possible, with adjoining management entities that share habitats or populations.	No changes made.	Partially revised – to update Executive Order referenced
MD GMD 9: Design all projects in a manner that minimizes potential for invasive species establishment. Monitor and treat invasive species associated with all permitted activities consistent with BLM Handbook H-1740-2.	No changes made.	No change (same as 2015)
MD GMD 10: Apply all appropriate RDFs (Appendix C) as mandatory Stipulations/COA/Terms and Conditions within PHMA for all program areas as applicable.	No changes made.	Partially revised – to update Appendix referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 11: Integrated vegetation management will be used to control, suppress, and eradicate, where possible, noxious and invasive species per BLM Handbook H-1740-2. Manage weed treatments to maintain and improve Greater Sage-Grouse habitat. RDFs and BMPs will be applied to the permit as COA as determined through the site-specific analysis.	No changes made.	No change (same as 2015)
MD GMD 12: Existing notices and approved plans of operations under 43 CFR 3809: For projects that overlap PHMA, operators may be requested to submit modifications to the accepted notice or approved plan of operations so that the operations minimally affect PHMA (core only). The AO may convey to the operator suggested conservation measures, based on the notice or plan level operations and the geographic area of those operations (also called the project area, which is defined in 43 CFR 3809.5). These suggested conservation measures include measures that support the overall goals and objectives of the priority/core population area strategy and may not be reasonable or applicable to the BLM's determination of whether the proposed operations will cause unnecessary or undue degradation under 43 CFR 3809.5. The request containing the suggested conservation measures must make clear that the operator's compliance is not mandatory. Notices or plans of operation, or modifications thereto, submitted following the issuance of this guidance: As part of the 15-day completeness review of notices (or modifications thereto) and 30-day completeness review of plans of operations (or modifications thereto), the proposed project area(s) where exploration,	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
development, mining, access and reclamation would take place will be reviewed for overlap of Greater Sage-Grouse PHMA in the corporate GIS database. If there is overlap, the BLM AO may notify the operator of ways that they may minimize impacts on PHMA (core only) and request the operator to amend its notice or plan to include such measures. The request to amend the submitted notice or plan of operations must make clear that the operator's compliance is not mandatory and that including such measures is not a requirement for completeness of either the notice or a plan of operations, nor is it a condition of acceptance of the notice or approval of the plan of operations.		
MD GMD 13: As new occupied Greater Sage-Grouse habitat is found or occurs either through additional inventories or expansion into previously unoccupied habitat, the BLM will incorporate, through appropriate processes and analyses, these areas into the GHMA category and manage them as such, until the earliest review occurs by the SGIT. At that time, they will be considered for PHMA status or continue to be managed as GHMA and will be added to the statewide map.	No changes made.	Partially revised – to include SHMA
MD GMD 14: Contribute to actions that help to ground-truth the statewide Greater Sage-Grouse seasonal habitat models for the State of Wyoming.	No changes made.	No change (same as 2015)
MD GMD 15: Use the Sage-grouse Habitat Assessment Framework or best available assessment tool (approved by the AO) when assessing or evaluating Greater Sage-Grouse habitats at multiple scales.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 16: The official Wyoming Greater Sage-Grouse lek database is maintained by the WGFD in accordance with Appendix 4B of the Umbrella MOU between the WGFD and BLM (WGFD and BLM 1990). The MOU states that agencies will meet at least annually to coordinate and review the accuracy of data, and incorporate the most up-to-date information.	No changes made.	No change (same as 2015)
MD GMD 17: Many Greater Sage-Grouse seasonal habitats within and outside of PHMA (core only) are encumbered by valid existing rights, such as mineral leases or existing rights-of-way. Fluid mineral leases often will include less stringent lease stipulations than the timing, distance, and density requirements identified for consideration in this plan. The BLM will work with proponents holding valid existing leases that include less stringent lease stipulations than the timing, distance, and density restrictions described within this plan to ensure that measurable Greater Sage-Grouse conservation objectives (such as, but not limited to, consolidation of infrastructure to reduce habitat fragmentation and loss, and effective conservation of seasonal habitats and habitat connectivity to support management objectives set by the WGFD) are included in all project proposals.	No changes made.	Completely revised – revised by rangewide
MD GMD 18: PHMA will be designated as OHV Limited Areas. The OHV limitation will ultimately be to "Designated Routes" as determined through a subsequent implementation/activity-level Travel Management Plan. In the interim, motorized use on existing routes may occur; however, no new routes may be created without specific authorization.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 19: Complete activity-level travel plans within 5 years of the record of decision (ROD) for this planning effort. During activity-level planning, where appropriate, designate routes in PHMA with current administrative/agency purpose or need to administrative access only. Existing plans shall be assessed for consistency with Greater Sage-Grouse conservation objectives.	No changes made.	No change (same as 2015)
MD GMD 20: Construct roads needed for production activities to minimum design standards within PHMA, in compliance with the Density and Disturbance Calculation Tool (DDCT) process.	No changes made.	No change (same as 2015)
MD GMD 21: Field office staff will work with project proponents (including those within the BLM) and the WGFD to site their projects in locations that meet the purpose and need for their project, utilize the DDCT, and have been determined to contain the least sensitive habitats.	No changes made.	No change (same as 2015)
MD GMD 22: Evaluate opportunities to coordinate management plans and strategies on multiple allotments where coordination under a single management plan/strategy will result in enhancing Greater Sage-Grouse populations or its habitat, as determined in coordination with the state wildlife agency and with project proponents, partners, and stakeholders.	No changes made.	No change (same as 2015)
MD GMD 23: Existing RMP decisions, pertaining to non-Greater Sage-grouse resources, will be retained unless vacated or modified by decisions in this ARMPA. Where more restrictive land use allocations or decisions are made in existing RMPs, those more restrictive land use allocations or decisions will remain in effect and will not be amended by this ARMPA.	Existing RMP decisions, pertaining to non-Greater Sage-Grouse resources, will be retained unless vacated or modified by decisions in this ARMPA. Where inconsistencies between the 2015 Greater Sage-Grouse ARMPA and this 2019 Wyoming GrSG ARMPA arise, the 2019 Wyoming GrSG ARMPA decisions and Appendices apply.	Partially revised (from 2019) – to reflect that inconsistencies invoke the most recent planning effort

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GMD 24: Fire and fuels management actions will be designed to contribute to the protection and enhancement of sagebrush habitat that support Greater Sage-Grouse populations (including large, contiguous blocks of sagebrush).	No changes made.	No change (same as 2015)
MD GMD 25: BLM planning units (Districts), in coordination with the USFWS and relevant state agencies, will complete and continue to update Greater Sage-Grouse Landscape Wildfire & Invasive Species Habitat Assessments to prioritize at-risk habitats, and identify fuels management, preparedness, suppression and restoration priorities necessary to maintain sagebrush habitat to support interconnecting Greater Sage-Grouse populations. These assessments and subsequent assessment updates will also be a coordinated effort with an interdisciplinary team to take into account other Greater Sage-Grouse priorities identified in this plan. 2015 ARPMA Appendix L describes a minimal framework example and suggested approach for this assessment. Implementation actions will be tiered to the Local (District) Greater Sage-Grouse Landscape Wildfire & Invasive Species Assessment using the best available science related to the conservation of Greater Sage-Grouse. In coordination with the USFWS and relevant state agencies, the BLM planning units (Districts) will identify annual treatment needs for wildfire and invasive species management as identified in local unit-level Landscape Wildfire and Invasive Species Assessments. Annual treatment needs will be coordinated across state/regional scales and across jurisdictional boundaries for long-term conservation of Greater Sage-	No changes made.	Partially revised – to update Appendix referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Grouse. These landscape assessment implementation efforts will be reviewed annually with appropriate USFWS and state agency personnel.		
MD GMD 26: Implement a coordinated inter-agency approach to fire restrictions based on National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns) for Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD GMD 27: Within acceptable risk levels, utilize a full range of fire management strategies and tactics, including the management of wildfires, to achieve resource objectives across the range of Greater Sage-Grouse habitat consistent with land use plan direction.	No changes made.	No change (same as 2015)
(No similar action.)	MD GMD 28: The BLM will update its Greater Sage-Grouse habitat management areas, including biologically significant units (BSUs), in conjunction with the State of Wyoming's core areas, upon issuance of any Wyoming Governor's Executive Order revising or amending the core area boundaries and upon completion of appropriate NEPA analysis and process. The BLM will complete the appropriate NEPA documentation (including appropriate public comment) prior to adopting any revised core area boundaries (e.g., maintenance action or plan amendment, environmental assessment, etc.).	Partially revised – to change reference from BSUs to HAF multi-scale areas

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 1: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: The BLM, in coordination with the State of Wyoming and its agencies, other local partners and stakeholders, will establish monitoring framework (Appendix D) for Greater Sage-Grouse populations and habitat that will be incorporated into individual project approvals, including small and in-house projects, as appropriate and necessary. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Bates Hole and Fish Creek/Willow Creek: The areas will have priority for vegetation treatments to improve Greater Sage-Grouse habitats and for vegetation monitoring to ensure residual herbaceous vegetation is maintained for nesting cover on public lands.	No changes made.	Partially revised – to update Appendix referenced
MD SSS 2: In PHMA (core only), the density of disturbance of an energy or mining facility (Appendix D) will be limited to an average of one site per square mile (640 acres) within the DDCT, subject to valid existing rights. The one location and cumulative value of existing disturbances will not exceed 5 percent of suitable habitat of the DDCT area. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the DDCT area using the DDCT process.	No changes made.	Partially revised – density of disturbance (i.e., 1 per 640) revised to update Appendix referenced; Completely revised – surface disturbance (5%) revised by rangewide and state-specific
MD SSS 3: Inside PHMA (connectivity only), all suitable habitat disturbed (any program area) will not exceed 5 percent of suitable habitat within the DDCT area using the DDCT process.	No changes made.	Completely revised – revised by rangewide and state-specific

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 4: Within PHMA, Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: In undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation in PHMA, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. In Wyoming, the USFWS has found that "the core area strategy, if implemented by all landowners via regulatory mechanism, would provide adequate protection for Greater Sage-Grouse and their habitats in the state." The BLM will implement actions to achieve the goal of net conservation gain consistent with the Wyoming Strategy (EO2015-4) that includes "compensatory mitigation as a strategy that should be used when avoidance and minimization are inadequate to protect Core Population Area Greater sage-grouse." Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Pinedale RMP:</u> Off-site mitigation proposed by oil and gas or other operators shall be considered and analyzed in future environmental documents as possible mitigation for proposed activities within the planning area. Proposed off-site mitigation will be described and analyzed for effectiveness in detail on a project-specific basis. Planning for off-site mitigation will be performed in coordination with local	Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Adopt the State of Wyoming's Greater Sage-Grouse Compensatory Mitigation Framework to the extent consistent with federal law, regulations, and policy. In all Greater Sage-Grouse habitat, when authorizing third-party actions in designated Greater Sage-Grouse habitat, the BLM will seek to achieve the planning-level Greater Sage-Grouse management goals and objectives through implementation of mitigation and management actions, consistent with valid existing rights and applicable law. Under this Plan Amendment, management would be consistent with the Greater Sage-Grouse goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [Greater Sage-Grouse] or to improve the condition of [Greater Sage-Grouse] habitat" across the planning area. Accordingly, before authorizing third-party actions that result in habitat loss and degradation, the BLM will complete the following steps, in alignment with the Governor of Wyoming's Executive Order 2015-4 (July 29, 2015): 1. Work jointly with the WGFD to evaluate projects and recommend mitigation in the form of avoidance and minimization. 2. The WGFD will determine if the State requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of Greater Sage-Grouse. 3. Incorporate state required or recommended mitigation into the	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
government agencies. The need for off-site mitigation will be determined in conformance with current BLM policy, as updated. The order of use of mitigation methods from most to least preferred is as follows: 1. On-site mitigation directly resolving impacts created by the action 2. Off-site mitigation to the resources affected by the action that cannot be resolved on-site 3. Off-site mitigation to similar or related resources affected by the action that cannot be resolved on-site. The following stipulations apply to off-site mitigation measures: 1. Off-site mitigation will be used as a last choice when developing mitigation measures. 2. Off-site mitigation proposals will describe the replacement or substitution activities or methods that are used to address potential impacts on specific resources or environments or both. 3. Off-site mitigation must be as close to "in-kind" in replacement or substitution of resources, habitat function, or environments as practicable (e.g., elk habitat for elk habitat, historical properties for historical properties). 4. Off-site mitigation practices must last as long as the impacts are expected to occur. 5. Off-site mitigation practices are to be developed, conducted or performed, and funded by the project proponent. 6. Off-site mitigation activities must be conducted subject to BLM review and approval that the mitigation will actually address the impacts occurring on the public lands. The priority order for mitigating resource impacts on-site or off-site is as follows:	BLM's NEPA decision-making process, if the WGFD determines that compensatory mitigation is required to address impacts to GRSG habitat as a part of State policy or authorization, or if a proponent voluntarily offers mitigation. 4. Analyze whether the compensatory mitigation (deferring to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action): • achieves measurable outcomes for Greater Sage-Grouse habitat function on a landscape scale as determined by WGFD that are at least equal to the lost or degraded values in accordance with the Governor of Wyoming's Executive Order 2015-4. • provides benefits that are in place for at least the duration of the impacts • accounts for a level of risk that the mitigation action may fail or not persist for the full duration of the impact 5. Ensure mitigation outcomes are consistent with the State of Wyoming's mitigation strategy and principles outlined in 2019 GrSG ARMPA Appendix C, The Greater Sage-Grouse Habitat Management Strategy The BLM has determined that, except where the law specifically requires, compensatory mitigation must be voluntary unless required by other applicable law and in recognition that State authorities may also require compensatory mitigation (IM 2019-018, *Compensatory Mitigation*, December 6, 2018). Therefore, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
1. On-site Mitigation – On-site (avoid, minimize, rectify, or reduce in time). 2. Off-site Mitigation – Local (unless greater resource benefits can be achieved through regional or interstate mitigation). 3. Off-site Mitigation – Regional (unless greater resource benefits can be achieved through interstate mitigation). 4. Off-site Mitigation – Interstate: The preferred area for conducting off-site mitigation is as near (local off-site mitigation) to the project or affected area as possible or as scientific information and impact analysis suggests. 5. Off-site Mitigation – Interstate: The preferred area for conducting off-site mitigation is as near (local off-site mitigation) to the project or affected area as possible or as scientific information and impact analysis suggests.	degradation, the BLM will consider voluntary compensatory mitigation actions only as a component of compliance with a State mitigation plan, program, or authority, or when offered voluntarily by a project proponent. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and alignment with State policies and requirements, including those regarding compensatory mitigation. When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a mitigation requirement from the State, the BLM's NEPA analysis would evaluate the need to avoid or minimize impacts of the proposed project and achieve the goals and objectives of this RMPA. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action.	
MD SSS 5: Greater Sage-Grouse leks inside PHMA: Surface occupancy and surface-disturbing activities will be prohibited on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (Map 2-8). The AO may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse.	Greater Sage-Grouse leks inside PHMA: Surface occupancy and surface-disturbing activities will be prohibited on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) (Map 2-8). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SSS 4).	Partially revised (2019) – to update map referenced and update EO referenced and to reference Fluid Mineral Appendix with fluid mineral exceptions, waivers, and modifications (updated to reflect rangewide and state-specific)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 6: Greater Sage-Grouse leks outside PHMA: Surface occupancy and surface-disturbing activities will be prohibited on or within a 0.25-mile radius of the perimeter of occupied Greater Sage-Grouse leks (Map 2-8). The AO may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse.	Greater Sage-Grouse leks outside PHMA: Surface occupancy and surface-disturbing activities will be prohibited on or within a 0.25-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) (Map 2-8). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4)(see MD SSS 4).	Partially revised (2019) – to update map referenced and update EO referenced and to reference Fluid Mineral Appendix with fluid mineral exceptions, waivers, and modifications (updated to reflect rangewide and state-specific)
MD SSS 7: Greater Sage-Grouse breeding, nesting, and early brood-rearing habitat inside PHMA (core only): Surface-disturbing and/or disruptive activities will be prohibited from March 15–June 30 to protect Greater Sage-Grouse breeding, nesting, and early brood rearing habitat. This timing limitation will be applied throughout the PHMA (core only). Activities in unsuitable habitats will be evaluated under the exception and modification criteria and shall be allowed on a case by case basis. Where credible data support different timeframes for this seasonal restriction, dates may be expanded by up to 14 days prior to or subsequent to the above dates.	Greater Sage-Grouse breeding, nesting, and early brood-rearing habitat inside PHMA (core only): Surface-disturbing and/or disruptive activities will be prohibited from March 15–June 30 to protect Greater Sage-Grouse breeding, nesting, and early brood rearing habitat. This timing limitation will be applied throughout the PHMA (core only). 2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 10: Sage-Grouse Winter Concentration Areas: Surface-disturbing and/or disruptive actives in Greater Sage-Grouse winter concentration areas would be prohibited from December 1—March 14. Activities in unsuitable habitats within PHMA would be evaluated under the exception and modification criteria and could be allowed on a case-by-case basis. Protection of additional mapped winter concentration areas in GHMA would be implemented where winter concentration areas are identified as supporting populations of Greater Sage-Grouse that attend leks within PHMA (core only). Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated on consultation with the WGFD in all identified winter concentration areas.	Greater Sage-Grouse Winter Concentration Areas: Surface-disturbing and/or disruptive actives in Greater Sage-Grouse winter concentration areas would be prohibited from December 1—March 14. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SSS 4). Protection of additional mapped winter concentration areas in GHMA would be implemented where winter concentration areas are mapped and designated by the State of Wyoming. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated on consultation with the WGFD in all identified winter concentration areas.	Partially revised (2019) – to update EO referenced, include SHMA, and to reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific) for winter concentration areas in PHMA
MD SSS 11: The BLM will support other agencies in their efforts to minimize impacts from predators. The BLM will implement strategies and techniques in land management decisions that address predators shown to pose a threat to Greater Sage-Grouse (Appendix N). The BLM will support and encourage other agencies in their efforts to minimize impacts from predators on Greater Sage-Grouse where needs have been documented.	The BLM will support other agencies in their efforts to minimize impacts from predators. The BLM will implement strategies and techniques in land management decisions that address predators shown to pose a threat to Greater Sage-Grouse (2015 ARMPA Appendix N). The BLM will support and encourage other agencies in their efforts to minimize impacts from predators on Greater Sage-Grouse where needs have been documented.	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 12: New project noise levels, either individual or cumulative, should not exceed 10 dBA (as measured by L50) above baseline noise at the perimeter of the lek from 6:00 pm to 8:00 am during the breeding season (March 1–May 15). Specific noise protocols for measurement and implementation will be developed as additional research and information emerges.	Within PHMA (core only), new project noise levels, either individual or cumulative, should not exceed 10 dBA (as measured by L50) above baseline noise at the perimeter of the lek (or lek center if no perimeter is yet mapped) from 6:00 pm to 8:00 am during the breeding season (March 1–May 15). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SSS 4). In coordination with the State of Wyoming, specific noise protocols for measurement and implementation will be developed as additional research and information emerges. These measures would be considered at the site-specific project level where and when appropriate.	Partially revised (2019) – to update EO referenced
MD SSS 13: The Greater Sage-Grouse adaptive management plan (Appendix D) provides a means of addressing and responding to unintended negative impacts on Greater Sage-Grouse, and its habitat will be addressed before consequences become severe or irreversible. The Wyoming Greater Sage-Grouse ARMPA will include the requirement for projects requiring an EIS to develop adaptive management strategies in support of the population management objectives for Greater Sage-Grouse set by the State of Wyoming. Wyoming ADPPs will include an adaptive management plan, as reviewed by the BLM WO, Solicitor's Office, and USFWS, which includes: Upon determination that a hard trigger is tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions for a period of 90 days.	The Greater Sage-Grouse adaptive management plan (2019 Wyoming GrSG ARMPA Appendix C) provides a means of addressing and responding to unintended negative impacts on Greater Sage-Grouse, and its habitat will be addressed before consequences become severe or irreversible. The Wyoming Greater Sage-Grouse ARMPA will include the requirement for projects requiring an EIS to develop adaptive management strategies in support of the population management objectives for Greater Sage-Grouse set by the State of Wyoming. Wyoming ADPPs will include an adaptive management plan, as reviewed by the BLM WO, Solicitor's Office, and USFWS, which includes: Upon determination that a hard trigger is tripped, the BLM will immediately defer issuance of discretionary authorizations for	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
In addition, within 14 days of a determination, the AMWG will convene to develop an interim response strategy and initiate an assessment to determine the causal factors. Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. In making amendments to this plan, the BLM will coordinate with the USFWS as the BLM continues to meet its objective of conserving, enhancing, and restoring Greater Sage-Grouse habitat by reducing, minimizing, or eliminating threats to that habitat. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter. <u>Soft Triggers:</u> Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation action or that unanticipated changes to populations or habitats have occurred that have the potential to place habitats or populations at risk. The soft trigger is any deviation from normal trends in habitat or population in any given year. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and DDCT evaluations. BLM field offices, with the assistance of their respective land and resource management plan implementation	new actions for a period of 90 days. In addition, within 14 days of a determination, the AMWG will convene to develop an interim response strategy and initiate an assessment to determine the causal factors. The AMWG would define a process to review and reverse adaptive management actions once the identified causal factor is resolved (e.g., returning to previous management once objectives of interim management strategy have been met). Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. In making amendments to this plan, the BLM will coordinate with the USFWS as the BLM continues to meet its objective of conserving, enhancing, and restoring Greater Sage-Grouse habitat by reducing, minimizing, or eliminating threats to that habitat. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter. <u>Soft Triggers:</u> Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation action or that unanticipated changes to populations or habitats have occurred that have the potential to place habitats or populations at risk. The soft trigger is any deviation from normal trends in habitat or	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
groups, local WGFD offices, and local Greater Sage-Grouse working groups, will evaluate the metrics with the AMWG on an annual basis. For population metrics, normal population trends are calculated as the 5-year running mean of annual population counts. The purpose of these strategies is to address localized Greater Sage-Grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold. Hard Triggers: Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers will be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact or set of impacts is having a negative effect. Within the range of normal population variables (5-year running mean of annual population counts), hard triggers shall be determined to take effect when two of the three metrics exceeds 60 percent of normal variability for the area under management in a single year, or when any of the three metrics exceeds 40 percent of normal variability for a 3-year time period within a 5-year range of analysis. A minimum of 3 consecutive years in a 5-year period is used to determine trends (i.e., Y1-2-3, Y2-3-4, Y3-4-5).	population in any given year. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and DDCT evaluations. BLM field offices, with the assistance of their respective land and resource management plan implementation groups, local WGFD offices, and local Greater Sage-Grouse working groups, will evaluate the metrics with the AMWG on an annual basis. For population metrics, normal population trends are calculated as the 5-year running mean of annual population counts. The purpose of these strategies is to address localized Greater Sage-Grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold. Hard Triggers: Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers will be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact or set of impacts is having a negative effect. Within the range of normal population variables (5-year running mean of annual population counts), hard triggers shall be determined to take effect when two of the three metrics exceeds 60 percent of normal variability for the area under management in a single year, or when any of the three metrics exceeds 40 percent of normal variability for a 3-year time period within a 5-year range of analysis. A minimum of 3 consecutive years in a 5-year period is used to determine trends (i.e., Y1-2-3, Y2-3-4, Y3-4-5).	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SSS 14: Designate SFAs as shown on Map 1-2 (1,915,990 acres). SFAs will be managed as PHMA, with the following additional management: Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights, the lands shown in Map 2-3 (252,160 acres), and 2) Prioritized for vegetation management and conservation actions in these areas, including, but not limited to land health assessments, wild horse and burro management actions, review of livestock grazing permits/leases, and habitat restoration (see specific management sections).	Lands identified as Sagebrush Focal Areas (SFAs) will no longer be designated as SFAs. Lands previously identified as SFAs will be managed as Priority Habitat Management Areas (PHMAs), consistent with Core Area boundaries.	No change (same as 2019)
MD VEG 1: Manage vegetation composition, diversity, and structure, as determined by ESD, or other methods that reference site potential, and WGFD protocols, to achieve Greater Sage-Grouse habitat management objectives, in cooperation with stakeholders.	No changes made.	No change (same as 2015)
MD VEG 2: Within PHMA in northeast Wyoming (as mapped in EO 2015-4), vegetation treatments in nesting and wintering habitat that will reduce sagebrush canopy to less than 15 percent will not be conducted.	No changes made.	Partially revised – to update EO referenced
MD VEG 3: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: For vegetation treatments in sagebrush within PHMA, refer to 2015 ARMPA Appendix H, WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2011, as updated) and BLM Washington Office Instruction Memorandum 2013-128 (Sage-grouse Conservation Related to Wildland Fire and Fuels Management). These recommended protocols will be used in determining whether proposed treatment constitutes a "disturbance" that will contribute	No changes made.	Partially revised – to update Appendix referenced and WGFD Protocols for Treating Sagebrush version referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
toward the 5 percent threshold within PHMA maintenance. Additionally, these protocols will be used to determine whether the proposed treatment configuration is expected to have neutral or beneficial impacts for PHMA (core only) populations or if they represent additional habitat loss or fragmentation. Treatments to enhance sagebrush/grasslands habitat for Greater Sage-Grouse will be evaluated based on habitat quality and the functionality/use of treated habitats post-treatment. The BLM will work collaboratively with partners at the state and local level to maintain and enhance Greater Sage-Grouse habitats. Seasonal restriction would be applied, as needed, for implementing fuels management treatments according to the type of seasonal habitat present. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Green River RMP:</u> Prescribed burns generally will be conducted in areas having greater than 35 percent sagebrush composition, 20 percent desirable grass composition, and greater than 10 inches of precipitation. Other vegetation manipulation methods will be considered on a case-by-case basis depending on objectives and cost benefits. <u>Casper RMP:</u> Decision 4053: The areas (Bates Hole and Fish Creek/Willow Creek) will have priority for vegetative treatments to improve Greater Sage-Grouse habitats and for vegetation monitoring to ensure residual herbaceous vegetation is maintained for nesting cover on public lands.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 4: Within PHMA, grazing will be deferred on treated areas for two full growing seasons unless vegetation objectives or vegetation recovery indicates a shorter or longer rest period is necessary based on vegetation monitoring results.	No changes made.	No change (same as 2015)
MD VEG 5: Reclamation of surface disturbances in PHMA will be consistent with the Wyoming Reclamation Policy (BLM 2009a), vegetation objectives (Table 2-2 and 2-3), and Appendix M. A monitoring plan will be developed for each restoration or reclamation project and will report progress and changes in resource condition.	No changes made.	Partially revised – to update vegetation objectives Tables referenced and Appendix referenced
MD VEG 6: Areas for vegetation restoration and/or restoration criteria that include state Greater Sage-Grouse conservation plans and appropriate local information will be identified. The use of native plants and seeds for restoration will be required unless the probability for success is low (nonnative plants and seeds may be used as long as they meet Greater Sage-Grouse habitat objectives), and restoration management will be designed to obtain long-term persistence based on ESD. Reestablishment of sagebrush cover and desirable understory plants will be the highest priority for restoration efforts. Landscape patterns that most benefit Greater Sage-Grouse will be restored and created, considering potential changes in climate.	No changes made.	No change (same as 2015)
MD VEG 7: Within PHMA, implementation of restoration projects will be prioritized based on environmental variables that improve chances for project success in areas most likely to benefit Greater Sage-Grouse. Restoration will be prioritized in seasonal habitats that are thought to be limiting Greater Sage-Grouse distribution and/or abundance.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 8: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Where probability of success or native seed availability is low or where there is a specific identified purpose that cannot be met with natives, nonnative seeds can be used provided they meet Greater Sage-Grouse habitat conservation and vegetation (see Tables 2-2 and 2-3) objectives. The use of native seeds for fuels management treatment will be prioritized based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low, non- native seeds may be used to meet Greater Sage-Grouse habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks. Native seed allocation will be prioritized for use in Greater Sage-Grouse habitat. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Kemmerer RMP:</u> Require the use of certified weed-free seed and mulch for rehabilitation projects. <u>Pinedale RMP:</u> Disturbed areas will be reclaimed to native site plant composition. If reclamation of original plant composition is impossible or not desirable, reclamation will achieve a native plant community that meets the Wyoming Standards for Rangeland Health.	No changes made.	Partially revised – to update vegetation objectives Tables referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 9: Post emergency stabilization and rehabilitation (ES&R) and burn area emergency rehabilitation (BAER) management will be designed to ensure long-term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse, and travel management, etc., to achieve and maintain the desired condition of ES&R and BAER projects to benefit Greater Sage-Grouse (Eiswerth and Shonkwiler 2006).	No changes made.	No change (same as 2015)
MD VEG 10: Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to Greater Sage-Grouse habitat to determine if they should be restored to sagebrush or habitat of higher quality for Greater Sage-Grouse. If these seedings provide value in conserving or enhancing Greater Sage-Grouse habitats, then no restoration would be necessary. Assess the compatibility of these seedings for Greater Sage-Grouse habitat during the land health assessments.	No changes made.	No change (same as 2015)
MD VEG 11: Priority will be given for implementing specific Greater Sage-Grouse habitat restoration projects in areas invaded by annual grasses first to sites that are adjacent to or surrounded by PHMA. Areas invaded by annual grasses will be second priority for restoration when the sites are not adjacent to PHMA, but are within 2 miles of PHMA. The third priority for areas invaded by annual grasses habitat restoration projects will be sites beyond 2 miles of PHMA. The intent will be to focus restoration outward from existing, intact habitat.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD VEG 12: In fire prone areas where sagebrush seed is required for Greater Sage-Grouse habitat restoration, the BLM will consider establishing seed harvest areas that are managed for seed production and are a priority for protection from outside disturbances.	No changes made.	No change (same as 2015)
MD VEG 13: Vegetation treatment proposals must include evaluation of soils, precipitation, invasive/exotic plants, as well as the current condition of PHMA. Avoid aerial pesticide/herbicide spraying in favor of ground applications to minimize drift into nontarget areas in Greater Sage-Grouse habitat unless benefits of treatments are likely to outweigh impacts.	No changes made.	No change (same as 2015)
MD VEG 14: Treat areas that contain cheatgrass and other invasive or noxious species to minimize competition and favor establishment of desired species.	No changes made.	No change (same as 2015)
MD VEG 15: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: The BLM can implement treatments within PHMA where outbreaks of grasshopper or Mormon cricket populations are expected to rise above economic levels. Treatments must be conducted only following reduced agent-area treatments protocols. The BLM will work collaboratively with partners at the federal, state, and local levels, including the Wyoming Weed and Pest Districts within the counties where the treatment is to occur, to maintain and enhance Greater Sage-Grouse habitats in a manner consistent with the core population area strategy for conservation. The BLM will be directed to utilize the Wyoming Grasshopper and Mormon Cricket Control website as a resource for updated information when conducting analysis of grasshopper and	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Mormon cricket control in Greater Sage-Grouse habitats. Avoid aerial pesticide/herbicide spraying in favor of ground applications to minimize drift into nontarget areas in Greater Sage-Grouse habitat unless benefits of treatments are likely to outweigh impacts. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Work with Animal and Plant Health Inspection Service to control outbreaks of grasshoppers and Mormon crickets on public lands in the planning area in accordance with the MOU between U.S. Department of the Interior and Animal and Plant Health Inspection Service.		
MD FIRE 1: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: For Wildland Fire Management, the protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection. The goal is to restore, enhance, and maintain areas suitable for Greater Sage-Grouse. Greater Sage-Grouse habitat (GHMA) will be prioritized commensurate with local fire plans, property values and other important habitat to be protected, with the goal to restore, enhance, and maintain areas suitable for Greater Sage-Grouse. PHMA (and Priority Areas for Conservation, if so determined by individual RMP efforts) will be the highest priority for conservation	No changes made.	Partially revised – to update Appendix referenced and to include SHMA

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
and protection during fire operations and fuels management decision-making. The PHMA will be viewed as more valuable than GHMA when priorities are established. When suppression resources are widely available, maximum efforts will be placed on limiting fire growth in GHMA polygons as well. These priority areas will be further refined following completion of the Greater Sage-Grouse Landscape Wildfire and Invasive Species Habitat Assessments described in Appendix L. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: Appropriate management response will be used on all wildfires in the planning area. Full protection strategies and tactics will be used in the following areas: 1. Wildland Urban Interface (WUI) 2. Wildland industrial interface 3. Developed recreation sites 4. Developed electronics sites of all types. In all other areas appropriate management response (AMR) strategies and tactics will be determined by (but not limited to) the following: 1. Firefighter and public safety 2. Resource values at risk 3. Proximity to private land 4. Firefighting resource availability. Tactical constraints follow: 1. The use of retardant within 300 feet of surface water (standing or running) is prohibited. 2. No trees are to be cut during suppression activities within 200 yards of an identified bald eagle roost. No heavy equipment will be used within the following areas, except when human safety is at risk:		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
1. Areas of cultural resource sensitivity 2. Riparian/wetland habitats 3. Big game crucial winter range habitats 1. Greater Sage-Grouse leks 2. Areas of highly erosive soils. In areas not identified as full protection, heavy equipment usage will be limited to existing roads and trails or immediately adjacent to them. <u>Kemmerer RMP:</u> In areas of high-density urban and (or) industrial interface with intermingled BLM-administered lands, suppression objectives will follow the AMR in an approved fire management plan for the planning area to provide first for human health and safety, while minimizing loss of property and threats to other surface owners. Generally, wildland fires are suppressed in these areas. In areas of low-density urban and (or) industrial interface where BLM-administered lands occur in large contiguous blocks, fire suppression objectives will follow the AMR in an approved fire management plan for the planning area to provide first for human health and safety, while allowing for achievement of resource objectives. <u>Newcastle RMP:</u> Full suppression will be used on fires endangering human life or that spread to within 0.25 miles of state or private lands, structures and facilities, oil and gas fields, important riparian habitat, or other sensitive resources. All wildfires will be evaluated to determine the need for rehabilitation or restoration measures. Restoration of burned areas will be by natural succession unless a special need is identified to prevent further resource damage. <u>Pinedale RMP:</u> Wildland fire mitigation and fuels activities will be managed to		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
provide for firefighter and public safety as a first priority. Public lands within intermixed land ownership areas will be managed in association with the adjoining and nearby private and state lands. Areas of mixed land ownership, communities at risk as identified in the *Federal Register*, Volume 66, Number 160, 2001 (Antelope Run, Beaver Creek area, Boulder, Cottonwood Creek, Daniel, Forty Rod, Hoback Ranches, New Fork, Pinedale, Pocket Creek, and Upper Green); urban and industrial interface areas; and areas containing high-priority resource values have high priority for response to wildland fires and/or for fuels reduction and mitigation. Wildland fire suppression activities will be based on the AMR. Rawlins RMP: A high priority for fire management activities will be given to areas identified as communities at risk, industrial interface areas, and areas containing resource values considered high priority within the RMP planning area. Green River RMP: Wildfire suppression will emphasize AMR. Immediate control actions will be used only in cases of arson, direct threat to public safety, or a strong potential threaten structural property. Fire suppression actions will be based on achieving the most efficient control and allowing historical acres burned to increase. Activity plans will be developed for designated fire management areas defining specific parameters for all fire occurrences. JMH CAP: Appropriate management response to protect the basin big sagebrush/lemon scurfpea plant communities will be applied. Wildland and prescribed fires will be managed in all vegetation types		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
to maintain or improve biological diversity and the overall health of the public lands. In particular, plant species and age class diversity will be a priority; thus, AMR for all wildland fires will be identified and implemented depending on the resources and management objectives for the area. Suppression techniques and hazardous fuels reduction activities will be identified to reduce wildland fire severity and occurrence on portions of the landscape where fire causes undesirable changes in plant community composition and structure. A site-specific analysis will be prepared for sensitive resource areas, such as special status plant species sites, heritage sites, historic trails, and areas of critical environmental concern (ACECs), to determine the type of fire suppression activity that will be acceptable. Fire equipment and fire suppression techniques, such as vegetation clearing, will be limited to existing roads and trails in special status plant species habitat. As appropriate, the Fire Management Plan will be updated to reflect the appropriate suppression activity in sensitive resource areas.		
MD FIRE 2: In PHMA, fuels treatments will be designed and implemented with an emphasis on protecting existing sagebrush ecosystems and enhancing and protecting future sagebrush ecosystems (refer to WGFD Protocols for Treating Sagebrush to Benefit Sage-grouse [WGFD 2011, as updated]) and 2015 ARMPA Appendix H. These recommended protocols will be used in determining whether proposed treatment constitutes a "disturbance" that will contribute toward the 5 percent threshold for habitat maintenance. Fuel treatments will be designed	No changes made.	Partially revised – to update Appendices referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
through an interdisciplinary process to expand, enhance, maintain, and protect Greater Sage-Grouse habitat. Green strips (using native fire resistant/resilient species) and/or fuel breaks will be used, where appropriate, to protect seeding efforts from subsequent fire events. In coordination with the USFWS and relevant state agencies, BLM planning units (Districts) with large blocks of Greater Sage-Grouse habitat will develop, using the assessment process described in 2015 ARMPA Appendix L, a fuels management strategy which considers an up-to-date fuels profile, land use plan direction, current and potential habitat fragmentation, sagebrush and Greater Sage-Grouse ecological factors, and active vegetation management steps to provide critical breaks in fuel continuity, where appropriate. When developing this strategy, planning units will consider the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken. Utilizing an interdisciplinary approach, a full range of fuel reduction techniques will be available. Fuel reduction techniques such as grazing, prescribed fire, chemical, biological, and mechanical treatments will be acceptable. Upon project completion, fuels projects will be monitored and managed to ensure long-term success, including persistence of seeded species and/or other treatment components. Invasive vegetation post-treatment will be controlled. Wildfire prevention plans will be developed that explain the resource value of Greater Sage-Grouse habitat and include fire prevention messages and actions to reduce human-caused ignitions.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 3: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: For fuels management, the BLM will consider multiple tools for fuels reduction and will analyze in NEPA compliance documentation before electing to implement prescribed fire in PHMA. If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address: • Why alternative techniques were not selected as a viable options • How Greater Sage-Grouse goals and objectives will be met by its use • How the COT (Conservation Objectives Team) report objectives will be addressed and met • A risk assessment to address how potential threats to Greater Sage-Grouse habitat will be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire can be used to meet specific fuels objectives that protect Greater Sage-Grouse habitat in PHMA (e.g., creation of fuel breaks that disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat will need to be designed to strategically reduce	No changes made.	Partially revised – to update Appendix referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
wildfire risk around and/or in the winter range and designed to protect winter range habitat quality. Refer to 2015 ARMPA Appendix H, WGFD Protocols for Treating Sagebrush to Benefit Sage-grouse (WGFD 2011, as updated) and BLM Washington Office Instruction Memorandum 2013-128. If prescribed fire activities are not in compliance with these protocols, the treatment will be considered a PHMA disturbance. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: Use prescribed burning to achieve measurable 5th-order watershed objectives from (1) other resources, including, but not limited to, forestry, wildlife, range, vegetation, and watershed; (2) the reduction of hazardous fuels; and (3) the introduction of fire into fire-adapted ecosystems. Green River RMP/JMH CAP: Prescribed fire will generally be the preferred method of vegetation manipulation to convert decadent stands of brushland to grasslands and to stimulate sprouting of old, decadent aspen stands and/or shrub species. Prescribed burns are preferred in areas having greater than 35 percent sagebrush composition, 20 percent desirable grass composition, and greater than 10 inches of precipitation. Rawlins RMP: Fuel treatments, including prescribed fire, mechanical, chemical, and biological treatments will be used for fuels reduction and to meet other multiple-use resource objectives, including returning fire to its natural role in the ecosystem. WUIs and communities at risk will receive priority for fuels reduction.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 4: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Remove conifers encroaching into sagebrush habitats in a manner that considers tribal cultural values. Prioritize treatments closest to occupied Greater Sage-Grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and principles like those included in the FIAT (Fire and Invasive Species Assessment) report (Chambers et. al., 2014) and other ongoing modeling efforts to address conifer encroachment will help refine the location for specific priority areas to be treated. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: Treat woodland encroachment in grassland, sagebrush, aspen, and other vegetative communities where it is determined to be detrimental to other resource values or uses. Manage 630,180 acres of sagebrush communities toward Desired Plant Community.	No changes made.	No change (same as 2015)
MD FIRE 5: The following RMP decisions remain in effect for both PHMA and GHMA: <u>Pinedale RMP:</u> In the WUI or industrial interface, fuels reduction methods best suited to the area will be used to reduce the risk of catastrophic fire to these areas. <u>Casper RMP:</u> Use prescribed burning to achieve measurable 5th-order watershed objectives from (1) other resources, including, but not limited to, forestry, wildlife, range, vegetation, and watershed; (2) the reduction of hazardous fuels; and (3) the introduction of fire into fire-adapted	No changes made.	Partially revised – to include SHMA

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
ecosystems. Utilize an integrated management technique approach (defined as prescribed fire, mechanical, chemical, or biological, followed by desired reseeding) to reduce fuels to protect high priority areas or resource values defined as, but not limited to the following: • Urban and industrial interface areas • Developed recreation areas • Commercial timber areas • Wildlife habitats • Range-improvement facilities • Communication sites • Municipal watersheds. Decision 3008 Fuels Management. <u>Rawlins RMP:</u> A high priority for fire management activities will be given to areas identified as communities at risk, industrial interface areas, and areas containing resource values considered high priority within the RMP planning area. <u>JMH CAP:</u> Appropriate management response to protect the basin big sagebrush/lemon scurfpea plant communities will be applied. Wildland and prescribed fires will be managed in all vegetation types to maintain or improve biological diversity and the overall health of the public lands. In particular, plant species and age class diversity will be a priority; thus, AMR for all wildland fires will be identified and implemented depending on the resources and management objectives for the area. Suppression techniques and hazardous fuels reduction activities will be identified to reduce wildland fire severity and occurrence on portions of the landscape where fire can cause undesirable changes in plant community composition and structure. A site-specific analysis will be prepared for sensitive resource areas, such as special status plant		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
species sites, heritage sites, historic trails, and ACECs, to determine the type of fire suppression activity that will be acceptable. Fire equipment and fire suppression techniques, such as vegetation clearing, will be limited to existing roads and trails in special status plant species habitat. As appropriate, the Fire Management Plan will be updated to reflect the appropriate suppression activity in sensitive resource areas.		
MD FIRE 6: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Burned areas within PHMA will be restored to suitable habitat with consideration given to ESDs, reference sites, site potential, habitat objectives and local variability. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Kemmerer RMP: Implement BLM Emergency Stabilization and Rehabilitation standards located in the DOI Interagency Burned Area Emergency Response Guidebook and BLM Burned Area Emergency Stabilization and Rehabilitation Handbook on wildland fires to protect and sustain healthy ecosystems and protect life and property. Newcastle RMP: All wildfires will be evaluated to determine the need for rehabilitation or restoration measures. Restoration of burned areas will be by natural succession unless a special need is identified to prevent further resource damage. Rawlins RMP: Rehabilitation and restoration efforts specific to a fire event will be undertaken to protect and sustain ecosystems, public health and safety, and to help communities protect infrastructure.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD FIRE 7: Within PHMA, post fuels management projects will be designed to ensure long-term persistence of seeded or pre-treatment native plants (while controlling for erosion and treating infestation of invasive plant species), to return to suitable sage-grouse habitat.	No changes made.	No change (same as 2015)
MD LG 1: The BLM policy in WO-IM-2009-007 and BLM Handbook H-4180-1 will be used to evaluate land health standards achievement in PHMA (core only) and, where not achieved, to determine if existing grazing management practices or levels of grazing use on public lands are significant factors in failing to achieve the standards and conform with the guidelines, which through this process will identify appropriate actions to address nonachievement and nonconformance. When determining appropriate actions to address nonachievement of land health standards and nonconformance with the guidelines due to existing grazing management practices or levels of grazing use, management actions including but not limited to the following will be considered singly or in combination: 1. Season or timing of use 2. Numbers of livestock (includes temporary nonuse or livestock removal) 3. Distribution of livestock use 4. Intensity of use 5. Kind of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats) 6. Class of livestock (e.g., yearlings versus cow calf pairs) 7. Range improvements. Refer to the document, "Grazing Influence, Management, and Objective Development in Wyoming's Greater Sage-Grouse Habitat" (Cagney et al. 2010) for guidance when considering appropriate management actions to achieve conformance.	No changes made.	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 2: Within PHMA the BLM will work cooperatively with permittees, lessees, and other landowners to develop voluntary grazing management strategies that integrate both public and private lands into single management units to improve Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD LG 3: The following RMP decisions remain in effect: Casper RMP: Grazing leases will be adjusted where an evaluation of monitoring, field observations, or other data indicate changes, and either increases or decreases, in forage allocation are needed or when necessary or required by other applicable law or regulation. Kemmerer RMP: Vegetative communities will be managed in accordance with Wyoming Standards for Healthy Rangelands. Appropriate livestock grazing management actions will be developed and integrated to address rangeland health standards, improve forage for livestock, and enhance rangeland health. Newcastle RMP: Any adjustments in livestock grazing use will be made as a result of monitoring and consultation with grazing permittees. Monitoring studies will be conducted using the current BLM-approved methodology. Pinedale RMP: Monitoring of the range and the vegetation resource will be conducted at a level sufficient to detect changes in grazing use, trend, and range conditions. Monitoring will be tied to land health standards and indicators that help determine change in status and progress toward meeting objectives. Data will be used to direct and support grazing management decisions consistent	No changes made.	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
with national policy. Rawlins RMP: Livestock grazing will be managed to meet the Wyoming Standards for Healthy Rangelands. Green River RMP/JMH CAP: The kinds and seasons of livestock grazing use will continue to be licensed until monitoring, negotiation, consultation, or a change in resources conditions indicate that a modification is needed. Monitoring will be continued or initiated following adjustments in grazing use to assure that grazing and other management objectives are being met.		
MD LG 4: Within PHMA, all BLM use authorizations will contain terms and conditions regarding the actions needed to meet or progress toward meeting the habitat objectives. If monitoring data show the habitat objectives have not been met nor progress being made toward meeting them, there will be an evaluation and a determination made as to the cause. If it is determined that the authorized use is a significant factor in failing to achieve the standards for healthy rangelands, the use will be adjusted by the response specified in the instrument that authorized the use. The NEPA analysis for renewals and modifications of livestock grazing permits/leases that includes lands within SFAs and PHMA will include specific management thresholds based on GRSG habitat objectives (Tables 2-2 and 2-3) and Land Health Standards (43 CFR 4180.2), and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Within PHMA, if monitoring data show the wildlife/special status species standard has not been met nor progress being made toward meeting that standard, there would be an evaluation and a determination made as to the cause. If it is determined that the current authorized livestock use is a significant causal factor in failing to achieve the wildlife/special status species standards, the BLM would address the achievement or progress toward achieving the LHSs (43 CFR 4180.2) and, if needed, Greater Sage-Grouse habitat maintenance or improvement. When NEPA analysis is required for a specific implementation action, one alternative would include mechanisms to make adjustments to meet or make progress toward meeting the wildlife/special status species standard. The analysis should also identify the BLM-approved data collection methodologies used for monitoring conditions and determining when adjustments are necessary. If current grazing management meets land health standards and provides for Greater Sage-Grouse habitat, there would	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	be no need to analyze an alternative for Greater Sage-Grouse. Authorized uses in PHMA that incorporate habitat objectives for Greater Sage-Grouse must develop desired conditions based on Greater Sage-Grouse habitats present in the allotment and the ecological potential of sites that supports these habitats. Metrics used to monitor for objectives must be developed and inform the wildlife/SSS portion of the Standards for Healthy Rangelands. Within PHMA, seasonal habitat objectives for Greater Sage-Grouse apply only to those habitats delineated within an allotment during the specific season (e.g., breeding season objectives during breeding season). Data needed to inform the relationship between the authorized use and habitat condition would come from sample locations that appropriately reflect the impact of the authorized use on habitat conditions. Data points should fall within Greater Sage-Grouse seasonal habitat areas and be collected on ecological sites that have the potential to produce Greater Sage-Grouse habitat.	
MD LG 5: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: BLM monitoring would be used to evaluate progress toward achieving land health standards within PHMA and, where not achieved, to determine if existing grazing management practices or levels of grazing use on public lands are significant factors in failing to meet, maintain or make progress toward achieving the standards and conform with the guidelines, which through this process will identify appropriate actions to address nonachievement and nonconformance.	Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: BLM monitoring would be used to evaluate progress toward achieving land health standards within PHMA and, where not achieved, to determine if existing grazing management practices or levels of grazing use on public lands are significant factors in failing to meet, maintain or make progress toward achieving the standards and conform with the guidelines, which through this process will identify appropriate actions to address nonachievement and nonconformance.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2019) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Allotments within SFAs, followed by those within PHMA, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks include monitoring for actual use, utilization, and use supervision. The BLM would prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in SFAs followed by PHMA outside of the SFAs. In setting workload priorities, precedence would be given to existing permits/leases in these areas not meeting LHSs, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Conversions in kinds of livestock and changes in season of use will be considered on a case-by-case basis through an environmental analysis. Such changes will be consistent with rangeland health objectives. Grazing leases will be adjusted to accurately reflect the kind of livestock use on public land in all allotments. <u>Kemmerer RMP:</u> Current amounts, kinds, and seasons of livestock grazing uses will be authorized until rangeland health standards assessment results and (or) monitoring indicates a grazing use adjustment is necessary, or that a kind and (or) class of livestock or season of use	The BLM would prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMA. Monitoring studies will be conducted using the current BLM-approved methodology. <u>Pinedale RMP:</u> Conversions from one type of	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
modification can be accommodated. Newcastle RMP: Any adjustments in livestock grazing use will be made as a result of monitoring and consultation with grazing permittees. Monitoring studies will be conducted using the current BLM-approved methodology. Pinedale RMP: Conversions from one type of livestock to another will be evaluated on a case-by-case basis, including an environmental analysis, and will be authorized in conformance with the goals and objectives of the RMP. Rawlins RMP: The current amounts, kinds, and seasons of livestock grazing use will be authorized until monitoring, field observations, ecological site inventory, or other data acceptable to BLM indicates a grazing use adjustment is needed, as appropriate. Requests for changes in season-of use or kind-of-livestock will be considered on a case-by-case basis. Any decision regarding changes in grazing use will include cooperation, consultation, and coordination with the grazing permittees and the interested public. Green River RMP: The Wyoming Standards for Healthy Rangelands (BLM 1997a) will apply to all resource uses on BLM- administered lands. These standards are the minimal acceptable conditions that address the health, productivity, and sustainability of the rangeland. The standards describe healthy rangelands rather than rangeland by-products. Achievement of a standard is determined through observing, measuring, and monitoring appropriate indicators. An indicator is a component of a	livestock to another will be evaluated on a case-by-case basis, including an environmental analysis, and will be authorized in conformance with the goals and objectives of the RMP. Rawlins RMP: The current amounts, kinds, and seasons of livestock grazing use will be authorized until monitoring, field observations, ecological site inventory, or other data acceptable to BLM indicates a grazing use adjustment is needed, as appropriate. Requests for changes in season-of use or kind-of-livestock will be considered on a case-by-case basis. Any decision regarding changes in grazing use will include cooperation, consultation, and coordination with the grazing permittees and the interested public. Green River RMP: The Wyoming Standards for Healthy Rangelands (BLM 1997a) will apply to all resource uses on BLM- administered lands. These standards are the minimal acceptable conditions that address the health, productivity, and sustainability of the rangeland. The standards describe healthy rangelands rather than rangeland by-products. Achievement of a standard is determined through observing, measuring, and monitoring appropriate indicators. An indicator is a component of a system whose characteristics (e.g., presence, absence, quantity, and distribution) can be observed, measured, or monitored based on sound scientific principles. The standards will direct the management of public lands and focus the implementation of this activity plan toward the maintenance or attainment of healthy rangelands.	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
system whose characteristics (e.g., presence, absence, quantity, and distribution) can be observed, measured, or monitored based on sound scientific principles. The standards will direct the management of public lands and focus the implementation of this activity plan toward the maintenance or attainment of healthy rangelands.		
MD LG 6: At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fire breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	No changes made.	Completely revised – revised by rangewide
MD LG 7: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: When periods of drought occur, where appropriate, the AO will evaluate strategies to address drought through coordination with grazing permittee/lessee and annual billings processes. In cooperation with livestock grazing permittees/lessees, drought contingency plans will be developed at the appropriate landscape unit that provide for a consistent/appropriate BLM response. Contingency plans shall establish strategies for addressing ongoing drought and post-drought recovery. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Other management considerations for use of stock driveway withdrawals (SDW) will include	No changes made.	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
providing emergency use for relief from fire, drought, or other natural causes or to meet management objectives in adjoining allotments that require rest. These other uses will be addressed on a case-by-case basis and may occur any time during the year provided the AO has determined adequate forage is available and it does not interfere with regular trail use. The decision determining there is adequate forage will be documented and filed in the appropriate SDW file. Consultation and coordination with livestock owners who regularly use the respective SDW will be made prior to authorizing this type of use. This use will be authorized in accordance with federal grazing regulations (also see MD LG 9). A drought contingency plan will be developed to maintain adequate habitat components for viable fish, wildlife, and SSS populations.		
MD LG 8: In GHMA and PHMA, existing range improvements (e.g., fences, livestock/wildlife watering facilities) would continue to be evaluated and modified when necessary. The potential risk to Greater Sage-Grouse and its habitats from existing structural range improvements will be evaluated. The potential for modification of those structural range improvements identified as posing a risk will be addressed. Supplements and supplemental feeding would continue to be authorized where appropriate. Outside of PHMA and GHMA, and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Identified hazard fences will be modified and new fences will be constructed in accordance with the BLM Fencing Handbook 1741-1.	In PHMA, existing range improvements (e.g., fences, livestock/wildlife watering facilities) would continue to be evaluated and modified when necessary. Supplements and supplemental feeding would continue to be authorized where appropriate. Outside of PHMA and GHMA, and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> Identified hazard fences will be modified and new fences will be constructed in accordance with the BLM Fencing Handbook 1741-1. Decision 4010. Placement of salt, mineral, or forage supplements for livestock will not be allowed within 0.25 miles of water, wetlands, and riparian areas, unless written analysis shows that watershed, riparian, wetland, wildlife, and vegetative values will not be	Completely revised by rangewide for management in PHMA Partially revised – "Outside GHMA" removed as requirement from Field Office-specific direction No change (same as 2019) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Decision 4010. Placement of salt, mineral, or forage supplements for livestock will not be allowed within 0.25 miles of water, wetlands, and riparian areas, unless written analysis shows that watershed, riparian, wetland, wildlife, and vegetative values will not be adversely affected. Forage supplements will be required to be "certified weed- free." <u>Kemmerer RMP:</u> BLM fencing standards will be applied to newly constructed fences on BLM-administered lands within the planning area. Existing fences will be eliminated or modified to reduce conflicts on a case-by-case basis. Livestock salt or mineral supplements will be located a minimum of 0.25 miles away from water sources, riparian areas, and aspen stands. Buffers will be based on resource concerns on a case-by-case basis. <u>Newcastle RMP:</u> Fence construction will be required to meet current BLM fence standards. Fences on BLM-administered land surface that cause documented wildlife conflicts will be removed, reconstructed, or modified, as appropriate or necessary, to eliminate or reduce the conflict. Construction of fences that interfere with movements of big game species in crucial big game winter range will not be allowed on BLM-administered land surface. <u>Pinedale RMP:</u> Mineral supplement blocks will be placed in locations that promote proper grazing distribution and prevent inappropriate livestock use on riparian habitat; for example, by locating supplements on ridgetops and/or approximately 0.25 miles from riparian habitat. Placement of supplements near water sources,	adversely affected. Forage supplements will be required to be "certified weed- free." <u>Kemmerer RMP:</u> BLM fencing standards will be applied to newly constructed fences on BLM-administered lands within the planning area. Existing fences will be eliminated or modified to reduce conflicts on a case-by-case basis. Livestock salt or mineral supplements will be located a minimum of 0.25 miles away from water sources, riparian areas, and aspen stands. Buffers will be based on resource concerns on a case-by-case basis. <u>Newcastle RMP:</u> Fence construction will be required to meet current BLM fence standards. Fences on BLM-administered land surface that cause documented wildlife conflicts will be removed, reconstructed, or modified, as appropriate or necessary, to eliminate or reduce the conflict. Construction of fences that interfere with movements of big game species in crucial big game winter range will not be allowed on BLM-administered land surface. <u>Pinedale RMP:</u> Mineral supplement blocks will be placed in locations that promote proper grazing distribution and prevent inappropriate livestock use on riparian habitat; for example, by locating supplements on ridgetops and/or approximately 0.25 miles from riparian habitat. Placement of supplements near water sources, such as wells and reservoirs, will consider rangeland objectives, such as grazing distribution, wildlife habitat requirements, and reclamation success. Mineral supplement blocks will not be placed within 0.25 miles of an occupied Greater Sage-Grouse lek. Mineral supplement blocks will not	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
such as wells and reservoirs, will consider rangeland objectives, such as grazing distribution, wildlife habitat requirements, and reclamation success. Mineral supplement blocks will not be placed within 0.25 miles of an occupied Greater Sage-Grouse lek. Mineral supplement blocks will not be placed within 0.25 miles of known Special Status Plant Species locations. Rawlins RMP: New fence construction will be authorized according to BLM standards unless modified following consultation with affected parties. Existing fences will be modified according to current BLM standards and according to wildlife and livestock management needs. Green River RMP/JMH CAP: Where documented wildlife conflicts with fencing on public lands occur, fences will be modified, reconstructed, or, if necessary, removed. Herding control of livestock will be encouraged as an alternative to fencing. Fence construction will be in accordance with BLM design standards and located so as not to overly impede wildlife movement. Consideration will also be given to SSS and wild horse movement. Green River RMP: Livestock water developments and range improvements will be considered to maintain or improve resource conditions, enhance livestock distribution, or both. Compatibility with special status plant species will be required. Water developments and/or range improvements proposed in sensitive areas will be considered only if wildlife habitat and resource conditions are maintained or improved and no significant or irreversible adverse effects will occur. Salt or nutritional supplements will	be placed within 0.25 miles of known Special Status Plant Species locations. Rawlins RMP: New fence construction will be authorized according to BLM standards unless modified following consultation with affected parties. Existing fences will be modified according to current BLM standards and according to wildlife and livestock management needs. Green River RMP/JMH CAP: Where documented wildlife conflicts with fencing on public lands occur, fences will be modified, reconstructed, or, if necessary, removed. Herding control of livestock will be encouraged as an alternative to fencing. 2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 9: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Livestock trailing that is authorized will include a trailing plan to utilize non-habitat to the extent possible, include specific routes and timeframes for trailing, utilize existing trails, and avoid stopovers on occupied leks, as appropriate. The following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> The revocation of withdrawals for those trails that are no longer active will be reviewed and recommended and these lands will be incorporated into adjacent allotments (46,050 acres). Grazing leases will be offered to the respective grazing lessees. All remaining SDW lands for trail use (55,680 acres) will be retained. <u>Kemmerer RMP:</u> Current livestock trails will be retained. Livestock trailing use will occur within 0.5 miles of the mapped centerline. <u>Pinedale RMP:</u> Adequate stock trails will be maintained to support livestock trailing needs.	No changes made.	Completely revised – revised by rangewide
MD LG 10: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Grazing between riparian habitats and upland habitats will be balanced to promote the production and availability of beneficial forbs to GRSG for use during nesting and brood-rearing. Grazing in meadows, mesic habitats, and riparian pastures also will be balanced to promote the production and availability of beneficial grasses and forbs for use during late brood-rearing within PHMA, while maintaining upland conditions and functions.	Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: In PHMA, for riparian habitats and/or wet meadow communities utilized by Greater Sage-Grouse, livestock grazing would be managed to promote the production and availability of beneficial forbs for use during brood-rearing, while maintaining upland conditions and functions. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above:	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: Lotic and lentic wetland/riparian areas will be managed toward Proper Functioning Condition (PFC). The BLM will manage toward PFC and identified Desired Plant Community on 350 miles of lotic and adjacent riparian habitat and 10,000 acres of lentic habitat to meet fish, wildlife, and SSS habitat requirements. Kemmerer RMP: Livestock conversions will be allowed in allotments with riparian concerns only when a plan is approved to address riparian issues. Management actions and range improvements proposed to address riparian issues will have to be implemented prior to authorizing the conversion. Livestock conversions may be approved only after completion of a suitability study for the conversion. The conversion may be authorized if it is determined that riparian habitats will be maintained or improved by the conversion. Pinedale RMP: Meet the Wyoming Standards for Rangeland Health and maintain or enhance wetland and riparian vegetation to achieve PFC. Grazing systems will be designed to maintain or improve watershed and range condition; for example, through changing seasons of use, implementing rotational or other grazing management systems, or developing infrastructure for livestock management. In allotments with riparian habitat, grazing management actions will be designed to maintain or achieve proper functioning condition. Green River RMP:	Casper RMP: Lotic and lentic wetland/riparian areas will be managed toward Proper Functioning Condition (PFC). The BLM will manage toward PFC and identified Desired Plant Community on 350 miles of lotic and adjacent riparian habitat and 10,000 acres of lentic habitat to meet fish, wildlife, and SSS habitat requirements. Kemmerer RMP: Livestock conversions will be allowed in allotments with riparian concerns only when a plan is approved to address riparian issues. Management actions and range improvements proposed to address riparian issues will have to be implemented prior to authorizing the conversion. Livestock conversions may be approved only after completion of a suitability study for the conversion. The conversion may be authorized if it is determined that riparian habitats will be maintained or improved by the conversion. Pinedale RMP: Meet the Wyoming Standards for Rangeland Health and maintain or enhance wetland and riparian vegetation to achieve PFC. Grazing systems will be designed to maintain or improve watershed and range condition; for example, through changing seasons of use, implementing rotational or other grazing management systems, or developing infrastructure for livestock management. In allotments with riparian habitat, grazing management actions will be designed to maintain or achieve proper functioning condition. Green River RMP: Range improvements will be directed at resolving or reducing resource concerns, improvement of wetland/riparian areas, and overall improvement of

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LG 11: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Range improvement projects will be planned and authorized in a way that contributes to rangeland health and maintains and/or improves Greater Sage-Grouse and its habitat. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Green River RMP:</u> Water sources may be developed in crucial wildlife winter ranges only when consistent with wildlife habitat needs. Such sources will be designed to benefit livestock, wild horses, and wildlife. Alternative water supplies or facilities for livestock may be provided to relieve livestock grazing pressure along stream bottoms and improve livestock distribution. <u>JMH CAP:</u> Livestock water developments and range improvements will be considered to maintain or improve resource conditions, enhance livestock distribution, or both. Compatibility with special status plant species will be required. Water developments and/or range improvements proposed in sensitive areas will be considered only if wildlife habitat and resource conditions are maintained or improved and no significant or irreversible adverse effects will occur.	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect with the modification described above
MD LG 12: Existing water developments associated with springs and seeps will be evaluated and associated pipelines/structures to those developments having a negative effect on PHMA will be modified.	No changes made.	Completely revised – revised by rangewide

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD WHB 1: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Manage herd management areas (HMAs) in Greater Sage-Grouse habitat within established appropriate management level range to achieve and maintain Greater Sage-Grouse habitat (see Tables 2-2 and 2-3). Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Green River RMP/JMH CAP:</u> Specific habitat objectives for herd management areas will be developed. Consideration will be given to desired plant communities, wildlife, watershed, livestock grazing, and other resource needs.	No changes made.	Completely revised by rangewide and state-specific for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect with the modification described above
MD WHB 2: PHMA (core only) management objectives will be considered when evaluating appropriate management levels.	No changes made.	Completely revised – revised by rangewide and state-specific
MD WHB 3: PHMA (core only) management objectives will be considered when conducting land health assessments in BLM HMAs.	No changes made.	Completely revised – revised by rangewide and state-specific
MD WHB 4: When conducting NEPA analysis for wild horse management activities, water developments or other rangeland improvements for wild horses in PHMA, the direct and indirect effects on Greater Sage-Grouse populations and habitat will be addressed. Water developments or rangeland improvements will be implemented using the criteria identified for domestic livestock identified above in PHMA.	No changes made.	No change (same as 2015)
MD WHB 5: Coordinate with other resources (Range, Wildlife, and Riparian) to conduct land health assessments within all BLM HMAs.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 1: Fluid Minerals (Unleased Estate) Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: The BLM will allow oil and gas leasing consistent and subject to the leasing stipulations analyzed in the timing, distance, disturbance, and density restrictions sections (Map 2-2) (see Appendix B – Fluid Mineral Stipulations). Ensure that leasing activities in PHMA comply with Greater Sage-Grouse resource management plan decisions and remain in compliance with laws, regulations and policy. Fluid mineral leasing will be allowed in PHMA (core only), except in areas that are closed to leasing due to the need to protect other sensitive resources.	No changes made.	No change (same as 2015) – however, the exceptions, waivers, and modifications in the referenced Appendix B would be revised by rangewide language
MD MR 2: Fluid Minerals (Unleased Estate) Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Geophysical exploration projects that are designed to minimize habitat fragmentation within PHMA will be allowed, except where prohibited or restricted by existing RMP decisions, and in conformance with timing and distances Management Decisions (see Decisions MD SSS 5 through MD SSS 10). Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> The blocks of public land identified as mapped in the Casper Field Office GIS database will be managed to retain intact blocks of native vegetation (192,550 acres, of which 131,880 acres are BLM-administered surface). In these	No changes made.	Partially revised – to update Management Decisions referenced No change (same as 2015) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
areas, the following restrictions apply: 1. These blocks are (1) unavailable for oil and gas leasing, and (2) a geophysical operation on public surface for the life of the plan. Activities for existing oil and gas leases are managed intensively (see Appendix U of the Casper RMP). Existing leases will be allowed to expire and not be renewed. 2. Within these blocks, a withdrawal from the operation of the public land laws, including the mining laws will be pursued. 3. These blocks are closed to mineral material disposal. Existing permits will be allowed to expire without renewal or expansion. 4. These blocks are not open to wind/renewable energy development. 5. These blocks remain open to livestock grazing. 6. All allowed surface-disturbing activities within the designated blocks are subject to a Controlled Surface Use restriction, minimizing surface disturbance to meet management objectives. Decision 4024 The North Platte River Special Recreation Management Area will continue to be open to oil and gas leasing and geophysical operations. Decision 7039 The area is unavailable for oil and gas leasing and geophysical exploration is not allowed. Decision 7047 The MA is unavailable for new oil and gas leasing. No geophysical operations will be allowed on public surface. Activities on existing leases will be managed intensively to meet the objectives of the MA (see Appendix U of the Casper RMP – Intensive Management). To		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
minimize surface-disturbing activities, oil and gas exploration and development will use directional drilling techniques and well twinning whenever practicable. Decision 7059 The Red Wall/Gray Wall complex is located entirely within the South Bighorns/Red Wall Management Area and is unavailable for new oil and gas leasing. No geophysical operations will be allowed on public surface. Activities on existing leases will be intensively managed to meet the objectives of the MA (see Appendix U of the Casper RMP–Intensive Management). To minimize surface-disturbing activities, oil and gas exploration and development will use directional drilling techniques and well twinning whenever practicable. Decision 7063 Those lands currently open to oil and gas leasing will continue to be open to geophysical operations. Those lands open to oil and gas leasing, but subject to a NSO restriction, may be open to geophysical operations should site specific NEPA analysis disclose a finding of no significant impact. No geophysical operations are allowed in areas closed for oil and gas leasing. Decision 2019 <u>Kemmerer RMP:</u> Allow for geophysical exploration on lands throughout the planning area subject to identified conditions of approval. <u>Newcastle RMP:</u> Surface-disturbing and disruptive activities associated with all types of minerals exploration and development and with geophysical exploration will be subject to appropriate mitigation measures determined through, but not limited to, use of MD SSS 4. <u>Pinedale RMP:</u>		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Vehicle-based geophysical activities will be assessed on a case-by-case basis. The use of surface and/or aboveground (Poulter shot) explosive charges for geophysical exploration will be assessed case by case. Geophysical projects, including projects proposed in areas with an NSO restriction, will be analyzed and mitigation developed on a case-by-case basis. Geophysical activities that are considered casual use actions are allowed within 0.25 miles of active Greater Sage-Grouse leks provided that: • Operations are conducted on designated roads and trails. • Operations during the breeding season (March 1 through May 15) are conducted between the hours of 8:00 a.m. and 8:00 p.m. • A 150-foot wide strip of undisturbed sagebrush is maintained around the perimeter of the lek for hiding and escape cover. <u>Rawlins RMP:</u> All lands open to oil and gas leasing consideration will also be open to geophysical exploration, subject to appropriate resource surveys, surface protection measures, adequate bonding, and adherence to State of Wyoming standards for geophysical operations. Vehicular use for "necessary tasks" (as defined in the glossary), such as geophysical exploration including project survey and layout, will be permitted except where specifically prohibited (e.g., some SD/MAs). <u>Green River RMP:</u> Geophysical exploration (vehicles and detonation) activities will be prohibited within 0.5 miles of the Pinnacles Geologic Feature. Areas of sensitive heritage resources and geologic features, such as Boars Tusk, White		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Mountain Petroglyphs, special status plant species, wilderness study areas (WSAs), and historic trails, will remain closed. Receiver lines may be laid using foot traffic within these areas. Exceptions to these restrictions may be granted on a case-by-case basis subject to appropriate site-specific analysis and mitigation requirements. The remainder of the planning area will be open to geophysical exploration, with application of appropriate mitigation. Rights-of-way limitations in the planning area apply to on- and off-road vehicle traffic used for geophysical activities. Exploration activities will be allowed in sensitive resource areas only if they can be performed with acceptable mitigation of impacts. <u>JMH CAP:</u> Geophysical exploration (vehicles and detonation) activities will be prohibited within 0.5 miles of the Pinnacles Geologic Feature. Areas of sensitive heritage resources and geologic features, such as Boars Tusk, White Mountain Petroglyphs, special status plant species, WSAs, and historic trails, will remain closed. Receiver lines may be laid using foot traffic within these areas. Exceptions to these restrictions may be granted on a case-by-case basis subject to appropriate site-specific analysis and mitigation requirements. The remainder of the planning area will be open to geophysical exploration, with application of appropriate mitigation. ROW limitations in the planning area apply to on- and off-road vehicle traffic used for geophysical activities. Exploration activities will be allowed in sensitive resource areas only if they can be performed with acceptable mitigation of impacts.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 3, Fluid Minerals, Leased Estate: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: In cases where federal oil and gas leases have been issued with stipulations varying from those in Appendix B for the protection of Greater Sage-Grouse or their habitats, as provided in the applicable RMP decision, as revised or amended, their inclusion as APD COAs will be considered when approving exploration and development activities through completion of the environmental record of review (43 CFR 3162.5 and 36 CFR 228.108), including appropriate documentation of compliance with NEPA. Overall consideration shall be given to minimizing the impact on Greater Sage-Grouse through a project design that avoids, minimizes, reduces, rectifies, and/or adequately compensates for direct and indirect impacts on PHMA or use and includes applicable and technical COAs. Selection and application of these measures shall be based on current science and research on the effects on important breeding, nesting, brood-rearing, and wintering areas. For proposed operations in PHMA, the Surface Use Plan of Operations (see 43CFR 3162.3-1(f)) shall address, at a minimum, the anticipated noise, density and amount of disturbance, mechanical movement (e.g., pump jacks), permanent and temporary facilities, traffic, phases of development over time, off-site mitigation, and expected periods of use associated with the proposed project. Seasonal habitats or project features related to potential Greater Sage-Grouse impacts that are not addressed in the Surface Use Plan of Operations based on site- specific or project-specific considerations shall be noted	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
in the project file, along with a rationale for not including them. In this process the BLM will evaluate, among other things: Whether the conservation measure is "reasonable" (43 CFR 3101.1-2) and consistent with valid existing rights Whether the action is in conformance with the approved LUP; and the effectiveness of the proposed mitigation measures (See MD SSS 4). The BLM will work with project proponents in these situations to promote measurable Greater Sage-Grouse conservation objectives such as, but not limited to, consolidation of project related infrastructure to reduce habitat fragmentation and loss and to promote effective conservation of seasonal habitats and PHMA (connectivity only) that support population management objectives set by the state. The BLM will continue to work with project proponents and the WGFD to site their projects in locations that meet the purpose and need for their project, but have been determined to contain the least sensitive habitats (based on vegetation, topography, or other habitat features) and resources whether inside or outside of PHMA (utilizing DDCT analysis process). Valid existing rights will be recognized and respected. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Kemmerer RMP:</u> Choose and implement appropriate mitigation in a timely manner to minimize decreases in habitat function. Utilize appropriate voluntary off-site compensatory mitigation to reduce impacts. This will be necessary if (1) all on-site mitigation has been accomplished and adverse effects		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
have not been mitigated; or (2) if on-site mitigation is not feasible. Pinedale RMP: Off-site mitigation proposed by oil and gas or other operators can be considered and analyzed in future environmental documents as mitigation for proposed activities within the planning area. Proposed off-site mitigation will be described and analyzed for effectiveness in detail on a project-specific basis. Off-site mitigation will conform to requirements in the Pinedale RMP regarding the order of use of mitigation methods, stipulations applied to off-site mitigation measures, and priority order for mitigating resource impacts on-site or off-site. Green River RMP: Development actions will be analyzed on a case-by-case basis to identify mitigation needs to meet RMP objectives, provide for resource protection, and provide for logical development. Limitations on the amount, sequence, timing, or level of development may occur. This may result in transportation planning and in limitations in the number of roads and drill pads, or deferring development in some areas until other areas have been restored to previous uses. JMH CAP: COAs attached to an APD will be based on site-specific NEPA or other analysis and will establish specific, necessary mitigation measures not covered by stipulations for resource and environmental protection. Some areas will need more intensive mitigation measures to protect sensitive resources and provide for public health and safety. These intensive mitigation measures or COAs will mostly apply to areas with overlapping sensitive resources (e.g., Areas 2 and 3). Examples of intensive mitigation that can apply to all activities based on site- specific		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
analysis include off-site placement of facilities, remote control monitoring, restricted or prohibited surface use including road construction, multiple wells from a single pad, central tank batteries/facilities, and pipelines and power lines concentrated in specific areas. In addition, refer to Section 3.12.3 for additional mitigation measures that may apply as part of the transportation plan.		
MD MR 4: Within PHMA, field offices will work with project proponents (including those within BLM) to site their projects in locations that minimize impacts on sensitive resources.	No changes made.	No change (same as 2015)
MD MR 5: Master Development Plans will be considered and encouraged for projects involving multiple proposed disturbances within PHMA.	No changes made.	No change (same as 2015)
MD MR 6: Within PHMA, unitization will be encouraged as a means of minimizing adverse impacts on Greater Sage-Grouse to reduce fragmentation and surface-disturbing and disruptive activities.	No changes made.	No change (same as 2015)
MD MR 7: The BLM shall closely examine the applicability of categorical exclusions in PHMA and GHMA. If extraordinary circumstances review is applicable, the BLM shall determine whether those circumstances exist. For proposed actions in PHMA, determine whether a categorical exclusion is applicable and if so, closely examine the extraordinary circumstances, if applicable, to determine whether one or more exists that will require preparation of a NEPA analysis. If a categorical exclusion applies, and no extraordinary circumstances exist, determine whether preparing a NEPA analysis will help inform decision making.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 8: Federal Regulations, 43 CFR 3104.1 requires that a bond be furnished before any drilling or surface disturbance activities begin. The lessee, sublessee or the operator must furnish a surety or personal bond in the amount of at least $10,000 to ensure compliance with all the lease terms, including protection of the environment. With the consent of the surety and principal, the operator may use the bond of another party, such as the lessee. Each time there is a new operator, that operator must notify the BLM that he/she is the responsible operator, giving the particulars of the bond under which he/she will operate. The BLM can require an increase in a bond amount any time conditions warrant such an increase. A reclamation bond will be required on all projects that is commensurate with the scope, scale, size of the project within PHMA. Partial bonding may be appropriate depending on these factors.	No changes made.	No change (same as 2015)
MD MR 9: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Produced water from coalbed natural gas wells will be treated and disposed of in collaboration and consistent with the requirements of the state, and RDFs specified in Management Action 10 (Appendix C). Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Pinedale RMP:</u> Produced water from coalbed natural gas wells will be treated and disposed of in collaboration and consistent with the requirements of the state.	No changes made.	Partially revised – to update Management Action referenced and Appendix referenced No change (same as 2015) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 10: Specific to management for Greater Sage-Grouse, within PHMA (core only), all RMPs are amended as follows: Where the federal government owns the mineral estate, and the surface is in nonfederal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner. Within PHMA (non-core only) and outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Pinedale RMP:</u> BLM-permitted actions on split estate lands are subject to the same stipulations as leased federal mineral estate on federal surface lands, provided the stipulations do not adversely affect the surface owner's land use or actions. Exceptions to surface development restrictions may be granted if requested or agreed to by the surface owner.	No changes made.	No change (same as 2015)
MD MR 11: Within PHMA where the federal government owns the surface and the mineral estate is in nonfederal ownership, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	No changes made.	No change (same as 2015)
MD MR 12: Locatable Minerals Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: 252,160 acres within SFAs (see MD SSS 14 for identification of SFAs)	Locatable Minerals Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: A total of approximately 21,251,690 acres are open to	Partially revised – to update acreage estimates, map referenced, and Management Decisions referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
will be recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights. A total of approximately 21,251,690 acres are open to locatable mineral location and entry (Map 2-3). Operators may be requested to submit modifications to the accepted notice or approved plan of operations so that the operations minimally impact PHMA. The AO may convey to the operator suggested conservation measures, based on the notice or plan level operations and the geographic area of those operations (also called the project area which is defined in 43 CFR 3809.5 and 36 CFR 228.3). These suggested conservation measures include measures that support the overall goals and objectives of the core population area strategy, though measures listed for protection of Greater Sage-Grouse breeding, nesting, brood- rearing, and wintering may not be reasonable or applicable to the BLM's determination of whether the proposed operations will cause unnecessary or undue degradation under 43 CFR 3809.5 and 36 CFR 228.3. The request containing the suggested conservation measures must make clear that the operator's compliance is not mandatory. Notices or Plans of Operation, or modifications thereto, submitted following the issuance of this guidance: As part of the 15-day completeness review of notices [or modifications thereto] and 30-day completeness review of plans of operations [or modifications thereto], the proposed project area(s) where exploration, development, mining, access and reclamation will take place shall be reviewed for overlap of PHMA in the corporate GIS database. If there is overlap, the BLM AO may	locatable mineral location and entry (Map 2-3). Operators may be requested to submit modifications to the accepted notice or approved plan of operations so that the operations minimally impact PHMA. The AO may convey to the operator suggested conservation measures, based on the notice or plan level operations and the geographic area of those operations (also called the project area which is defined in 43 CFR 3809.5 and 36 CFR 228.3). These suggested conservation measures include measures that support the overall goals and objectives of the core population area strategy, though measures listed for protection of Greater Sage-Grouse breeding, nesting, brood- rearing, and wintering may not be reasonable or applicable to the BLM's determination of whether the proposed operations will cause unnecessary or undue degradation under 43 CFR 3809.5 and 36 CFR 228.3. The request containing the suggested conservation measures must make clear that the operator's compliance is not mandatory. Notices or Plans of Operation, or modifications thereto, submitted following the issuance of this guidance: As part of the 15-day completeness review of notices [or modifications thereto] and 30-day completeness review of plans of operations [or modifications thereto], the proposed project area(s) where exploration, development, mining, access and reclamation will take place shall be reviewed for overlap of PHMA in the corporate GIS database. If there is overlap, the BLM AO may notify the operator of ways that they may minimize impacts on PHMA and request the operator to amend its notice or plan to include such measures. The request to	

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
notify the operator of ways that they may minimize impacts on PHMA and request the operator to amend its notice or plan to include such measures. The request to amend the submitted notice or plan of operations must make clear that the operator's compliance is not mandatory and that including such measures is not a requirement for completeness of either the notice or a plan of operations, nor is it a condition of acceptance of the notice or approval of the plan of operations. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect: 1,785,230 acres are withdrawn from mineral entry for the protection of sensitive resources.	amend the submitted notice or plan of operations must make clear that the operator's compliance is not mandatory and that including such measures is not a requirement for completeness of either the notice or a plan of operations, nor is it a condition of acceptance of the notice or approval of the plan of operations. (see also MD SSS 4 through MD SSS 10 and MD SSS 12) For values other than Greater Sage-Grouse, the following RMP decisions remain in effect: 1,785,230 acres are withdrawn from mineral entry for the protection of sensitive resources.	
MD MR 13: Salable Minerals PHMA will be open to mineral material exploration, sales, and free use permits, except in areas that are unavailable due to the need to protect other resource values. All salable mineral activities within PHMA will be considered, provided they can be completed in compliance within surface occupancy, seasonal restrictions, and disturbance and density stipulations (Map 2-4 and MD SSS 2, 3,5 through 10) analyzed through the DDCT process.	No changes made.	Completely revised – revised by rangewide and state-specific
MD MR 14: Salable Minerals Within PHMA closure and restoration of salable mineral pits no longer in use will be considered to meet Greater Sage-Grouse habitat conservation objectives. Emphasis will be given to reclamation/restoration of PHMA as a viable long term goal to improve Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD MR 15: Nonenergy Leasable Minerals Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as	No changes made.	Completely revised by rangewide and state-specific for All RMPs amended for management of GRSG in PHMA

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
follows: All nonenergy leasable mineral activities will be considered in PHMA, provided that the activities can be completed in compliance with all occupancy, timing, density and disturbance restrictions (Map 2-5). Exploration licenses and prospecting permits will be considered with appropriate mitigating measures. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Portions of PHMA will be unavailable for leasing in accordance with existing RMP decisions for resource values other than Greater Sage-Grouse. <u>Kemmerer RMP:</u> Sodium: All public lands (outside of the Raymond Mountain WSA and exceptions identified below) within the planning area are available for sodium leasing consideration. Exploration for sodium will be considered on a case-by-case basis. Limited surface occupancy criteria contained in the Sodium Mineral Development Environmental Assessment will be applied on a case-by-case basis. No new sodium leases or exploration licenses may be issued on lands within the Raymond Mountain WSA. No new sodium exploration and leasing will be considered for Rock Creek/Tunp and Bear River Divide management areas. Phosphate: All public lands (outside of the Raymond Mountain WSA and exceptions identified below) within the planning area are available for phosphate leasing consideration. Exploration for phosphate will be considered on a case-by-case basis. No new phosphate exploration and leasing will be considered for Rock		No change (same as 2015) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Creek/Tunp and Bear River Divide management areas. Pinedale RMP: Should interest in other leasable minerals materialize in the future, leasing will be considered on a case-by- case basis, and the RMP will be amended as appropriate and necessary. The same surface disturbance restrictions will be used in analyzing leasing proposals and determining the issuance of any leases (for example, geothermal steam, coal, sodium, oil shale, and phosphate). Green River RMP/JMH CAP: The known sodium leasing area is open to exploration and consideration for leasing and developments, but is closed to prospecting permits. The remainder of the planning area is open to sodium prospecting except for areas that are closed to mineral leasing, surface mining, or mechanical prospecting type activities (areas closed to drilling, off road vehicle use, and explosive charges). Sodium (trona) leasing will be considered on a case-by-case basis, and is subject to the same conditional requirements as oil and gas and coal, and the general management direction applied in this RMP.		
MD MR 16: Solid Leasable Minerals Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect with the modification described above

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
CFR 3461.5(o)(1). The BLM will also consider that USFWS has found "the core area strategy…if implemented by all landowners via regulatory mechanisms, would provide adequate protection for Greater Sage-Grouse and their habitats in the state" when considering leasing coal in PHMA under the criteria set for at 43 CFR 3461.5(o)(1). Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> If coal development potential is shown to exist, all BLM-administered lands outside the Coal Development Potential Area (CDPA) will be considered for coal leasing, unless specifically closed to mineral leasing. The coal-screening process will be completed on all newly identified lands having coal development potential. All BLM-administered lands within the CDPA identified in the 2001 Buffalo RMP maintenance action are acceptable for further consideration for coal leasing. The only exceptions are those lands determined unacceptable within the area or those lands that fall within PHMA. The coal unsuitability criteria are re-evaluated whenever new coal lease applications are received. <u>Kemmerer RMP:</u> Process new coal lease applications by using the coal screening process. The coal screening process results will determine which lands may be available for further consideration for coal leasing and development. Appropriate NEPA analysis will be required prior to leasing. Federal land within the proposed Haystack project area outside of the PHMA is determined acceptable for further consideration for coal		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
leasing and development. No coal LBAs will be considered for Rock Creek/Tunp and Bear River Divide management areas. Pinedale RMP: Decisions on lands acceptable for leasing consideration for coal development will be made after an application is received and the coal screening process is conducted. Rawlins RMP: Federal coal lease applications will be accepted only on those federal coal lands with development potential identified as suitable for further leasing consideration after application of the coal unsuitability criteria (the above-mentioned approximately 51,250 acres and 2,318.7 million tons of surface minable federal coal). Green River RMP/JMH CAP: Federal coal lands within the Coal Occurrence and Development Potential area (about 422,000 acres) are open to further consideration for coal leasing and development (i.e., new competitive leasing, emergency leasing, lease modifications, and exchange proposals, under the Federal Coal Management Program) with appropriate and necessary conditions and requirements for protection of other land and resource values and uses.		
MD MR 17: Solid Leasable Minerals Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Upon receipt of a coal lease application proposing underground mining methods that include surface operations and impacts within PHMA, Criterion 15 will be applied and the area will be identified as suitable for further coal leasing consideration after consultation with the state and, where applicable, surface management agency to determine that all or certain	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
stipulated methods of coal mining will not have a significant long-term impact on Greater Sage-Grouse. Stipulated methods may include, but not limited to, underground mining methods with no placement of surface facilities except for purposes of health and human safety. Unsuitability is not applied to underground operations without surface impacts (43 CFR 3461.1) This will be consistent with IM WY-2012-019 says that the BLM will assess potential impacts on Greater Sage-Grouse through the NEPA process, and that the state regulatory agency will apply this mitigation, as well as protective measures consistent with the state policy for solid leasable mining action at the permitting stage. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: If coal development potential is shown to exist, all BLM-administered lands outside the CDPA will be considered for coal leasing, unless specifically closed to mineral leasing. The coal-screening process will be completed on all newly identified lands having coal development potential. All BLM-administered lands within the CDPA identified in the 2001 Buffalo RMP maintenance action are acceptable for further consideration for coal leasing. The only exceptions are those lands determined unacceptable within the area. The coal unsuitability criteria are re-evaluated whenever new coal lease applications are received. Kemmerer RMP: Process new coal lease applications by using the coal screening process. The coal screening process results will determine which lands may be available for further consideration		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
for coal leasing and development. Appropriate NEPA analysis will be required prior to leasing. Federal land within the proposed Haystack project area is determined acceptable for further consideration for coal leasing and development. No coal LBAs will be considered for Rock Creek/Tunp and Bear River Divide management areas. Pinedale RMP: Decisions on lands acceptable for leasing consideration for coal development will be made after an application is received and the coal screening process is conducted. Rawlins RMP: Federal coal lease applications will be accepted only on those federal coal lands with development potential identified as suitable for further leasing consideration after application of the coal unsuitability criteria (the above-mentioned approximately 51,250 acres and 2,318.7 million tons of surface minable federal coal). Green River RMP/JMH CAP: Federal coal lands within the Coal Occurrence and Development Potential area (about 422,000 acres) are open to further consideration for coal leasing and development (i.e., new competitive leasing, emergency leasing, lease modifications, and exchange proposals, under the Federal Coal Management Program) with appropriate and necessary conditions and requirements for protection of other land and resource values and uses.		
MD MR 18: Coal exploration activities will be allowed in PHMA if they can be completed in compliance to surface occupancy and disturbance and density stipulations analyzed through the DDCT process.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD MR 19: Exceptions to lease stipulations, COA, and terms and conditions: Exceptions waivers, and modifications to lease stipulations, COAs, and terms and conditions, for Greater Sage-Grouse will continue to be considered on a case-by-case basis consistent with approved LUPs and other BLM policy and regulations as they relate to exceptions within PHMA and GHMA.	No changes made.	Completely revised – revised by rangewide
MD RE 1: Within PHMA, all RMPs are amended as follows: Wind energy development would be avoided in PHMA (Map 2-6), and not allowed unless it can be sufficiently demonstrated that the development activity would not result in declines of PHMA populations. Sufficient demonstration of "no declines" should be coordinated with the WGFD and USFWS. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect: Areas that are currently unavailable due to the need to protect sensitive resources would remain unavailable to wind energy development.	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect
MD RE 2: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: The use of guy wires for meteorological towers (MET) tower supports would be avoided within PHMA. All existing and any new unavoidable guy wires should be marked with recommended bird deterrent devices. The siting of new temporary MET towers within PHMA would be avoided within 2 miles of occupied Greater Sage-Grouse leks, unless they are out of the direct line of sight of the occupied lek. Outside of PHMA, the following RMP decisions remain in effect:	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Kemmerer RMP: New MET towers would be avoided within 1 mile of occupied sagebrush obligate habitats, unless anti-perch devices are installed. MET towers relying on guy wires for support would be prohibited in these habitats. Exceptions could be made if NEPA analysis shows little or no impact on sagebrush obligate species. Rawlins RMP: MET towers would be authorized on a case-by-case basis from 0.25 miles to 1 mile of an occupied Greater Sage-Grouse and sharp-tailed grouse lek.		
MD LR 1: *Land Use Authorizations* Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: PHMA will be managed as ROW avoidance areas for new ROW or Special Use Authorization (SUA) permits (Map 2-7). Within PHMA where new ROWs/SUAs are necessary, new ROWs/SUAs will be located within designated RMP corridors or adjacent to existing ROWs/SUAs where technically feasible. Subject to valid existing rights including nonfederal land inholdings, required new ROWs/SUAs will be located adjacent to existing ROWs/SUAs or where it best minimizes Greater Sage-Grouse impacts. Consider the likelihood of development of not-yet-constructed surface-disturbing activities, as defined in Table 2 of the Monitoring Framework (Appendix D under valid existing rights. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect: Portions of PHMA will be managed as ROW exclusion areas in accordance with existing RMP decisions for resource values other than Greater Sage-Grouse.	No changes made.	Partially revised by rangewide for All RMPs amended for management of GRSG in PHMA for major ROWs. No change (same as 2015) for decisions that remain in effect

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 2: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Within GHMA where new ROWs/SUAs are necessary, new ROWs/SUAs will be collocated within existing ROWs/SUAs where technically feasible. Appropriate Greater Sage-Grouse seasonal timing constraints will be applied. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect: Portions of GHMA will be managed as ROW avoidance areas in accordance with existing RMP decisions for resource values other than Greater Sage-Grouse.	No changes made.	Partially revised – to include SHMA
MD LR 3: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: <u>New Transmission Lines (greater than 115 kV):</u> New transmission lines greater than 115 kV in PHMA (core only) will be allowed only (1) within the 2-mile wide transmission line route through PHMA (core only) population areas in south-central and southwestern Wyoming (Attachment 1 from EO 2015-4); (2) when located within 0.5 miles or less of an existing 115 kV or greater transmission line constructed prior to 2008; or (3) in designated RMP corridors authorized for aboveground transmission lines. Transmission lines routed using one or more of the three criteria listed above will not be counted against the DDCT 5 percent disturbance cap. New transmission lines greater than 115 kV proposed outside of these areas will be considered where it can be demonstrated that declines in Greater Sage-Grouse populations can be avoided through project design and/or mitigation. These projects will be subject to the	No changes made.	Partially revised by rangewide for All RMPs amended for management of GRSG in PHMA to incorporate major ROW rangewide language No change (same as 2015) for decisions that remain in effect

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
density and disturbance restrictions for PHMA. Construction of new transmission lines will adhere to the restrictions associated with conducting activities within PHMA. Review of transmission line proposals will incorporate the Framework for Sage-grouse Impacts Analysis for Interstate Transmission Lines and other appropriate documents consistent with the three routing criteria described above. New projects within PHMA that may require future utility lines, including distribution and transmission lines or pipelines, will include the proposed utility lines in their DDCT as part of the proposed disturbance. Lines permitted but not located in the above mentioned routes or a designated corridor will be counted toward the 5 percent disturbance calculation (line disturbance is equal to the anticipated construction footprint or construction ROW width multiplied by length and includes all access roads, staging areas, and other surface disturbance associated with construction outside of the construction ROW). <u>New Electric Distribution Lines (less than 115 kV):</u> New electric distribution lines will be buried where feasible and economically feasible. If not economically feasible, distribution lines may be authorized when effectively designed/mitigated to protect Greater Sage-Grouse and the AO determines that overhead installation is the action alternative with the fewest adverse impacts while still meeting the project need. Agricultural and residential lines will be considered to be adequately mitigated for Greater Sage-Grouse if constructed at least 0.6 miles from the lek perimeter		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
with appropriate timing constraints and constructed to the latest APLIC guidance. These ROW authorizations will be subject to approval by the State Director. Priority Transmission Lines: PHMA are designated as avoidance areas for high voltage transmission line and pipeline ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the following identified projects, must comply with the conservation measures outlined in this proposed plan, including the RDF and avoidance criteria presented Appendix C of this document. The BLM is currently processing an application for Gateway South, Gateway West, and TransWest Express and the NEPA review for these projects is well underway. The BLM is analyzing Greater Sage-Grouse mitigation measures through the project's NEPA review process. Pipelines: New pipelines through PHMA will be allowed: (1) within an RMP corridor currently authorized for that use or designated through future RMP amendments; or (2) constructed in or adjacent to existing utilities (buried and aboveground) or roads. Pipelines constructed in RMP corridors or adjacent to existing utilities or roads will require completion of a DDCT analysis for baseline data collection but the project is not required to meet the threshold of 5 percent. However, within 6 months of the completion of construction, the project proponent will provide the AO with as-built drawings so that total disturbance within core area can be calculated annually. The following RMP decisions remain in effect with the modification described above:		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Casper RMP: No new corridor designations will be made in Bates Hole. When placement of a major ROW facility within a designated corridor is not possible, and for smaller ROW and other linear facilities, placement will be adjacent to existing facilities or disturbances. Cross-country placement of ROW and other linear facilities will be allowed only when placement in a designated corridor or adjacent to an existing facility is not practical or feasible. The extent of all surface disturbances will be minimized. No new corridors will be established in the Sand Hills Management Area; ROWs will be allowed when management objectives for the area can still be achieved. All currently designated corridors will be maintained. All special restrictions that apply to types of use/facilities on the corridors will be removed, except as noted for the Oregon Trail Road ROW Corridor, Segment A. The corridors include 351,020 acres, of which 94,580 acres are federal surface. The widths/size of designated corridors will not change. Special restrictions applying to types of use/facilities on the corridors will be removed on a case-by-case basis. Existing corridors include: 1. Oregon Trail Road Corridor, Segment A 2. Oregon Trail Road Corridor, Segment B 3. Oregon Trail Road Corridor, Segment C 4. Poison Spider/Gas Hills Road Corridor 5. Highway 20-26 Corridor 6. Wyoming Highway 259/U.S. 87 Corridor 7. Wyoming Highway 387 Corridor		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
8. Lost Cabin-Arminto Road Corridor 9. RMP Change No. 2012-03, including the West-Wide Energy Corridor 10. Cabin Creek Corridor 11. Existing Oregon Trail Road ROW Corridor, Segment A. Oregon Trail Road ROW Corridor, Segment A allows additional ROW facilities provided they are subsurface, surface, or low profile developments. ROW facilities that introduce visual intrusions on the skyline along the corridor will not be allowed. Special restrictions applying to types of use/facilities on the corridors will be removed on a case-by-case basis, and a new corridor, to be called the Cabin Creek Corridor, will be designated. Future Corridor Adjustments and New Corridor Designations: Future corridor adjustments and new corridor designations will be made only when facility placement within an existing designated corridor is incompatible, unfeasible, or impractical and when the environmental consequences can be adequately mitigated. Problems of technical compatibility between facilities and spacing of facilities in corridors will be solved on a case-by-case basis. Special restrictions applying to types of use/facilities on the corridors will be removed on a case-by-case basis. South Bighorns/Red Wall Management Area: No corridors will be designated; however, ROWs will be allowed on a case-by-case basis when management objectives for the area can still be achieved. <u>Kemmerer RMP:</u> Utility corridors will be designated, based on use (i.e., power lines, pipelines, and fiber optic lines). Preferred utility corridors will be 2 miles wide (width will be determined based on resource		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
values) and designated as follows, but variances will be allowed based on application where conflicts with other resources were minimal or can be mitigated through resource-specific stipulations: High-voltage power line corridors will be established north of and parallel to I-80, and along Wyoming State Highway 89 from the junction of I-80 and the Wyoming state line. Fiber optic and low-voltage power line corridors will be located along currently established road systems (e.g., interstate or state highways and paved county roads). <u>Newcastle RMP:</u> Utility/transportation systems will be located adjacent to existing utility/transportation systems whenever practical. Areas to be avoided for new facility placement and routes will be identified on a case-by-case basis, rather than attempting to establish utility corridors. <u>Pinedale RMP:</u> Utility facilities will be restricted to existing routes and designated corridors where practicable, including environmental and socioeconomic considerations. Corridor routes include U.S. Highways 189 and 191 and State Highways 189, 191, 350, 351, 352, 353, and 354. New corridors may be established as oil and gas fields are developed. <u>Rawlins RMP:</u> All BLM-administered lands, except WSA and some SD/MAs (including ACEC/Special Interest Areas), will be open to consideration for placement of utility ROW systems. Each utility ROW will be located adjacent to existing facilities, when possible. Areas with important or sensitive resource values will be avoided. Existing major transportation and utility ROW routes will be designated corridors. However,		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
major transportation routes within the planning area that are located east of the Carbon County-Albany County line will not be considered for ROW corridor designation because of the scattered public land ownership pattern in the area. All corridors will be designated for power lines (aboveground and buried), telephone lines, and fiber optic lines. Specific proposals will require site-specific environmental analysis and compliance with established permitting processes. Activities generally excluded from ROW corridors include mineral materials disposal, range and wildlife habitat improvements involving surface disturbance and facility construction, campgrounds, and public recreation facilities and other facilities that will attract public use. ROW facilities will not be placed adjacent to each other if issues with safety or incompatibility or resource conflicts were identified. The designated width, allowable uses, and excluded uses for each corridor may be modified during implementation of the Approved RMP. <u>Green River RMP:</u> Areas designated as utility windows will be preferred locations for future grants. Five windows have been identified: 2 east-west, 3 north-south. Other areas will be considered for rights-of-way on a case-by-case basis. Windows 0.5 miles in width have been identified for the placement of utilities. The northern east-west window will be for underground facilities only, and the southern east-west window will be for both above and below ground facilities. A 0.5-mile wide north-south window on the west side of Flaming Gorge, a window south along Highway 430, and a north-south window along the east		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
side of Flaming Gorge have been identified for above and below ground utilities. JMH CAP: The planning area, with the exception of defined exclusion and avoidance areas, will be open to considering grants of rights-of-way if area objectives can be met. Exclusion areas are closed to rights-of-way. Avoidance and special management areas not identified as exclusion areas will be open to consideration only after site-specific analysis demonstrates area objectives can be met (see glossary) in Greater Sage-Grouse potential nesting habitat.		
MD LR 4: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Maintenance/replacement of existing structures will be allowed subject to valid and existing rights. Upgrades will be considered, subject to mandatory RDFs (Appendix C). Existing guy wires shall be removed or appropriately marked with bird flight diverters to make them more visible to Greater Sage-Grouse in flight. Power lines (distribution and transmission) will be designed to minimize wildlife-related impacts and constructed to the latest APLIC standards. Outside of PHMA the following RMP decisions remain in effect: Kemmerer RMP: New utility lines will be buried or BLM-approved anti-perch devices will be installed on all new utility lines within sagebrush and/or semiarid shrub-dominated habitats, unless NEPA analysis shows little or no impact without burial or modification.	No changes made.	Partially revised – to update Appendix referenced

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 5: Within PHMA where existing authorizations, ROWs, or SUAs have had some level of development (e.g., road, fence, and well) and are expired and are no longer in use, the site will be reclaimed by removing these features and restoring the habitat. Power lines (distribution and transmission) will be designed to minimize wildlife-related impacts and constructed to the latest APLIC standards.	No changes made.	No change (same as 2015)
MD LR 6: Within PHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: The use of guy wires for MET tower supports will be avoided within PHMA. All existing and any new unavoidable guy wires shall be marked with recommended bird deterrent devices. The siting of new temporary MET towers within PHMA will be avoided within 2 miles of occupied Greater Sage-Grouse leks, unless they are out of the direct line of sight of the occupied lek. Outside of PHMA, the following RMP decisions remain in effect: <u>Kemmerer RMP:</u> New MET towers will be avoided within 1 mile of occupied sagebrush obligate habitats, unless anti-perch devices are installed. MET towers relying on guy wires for support will be prohibited in these habitats. Exceptions can be made if NEPA analysis shows little or no impact on sagebrush obligate species. <u>Rawlins RMP:</u> MET towers will be authorized on a case-by-case basis from 0.25 miles to 1 mile of an occupied Greater Sage-Grouse and sharp-tailed grouse lek.	No changes made.	Completely revised by rangewide for All RMPs amended for management of GRSG in PHMA No change (same as 2015) for decisions that remain in effect
MD LR 7: Within PHMA and GHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Lands classified as PHMA for	No changes made.	Partially revised – to include SHMA

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, that disposal of the parcel is in the public's best interest or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Exceptions will be considered where there is mixed ownership and land exchanges will allow for additional or more contiguous federal ownership patterns within PHMA. For PHMA with minority federal ownership, an additional, effective mitigation agreement will be included for any disposal of federal land. As a final preservation measure, consideration shall be given to pursuing a permanent conservation easement. For lands in GHMA that are identified for disposal, the BLM will only dispose of such lands consistent with the goals and objectives of this plan, including, but not limited to, the RMP goal to conserve, recover, and enhance Greater Sage-Grouse habitat on a landscape scale. For values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> 224,830 acres of public lands are identified as potentially suitable for disposal. At the implementation stage, site-specific analysis with public participation will be conducted. Based on the analysis and public comments received, a determination will be made on whether disposal of the parcel is in the public's best interest. If it is not in the public's best interest, the		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
parcel will be retained in public ownership. Restricted Disposal – dispose of 5,450 acres on a restricted basis. Allow land-use authorizations under FLPMA Section 302(b) leases and permits to meet public demand. Evaluate on a case-by-case basis as proposals are presented. Potential lease and permit areas may include, but are not limited to the following: • Areas where there are documented or existing trespass facilities that can be resolved by an authorization under this section • Areas along major highways where developments may facilitate public needs • Areas in or adjacent to residential, agricultural, commercial, or industrial developments. The BLM will pursue acquisition of lands and interest in lands in the South Bighorns/Red Wall area.		
MD LR 8: Within PHMA and GHMA, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Areas where acquisitions (including subsurface mineral rights) or conservation easements will benefit Greater Sage-Grouse habitat will be identified. Outside of PHMA and GHMA, and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: <u>Casper RMP:</u> The BLM will pursue acquisition of lands and interest in lands in the Bolton Creek Drainage and Bates Creek areas.	No changes made.	Partially revised – to include SHMA
MD LR 9: Greater Sage-Grouse habitat requirements will be utilized to prioritize parcels for exchange or acquisition within PHMA.	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD LR 10: Within PHMA, non-mineral withdrawals will be evaluated to determine if the withdrawal action is consistent with Greater Sage-Grouse conservation.	No changes made.	No change (same as 2015)
MD REC 1: Specific to management for Greater Sage-Grouse or PHMA, all RMPs are amended as follows: BLM Special Recreation Permits will be allowed in PHMA, unless negative impacts on Greater Sage-Grouse cannot be adequately mitigated. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Casper RMP: The entire planning area will remain open to dispersed recreation. The camping limit on public lands is set by BLM policy and is currently limited to 14 days. Emphasis will be placed on providing interpretive and information signs and materials for public land visitors, maintaining existing facilities to a high standard consistent with the recreational setting, and limiting development of additional facilities to those areas where public recreational use of surrounding public lands requires. Work with state, local groups, and adjacent landowners will be conducted to identify and develop recreational trails, both motorized and nonmotorized, when the opportunities presents themselves. Special Recreation Permits will be allowed for commercial, noncommercial, and competitive events on a case-by-case basis. Cooperation will be maintained with a variety of user groups, especially in the local area, to provide diverse recreational opportunities for enjoyment of public lands. BLM will pursue acquisition of lands and interest in lands in the Rattlesnake Range and Pine Ridge areas, as well	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
as promote and support recreation-based tourism. Kemmerer RMP: Allow dispersed recreation and permit special recreational activities (e.g., outfitting and guiding permits and OHV events permitted on an annual basis after evaluation). Green River RMP: Special recreation permits will be considered on a case-by-case basis. Appropriate mitigation will be included in special recreation permits, commercial recreation uses, and major competitive recreation events to provide resource protection and public safety. JMH CAP: Special recreation use permits for managed activities that occur in the JMH CAP planning area will be reviewed and subject to recommendations made by the Rock Springs Field Office. This will allow the Rock Springs Field Office to track the amount, location, and timing of organized activity occurring within the planning area to monitor resource pressure. The permit evaluation process will consider the nature of the event, potential impacts on resources, conflicts with other events, and impacts on the quality of other visitors' experiences. Mitigation measures necessary to protect the resources will be included in any permit issued. A plan of operation will be required for all commercial recreational operators and outfitters. The plan will describe the type, extent, and location of the recreation use and the mechanisms by which the operator/outfitter will prevent impacts on environmental resources. Any requests in special recreation use permit applications to remove natural resources will be evaluated on a case-by-case basis after an environmental analysis process.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD REC 2: Construction of recreation facilities within PHMA must conform with the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will consider and ensure compensatory mitigation that provides a net conservation gain to the species.	Construction of recreation facilities within PHMA must conform to the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will consider mitigation consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4 (see also MD SSS 4).	Partial revision – to update EO referenced and update mitigation reference
MD TTM 1: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Within PHMA, designate the non-sand dune portions of the following OHV Open Areas as OHV Limited Area. The OHV limitation will ultimately be to "Designated Routes" as determined through a subsequent implementation/activity level Travel Management Plan. In the interim, motorized use on existing routes may occur; however, no new routes may be created without specific authorization: Rawlins Field Office: Dune Pond Cooperative Management Area. Rock Springs Field Office: Portion of the Greater Sand Dunes Recreation Area. The following RMP decisions remain in effect: The Casper Field Office Poison Spider OHV Park (290 acres) will remain as an "open" OHV area.	No changes made.	No change (same as 2015)
MD TTM 2: Within PHMA and GHMA, all motorized use (of which OHVs are a subset) will be limited to designated routes. Route designations will occur in subsequent implementation/activity level Travel Management Plans. In the interim motorized use on existing routes may occur; however, no new routes may be created without specific authorization. In PHMA and	No changes made.	Partially revised – to include SHMA

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
GHMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the AO to resolve management conflicts and protect persons, property, and public lands and resources. Where an AO determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order shall be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders shall be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.		

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD TTM 3: New local or collector roads (as defined in BLM Manual 9113) will be avoided within 1.9 miles of the perimeter of occupied Greater Sage-Grouse leks within PHMA. All new roads will be prohibited within 0.6 miles of the perimeter of occupied Greater Sage-Grouse leks within PHMA.	No changes made.	No change (same as 2015)
MD TTM 4: Within PHMA, no upgrading of existing routes that will change route category or capacity will be allowed unless the upgrading will have minimal impact on Greater Sage-Grouse in PHMA, was necessary for motorist safety, or eliminated the need to construct a new road.	No changes made.	No change (same as 2015)
MD TTM 5: In PHMA, existing roads or realignments will be used to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, any new road will be constructed to the absolute minimum standard necessary, and the surface disturbance will be added to the total disturbance in the PHMA.	No changes made.	No change (same as 2015)
MD TTM 6: Specific to management for Greater Sage-Grouse or PHMA, all RMPs are amended as follows: For roads, primitive roads and trails not designated in travel management plans within PHMA, natural reclamation of roads and trails will be allowed in appropriate situations where additional resource damage is not foreseeable. This will include primitive route/roads that were not designated in wilderness study areas and within lands with wilderness characteristics that have been selected to be managed to retain those characteristics for protection. In PHMA, locate new roads that will have relatively high levels of activity	No changes made.	No change (same as 2015)

2015 BLM GRSG Approved RMP Amendment	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
(accessing multiple wells, housing development) greater than 1.9 miles from the perimeter of occupied Greater Sage-Grouse leks. Locate new other roads used to provide facility site access and maintenance >0.6 miles from the perimeter of occupied Greater Sage-Grouse leks. Outside of PHMA and/or for values other than Greater Sage-Grouse, the following RMP decisions remain in effect with the modification described above: Kemmerer RMP: Roads and two-track routes determined to be unauthorized or redundant and unnecessary for resource management purposes will be reclaimed to achieve surrounding native conditions. Rawlins RMP: Roads or trails that are eroding beyond a reasonable level will be fixed or closed. JMH CAP: Transportation planning will provide for access to achieve multiple-use goals while providing maximum protection for crucial habitats and sensitive resources and will consider: Closing and rehabilitating unused roads and trails and those causing resource damage. This will be subject to county review of existing rights-of-way needs.		
MD TTM 7: Within PHMA, when reseeding roads and trails, appropriate seed mixtures will be used and the use of transplanted sagebrush will be considered.	No changes made.	No change (same as 2015)
MD Special Designations and Other Management Areas: New Greater Sage-Grouse conservation ACECs will not be designated.	No changes made.	No change (same as 2015)

[From Tables A-2 through A-5 in Appendix A from the 2019 Wyoming Greater Sage-Grouse ARMPA]:

Table 2. Seasonal Habitat Objectives for GRSG

Table 2 Completely revised by rangewide and state-specific

Attribute	Indicators	Desired Condition[6]	Reference
Breeding and Nesting (Seasonal Use Period March 1–June 15 (Doherty 2008; Holloran and Anderson 2005)			
Lek Security	Proximity of trees	Trees absent or uncommon shrub/grassland ecological sites within 1.8 miles (approximately 3 kilometers) of occupied leks	Baruch-Mordo et al. 2013; Stiver et al. 2015
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 330 feet (approximately 100 meters) of an occupied lek	Stiver et al. 2015
Cover	% of seasonal habitat meeting desired conditions	>80% of the nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).	Connelly et al. 2000
	Sagebrush cover[2]	5 to 25%	Connelly et al. 2000; Connelly et al. 2003; Hagen et al. 2007
	Sagebrush height Arid sites[3] Mesic sites[4]	 4–31 inches (10–80 centimeters) 12–31 inches (30–80 centimeters)	Connelly et al. 2000
	Predominant sagebrush shape	Predominantly spreading shape[5]	Stiver et al. 2015
	Perennial grass cover (such as native bunchgrass)[2] Arid sites[3] Mesic sites[4]	 >10% >15% Cool-season bunchgrasses preferred	Connelly et al. 2000; Stiver et al. 2015; Cagney et al. 2010
	Perennial grass and forb height (including residual grasses)	Adequate nesting cover ~~of >7" or~~ **would be** as determined by ESD site potential ~~and~~ **or best available science in consideration of** local variability.	Connelly et al. 2000; Connelly et al. 2003; Doherty et al. 2014; Hagen et al. 2007; Stiver et al. 2015
	Perennial forb cover[2] Arid sites[3] Mesic sites[4]	 >5% >10%	Connelly, J. W., M. A. Schroeder, A. R. Sands, and C. E. Braun 2000.

Attribute	Indicators	Desired Condition[6]	Reference
Brood-Rearing/Summer[1] (Seasonal Use Period June 16–October 31)			
Cover	% of seasonal habitat meeting desired condition	>40% of the summer/brood habitat meets recommended brood habitat characteristics where appropriate (relative to ecological site potential, etc.)	Connelly et al. 2000
	Sagebrush cover[2]	5–25%	Connelly et al. 2000
	Sagebrush height	4–32 inches (20.3–80 centimeters)	Connelly et al. 2000
	Perennial grass cover and forbs[2]	>5% arid sites >10% mesic sites	Connelly et al. 2000
	Riparian areas/mesic meadows[2]	Proper functioning condition	Preferred forbs are listed in Stiver et al. 2015
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present	Stiver et al. 2015
Winter (Seasonal Use Period November 1–February 28)			
Cover and Food	% of seasonal habitat meeting desired conditions	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).	Connelly et al. 2000
	Sagebrush cover above snow[2]	>5%	Connelly et al. 2000; Stiver et al. 2015
	Sagebrush height above snow	>10 inches (>25 centimeters)	Connelly et al. 2000

Notes:

1 Where credible data support different seasonal dates than those identified, dates may be shifted, but the amount of days cannot be shortened or lengthened by the local unit.

2 Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush and preferred forbs) that are sampled to determine suitability of habitat for Greater Sage-Grouse. Overall cover at the site will be greater than that sampled for Greater Sage-Grouse habitat, due to other species present. 3 Arid corresponds to the 10-12-inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush subspecies for this type site (Stiver et al. 2015).

4 Mesic corresponds to the ≥12-inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush subspecies for this type site (Stiver et al. 2015).

5 Collectively, the indicators for sagebrush (cover, height, and shape), perennial grass, and perennial forb (cover, height, and/or availability) represent the desired condition range for nesting/early brood-rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. 2015. Sagebrush plants that are more tree or columnar shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush) and a natural part of the plant community; however, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site-specific scales.

6 All desired conditions will be dependent upon site capability and local variation (e.g., weather patterns, localized drought, and ESD state).

2.16.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that would change by the Proposed RMP Amendment. Note that if 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The appendices can be found on the Wyoming GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Approved RMP Amendment Maps	2015	Completely Revised-revised by rangewide
A: Approved RMP Amendment with Management Goals, Objectives, and Decisions	2019	Partially Revised based on changes in Proposed RMP Amendment
B: Fluid Mineral Stipulations	2015	Partially Revised- Applies rangewide exceptions, modifications, and waivers
C: Required Design Features	2015, 2019	No change (same as 2019)
D: The Greater Sage-Grouse Habitat Management Strategy	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
C: Greater Sage-Grouse Habitat Management Strategy	2019	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
F: Mitigation Guidelines for Surface-Disturbing and Disruptive Activities on Wyoming BLM Lands	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
G: Federal Oil and Gas Operations on Split Estate Lands	2015	No change (same as 2015)
H: Wyoming Game and Fish Department Protocols for Treating Sagebrush in Greater Sage-Grouse Habitat	2015	No change based on this amendment, but updated to incorporate version as revised by WGFD Jan 2024
J: Disturbance Density Calculation Tool Manual	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
L: Greater Sage-Grouse Wildfire and Invasive Species Habitat Assessment	2015	No change (same as 2015)
M: Reclamation Plan	2015	No change (same as 2015)
N: Predator Management	2015	Completely Revised-revised by rangewide

2.17 BUFFALO, WYOMING RMP REVISIONS

This appendix presents the approved RMP revision language from the record of decision for the Buffalo RMP that relate to GRSG management, and changes that were made in the 2019 GRSG amendment effort. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.17.2** of this appendix. For the additional state-specific Wyoming management direction for the Proposed RMPA, see Chapter 2, Table 2-13.

2.17.1 Buffalo RMP (Wyoming)

Table 1. Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Decisions in the Buffalo RMP (Wyoming)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
MG BR:10: Distribution and abundance of all special status species are optimized.	No changes made.	No change (same as 2015)
MO BR:10.1: Maintain or enhance special status species plant communities and habitats.	No changes made.	No change (same as 2015)
MO:10.2: Manage BLM-administered lands to maintain or restore populations and habitat consistent with conservation requirements for special status species.	No changes made.	No change (same as 2015)
MO:10.3: Develop effective conservation and cooperative management plans, strategies, and agreements with stakeholders.	No changes made.	No change (same as 2015)
MG BR:11: Sustainable sagebrush habitats that provide the quantity, quality, and connectivity that is necessary to maintain sustainable populations of Greater Sage-Grouse and other special status species.	No changes made.	Completely revised – revised by rangewide
MO BR:11.1: Maintain large patches of high quality interconnected sagebrush habitats, with emphasis on patches occupied by Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO BR:11.2: Maintain connectivity between and within sagebrush habitats with emphasis on communities occupied by Greater Sage-Grouse.	No changes made.	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO BR:11.3: In all PHMA, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70%) with a minimum of 15% sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).	No changes made.	No change (same as 2015)
MG BR:12: Successful restoration and rehabilitation of potential Greater Sage-Grouse habitat across the planning area.	No changes made.	No change (same as 2015)
MO BR:12.1: Reestablish sagebrush corridors, where feasible, between Greater Sage-Grouse occupied habitats.	No changes made.	No change (same as 2015)
MO BR:12.2: Reconnect large patches of sagebrush habitat with emphasis on reconnecting patches occupied by stronghold and isolated populations of Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MD SS WL-4001: Utilize current research, management and conservation plans, and similar related documents to guide special status species habitat management.	No changes made.	No change (same as 2015)
MD SS WL-4002: Implement actions set forth in recovery plans, conservation measures, terms and conditions, protection measures, and appropriate BMPs and reasonable and prudent measures within biological opinions for Threatened and/or Endangered wildlife species, including those specific to this RMP and any future statewide programmatic biological opinions.	No changes made.	No change (same as 2015)
MD SS WL-4003: Maintain (size and quality) or enhance current habitat utilized by special status species. Enlarge/restore habitat on a site-specific basis.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SS WL-4004: Maintain or enhance the integrity of identified special status wildlife species migration corridors. Manage identified special status wildlife species travel corridors consistent with other resource values.	No changes made.	No change (same as 2015)
MD SS WL-4005: Locate and manage facilities to mitigate noise impacts on special status species.	No changes made.	No change (same as 2015)
MD SS WL-4006: Manage surface-disturbing and disruptive activities to mitigate impacts on special status wildlife species and their habitats.	No changes made.	No change (same as 2015)
MD SS WL-4007: Apply a CSU stipulation to fluid mineral leases containing special status species habitat. Surveys required for clearance.	No changes made.	No change (same as 2015)
*MD SS WL-4010: The BLM will coordinate new recommendations, mitigation, and Greater Sage-Grouse habitat objectives and management considerations with the WGFD and other appropriate agencies, local government cooperators, and the Wyoming SGIT. These measures will be analyzed in site-specific NEPA documents, as necessary. The Greater Sage-Grouse adaptive management plan (Appendix D (p. 325)) provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. Projects requiring an EIS shall develop adaptive management strategies in support of the population management objectives for Greater Sage-Grouse set by the State of Wyoming (State of WY EO 2015-4). Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use	The BLM will coordinate new recommendations, mitigation, and Greater Sage-Grouse habitat objectives and management considerations with the WGFD and other appropriate agencies, local government cooperators, and the Wyoming Sage-Grouse Implementation Team. These measures will be analyzed in site-specific NEPA documents, as necessary. The Greater Sage-Grouse adaptive management plan (2019 Wyoming GrSG ARMPA Appendix C) provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. Projects requiring an EIS shall develop adaptive management strategies in support of the population management objectives for Greater Sage-Grouse set by the State of Wyoming (State of WY EO 2015-4). Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives.	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
soft and hard triggers. Soft and hard triggers are focused on three metrics: (1) number of active leks, (2) acres of available habitat, and (3) population trends based on annual lek counts. **Soft Triggers Response**: Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short- or long-term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency (BLM) and the Adaptive Management Working Group will implement an appropriate response strategy to address causal factors not attributable to a specific project or to make adjustments at a larger regional or statewide level. **Hard Trigger Response**: Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the Biologically Significant Unit for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Working Group will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment).	With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: (1) number of active leks, (2) acres of available habitat, and (3) population trends based on annual lek counts. Soft Triggers Response: Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short- or long-term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency (BLM) and the Adaptive Management Working Group will implement an appropriate response strategy to address causal factors not attributable to a specific project or to make adjustments at a larger regional or statewide level. Hard Trigger Response: Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the Biologically Significant Unit for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Working Group will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment). The Adaptive Management Working Group would define a process to review and reverse adaptive management actions once the identified causal factor is resolved (e.g., returning to previous management once objectives of interim management strategy have been met).	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SS WL-4011: Develop avoidance areas restricting the application of broad-spectrum pesticides in areas containing Greater Sage-Grouse nesting and brood-rearing habitats.	No changes made.	No change (same as 2015)
MD SS WL-4012: Restore Greater Sage-Grouse brood-rearing habitats in wetland/riparian areas. Maintain seeps, springs, wet meadows, and riparian vegetation in a functional and diverse condition for young Greater Sage-Grouse and other species that depend on forbs and insects associated with these areas.	No changes made.	No change (same as 2015)
**MD SS WL-4013: Manage vegetation composition, diversity and structure, as determined by ecological site description and WGFD protocol, to achieve Greater Sage-Grouse habitat management objectives, in cooperation with stakeholders. Vegetation treatments in nesting and wintering habitat that would reduce sagebrush canopy cover to less than 15% would not be conducted unless it can be shown to be beneficial to Greater Sage-Grouse habitat and removal of sagebrush canopy cover below 15% will be subject to the DDCT. For vegetation treatments in sagebrush within PHMAs, refer to Appendix A, WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2011, as updated). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5% threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA (core only) populations or if they represent additional habitat loss or fragmentation.	Manage vegetation composition, diversity and structure, as determined by ecological site description and WGFD protocols, to achieve Greater Sage-Grouse habitat management objectives, in cooperation with stakeholders. Vegetation treatments in nesting and wintering habitat that would reduce sagebrush canopy cover to less than 15% would not be conducted unless it can be shown to be beneficial to sage-grouse habitat and removal of sagebrush canopy cover below 15% will be subject to the DDCT. For vegetation treatments in sagebrush within PHMAs, refer to 2015 Buffalo RMP Appendix A, WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2015, as updated). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5% threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA (core only) populations or if they represent additional habitat loss or fragmentation. Treatments to enhance sagebrush/grasslands habitat for sage-grouse would be evaluated	Partially revised – to update Appendix referenced

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Treatments to enhance sagebrush/grasslands habitat for Greater Sage-Grouse would be evaluated based upon habitat quality and the functionality/use of treated habitats post-treatment. The BLM would work collaboratively with partners at the state and local level to maintain and enhance Greater Sage-Grouse habitats. Seasonal restrictions would be applied, as needed, for implementing fuels management treatments according to the type of seasonal habitat present. Wildland fire burns will be treated as disturbance if sagebrush is reduced below 5% canopy cover, unless there is an implementation plan outlining restoration efforts and 3 years of data showing a trend back to suitable habitat. Burned areas within PHMAs would be restored to suitable habitat with consideration given to ESDs, reference sites, site potential and local variability.	based upon habitat quality and the functionality/use of treated habitats post-treatment. The BLM would work collaboratively with partners at the state and local level to maintain and enhance sage-grouse habitats. Seasonal restrictions would be applied, as needed, for implementing fuels management treatments according to the type of seasonal habitat present. Wildland fire burns will be treated as disturbance if sagebrush is reduced below 5% canopy cover, unless there is an implementation plan outlining restoration efforts and 3 years of data showing a trend back to suitable habitat. Burned areas within PHMAs would be restored to suitable habitat with consideration given to ESDs, reference sites, site potential and local variability.	
MD SS WL-4014: Minimize disturbances that would result in alterations to springs and riparian Greater Sage-Grouse habitat. In coordination with stakeholders, develop alternative water sources to replace natural sources that have been affected or destroyed.	No changes made.	No change (same as 2015)
MD SS WL-4015: Manage stored water to control mosquitoes and prevent the spread of WNv to Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MD SS WL-4016: Design water facilities with protective features to reduce mortality of Greater Sage-Grouse from drowning or entrapment.	No changes made.	No change (same as 2015)
MD SS WL-4017: Design and locate fences to reduce impacts to important Greater Sage-Grouse habitat.	No changes made.	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD SS WL-4018: Use the Fire Management Plan to incorporate the most current sagebrush habitat information and to guide fire suppression priorities in sagebrush habitats.	No changes made.	No change (same as 2015)
MD SS WL-4019: Remove conifers where they have encroached upon Greater Sage-Grouse habitat in cooperation with stakeholders. Reduce the density of conifers that have encroached into, but do not yet dominate sagebrush plant communities.	No changes made.	No change (same as 2015)
MD SS WL-4020: Inventory, record, and report existing type and condition of BLM fences. Prioritize areas and annually implement modifications to existing fences to reduce hazards to flying Greater Sage-Grouse, in cooperation with stakeholders. All new fences, in priority areas, will be properly designed and located to avoid hazards to flying Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MD SS WL-4021: Avoid renewable energy (solar and wind) projects in Greater Sage-Grouse Core Population Areas unless it can be demonstrated that the activity would not result in declines of core Greater Sage-Grouse populations. Sufficient demonstration of "no declines" should be coordinated with the WGFD and USFWS.	No changes made.	Completely revised – revised by rangewide
**MD SS WL-4022: Powerlines (distribution and transmission) will be designed to minimize wildlife related impacts. This action includes but is not limited to: • Avoid areas of high avian use such as water bodies (including ponds, lakes, rivers, streams and wetlands), ridge tops, prairie dog colonies, Greater Sage-Grouse Core Population and Core Population Connectivity Corridors, and sharp-tailed grouse leks (PRB Final EIS, EO 2011-05).	Powerlines (distribution and transmission) will be designed to minimize wildlife related impacts. This action includes but is not limited to: • Avoid areas of high avian use such as water bodies (including ponds, lakes, rivers, streams and wetlands), ridge tops, prairie dog colonies, Greater Sage-Grouse Core Population and Core Population Connectivity Corridors, and sharp-tailed grouse leks (PRB Final EIS, EO 2015-4).	Partially revised – revised by rangewide to add GRSG major ROW language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• Prohibit above ground distribution powerlines unless identified in an approved distribution plan. • PHMA: o New transmission lines greater than 115 kV in PHMA (core only) would be allowed only: (1) when located within 0.5 mile or less of an existing 115 kV or greater transmission line or constructed prior to 2008; or (2) in designated RMP corridors authorized for aboveground transmission lines. Transmission lines routed using one or more of the two criteria listed above will not be counted against the DDCT 5% disturbance cap. New transmission lines greater than 115 kV proposed outside of these areas would be considered where it can be demonstrated that declines in Greater Sage-Grouse populations could be avoided through project design and/or mitigation. These projects will be subject to the density and disturbance restrictions for PHMA. Construction of new transmission lines will adhere to the restrictions associated with conducting activities within PHMAs. Review of transmission line proposals would incorporate the Framework for Sage-grouse Impacts Analysis for Interstate Transmission Lines and other appropriate documents consistent with the three routing criteria described above. New electric distribution lines (less than 115 kV) would be buried where feasible and economically feasible. If not economically feasible, distribution lines may be authorized when effectively designed/mitigated to protect Greater Sage-Grouse and the authorized officer determines that overhead installation is the action alternative with the	• Prohibit above ground distribution powerlines unless identified in an approved distribution plan. • PHMA: o New transmission lines greater than 115 kV in PHMA (core only) would be allowed only: (1) when located within 0.5 mile or less of an existing 115 kV or greater transmission line or constructed prior to 2008; or (2) in designated RMP corridors authorized for aboveground transmission lines. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SS WL-4036). Where credible data support different timeframes for this seasonal restriction, dates may be expanded by up to 14 days prior to or subsequent to the above dates. • TLS prohibiting surface-disturbing and disruptive activities within mapped Greater Sage-Grouse	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment

adjusted by up to 14 days prior to or subsequent to the above dates.
Apply the following stipulations to fluid mineral leases within Greater Sage-Grouse Core Population Connectivity Corridors:
• NSO prohibiting surface occupancy and disturbing activities, within 0.6 mile of the perimeter of occupied Greater Sage-Grouse leks (independent of habitat suitability).
• CSU within Greater Sage-Grouse Population Connectivity Corridors.
  ○ Inside Greater Sage-Grouse (priority habitat) core population area connectivity corridors, all suitable habitat disturbed (any program area) will not exceed 5% of suitable habitat within the DDCT area using the DDCT process.
  ○ Design and manage facilities to prevent WNv transmission. Restore disturbed sagebrush communities on BLM surface to meet the Wyoming DEQ community-specific full shrub density standard (Chapter 4 Rules and Regulations, option III) for all predisturbance shrub species and 5% minimum canopy cover of sagebrush. A 90% confidence interval is required to demonstrate achievement of the standard. The standard must be demonstrated the last year of the responsibility period, and all planted shrubs shall have been in place for at least two years.
• TLS prohibiting surface-disturbing and/or disruptive activities within 4.0 miles of an occupied Greater Sage-Grouse lek, from March 15 to June 30 (independent of habitat suitability and restricted to within Population Connectivity Corridors). Activities in unsuitable habitats would be evaluated under the exception and modification
	winter concentration areas, from December 1 to March 14. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SS WL-4036). Protection of additional mapped winter concentration areas in GHMA would be implemented where winter concentration areas are mapped and designated by the State of Wyoming. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas. Where credible data support different timeframes for this seasonal restriction, dates may be expanded by up to 14 days prior to or subsequent to the above dates.
	Apply the following stipulations to fluid mineral leases within Greater Sage-Grouse Core Population Connectivity Corridors:
	• NSO prohibiting surface occupancy and disturbing activities, within 0.6 mile of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) (independent of habitat suitability).
	• CSU within Greater Sage-Grouse Population Connectivity Corridors.
	  ○ Inside Greater Sage-Grouse (priority habitat) core population area connectivity corridors, all suitable habitat disturbed (any program area) will not exceed 5% of suitable habitat within the DDCT area using the DDCT process.

	timeframes for this seasonal restriction, dates may be expanded by up to 14 days prior to or subsequent to the above dates. **Note (PHMA and GHMA):** The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SS WL-4036).	
No similar action.	*MD SS WL-4035: The BLM will update its Greater Sage-Grouse habitat management areas, including biologically significant units (BSUs), in conjunction with the State of Wyoming's core areas, upon issuance of any Wyoming Governor's Executive Order revising or amending the core area boundaries and upon completion of appropriate NEPA analysis and process. The BLM will complete the appropriate NEPA documentation (including appropriate public comment) prior to adopting any revised core area boundaries (e.g., maintenance action or plan amendment, environmental assessment, etc.).	Partially revised – to change reference from BSUs to HAF multi-scale areas.
No similar action.	*MD SS WL-4036: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Adopt the State of Wyoming's Greater Sage-Grouse Compensatory Mitigation Framework to the extent consistent with federal law, regulations, and policy. In all Greater Sage-Grouse habitat, when authorizing third-party actions in designated Greater Sage-Grouse habitat, the BLM will seek to achieve the planning-level Greater Sage-Grouse management goals and objectives through implementation	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	of mitigation and management actions, consistent with valid existing rights and applicable law. Under this Plan Amendment, management would be consistent with the Greater Sage-Grouse goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [Greater Sage-Grouse] or to improve the condition of [Greater Sage-Grouse] habitat" across the planning area. Accordingly, before authorizing third-party actions that result in habitat loss and degradation, the BLM will complete the following steps, in alignment with the Governor of Wyoming's Executive Order 2015-4 (July 29, 2015): 1. Work jointly with the WGFD to evaluate projects and recommend mitigation in the form of avoidance and minimization. 2. The WGFD will determine if the State requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of Greater Sage-Grouse. 3. Incorporate state required or recommended mitigation into the BLM's NEPA decision-making process, if the WGFD determines that compensatory mitigation is required to address impacts to GRSG habitat as a part of State policy or authorization, or if a proponent voluntarily offers mitigation. 4. Analyze whether the compensatory mitigation (deferring to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	recommended compensatory mitigation action): • achieves measurable outcomes for Greater Sage-Grouse habitat function on a landscape scale as determined by WGFD that are at least equal to the lost or degraded values in accordance with the Governor of Wyoming's Executive Order 2015-4. • provides benefits that are in place for at least the duration of the impacts • accounts for a level of risk that the mitigation action may fail or not persist for the full duration of the impact 5. Ensure mitigation outcomes are consistent with the State of Wyoming's mitigation strategy and principles outlined in 2019 Wyoming GrSG ARMPA Appendix C, The Greater Sage-Grouse Habitat Management Strategy. The BLM has determined that compensatory mitigation must be voluntary unless required by other applicable law and in recognition that State authorities may also require compensatory mitigation (IM 2019-018, *Compensatory Mitigation*, December 6, 2018). Therefore, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and degradation, the BLM will consider voluntary compensatory mitigation actions only as a component of compliance with a State mitigation plan, program, or authority, or when offered voluntarily by a project proponent. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and alignment with	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	State policies and requirements, including those regarding compensatory mitigation. When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a mitigation requirement from the State, the BLM's NEPA analysis would evaluate the need to avoid or minimize impacts of the proposed project and achieve the goals and objectives of this RMPA. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action.	
MO PR:2.1: Achieve and maintain Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming (Appendix I (p. 419)).	No changes made.	Partially revised – revised by rangewide (addition of GRSG-specific components)
MO PR:2.3: Rehabilitate all surface-disturbing activities consistent with applicable laws, regulations, and policies.	No changes made.	No change (same as 2015)
MD Soil-1002: Authorized surface-disturbing activities will include plans for reclamation; site-specific reclamation actions should reflect the complexity of the project, environmental concerns, and the reclamation potential of the site.	No changes made.	No change (same as 2015)
MG PR:3: Watershed, surface water, and groundwater resources are consistent with applicable state and federal standards and regulations.	No changes made.	No change (same as 2015)
MO PR:3.1: BLM actions maintain or improve watershed, wetland, and riparian functions to support desired surface-flow regimes and water quality.	No changes made.	No change (same as 2015)
MD Water-1007: Design and manage land use and surface-disturbing activities to reduce channel and bank erosion and the associated loss of riparian habitats.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Water-1013: Allow surface disturbance within 500 feet of springs, non-CBNG reservoirs, water wells, or perennial streams with an approved site-specific plan that ensures construction, stabilization and reclamation methods are meeting water and other resource objectives including, but not limited to soil, slope, and vegetation, and wildlife habitat.	No changes made.	No change (same as 2015)
MD Water-1016: Evaluate unneeded reservoirs for removal and reclamation.	No changes made.	No change (same as 2015)
MO MR:1.1: Provide opportunities for the exploration and development of locatable minerals, as well as mill and tunnel site operations, while avoiding or mitigating the effects of these activities on other resource values so that unnecessary or undue degradation is prevented.	No changes made.	No change (same as 2015)
MO MR:2.1: Maintain coal leasing and exploration, while minimizing impacts to other resource values.	No changes made.	Partially Revised – addition of rangewide language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Coal-2001: Coal planning was completed as part of the April 2001 BFO RMP update. At that time the four coal planning screens (i.e., coal development potential, unsuitability, multiple use and surface owner consultation) were applied to certain federal coal lands within the BFO planning area. The result of this planning effort was a decision identifying lands acceptable for further coal leasing consideration. The coal management decisions made in the BFO RMP update will be carried forward in this Approved RMP. Federal coal lands identified acceptable for further coal leasing consideration are available for Lease By Applications, lease modifications, emergency leases, and exchanges. Prior to offering a coal tract for sale, the need to reapply the unsuitability criteria will be reviewed, a tract specific NEPA analysis will be completed, and there will be opportunity for public comment. At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. Priority habitat (core population areas and core population connectivity corridors) is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1).	No changes made.	Partially Revised – revised by addition of rangewide language for applications for new coal lease or lease modification No change (same as 2015) for completed coal planning

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO MR:3.4: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of Greater Sage-Grouse habitat. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in priority habitat (core population areas and core population connectivity corridors) and general habitat, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	Leasing is allowed in PHMA. Where the BLM has a backlog of Expressions of Interest for leasing, the BLM will prioritize its work first in non-habitat management areas, followed by lower priority habitat management areas (e.g., GHMA) and then higher priority habitat management areas (i.e., PHMA). To the extent consistent with federal regulation, law, and policy, priority would be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority would be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. To incentivize development to locate outside of PHMA, the BLM would work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts on Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
**MD O&G-2001: Continue to require lessees to conduct operations in a manner that minimizes adverse impacts to other resources and other land uses and users. Where the federal government owns the mineral estate in Greater Sage-Grouse habitat and the surface is in non-federal ownership, apply to BLM authorizations regulating the federal lessee the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered surface lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner. Where the federal government owns the surface and the mineral estate is in non-federal ownership in Greater Sage-Grouse habitat, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.	Continue to require lessees to conduct operations in a manner that minimizes adverse impacts to other resources and other land uses and users. Where the federal government owns the mineral estate in Greater Sage-Grouse habitat and the surface is in non-federal ownership, apply to BLM authorizations regulating the federal lessee the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered surface lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner. Where the federal government owns the surface and the mineral estate is in non-federal ownership in Greater Sage-Grouse habitat, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee (see also MD SS WL-4024 and MD SS WL-4036).	No change (same as 2019)
**MD O&G-2006: Areas that are open to oil and gas leasing are open to geophysical exploration subject to appropriate mitigation developed through use of the mitigation guidelines described in Appendix F (p. 397). Areas closed to oil and gas leasing are closed to geophysical exploration. Geophysical exploration is subject to motorized travel limitations and restrictions on surface-disturbing and disruptive activities. Geophysical exploration projects that are designed to minimize habitat fragmentation within PHMA would be allowed, except where prohibited or restricted by LUP decisions, and in conformance with timing and distances Management Decisions (see SS WL-4024).	Areas that are open to oil and gas leasing are open to geophysical exploration subject to appropriate mitigation developed through use of the mitigation guidelines described in Appendix F (p. 397). Areas closed to oil and gas leasing are closed to geophysical exploration. Geophysical exploration is subject to motorized travel limitations and restrictions on surface-disturbing and disruptive activities. Geophysical exploration projects that are designed to minimize habitat fragmentation within PHMA would be allowed, except where prohibited or restricted by LUP decisions, and in conformance with timing and distances Management Decisions (see also MD SS WL- 4024 and MD SS WL-4036).	Partially revised – to update Appendix and Management Decisions referenced

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MG MR:4: Manage leasable minerals other than oil, gas, coal, and geothermal energy based on demand, while avoiding or mitigating impacts to other resource values.	No changes made.	Partially revised – revised by addition of rangewide and state-specific language specific to GRSG
MO MR:4.1: Make opportunities available for exploration and development of leasable minerals other than oil, gas, coal, and geothermal energy, while avoiding or mitigating impacts of these activities on other resource values.	No changes made.	Partially revised – revised by addition of rangewide and state-specific language specific to GRSG
MD OL-2001: All lands in the planning area are available to exploration and development of other leasable minerals unless closed to mineral leasing. All non-energy leasable mineral activities would be considered in PHMA, provided that the activities can be completed in compliance with all Greater Sage-Grouse occupancy, timing, density and disturbance restrictions (see SS WL-4024).	All lands in the planning area are available to exploration and development of other leasable minerals unless closed to mineral leasing. All non-energy leasable mineral activities would be considered in PHMA, provided that the activities can be completed in compliance with all Greater Sage-Grouse occupancy, timing, density and disturbance restrictions (see also MD SS WL-4024 and MD SS WL-4036).	Partially revised – revised by addition of rangewide and state-specific GRSG language
MO MR:5.1: Provide opportunities for exploration and development of salable minerals while avoiding or mitigating effects to other resource values.	No changes made.	Partially revised – revised by addition of rangewide and state-specific GRSG language
MG FM:1: Life, property, and resource values are protected. The protection of human life is the single, overriding priority. Setting priorities among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources will be done based on the values to be protected, human health and safety, and the costs of protection.	No changes made.	No change (same as 2015)
MO FM:1.1: Respond to unplanned wildfires based on: (1) ecological, (2) social, and (3) legal consequences while supporting other resource values.	No changes made.	No change (same as 2015)
MO FM:1.5: Implement appropriate emergency stabilization and rehabilitation actions following wildland fire.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MG FM:2: Plant community and hazardous fuel objectives are achieved.	No changes made.	No change (same as 2015)
MO FM:2.1: Improve fire regime condition class and maintain or improve conditions of fire-adapted landscapes by managing fire, planned and unplanned, to accomplish beneficial resource objectives.	No changes made.	No change (same as 2015)
MD Fire-3001: A Fire Management Plan for the Wyoming High Plains District will be maintained that more specifically outlines management response and implementation actions for wildland fire response of public lands.	No changes made.	No change (same as 2015)
MD Fire-3002: A resource advisor appropriate to the potentially affected resource will be consulted, or assigned, to all wildland fires that involve or threaten BLM-administered lands.	No changes made.	No change (same as 2015)
MD Fire-3006: Implement the BLM Emergency Stabilization and Burned Area Rehabilitation standards located in the DOI Interagency Burned Area Emergency Response Guidebook (DOI 2004) and BLM Burned Area Emergency Stabilization and Rehabilitation Handbook (BLM 2007a) as needed. Appendix P (p. 625) provides additional information regarding the BLM's approach to emergency stabilization and rehabilitation.	No changes made.	Partially revised – to update Appendix referenced
MD Fire-3007: Use the District Fire Management Plan to implement the objectives of this RMP; to address fire management on a landscape scale, to maintain or improve conditions in fire-adapted landscapes, and to accomplish resource management objectives.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Fire-3008: Ensure all prescribed burning activities comply with Wyoming DEQ air quality standards and smoke management rules. For fuels management, the BLM would consider multiple tools for fuels reduction and would analyze in NEPA compliance documentation before electing to implement prescribed fire in PHMAs. If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how Greater Sage-Grouse goals and objectives would be met by its use; • how the Conservation Objectives Team Report objectives would be addressed and met; • a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known Greater Sage-Grouse winter range shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in winter habitat would need to be designed to strategically reduce wildfire risk around and/or in the winter range and designed to protect winter range habitat quality.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Fire-3011: Response to wildfire varies from full protection in areas where fire is undesirable to monitoring fire behavior in areas where fire can be managed to accomplish other resource objectives. The entire planning area is available to manage wildfire for multiple objectives.	No changes made.	No change (same as 2015)
MD Fire-3012: Prohibit heavy equipment use within the following areas, except when human safety is at risk or if the expected fire effects would cause more resource damage than the use of heavy equipment: • Areas of cultural resource sensitivity • Riparian/wetland habitats • Identified Greater Sage-Grouse important habitats: Core Population Areas, nesting, brood-rearing, Core Population Connectivity Corridors, or winter habitat • Areas of highly erosive soils • Lands with wilderness characteristics Limit heavy equipment usage to existing roads and trails, or immediately adjacent to them, in areas not identified as full protection.	No changes made.	No change (same as 2015)
MD Fire-3013: Use protection strategies in the following areas: • WUI • Wildland Industrial Interface • Developed recreation • Developed electronic/communication sites of all types • Where sensitive or high value resources would be adversely affected by fire (i.e., Greater Sage-Grouse Core Population Area and Connectivity Corridor)	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Fire-3014: Evaluate all fires and rehabilitate fire-damaged lands as needed to meet resource objectives. Repair suppression damages as necessary. Post ES&R and BAER management would be designed to ensure long-term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse, and travel management, etc., to achieve and maintain the desired condition of ES&R and BAER projects to benefit Greater Sage-Grouse (Eiswerth and Shonkwiler 2006). The BLM could bring in BAR and BAER teams who would work collaboratively with partners at the federal, state, and local level to rehabilitate and restore Greater Sage-Grouse habitats in a manner consistent with the core habitat population area strategy for conservation. DDCT reviews would be conducted in coordination with the WGFD Habitat Protection Program located in Cheyenne, Wyoming at the WGFD headquarters. Areas within PHMAs would be high priority for restoration of Greater Sage-Grouse habitat beyond immediate response.	No changes made.	No change (same as 2015)
MD Fire-3015: Use wildland fire and other vegetation treatments to meet desired management objectives.	No changes made.	No change (same as 2015)
MG BR:1: Vegetation resources sustained in desired ecological conditions.	No changes made.	No change (same as 2015)
MO BR:1.1: Manage communities for a diversity of native species, habitats, seral stages, and distribution.	No changes made.	No change (same as 2015)
MO BR:1.2: Manage for healthy vegetation communities to ensure their capability to provide sufficient plant composition, cover, and litter accumulation to protect soils from wind and water erosion and enhance nutrient cycling and productivity.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO BR:1.3: Reclaim areas affected by surface-disturbing activities to promote healthy functioning native plant communities.	No changes made.	No change (same as 2015)
MO BR:1.4: Manage habitat to facilitate the conservation, recovery, and maintenance of populations of native, desirable non-native, and special status plant species consistent with appropriate local, state, and federal conservation requirements and management plans.	No changes made.	No change (same as 2015)
MO BR:1.5: Manage for healthy native plant communities by reducing and managing invasive, non-native noxious species.	No changes made.	No change (same as 2015)
MD Forest-4006: Actively manage woodlands to prevent expansion into other communities consistent with multiple resource values, on a project-specific basis.	No changes made.	No change (same as 2015)
MG BR:3: A diverse landscape of native grasslands and shrublands sustained in desired ecological conditions.	No changes made.	No change (same as 2015)
MO BR:3.1: Manage for a full range of sagebrush, shrub, and grassland communities with diverse native species and subspecies, composition, canopies, densities, and age classes across the landscape.	No changes made.	No change (same as 2015)
MD GS-4001: Manage vegetative communities in accordance with Wyoming Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming.	No changes made.	Partially revised – revised by adding GRSG specific rangewide language
MD GS-4003: Use an integrated management approach (e.g., mechanical, chemical, biological treatments, prescribed fire, and grazing management techniques) to maintain, restore, and enhance the health and diversity of plant communities to achieve resource or multi-resource objectives.	No changes made.	No change (same as 2015)
MD GS-4005: Manage grasslands and shrublands to protect, preserve, or enhance plant communities.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD GS-4006: Manage the siting of facilities and related infrastructure (utility corridors, roads) to reduce impacts to vegetation resources.	No changes made.	No change (same as 2015)
MD GS-4007: Manage the planning and development of travel routes, recreational uses, mineral exploration and development sites, and ROW to reduce impacts to the vegetation resource.	No changes made.	No change (same as 2015)
MD GS-4008: Develop a contingency plan addressing catastrophic natural events such as drought, wildfires, and large-scale pest infestations, incorporating strategies that best protect vegetation resources.	No changes made.	No change (same as 2015)
MD GS-4009: Work with landowners on split estate lands to reestablish disturbed sites to healthy plant communities in accordance with the ecological site potential	No changes made.	No change (same as 2015)
MG BR:4: Health and functional capabilities in riparian/wetland systems.	No changes made.	No change (same as 2015)
MO BR:4.1: Manage lotic and lentic wetland/riparian systems at a minimum to achieve and/or maintain PFC.	No changes made.	No change (same as 2015)
MO BR:4.2: Improve riparian systems and wetlands in systems operating at less than PFC.	No changes made.	No change (same as 2015)
MO BR:4.3: Manage contributing watersheds to sustain riparian health and water quality.	No changes made.	No change (same as 2015)
MO BR:4.4: Manage and enhance riparian and wetland systems for plant, insect, fish and wildlife species that depend on these systems for their health and well being.	No changes made.	No change (same as 2015)
MO BR:4.5: CBNG created riparian and wetland systems will be evaluated, retained, or reclaimed to support vegetation and other resource values.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Riparian-4002: Prioritize, and develop activity and implementation plans to manage riparian systems to be at or above, or continue to be improving toward, PFC while achieving the Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming.	No changes made.	No change (same as 2015)
MD Riparian-4003: Manage riparian and wetland systems to enhance forage conditions and improve water quality. Manage all riparian systems with sensitive species concerns to a succession stage appropriate for that system, including vertical as well as horizontal vegetative structure and composition.	No changes made.	No change (same as 2015)
MD Riparian-4004: Expand and enhance riparian/wetland systems and habitat in cooperation with stakeholders.	No changes made.	No change (same as 2015)
MD Riparian-4005: Prevent degradation, loss, or destruction of riparian/wetland habitat.	No changes made.	No change (same as 2015)
MD Riparian-4008: Allow surface-disturbing activities within 500 feet of riparian/wetlands systems with an approved site-specific plan that ensures construction, stabilization, and reclamation methods are meeting resource objectives, including, but not limited to soil, vegetation and wildlife habitat.	No changes made.	No change (same as 2015)
MD Riparian-4010: Identify and manage systems capable of achieving DFC.	No changes made.	No change (same as 2015)
MD Riparian-4011: Restore vegetation in CBNG supported wetland and riparian systems on BLM surface and/or lease in accordance with the ecological site potential.	No changes made.	No change (same as 2015)
MG BR:5: Healthy native communities with manageable levels of pathogens, undesirable, invasive, non-native, or noxious species.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO BR:5.1: Develop and maintain baseline information regarding the extent, location, and potential impact(s) of pest species. From this baseline information develop and implement an Integrated Pest Management Plan. Integrated management would be used to control, suppress, and eradicate, where possible, noxious and invasive species per BLM Handbook H-1740-2. Manage noxious or invasive species treatments to maintain or improve Greater Sage-Grouse habitat. Apply Required Design Features as Conditions of Approval, such as those in Appendix C (p. 285). Encourage the use of voluntary BMPs.	Develop and maintain baseline information regarding the extent, location, and potential impact(s) of pest species. From this baseline information develop and implement an Integrated Pest Management Plan. Integrated management would be used to control, suppress, and eradicate, where possible, noxious and invasive species per BLM Handbook H-1740-2. Manage noxious or invasive species treatments to maintain or improve Greater Sage-Grouse habitat. Apply Required Design Features as Conditions of Approval, such as those in the 2019 Wyoming GrSG ARPMA Appendix B. Encourage the use of voluntary BMPs.	Partially revised – to update Appendix referenced
MO BR5.2: Facilitate support for an integrated approach for the detection, management, or eradication of new and minor infestations.	No changes made.	No change (same as 2015)
MO BR:5.3: Develop, implement, and maintain a management program for annual bromes and other invasive or undesirable species not listed as noxious, utilizing the best available science and BMPs.	No changes made.	No change (same as 2015)
MO BR:5.4: Coordinate with APHIS to facilitate pest and predator management.	No changes made.	Partially revised – addition of rangewide GRSG-specific predator management language
MD Pest-4002: Manage designated pests on public surface lands using an Integrated Pest Management Approach consistent with DOI Manual 517 (BLM 2007b).	No changes made.	No change (same as 2015)
MD Pest-4003: Limit surface disturbance to the minimum needed for safe project completion to limit the spread of noxious weeds.	No changes made.	No change (same as 2015)
MD Pest-4004: Use certified noxious weed seed-free products on all BLM-administered projects and lands.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Pest-4005: Implement and maintain cooperative integrated pest management programs with county weed and pest districts, state agencies, private industry, grazing lessees, and other stakeholders in conjunction with BLM weed and pest control work on public lands adjoining deeded and state lands.	No changes made.	No change (same as 2015)
MD Pest-4006: Require surface or vegetation disturbance areas, including areas formerly receiving or holding water, be treated for invasive species and revegetated.	No changes made.	No change (same as 2015)
MD Pest-4009: Treat those plants on the State of Wyoming Designated list, the appropriate county lists, and other species of concern as determined by BLM resource specialists. Note: Priority treatments are those areas where infestations on private land are threatening public lands. Treat areas that contain annual bromes and/or other invasive species to minimize competition and favor establishment of desired species	No changes made.	No change (same as 2015)
MD Pest-4010: Designate and prioritize areas for the treatment of annual brome species.	No changes made.	No change (same as 2015)
MG BR:6: Distribution and abundance of all native and desirable non-native species are optimized.	No changes made.	No change (same as 2015)
MO BR:6.1: BLM actions prevent and/or reduce impacts to desirable species.	No changes made.	No change (same as 2015)
MO BR:6.2: In coordination with cooperating agencies, develop and implement an achievable Wildlife Monitoring and Protection Plan.	No changes made.	No change (same as 2015)
MO BR:6.3: Maintain, restore, or improve the continuity and productivity of fish and wildlife habitats to support WGFD population objectives.	No changes made.	No change (same as 2015)
MO BR:6.4: Develop and implement an adaptive conservation and management strategy.	No changes made.	No change (same as 2015)
MG BR:7: Sufficient functional habitat for native and desirable non-native species.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO BR:7.1: Evaluate, update, and revise as necessary existing Wildlife Habitat Management Plans.	No changes made.	No change (same as 2015)
MO BR:7.2: Develop Wildlife Habitat Management Plans for areas with important habitats.	No changes made.	No change (same as 2015)
MO BR:7.3: Manage habitat consistent with local, state, and federal management plans, as applicable.	No changes made.	No change (same as 2015)
MO BR:7.4: Continue to gather habitat and population data while concurrently monitoring human and natural disturbance dynamics to improve habitat management.	No changes made.	No change (same as 2015)
MO BR:7.5: Provide security habitat, sufficient in amount and distribution, to support WGFD population objectives for fish and wildlife to escape from disruptive activities.	No changes made.	No change (same as 2015)
MO BR:7.6: Maintain and provide functioning sagebrush habitat to sustain sagebrush obligates and other sagebrush dependent species.	No changes made.	Partially revised – addition of rangewide GSRG specific habitat objective language
MG BR:8: Fish and wildlife are able to move between areas of functionally intact habitat.	No changes made.	No change (same as 2015)
MO BR:8.1: Develop Travel Management Plans for areas important for fish and wildlife while supporting other resource values.	No changes made.	No change (same as 2015)
MO BR:8.2: Develop a ROW Management Plan for utility corridors to manage impacts to areas of habitat important to fish and wildlife consistent with other resource values.	No changes made.	No change (same as 2015)
MO BR:8.3: Land acquisitions should support desirable fish and wildlife populations or habitat.	No changes made.	No change (same as 2015)
MO BR:8.4: Restore functionality to areas of degraded habitat important to fish and wildlife populations consistent with other resource values.	No changes made.	No change (same as 2015)
MD Fish-4008: Maintain or enhance streams and riparian areas associated with Class I and II streams (WGFD classifications), Powder River, Tongue River, and other appropriate areas for desired fisheries potential.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Fish-4012: Allow surface-disturbing activities within 0.25 mile of naturally occurring water bodies containing native and desirable non-native fish species where fish resource objectives can be met.	No changes made.	No change (same as 2015)
MD WL-4001: Develop appropriate mitigation for surface-disturbing and disruptive activities associated with wildlife habitat management through use of the mitigation guidelines described in Appendix F (p. 397).	No changes made.	Completely revised – revised by rangewide
MD WL-4002: Maintain or improve important wildlife habitats through vegetative manipulations, habitat improvement projects, livestock grazing strategies and the application of The Wyoming Guidelines for Managing Sagebrush Communities with Emphasis on Fire Management (Wyoming Interagency Vegetation Committee 2002) and Appendix F (p. 397), WGFD Strategic Habitat Plan (WGFD 2001), State Wildlife Action Plan (WGFD 2010), and similar guidance updated over time.	No changes made.	Partially revised – to update Appendix referenced
MD WL-4003: Continue to use existing Habitat Management Plans and update as necessary to include management objectives and prescriptions for wildlife: South Big Horns Habitat Management Plan (BLM 1986b), including a portion or all of the Gardner Mountain and North Fork WSAs; Wetlands Habitat Management Plan (BLM 1986a); and Middle Fork Powder River Habitat Management Plan (BLM 1980).	No changes made.	No change (same as 2015)
MD WL-4005: Consult with the WGFD and USFWS, in accordance with MOUs, when applying mitigation for wildlife and before waiving, allowing exceptions to, or modifying wildlife-related land use restrictions and mitigation.	No changes made.	Completely revised – revised by rangewide and state-specific

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD WL-4006: Provide, to the extent possible, suitable habitat and forage to support wildlife population objectives as defined by WGFD. BLM will cooperatively consider proposals by the WGFD to change population objective levels based on habitat capability and availability.	No changes made.	No change (same as 2015)
MD WL-4007: Manage access to protect crucial habitats in cooperation with WGFD and other stakeholders.	No changes made.	No change (same as 2015)
MD WL-4008: Utilize current research, management and conservation plans, and similar related documents to guide wildlife habitat management.	No changes made.	No change (same as 2015)
MD WL-4009: Construct new fences to avoid adverse impacts to wildlife and in accordance with BLM Fencing Handbook 1741-1 (BLM 1989) and WO Instruction Memorandum 2010-022: Managing Structures for the Safety of Sage-grouse, Sharp-tailed grouse, and Lesser prairie chicken (BLM 2009b).	No changes made.	Partially revised – revised by adding rangewide language for managing fences for GRSG No change (same as 2015) for other species
MD WL-4012: Inventory, record, and report existing type, condition, and location of BLM fences. Prioritize fence projects and annually implement modifications in accordance with appropriate wildlife needs and the BLM Fencing Handbook 1741-1.	No changes made.	No change (same as 2015)
MD WL-4013: Allow surface-disturbing and disruptive activities to occur throughout the entire life of projects during seasons important for wildlife when wildlife resource objectives can be met	No changes made.	Partially revised – revised by adding rangewide and state-specific GRSG language
MD WL-4014: Powerlines (distribution and transmission) will be designed to minimize wildlife related impacts and constructed to the latest APLIC guidance. Prohibit above ground distribution powerlines unless identified in an approved distribution plan.	No changes made.	Partially revised – revised by adding rangewide GRSG ROW language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Cultural-5007: Prohibit surface disturbance within the following sites: • Pumpkin Buttes • Cantonment Reno • Dull Knife Battle • Crazy Woman Battle • Contributing and Unevaluated Segments of the Bozeman Trail • All Rock Art Sites • All Rock Shelter Sites • All Native American Burials Allow surface disturbance and infrastructure within 3.0 miles of the following sites where development is either not visible, or will result in a weak contrast to the setting: • Pumpkin Buttes • Cantonment Reno • Dull Knife Battle • Crazy Woman Battle • Contributing and Unevaluated Segments of the Bozeman Trail • All Rock Art Sites • All Native American Burials	No changes made.	No change (same as 2015)
MD Paleo-5001: Retain public lands with significant paleontological values.	No changes made.	No change (same as 2015)
MD Paleo-5006: Avoid areas containing paleontological resources of high quality or importance when developing locatable minerals.	No changes made.	No change (same as 2015)
MD Paleo-5007: Apply an NSO stipulation to mineral leases in areas containing paleontological resources of high quality or importance.	No changes made.	No change (same as 2015)
MD Paleo-5008: Avoid areas containing paleontological resources of high quality or importance when developing salable minerals.	No changes made.	No change (same as 2015)
MD VRM-5002: Incorporate BMPs for visual resources into project planning for federal actions.	No changes made.	No change (same as 2015)
MG LR:2: Manage land tenure adjustments and land use authorizations to meet the needs of the customers while protecting other resource values.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO LR:2.1: Develop and maintain a land-ownership pattern that improves access for public use, and improves management and protection of BLM-administered lands by: 1. Acquiring legal easements to BLM-administered lands for recreational opportunities and administrative use. 2. Responding to requests for land authorizations for access needs. 3. Responding to requests for land transfers. 4. Giving priority to land exchanges and/or sales on custodial grazing allotments while supporting other resource values.	No changes made.	No change (same as 2015)
MO LR:2.3: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
MD L&R-6002: Consider land use authorizations (permits, leases, etc.) on a project-specific basis consistent with other resource objectives.	No changes made.	No change (same as 2015)
MD L&R-6003: Consider withdrawals for surface and/or minerals on a project-specific basis.	No changes made.	No change (same as 2015)
MD L&R-6011: Acquire private or state land or interest in land from willing sellers consistent with other resource objectives, on a project-specific basis.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
**MD L&R-6012: Acquire and dispose of land based on all resource values, including but not limited to agricultural potential and water. Do not classify, open, or make available any BLM-administered public lands within the planning area for agricultural leasing or agricultural entry under either Desert Land Entry or Indian Allotment for one or more of the following reasons: rugged topography, presence of sensitive resources, lack of water or access, small parcel size, and/or unsuitable soils. Lands classified as PHMA and GHMA for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal, including land exchanges, of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Exceptions would be considered where there is mixed ownership and land exchanges would allow for additional or more contiguous federal ownership patterns within PHMA. For PHMA with minority federal ownership, an additional, effective mitigation agreement would be included for any disposal of federal land. As a final preservation measure, consideration should be given to pursuing a permanent conservation easement. For lands in GHMA that are identified for disposal, the BLM will only dispose of such lands consistent with the goals and objectives of this plan, including, but not limited to, the land use plan goal to conserve, recover, and enhance Greater Sage-Grouse habitat on a landscape scale.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD L&R-6014: Prioritize acquiring land or interests in lands in areas adjacent to large blocks of BLM-administered land or other lands having significant resource or other values before other areas.	No changes made.	No change (same as 2015)
MG LR:4: Primary infrastructure corridors and subsidiary routes consistent with other resource values.	No changes made.	No change (same as 2015)
MO LR:4.1: Manage public lands to meet the needs of ROW customers while supporting other resource values.	No changes made.	Partially revised – add rangewide GRSG ROW language
MO LR:4.3: Identify infrastructure corridors consistent with other resource values.	No changes made.	No change (same as 2015)
MO LR:4.4: Make opportunities available for exploration and development of CO2 sequestration research and activities, while avoiding or mitigating impacts of these activities on other resource values.	No changes made.	No change (same as 2015)
MO LR:4.5: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
MD ROW-6001: Designate corridors for major ROW to minimize surface disturbance and impacts to other resources.	No changes made.	No change (same as 2015)
MD ROW-6004: The preferred location for new ROW will be in or adjacent to existing disturbed areas associated with existing ROW, constructed roads, or highways.	No changes made.	Partially revised – revised by adding rangewide GRSG ROW language
MD ROW-6005: Maintain a transportation management system in cooperation with appropriate state and local agencies to meet public and resource management needs.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD ROW-6006: Make lands available for ROW in accordance with management identified within the Approved RMP to conserve other resources. This results in: • 79,777 acres excluded from ROW. • 321,149 acres identified for ROW avoidance. PHMA would be managed as ROW avoidance areas for new ROW or SUA permits. Within PHMA where new ROWs/SUAs are necessary, new ROWs/SUAs would be located within designated RMP corridors or adjacent to existing ROWs/SUAs where technically feasible. Subject to valid existing rights including non-federal land inholdings, required new ROWs/SUAs would be located adjacent to existing ROWs/SUAs or where it best minimizes Greater Sage-Grouse impacts. Greater Sage-Grouse priority habitat (Core Population Areas and Core Population Connectivity Corridors) are designated as avoidance areas for ROWs. • 381,176 acres are open for ROW development.	No changes made.	Completely revised – revised by rangewide
MD ROW-6009: Designate the following corridors for major ROW transportation and utility use, in cooperation with the State of Wyoming: • Echeta Road • Sheridan to Gillette, largely following US 14/16 • Highway 59 north of Gillette • Interstate 25 • Interstate 90, Gillette to Montana State Line • Powder River • Powder River Breaks (Buffalo to Gillette) Corridor use is required. No above ground lines will be authorized in the Powder River or Powder River Breaks corridors. Corridor requirements within Greater Sage-Grouse habitat are identified in SS WL-4022.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD ROW-6010: Authorize and place above ground facilities (i.e., compressors, electric distribution powerlines) within ROW and other disturbance areas when resource objectives can be met.	No changes made.	No change (same as 2015)
MD ROW-6012: Evaluate CO2 sequestration proposals where in accordance with management identified within the Approved RMP.	No changes made.	No change (same as 2015)
MG LR:5: A safe transportation network that supports other resource values.	No changes made.	No change (same as 2015)
MO LR:5.1: Utilize a comprehensive travel management approach to sustain and enhance access, recreational experiences, and support other resource values.	No changes made.	No change (same as 2015)
MO LR:5.3: Designate all BLM-administered lands as Open, Limited, or Closed to OHV use, in consideration of other resource values.	No changes made.	No change (same as 2015)
MO LR:5.4: Provide for acceptable modes of legal public access that supports other resources, reduces conflicts, and provides for diverse recreation opportunities.	No changes made.	No change (same as 2015)
MD Trans-6002: Evaluate roads constructed under other initiatives (e.g., oil and gas exploration) for inclusion in the BLM transportation system. Roads that are no longer needed for their original purposes are assessed for addition to the BLM transportation system prior to reclamation.	No changes made.	No change (same as 2015)
MD Trans-6004: Design, construct, and maintain roads or trails based on the specific objectives for that trail or road in consideration of other resources. Design, construct, and maintain roads to minimize surface disturbance, changes to surface water runoff, and erosion.	No changes made.	No change (same as 2015)
MD Trans-6006: Base road or trail closures and abandonments on resource protection, demand for new roads, and accommodation of authorized uses.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Trans-6007: Maintain transportation system roads under BLM jurisdiction in accordance with assigned maintenance levels and in consideration of other resource values. Maintain administrative roads on an as needed basis, dependent on time, funding, and access priorities.	No changes made.	No change (same as 2015)
MD Trans-6008: Within 5 years of the ROD, inventory all routes on public land and develop a travel management plan to classify and designate routes for continued use or decommissioning and reclamation. Include maintenance standards for routes to be retained for public use, as well as specific measures to accomplish road closure in the travel management plan. Inventory, designate, number, and sign all routes as appropriate. Posted signs will include allowed uses and activities. Restrictions to existing roads and trails remains in effect until travel management planning is completed and designated routes are identified. Appendix S (p. 667) provides additional information regarding the travel management planning process.	No changes made.	Partially revised – to update Appendix referenced
MD Trans-6013: Allow temporary closures to motorized vehicle use in areas that pose public health and safety risks, and/or where resource damage is imminent. In Greater Sage-Grouse priority habitat (Core Population Areas and Core Population Connectivity Corridors) and general habitat, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that OHVs are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence (43 CFR 8341.2). A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.		
MD Trans-6014: Limit OHV use to designated routes unless compelling reasons exist to classify parcels as Open or Closed, and is consistent with other resource values. Until individual routes are designated, areas subject to route designation will be classified as Limited to existing routes. Once route designation is completed, areas will no longer be classified as Limited to existing routes.	No changes made.	Completely revised – revised by rangewide
MD Trans-6019: Limit motorized vehicle use to designated routes within habitat of special status species consistent with travel management designations for that area. Routes will be designated to avoid occupied habitat during travel management planning.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Trans-6020: Evaluate existing routes in the vicinity of any new system roads for closure and reclamation consistent with other resource values.	No changes made.	No change (same as 2015)
MO LR:7.2: Manage recreation to protect resources, maintain public health and safety, and to provide a diverse array of benefits to the public.	No changes made.	No change (same as 2015)
MG LR:8: Recreation facilities balance public demand with other resource values.	No changes made.	No change (same as 2015)
MO LR:8.1: Design and maintain recreation sites to meet acceptable health and safety standards while supporting other resource values.	No changes made.	No change (same as 2015)
MD Rec-6003: Open the planning area to dispersed recreation where consistent with other resource values.	No changes made.	No change (same as 2015)
MD Rec-6010: Avoid riparian habitat or develop and manage recreational sites, recreation facilities, and recreational access in a manner that minimizes impacts to riparian habitats.	No changes made.	No change (same as 2015)
MD Rec-6011: Prohibit dispersed camping and commercial camps within 200 feet of perennial surface water.	No changes made.	No change (same as 2015)
**MD Rec-6015: Allow additional recreation facilities in areas where they are supported by recreational use and are consistent with other resource values. Construction of recreation facilities within Greater Sage-Grouse PHMA (Core Population Areas and Core Population Connectivity Corridors) must conform with the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will require and ensure compensatory mitigation that provides a net conservation gain to the species.	Allow additional recreation facilities in areas where they are supported by recreational use and are consistent with other resource values. Construction of recreation facilities within Greater Sage-Grouse PHMA (Core Population Areas and Core Population Connectivity Corridors) must conform to the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will consider mitigation consistent with the applicable State Management Strategy (currently Governor's Executive Order 2015-4) (see also MD SS WL-4036).	Partially revised – revised to update mitigation reference

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Rec-6018: Designate the following areas as SRMAs and delineate discrete recreation management zone boundaries: • Burnt Hollow (17,280 acres) • Dry Creek Petrified Tree (2,567 acres) • Hole-in-the-Wall (11,952 acres) • Middle Fork Powder River (10,083 acres) • Mosier Gulch (1,026 acres) • Welch Ranch (1,748 acres) • Weston Hills (9,504 acres) Strategically emphasize a variety of recreation opportunities along with the protection of natural and cultural resources. R&VS management will be recognized as the predominant land use focus in SRMAs. Manage SRMAs under site-specific management plans. Site-specific management plans will be consistent with and implement the provisions specified for SRMAs in Appendix T (p. 679).	No changes made.	No change (same as 2015)
MD Rec-6019: Do not lease minerals within the boundary of the following SRMAs: • Burnt Hollow (17,280 acres) • Dry Creek Petrified Tree (2,567 acres) • Hole-in-the-Wall (11,952 acres) • Middle Fork Powder River (10,083 acres) • Mosier Gulch (1,026 acres) • Welch Ranch (1,748 acres) Lease fluid minerals with a CSU stipulation to be consistent with SRMA management in the following SRMA: • Weston Hills (9,504 acres)	No changes made.	No change (same as 2015)
MD Rec-6021: Allow surface disturbance within designated SRMAs for administrative use only, where consistent with other resource values.	No changes made.	No change (same as 2015)
MD Rec-6022: Recommend withdrawals from mineral entry under the mining laws in designated SRMAs.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Rec-6023: Allow salable mineral development within designated SRMAs for administrative use only.	No changes made.	No change (same as 2015)
MG LR:11: Public rangelands provide for a sustainable level of livestock grazing consistent with other resource values and sustained yield.	No changes made.	No change (same as 2015)
MO LR:11.2: Manage forage to maintain or improve ecological states and achieve and/or maintain Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming.	No changes made.	No change (same as 2015)
MO LR:11.3: Monitor and evaluate rangeland health and condition in coordination with cooperators, and lessees to determine if, and what additional management is needed to achieve desired ecological state.	No changes made.	No change (same as 2015)
MD Grazing-6001: Develop and implement appropriate livestock grazing management actions to achieve the Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming, to provide watershed protection, to improve forage for livestock, forage and habitat for wildlife, and enhance rangeland health.	No changes made.	Partially revised – revised by adding rangewide GRSG livestock grazing language
MD Grazing-6004: Continue implementation of existing AMPs. Develop and implement new AMPs with grazing lessees and other stakeholders to achieve desired resource goals and objectives.	No changes made.	Partially revised – revised by adding rangewide GRSG livestock grazing language
MD Grazing-6005: Manage livestock grazing to sustain riparian, wetland, mountain mahogany, specials status species or other special habitats.	No changes made.	Partially revised – revised by adding rangewide GRSG livestock grazing language
MD Grazing-6009: Implement strategies that best protect rangeland resources during periods of drought. Cooperate with stakeholders for voluntary adjustments in livestock use and/or livestock management.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD Grazing-6015: Develop range improvements in accordance with resource needs and livestock management.	No changes made.	Partially revised – revised by adding rangewide GRSG livestock grazing language
MD Grazing-6016: Conduct baseline inventories. Develop, implement, and monitor AMPs. Base AMP goals/objectives in Category I and M allotments on resource protection and watershed health.	No changes made.	No change (same as 2015)
*MD Grazing- 6017: Allow livestock grazing on all public lands in the planning area except where an evaluation has determined it to be incompatible with other resource uses or values (campgrounds, entrances of caves, sites of cultural significance). • The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Greater Sage-Grouse priority habitat (Core Population Areas and Core Population Connectivity Corridors) followed by general habitat. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations. • The BLM will collaborate with appropriate federal agencies and the State of Wyoming, as contemplated under the Wyoming Governor's Executive Order 2013-3, to: (1) develop appropriate conservation objectives; (2) define a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a significant causal	Allow livestock grazing on all public lands in the planning area except where an evaluation has determined it to be incompatible with other resource uses or values (campgrounds, entrances of caves, sites of cultural significance). • The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Greater Sage-Grouse priority habitat (Core Population Areas and Core Population Connectivity Corridors) followed by general habitat. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., fire) and legal obligations. • Within PHMA, if monitoring data show the wildlife/special status species standard has not been met nor progress being made toward meeting that standard, there would be an evaluation and a determination made as to the cause. If it is determined that the current authorized livestock use is a significant causal factor in failing to achieve the wildlife/special status species standards, the BLM would address the achievement or	Partially revised – revised by adding or replacing applicable language with rangewide GRSG livestock grazing language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and (3) identify appropriate site-based actions to achieve Greater Sage-Grouse conservation objectives within the framework. Absent substantial and compelling information that adjustments are necessary to the core population area strategy, these core population areas, connectivity areas, identified and mapped winter concentration areas, and protective stipulations shall not be altered for a minimum of 7 years. Any changes shall involve a transparent process that provides an opportunity for public input and proper consideration of any proposal consistent with the provisions contemplated under Wyoming's core population area strategy. • The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on Greater Sage-Grouse Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis. • Allotments within priority habitat (Core Population Areas and Core Population Connectivity Corridors), and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	progress toward achieving the LHSs (43 CFR 4180.2) and, if needed, Greater Sage-Grouse habitat maintenance or improvement. The BLM will collaborate with appropriate federal agencies and the State of Wyoming, as contemplated under the Wyoming Governor's Executive Order 2013-3, to: (1) develop appropriate conservation objectives; (2) define a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a significant causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and (3) identify appropriate site-based actions to achieve Greater Sage-Grouse conservation objectives within the framework. Absent substantial and compelling information that adjustments are necessary to the core population area strategy, these core population areas, connectivity areas, identified and mapped winter concentration areas, and protective stipulations shall not be altered for a minimum of 7 years. Any changes shall involve a transparent process that provides an opportunity for public input and proper consideration of any proposal consistent with the provisions contemplated under Wyoming's core population area strategy. • When NEPA analysis is required for a specific implementation action, one alternative would include mechanisms to make adjustments to meet or make progress toward meeting the wildlife/special status species standard. The analysis should also	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fuel breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3. 9,992 acres are incompatible with and 772,110 acres are available for livestock grazing. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	identify the BLM-approved data collection methodologies used for monitoring conditions and determining when adjustments are necessary. If current grazing management meets land health standards and provides for Greater Sage-Grouse habitat, there would be no need to analyze an alternative for Greater Sage-Grouse. Within PHMA, seasonal habitat objectives for Greater Sage-Grouse apply only to those habitats delineated within an allotment during the specific season (e.g., breeding season objectives during breeding season). Data needed to inform the relationship between the authorized use and habitat condition would come from sample locations that appropriately reflect the impact of the authorized use on habitat conditions. Data points should fall within Greater Sage-Grouse seasonal habitat areas and be collected on ecological sites that have the potential to produce Greater Sage-Grouse habitat. Allotments within priority habitat (Core Population Areas and Core Population Connectivity Corridors), and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision. • Authorized uses in PHMA that incorporate habitat objectives for Greater Sage-Grouse must develop desired conditions based on Greater Sage-Grouse habitats present in the allotment and the ecological potential of sites that supports these habitats. Metrics used to monitor for objectives must be developed and inform	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendment	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	the wildlife/SSS portion of the Standards for Healthy Rangelands. • At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives, such as reserve common allotments or fuel breaks. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3. 9,992 acres are incompatible with and 772,110 acres are available for livestock grazing. This does not apply to or impact grazing preference transfers, which are addressed in 43 CFR 4110.2-3.	
MD Grazing-6019: Locate livestock salt or mineral supplements a minimum of 500 feet away from water sources, riparian areas, and aspen stands.	No changes made.	No change (same as 2015)
MD Grazing-6021: Provide rest/deferment from livestock grazing following wildfire, prescribed burns, and other vegetative treatments until resource objectives are met.	No changes made.	No change (same as 2015)

2.17.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that would change by the Proposed RMP Amendment. Note that if 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The 2015 appendices can be found on the Buffalo RMP ePlanning website. The 2019 appendices can be found on the Wyoming GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Maps	2015	Completely Revised-revised by rangewide
A: Approved RMP Amendment with Management Goals, Objectives, and Decisions	2019	Partially Revised based on changes in Proposed RMP Amendment
B: Fluid Mineral Lease Notices; Lease Stipulations; and the Process for Exceptions, Modifications, and Waivers	2015	Partially Revised- Applies rangewide exceptions, modifications, and waivers
C: Best Management Practices and Required Design Features	2015, 2019	Partial change – no change (same as 2019) except the addition of livestock grazing BMPs

2.18 CODY, WYOMING RMP REVISIONS

This appendix presents the approved RMP revision language from the record of decision for the Cody RMP that relate to GRSG management, and changes that were made in the 2019 GRSG amendment effort. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.18.2** of this appendix. For the additional state-specific Wyoming management direction for the Proposed RMPA, see Chapter 2, Table 2-13.

2.18.1 Cody RMP (Wyoming)

Table 1. Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Decisions in the Cody RMP (Wyoming)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment (no change, partial revision, complete revision, new direction)
Land Use Plan Revisions/Amendments to the Cody RMP		
MO MR:2.3: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h).	Leasing is allowed in PHMA. Where the BLM has a backlog of Expressions of Interest for leasing, the BLM will prioritize its work first in non-habitat management areas, followed by lower priority habitat management areas (e.g., GHMA) and then higher priority habitat management areas (i.e., PHMA). To the extent consistent with federal regulation, law, and policy, priority would be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority would be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid mineral	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. To incentivize development to locate outside of PHMA, the BLM would work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts on Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	
*MO MR:2.4: Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases (see MDs 4107, 4108, 4109, 4111, and 4157).	Completely revised – revised by rangewide
**MD 2006 MR:3.1: Consider interest in exploration for, or leasing of, federal coal (Map 3-5), if any on a case-by-case basis. Allow coal exploration licenses subject to the regulations of 43 CFR 3410, and subject to guidance mitigating for surface-disturbing activities in the Wyoming BLM Standard Oil	Consider interest in exploration for, or leasing of, federal coal (Map 3-5), if any on a case-by-case basis. Allow coal exploration licenses subject to the regulations of 43 CFR 3410, and subject to guidance mitigating for surface-disturbing activities in the Wyoming BLM Standard Oil and Gas Lease	Partially revised – revised by addition/replacement of applicable rangewide GRSG management

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
and Gas- Lease Stipulations (Appendix B, Oil and Gas Lease Notices and Lease Stipulations, including Exception, Modification, and Waiver Criteria (p. 211)). Before issuing a coal exploration license, require the authorized officer to prepare an environmental assessment or environmental impact statement, if necessary, of the potential effects of the proposed exploration on the natural and socioeconomic environment of the affected area. If an application for a federal coal lease is received, conduct an appropriate land use and environmental analysis, including the coal screening process, to determine whether the area(s) proposed for leasing is (are) acceptable for coal development and leasing (as per 43 CFR 3425). If public lands are determined to be acceptable for further consideration for coal leasing, amend the land use plan as necessary. Only accept federal coal lease applications on those federal coal lands with development potential identified as suitable for further leasing consideration, after application of the coal screens and unsuitability criteria. At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1). The BLM will also consider that USFWS has found "the core area strategy…if implemented by all landowners via regulatory mechanisms, would provide adequate protection for sage-grouse and their habitats in the state" when considering leasing	Stipulations (2015 Cody RMP Appendix B, Oil and Gas Lease Notices and Lease Stipulations, including Exception, Modification, and Waiver Criteria (p. 211)). Before issuing a coal exploration license, require the authorized officer to prepare an environmental assessment or environmental impact statement, if necessary, of the potential effects of the proposed exploration on the natural and socioeconomic environment of the affected area. If an application for a federal coal lease is received, conduct an appropriate land use and environmental analysis, including the coal screening process, to determine whether the area(s) proposed for leasing is (are) acceptable for coal development and leasing (as per 43 CFR 3425). If public lands are determined to be acceptable for further consideration for coal leasing, amend the land use plan as necessary. Only accept federal coal lease applications on those federal coal lands with development potential identified as suitable for further leasing consideration, after application of the coal screens and unsuitability criteria. At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1). The BLM will also consider that USFWS has found "the core area strategy…if implemented by all landowners via regulatory mechanisms, would provide adequate protection for sage-grouse and their habitats in the state" when considering leasing	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
coal in PHMA under the criteria set for at 43 CFR 3461.5(o)(1) (USFWS 2010).	coal in PHMA under the criteria set for at 43 CFR 3461.5(o)(1) (USFWS 2010) (see also MDs 4107, 4108, 4109, 4111, and 4157).	
**MD 2013: Process oil and gas lease applications on a case-by-case basis. Ensure that leasing activities in PHMAs comply with Greater Sage-Grouse RMP decisions and remain in compliance with laws, regulations, and policy.	Process oil and gas lease applications on a case-by-case basis. Ensure that leasing activities in PHMAs comply with Greater Sage-Grouse RMP decisions and remain in compliance with laws, regulations, and policy (see also MDs 4107, 4108, 4109, 4111, and 4157).	Partially revised (2019) – add rangewide GRSG fluid mineral leasing objective language and update Management Direction referenced
MD 2023: Delineate **Oil and Gas Management Areas (Map 3-9) (108,174 acres of federal mineral estate) around existing intensively-developed fields, applying a 2-mile buffer from the outer boundary of the existing field (Map 3-10); adding enhanced oil recovery areas identified by the Governor's Office Enhanced Oil Recovery Institute and excluding Greater Sage-Grouse PHMAs. Manage these areas primarily for oil and gas exploration and development. Oil and gas development, including enhanced oil recovery operations, within Oil and Gas Management Areas is allowed to take place at the same level and density as the existing development in the field, except in the Oregon Basin Oil Field, where new development must result in no net gain of surface disturbance. Levels and densities beyond the existing field development may require additional reclamation or compensatory offsite mitigation. As oil and gas fields expand or exploration reaches beyond the Oil and Gas Management Areas depicted on Map 3-9, Oil and Gas Management Areas may be enlarged as appropriate. To enlarge Oil and Gas Management Areas, the expansion area would: i) have to be adjacent to the field and under valid oil and gas lease(s) with stipulations allowing surface	No changes made.	Partially revised – to update map and acres referenced

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
occupancy and development; ii) have to have a surface density of, on average, at least four well pads per 640 acres; a determination that additional well density is required to efficiently and adequately produce the oil or gas resource; iii) have a project-specific environmental analysis prepared to analyze the impacts and determine operating methods, mitigation, and BMPs to be used in the efficient and comprehensive development of the field; iv) need surface resources to be satisfactorily mitigated; and v) need commitment to accelerate reclamation as required by the authorized officer.		
MO FM:1.5: Following wildland fires, conduct appropriate emergency stabilization and rehabilitation when and where needed. In priority Greater Sage-Grouse habitat areas, prioritize suppression immediately after life and property to conserve the habitat. In general Greater Sage-Grouse habitat, prioritize suppression where wildfires threaten priority Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MO FM:2.1: Consult and cooperate with adjacent landowners, state and local governments, and other stakeholders to plan and implement prescribed fire and other vegetation treatments across the landscape. In areas of general Greater Sage-Grouse habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems.	No changes made.	No change (same as 2015)
MD 3008: Suppress fires threatening Greater Sage-Grouse habitats and crucial winter wildlife habitat within Wyoming big sagebrush communities. Where fire would be utilized to meet resource objectives, work closely with resource specialists to protect and improve Greater Sage-Grouse habitat. For	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
fuels management, the BLM would consider multiple tools for fuels reduction and would analyze in NEPA compliance documentation before electing to implement prescribed fire in PHMAs. If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how Greater Sage-Grouse goals and objectives would be met by its use; • how the COT Report objectives would be addressed and met; and • a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment in Greater Sage-Grouse habitat shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known crucial winter wildlife habitat shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in and/or around crucial winter wildlife habitat must be strategically-designed to reduce wildfire risk and protect winter range habitat quality.		

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MO BR:2.6: In PHMAs, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Technical Reference 1734-6 [BLM 2005c]).	No changes made.	No change (same as 2015)
MG BR:9: GREATER SAGE-GROUSE – Sustain the integrity of the sagebrush biome to provide the amount, continuity, and quality of habitat that is necessary to maintain sustainable populations of Greater Sage-Grouse and other species by achieving the objectives below.	No changes made.	Completely revised – revised by rangewide
MO BR:9.1: Maintain large patches of high quality sagebrush habitats, with emphasis on patches occupied by Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO BR:9.2: Maintain connections between sagebrush habitats, with emphasis on connections between habitats occupied by Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO BR:10.1: Reconnect large patches of sagebrush habitat with emphasis on reconnecting patches occupied by stronghold and isolated populations of Greater Sage-Grouse.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
**MD 4059: Maintain or improve important wildlife habitats through vegetative manipulations, habitat improvement projects, livestock grazing strategies and the application of The Wyoming Guidelines for Managing Sagebrush Communities with Emphasis on Fire Management (Wyoming Interagency Vegetation Committee 2002) and the Wyoming BLM Standard Mitigation Guidelines for Surface-Disturbing and Disruptive Activities (Appendix F, Wyoming Bureau of Land Management Mitigation Guidelines for Surface-Disturbing and Disruptive Activities (p. 351)), BMPs (Appendix C, Required Design Features and Best Management Practices (p. 251)), and similar guidance updated over time.	Maintain or improve important wildlife habitats through vegetative manipulations, habitat improvement projects, livestock grazing strategies and the application of The Wyoming Guidelines for Managing Sagebrush Communities with Emphasis on Fire Management (Wyoming Interagency Vegetation Committee 2002) and the Wyoming BLM Standard Mitigation Guidelines for Surface-Disturbing and Disruptive Activities (Appendix F, Wyoming Bureau of Land Management Mitigation Guidelines for Surface-Disturbing and Disruptive Activities (p. 351)), BMPs (2019 Wyoming GrSG ARMPA Appendix B, Required Design Features and Best Management Practices), and similar guidance updated over time.	Partially revised – to update Appendices referenced, as well as adding rangewide GRSG objectives
MD 4071: Conduct habitat enhancement vegetation treatments within sagebrush communities as opportunities and funding allow, consistent with EO 2015-4 (Wyoming Office of the Governor 2015).	No changes made.	Partially revised – to update EO referenced
MD 4072: Modify identified hazard fences, and analyze and construct new fences in accordance with wildlife needs, the BLM Fencing Handbook 1741-1, and WO IM 2010-022, Managing Structures for the Safety of Sage-grouse, Sharp-tailed grouse, and Lesser Prairie-chicken, and similar guidance and policy as updated over time.	No changes made.	Partially revised – revised by adding rangewide GRSG fence language
MD 4077: Allow water development projects in crucial elk winter range and in Greater Sage-Grouse nesting habitat with 10 inches or less annual precipitation only when adverse effects can be avoided, minimized and/or compensated based on site-specific analysis. Allow existing uses pending site-specific analysis on a priority basis.	No changes made.	Partially revised – revised by adding rangewide GRSG water development language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4081: Avoid wind energy projects in big game crucial winter range and raptor concentration areas. Wind-energy development would be avoided in Greater Sage-Grouse PHMAs (Map 3-17), and not allowed unless it can be sufficiently demonstrated that the development activity would not result in declines of Greater Sage-Grouse PHMA populations. Sufficient demonstration of "no declines" should be coordinated with the WGFD and USFWS.	No changes made.	Partially revised– revised by addition of rangewide language for GRSG portion of MD
MD 4088: Discourage the use of broad-spectrum insecticides where insect control is required. Target pest control toward key problem areas and schedule applications to be effective in minimum doses in Greater Sage-Grouse brood-rearing areas. Field Offices may implement treatments within Greater Sage-Grouse habitat utilizing RAATS protocols	No changes made.	No change (same as 2015)
MD 4089: Avoid aerial pesticide spraying in favor of ground applications to minimize drift into non-target areas in Greater Sage-Grouse habitat unless benefits of treatments are likely to outweigh impacts.	No changes made.	No change (same as 2015)
MD 4090: Avoid applying pesticides to Greater Sage-Grouse breeding habitat during the nesting and early brood-rearing season (March 15 through June 30) to reduce the loss of food supply to chicks and avoid the chance of secondary poisoning unless benefits of treatments are likely to outweigh impacts.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4091: Maintain seeps, springs, wet meadows, and riparian vegetation in a functional and diverse condition for young Greater Sage-Grouse and other species that depend on forbs and insects associated with these areas. Consider management actions if desirable green vegetation associated with these wet areas is not available, accessible, or cannot be maintained with current livestock, wildlife, or wild horse use, and the impacts are outweighed by the improved habitat quality.	No changes made.	No change (same as 2015)
MD 4092: Restore Greater Sage-Grouse brood-rearing habitats in riparian/wetland areas.	No changes made.	No change (same as 2015)
MD 4093: Restore lost riparian functioning systems by repairing abnormally incised drainages to raise water tables and increase water storage and brood-rearing habitats within Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD 4094: Manage vegetation composition diversity and structure, as determined by ESD, or other methods that reference site potential, and WGFD protocols to achieve Greater Sage-Grouse habitat management objectives, in cooperation with stakeholders. Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to Greater Sage-Grouse habitat to determine if they should be restored to sagebrush or habitat of higher quality for Greater Sage-Grouse. If these seedings provide value in conserving or enhancing Greater Sage-Grouse habitats, then no restoration would be necessary. Assess the compatibility of these seedings for Greater Sage-Grouse habitat during the land health assessments.	No changes made.	Partially revised– revised by addition of rangewide GRSG habitat objectives for GRSG portion of MD

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Burned areas within PHMAs would be restored to suitable habitat with consideration given to ESDs, reference sites, site potential and local variability. The BLM could bring in burned area rehabilitation and Burned Area Emergency Response teams who would work cooperatively with partners at the federal, state, and local levels to rehabilitate and restore Greater Sage-Grouse habitats in a manner consistent with the core habitat populations area strategy for conservation. DDCT reviews would be conducted in coordination with the WGFD Habitat Protection Program located in Cheyenne, Wyoming at the WGFD headquarters. Areas within PHMAs would be prioritized for restoration of Greater Sage-Grouse habitat beyond immediate response.		
MD 4095: Maintain sagebrush and understory diversity (relative to ecological site description) in crucial seasonal Greater Sage-Grouse habitats unless such removal is necessary to achieve Greater Sage-Grouse habitat management objectives. For example, thinning small patches of dense sagebrush may increase desirable forbs in early brood-rearing habitat.	No changes made.	No change (same as 2015)
MD 4096: Increase the composition and canopy cover of Wyoming big sagebrush, within existing nonnative grass seedings with less than 5 percent sagebrush canopy cover, to greater than or equal to neighboring sagebrush communities or historical levels. (See Shrubland-Salt Desert/Salt Bottom on Map 3-14; deeper soiled, and gentler sloped portions of the Shrubland-Salt Desert/Salt Bottom, colored in pink, would be those areas where sagebrush restoration efforts could be conducted.)	No changes made.	Partially revised – to update Map referenced

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4097: Investigate opportunities to increase sagebrush in lower precipitation zones.	No changes made.	No change (same as 2015)
MD 4098: Plan and construct mining and mineral development activities, to the degree possible given state water rights, to minimize disturbances that would result in alterations to springs and riparian Greater Sage-Grouse habitat. Alternative water sources may be developed to replace natural sources that have been affected or destroyed during these development activities.	No changes made.	No change (same as 2015)
MD 4099: Treat constructed or non-natural water storage impoundments to control mosquito breeding (and the associated spread of West Nile virus), to prevent disease spread to Greater Sage-Grouse as necessary.	No changes made.	No change (same as 2015)
MD 4100: In cooperation with stakeholders, manage to promote the growth and persistence of native shrubs, grasses, and forbs needed by Greater Sage-Grouse for seasonal food and concealment	No changes made.	No change (same as 2015)
MD 4101: In cooperation with stakeholders, design and locate fences so as not to disturb PHMAs. Increase the visibility of fences in these areas which have been identified as hazardous to flying Greater Sage-Grouse.	No changes made.	Partially revised – revised by adding rangewide GRSG fence language
MD 4102: Conduct fire management activities to minimize overall wildfire size and frequency in sagebrush plant communities where Greater Sage-Grouse habitat objectives are at risk. General priorities for habitat protection: Priority # 1 – Protection of Greater Sage-Grouse PHMAs. Priority # 2 – Wyoming big sagebrush communities outside Greater Sage-Grouse PHMAs and habitats recovering from disturbance within or adjacent to Greater Sage-Grouse PHMAs.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4103: Annually maintain FMPs to incorporate updated sagebrush habitat information as well as fire suppression priorities in sagebrush habitats. Incorporate fire management objectives for the management of sagebrush ecosystems into FMPs. Provide fire management objectives for sagebrush ecosystems to initial attack personnel at the beginning of each fire season.	No changes made.	No change (same as 2015)
MD 4104: Establish fuels treatment projects at strategic locations to minimize size of wildfires and limit loss of Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD 4105: Reintroduce appropriate fire regimes to limit conifer encroachment into the sagebrush plant communities. Take into account invasive herbaceous species and Fire Regime Group and FRCC (measure of departure from historic fire regime) with treatments. Where possible, achieve a balance between treating areas that have significantly departed from the historic fire regime (Condition Class 3) and areas that are functioning within an appropriate fire regime (Condition Class 1).	No changes made.	No change (same as 2015)
MD 4106: Remove conifers encroaching into sagebrush habitats in a manner that considers tribal and cultural values. Prioritize treatments closest to occupied Greater Sage-Grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2 as defined in Miller et al. (2005). Refine the location of specific priority areas to be treated by utilizing site-specific analysis and principles like those included in the FIAT report (Chambers et. al. [2014]) and other ongoing modeling efforts to address conifer encroachment.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4107: **Inside PHMAs Prohibit surface occupancy and surface-disturbing activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks. The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse (Map 3-17). **Outside PHMAs** Prohibit surface-disturbing and disruptive activities and apply a NSO restriction within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks (Map 3-17). Outside Greater Sage-Grouse PHMAs, the BLM's goal is to sustain important habitats that support core populations and to maintain lek persistence over the long term in sufficient proportions of the Greater Sage-Grouse population to facilitate movement and genetic transfer between core populations, including those found in adjacent states.	**Inside PHMAs** Prohibit surface occupancy and surface-disturbing activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped). **Outside PHMAs** Prohibit surface-disturbing and disruptive activities and apply a NSO restriction within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) (Map 3-17). Outside Greater Sage-Grouse PHMAs, the BLM's goal is to sustain important habitats that support core populations and to maintain lek persistence over the long term in sufficient proportions of the Greater Sage-Grouse population to facilitate movement and genetic transfer between core populations, including those found in adjacent states. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD 4157).	Partially revised (2019) – to update map referenced, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications)
MD 4108: **Inside PHMAs Prohibit disruptive activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks from March 15 to June 30 (40,039 acres). **Outside PHMAs** Prohibit disruptive activities on or within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks from March 15 to June 30 (1,116 acres). **Inside PHMAs** Prohibit surface-disturbing and/or disruptive activities from March 15	**Inside PHMAs** Prohibit disruptive activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) from March 15 to June 30 (40,039 acres). **Outside PHMAs** Prohibit disruptive activities on or within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) from March 15 to June 30 (1,116 acres). **Inside PHMAs**	Partially revised (2019) – to update acreage, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
to June 30 to protect Greater Sage-Grouse breeding, nesting, and early brood-rearing habitat (437,045 acres). Apply this timing limitation throughout the PHMAs. Activities in unsuitable habitats would be evaluated under the exception and modification criteria and could be allowed on a case-by-case basis. **Outside PHMAs** Prohibit surface-disturbing and/or disruptive activities in Greater Sage-Grouse nesting and early brood-rearing habitat within a 2-mile radius of the perimeter of occupied Greater Sage-Grouse leks from March 15 to June 30. Note: Where credible data support different timeframes for these seasonal restrictions, dates may be expanded by up to 14 days prior to or subsequent to the above dates.	Prohibit surface-disturbing and/or disruptive activities from March 15 to June 30 to protect Greater Sage-Grouse breeding, nesting, and early brood-rearing habitat (437,045 acres). Apply this timing limitation throughout the PHMAs. **Outside PHMAs** Prohibit surface-disturbing and/or disruptive activities in Greater Sage-Grouse nesting and early brood-rearing habitat within a 2-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) from March 15 to June 30. Note: Where credible data support different timeframes for these seasonal restrictions, dates may be expanded by up to 14 days prior to or subsequent to the above dates. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD 4157).	
MD 4109: **Greater Sage-Grouse winter concentration areas: Surface-disturbing and/or disruptive activities in sage-grouse winter concentration areas would be prohibited from December 1–March 14. Activities in unsuitable habitats within PHMAs would be evaluated under the exception and modification criteria and could be allowed on a case-by-case basis. Protection of additional mapped winter concentration areas in GHMAs would be implemented only where winter concentration areas are identified as supporting biologically significant numbers of sage-grouse nesting in PHMAs and/or attending leks within	**Greater Sage-Grouse winter concentration areas:** Surface-disturbing and/or disruptive actives in Greater Sage-Grouse winter concentration areas would be prohibited from December 1—March 14. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD 4157). Protection of additional mapped winter concentration areas in GHMA would be implemented where winter concentration areas	Partially revised (2019) – to update EO referenced, include SHMA, and to reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications) for winter concentration areas in PHMA

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
PHMAs. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas. Evaluate and allow activities in unsuitable habitats within PHMAs in accordance with exception and modification criteria on a case-by-case basis. Protection of additional mapped winter concentration areas in GHMAs would be implemented only where winter concentration areas are identified as supporting biologically significant numbers of Greater Sage-Grouse nesting in PHMAs and/or attending leks within PHMAs. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas.	are mapped and designated by the State of Wyoming. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated on consultation with the WGFD in all identified winter concentration areas.	
**MD 4110: Density of Disturbances: In Greater Sage-Grouse PHMAs, the density of disturbance of energy or mining facilities would be limited to an average of one site per square mile (640 acres) within the DDCT, subject to valid existing rights (Appendix D, Greater Sage-Grouse Habitat Management Strategy (p. 273)). The one location and cumulative value of existing disturbances would not exceed 5 percent of habitat of the DDCT area. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the DDCT area using the DDCT process. Consolidate anthropogenic features from development and transmission on the landscape. Allow on a case-by-case basis high profile structures within Greater Sage-Grouse nesting habitat.	Density of Disturbances: In Greater Sage-Grouse PHMAs, the density of disturbance of energy or mining facilities would be limited to an average of one site per square mile (640 acres) within the DDCT, subject to valid existing rights (2019 Wyoming GrSG ARMPA Appendix C, Greater Sage-Grouse Habitat Management Strategy). The one location and cumulative value of existing disturbances would not exceed 5 percent of habitat of the DDCT area. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the DDCT area using the DDCT process. Consolidate anthropogenic features from development and transmission on the landscape. Allow on a case-by-case basis high profile structures within Greater Sage-Grouse nesting habitat.	Completely revised – revised by rangewide and state-specific for surface disturbance cap Partially revised (2019) – to update Appendix referenced for density cap and to update WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse referenced.

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Sagebrush Treatment: For vegetation treatments in sagebrush within PHMAs, refer to WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2011, as updated) and BLM WO IM 2013-128 (Sage-grouse Conservation Related to Wildland Fire and Fuels Management). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5 percent threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA populations or if they represent additional habitat loss or fragmentation. Treatments to enhance sagebrush/grasslands habitat for Greater Sage-Grouse would be evaluated based upon habitat quality and the functionality/use of treated habitats post-treatment. The BLM would work collaboratively with partners at the state and local level to maintain and enhance Greater Sage-Grouse habitats. Seasonal restrictions would be applied, as needed, for implementing fuels management treatments according to the type of seasonal habitat present. Wildfire burns will be treated as disturbed if sagebrush is reduced below 5 percent unless there is an implementation plan outlining restoration efforts and 3 years of data showing a trend back to suitable habitat.	Sagebrush Treatment: For vegetation treatments in sagebrush within PHMAs, refer to WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2015, as updated) and BLM WO IM 2013-128 (Sage-grouse Conservation Related to Wildland Fire and Fuels Management). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5 percent threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA populations or if they represent additional habitat loss or fragmentation. 2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
MD 4113: In PHMAs, implement mitigation and minimization guidelines and required design features, including specific measures for Greater Sage-Grouse (refer to Appendix C, Required Design Features and Best Management Practices (p. 251)), as applicable and consistent with EO 2015-4 (Wyoming Office of the Governor 2015). Incorporate Greater Sage-Grouse specific measures into project proposals as required design features or mitigation for any authorized federal action, regardless of surface ownership.	In PHMAs, implement mitigation and minimization guidelines and required design features, including specific measures for Greater Sage-Grouse (refer to 2019 Wyoming GrSG ARMPA Appendix B, Required Design Features and Best Management Practices), as applicable and consistent with EO 2015-4 (Wyoming Office of the Governor 2015). Incorporate Greater Sage-Grouse specific measures into project proposals as required design features or mitigation for any authorized federal action, regardless of surface ownership.	Completely revised – revised by rangewide for mitigation Partially revised – to update Appendix referenced and update EO referenced for RDFs
MD 4114: In PHMAs, require the development of a wildlife resource monitoring and mitigation plan to address potential impacts from mineral development on wildlife populations and/or habitat on a case-by-case basis.	No changes made.	No change (same as 2015)
MD 4115: Use the following travel management criteria in PHMAs: • During subsequent travel management planning, all routes within PHMAs would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive Greater Sage-Grouse habitat. • During implementation-level travel planning, threats to Greater Sage-Grouse and their habitat would be considered when evaluating route designations and/or closures. • During subsequent travel management planning, routes within PHMAs that do not have a purpose or need would be considered for closure.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
• During subsequent travel management planning, routes within PHMAs that are duplicative parallel, or redundant would be considered for closure. • During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat. • During subsequent travel management planning, consider limiting snow machine travel to designated routes or consider seasonal closures in Greater Sage-Grouse wintering areas from November 1 through March 31. • During subsequent travel management planning, routes in PHMAs not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only. • During subsequent travel management planning, prioritize restoration of routes not designated in a Travel Management Plan within PHMAs. • During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance Greater Sage-Grouse habitat when rehabilitating linear disturbances. • During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Use time of day limits (after 10:00 AM to 7:00 PM) to reduce impacts on Greater Sage-Grouse during breeding and nesting periods.		

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
*MD 4116: The Greater Sage-Grouse adaptive management plan provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. See Appendix D, Greater Sage-Grouse Habitat Management Strategy (p. 273) for more information on soft and hard triggers. <u>Soft Triggers Response:</u> Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation action or that unanticipated changes to populations or habitats have occurred that have the potential to place habitats or populations at risk. The soft trigger is any deviation from normal trends in habitat or population in any given year. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and DDCT evaluations. For population metrics, normal population trends are calculated as the 5-year running mean of annual population counts. BLM field offices, with the assistance of their respective land and RMP implementation groups, local WGFD offices, and local sage-grouse working groups will evaluate the metrics with the	The Greater Sage-Grouse adaptive management plan provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. 2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Adaptive Management Working Group on an annual basis. The purpose of these strategies is to address localized greater sage-grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold. Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short or long term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency (BLM) and the Adaptive Management Work Group will implement an appropriate response strategy to address causal factors not attributable to a specific project or to make adjustments at a larger regional or statewide level. <u>Hard Trigger Response:</u> Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers would be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact or set of impacts is having a negative effect. Within the range of normal population variables (5-year running mean of annual population counts), hard triggers shall be determined to take effect when two of the three metrics exceeds 60 percent of normal variability for the area under management in a single year, or when any of the three metrics exceeds 40 percent of normal variability for a 3 year time period within a 5-year range of analysis. A minimum of 3 consecutive years in a 5-year	Management Working Group on an annual basis. 2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
period is used to determine trends (i.e., years 1-2-3, years 2-3-4, years 3-4-5). Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the Biologically Significant Unit for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Work Group will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment). In making amendments to this plan, the BLM will coordinate with the USFWS as BLM continues to meet its objective of protecting, restoring, and enhancing Greater Sage-Grouse habitat by reducing, minimizing or eliminating threats to that habitat. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	determine trends (i.e., years 1-2-3, years 2-3-4, years 3-4-5). Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the Biologically Significant Unit for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Work Group will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment). The Adaptive Management Working Group would define a process to review and reverse adaptive management actions once the identified causal factor is resolved (e.g., returning to previous management once objectives of interim management strategy have been met). In making amendments to this plan, the BLM will coordinate with the USFWS as BLM continues to meet its objective of protecting, restoring, and enhancing Greater Sage-Grouse habitat by reducing, minimizing or eliminating threats to that habitat. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	
MD 4145: Base future adjustments to the appropriate management level on monitoring information and multiple use considerations through development of and/or revisions to HMA Plans. Update HMA plans to include Greater Sage-Grouse objectives.	No changes made.	No change (same as 2015)

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
*MD 4156: No similar action.	The BLM will update its Greater Sage-Grouse habitat management areas, including biologically significant units (BSUs), in conjunction with the State of Wyoming's core areas, upon issuance of any Wyoming Governor's Executive Order revising or amending the core area boundaries and upon completion of appropriate NEPA analysis and process. The BLM will complete the appropriate NEPA documentation (including appropriate public comment) prior to adopting any revised core area boundaries (e.g., maintenance action or plan amendment, environmental assessment, etc.).	Partially revised – to change reference from BSUs to HAF multi-scale areas
No similar action.	*MD 4157: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Adopt the State of Wyoming's Greater Sage-Grouse Compensatory Mitigation Framework to the extent consistent with federal law, regulations, and policy. In all Greater Sage-Grouse habitat, when authorizing third-party actions in designated Greater Sage-Grouse habitat, the BLM will seek to achieve the planning-level Greater Sage-Grouse management goals and objectives through implementation of mitigation and management actions, consistent with valid existing rights and applicable law. Under this Plan Amendment, management would be consistent with the Greater Sage-Grouse goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [Greater Sage-Grouse] or to improve the condition of [Greater Sage-	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	Grouse] habitat" across the planning area. Accordingly, before authorizing third-party actions that result in habitat loss and degradation, the BLM will complete the following steps, in alignment with the Governor of Wyoming's Executive Order 2015-4 (July 29, 2015): 1. Work jointly with the WGFD to evaluate projects and recommend mitigation in the form of avoidance and minimization. 2. The WGFD will determine if the State requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of Greater Sage-Grouse. 3. Incorporate state required or recommended mitigation into the BLM's NEPA decision-making process, if the WGFD determines that compensatory mitigation is required to address impacts to GRSG habitat as a part of State policy or authorization, or if a proponent voluntarily offers mitigation. 4. Analyze whether the compensatory mitigation (deferring to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action): • achieves measurable outcomes for Greater Sage-Grouse habitat function on a landscape scale as determined by WGFD that are at least equal to the lost or degraded values in accordance with the Governor of Wyoming's Executive Order 2015-4.	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	• provides benefits that are in place for at least the duration of the impacts. • accounts for a level of risk that the mitigation action may fail or not persist for the full duration of the impact 5. Ensure mitigation outcomes are consistent with the State of Wyoming's mitigation strategy and principles outlined in 2018 Approved RMPA Appendix C, The Greater Sage-Grouse Habitat Management Strategy. The BLM has determined that compensatory mitigation must be voluntary unless required by other applicable law and in recognition that State authorities may also require compensatory mitigation (IM 2019-018, *Compensatory Mitigation*, December 6, 2018). Therefore, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and degradation, the BLM will consider voluntary compensatory mitigation actions only as a component of compliance with a State mitigation plan, program, or authority, or when offered voluntarily by a project proponent. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and alignment with State policies and requirements, including those regarding compensatory mitigation. When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a mitigation requirement from the State, the BLM's NEPA analysis would evaluate the need to avoid or minimize impacts of the proposed project and achieve the	

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
	goals and objectives of this RMPA. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action.	
MO LR:1.5: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
**MD 6016: Retain approximately 1,072,653 acres of BLM-administered land. 14,283 acres of BLM-administered land are available for disposal by sale, exchange or other means (Map 3-21) (Appendix I, Land Disposal and Acquisition (p. 381)). Disposal can include none, some, or all of the mineral estate as allowed by 43 CFR 2720 and FLPMA Section 209(b)(1). A mineral potential report would determine if a surface estate disposal includes none, some, or all of the mineral estate. Lands classified as PHMAs and GHMAs for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Consider exceptions where there is mixed ownership. Allow land exchanges for additional or more contiguous federal ownership patterns within PHMAs. For PHMAs with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land.	No changes made.	Partially revised – to update Map referenced, to update Appendix referenced, and to add SHMA

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
Consider pursuing a permanent conservation easement as a final preservation measure. For lands in GHMAs that are identified for disposal, the BLM will only dispose of such lands consistent with the goals and objectives of this plan, including, but not limited to, the land use plan objective to maintain or increase Greater Sage-Grouse abundance and distribution. Note: All land actions to acquire or dispose of lands would require a site specific analysis under NEPA.		
MD 6032: Designate ROW corridors as shown on Map 3-24. PHMAs are designated as avoidance areas for high voltage transmission line and pipeline ROWs. All authorizations in these areas must comply with the conservation measures outlined in this Approved RMP, including the RDFs and avoidance criteria presented in Appendix C, Required Design Features and Best Management Practices (p. 251). Within PHMAs, specific to management for Greater Sage-Grouse, all RMPs are amended as follows: **New Transmission Lines (greater than 115 kV): New transmission lines greater than 115 kV in PHMA would be allowed only (1) when located within 0.5 miles or less of 115 kV or greater transmission lines constructed prior to 2008; or (2) in designated RMP corridors authorized for aboveground transmission lines. Transmission lines routed using one or more of the two criteria listed above will not be counted against the DDCT 5 percent disturbance cap. New transmission lines greater than 115 kV proposed outside of these areas would be considered where it can be demonstrated that declines in Greater Sage-Grouse populations could be avoided	No changes made.	Partially revised – revised by adding rangewide GRSG major ROW language

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
through project design and/or mitigation. These projects will be subject to the density and disturbance restrictions for PHMA. Review of transmission line proposals would incorporate the Framework for Sage-grouse Impact Analysis for Interstate Transmission Lines (BLM 2012b) and other appropriate documents consistent with the three routing criteria described above. New projects within PHMAs that may require future utility lines, including distribution and transmission lines or pipelines, would include the proposed utility lines in their DDCT as part of the proposed disturbance. Lines permitted, but not located in the above mentioned routes or a designated corridor will be counted toward the 5 percent disturbance calculation (line distance is equal to the anticipated construction footprint or construction ROW width multiplied by length and includes all access roads, staging area, and other surface disturbance associated with construction outside of the construction ROW). **New Electric Distribution Lines (less than 115 kV):** Require burial of new electric distribution lines where economically feasible. If not economically feasible, distribution lines may be authorized when effectively designed/mitigated to protect Greater Sage-Grouse and when the authorized officer determines that overhead installation is the action alternative with the fewest adverse impacts while still meeting the project need. Consider agricultural and residential distribution lines to be adequately mitigated for Greater Sage-Grouse if constructed at least 0.6 mile from the lek perimeter with appropriate timing constraints and constructed to the latest		

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
APLIC standards. These ROW authorizations will be subject to approval by the State Director. **Pipelines:** Allow new pipelines through PHMAs: (1) within an RMP corridor currently authorized for that use or designated through future RMP amendments; or (2) constructed in or adjacent to existing utilities (buried and aboveground) or roads. Pipelines constructed in RMP corridors or adjacent to existing utilities or roads will require completion of a DDCT analysis for baseline data collection, but the project is not required to meet the threshold of 5 percent. However, within 6 months of the completion of construction, the project proponent will provide the authorized officer with as-built drawings so that the total disturbance within PHMAs can be calculated annually.		
MD 6033: Manage 637,154 acres as ROW avoidance areas (Map 3-24). Manage PHMAs as ROW avoidance areas for new ROW or SUA permits (317,307 acres). Within PHMAs where new ROWs/SUAs are necessary, locate new ROWs/SUAs within designated RMP corridors or adjacent to existing ROWs/SUAs where technically feasible. Subject to valid existing rights, including non-federal land inholdings, locate new, required ROWs/SUAs adjacent to existing ROWs/SUAs or where impacts to Greater Sage-Grouse are minimized. Work with proponents to design ROW applications to protect Greater Sage-Grouse.	No changes made.	Partially revised – revised by adding rangewide GRSG ROW language
MD 6046: Allow temporary closures to motorized vehicle use in areas that pose public health and safety risks, and/or where resource damage is imminent. In PHMAs and GHMAs, temporary closures will	No changes made.	Partially revised – to include SHMA

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.		

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
*MD 6059: Design recreational sites, recreation facility development, and recreational access to avoid riparian habitat areas or develop and manage them in a manner that minimizes effects on riparian habitats. Construction of recreation facilities within PHMA must conform with the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater sage-grouse, the BLM will require and ensure compensatory mitigation that provides a net conservation gain to the species.	Design recreational sites, recreation facility development, and recreational access to avoid riparian habitat areas or develop and manage them in a manner that minimizes effects on riparian habitats. Construction of recreation facilities within PHMA must conform to the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will consider mitigation is consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4 (see also MD 4157).	Partially revised – to update mitigation reference
**MD 6126: In cooperation, consultation, and coordination with permittees/lessees, cooperators, and interested public, develop and implement appropriate livestock grazing management actions to enhance land health, improve forage for livestock, and meet other multiple use objectives by using the *Wyoming Guidelines for Livestock Grazing Management*, other appropriate BMPs (see Appendix C, *Required Design Features and Best Management Practices* (p. 251)), and development of appropriate range improvements. The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on allotments containing riparian areas or wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., wildfire) and legal obligations.	In cooperation, consultation, and coordination with permittees/lessees, cooperators, and interested public, develop and implement appropriate livestock grazing management actions to enhance land health, improve forage for livestock, and meet other multiple use objectives by using the Wyoming Guidelines for Livestock Grazing Management, other appropriate BMPs (see 2019 Wyoming GrSG ARMPA Appendix B, Required Design Features and Best Management Practices), and development of appropriate range improvements. The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on allotments containing riparian areas or wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., wildfire) and legal obligations.	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under EO 2013–3 (Wyoming Office of the Governor 2013), to 1) develop appropriate conservation objectives; (2) defined a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-specific actions to achieve Greater Sage-Grouse conservation objectives within the framework.	The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under EO 2013–3 (Wyoming Office of the Governor 2013), to 1) develop appropriate conservation objectives; (2) defined a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-specific actions to achieve Greater Sage-Grouse conservation objectives within the framework.	
*MD 6130: Utilize a rangeland health assessment, resource monitoring, or analysis to determine if livestock grazing adjustments in amounts, kinds, or season are necessary. The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on Greater Sage-Grouse Habitat Objectives Table (Table 2.7, "Greater Sage-Grouse Seasonal Habitat Objectives" (p. 21)) and Land Health Standards (43 CFR 4180.2) and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis. Greater Sage-Grouse Habitat Objectives Habitat Objectives Table (Table 2.7, "Greater Sage-Grouse Seasonal Habitat Objectives" (p. 21)), Land Health Standards (43 CFR 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to	Utilize a rangeland health assessment, resource monitoring, or analysis to determine if livestock grazing adjustments in amounts, kinds, or season are necessary. Within PHMA, if monitoring data show the wildlife/special status species standard has not been met nor progress being made toward meeting that standard, there would be an evaluation and a determination made as to the cause. If it is determined that the current authorized livestock use is a significant causal factor in failing to achieve the wildlife/special status species standard~~s,~~ the BLM would address the achievement or progress toward achieving the LHSs (43 CFR 4180.2) and, if needed, Greater Sage-Grouse habitat maintenance or improvement. When NEPA analysis is required for a specific implementation action, one alternative would include mechanisms to make adjustments to meet or make progress toward meeting the wildlife/special status species standard. The analysis should also	Completely revised – revised by rangewide

2015 Approved RMP	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment
livestock grazing that have already been subjected to NEPA analysis.	identify the BLM-approved data collection methodologies used for monitoring conditions and determining when adjustments are necessary. If current grazing management meets land health standards and provides for Greater Sage-Grouse habitat, there would be no need to analyze an alternative for Greater Sage-Grouse. Authorized uses in PHMA that incorporate habitat objectives for Greater Sage-Grouse must develop desired conditions based on Greater Sage-Grouse habitats present in the allotment and the ecological potential of sites that supports these habitats. Metrics used to monitor for objectives must be developed and inform the wildlife/SSS portion of the Standards for Healthy Rangelands. Within PHMA, seasonal habitat objectives for Greater Sage-Grouse apply only to those habitats delineated within an allotment during the specific season (e.g., breeding season objectives during breeding season). Data needed to inform the relationship between the authorized use and habitat condition would come from sample locations that appropriately reflect the impact of the authorized use on habitat conditions. Data points should fall within Greater Sage-Grouse seasonal habitat areas and be collected on ecological sites that have the potential to produce Greater Sage-Grouse habitat.	
MD 6142: Allotments within PHMAs, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	No changes made.	No change (same as 2015)

2.18.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that would change by the Proposed RMP Amendment. If 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The 2015 Appendices can be found on the Bighorn Basin RMP ePlanning website. The 2019 Appendices can be found on the Wyoming GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Maps	2015	Completely Revised-revised by rangewide
A: Approved RMP Amendment with Management Goals, Objectives, and Decisions	2019	Partially Revised based on changes in Proposed RMP Amendment
B: Oil and Gas Lease Notices and Lease Stipulations; including Exception, Modification, and Waiver Criteria	2015	Partially Revised- Applies rangewide exceptions, modifications, and waivers
C: Required Design Features and Best Management Practices	2015, 2019	Partial change – no change (same as 2019) except the addition of livestock grazing BMPs
D: Greater Sage-Grouse Habitat Management Strategy	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
C: Greater Sage-Grouse Habitat Management Strategy	2019	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
F: Wyoming Bureau of Land Management Mitigation Guidelines for Surface-Disturbing and Disruptive Activities	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
G: Federal Oil and Gas Operations on Split-Estate Lands	2015	No change (same as 2015)
H: Monitoring and Evaluation	2015	Partially revised – revised by adding rangewide GRSG monitoring language
I: Land Disposal and Acquisition	2015	No change (same as 2015)
J: Recreation Management	2015	No change (same as 2015)
L: Implementation	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
M: Bighorn Basin Air Resource Management Plan	2015	No change (same as 2015)
N: Seasonal Raptor Stipulations for All Surface-Disturbing and Disruptive Activities	2015	No change (same as 2015)
O: Livestock Grazing	2015	No change (same as 2015)

Lander, Wyoming RMP Revisions

This page intentionally left blank.

2.19 LANDER, WYOMING RMP REVISIONS

This appendix presents the approved RMP revision language from the record of decision for the Lander RMP that relate to GRSG management, and changes that were made in the 2019 GRSG amendment effort. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.19.2** of this appendix. For the additional state-specific Wyoming management direction for the Proposed RMPA, see Chapter 2, Table 2-13.

2.19.1 Lander RMP (Wyoming)

Table 1. Summary of Goals, Objectives, and Management Actions to the Lander RMP

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan (no change, partial revision, complete revision, new direction)
Land Use Plan Revisions/Amendments to the Lander RMP		
**MD 1015: Implement BLM National and Wyoming Reclamation Policies requiring the development of reclamation plans for all federal actions authorized, conducted, or funded by the BLM that disturb vegetation and/or the mineral/soil resources. Require that site-specific interim and final reclamation practices be developed and implemented that will meet the reclamation standards as identified in Appendix B (p. 185). The type and detail of the reclamation plan will be commensurate with the extent and duration of soil disturbance. For extensive disturbance such as a full-field oil and gas development, a detailed, multi-phase plan such as the Continental Divide Creston oil and gas project reclamation plan (attached as Appendix G to the Proposed RMP and Final EIS as an example) will be required.	No changes made.	Partially revised – to update Appendices referenced

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 1016: Require a full reclamation bond specific to the site for all new disturbances in accordance with 43 CFR 3104.2, 3104.3, and 3104.5 or current policy. Ensure bonds are sufficient for costs relative to reclamation (Connelly et al. 2000; Hagen et al. 2007) that would result in restoration of disturbed lands in accordance with the final reclamation standards and objectives identified in Appendix B (p. 185). Base the reclamation costs on the assumption that contractors for the BLM will perform the work.	No changes made.	Partially revised – to update Appendix referenced
MD 1017: Require that surface-disturbing activities minimize the surface disturbance footprint to the maximum extent possible to limit the areas requiring reclamation. Limit disturbance of desirable vegetative communities established during interim reclamation when implementing final reclamation.	No changes made.	No change (same as 2014)
MD 1018: Require that all reclamation plans identify the desired plant community for final reclamation.	No changes made.	No change (same as 2014)
MD 1019: Consider wildlife habitat objectives in all final reclamation objectives. In Core Area, final reclamation objectives will be to restore greater sage-grouse habitat. Include metrics to ensure that restoration goals are met.	No changes made.	No change (same as 2014)
MD 1020: Require site stabilization and sediment control in compliance with Wyoming Stormwater Discharge requirements and BLM reclamation policies.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 1021: Require that during and following reclamation activities, the land user is responsible for monitoring to help ensure interim and final reclamation success as defined in reclamation policies and with the standards identified in Appendix B (p. 185) is achieved. Require follow-up seeding and/or other corrective or remedial erosion-control measures on areas of surface disturbance, as appropriate and, if necessary, protecting the reclaimed landscape until reclamation standards have been achieved. Monitoring and follow-up reclamation practices will continue on interim and final reclaimed areas until the standards identified in Appendix B (p. 185) have been successfully achieved.	No changes made.	Partially revised – to update Appendix referenced
MD 1022: Identify areas with soil disturbance that were not successfully reclaimed. Priorities for reclamation of these areas are determined on a case-by-case basis with an emphasis on greater sage-grouse Core Area and other important wildlife habitat. Develop partnerships and funding sources to implement reclamation where no responsible party has the reclamation obligation.	No changes made.	No change (same as 2014)
**MD 1023: Adapt reclamation methods to specific requirements based on plant communities within ecological sites and site-specific objectives. Incorporate reclamation objectives and require reclamation plans, including reclamation standards as identified in Appendix B (p. 185) on a site-specific basis.	No changes made.	Partially revised – to update Appendix referenced
MD 1024: Utilize management practices, including phased development and BMPs, to achieve reclamation success. Require Reclamation Objectives and Standards as identified in all reclamation plans.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 1025: Reclamation management practices will select native plant species based on site characteristics and ecological site descriptions. Reclamation success will be determined based on the criteria and standards identified in Appendix B (p. 185).	No changes made.	Partially revised – to update Appendix referenced
MD 2001: Do not lease coal or oil shale-tar sands.	No changes made.	No change (same as 2014)
MD 2002: Incorporate proponent committed or BLM Required Design Features or mitigation such as BMPs as Conditions of Approval for any authorized mineral activity for federal minerals, regardless of surface ownership.	No changes made.	No change (same as 2014)
2003 (MR: 1.3): In project-level EISs and EAs, require, on a case-by-case basis, the development of a wildlife resource monitoring and mitigation plan to address potential impacts from mineral development on wildlife populations and/or habitat.	Action was removed in 2019.	Completely revised-revised by addition of rangewide GRSG monitoring and mitigation language.
MD 2004: Recommend for withdrawal from locatable mineral entry (Map 9) approximately 467,065 acres. (In addition, approximately 8,634 acres are withdrawn in pre-FLPMA actions that do not expire.) See decisions under resource programs such as wildlife, cultural, and recreation for specific details of acres recommended for withdrawals. A total of approximately 2,333,402 acres are open to locatable mineral entry (Map 9).	No changes made.	Partially revised – to update Map referenced
2005 (MR:1.3): 1,411,095 acres of federal mineral estate are open to geothermal leasing with moderate constraints (Map 10). 603,633 acres of federal mineral estate are open to geothermal leasing with major constraints (Map 10). 714,545 acres of federal mineral estate are closed to geothermal leasing (Map 10).	Action was removed in 2019.	No change (same as 2019)
2006 (MR:1.3): Constraints applied for oil and gas leasing also apply to geothermal leasing.	Action was removed in 2019.	No change (same as 2019)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 2008: Approximately 67,511 acres of federal mineral estate are open to oil and gas leasing subject only to standard lease stipulations (Map 11). Approximately 1,423,264 acres of federal mineral estate are open to oil and gas leasing subject to controlled surface use and/or timing limitation stipulations (Map 11 and Appendix I (p. 255)). Approximately 1,146,630 acres of federal mineral estate are open to oil and gas leasing subject to NSO stipulations (Map 11 and Appendix I (p. 255)). Approximately 172,071 acres of federal mineral estate are closed to oil and gas leasing (Map 11).	Approximately 80,198 acres of federal mineral estate are open to oil and gas leasing subject only to standard lease stipulations (Map 11). Approximately 1,419,568 acres of federal mineral estate are open to oil and gas leasing subject to controlled surface use and/or timing limitation stipulations (Map 11 and Appendix I (p. 255)). Approximately 1,137,666 acres of federal mineral estate are open to oil and gas leasing subject to NSO stipulations (Map 11 and Appendix I (p. 255)). Approximately 171,669 acres of federal mineral estate are closed to oil and gas leasing (Map 11).	Completely revised – revised by rangewide and state-specific
MD 2009: All oil and gas and other mineral leases are subject to standard lease stipulations. Additional stipulations may apply as otherwise specified in this RMP. In areas that are closed to mineral leasing, do not re-offer existing leases when they expire. If drainage occurs in an area closed to oil and gas leasing, authorize leasing on a case-by-case basis with an NSO stipulation.	No changes made.	No change (same as 2014)
MD 2010: For proposed actions in greater sage-grouse Core Area, determine whether a categorical exclusion is applicable and if so, closely examine the extraordinary circumstances, if applicable, to determine whether one or more exists that would require preparation of a NEPA analysis. If a categorical exclusion applies, and no extraordinary circumstances exist, determine whether preparing a NEPA analysis would help inform decision making.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 2011: Require unitization when deemed necessary for proper development and operation of an area or to facilitate more orderly (e.g., phased and/or clustered) development as a means of minimizing adverse impacts to resources, including greater sage-grouse, so long as the unitization plan adequately protects the rights of all parties, including the United States.	No changes made.	No change (same as 2014)
MD 2012: Disposal of produced water is authorized in accordance with Onshore Oil and Gas Order #7, Disposal of Produced Water, and in compliance with state regulations. If there is Wyoming Pollutant Discharge Elimination System permitted discharge, consider soil erosion, degradation of soil quality, sedimentation, and other factors in coordination with the State of Wyoming.	No changes made.	No change (same as 2014)
MD 2013: The planning area is open to geophysical exploration except for lands identified as closed to mineral leasing or NSO to oil and gas leasing or as otherwise provided in other decisions. Geophysical exploration is subject to motorized travel limitations and restrictions on surface-disturbing and disruptive activities.	No changes made.	No change (same as 2014)
MD 2017: Approximately 1,955,798 acres are open for mineral material disposal on a demand basis (Map 12) subject to resource protections. 853,303 acres are closed to mineral material disposal (Map 12).	Action was removed in 2019.	Completely revised – revised by rangewide and state-specific GRSG additions

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 2018: Identify areas disturbed by expired mineral material sales, including free-use permits and community use pits. Prioritize reclamation of these sites, starting with those in greater sage-grouse Core Area where restoration as long-term greater sage-grouse habitat is possible. Next in priority are those in riparian-wetland areas, ACECs, the National Trails Management Corridor, VRM Class II areas, non-Core Area greater sage-grouse habitat, and wildlife migration corridors. Seek partnerships with others to complete restoration, including applicants seeking suitable offsite mitigation opportunities.	Action was removed in 2019.	No change (same as 2019)
FM: 2: Manage fire and fuels to restore or maintain natural ecosystem functions, restore fire-adapted ecosystems, reduce losses from landscape-level wildland fire, and protect multiple-use values.	Action was removed in 2019.	No change (same as 2019)
FM 2.6: Utilize fuels and vegetation treatments to maintain and enhance greater sage-grouse habitat where applicable.	Action was removed in 2019.	No change (same as 2019)
MD 3004: In greater sage-grouse Core Area, prioritize suppression to conserve the habitat. Where applicable and technically feasible, apply greater sage-grouse BMPs such as those identified in Appendix E (p. 215).	No changes made.	Partially revised – to update Appendix referenced
MD 3007: Use chemical, biological, and mechanical treatments to reduce the risk of landscape-level wildfire within priority areas. Alter fuel loading and improve ecological condition of vegetation communities. Consider the presence and potential for noxious and nonnative plant species when designing wildland fire response and fuels treatments.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 3008: Use personal use and commercial vegetation sale permits, where not otherwise constrained or prohibited (as identified in Records 4012, 6139, and 7045), for removal of firewood, post and pole, Christmas trees, sawlogs, and wildlings, for hazardous fuels management.	Use personal use and commercial vegetation sale permits, where not otherwise constrained or prohibited, for removal of firewood, post and pole, Christmas trees, sawlogs, and wildlings, for hazardous fuels management.	No change (same as 2019)
MD 3009: Monitor fuels treatment and wildfire burn areas for sufficient time after treatment or fire event in order to determine short-term and long-term project success, detect weed infestations and accelerated soil erosion, and assess overall vegetation recovery. Utilize all available rehabilitation tools to control weed infestation and accelerated soil erosion. Implement post-treatment rest of treated areas from livestock grazing for two full growing seasons on all prescribed or wildland fire burn areas unless vegetation recovery dictates otherwise.	No changes made.	No change (same as 2014)
MD 3010: Partner with the University of Wyoming and other research entities to develop a greater understanding of the ecology and disturbance regime of sagebrush steppe, woodland, and forested vegetation communities found within the planning area. Use this information to develop a regionally specific scientific foundation for vegetation management activities.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 3011: Inventory the Fire Regime Condition Class (Map 14) of the vegetative communities found within the fire management units (Map 15). In coordination with stakeholders and in consideration of greater sage-grouse Core Area objectives, prioritize areas requiring treatment and utilize appropriate vegetation treatment techniques to improve the condition class across a landscape. Prioritize those projects in areas with the greatest benefits to wildlife and the highest likelihood of landscape-level wildfire.	No changes made.	Partially revised – to update Maps referenced
MD 3012: Allow vegetation treatments in greater sage-grouse Core Area that conserve, enhance, or restore greater sage-grouse habitat excluding the use of prescribed fire unless specifically for the purpose of greater sage-grouse habitat improvement (this includes treatments that benefit livestock as part of an allotment management plan/conservation plan to improve greater sage-grouse habitat). In suitable habitat within greater sage-grouse Core Area, incorporate specific greater sage-grouse habitat objectives and apply appropriate seasonal restrictions for implementing vegetation management treatments. In identified greater sage-grouse winter concentration areas, vegetation treatments should emphasize strategically reducing wildfire risk around or in the winter concentration areas and maintaining winter concentration habitat quality. Prioritize restoration treatments in areas that are thought to limit greater sage-grouse distribution and/or abundance. Focus vegetation treatments outward from existing, intact greater sage-grouse habitat. Utilize BMPs, such as those in Appendix E (p. 215) and other current habitat management guidelines, when designing and implementing the project.	No changes made.	Partially revised – to update Appendix referenced

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 3013: In suitable greater sage-grouse Core Area, do not reduce sagebrush canopy cover to less than 15 percent within a defined treatment polygon unless a vegetation management objective requires additional reduction in sagebrush cover to protect or to conserve habitat quality for greater sage-grouse or other sagebrush steppe obligate species. Maintain sagebrush and understory diversity (relative to ecological site description) unless such removal is necessary to achieve greater sage-grouse habitat management objectives. Remove conifers or reduce the density of conifers that have encroached into sagebrush plant communities.	No changes made.	No change (same as 2014)
MD 3014: Outside of greater sage-grouse Core Area, emphasize the reintroduction of fire into its natural role in the ecosystem in consideration of Decision Record 3016. Where possible, use wildland fire and prescribed fire to achieve management objectives, including reducing hazardous fuel loading, restoring vegetation communities, improving and/or protecting wildlife habitat, enhancing forage production, and addressing forest and woodland health issues such as pine beetle outbreaks.	Action was removed in 2019.	No change (same as 2019)
MD 3015: Cooperate with stakeholders to conduct landscape level treatments resulting in enhanced fuels management and/or restoration of fire-adapted ecosystems. In cooperation with stakeholders, manage to promote the growth and persistence of native shrubs, grasses, and forbs.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 3016: Limit the use of fire to treat areas receiving less than 12 inches of annual precipitation. Prescribed fire to reduce hazardous fuels or enhance land health in areas receiving less than 12 inches of annual precipitation could be utilized after exploring other potential treatment methods and in areas where the relative resistance and relative recovery rate of the site allows for the successful post-fire reestablishment of desired native vegetation.	No changes made.	No change (same as 2014)
MD 3017: Utilizing Required Design Features and BMPs applied as Conditions of Approval, establish fuels treatment projects at strategic locations to minimize the size of wildfires. Restore native or desirable plants and create landscape patterns to benefit wildlife. Power wash all fire vehicles including engines, water tenders, personnel vehicles, and OHVs after they have been in the field to help prevent the establishment or spread of invasive weeds.	No changes made.	No change (same as 2014)
MD 4015: Identify unique plant communities and manage to protect, preserve, or enhance these communities.	No changes made.	No change (same as 2014)
MD 4016: Manage vegetation communities for vegetative attributes described in NRCS Ecological Site Guides and to meet identified vegetative goals. When existing Ecological Site Descriptions have not been developed, are too general, or are not correct to serve adequately as benchmarks, identify and document local areas of similar potential within each specific ecological site that exemplify achievement of appropriate habitat objectives, and use these sites for the development of new reference sheets to be used as the benchmark reference.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4017: Use vegetation treatments to change plant community composition in a manner that achieves wildlife objectives, rangeland health objectives, and facilitates grazing management. Ensure that projects conform to resource objectives for the site.	No changes made.	No change (same as 2014)
MG BR:3: Manage for healthy native plant communities by reducing, preventing expansion of, or eliminating the occurrence of invasive nonnative species, undesirable vegetation, or noxious weeds, and predatory plant pests or disease by implementing decisions consistent with goals included in Partners Against Weeds and consistent with state and local weed management plans.	No changes made.	No change (same as 2014)
MO BR:3.1: Maintain adequate baseline information, and inventory and monitoring data, regarding the extent and control of invasive species. Evaluate effectiveness of decisions, and assess progress toward goals to improve invasive species management. Develop a prevention and early detection program.	No changes made.	No change (same as 2014)
MO BR:3.2: Coordinate with adjoining jurisdictions in management and control of invasive nonnative species across jurisdictional and political boundaries.	No changes made.	No change (same as 2014)
MO BR:3.3: Include provisions for invasive nonnative species management in all BLM-funded or authorized actions.	No changes made.	No change (same as 2014)
MG BR:4: Support internal and external education and awareness of noxious weeds.	No changes made.	No change (same as 2014)
MO BR:4.1: Develop and deploy educational and public awareness programs and materials in cooperation with other agencies and organizations.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MG BR:5: In all parts of the planning area, manage for the reduction, prevention, and halting the expansion of cheatgrass. Emphasize the prevention of invasive annual grass and woody plants in greater sage-grouse Core Area.	No changes made.	No change (same as 2014)
MD 4020: Manage weed treatments to maintain and improve greater sage-grouse habitat. Apply Required Design Features and BMPs as Conditions of Approval, such as those in Appendix E (p. 215).	No changes made.	Partially revised – to update Appendix referenced
MD 4021: Require the use of certified noxious-weed free forage, mulch, and other land-applied products for BLM-authorized activities on BLM-administered lands.	No changes made.	No change (same as 2014)
MD 4022: Should invasive nonnative species become established in a location, develop and implement site-specific plans to eradicate/control invasive weeds for all surface-disturbing activities in the immediate vicinity. Priority for control will be: (1) Wyoming Declared Weed and Pest Species, (2) those weeds on the Western States Combined Declared Noxious Weed List, (3) those annual/biennial invasive weeds interfering with reclamation efforts, and (4) those invasive nonnative species interfering with a management objective.	No changes made.	No change (same as 2014)
MD 4023: Require that equipment and vehicles used for BLM-authorized activities be cleaned for seeds of noxious weeds and invasive nonnative species before moving onto BLM-administered lands. Prohibit project vehicles accessing BLM-administered lands via cross-county travel from driving through infestations during access to the site. If the area on which BLM-authorized activities take place is identified as being a high risk for invasive and/or noxious weeds, require that vehicles be cleaned before leaving the worksite and include prescriptions for the disposal of wash water.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4024: Develop a plan to manage cheatgrass in coordination with other agencies and individuals, with the local County Weed & Pest Control Districts acting as the point of contact among all parties.	No changes made.	No change (same as 2014)
MD 4025: If the Authorized Officer determines that BLM-authorized activities are contributing to the spread of noxious or invasive species, adjust the terms of the authorized activity to aid in the control of the species.	No changes made.	No change (same as 2014)
MD 4026: If the Authorized Officer determines that livestock are likely carrying ingested seeds of invasive nonnative species, the Authorized Officer may require that livestock be flushed for weeds for a period of 72 hours before allowing livestock to move onto BLM-administered lands.	No changes made.	No change (same as 2014)
MD 4027: Develop and implement a program promoting public awareness of Wyoming Declared Noxious Weeds and Pests as well as invasive nonnative species.	No changes made.	No change (same as 2014)
MD 4028: Identify riparian-wetland management actions to promote biodiversity and develop an implementation plan to incorporate actions into BLM-authorized activities. Manage riparian-wetland areas and wet meadows to achieve or maintain diverse species richness that includes a component of perennial forbs in conjunction with desirable riparian sedges, rushes, bulrushes, and grasses, as appropriate.	No changes made.	No change (same as 2014)
MD 4029: Implement management actions to have riparian-wetland areas meet or exceed proper functioning conditions and Standard 2 of the Wyoming Standards for Healthy Rangelands.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4035: Use an integrated management approach (mechanical, chemical, or biological treatments, prescribed fire, and grazing management techniques) to manipulate vegetative communities to achieve fish, wildlife, and watershed objectives. See the *Special Status Species* section for limitations on the use of prescribed fire in greater sage-grouse habitat.	Action was removed in 2019.	No change (same as 2019)
MD 4041: The Dubois, Red Canyon, Lander Slope, and Green Mountain ACECs, greater sage-grouse Core Area, and the Sweetwater River watershed are priorities for management of fish and wildlife and their habitat. See the *Areas of Critical Environmental Concern* section for ACEC decisions. See the *Special Status Species – Wildlife* section for greater sage-grouse management.	Action was removed in 2019.	No change (same as 2019)
MD 4051: Avoid the movement of water from one 4th level hydrologic unit code drainage to another 4th level hydrologic unit code drainage to prevent aquatic invasive species and disease transfer.	No changes made.	No change (same as 2014)
**MD 4056: Outside of DDAs, wildlife seasonal protections for surface-disturbing and disruptive activities apply to maintenance and operations actions when the activity is determined to be detrimental to wildlife (see Appendix F (p. 229)). Reclamation of surface disturbance will be in accordance with Appendix B (p. 185) for non-DDAs.	No changes made.	Partially revised – to update Appendices referenced
MD 4059: On a case-by-case basis, close and reclaim redundant roads to reduce road density and habitat fragmentation in coordination with adjacent landowners and/or state and county governments.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4060: Manage wind-energy development on a case-by-case basis and in consideration of the resource values in big game crucial winter range, migration corridors, and parturition areas, raptor concentration areas, and other areas with wildlife values. Wind-energy management in greater sage-grouse Core Area is found in the *Special Status Species – Wildlife* section.	Action was removed in 2019.	No change (same as 2019), except Wind-energy management in GRSG habitat is completely revised through addition of rangewide and state-specific GRSG language.
MD 4067: On a case-by-case basis, manage vegetation in identified crucial winter range and parturition areas to benefit the identified species (Maps 18-22).	No changes made.	Partially revised – to update Maps referenced
MD 4069: Avoid authorizing road development in big game crucial winter range and parturition areas.	No changes made.	No change (same as 2014)
MG BR:13: Maintain and/or increase greater sage-grouse abundance and distribution by conserving, enhancing, or restoring the sagebrush ecosystem upon which populations depend, in cooperation with other conservation partners. Sustain the integrity of the sagebrush biome to provide the amount, continuity, and quality of habitat that is necessary to maintain sustainable populations of greater sage-grouse and other species by achieving the objectives below.	No changes made.	Completely revised – revised by rangewide
MO BR:13.1: Maintain large patches of high-quality sagebrush habitats with emphasis on patches occupied by greater sage-grouse.	No changes made.	No change (same as 2014), except addition of rangewide GRSG habitat objectives
MO BR:13.2: Maintain connections between sagebrush habitats, with emphasis on connections between habitats occupied by greater sage-grouse.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4072: Develop and implement protective measures for federally listed species in coordination with the USFWS. For proposed actions in greater sage-grouse Core Areas, determine whether a categorical exclusion is applicable and if so, closely examine the extraordinary circumstances, if applicable, to determine whether one or more exists that would require preparation of a NEPA analysis. If a categorical exclusion applies, and no extraordinary circumstances exist, determine whether preparing a NEPA analysis would help inform decision making. Continue to take action in cooperation with the USFWS to facilitate the recovery of threatened and endangered plant species that occur on BLM-administered land.	Action was removed in 2019.	No change (same as 2019)
MD 4074: Coordinate with agencies, including state and local governments, in the restoration, reintroduction, augmentation, or reestablishment of threatened, endangered, and other special status species populations and/or habitats.	No changes made.	No change (same as 2014)
MD 4076: Develop site-specific measures for BLM-authorized activities to protect threatened, endangered, and sensitive species. Reduce the footprint of development and facilities to the smallest practical to protect special status species and their habitat. Incorporate Required Design Features and BMPs such as those identified in Appendix E (p. 215) as Conditions of Approval as appropriate for authorized activities to address adverse impacts to special status species.	Develop site-specific measures for BLM-authorized activities to protect threatened, endangered, and sensitive species. Reduce the footprint of development and facilities to the smallest practical to protect special status species and their habitat. Incorporate Required Design Features and BMPs such as those identified in Appendix E (p. 215) as conditions of approval as appropriate for authorized activities to address adverse impacts to special status species. Conditions of approval are called stipulations or terms and conditions in some programs.	Partially revised – to update Appendix referenced
MD 4079: On a case-by-case basis, require surveys for BLM sensitive species as part of authorizing actions. Require protective actions when appropriate.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4080: Establish limits of acceptable cumulative habitat loss, including habitat modification, fragmentation, and loss of function, for special status species on a case-by-case basis. Limits of habitat loss and fragmentation for greater sage-grouse in Core Area are addressed in Decision Record 4109.	No changes made.	Partially revised – to update reference to GRSG habitat loss thresholds (surface disturbance caps; adaptive management)
MD 4096: Manage travel corridors for threatened and endangered species and BLM sensitive species on a case-by-case basis (Map 25). (Note: Only Canada lynx analysis units have been identified to date.) Manage permitted activities within travel corridors to avoid adverse impacts to sensitive species.	No changes made.	Partially revised – to update Map referenced
MD 4097: To protect the concentration of special status species and their habitats, mineral and ROW actions in the Dubois area not within a WSA or an ACEC are managed as follows: • Closed to oil and gas leasing • Closed to geophysical exploration • Closed to phosphate leasing • Open to locatable minerals • Closed to mineral material disposals unless entirely contained within the 120 acres located in T41N, R107W, Sec. 1 N½SE¼ • Excluded to major ROWs • Avoided for minor ROWs	No changes made.	No change (same as 2014)
**MD 4098: Maintain sagebrush and understory diversity (relative to ecological site description) in seasonal greater sage-grouse and other sagebrush-obligate species habitats unless plant removal is necessary to achieve habitat management objectives. Vegetation treatments for greater sage-grouse would follow the "Wyoming Game and Fish Department Protocols for Treating Sagebrush to be Consistent with Wyoming Executive Order 2011-5; Greater Sage-Grouse Core Area Protection" (WGFD 2011) or the most current version or science available.	Maintain sagebrush and understory diversity (relative to ecological site description) in seasonal Greater Sage-Grouse and other sagebrush-obligate species habitats unless plant removal is necessary to achieve habitat management objectives. Vegetation treatments for Greater Sage-Grouse would follow the "Wyoming Game and Fish Department Protocols for Treating Sagebrush to be Consistent with Wyoming Executive Order 2015-4; Greater Sage-Grouse Core Area Protection" (WGFD 2015) or the most current version or science available.	Partially revised – to update EO referenced and update version of WGFD Protocols for Treating Sagebrush document referenced and addition of rangewide GRSG habitat objective language and appendix

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4099: To minimize adverse impacts to greater sage-grouse from allowable uses, utilize recommendations and guidance from the following sources: • Grazing Influence, Management, and Objective Development in Wyoming's Greater Sage-Grouse Habitat-With Emphasis on Nesting and Early Brood Rearing • Sage-Grouse Habitat Management Guidelines for Wyoming • Studies in Avian Biology article "Ecology and Conservation of Greater Sage-Grouse: A Landscape Species and Its Habitats" • Western Association of Fish and Wildlife Agencies Greater Sage-Grouse Conservation Strategy • Conservation Objectives Team Report • National Technical Team Report Utilize additional information as it becomes available.	No changes made.	Partially revised – revised to add rangewide GRSG habitat objectives, disturbance cap language, allocations for PHMA and GHMA, mitigation, and adaptive management language.
MD 4100: Maintain seeps, springs, wet meadows, and riparian vegetation in a functional and diverse condition for young greater sage-grouse and other species that depend on forbs and insects associated with these areas. Restore non-functioning riparian systems by repairing abnormally incised drainages to raise water tables and increase water storage and brood-rearing habitats within greater sage-grouse habitat.	No changes made.	No change (same as 2014)
MD 4101: Discourage the use of broad-spectrum insecticides where insect control is required. Target pest control toward key problem areas and schedule applications to be the smallest amount effective in greater sage-grouse brood-rearing areas.	No changes made.	No change (same as 2014)
MD 4102: Establish forage utilization levels in greater sage-grouse nesting habitat to ensure adequate cover remains.	No changes made.	Completely revised – revised by rangewide and state-specific

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4103: Except as otherwise provided in this RMP, greater sage-grouse Core Area is open to oil and gas and geothermal leasing, subject to standard stipulations for the protection of greater sage-grouse and other resources as described elsewhere in this RMP.	No changes made.	Completely revised – revised by rangewide and state-specific
**MD 4104: Prohibit surface-disturbing or surface occupancy on or within a 0.6-mile radius of the perimeter of occupied greater sage-grouse leks in Core Area and on or within a 0.25-mile radius of the perimeter of occupied greater sage-grouse leks outside Core Area (Map 24). In Core Area, keep any new roads or road upgrades 1.9 miles from the perimeter of the lek.	Prohibit surface-disturbing **activities** or surface occupancy on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) in Core Area and on or within a 0.25-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) outside Core Area (Map 24). In Core Area, keep any new roads or road upgrades 1.9 miles from the perimeter of the lek (or lek center if no perimeter is yet mapped). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see also MD 4134).	Partially revised (2019) – to update map referenced, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes in waivers, exceptions, and modifications)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 4105: Prohibit surface-disturbing activities and/or disruptive activities from March 15 to June 30 in Core Area. Outside of Core Area, prohibit surface-disturbing and/or disruptive activities from March 15 to June 30 within 2 miles of the perimeter of occupied leks (Map 24). Where credible data support different timeframes for these seasonal restrictions, dates may be expanded 14 days prior to or subsequent to the above dates.	Prohibit surface-disturbing and/or disruptive activities from March 15 to June 30 in Core Area. Outside of Core Area, prohibit surface-disturbing and/or disruptive activities from March 15 to June 30 within 2 miles of the perimeter of occupied leks (or lek center if no perimeter is yet mapped) (Map 24). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site- specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see also MD 4134). Where credible data support different timeframes for these seasonal restrictions, dates may be expanded 14 days prior to or subsequent to the above dates.	Partially revised (2019) – to update map referenced, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes in waivers, exceptions, and modifications)
**MD 4106: Consistent with the BLM's regulatory authority over locatable mineral exploration and development, prohibit surface disturbance or disruptive activities from notice-level activity under 43 CFR 3809.320 in Core Area during the period March 15 to June 30.	Consistent with the BLM's regulatory authority over locatable mineral exploration and development, prohibit surface disturbance or disruptive activities from notice-level activity under 43 CFR 3809.320 in Core Area during the period March 15 to June 30. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see also MD 4134).	Partially revised (2019) – to update EO referenced

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 4107: Prohibit disruptive activities between 6 p.m. and 8 a.m. from March 1 to May 15 on or within a 0.6-mile radius of the perimeter of occupied greater sage-grouse leks in Core Area (Map 24).	Prohibit disruptive activities between 6 p.m. and 8 a.m. from March 1 to May 15 on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) in Core Area (Map 24). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see also MD 4134).	Partially revised (2019) – to update map referenced, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes in waivers, exceptions, and modifications)
**MD 4108: Prohibit surface-disturbing and disruptive activities in greater sage-grouse winter concentration areas, as they are identified, from December 1 to March 14 unless data indicate a date modification is necessary to better protect wintering greater sage-grouse.	Prohibit surface-disturbing and disruptive activities in Greater Sage-Grouse winter concentration areas, as they are identified, from December 1 to March 14 unless data indicate a date modification is necessary to better protect wintering Greater Sage-Grouse. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see also MD 4134). Protection of additional mapped winter concentration areas in GHMA would be implemented where winter concentration areas are mapped and designated by the State of Wyoming. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas.	Partially revised (2019) – to update EO referenced, include SHMA, and to reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes in waivers, exceptions, and modifications) for winter concentration areas in PHMA

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4109: In greater sage-grouse Core Area, limit the density of disturbance of an activity (oil and gas or mining) to an average of one site per square mile (640 acres) within the DDCT. The one location and cumulative value of existing disturbances will not exceed 5 percent of suitable habitat of the DDCT area. Utilize the most current greater sage-grouse density disturbance process or other state and/or federal agreed-upon process for compliance evaluations.	No changes made.	Partially revised – density of disturbance (i.e., 1 per 640) revised to update Appendix referenced; Completely revised – surface disturbance (5%) revised by rangewide and state-specific
MD 4110: If in order to accommodate valid existing rights, the new disturbance for a ROW in greater sage-grouse Core Area coupled with existing disturbance would exceed 5 percent of suitable habitat within the DDCT area (see current guidance with respect to disturbance calculations), then additional effective mitigation is necessary to offset the resulting loss of greater sage-grouse habitat. Interim reclamation following construction of the ROW and final reclamation following the relinquishment of the ROW will ensure reestablishment of the predisturbance greater sage-grouse habitat, with the reclamation bond amount set in consideration of this reclamation obligation. These ROW authorizations will be subject to approval by the State Director.	No changes made.	Partially revised – to update surface disturbance threshold (HAF fine scale)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4111: In Core Area, major overhead powerlines will not be authorized unless co-located with an existing 115 kilovolt or greater powerline, as close as technically feasible, not to exceed 0.5 miles or within a designated corridor authorized for overhead powerlines. Distribution lines may be authorized when effectively mitigated to protect greater sage-grouse and the Authorized Officer determines that overhead installation is the action alternative with the fewest adverse impacts. Agricultural and residential lines will be considered to be adequately mitigated for greater sage-grouse if constructed at least 0.6 mile from the lek perimeter with appropriate timing constraints and installation of raptor deterrents. These ROW authorizations will be subject to approval by the State Director.	In Core Area, major overhead powerlines will not be authorized unless co-located with an existing 115 kilovolt or greater powerline, as close as technically feasible not to exceed 0.5 miles or within a designated corridor authorized for overhead powerlines. Distribution lines may be authorized when effectively mitigated to protect Greater Sage-Grouse and the Authorized Officer determines that overhead installation is the action alternative with the fewest adverse impacts. Agricultural and residential lines will be considered to be adequately mitigated for Greater Sage-Grouse if constructed at least 0.6 mile from the lek perimeter (or lek center if no perimeter is yet mapped) with appropriate timing constraints and installation of raptor deterrents. These ROW authorizations will be subject to approval by the State Director.	Completely revised – revised by rangewide
MD 4112: Until research on impacts of wind energy to greater sage-grouse is completed and adequate mitigation can be developed, exclude wind-energy development in Core Area.	No changes made.	Completely revised – revised by rangewide
MD 4113: Allow livestock water development projects in greater sage-grouse nesting habitat. Consistent with the intent of greater sage-grouse Core Area management, such projects will only be allowed if they will contribute to improved greater sage-grouse habitat, developments can be designed to be compatible with greater sage-grouse, and they are part of a comprehensive grazing strategy.	No changes made.	Completely revised – revised by rangewide

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4114: The BLM will collaborate with appropriate federal agencies and the State of Wyoming, as contemplated under the Wyoming Governor's Executive Order 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where greater sage-grouse conservation objectives are not being achieved on federal land, to determine if a significant causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and greater sage-grouse conservation objectives; and 3) identify appropriate site-based actions to achieve greater sage-grouse conservation objectives within the framework.	No changes made.	Completely revised – revised by rangewide
MD 4115: In cooperation with stakeholders, design and locate fences, so as not to disturb important greater sage-grouse habitat areas. When fences are authorized, require a design that has the fewest adverse impacts to greater sage-grouse, including features to reduce greater sage-grouse strikes and mortality. Require the installation of fence markers on wire fences constructed in greater sage-grouse habitat to increase fence visibility and reduce collision potential. Remove, modify, or mark fences with high-risk for collision.	No changes made.	Completely revised – revised by rangewide
MD 4116: New permanent, high-profile structures within greater sage-grouse nesting habitat will be allowed on a case-by-case basis. Require the installation of anti-perching devices on appropriate structures to reduce predation opportunities.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
*MD 4117: Limit noise sources to 10 decibels above ambient noise measured at the perimeter of occupied greater sage-grouse leks from March 1 to May 15, unless scientific findings indicate a different noise level is appropriate. In addition, limit noise sources in other important greater sage-grouse habitats if research and/or policy indicate the need.	Within PHMA (core only), new project noise levels, either individual or cumulative, should not exceed 10 dBA (as measured by L50) above baseline noise at the perimeter of the lek (or lek center if no perimeter is yet mapped) from 6:00 pm to 8:00 am during the breeding season (March 1–May 15). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD 4134). In coordination with the State of Wyoming, specific noise protocols for measurement and implementation will be developed as additional research and information emerges. These measures would be considered at the site-specific project level where and when appropriate.	Partially revised (2019) – to update EO referenced
MD 4118: To minimize raptor use, require anti-perching devices on new overhead powerlines in greater sage-grouse Core Area. Require anti-perching devices on new overhead powerlines and wind energy meteorological towers in prairie dog, mountain plover, and pygmy rabbit habitats on a case-by-case basis. Work with ROW holders to install anti-perching devices on existing powerlines in these habitats.	No changes made.	No change (same as 2014) for non-GRSG species. For GRSG, add rangewide GRSG predation language
MD 4119: Allow above ground low voltage utility lines or require burying lines in greater sage-grouse, prairie dog, mountain plover, and pygmy rabbit habitats on a case-by-case basis. Evaluate and take advantage of opportunities such as the renewal of existing ROWs to remove or modify existing powerlines, prioritizing greater sage-grouse Core Area.	No changes made.	Completely revised – revised by rangewide for ROWs in PHMA No change (same as 2014) for ROWs in SHMA and GHMA, and for resources other than GRSG

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4120: In order to avoid surface-disturbing activities in Core Areas, priority will be given to development of oil and gas and other mineral resources outside of Core Areas, subject to applicable stipulations. When authorizing development of oil and gas and other mineral resources in core habitat, subject to applicable stipulations for the conservation of greater sage-grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse.	No changes made.	Completely revised – revised by rangewide and state-specific
MD 4129: Update the Herd Area Management Plan as needed to meet herd health objectives, including Appropriate Management Levels, and to address impacts to other resources. Consider forage competition and evaluate overall utilization levels by all grazing animals, and incorporate greater sage-grouse habitat management objectives.	No changes made.	Completely revised – revised by rangewide (WHB)
No similar action.	*MD 4133: The BLM will update its Greater Sage-Grouse habitat management areas, including biologically significant units (BSUs), in conjunction with the State of Wyoming's core areas, upon issuance of any Wyoming Governor's Executive Order revising or amending the core area boundaries and upon completion of appropriate NEPA analysis and process. The BLM will complete the appropriate NEPA documentation (including appropriate public comment) prior to adopting any revised core area boundaries (e.g., maintenance action or plan amendment, environmental assessment, etc.).	Partially revised – to change reference from BSUs to HAF multi-scale areas.
No similar action.	*MD 4134: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Adopt the State of Wyoming's Greater Sage-Grouse Compensatory Mitigation Framework to the extent	Completely revised – revised by rangewide

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	consistent with federal law, regulations, and policy. In all Greater Sage-Grouse habitat, when authorizing third-party actions in designated Greater Sage-Grouse habitat, the BLM will seek to achieve the planning-level Greater Sage-Grouse management goals and objectives through implementation of mitigation and management actions, consistent with valid existing rights and applicable law. Under this Plan Amendment, management would be consistent with the Greater Sage-Grouse goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [Greater Sage-Grouse] or to improve the condition of [Greater Sage-Grouse] habitat" across the planning area. Accordingly, before authorizing third-party actions that result in habitat loss and degradation, the BLM will complete the following steps, in alignment with the Governor of Wyoming's Executive Order 2015-4 (July 29, 2015): 1. Work jointly with the WGFD to evaluate projects and recommend mitigation in the form of avoidance and minimization. 2. The WGFD will determine if the State requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of Greater Sage-Grouse. 3. Incorporate state required or recommended mitigation into the BLM's NEPA decision-making process, if the WGFD determines that compensatory mitigation is required to address impacts to	

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	GRSG habitat as a part of State policy or authorization, or if a proponent voluntarily offers mitigation. 4. Analyze whether the compensatory mitigation (deferring to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action): • achieves measurable outcomes for Greater Sage-Grouse habitat function on a landscape scale as determined by WGFD that are at least equal to the lost or degraded values in accordance with the Governor of Wyoming's Executive Order 2015-4. • provides benefits that are in place for at least the duration of the impacts. • accounts for a level of risk that the mitigation action may fail or not persist for the full duration of the impact. 5. Ensure mitigation outcomes are consistent with the State of Wyoming's mitigation strategy and principles outlined in 2019 Wyoming GrSG ARMPA Appendix C, The Greater Sage-Grouse Habitat Management Strategy. The BLM has determined that compensatory mitigation must be voluntary unless required by other applicable law and in recognition that State authorities may also require compensatory mitigation (IM 2019-018, *Compensatory Mitigation*, December 6, 2018). Therefore, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and degradation, the BLM will consider voluntary compensatory mitigation actions only as a component of compliance	

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	with a State mitigation plan, program, or authority, or when offered voluntarily by a project proponent. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and alignment with State policies and requirements, including those regarding compensatory mitigation. When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a mitigation requirement from the State, the BLM's NEPA analysis would evaluate the need to avoid or minimize impacts of the proposed project and achieve the goals and objectives of this RMPA. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action.	
MD 6001: Respond to specific proposals for land use authorizations on a case-by-case basis. Do not classify, open, or make available any BLM-administered lands for agricultural leasing or agricultural entry under either Desert Land Entry or Indian Allotment for one or more of the following reasons: unsuitable topography, presence of sensitive resources or resource conflicts, lack of water or access, small parcel size, or unsuitable soils.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6002: Identify lands for acquisition through exchange and/or purchase with a priority on meeting special management objectives such as greater sage-grouse Core Area, ACECs, and National Landscape Conservation System lands. Prioritize lands for acquisition that do not have split-estate unless in Core Area where greater sage-grouse management objectives would benefit greater sage-grouse conservation. Lands and/or interests in lands acquired, and former withdrawn lands relinquished would be managed in a manner consistent with adjacent or nearby BLM-administered land including surface and mineral estate management and pursuing withdrawals as appropriate, unless otherwise addressed through further land use planning actions. Subject to further NEPA analysis.	Action was removed in 2019.	No change (same as 2019)
MD 6003: Continue to administer lands leased under the Recreation and Public Purposes Act. Respond to requests for additional Recreation and Public Purposes Act leases.	No changes made.	No change (same as 2014)
MD 6005: No parcels within a National Landscape Conservation System unit, including the National Trails Management Corridor or an ACEC, or in greater sage-grouse Core Area, are identified for disposal unless the disposal would benefit the goals and objectives of the area's priority values or other important resource values. Acquire lands in areas with mixed ownership and where land exchanges would result in additional or more contiguous federal ownership patterns or would improve management for the benefit of priority resources as identified in other decisions such as ACECs.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6011: Management prescriptions for wind-energy development in important wildlife habitat, areas managed as VRM Classes I and II, RMZs, areas with cultural resources, and special designations are found in those respective sections.	No changes made.	No change (same as 2014)
MD 6012: Implement the programmatic policies and BMPs for wind-energy development as identified in the ROD for Wind-Energy Development on Bureau of Land Management-Administered Land in the Western States (BLM 2005b) and Instruction Memorandum 2009-043 or subsequent guidance as part of any wind-energy authorization.	No changes made.	No change (same as 2014) for all resources except GRSG. For GRSR, completely revised – revised by rangewide and state-specific
MD 6015: Programmatic policies, BMPs, leasing procedures, and stipulations identified in the ROD for the Programmatic EIS for Geothermal Leasing in the Western United States (BLM and Forest Service 2008) are analyzed in the *Minerals* section.	No changes made.	No change (same as 2014)
**MD 6016: Manage 1,279,633 acres as ROW avoidance areas (Map 33). See Appendix C (p. 191) for avoidance criteria. Manage 576,458 acres as ROW exclusion areas (Map 33). Manage 538,110 acres as open to ROW (Map 33).	Manage 1,282,773 acres as ROW avoidance areas (Map 33). See 2014 Lander RMP Appendix C (p. 191) for avoidance criteria. Manage 567,476 acres as ROW exclusion areas (Map 33). Manage 543,961 acres as open to ROW (Map 33).	Completely revised – revised by rangewide and state-specific
MD 6017: The Beef Gap section of the Sweetwater Rocks Complex (the gap between the Split Rock and the Miller Springs WSAs [Map 44]) is closed to any new ROWs even if co-located with existing ROWs.	No changes made.	Partially revised – to update Map referenced
MD 6018: Energy Corridor 79-216 is a designated corridor (Map 34).	No changes made.	Partially revised – to update Map referenced
MD 6019: The following are designated corridors for major ROW development (Map 34) open for above and/or below ground ROWs as indicated. The location of the designated corridors as represented on the map is approximate and subject to verification based on existing	No changes made.	Partially revised – to update (per rangewide) designated corridor avoidance criteria in PHMA

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
disturbance, particularly in the Sand Draw to Casper corridor through the Gas Hills mining district and the Lost Creek corridor north and south of Jeffrey City. The corridor widths displayed on Map 34 are overstated to improve clarity. The specific location of the designated corridors is based on the existing ROW. The Lost Creek Corridor, for example, is the area adjacent to the Lost Creek pipeline. These locations are subject to on-the-ground verification which will be reflected on updated iterations of Map 34. • Jim Bridger (containing the Spence-Mustang-Jim Bridger existing 230 kV powerline) from where it enters the Lander planning area in Township 25 North, Range 94 West to where it intersects with the Lost Creek pipeline: above and below ground • Lost Creek: variously below ground only and above and below ground as follows: o Lost Creek 1: from where the pipeline enters the Lander planning area in the south in Township 25 North, Range 93 West to where the pipeline meets the existing 230 kV powerline in the Jim Bridger corridor: below ground only o Lost Creek 2: from the Jim Bridger meeting point northward until the Lost Creek pipeline meets the Sand Draw to Casper designated corridor: above and below ground. The section of the corridor through the Jeffrey City area that is not within the National Trails Management Corridor is open to oil and gas leasing subject to CSU stipulations o Lost Creek 3: from the Sand Draw to Casper meeting point north to Highway 20/26: below ground only		

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
○ Lost Creek 4: from north of Highway 20/26 to the Westwide Corridor: above and below ground • Pathfinder: below ground only. (The Pathfinder corridor is only in the Lander planning area in Township 30 North, Range 85 West.) • Sand Draw to Casper: above and below ground • Highway 20/26: above and below ground • Beaver Creek (formerly called Beaver Creek North and Lost Creek Spur): below ground only • Shoshoni/Badwater: below ground • Bairoil: below ground only • Sand Draw: below ground only • Bison Basin: below ground only • Frontier going southwest from the Bairoil corridor to where it leaves the Lander planning area: below ground only • Rattlesnake Hills (formerly called Frontier-Anadarko) north of Black Rock: below ground • Black Rock (formerly called Pacificorp): above and below ground • Pacificorp (going east-west in Township 35): above and below ground Widths for these corridors are 0.5 mile unless there are resource conflicts, then the construction ROW width will be adjusted accordingly. Within these corridors, new facilities will be constructed adjacent to existing linear facilities and overlapping existing ROWs where feasible, recognizing the need for adequate separation for operating system integrity, safety (construction and operation), appropriate local, state, and federal policies, regulations and laws, and land-use constraints. Designated corridors are subject to the prescriptions for resource		

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
protections except that they are open for ROWs even if the surrounding areas are excluded or avoided. Management prescriptions for ROWs are found in other resource areas such as Special Designations.		
MD 6020: The preferred location for new ROWs and access route authorizations is in areas already disturbed by existing ROWs. See Appendix E (p. 215) for design constraints to limit surface disturbance associated with new ROWs. Identify opportunities to reclaim duplicative ROWs or those no longer in use.	No changes made.	Partially revised – revised by rangewide for major ROWs in PHMA Partially revised – to update Appendix referenced for outside of PHMA
MD 6021: Utilize the most current greater sage-grouse density disturbance process or other state/federal agreed-upon process for compliance evaluations.	No changes made.	Completely revised for disturbance cap – revised by rangewide and state-specific
MD 6022: Locate linear ROWs such as fiber optic and low-voltage powerline corridors along currently established road systems (for example, state highways and county roads).	No changes made.	No change (same as 2014)
MD 6024: Lands that are available to oil and gas leasing are available to carbon dioxide sequestration and research subject to the same surface limitations as would be applied to oil and gas operations. Lands that are closed to oil and gas leasing are excluded for carbon dioxide sequestration and research.	No changes made.	No change (same as 2014)
MD 6029: Grant administrative use authorizations on a case-by-case basis with approval from the Authorized Officer. All access agreements will specify the following: what type of use is allowed and for what purpose, times, dates or seasons of access, where the use will occur, and additional stipulations required to provide for adequate resource protection and to meet pertinent planning decisions.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6050: Livestock grazing in the planning area (Map 38) is managed as follows: • 2,323,152 acres are open to grazing • 7,665 acres are closed to grazing • 63,393 acres are unavailable to grazing	No changes made.	Partially revised – to update Map referenced and addition of rangewide GRSG livestock grazing language
MD 6052: In cooperation, consultation, and coordination with permittees/lessees, cooperators, and stakeholders including interested parties, develop and implement appropriate livestock grazing management actions to achieve the Wyoming Standards for Healthy Rangelands, improve forage for livestock, and enhance rangeland health. Within greater sage-grouse Core Area, incorporate greater sage-grouse habitat objectives and management considerations into all BLM grazing allotments containing greater sage-grouse habitat through Allotment Management Plans or permit renewals. Consider the application of BMPs for the protection of greater sage-grouse as terms and conditions of grazing permit/lease renewals. In areas where Wyoming Standards for Healthy Rangelands are not being met or are not making progress toward meeting standards, because of current livestock grazing, modify existing permits or condition the issuance of new permits on the implementation of new grazing strategies to meet standards in accordance with grazing regulations. Apply appropriate BMPs as terms and conditions of the permit.	Action was removed in 2019.	Completely revised – revised by rangewide GRSG livestock grazing language
MD 6054: Conduct grazing program monitoring (see Glossary) of allotments by focusing on Category I allotments in order of priority starting with those allotments that have degraded riparian-wetland areas or are in whole or in part in greater sage-grouse Core Area. Modify BLM-authorized grazing use on an allotment-by-allotment basis to protect soil, water, vegetative resources, and wildlife.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6055: When a permittee or lessee voluntarily takes non-use of their grazing preference in a specific grazing allotment, permit annual periods of non-use of grazing preference, without penalty, on a case-by-case basis when the advantage to greater sage-grouse habitat or other resource values warrant.	No changes made.	Completely revised – revised by rangewide
MD 6056: Include terms and conditions on grazing permits and leases that ensure plant growth requirements are met and that adequate forage remains available for greater sage-grouse hiding cover as necessary. Do not permit new range improvement projects within 500 feet of water and riparian-wetland areas except to benefit watershed health or vegetation. Develop project-specific BMPs that become terms and conditions of the grazing permit.	No changes made.	Completely revised – revised by rangewide
MD 6057: Locate supplements such as minerals and salt in a manner designed to conserve, enhance, or restore greater sage-grouse habitat.	No changes made.	Completely revised – revised by rangewide
MD 6058: Prioritize completion of land health assessments and processing of grazing permits within greater sage-grouse Core Area and on allotments with riparian-wetland areas not achieving or making significant progress towards proper functioning condition. Emphasize allotments that have the best opportunities for riparian-wetland improvement or for conserving, enhancing, or restoring habitat for greater sage-grouse. When conducting land health assessments, include indicators and measurements of structure, condition, and composition of vegetation specific to achieving greater sage-grouse habitat objectives. If local/state seasonal habitat objectives are not available, use greater sage-grouse habitat recommendations from Connelly et al. 2000 and Hagen et al. 2007 or updated research findings.	No changes made.	Completely revised – revised by rangewide

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6059: Work cooperatively with permittees, lessees, and other landowners to develop comprehensive grazing management strategies to develop site-specific objectives to conserve, enhance, or restore greater sage-grouse Core Area and general habitat areas. Develop a comprehensive grazing strategy to achieve these objectives. In Core Area, monitor measurable objectives in representative sites and evaluate grazing management to ensure that decisions are achieving greater sage-grouse habitat objectives.	No changes made.	Completely revised – revised by rangewide
MD 6060: Monitor precipitation and vegetative production trends on BLM-administered lands as a tool to understand impacts to soil, water, and vegetative resources. Monitor measurable objectives and evaluate grazing management to confirm that decisions are achieving greater sage-grouse habitat objectives.	No changes made.	Completely revised – revised by rangewide and state-specific
MD 6061: Allotments are categorized as M, I, and C (see Appendix G (p. 231)). Re-categorize as appropriate during livestock grazing permit renewals.	No changes made.	Partially revised – to update Appendix referenced
MD 6062: When livestock grazing permits and/or grazing preference are voluntarily relinquished in portions of or all of an allotment, analyze suitable livestock grazing management, including closure to livestock grazing where appropriate, based on benefits to resources and other uses.	No changes made.	Partially revised – – revised by addition of rangewide GRSG language
MD 6063: Establish stocking rates in areas preferred by livestock that allow for appropriate utilization levels by livestock, adjusted for the anticipated intensity of use necessary to provide sufficient forage and cover to support and maintain healthy, diverse wildlife and wild horse populations and to achieve the Wyoming Standards for Healthy Rangelands. Utilization levels may vary based on the implementation of a comprehensive grazing strategy or as needed to achieve vegetation objectives.	No changes made.	Partially revised – revised by addition of rangewide GRSG language

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6064: Prioritize the management of hot-season grazing on riparian-wetland and meadow complexes to promote recovery or maintenance of key vegetation species appropriate for the ecological site and water quality through the use of comprehensive grazing strategies (see Glossary) as identified in Appendix G (p. 231). In areas of continuous season-long grazing where rangeland health standards are not met, modify existing grazing permits to incorporate rest and/or deferment of grazing to facilitate rangeland health recovery and attainment of rangeland health standards.	No changes made.	Partially revised – to update Appendix referenced and apply applicable rangewide GRSG grazing language
MD 6065: Continue implementation of existing allotment management plans. Develop and implement new comprehensive grazing strategies and Allotment Management Plans with grazing permittees/lessees and interested public to achieve desired resource goals. Grant administrative use authorizations on a case-by-case basis with approval from the Authorized Officer. All administrative use agreements will specify the following: what type of use is allowed and for what purpose; times, dates or seasons of access; where the use will occur; and additional stipulations required to provide for adequate resource protection and to meet planning decisions.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6066: Utilizing Required Design Features and BMPs such as those in Appendix E (p. 215) applied as Conditions of Approval, develop and install range improvement projects necessary to implement comprehensive grazing strategies which will lead to improved rangeland health, or to enhance successful comprehensive grazing strategies already in place. Benefits associated with the projected improvement in rangeland health should exceed the adverse impacts associated with the project infrastructure. Avoid projects that would expand grazing on the landscape without a clear link to a comprehensive grazing strategy and consideration of other resources.	No changes made.	Partially revised – to update Appendix referenced and add rangewide GRSG language regarding range improvements
MD 6067: Evaluate existing project infrastructure in the development of comprehensive grazing strategies. In consultation with the livestock grazing permittees authorized to use the allotment, identify projects that are no longer necessary, or that are contributing to adverse impacts to other resources, and modify or remove projects as appropriate to mitigate impacts. Evaluate whether the infrastructure contributes to the introduction or spread of invasive nonnative species, and develop mitigation (including removal of infrastructure) to reduce or eliminate weed infestation and spread.	No changes made.	Partially revised –add rangewide GRSG language regarding range infrastructure
MD 6068: Remove or modify fences and cattleguards on a case-by-case basis to enhance other resource values and to facilitate livestock, wild horses, and wildlife movement and management.	No changes made.	Partially revised –add rangewide GRSG language regarding fencing
MD 6069: Establish and manage future forage reserves as opportunities arise within the planning area on a voluntary basis or as lands are acquired.	No changes made.	Completely revised – revised by rangewide

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6070: Retain designated stock driveways. Permit other livestock trails on a case-by-case basis.	No changes made.	No change (same as 2014)
MD 6071: Require that forage supplements have label information stating that the material is safe/compatible for sheep, wildlife, and wild horses in areas where their ranges overlap. Require that all forage supplement labels be submitted to the field office for approval by the Authorized Officer prior to use.	No changes made.	No change (same as 2014)
MD 6072: Prohibit placement of salt and mineral supplements, such as low-moisture block supplements, in the following areas: • Within 0.5 mile of water and riparian-wetland areas • Within 0.6 mile of the perimeter of occupied greater sage-grouse leks • Within 0.5 mile of areas being reclaimed from surface disturbance	No changes made.	No change (same as 2014)
MD 6073: Modify or implement livestock grazing management (Appendix G (p. 231)) to facilitate successful reclamation efforts.	No changes made.	Partially revised – to update Appendix referenced
MD 6074: Determine livestock grazing management for acquired lands consistent with the management objectives for the acquisition or for the area in which the land is located, for example, an ACEC, WSA, or within the National Trails Management Corridor.	No changes made.	No change (same as 2014)
MD 6077: In greater sage-grouse Core Area, authorize Special Recreation Permits that, through mitigation or design, will have neutral or beneficial impacts to greater sage-grouse.	Action was removed in 2019.	No change (same as 2019)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6090: Sustain or enhance the Johnny Behind the Rocks RMZ (4,828 acres) for nonmotorized recreationists to engage in horseback riding, hiking, trail running, wildlife viewing, and mountain biking so that participants in visitor assessments/surveys report a higher than average (mean average of 4.0 on a 5-point scale) realization of the following experience and benefit outcomes: • **Experiences:** Enjoying the sensory experience of a natural landscape, enjoying exercise and physical fitness, developing skills and abilities, enjoying having access to close to home outdoor amenities, and feeling that this community is a special place to live. • **Benefits:** Improved mental and physical health, greater connection to nature, improved opportunity to view wildlife close up, greater sense of place, improved outdoor recreation skills, heightened sense of satisfaction with our community, and reduced adverse human impacts such as litter, vegetative trampling, and unplanned trails.	No changes made.	No change (same as 2014)
MD 6091: Create and maintain the following desired future recreation setting qualities in the Johnny Behind the Rocks RMZ: • **Physical Recreation Setting:** The natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area. Facility and trail development will focus on sufficient densities and developments to provide for a full day (6 to 8 hours or up to 40 miles of trail) of use. Non-trail facilities and structures will continue to be rare and co-located within close proximity to the highway/parking area.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
• **Social Recreation Setting:** Usually 3-6 encounters per day off travel routes and 7-15 encounters per day on travel routes. Group size is usually small. • **Operational Recreation Setting:** Excluding the adjacent highway, the Blue Ridge Road, and livestock permittee access to range improvements; the area will be managed for mountain bikes and other nonmotorized use(s). Mechanized/motorized trail building will be approved as needed to support the identified outcome objective. Onsite controls and services will be present, but harmonize with the natural environment.		
MD 6092: Mineral and ROW actions in the Johnny Behind the Rocks RMZ are managed with the following restrictions: • Oil and gas leasing subject to NSO • Closed to geophysical exploration • Closed to phosphate exploration • Recommend for withdrawal to locatable mineral entry • Closed to mineral material sales • Excluded from ROW actions	No changes made.	No change (same as 2014)
MD 6093: Initiate the following recreation decisions to support the identified outcome objective and desired future setting condition: • Utilize monitoring and evaluation to adjust management techniques and implementation decisions as necessary to reach desired future setting conditions and provide identified recreation opportunities (activities, experiences, and benefits). • New trails will be identified and authorized in a master trails plan and supported through implementation-level decision making.	No changes made.	No change (same as 2014)

2014Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
• Pursue land exchanges and access agreements for parcels in and adjacent to this RMZ. • Solicit partnerships and cooperative agreements to monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies). • Monitor recreation setting condition through onsite patrols May through November.		
MD 6094: Close the Johnny Behind the Rocks RMZ to motorized travel, except with an allowance for administrative access agreements with livestock grazing permittees. This management decision does not close motorized travel on the Blue Ridge Road and other roads adjacent to or outside of the SRMA. Motorized travel on and west of Cedar Ridge will be closed as a result of this decision.	No changes made.	No change (same as 2014)
MD 6095: The Johnny Behind the Rocks area is open to cross-country nonmotorized travel.	No changes made.	No change (same as 2014)
MD 6096: Manage the Johnny Behind the Rocks RMZ as VRM Class II.	No changes made.	No change (same as 2014)
MD 6113: Mineral and ROW actions in the Dubois Mill-Site SRMA are managed with the following restrictions: • Closed to oil and gas leasing • Closed to geophysical exploration • Closed to phosphate leasing • Open to locatable minerals • Closed to mineral material disposals • Excluded to major ROWs • Avoided for minor ROWs	No changes made.	No change (same as 2014)

2.19.2 Relevant Appendices

The following table shows which appendices from the 2014 and 2019 plans have management direction that would change by the Proposed RMP Amendment. If 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The 2014 Appendices can be found on the Lander RMP ePlanning website. The 2019 Appendices can be found on the Wyoming GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP AmendmentProposed Plan
A: Maps	2014	Completely Revised-revised by rangewideYes
A: Approved RMP Amendment with Management Goals, Objectives, and Decisions	2019	Partially Revised based on changes in Proposed RMP AmendmentYes
B: Reclamation Objectives and Standards	2014	No change (same as 2014)No
C: Exception, Modification, and Waiver Criteria, Avoidance Criteria, and Special Management for Designated Corridors	2014	Partially Revised- Applies rangewide exceptions, modifications, and waivers
D: Lander Air Resources Management Plan	2014	No change (same as 2014)
E: Required Design Features and Best Management Practices	2014, 2019	Partial change – no change (same as 2019) except the addition of livestock grazing BMPs
F: Stipulations and Conditions of Approval in Designated Development Areas and in Non-Designated Development Areas	2014	No change (same as 2014)
G: Livestock Grazing Allotments and Range Improvements	2014	No change (same as 2014)
H: Wyoming BLM Mitigation Guidelines for Surface-Disturbing and Disruptive Activities	2014	Partially Revised to incorporate applicable changes from Proposed RMP Amendment

2.20 WORLAND, WYOMING RMP REVISIONS

This appendix presents the approved RMP revision language from the record of decision for the Worland RMP that relate to GRSG management, and changes that were made in the 2019 GRSG amendment effort. The tables below note which goals, objectives, appendices, and management decisions/actions would be amended by the Proposed RMP Amendment (RMPA), either partially or completely, and which existing decisions would not be amended at all. The types of change to existing management direction from the Proposed RMPA include: no change, partial revision, complete revision, and new direction. Note that any references to tables and appendices are to those applicable RMP appendices that are listed in **Section 2.20.2** of this appendix. For the additional state-specific Wyoming management direction for the Proposed RMPA, see Chapter 2, Table 2-13.

2.20.1 Worland RMP (Wyoming)

Table 1. Comparison of Proposed RMP Amendment to Existing GRSG RMP Management Decisions in the Worland RMP (Wyoming)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan (no change, partial revision, complete revision, new direction)
Land Use Plan Revisions/Amendments to the Worland RMP		
MO MR:2.3: Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h).	Leasing is allowed in PHMA. Where the BLM has a backlog of Expressions of Interest for leasing, the BLM will prioritize its work first in non-habitat management areas, followed by lower priority habitat management areas (e.g., GHMA) and then higher priority habitat management areas (i.e., PHMA). To the extent consistent with federal regulation, law, and policy, priority would be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority would be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3-1(h). Where a proposed fluid	Completely revised – revised by rangewide

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts on the extent compatible with lessees' rights to drill and produce fluid mineral resources. To incentivize development to locate outside of PHMA, the BLM would work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts on Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.No changes made.	
MO MR:2.4: Where a proposed fluid mineral development project on an existing lease could adversely affect Greater Sage-Grouse populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce, and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to Greater Sage-Grouse or its habitat and will ensure that the best information about the Greater Sage-Grouse and its habitat informs and helps to guide development of such federal leases.	No changes made.	Completely revised – revised by rangewide
**MD 2005: Consider interest in exploration for, or leasing of, federal coal (Map 3-5), if any on a case-by-case basis. Allow coal exploration licenses subject to the regulations of 43 CFR 3410, and subject to guidance mitigating for surface-disturbing activities in the *Wyoming BLM Standard Oil and Gas-Lease Stipulations*	No changes made.	Partially revised – revised by addition/replacement of applicable rangewide GRSG management

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
(Appendix B, *Oil and Gas Lease Notices and Lease Stipulations, including Exception, Modification, and Waiver Criteria* (p. 211)). Before issuing a coal exploration license, require the authorized officer to prepare an environmental assessment or environmental impact statement, if necessary, of the potential effects of the proposed exploration on the natural and socioeconomic environment of the affected area. If an application for a federal coal lease is received, conduct an appropriate land use and environmental analysis, including the coal screening process, to determine whether the area(s) proposed for leasing is (are) acceptable for coal development and leasing (as per 43 CFR 3425). If public lands are determined to be acceptable for further consideration for coal leasing, amend the land use plan as necessary. Only accept federal coal lease applications on those federal coal lands with development potential identified as suitable for further leasing consideration, after application of the coal screens and unsuitability criteria. At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is "unsuitable" for all or certain coal mining methods pursuant to 43 CFR 3461.5. PHMA is essential habitat for maintaining Greater Sage-Grouse for purposes of the suitability criteria set forth at 43 CFR 3461.5(o)(1). The BLM will also consider that USFWS has found "the core area strategy…if implemented by all landowners via regulatory mechanisms, would provide adequate protection for sage-grouse and their habitats in the state" when considering leasing coal in PHMAs under the criteria set for at 43 CFR 3461.5(o)(1) (USFWS 2010).		

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 2013: Process oil and gas lease applications on a case-by-case basis. Ensure that leasing activities in PHMAs comply with Greater Sage-Grouse RMP decisions and remain in compliance with laws, regulations, and policy.	Process oil and gas lease applications on a case-by-case basis. Ensure that leasing activities in PHMAs comply with Greater Sage-Grouse RMP decisions and remain in compliance with laws, regulations, and policy (See MDs 4106, 4107, 4108, 4110, and 4152).	Partially revised (2019) – to update Management Direction referenced
MD 2023: Delineate **Oil and Gas Management Areas (Map 3-9) (333,488 acres of federal mineral estate) around existing intensively-developed fields, applying a 2-mile buffer from the outer boundary of the existing field (Map 3-10); adding enhanced oil recovery areas identified by the Governor's Office Enhanced Oil Recovery Institute and excluding Greater Sage-Grouse PHMAs. Manage these areas primarily for oil and gas exploration and development. Oil and gas development, including enhanced oil recovery operations, within Oil and Gas Management Areas is allowed to take place at the same level and density as the existing development in the field. Levels and densities beyond the existing field development may require additional reclamation or compensatory offsite mitigation. As oil and gas fields expand or exploration reaches beyond the Oil and Gas Management Areas depicted on Map 3-9, Oil and Gas Management Areas may be enlarged as appropriate. To enlarge Oil and Gas Management Areas, the expansion area would: i) have to be adjacent to the field and under valid oil and gas lease(s) with stipulations allowing surface occupancy and development; ii) have to have a surface density of, on average, at least four well pads per 640-acres; a determination that additional well density is required to efficiently and adequately produce the oil or gas resource;	No changes made.	Partially revised – to update map and acres referenced

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
iii) have a project-specific environmental analysis prepared to analyze the impacts and determine operating methods, mitigation, and BMPs to be used in the efficient and comprehensive development of the field; iv) need surface resources to be satisfactorily mitigated; and v) need commitment to accelerate reclamation as required by the authorized officer.		
MO FM:1.5:: Following wildland fires, conduct appropriate emergency stabilization and rehabilitation when and where needed. In priority Greater Sage-Grouse habitat areas, prioritize suppression immediately after life and property to conserve the habitat. In general Greater Sage-Grouse habitat, prioritize suppression where wildfires threaten priority Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD FM:2.1: Consult and cooperate with adjacent landowners, state and local governments, and other stakeholders to plan and implement prescribed fire and other vegetation treatments across the landscape. In areas of general Greater Sage-Grouse habitat, design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems.	No changes made.	No change (same as 2015)
MD 3008: Suppress fires threatening Greater Sage-Grouse habitats and crucial winter wildlife habitat within Wyoming big sagebrush communities. Where fire would be utilized to meet resource objectives, work closely with resource specialists to protect and improve Greater Sage-Grouse habitat. For fuels management, the BLM would consider multiple tools for fuels reduction and would analyze in NEPA compliance documentation before electing to implement prescribed fire in PHMAs.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
If prescribed fire is used in Greater Sage-Grouse habitat, the NEPA analysis for the Burn Plan will address: • why alternative techniques were not selected as a viable options; • how Greater Sage-Grouse goals and objectives would be met by its use; • how the COT Report objectives would be addressed and met; and • a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. Prescribed fire as a vegetation or fuels treatment in Greater Sage-Grouse habitat shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Prescribed fire could be used to meet specific fuels objectives that would protect Greater Sage-Grouse habitat in PHMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). Prescribed fire in known crucial winter wildlife habitat shall only be considered after the NEPA analysis for the Burn Plan has addressed the four bullets outlined above. Any prescribed fire in and/or around crucial winter wildlife habitat must be strategically-designed to reduce wildfire risk and protect winter range habitat quality.		

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MO BR:2.6: In PHMAs, the desired condition is to maintain all lands ecologically capable of producing sagebrush (but no less than 70 percent) with a minimum of 15 percent sagebrush cover or as consistent with specific ecological site conditions. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Technical Reference 1734-6 [BLM 2005c]).	No changes made.	No change (same as 2015)
MG BR:9: GREATER SAGE-GROUSE – Sustain the integrity of the sagebrush biome to provide the amount, continuity, and quality of habitat that is necessary to maintain sustainable populations of Greater Sage-Grouse and other species by achieving the objectives below.	No changes made.	Completely revised – revised by rangewide
MO BR:9.1: Maintain large patches of high quality sagebrush habitats, with emphasis on patches occupied by Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO BR:9.2: Maintain connections between sagebrush habitats, with emphasis on connections between habitats occupied by Greater Sage-Grouse.	No changes made.	No change (same as 2015)
MO BR:10.1: Reconnect large patches of sagebrush habitat with emphasis on reconnecting patches occupied by stronghold and isolated populations of Greater Sage-Grouse.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4058: Maintain or improve important wildlife habitats through vegetative manipulations, habitat improvement projects, livestock grazing strategies and the application of *The Wyoming Guidelines for Managing Sagebrush Communities with Emphasis on Fire Management* (Wyoming Interagency Vegetation Committee 2002) and the *Wyoming BLM Standard Mitigation Guidelines for Surface-Disturbing and Disruptive Activities* (Appendix F, *Wyoming Bureau of Land Management Mitigation Guidelines for Surface-Disturbing and Disruptive Activities* (p. 349)), BMPs (Appendix C, *Required Design Features and Best Management Practices* (p. 249)), and similar guidance updated over time.	No changes made.	Partially revised – to update Appendices referenced, as well as adding rangewide GRSG objectives
MD 4070: Conduct habitat enhancement vegetation treatments within sagebrush communities as opportunities and funding allow, consistent with EO 2015-4 (Wyoming Office of the Governor 2015).	No changes made.	Partially revised – to update EO referenced
MD 4071: Modify identified hazard fences, and analyze and construct new fences in accordance with wildlife needs, the BLM Fencing Handbook 1741-1, and WO IM 2010-022, *Managing Structures for the Safety of Sage-grouse, Sharp-tailed grouse, and Lesser Prairie-chicken*, and similar guidance and policy as updated over time.	No changes made.	Partially revised – revised by adding rangewide GRSG fence language
MD 4076: Allow water development projects in crucial elk winter range and in greater Greater Sage-Grouse nesting habitat with 10 inches or less annual precipitation only when adverse effects can be avoided, minimized and/or compensated based on site-specific analysis. Allow existing uses pending site-specific analysis on a priority basis.	No changes made.	Partially revised – revised by adding rangewide GRSG water development language

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4080: Avoid wind energy projects in big game crucial winter range and raptor concentration areas. Wind-energy development would be avoided in Greater Sage-Grouse PHMAs (Map 3-17), and not allowed unless it can be sufficiently demonstrated that the development activity would not result in declines of Greater Sage-Grouse PHMA populations. Sufficient demonstration of "no declines" should be coordinated with the WGFD and USFWS.	No changes made.	Partially revised – revised by addition of rangewide for GRSG portion of MD
MD 4087: Discourage the use of broad-spectrum insecticides where insect control is required. Target pest control toward key problem areas and schedule applications to be effective in minimum doses in Greater Sage-Grouse brood-rearing areas. Field Offices may implement treatments within Greater Sage-Grouse habitat utilizing RAATS protocols.	No changes made.	No change (same as 2015)
MD 4088: Avoid aerial pesticide spraying in favor of ground applications to minimize drift into non-target areas in Greater Sage-Grouse habitat unless benefits of treatments are likely to outweigh impacts.	No changes made.	No change (same as 2015)
MD 4089: Avoid applying pesticides to Greater Sage-Grouse breeding habitat during the nesting and early brood-rearing season (March 15 through June 30) to reduce the loss of food supply to chicks and avoid the chance of secondary poisoning unless benefits of treatments are likely to outweigh impacts.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4090: Maintain seeps, springs, wet meadows, and riparian vegetation in a functional and diverse condition for young Greater Sage-Grouse and other species that depend on forbs and insects associated with these areas. Consider management actions if desirable green vegetation associated with these wet areas is not available, accessible, or cannot be maintained with current livestock, wildlife, or wild horse use, and the impacts are outweighed by the improved habitat quality.	No changes made.	No change (same as 2015)
MD 4091: Restore Greater Sage-Grouse brood-rearing habitats in riparian/wetland areas.	No changes made.	No change (same as 2015)
MD 4092: Restore lost riparian functioning systems by repairing abnormally incised drainages to raise water tables and increase water storage and brood-rearing habitats within Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD 4093: Manage vegetation composition diversity and structure, as determined by ESD, or other methods that reference site potential, and WGFD protocols to achieve Greater Sage-Grouse habitat management objectives, in cooperation with stakeholders. Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to Greater Sage-Grouse habitat to determine if they should be restored to Greater Sage-Grouse or habitat of higher quality for Greater Sage-Grouse. If these seedings provide value in conserving or enhancing Greater Sage-Grouse habitats, then no restoration would be necessary. Assess the compatibility of these seedings for Greater Sage-Grouse habitat during the land health assessments. Burned areas within PHMAs would be restored to suitable habitat with consideration given to ESDs,	No changes made.	Partially revised– revised by addition of rangewide GRSG habitat objectives for GRSG portion of MD

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
reference sites, site potential and local variability. The BLM could bring in burned area rehabilitation and Burned Area Emergency Response teams who would work cooperatively with partners at the federal, state, and local levels to rehabilitate and restore Greater Sage-Grouse habitats in a manner consistent with the core habitat populations area strategy for conservation. DDCT reviews would be conducted in coordination with the WGFD Habitat Protection Program located in Cheyenne, Wyoming at the WGFD headquarters. Areas within PHMAs would be prioritized for restoration of Greater Sage-Grouse habitat beyond immediate response.		
MD 4094: Maintain sagebrush and understory diversity (relative to ecological site description) in crucial seasonal Greater Sage-Grouse habitats unless such removal is necessary to achieve Greater Sage-Grouse habitat management objectives. For example, thinning small patches of dense sagebrush may increase desirable forbs in early brood-rearing habitat.	No changes made.	No change (same as 2015)
MD 4095: Increase the composition and canopy cover of Wyoming big sagebrush, within existing nonnative grass seedings with less than 5 percent sagebrush canopy cover, to greater than or equal to neighboring sagebrush communities or historical levels. (See Shrubland-Salt Desert/Salt Bottom on Map 3-15; deeper soiled, and gentler sloped portions of the Shrubland-Salt Desert/Salt Bottom, colored in pink, would be those areas where sagebrush restoration efforts could be conducted.)	No changes made.	Partially revised – to update Map referenced
MD 4096: Investigate opportunities to increase sagebrush in lower precipitation zones.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4097: Plan and construct mining and mineral development activities, to the degree possible given state water rights, to minimize disturbances that would result in alterations to springs and riparian Greater Sage-Grouse habitat. Alternative water sources may be developed to replace natural sources that have been affected or destroyed during these development activities.	No changes made.	No change (same as 2015)
MD 4098: Treat constructed or non-natural water storage impoundments to control mosquito breeding (and the associated spread of West Nile virus), to prevent disease spread to Greater Sage-Grouse as necessary.	No changes made.	No change (same as 2015)
MD 4099: In cooperation with stakeholders, manage to promote the growth and persistence of native shrubs, grasses, and forbs needed by Greater Sage-Grouse for seasonal food and concealment.	No changes made.	No change (same as 2015)
MD 4100: In cooperation with stakeholders, design and locate fences so as not to disturb PHMAs. Increase the visibility of fences in these areas which have been identified as hazardous to flying Greater Sage-Grouse.	No changes made.	Partially revised – revised by adding rangewide GRSG fence language
MD 4101: Conduct fire management activities to minimize overall wildfire size and frequency in sagebrush plant communities where Greater Sage-Grouse habitat objectives are at risk. General priorities for habitat protection: Priority # 1 – Protection of Greater Sage-Grouse PHMAs. Priority # 2 – Wyoming big sagebrush communities outside Greater Sage-Grouse PHMAs and habitats recovering from disturbance within or adjacent to Greater Sage-Grouse PHMAs.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4102: Annually maintain FMPs to incorporate updated sagebrush habitat information as well as fire suppression priorities in sagebrush habitats. Incorporate fire management objectives for the management of sagebrush ecosystems into FMPs. Provide fire management objectives for sagebrush ecosystems to initial attack personnel at the beginning of each fire season.	No changes made.	No change (same as 2015)
MD 4103: Establish fuels treatment projects at strategic locations to minimize size of wildfires and limit loss of Greater Sage-Grouse habitat.	No changes made.	No change (same as 2015)
MD 4104: Reintroduce appropriate fire regimes to limit conifer encroachment into the sagebrush plant communities. Take into account invasive herbaceous species and Fire Regime Group and FRCC (measure of departure from historic fire regime) with treatments. Where possible, achieve a balance between treating areas that have significantly departed from the historic fire regime (Condition Class 3) and areas that are functioning within an appropriate fire regime (Condition Class 1).	No changes made.	No change (same as 2015)
MD 4105: Remove conifers encroaching into sagebrush habitats in a manner that considers tribal and cultural values. Prioritize treatments closest to occupied Greater Sage-Grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2 as defined in Miller et al. (2005). Refine the location of specific priority areas to be treated by utilizing site-specific analysis and principles like those included in the FIAT report (Chambers et. al. [2014]) and other ongoing modeling efforts to address conifer encroachment.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 4106: **Inside PHMAs Prohibit surface occupancy and surface-disturbing activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks. The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse (Map 3-17). **Outside PHMAs** Prohibit surface-disturbing and disruptive activities and apply a NSO restriction within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks (Map 3-17). Outside Greater Sage-Grouse PHMAs, the BLM's goal is to sustain important habitats that support core populations and to maintain lek persistence over the long term in sufficient proportions of the Greater Sage-Grouse population to facilitate movement and genetic transfer between core populations, including those found in adjacent states.	**Inside PHMAs** Prohibit surface occupancy and surface-disturbing activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped). **Outside PHMAs** Prohibit surface-disturbing and disruptive activities and apply a NSO restriction within a ¼-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) (Map 3-17). Outside Greater Sage-Grouse PHMAs, the BLM's goal is to sustain important habitats that support core populations and to maintain lek persistence over the long term in sufficient proportions of the Greater Sage-Grouse population to facilitate movement and genetic transfer between core populations, including those found in adjacent states. The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD 4152).	Partially revised (2019) – to update map referenced, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications)
MD 4107: **Inside PHMAs Prohibit disruptive activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks from March 15 to June 30 (81,281 acres). **Outside PHMAs** Prohibit disruptive activities on or within a ¼ mile radius of the perimeter of occupied Greater Sage-Grouse leks from March 15 to June 30 (3,157 acres). **Inside PHMAs** Prohibit surface-disturbing and/or disruptive activities from March 15 to June 30 to protect Greater Sage-Grouse breeding, nesting, and early	**Inside PHMAs** Prohibit disruptive activities on or within a 0.6-mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) from March 15 to June 30 (81,281 acres). **Outside PHMAs** Prohibit disruptive activities on or within a ¼ mile radius of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) from March 15 to June 30 (3,157 acres). **Inside PHMAs** Prohibit surface-disturbing and/or disruptive activities from March 15	Partially revised (2019) – to update acreage, update EO referenced, and reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications)

Protection of additional mapped winter	Partially revised (2019) – to update EO referenced, include SHMA, and to reference Fluid Mineral Appendix (updated to reflect rangewide and state-specific changes, including fluid mineral waivers, exceptions, and modifications) for winter concentration areas in PHMA

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
sage-grouse nesting in PHMAs and/or attending leks within PHMAs. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas. Evaluate and allow activities in unsuitable habitats within PHMAs in accordance with exception and modification criteria on a case-by-case basis. Protection of additional mapped winter concentration areas in GHMAs would be implemented only where winter concentration areas are identified as supporting biologically significant numbers of Greater Sage-Grouse nesting in PHMAs and/or attending leks within PHMAs. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas.	concentration areas in GHMA would be implemented where winter concentration areas are mapped and designated by the State of Wyoming. Appropriate seasonal timing restrictions and habitat protection measures would be considered and evaluated in consultation with the WGFD in all identified winter concentration areas. Where credible data support different timeframes for this seasonal restriction, dates may be expanded by up to 14 days prior to or subsequent to the above dates.	
MD 4109: **Density of Disturbances: In Greater Sage-Grouse PHMAs, the density of disturbance of energy or mining facilities would be limited to an average of one site per square mile (640 acres) within the DDCT, subject to valid existing rights (Appendix D, *Greater Sage-Grouse Habitat Management Strategy* (p. 271)). The one location and cumulative value of existing disturbances would not exceed 5 percent of habitat of the DDCT area. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the DDCT area using the DDCT process. Consolidate anthropogenic features from development and transmission on the landscape. Allow on a case-by-case basis high profile structures	**Density of Disturbances:** In Greater Sage-Grouse PHMAs, the density of disturbance of energy or mining facilities would be limited to an average of one site per square mile (640 acres) within the DDCT, subject to valid existing rights (2019 Wyoming GrSG ARMPA Appendix C, Greater Sage-Grouse Habitat Management Strategy). The one location and cumulative value of existing disturbances would not exceed 5 percent of habitat of the DDCT area. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the DDCT area using the DDCT process. Consolidate anthropogenic features from development and transmission on the landscape. Allow on a case-by-case basis high profile structures within Greater Sage-Grouse nesting habitat.	Completely revised – revised by rangewide and state-specific for surface disturbance cap Partially revised (2019) – to update Appendix referenced for density cap and to update WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse referenced

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
within Greater Sage-Grouse nesting habitat. Sagebrush Treatment: For vegetation treatments in sagebrush within PHMAs, refer to WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2011, as updated) and BLMWO IM 2013-128 (Sage-grouse Conservation Related to Wildland Fire and Fuels Management). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5 percent threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA populations or if they represent additional habitat loss or fragmentation. Treatments to enhance sagebrush/grasslands habitat for Greater Sage-Grouse would be evaluated based upon habitat quality and the functionality/use of treated habitats post-treatment. The BLM would work collaboratively with partners at the state and local levels to maintain and enhance Greater Sage-Grouse habitats. Seasonal restrictions would be applied, as needed, for implementing fuels management treatments according to the type of seasonal habitat present. Wildfire burns will be treated as disturbed if sagebrush is reduced below 5 percent unless there is an implementation plan outlining restoration efforts and 3 years of data showing a trend back to suitable habitat.	Sagebrush Treatment: For vegetation treatments in sagebrush within PHMAs, refer to WGFD Protocols for Treating Sagebrush to Benefit Sage-Grouse (WGFD 2015, as updated) and BLM WO IM 2013-128 (Sage-grouse Conservation Related to Wildland Fire and Fuels Management). These recommended protocols, subject to seasonal conditions of approval, would be used in determining whether proposed treatment constitutes a "disturbance" that would contribute toward the 5 percent threshold for habitat maintenance. Additionally, these protocols would be used to determine whether the proposed treatment configuration would be expected to have neutral or beneficial impacts for PHMA populations or if they represent additional habitat loss or fragmentation. Wildfire burns will be treated as disturbed if sagebrush is reduced below 5 percent unless there is an implementation plan outlining restoration efforts and 3 years of data showing a trend back to suitable habitat.	

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
*MD 4110: New project noise levels, either individual or cumulative, should not exceed 10 dBA (as measured by L50) above baseline noise at the perimeter of the lek from 6:00 pm to 8:00 am during the breeding season (March 1 to May 15). Specific noise protocols for measurement and implementation will be developed as additional research and information emerges.	Within PHMA (core only), new project noise levels, either individual or cumulative, should not exceed 10 dBA (as measured by L50) above baseline noise at the perimeter of the lek (or lek center if no perimeter is yet mapped) from 6:00 pm to 8:00 am during the breeding season (March 1–May 15). The authorized officer may grant an exception on a case-by-case basis subject to appropriate site-specific analysis, mitigation requirements, and consultation with the State of Wyoming and consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4) (see MD SSS 4). In coordination with the State of Wyoming, specific noise protocols for measurement and implementation will be developed as additional research and information emerges. These measures would be considered at the site-specific project level where and when appropriate.	Partially revised (2019) – to update EO referenced
MD 4111: Allow motorized vehicle use in Greater Sage-Grouse PHMAs consistent with other resource objectives. Manage new road construction in and adjacent to Greater Sage-Grouse habitat consistent with applicable restrictions on surface-disturbing and disruptive activities. Avoid construction of new or local collector roads (as defined in BLM Manual 9113 [BLM 2011d]) within 1.9 miles of the perimeter of occupied Greater Sage-Grouse leks within PHMAs. Prohibit all new roads within 0.6 miles of the perimeter of occupied Greater Sage-Grouse leks within PHMAs. Construct roads to minimum design standards needed for production activities.	Allow motorized vehicle use in Greater Sage-Grouse PHMAs consistent with other resource objectives. Manage new road construction in and adjacent to Greater Sage-Grouse habitat consistent with applicable restrictions on surface-disturbing and disruptive activities. Avoid construction of new or local collector roads (as defined in BLM Manual 9113 [BLM 2011d]) within 1.9 miles of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) within PHMAs. Prohibit all new roads within 0.6 miles of the perimeter of occupied Greater Sage-Grouse leks (or lek center if no perimeter is yet mapped) within PHMAs. Construct roads to minimum design standards needed for production activities.	No change (same as 2019)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
**MD 4112: In PHMAs, implement mitigation and minimization guidelines and required design features, including specific measures for Greater Sage-Grouse (refer to Appendix C, *Required Design Features and Best Management Practices* (p. 249)), as applicable and consistent with EO 2015-4 (Wyoming Office of the Governor 2015). Incorporate Greater Sage-Grouse specific measures into project proposals as required design features or mitigation for any authorized federal action, regardless of surface ownership.	No changes made.	Completely revised – revised by rangewide for mitigation Partially revised – to update Appendix referenced and update EO referenced for RDFs
MD 4113: In PHMAs, require the development of a wildlife resource monitoring and mitigation plan to address potential impacts from mineral development on wildlife populations and/or habitat on a case-by-case basis.	No changes made.	No change (same as 2015)
MD 4114: Use the following travel management criteria in PHMAs: • During subsequent travel management planning, all routes within PHMAs would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive Greater Sage-Grouse habitat. • During implementation-level travel planning, threats to Greater Sage-Grouse and their habitat would be considered when evaluating route designations and/or closures. • During subsequent travel management planning, routes within PHMAs that do not have a purpose or need would be considered for closure.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
• During subsequent travel management planning, routes within PHMAs that are duplicative parallel, or redundant would be considered for closure. • ● During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat. During subsequent travel management planning, consider limiting snow machine travel to designated routes or consider seasonal closures in Greater Sage-Grouse wintering areas from November 1 through March 31. • During subsequent travel management planning, routes in PHMAs not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only. • During subsequent travel management planning, prioritize restoration of routes not designated in a Travel Management Plan within PHMAs. • During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance Greater Sage-Grouse habitat when rehabilitating linear disturbances. • During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Use time of day limits (after 10:00 AM to 7:00 PM) to reduce impacts on Greater Sage-Grouse during breeding and nesting periods.		

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
*MD 4115: The Greater Sage-Grouse adaptive management plan provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. See Appendix D, *Greater Sage-Grouse Habitat Management Strategy* (p. 271) for more information on soft and hard triggers. Soft Triggers Response: Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation action or that unanticipated changes to populations or habitats have occurred that have the potential to place habitats or populations at risk. The soft trigger is any deviation from normal trends in habitat or population in any given year. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and DDCT evaluations. For population metrics, normal population trends are calculated as the 5-year running mean of annual population counts. BLM field offices, with the assistance of their respective land and RMP implementation groups, local WGFD offices, and local sage-grouse working groups will evaluate the metrics with the Adaptive	The Greater Sage-Grouse adaptive management plan provides regulatory assurance that unintended negative impacts to Greater Sage-Grouse habitat will be addressed before consequences become severe or irreversible. Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting Greater Sage-Grouse conservation objectives. With respect to Greater Sage-Grouse, all regulatory entities in Wyoming, including the BLM, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts. See 2019 Wyoming GrSG ARMPA Appendix C, Greater Sage-Grouse Habitat Management Strategy for more information on soft and hard triggers. 2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
Management Working Group on an annual basis. The purpose of these strategies is to address localized greater sage-grouse population and habitat changes byproviding the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold. Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short or long term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency (BLM) and the Adaptive Management Work Group will implement an appropriate response strategy to address causal factors not attributable to a specific project or to make adjustments at a larger regional or statewide level. Hard Trigger Response: Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers would be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact or set of impacts is having a negative effect. Within the range of normal population variables (5-year running mean of annual population counts), hard triggers shall be determined to take effect when two of the three metrics exceeds 60 percent of normal variability for the area under management in a single year, or when any of the three metrics exceeds 40 percent of normal variability for a 3 year time period within a 5-year range of analysis. A minimum of 3 consecutive years in a 5-year period is used to determine	metrics with the Adaptive Management Working Group on an annual basis. The purpose of these strategies is to address localized Greater Sage-Grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold. Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short or long term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. 2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
trends (i.e., years 1-2-3, years 2-3-4, years 3-4-5).	trends (i.e., years 1-2-3, years 2-3-4, years 3-4-5). Upon determination that a hard trigger has been tripped, the BLM will immediately defer issuance of discretionary authorizations for new actions within the Biologically Significant Unit for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the Adaptive Management Work Group will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment). The AMWG would define a process to review and reverse adaptive management actions once the identified causal factor is resolved (e.g., returning to previous management once objectives of interim management strategy have been met). In making amendments to this plan, the BLM will coordinate with the USFWS as BLM continues to meet its objective of protecting, restoring, and enhancing Greater Sage-Grouse habitat by reducing, minimizing or eliminating threats to that habitat. The hard and soft trigger data will be analyzed as soon as it becomes available after the signing of the ROD and then at a minimum, analyzed annually thereafter.	
MD 4142: Base future adjustments to the appropriate management level on monitoring information and multiple use considerations through development of and/or revisions to HMA Plans. Update HMA plans to include Greater Sage-Grouse objectives.	No changes made.	No change (same as 2015)

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
No similar action.	*MD 4151: The BLM will update its Greater Sage-Grouse habitat management areas, including biologically significant units (BSUs), in conjunction with the State of Wyoming's core areas, upon issuance of any Wyoming Governor's Executive Order revising or amending the core area boundaries and upon completion of appropriate NEPA analysis and process. The BLM will complete the appropriate NEPA documentation (including appropriate public comment) prior to adopting any revised core area boundaries (e.g., maintenance action or plan amendment, environmental assessment, etc.).	Partially revised – to change reference from BSUs to HAF multi-scale areas
No similar action.	*MD 4152: Specific to management for Greater Sage-Grouse, all RMPs are amended as follows: Adopt the State of Wyoming's Greater Sage-Grouse Compensatory Mitigation Framework to the extent consistent with federal law, regulations, and policy. In all Greater Sage-Grouse habitat, when authorizing third-party actions in designated Greater Sage-Grouse habitat, the BLM will seek to achieve the planning-level Greater Sage-Grouse management goals and objectives through implementation of mitigation and management actions, consistent with valid existing rights and applicable law. Under this Plan Amendment, management would be consistent with the Greater Sage-Grouse goals and objectives, and in conformance with BLM Manual 6840, Special Status Species Management. In accordance with BLM Manual 6840, the BLM will undertake planning decisions, actions and authorizations "to minimize or eliminate threats affecting the status of [Greater Sage-Grouse] or to improve the condition of [Greater Sage-Grouse] habitat" across the planning area.	Completely revised – revised by rangewide

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	Accordingly, before authorizing third-party actions that result in habitat loss and degradation, the BLM will complete the following steps, in alignment with the Governor of Wyoming's Executive Order 2015-4 (July 29, 2015): 1. Work jointly with the WGFD to evaluate projects and recommend mitigation in the form of avoidance and minimization. 2. The WGFD will determine if the State requires or recommends any additional mitigation – including compensatory mitigation – under State regulations, policies, or programs related to the conservation of Greater Sage-Grouse. 3. Incorporate state required or recommended mitigation into the BLM's NEPA decision-making process, if the WGFD determines that compensatory mitigation is required to address impacts to GRSG habitat as a part of State policy or authorization, or if a proponent voluntarily offers mitigation. 4. Analyze whether the compensatory mitigation (deferring to the appropriate State authority to quantify habitat offsets, durability, and other aspects used to determine the recommended compensatory mitigation action): • achieves measurable outcomes for Greater Sage-Grouse habitat function on a landscape scale as determined by WGFD that are at least equal to the lost or degraded values in accordance with the Governor of Wyoming's Executive Order 2015-4. • provides benefits that are in place for at least the duration of the impacts. • accounts for a level of risk that the mitigation action may fail or	

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	not persist for the full duration of the impact. 5. Ensure mitigation outcomes are consistent with the State of Wyoming's mitigation strategy and principles outlined in 2019 Wyoming GrSG ARMPA Appendix C, The Greater Sage-Grouse Habitat Management Strategy. The BLM has determined that compensatory mitigation must be voluntary unless required by other applicable law and in recognition that State authorities may also require compensatory mitigation (IM 2019-018, *Compensatory Mitigation*, December 6, 2018). Therefore, consistent with valid existing rights and applicable law, when authorizing third-party actions that result in habitat loss and degradation, the BLM will consider voluntary compensatory mitigation actions only as a component of compliance with a State mitigation plan, program, or authority, or when offered voluntarily by a project proponent. Project-specific analysis will be necessary to determine how a compensatory mitigation proposal addresses impacts from a proposed action. The BLM will cooperate with the State to determine appropriate project design and alignment with State policies and requirements, including those regarding compensatory mitigation. When the BLM is considering compensatory mitigation as a component of the project proponent's submission or based on a mitigation requirement from the State, the BLM's NEPA analysis would evaluate the need to avoid or minimize impacts of the proposed project and achieve the goals and objectives of this RMPA. The BLM will defer to the appropriate State authority to quantify habitat offsets, durability,	

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
	and other aspects used to determine the recommended compensatory mitigation action.	
MO LR:1.5: Effects of infrastructure projects, including siting, will be minimized using the best available science, updated as monitoring information on current infrastructure projects becomes available.	No changes made.	No change (same as 2015)
MD 6014: The Secretary's policy is, generally, not to dispose of public lands. However, FLPMA Sections 201 & 202 state the Secretary shall 'prepare and maintain on a continuing basis an inventory of all public lands and their resource and other values...' and '...develop, maintain, and, when appropriate, revise land use plans which provide by tracts or areas for the use of the public lands', respectively. Therefore, as mandated by FLPMA Sections 201 & 202, the following tract(s) of public land have been found to meet criteria for disposal in FLPMA Section 203 (Sales) and/or FLPMA Section 206 (Exchanges) during this land use planning effort (Appendix I, Land Disposal and Acquisition (p. 379); Map 3-21. The identification of a public land tract as having met FLPMA criteria for disposal is NOT, in itself, a decision to dispose of public lands. The process for disposing of public lands via FLPMA Section 203 or Section 206 is a lengthy multi-decisional process requiring a comprehensive site-specific analysis, survey, and follow-on decisions prior to a final decision being made by the Department of Interior. Disposal can include none, some, or all of the mineral estate as allowed by 43 CFR 2720 and FLPMA Section 209(b)(1). A mineral potential report would determine if a surface estate disposal includes none, some, or all of the mineral estate. (Map 3-21)	Retain approximately 2,048,905 acres of BLM-administered land. 52,080 acres of BLM-administered land are available for disposal by sale, exchange or other means (Map 3-21) (Appendix I, Land Disposal and Acquisition (p. 381)). Disposal can include none, some, or all of the mineral estate as allowed by 43 CFR 2720 and FLPMA Section 209(b)(1). A mineral potential report would determine if a surface estate disposal includes none, some, or all of the mineral estate. Lands classified as PHMAs and GHMAs for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, is in the public's best interest or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Consider exceptions where there is mixed ownership. Allow land exchanges for additional or more contiguous federal ownership patterns within PHMAs. For PHMAs with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. Consider pursuing a permanent conservation easement as a final preservation measure. For lands in GHMAs that are identified for disposal, the BLM will only dispose of such lands consistent	Partially revised (2019) – to update Map referenced, to update Appendix referenced, and to add SHMA

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
Lands classified as PHMAs and GHMAs for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands, including land exchanges, will provide a net conservation gain to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands, including land exchanges, will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Consider exceptions where there is mixed ownership. Allow land exchanges for additional or more contiguous federal ownership patterns within PHMAs. For PHMAs with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. Consider pursuing a permanent conservation easement as a final preservation measure. For lands in GHMAs that are identified for disposal, the BLM will only dispose of such lands consistent with the goals and objectives of this plan, including, but not limited to, the land use plan objective to maintain or increase Greater Sage-Grouse abundance and distribution. Note: All land actions to acquire or dispose of lands would require a site specific analysis under NEPA.	with the goals and objectives of this plan, including, but not limited to, the land use plan objective to maintain or increase Greater Sage-Grouse abundance and distribution. Note: All land actions to acquire or dispose of lands would require a site specific analysis under NEPA.	
**MD 6028: Designate ROW corridors as shown on Map 3-24. PHMAs are designated as avoidance areas for high voltage transmission line and pipeline ROWs. All authorizations in these areas must comply with the conservation measures outlined in this Approved RMP, including the RDFs and avoidance criteria presented in Appendix C, *Required Design Features and Best Management Practices* (p. 249). Consider agricultural and residential lines to be adequately mitigated for Greater Sage-Grouse if constructed at least 0.6 mile from the lek perimeter (or lek center if no perimeter is yet mapped) with appropriate timing constraints and constructed to the latest APLIC standards. These ROW authorizations will be subject to approval by the State Director. **Pipelines:** Allow new pipelines through PHMAs: (1) within an RMP corridor currently authorized for that use or designated through future RMP amendments; or (2) constructed in or adjacent to existing utilities (buried and aboveground) or roads. Pipelines constructed in RMP corridors or adjacent to existing utilities or roads will require completion of a DDCT analysis for baseline data collection, but the project is not required to meet the threshold of 5 percent. However, within 6 months of the completion of construction, the project proponent will provide the authorized officer with as-built drawings so that the total disturbance within PHMAs can be calculated annually.	

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6029: Manage 1,767,274 acres as ROW avoidance areas (Map 3-24). Manage PHMAs as ROW avoidance areas for new ROW or SUA permits (799,391 acres). Within PHMAs where new ROWs/SUAs are necessary, locate new ROWs/SUAs within designated RMP corridors or adjacent to existing ROWs/SUAs where technically feasible. Subject to valid existing rights, including non-federal land inholdings, locate new, required ROWs/SUAs adjacent to existing ROWs/SUAs or where impacts to Greater Sage-Grouse are minimized. Work with proponents to design ROW applications to protect Greater Sage-Grouse.	No changes made.	Partially revised – revised by adding rangewide GRSG ROW language
MD 6040: Allow temporary closures to motorized vehicle use in areas that pose public health and safety risks, and/or where resource damage is imminent. In PHMAs and GHMAs, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use). Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the	No changes made.	Partially revised – to include SHMA

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.		
MD 6054: Design recreational sites, recreation facility development, and recreational access to avoid riparian habitat areas or develop and manage them in a manner that minimizes effects on riparian habitats. Construction of recreation facilities within PHMA must conform with the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will require and ensure compensatory mitigation that provides a net conservation gain to the species.	Design recreational sites, recreation facility development, and recreational access to avoid riparian habitat areas or develop and manage them in a manner that minimizes effects on riparian habitats. Construction of recreation facilities within PHMA must conform to the avoidance and minimization measures of this plan. If it is determined that these conservation measures are inadequate for the conservation of Greater Sage-Grouse, the BLM will consider mitigation consistent with the applicable State management strategy (currently Governor of Wyoming's Executive Order 2015-4 (see also MD 4152).	Partially revised – to update mitigation reference
**MD 6198: In cooperation, consultation, and coordination with permittees/lessees, cooperators, and interested public, develop and implement appropriate livestock grazing management actions to enhance land health, improve forage for livestock, and meet other multiple use objectives by using the *Wyoming Guidelines for Livestock Grazing Management*, other appropriate BMPs (see Appendix C, *Required Design Features and Best Management Practices* (p. 249)), and development of appropriate range improvements. The BLM will prioritize (1) the review of grazing	In cooperation, consultation, and coordination with permittees/lessees, cooperators, and interested public, develop and implement appropriate livestock grazing management actions to enhance land health, improve forage for livestock, and meet other multiple use objectives by using the Wyoming Guidelines for Livestock Grazing Management, other appropriate BMPs (see 2019 Wyoming GrSG ARMPA Appendix B, Required Design Features and Best Management Practices), and development of appropriate range improvements. The BLM will	Completely revised – revised by rangewide

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on allotments containing riparian areas or wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., wildfire) and legal obligations. The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under EO 2013–3 (Wyoming Office of the Governor 2013), to 1) develop appropriate conservation objectives; (2) defined a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-specific actions to achieve Greater Sage-Grouse conservation objectives within the framework.	prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in PHMAs. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (e.g., wildfire) and legal obligations. The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under EO 2013–3 (Wyoming Office of the Governor 2013), to 1) develop appropriate conservation objectives; (2) defined a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-specific actions to achieve Greater Sage-Grouse conservation objectives within the framework.	
*MD 6202: Utilize a rangeland health assessment, resource monitoring, or analysis to determine if livestock grazing adjustments in amounts, kinds, or season are necessary. The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on Greater Sage-Grouse Habitat Objectives Table (Table 2.7, "Greater Sage-Grouse Seasonal Habitat Objectives" (p. 22)) and Land Health Standards (43 CFR 4180.2) and one or more defined	Within PHMA, if monitoring data show the wildlife/special status species standard has not been met nor progress being made toward meeting that standard, there would be an evaluation and a determination made as to the cause. If it is determined that the current authorized livestock use is a significant causal factor in failing to achieve the wildlife/special status species standards, the BLM would address the achievement or progress toward achieving the LHSs (43 CFR 4180.2) and, if needed,	Completely revised – revised by rangewide

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis. Greater Sage-Grouse Habitat Objectives Table (Table 2.7, "Greater Sage-Grouse Seasonal Habitat Objectives" (p. 22)), Land Health Standards (43 CFR 4180.2) and ecological site potential, and one or more defined responses that will allow the authorizing officer to make adjustments to livestock grazing that have already been subjected to NEPA analysis.	Greater Sage-Grouse habitat maintenance or improvement. When NEPA analysis is required for a specific implementation action, one alternative would include mechanisms to make adjustments to meet or make progress toward meeting the wildlife/special status species standard. The analysis should also identify the BLM-approved data collection methodologies used for monitoring conditions and determining when adjustments are necessary. If current grazing management meets land health standards and provides for Greater Sage-Grouse habitat, there would be no need to analyze an alternative for Greater Sage-Grouse. Authorized uses in PHMA that incorporate habitat objectives for Greater Sage-Grouse must develop desired conditions based on Greater Sage-Grouse habitats present in the allotment and the ecological potential of sites that supports these habitats. Metrics used to monitor for objectives must be developed and inform the wildlife/SSS portion of the Standards for Healthy Rangelands. Within PHMA, seasonal habitat objectives for Greater Sage-Grouse apply only to those habitats delineated within an allotment during the specific season (e.g., breeding season objectives during breeding season). Data needed to inform the relationship between the authorized use and habitat condition would come from sample locations that appropriately reflect the impact of the authorized use on habitat conditions. Data points should fall within Greater Sage-Grouse seasonal habitat areas and be collected on ecological sites that have the potential to produce Greater Sage-Grouse habitat.	

2015 Approved RMPs	2019 BLM GRSG Approved RMP Amendments	Type of Change to Existing Management Direction in the Proposed RMP Amendment Proposed Plan
MD 6214: Allotments within PHMAs, focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.	No changes made.	No change (same as 2015)

2.20.2 Relevant Appendices

The following table shows which appendices from the 2015 and 2019 plans have management direction that would change by the Proposed RMP Amendment. If 2019 is not listed in the year, then no change was made to the appendix between the 2015 and 2019 plans. The 2015 Appendices can be found on the Bighorn Basin RMP ePlanning website. The 2019 Appendices can be found on the Wyoming GRSG ePlanning website.

ARMPA Appendix Name	Year	Type of Change to Existing Appendix Language in the Proposed RMP Amendment
A: Maps	2015	Completely Revised-revised by rangewide
A: Approved RMP Amendment with Management Goals, Objectives, and Decisions	2019	Partially Revised based on changes in Proposed RMP Amendment
B: Oil and Gas Lease Notices and Lease Stipulations; including Exception, Modification, and Waiver Criteria	2015	Partially Revised- Applies rangewide exceptions, modifications, and waivers
C: Required Design Features and Best Management Practices	2015, 2019	Partial change – no change (same as 2019) except the addition of livestock grazing BMPs
D: Greater Sage-Grouse Habitat Management Strategy	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
C: Greater Sage-Grouse Habitat Management Strategy	2019	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
F: Wyoming Bureau of Land Management Mitigation Guidelines for Surface-Disturbing and Disruptive Activities	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
G: Federal Oil and Gas Operations on Split-Estate Lands	2015	No change (same as 2015)
H: Monitoring and Evaluation	2015	Partially revised – revised by adding rangewide GRSG monitoring language
I: Land Disposal and Acquisition	2015	No change (same as 2015)
J: Recreation Management	2015	No change (same as 2015)
L: Implementation	2015	Partially Revised to incorporate applicable changes from Proposed RMP Amendment
M: Bighorn Basin Air Resource Management Plan	2015	No change (same as 2015)
N: Seasonal Raptor Stipulations for All Surface-Disturbing and Disruptive Activities	2015	No change (same as 2015)
O: Livestock Grazing	2015	No change (same as 2015)

Greater Sage-Grouse Habitat Management Area State-by-State Mapping Strategies

This page intentionally left blank.

Appendix 3. Greater Sage-Grouse Habitat Management Area State-by-State Mapping Strategies

This appendix describes the BLM's GRSG habitat management area approach and state specific mapping strategies that were utilized in identifying habitat management areas (HMAs). The BLM identifies two primary rangewide habitat management areas, Priority Habitat Management Areas (PHMA) and General Habitat Management Areas (GHMA). Many individual BLM states also identify state-specific HMAs that respond to local habitat variation and management needs within those states. This appendix provides a description of the rangewide and state specific habitat management areas and the manner in which they have been updated as part of this RMP Amendment effort.

New spatial information published since 2015 provided data used in the revision of habitat management area boundaries to provide for increased conservation of GRSG. This information included GRSG habitat persistence (Wann et al., 2022), habitat and genetic connectivity (Cross et al., 2018, Row et al., 2018, Cross et al., 2022, Oyler-McCance et al., 2022), GRSG distribution (Doherty et al., 2016, Coates et al., 2021) and likelihood of sagebrush habitat persistence under changing climatic conditions (Palmquist et al., 2021, Rigge et al., 2022). The BLM reviewed this new data and coordinated with state wildlife agencies to propose adjustments to the habitat management areas to enhance GRSG conservation as a component of the RMP Amendment effort. Some states (OR, NV, WY) were already in the process of updating habitat management area delineations based on local data and the BLM worked closely with these states to consider all data in these revisions.

3.1 RANGEWIDE HABITAT MANAGEMENT AREAS

3.1.1 Priority Habitat Management Areas (PHMA)

PHMAs have the highest value to maintaining sustainable GRSG populations and can include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors. The BLM intent for these areas is to maintain and enhance habitat conditions that will support persistent and healthy GRSG populations through management to minimize habitat loss and degradation.

In response to cooperating agency and public comments and internal review of the effects of the Draft RMPA/EIS alternatives on GRSG and GRSG habitat, the BLM has identified areas within PHMA that will receive increased protections and these areas are referred to as PHMA with limited exceptions.

PHMA with Limited Exceptions

PHMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats.

Process and Criteria Used for Identifying PHMA with Limited Exceptions

The BLM received multiple comments across a broad spectrum of the public and cooperating agencies raising concerns about the impacts of renewable energy, fluid mineral, and rights of way development in GRSG habitats, including application of exceptions. In response, the BLM determined it would be appropriate to apply solar and wind development exclusion with exceptions in PHMA based on the rangewide nature of this development threat. The BLM further reviewed areas of habitat connectivity and population strongholds

to determine if additional protections would be necessary. The BLM focused this review primarily in the potential ACECs identified in Alternatives 3 and 6 due to the rigorous process that went into identifying these areas with relevant and important GRSG values. (The BLM considered all available data and multiple lines of information at multiple spatial scales to determine what, if any areas met relevance and importance criteria for ACEC designation. The incorporation of local information, and considerations of data accuracy and scale of application were carefully reviewed to identify potential areas of high value or concern related to GRSG use and conservation. Refer to Appendix 5 for greater detail on identifying potential ACEC areas).

In considering whether additional protections beyond those provided by the exclusion with exceptions to solar in wind development proposed in PHMA were necessary; the BLM considered the remaining risks that might still exist related to renewable energy, fluid mineral, and rights of way development. The review identified areas within existing PHMA (referred to as PHMA with limited exceptions) to be managed as exclusion areas for solar and wind development with no exceptions, no surface occupancy for fluid minerals with no exceptions, and exclusion areas for major rights-of-way with limited exceptions. Limiting the number of exceptions from management measures already in use for PHMA did not justify giving these areas a separate designation but rather recognizing they are areas within PHMA that require a limited amount of further protection. In addition, since the changes in management were consistent across the range, the areas were less suited to an ACEC designation, which are generally tailored to different values and locations.

Following is a state-by -state summary of the areas identified:

Colorado: The area identified as the Case Flat potential ACEC in Alternatives 3 and 6 was identified as requiring limited exceptions to PHMA protections due primarily to the threat from fluid mineral development. This 4,547-acre area provides a unique wintering habitat that supports the population in North Park, Colorado (refer to Appendix 5 for more information).

Idaho: The area identified as the Shoshone Basin potential ACEC in Alternatives 3 and 6 was identified as requiring limited exceptions to PHMA protections due primarily to the threat from major rights of way and wind energy development. The 257,472-acre Shoshone Basin area is contiguous with the North Fork O'Neil Nevada population, one of the largest intact habitat areas in that state. By providing the additional protections from major rights of way and renewable energy development, Shoshone Basin allows for seamless conservation across state lines and supports the population of GRSG that use both areas (refer to Appendix 5 for more information).

Montana: The area identified as South Valley Phillips potential ACEC in Alternatives 3 and 6 was identified as requiring limited exceptions to PHMA protections due to noteworthy genetic connectivity/value and population density, coupled with a relatively high proportion of federal ownership compared to the rest of Management Zone 1. In addition, the 615,888-acre South Valley Phillips area is an intact sagebrush landscape adjacent to other protected federal lands (notably Charles M. Russell National Wildlife Refuge) and provides the wintering habitat for GRSG migrating in from north of the Milk River, including Canada, maintaining the persistence of those birds, which are listed as endangered in Canada (refer to Appendix 5 for more information).

Nevada/California: The areas identified as Warm Springs, North Fork O'Neil, Owyhee East[1], Grass-Kobe Valley, South Fork Dixie Flats, Idaho Border, Hays Canyon, Vya-Massacre, and Buffalo Skedaddle potential

[1] As the two areas are adjacent, the Owyhee East potential ACEC area was incorporated into the North Fork O'Neil PHMA with limited exceptions area in the Proposed RMP Amendment.

ACECs in Alternatives 3 and 6 were identified as requiring limited exceptions to PHMA protections due primarily to the threats from major rights of way and renewable energy. Following are the acreages of each of the PHMA with limited exception areas: Warm Springs (89, 539 acres), North Fork O'Neil (1,546,044 acres), Grass-Kobe Valley (488,972 acres), South Fork Dixie Flats (133,406 acres), Idaho Border (49,140 acres), Hays Canyon (350,502 acres), Vya-Massacre (305,529 acres), Buffalo Skedaddle (190,800 acres). GRSG habitat is naturally fragmented by Nevada's basin and range geology. These areas represent remaining intact sagebrush habitat with minimal anthropogenic disturbance. Significant habitat losses due to wildfire and challenging restoration due to the low elevation, dry climate make conserving these remaining intact landscapes a conservation priority (refer to Appendix 5 for more information).

Oregon: The existing 32,952-acre High Lakes ACEC was identified as requiring limited exceptions to PHMA protections due primarily to the threats from major rights of way and renewable energy development. The additional restrictions in High Lakes for GRSG will also help maintain the sagebrush landscape integrity in that area, which supports dense populations of GRSG and other sagebrush associates such as pronghorn (refer to Appendix 5 for more information).

Utah: No areas were identified as requiring additional protections beyond those provided by PHMA management direction in the Proposed RMP Amendment.

Wyoming: The area identified as the Little Sandy/Golden Triangle ACEC in the Draft RMPA/EIS was identified as requiring limited exceptions to PHMA protections due to the unique ecological qualities, limited existing invasive annual grasses and anthropogenic infrastructure, and the threat of fluid mineral development. The 272,557-acre Little Sandy/Golden Triangle area is a large expanse of intact sagebrush that supports portions of the densest population of GRSG across its entire range. This area also provides important habitat for other sagebrush associated species, including elk, pronghorn and mule deer with known migration routes through this area (refer to Appendix 5 for more information).

3.1.2 General Habitat Management Areas (GHMA)

GHMAs are lands that are or have the potential to become occupied seasonal or year-round habitat outside of PHMA, managed to sustain GRSG populations. These areas are defined differently by state wildlife management agencies, but generally are of poorer GRSG habitat quality with reduced occupancy when compared to PHMA. Some state wildlife agencies have identified areas of GHMA as important for restoration, connectivity, or seasonal habitats, and most require mitigation for unavoidable impacts within this designation. The intent for GHMA is to maintain habitat conditions to support GRSG populations consistent with the state agency designations of recovery, connectivity, or seasonal habitats.

3.2 COLORADO

The BLM has incorporated Habitat Management Area (HMA) boundaries submitted by Colorado Parks and Wildlife (CPW) into the mapping efforts for the Greater Sage-Grouse Resource Management Plan Amendment effort. BLM Colorado relies on CPW's expertise as the state wildlife agency to map greater sage-grouse (GRSG) habitat using the best available science. The revised habitat Priority Habitat Management Area (PHMA) and General Habitat Management Area (GHMA) boundaries currently represent the best-known habitat delineations of GRSG habitat in Colorado.

The definitions of PHMA and GHMA have not changed since initially defined in the 2015 ARMPA. PHMAs have been identified as having the highest conservation value to maintaining sustainable GRSG populations. They include breeding, late brood-rearing, and winter concentration areas. The BLM has identified these areas in coordination with CPW. GHMAs are areas of seasonal or year-round GRSG habitat outside of

priority habitat. The BLM has identified these areas in coordination with CPW. In Colorado, the BLM and CPW incorporate an additional category, Linkage Management Areas (LMA) which were previously referred to as Linkage Connectivity Habitat Management Areas (LCHMAs) in the 2015 and 2019 ARMPAs. LMAs have been identified as broader regions of connectivity important to facilitate the movement of GRSG and maintain ecological processes, though they are not considered occupied habitat (Colorado Greater Sage-grouse Steering Committee, 2008). The BLM has removed the terms 'connectivity' and 'habitat' from the classification to reduce confusion with other applications of the term connectivity. Similarly, these areas are not considered occupied habitat though they might still contain sagebrush or associated vegetation communities that could serve as stop over points for grouse moving between populations. More information on the background and mapping methodology for LMAs can be found in the Colorado Sage-Grouse Conservation Plan (Colorado Greater Sage-grouse Steering Committee, 2008).

Prior to the current planning process, the BLM and CPW adopted refined HMA maps based on the modeling efforts of Olsson Consultants on behalf of the Associated Governments of Northwest Colorado (DOI-BLM-CO-S000-2020-0003-CX). The multi-year (2016-2019) collaborative mapping process refined the previously mapped areas to remove non-habitat in HMAs or expand areas with documented GRSG use. The 2019 re-mapping effort incorporated state-specific, timely research and mapping tools. For the full methodology, see Olsson Project No. 016-516 (2019).

The refined HMA (2019) dataset was created by preparing fine-scale population-specific Species Distribution Models (SDMs) to map revised PHMA and GHMA areas for each of the six GRSG populations within the current occupied range of Colorado. First, known presence locations of marked GRSG were used to train Random Forest and Resource Selection Function (RSF) models to estimate seasonal (e.g., breeding, summer-fall and winter) habitat suitability. Secondly, the seasonal model results were classified into high or low habitat suitability categories and subsequently compiled to produce a year-round habitat suitability map. Third, the resulting year-round habitat suitability maps were used to develop revised PHMA and GHMA areas for each population. All areas classified as highly suitable habitat in each population's year-round classified habitat layer were classified as PHMA, while the remaining low habitat suitability areas were classified as GHMA. Finally, the current occupied range for each population was modified to exclude areas identified as unsuitable habitats (Olsson 2019). CPW reviewed the dataset and made minor modifications to include areas outside of previously mapped occupied range where evidence of GRSG occupancy exists. The BLM made slight modifications to the dataset by incorporating a minimum mapping unit and snapping the GIS layers to the state boundary. The 2019 mapping update did not model or adjust LMA boundaries.

During the current planning effort, the BLM coordinated with CPW to review the previous HMA compared to new data that became available since 2015. The BLM and CPW also coordinated with the wildlife agencies from Wyoming and Utah to determine if there was relevant cross-border information. The BLM and CPW revised two areas in the Northwest CO population to incorporate new (2017-2022) lek count data and to incorporate GRSG location data provided by Utah Division of Wildlife Resources. The updates resulted in approximately 49,000 acres of previously mapped GHMA becoming PHMA and 1,400 acres of previously unmapped areas becoming GHMA.

Alternative 1 uses the refined HMA (2019) dataset that was incorporated into the 2015 Northwest Colorado GRSG ARMPA via plan maintenance action. Alternative 2 uses the previous HMA dataset that was originally used for the 2015 and 2019 ARMPAs. Because of the timing of the preliminary injunction for the 2019 ARMPA, the BLM only applied the maintenance action and updated maps to the 2015 ARMPA.

Alternatives 4, 5, and 6 incorporate the most recent lek count and telemetry data from both Colorado and adjacent states. Based on these data, approximately 49,000 acres of previously mapped GHMA would be classified as PHMA and 1,400 acres of previously unmapped areas would be classified as GHMA. Both changes occur in the Northwest Colorado population. They difference between alternative 1 and alternatives 4, 5, and 6 is a 4.2% increase of PHMA in Northwest Colorado resulting in a 2.6% increase of PHMA in all of Colorado. The portion of previously unmapped area that would be classified as GHMA represents a 0.05% increase of total habitat management area extent in the Northwest Colorado population.

Alternative 3 represents the total habitat management area extent of alternatives 4, 5, and 6 but PHMA and GHMA would both be classified as PHMA. Alternative 3 includes the 1,400 acres of previously unmapped area in the Northwest Colorado population and therefore has a larger spatial extent than Alternative 1.

Compared to all other alternatives, alternative 2 includes the highest acreage because many of the interior areas of non-habitat had not been removed. However, there are some areas where the most recent data indicate GRSG use that would not be captured by the alternative 2 HMAs. Using the HMAs in alternative 2 would require more on-the-ground verification and more plan criteria that addresses non-habitat. Alternatives 1, 4, 5, and 6 still require implementation-level verification but represent a more accurate depiction of GRSG habitat in Colorado. Alternatives 3, 4, 5, and 6 incorporate the most recent GRSG data.

The Proposed RMP Amendment is nearly identical to the HMA delineations for Alternatives 4, 5, and 6 with minor differences. CPW, based on information provided by Utah Division of Wildlife Resources, provided the BLM with more refined GHMA layers for the expanded mapped area in Northwest Colorado which increased the mapped GHMA extent by approximately 200 acres. In addition, approximately 500 acres of GHMA were converted to PHMA in the North Park population due to inclusion of a known, mapped winter concentration area with high conservation value. This reclassification is consistent with the definition of PHMA above.

3.3 IDAHO

BLM Idaho reviewed and revised HMAs for Alternatives 3, 4, 5, and 6 due to the availability of new data on GRSG, vegetation, and new range wide science on GRSG. BLM Idaho worked closely with Idaho's Governor's Office of Species Conservation (OSC), the Idaho Department of Fish and Game (IDFG), and other cooperating agencies during the review and revisions. First, IDFG worked to revise the extent of HMA based on biology, i.e. GRSG observations and habitat. Second, BLM Idaho reviewed HMA revisions as well as new range wide science and made HMA designations based on the 2015 Idaho-Southwest Montana Approved Resource Management Plan Amendment (ARMPA) for Alternatives 3 and 4. Third, the State of Idaho (OSC, IDFG) independently reviewed 2015 HMAs and new information including the modified HMA extent from Alternatives 3 and 4 and solicited input from stakeholders and other state agencies. The state provided BLM Idaho an initial draft in early May and a final draft in late September, taking into account the above input and assigning HMA designations based on definitions from the Idaho 2021 Plan (State of Idaho 2021). The BLM used the State of Idaho's final draft for HMA designations for Alternative 5 without modification and for Alternative 6, with the BLM's addition of ACECs within PHMA.

3.3.1 Data Sources

Data sources used during HMA review and revisions for all alternatives included:

- **GRSG observations and population data:**
  - Lek survey data
  - Idaho breeding bird density (IDFG 2020)

  - GPS and VHF radiotelemetry studies, including individual movements and connectivity areas between seasonal ranges
  - Other reliable observations of unmarked birds since 2000 (e.g. incidental observations during targeted sage-grouse surveys and big game aerial surveys, falconry reports)
- **GRSG habitat models:**
  - General Habitat Suitability Index (HSI; seasons pooled) (IDFG 2018, 2019a)
  - Winter habitat suitability model (IDFG 2019b)
  - Late Brood-rearing (LBR) habitat suitability model (IDFG 2019b)
  - Spring habitat suitability model (IDFG 2019b)
  - GRSG breeding habitat (Doherty et al. 2016)
  - Craters of the Moon (CRMO) Sage-Grouse Habitat (Univ of Idaho and NPS 2018)
- **Remote sensing habitat models:**
  - Sagebrush cover (Rangeland Condition Monitoring Assessment and Projection [RCMAP] 2020, 2021)
  - Tree canopy cover (Rangeland Analysis Platform [RAP] 2021; Allred et al. 2021)
  - Annual grass cover (RCMAP 2020)
- **Other data:**
  - Fire history; perimeters through 2021 (BLM, NIFC data)
  - Visual interpretation of ortho-imagery (e.g., 2021 NAIP [OCM Partners 2023], Google Earth imagery)
  - Anthropogenic features from the Idaho Sage-grouse Habitat Quantification Tool

Additional data sources used for Alternative 4 included:

- **New range wide science on GRSG**
  - GRSG breeding bird density (Doherty et al. 2016)
  - GRSG lek persistence (Wann et al. 2023)
  - Genetic connectivity (Row et al. 2018, Cross et al. 2023)
  - Sagebrush Conservation Design tool (Doherty et al. 2022)

3.3.2 Methods

HMA Background for Alternatives 3, 4, 5, and 6

First, IDFG revised the extent of HMA using the 2015 HMA as a base map and revised HMA based on direct evidence of habitat use (i.e., locations of observations) or a body of evidence that predicts GRSG space use irrespective of land ownership. Habitat was delineated using the best available science from the data sources listed above.

HMA Additions. In general, HMA was added if an area met one or more of the following criteria: documented GRSG observations, ≥ 3 models predicted suitable habitat, known winter or summer seasonal distributions, suitable (≥ 8%) sagebrush cover, and low (< 30%) tree canopy cover. With few exceptions, additions were located within a 10-km buffer of occupied and pending leks (i.e., 2022 management status). This criterion was a means to exclude seemingly good sagebrush habitat that appeared to be unoccupied.

HMA Subtractions. Areas that were subtracted from the 2015 HMA map generally lacked GRSG observations, had low habitat model agreement (< 3 models), low sagebrush cover and/or high tree canopy cover and annual grass cover (> 20%). Non-habitat areas were generally removed from the margins, whereas some

small gaps of non-habitat within existing HMAs were filled, particularly if near GRSG observations. Occupied areas subject to more recent disturbance were not subtracted, particularly if they were expected to recover naturally or through restoration and are adjacent to quality habitat.

A concerted effort was made to consistently represent habitat across the state, and rationales were developed to justify additions and subtractions. Local experts were consulted as needed. The new 'biology map' was used for the HMA extent for Alternatives 3 and 4 and an early draft of Alternatives 5 and 6.

HMA for Alternative 4

For HMA designations under Alternative 4, BLM Idaho evaluated the GRSG biology map's proposed additions and subtractions, and the new range wide science on GRSG and designated HMA based on the 2015 ARMPA definitions:

PHMA (Priority): Areas identified as having the highest value to maintaining sustainable GRSG populations. Areas of PHMA largely coincide with areas identified as priority areas for conservation in the United States Fish and Wildlife (USFWS) Conservation Objectives Team (COT) report. These areas include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors.

IHMA (Important): Areas that provide a management buffer for PHMA and connect patches of PHMA. IHMA encompass areas of generally moderate to high conservation value habitat and populations but that are not as important as PHMA.

GHMA (General): Areas where some special management will apply to sustain GRSG populations; areas of occupied seasonal or year-round habitat outside of PHMA or IHMA.

Efforts were made to protect PHMA by a) avoiding isolating or fragmenting large blocks of PHMA, and b) applying new rangewide science, i.e. lek persistence, breeding bird density, genetic connectivity. To focus on areas with high conservation value based on the new science, BLM Idaho combined the following data layers: lek persistence (medium or high; Wann et al 2022), breeding bird density (50 and 25 relative percentage of the population and the highest densities of breeding birds; Doherty et al. 2016); and genetic connectivity (> 90% or > 95%; Cross et al. 2023). This resulted in a raster layer with values ranging from 0 to 6. Any areas classified as 3 or higher by this model were compared with the existing HMA designation. If these areas were not in PHMA, new polygons were drawn, generally following the extent of values ≥ 4, or corresponding to either two of the three layers (lek persistence, breeding bird density, Priority Genetic Pathways). In some instances, the polygon boundary was refined with information from the Key Habitat map or aerial imagery. Areas with high tree cover (≥ 30%) or high annual grass cover (≥ 20%) were excluded from additional areas of high conservation value and were not added to PHMA.

HMA for Alternative 5

For this alternative, the BLM used HMA boundaries for GRSG provided by the State of Idaho for consideration in the LUP effort. This map was created by the IDFG and OSC to assist the BLM in their land use planning effort initiated in 2021 (86 FR 66331).

Consistent with the other alternatives, the state's map for alternative 5 adopts a 3-tiered habitat zoning strategy – PHMA, IHMA, and GHMA - to represent a management continuum strategy for GRSG conservation (see the 2021 Idaho Plan for more details, available at https://species.idaho.gov/wildlife-species/greater-sage-grouse/).

This HMA map was based on IDFG's "Biology Map" (version 03/08/2023), which describes GRSG habitat extent (i.e., space use) in Idaho, with the BLM's 2019 GRSG HMA applied. Between draft and final HMA maps, the State of Idaho refined the HMA extent further. HMAs were updated using new science and state policy direction. HMA types reflect breeding bird density (indexed by male lek attendance), habitat quality (suitability, the extent, configuration, and degree of fragmentation), GRSG occupancy and movements patterns. Data sources used are those listed under GRSG observations, Habitat suitability models, and remote sensing habitat models (see details listed above).

In general, PHMA encompassed high and medium-high BBD (25-50%), large areas of intact, habitat (medium and high HSI, high sagebrush cover (>8%), low tree canopy cover (<30%), and low annual herbaceous cover (<20%)), important connectivity and seasonal habitat, especially winter, as evidenced by telemetry locations, and a lack of disturbance (e.g., fire, anthropogenic features). IHMA serves to connect and buffer PHMA and encompassed slightly lower quality and/or more fragmented habitat, with lower BBD (50-100%). GHMA encompassed more marginal habitat outside of PHMA and IHMA, with the lowest BBD (100% or outside the 10km occupied lek buffers) and more limited sage-grouse space use.

When information was lacking, best professional judgments were made. There were a few exceptions to these general rules concerning policy (e.g., special community values) and land ownership. Other science products were referenced, e.g., lek persistence, landscape importance, sagebrush ecological integrity, and genetic connectivity models, but these were not primary decision support tools.

HMA for Alternative 6

For this alternative, the HMA boundaries were the same as for Alternative 5. Though BLM used this as the starting point, Alternative 6 also mapped ACECs (see Appendix 5).

HMA for the Proposed RMP Amendment

HMA for the Proposed RMP Amendment is as the HMA under Alternative 5, except for two polygons in Custer County. Both of these areas (west of Thousand Springs Valley and Sage Creek; and along the valley of the Big Lost River) were mapped as GHMA under Alternative 5. After additional review, it was determined that these areas provide important connectivity areas between PHMA to the north and south; therefore, these polygons were mapped as IHMA under the Proposed RMP Amendment.

3.3.3 Montana/Dakotas

In the Montana-Dakotas portion of their range, GRSG are found in southwestern Montana and across eastern Montana from the Canadian to the Wyoming border, as well as in northwestern South Dakota, and southwestern North Dakota. In Montana, there are about 1,000 confirmed active GRSG leks, out of 1,892 known lek locations (MT FWP 2022). The number of confirmed active leks has grown since 2002 as survey efforts have identified new leks and have been able to identify the status of unconfirmed leks. The Dakotas are on the far eastern edge of GRSG range and the two states' populations are considered at a higher risk of extirpation because of their small numbers and isolation. GRSG in the Dakotas form a population connected to areas in eastern Montana and northeast Wyoming, though it is unclear how many birds move between the states (Cross et al. 2016, Row et al. 2018, Oyler-McCance et al. 2022). In addition, GRSG may reside near (within a handful of miles) their spring breeding grounds, leks, or undertake migratory movements between seasonal habitats. Differences between seasonal movements across the range may be driven by weather, juxtaposition of seasonal habitats, and other factors. Therefore, to account for differences between states and GRSG populations, the strategy for identifying HMAs, in cooperation with state natural resource entities, varies both among the three states, and across Montana.

In Montana, the Governor's Executive Order (EO) 12-2015 delineated core areas, general habitat, and connectivity habitat. Core areas capture the leks for 75-80% of displaying males and associated breeding and other seasonal habitats. These areas are considered the highest conservation priority. General Habitat, therefore, contains about 1/5 of the displaying males and is also an important component. The EO states, "Development scenarios in General Habitat are more flexible than in Core Areas, but should still be designed and managed to maintain populations, habitats, and essential migration routes, since this Conservation Strategy requires habitat connectivity and movement between populations in Core Areas." The Montana EO also identifies connectivity habitat, specifically a corridor where birds move from spring and summer areas close to the Canadian border to wintering areas farther south in Valley County.

Conversely, both North and South Dakota use a different approach than Montana to account for fewer leks, small populations sizes, and being found on the periphery of the range. Both states included all active leks (known breeding population) in their core areas. In South Dakota, active leks were buffered by 4 mi (6.4km) and in North Dakota 5.3m (8.5km) to capture breeding areas and habitat (SD GF&P 2022, NDG&F 2014). Then these buffered areas were refined to account for large areas of non-habitat, bird location information, resource selection functions, and expert opinion (along with collaboration with neighboring states and the BLM). In 2022, the State of South Dakota Game, Fish, and Parks released a new GRSG Action Plan with update core areas accounting for new GRSG movement data.

In the 2015 GRSG Plans in MT-Dakotas, the BLM used the core areas from the three states and general habitat from Montana as a starting point to identify HMAs. The BLM designated Priority, Restoration, and General HMAs (PHMA, RHMA, and GHMA). Primarily PHMA is equivalent to the state identified core areas. Two main differences exist, first small adjustments were made during the planning process based on cooperating agency and public input to identify PHMA in some areas. Second, the BLM designated some core areas as RHMA, where there were ongoing or imminent impacts to these high-quality habitats to emphasize the long-term restoration needs. The objectives for these areas include restoring habitat in order to provide the ability for establishing or enhancing GRSG populations. In Montana the EO general habitat was used as a starting point to identify GHMA, and individual plans worked with local experts and stakeholders to refine these, as needed. To identify general habitat in North and South Dakota the BLM used the current occupied range, along with local vegetation mapping and biologists' opinion, to account for areas where there is limited evidence of breeding habitat but known seasonal or sporadic use by GRSG.

To create HMAs for this current planning effort the BLM built off these prior efforts and again engaged cooperating agencies and stakeholders in the process. The BLM combined local knowledge, experience since the 2015 plans, and updated state information to compliment and provide context to new range wide and management zone habitat modeling efforts. The new GRSG science was used to identify areas to consider emphasizing based on management zone or rangewide importance, and to refine the type, quality, and location of habitat areas. Throughout the process the BLM sought consistency, as appropriate and supported, with state natural resource entity core and general (also connectivity in MT) habitat areas. The two types of possible changes to be made in the range of alternatives by considering new information since prior planning efforts are: First, areas that should be added (or omitted) that provide (or do not) habitat for GRSG; and Second, what changes to HMA types should be made across Montana-Dakotas. HMAs are delineated as approximate boundaries and representations of habitat, utilize models and coarse grain data, and don't account for the dynamic nature of GRSG populations. Therefore, habitat characteristics should be verified with local data and efforts and there may be areas of non-habitat contained within HMAs.

The BLM considered designating (including new areas and adjustments) four types of HMAs. These include the 2015 types, PHMA, RHMA, and GHMA, and an additional HMA called Connectivity (CHMA) to capture unique, potential migration areas, particularly in silver sage habitat. Priority habitat (PHMA) includes areas with relatively limited impacts and containing substantial and high-quality habitat. These areas have been identified as having the highest conservation value to maintaining sustainable GRSG populations or maintaining the extent of the GRSG range. Restoration Habitat (RHMA) are areas with ongoing or imminent impacts that recently (i.e., in the 21st Century) contained substantial and high-quality GRSG habitat. In general, these areas differ from other HMAs as the BLM is identifying separate management actions to emphasize restoring habitat to establish or enhance GRSG populations. General habitat (GHMA) are areas with or without ongoing or imminent impacts containing seasonal or year-round habitat outside other HMA, including for the purpose of promoting movement and genetic diversity. Finally, Connectivity Habitat (CHMA) are areas that provide regions of connectivity important to facilitate the movement of GRSG and maintain ecological processes. While typically unoccupied or with inactive leks, this HMA boundary represents where stopover sites may exist, likely within a matrix of degraded or converted habitat or non-habitat, particularly in silver sagebrush habitats in northern Montana.

In both Alternatives 1 and 2 HMAs are the 2015 designations, as MT/Dak was not part of the 2019 plan amendments. In these alternatives two areas of the state with known GRSG habitat do not have designated HMAs because the Butte Field Office and the Upper Missouri River Breaks National Monument (UMRBNM) were not part of the 2015 planning effort. While there are no designated HMAs for Butte and UMRBNM these RMPs contain GRSG related objectives and management actions. While there are some differences between the MT EO habitat boundaries and the BLM 2015 GRSG Plan HMAs, the proportion of birds found in different habitat types remains similar. The BLM PHMA and RHMA boundaries encompass 75-80% of known displaying males (similar to core areas) with the remaining 1/5 to 1/4 of the state population found in GHMA (similar to general habitat). In North and South Dakota BLM PHMA matches the core habitat identified by those states at the time, capturing the majority of breeding habitat for all known active leks.

Alternative 3 considers HMA boundary adjustments to the 2015 plans, utilizing those HMAs as a starting point. Changes account for areas of GRSG habitat or leks identified since 2015, removal of areas that are not, and highly unlikely to be, occupied in the future and state identified connectivity habitats in Montana. This alternative would consider the same management across all HMAs, (i.e., all occupied HMAs as PHMA), therefore changes are focused on refining the extent of habitat. Through the planning process the BLM identified that in North Dakota and South Dakota GRSG habitat extent has not changed since 2015 Records of Decision (RODs). In Montana the BLM added in areas of habitat mapped by MT FWP where there is evidence of use, while also removing areas designated by the BLM in 2015 but are not considered GRSG habitat by MT Fish, Wildlife, and Parks (FWP) or based on multiple lines of evidence are not GRSG habitat. In addition, habitat in Butte and UMRBNM was included as HMAs. Finally, due to the unique behavior of GRSG in silver sage habitat (in the Havre, Malta, and Glasgow Field Offices under the HiLine RMP) the BLM mapped and designated Connectivity habitat (CHMA). These areas included state connectivity habitat as well as additional areas that may also provide for GRSG movement between known populations. All changes were made by considering local knowledge, cooperating agency input, and multiple sources of information, e.g., based on the preponderance of evidence.

For Alternative 4, 5 and 6 the outer boundaries (extent) for these alternatives remains the same as determined in Alternative 3. In addition, HMA designation do not vary between the alternatives 4, 5 and 6. The CHMA areas identified in Alternative 3 were included in 4, 5 and 6 as well. The criteria used to consider adjustment from prior HMA designations was to improve consistency between BLM field offices, between

BLM and state delineations, and between states (including Idaho and Wyoming), while accounting for new science and on-the-ground knowledge to consider adjustments to HMA boundaries. In some instances, meeting all criteria was not possible, as aspects were in conflict (e.g., consistency between multiple entities). The BLM weighed these various inputs and utilized the preponderance of evidence to designate HMA types. Overall, the goal is that changes are supported with a sound rationale including relevant biological and/or management considerations. The types of changes made in comparison with Alternative 1 and 2 HMAs include switching between RHMA and PHMA (where different management was not needed or for consistency across boundaries), changing GHMA to PHMA (areas of regional importance and for consistency with the state core areas or across state borders), switching GHMA to CHMA or identifying new CHMA (areas where habitat remains that may be important for movement), and changing PHMA to GHMA (improved consistency with state core areas). The proportion of breeding birds in HMAs among the three states remain about the same as Alternatives 1 and 2, with around 80% of birds (breeding habitat) in PHMA in Montana, whereas all known leks are within PHMA in North and South Dakota.

Consistent definitions are needed for HMAs in Montana/Dakotas due to variations in language between existing plans, lack of CHMA definitions in Alternatives 1 and 2, and to apply HMA definitions in the Upper Missouri River Breaks National Monument and Butte RMPs. HMAs would be defined in all applicable action alternatives as:

PHMA: Areas with limited impacts containing substantial and high quality GRSG habitat that have been identified as having the highest conservation value to maintaining both sustainable sage-grouse populations and the range of GRSG. Management actions would emphasize the protection and enhancement of GRSG. Areas are delineated using mapped state core areas, GRSG density/habitat models, genetic connectivity information, and other resource information that the BLM has identified in coordination with respective state and federal agencies. HMAs are delineated as approximate boundaries and representations of habitat, and therefore there may be areas of non-habitat contained within.

RHMA: Areas with ongoing or imminent anthropogenic impacts that recently (i.e. in the 21st Century) contained substantial and high-quality GRSG habitat and/or supported high density sustainable GRSG populations. Management actions would emphasize restoring habitat in order to provide the ability for establishing or enhancing GRSG populations to sustainable, dense levels. Areas are delineated using mapped state core areas, GRSG density/habitat models, genetic connectivity information other resource information, and human disturbance/footprint data. HMAs are delineated as approximate boundaries and representations of habitat, and therefore there may be areas of non-habitat contained within.

GHMA: Areas with or without ongoing or imminent impacts containing seasonal or year-round habitat outside other habitat management areas, including for the purpose of promoting movement and genetic diversity. Management actions will maintain, enhance, or restore habitat for GRSG. HMAs are delineated as approximate boundaries and representations of habitat, and therefore include potential or unoccupied habitat and may contain areas of non-habitat.

CHMA: Areas that provide regions of connectivity important to facilitate the movement of GRSG and maintain ecological processes, including between priority populations, adjacent states, and across international borders. This HMA boundary represents where stopover sites may exist, likely within a matrix of degraded or converted habitat or non-habitat. Areas are delineated using results from analyses of seasonal migratory movements and habitat characteristics conducive to movements, particularly between silver sagebrush and big sagebrush habitats.

Proposed RMP Amendment HMA Approach

To delineate HMAs for the Proposed RMP Amendment the BLM built on the strategy for identifying HMAs described above (state core sage-grouse areas, cooperating agencies, consistency as appropriate, and addressing the unique circumstances for GRSG in the region including peripheral populations). Additional information from the public comment period on the Draft EIS and continued coordination led to minor changes in HMAs from the preferred alternative (Alternative 5). For the Proposed RMP Amendment, the BLM would designate Priority and General HMAs, along with three unique HMA types. (PHMA, GHMA, and UHMA). The BLM identified "Unique" HMA (UHMA) types where there were ongoing or imminent impacts to these high-quality habitats and emphasis on the long-term habitat needs was necessary, or where the peripheral nature of the population introduced management challenges. Connectivity HMAs (CHMA), as described in the alternatives above, was added as a category of UHMAs. In addition, newer regulations and programs in the BLM have utilized the term "restoration," therefore, different terminology was used to avoid confusion with Restoration Management Areas (RHMA) as described in the DEIS. Finally, adjustments to HMAs in the Proposed RMP Amendment in Wyoming required changes to the edge mapping approach used in the preferred. Overall, changes between the Draft EIS and the Proposed RMP Amendment were made to avoid confusion and allow for specific objectives and management to address habitat. Specific areas with changes between preferred and proposed include:

- Little Missouri HMA (LMHMA): This area encompasses connected habitat on the Montana and North Dakota border. The LMHMA is a combination of the Cedar Creek RHMA and the North Dakota PHMA from Alternative 5 (preferred). The delineation of the LMHMA emphasizes better consistency with state management direction, objectives pertinent to challenges of the area, and cross-boundary coordination.
- South Carter HMA (SCHMA): A portion in south Carter County (on the Wyoming border) identified for unique management due to ongoing bentonite development in the area. The SCHMA was PHMA in Alternative 5 and RHMA in Alternative 1/2 (but the SCHMA is reduced in size relative to the RHNMA area).
- Musselshell-Yellowstone: Found within the Billings Field Office, areas of crested wheatgrass with lower habitat value. Formerly RHMA in the preferred alternative but changed to GHMA in the Proposed RMP Amendment (avoid confusion, management same as GHMA).
- West Decker: Found within the Billings and Miles City Field Offices, State of Montana core habitat, but surrounded by heavy surface disturbance. Formerly RHMA in the preferred alternative but changed to PHMA in the Proposed RMP Amendment (avoid confusion, despite challenges with surrounding habitat, management same as PHMA).
- Montana-Wyoming border: Updated areas in the Billings and Miles City Field Offices to account for changes in the Wyoming HMAs under the Proposed RMP Amendment.

Consistent definitions are needed for HMAs in Montana/Dakotas due to variations in language between existing plans and to apply new HMA definitions across offices. For the Proposed RMP Amendment, the HMAs would be defined as:

PHMA: Areas with limited impacts containing substantial and high quality GRSG habitat that have been identified as having the highest conservation value to maintaining sustainable sage-grouse populations. Management actions would emphasize the protection and enhancement of GRSG. Areas are delineated using core and connectivity data or maps and other resource information that the BLM has identified in coordination with respective state and federal agencies. HMAs are delineated as approximate boundaries and representations of habitat, and therefore there may be areas of non-habitat contained within.

GHMA: Areas with or without ongoing or imminent impacts containing seasonal or year-round habitat outside other habitat management areas, including for the purpose of promoting movement and genetic diversity (e.g., ranging from less dense occupied areas/leks to sporadic use/connectivity areas). Management actions will maintain, enhance, or restore habitat for GRSG. HMAs are delineated as approximate boundaries and representations of habitat, and therefore include potential or unoccupied habitat and may contain areas of non-habitat.

Unique HMAs: Areas identified that need different objectives or management to address unique challenges. For example, these are areas identified as habitats by state agencies but contain ongoing and imminent impacts due to oil and gas development and associated infrastructure, habitat conversion, mining, disease, and/or the peripheral nature of the population. Due to the unique circumstances management actions are needed that emphasize long-term reclamation and habitat goals, and maintain connectivity, in order to provide/enhance habitat for recovery of GRSG populations. These include three areas:

- **Little Missouri HMA**: Identified core area by the states of Montana and North Dakota. This area contained high-quality GRSG habitat in Montana and encompasses the remaining GRSG habitat in North Dakota. However, a substantial portion of the area is a unitized oil and gas field (the Cedar Creek Anticline). Formerly occupied habitat has been converted or degraded, an outbreak of West Nile Virus impacted bird numbers, and GRSG are challenged by being on the periphery of their range. Unique management is needed to maintain connectivity of sagebrush and GRSG habitat between Montana and North Dakota and focus restoration efforts.
- **South Carter HMA:** Identified core area by the State of Montana. However, this area is primarily developed or existing bentonite claims. Unique management is needed to balance GRSG habitat and mineral development, in the short term, while planning for longer-term reclamation.
- **Connectivity HMA**: Areas that provide regions of connectivity important to facilitate the movement of GRSG and maintain ecological processes, including between priority populations, adjacent states, and across international borders, including but not limited to Montana Connectivity areas. This HMA boundary represents where stopover sites may exist, likely within a matrix of degraded or converted habitat or non-habitat (such as in Montana general habitat within the HiLine). Areas are delineated using results from analyses of seasonal migratory movements and habitat characteristics conducive to movements, particularly between silver sagebrush and big sagebrush habitats.

3.4 NEVADA/CALIFORNIA

Greater Sage-Grouse Habitat Management Area (HMA) delineation in the BLM's resource management plan amendments (RMPAs) in Nevada and northeastern California is informed by a science-based modeling process developed by the US Geological Survey (USGS). As a summary, the model is informed by the following: resource selection information informed by telemetry locations from radio-marked greater sage-grouse (GRSG); the relationship of those telemetry points with associated habitat characteristics such as land cover composition, water resources, habitat configuration, elevation, and topography (each at multiple spatial scales related to the observed GRSG movement patterns); and a space use index based on GRSG breeding densities at leks. The modeled combination of these habitat characteristics and site use resulted in a model output of potential management prioritization scenarios (e.g., Priority, General and Other Habitat Management Area categories). The strength of using this model to identify the Habitat Management Areas (HMAs) is that it can be updated as new data become available.

Following the USFWS 2010 finding (75 Fed. Reg. 13910 [Mar. 23, 2010]) that the listing of GRSG was warranted but precluded and that regulatory mechanisms to protect the species were lacking, both the BLM and State of Nevada began planning processes to increase conservation and management of GRSG and its habitat. In 2013, there was a coordinated decision between the BLM, State of Nevada and US Forest Service (USFS) to develop a single science-based HMA delineation process (https://www.blm.gov/press-release/greater-sage-grouse-maps-available-public-comment) that coalesced in 2014 with the USGS publication: Spatially explicit modeling of greater sage-grouse (*Centrocercus urophasianus*) habitat in Nevada and northeastern California: a decision-support tool for management (Coates et al. 2014).

Mapping efforts prior to this publication varied widely as seen in the 2013 Nevada and Northeastern California GRSG Proposed Land Use Plan Amendment and Draft Environmental Impact Statement (2013 DEIS). In that document, the HMA maps in the BLM's Preferred Alternative and the state's Alternative differed by over 34 million acres in the management categories that were to become Priority, General and Other HMAs and included a nearly 5-million-acre difference for Priority and General HMAs (combined). This was due to each agency using differing strategies to identify the important GRSG areas, as well as lack of a consistent mapping approach. Following the release of the 2013 DEIS, the Sagebrush Ecosystem Program provided the BLM with the 2014 Nevada Greater Sage-grouse Conservation Plan, which included an HMA map for use in the state's Alternative and for consideration by the BLM and USFS in developing the Proposed Alternative in the 2015 Final EIS (2015 FEIS). Ultimately, the HMAs identified in the state and federal maps were both based on the 2014 USGS model, but included different naming conventions for HMA categories. In terms of HMA acres, the Proposed Alternative included about 1.2 million, or five percent, more than the state's Alternative within the 23-million-acre management area.

A central strength of adopting a science-based strategy, and challenge for management, is that science continues to improve over time as additional information is collected and new mapping products and techniques become available. The need to update the map as new information became available was disclosed and discussed throughout the 2013 DEIS, 2015 FEIS and ROD, and Nevada's Sage-grouse Conservation Plan. Following September publication of the BLM's 2015 ROD, the Sagebrush Ecosystem Program (SEP) adopted a new state map (on December 11, 2015) that included the results of an updated version of the 2014 HMA model (Coates et al., 2016) and removed modeled HMA that fell outside of the Nevada Department of Wildlife's Population Management Unit boundaries.

On September 23, 2015, Western Exploration LLC and several additional plaintiffs filed a complaint seeking judicial review of the BLM and USFS actions under the Administrative Procedure Act, 5 U.S.C. § 706. While litigation continued, the BLM was not able to update the HMA map included in the 2015 ROD to reflect changes made in the State of Nevada's HMA map. On March 31, 2017, the court ordered the BLM to conduct supplemental NEPA analysis to evaluate substantial changes between the 2013 DEIS and 2015 FEIS, including the addition of SFAs and their management, while not supporting other claims.

On October 11, 2017, the BLM released a Notice of Intent to consider the possibility of amending some, all or none of the BLM land use plans that were amended or revised in 2014 and 2015 regarding GRSG conservation. This effort resulted in targeted amendments to BLM RMPs through the March 2019 ROD. Through this planning effort, the Nevada and Northeastern California Sub-region updated the BLM's HMA map to match the State of Nevada's map within Nevada. However, these updates could not be completed in California where updated satellite imagery was not available during the USGS 2016 model update. USGS later updated the model to include new imagery of lands in California (Brussee et al., 2019).

On October 16, 2019, the U.S. District Court for the District of Idaho issued a preliminarily injunction, temporarily preventing the BLM from implementing the 2019 amendments, but did not vacate them. Since the 2019 plans were temporarily enjoined, the BLM reverted to the HMA map included in the 2015 ARMPA. Consistent with the intent of the BLM's decision to identify GRSG HMAs using the USGS model, the BLM updated the HMA map for Nevada and California through a plan maintenance action in 2022. This action allowed the Nevada BLM and the State of Nevada to use the same HMA map and for the California BLM to incorporate the 2019 model results into HMAs in California.

In late 2022, the BLM worked with the USGS and other state, local, and federal partners to begin updating the 2016 HMA model. This update is consistent with the approach from the previous two efforts while also incorporating new data and information related to habitat selection and space use. It also includes survival rates during reproductive life stages and specific seasons (e.g., brood-rearing or winter) and identifies corridors that link seasonal habitats. This update allows areas of high importance to current population dynamics (i.e., source areas) to be mapped. The final version of the USGS HMA model was not published in time for inclusion in the BLM's 2024 Draft RMPA/EIS. However, USGS provided the BLM with unpublished results for use in preparing the Draft RMPA/EIS range of alternatives and impact analyses. This ensured that the BLM was using the best science available at the time.

Within the Proposed RMPA/Draft EIS, the HMA maps for NV/CA differ by Alternative. The HMA map in Alternative 1 displays management areas as identified in the maintained 2015 ARMPA. Maintenance Action # 5 (BLM 2022) updated the 2015 ARMPA HMA with information USGS published in 2016 and 2019 (Coates et al., 2106, Brussee et al., 2019). Alternative 2 uses HMA delineations as presented in the 2019 ARMPA. Alternative 3 uses the draft results of the updated model (Milligan et al. 2024 (in review)) but treats all categories of HMA as PHMA. Alternative 4 also uses the draft results of the updated model and includes all three HMA categories (areas identified as PHMA+ by USGS are merged with PHMA). Alternatives 5 and 6 take into consideration the Population Management Units (PMUs) defined by NDOW and uses the same HMA results as Alternative 4 within these units. Areas identified by the USGS model that are outside of PMUs have not been occupied by grouse for decades and are not included in the state's management of the population. Despite providing landscapes characteristics that are likely consistent with GRSG habitat, these areas are not considered important to population persistence. The HMAs in the Proposed RMP Amendment are similar to Alternative 5 except that they use the published results of the updated model (Milligan et al. 2024) within PMUs. It also includes areas delineated as PHMA with Limited Exceptions. All areas within those boundaries are managed according to that designation regardless of how they were modeled. More than 95% of the area within those boundaries is modeled as PHMA or PHMA with limited exceptions in the published results. Modeled GHMA or OHMA within those boundaries connect patches of modeled PHMA and are managed as PHMA with limited exceptions due to their importance on the landscape in maintaining connected populations and to avoid errant gaps within those boundaries.

The unpublished results that the BLM used for the Draft RMPA/EIS included more than six years of additional field data collected since the last published version (Coates et al., 2016) and advances in methodology to produce the HMA model (The unpublished draft HMA results were the best available estimate of how HMA would change in comparison to the 2015 and 2019 ARMPA versions (current management). Omitting this information, because it was not final or published, would have resulted in less transparency with the public regarding the development of the updated model. In the Draft RMPA/EIS, the BLM anticipated and disclosed that changes to the model and associated maps were likely between the Draft and Final EIS and that the BLM would adopt the published information in the proposed management. The Draft EIS provided alternative uses of the model in supporting management of GRSG habitat in the planning region. However, the Draft

RMPA/EIS did not amend or address the decision to use the model, and future iterations of the model, for that purpose. The iterative evolution of the model is anticipated as addressed in both the 2015 and 2019 RODs that focus on using the results of the model as the primary tool to identify alignment of GRSG HMAs. These anticipated updates are also consistent with the BLM using the best available information to consider decisions, as well as Congress' direction that the BLM maintain and use updated inventories of public land resources as part of the planning process. The results of the published model (Milligan et al. 2024) were incorporated in the Final EIS. Updated HMA acreage can be found in **Chapter 2**, **Table 2-14**. For comparison, acreages from the Draft EIS can be found in Chapter 2, Table 2-3 of the Draft EIS. The Draft EIS can be accessed at the BLM National NEPA Register at https://eplanning.blm.gov/eplanning-ui/project/2016719/510. The range of variance between the acres identified between the Draft EIS and the Final EIS were within the range of alternatives analyzed in the Draft EIS.

Not all areas within HMAs will include characteristics associated with GRSG habitat. For example, areas of connectivity between seasonal habitats or areas recovering from fire might not support vegetation used by GRSG but these areas will be included in HMAs. Mapping errors are also anticipated to occur with HMA maps and the proposed management within this Proposed RMPA/Final EIS provides mechanisms to adjust management accordingly.

Within the USGS modeling framework, Priority HMA is defined as: 1) areas with relatively high habitat selection index (HSI) and relatively high likelihood of occupancy, or 2) source areas, which were defined as high selection and high survival during reproductive life stages, that were outside of areas of high occupancy. General HMA includes those areas of: 1) relatively high HSI but low occupancy, 2) relatively low HSI but high occupancy, or 3) relatively low HSI corridors that connect seasonal priority habitats (i.e., nesting areas around leks to brood-rearing source areas). Areas with moderate to low HSI and low evidence of occupancy were included as Other HMA.

The BLM's definitions for HMA are as follows:

Priority HMA: Areas that have been identified as having the highest conservation value to maintaining sustainable greater sage-grouse populations. These areas are occupied seasonally or year-round and include breeding, late brood-rearing, and winter concentration areas.

General HMA: An area that is likely to be occupied seasonally or year-round outside of a Priority Habitat Management Area and where management will apply to sustain the greater sage-grouse populations. GHMA may include active leks, seasonal habitats, and fragmented or marginal habitat, as well as areas identified as corridors connecting seasonal habitats.

Other HMA: Areas with appropriate environmental conditions for greater sage-grouse that are less used by greater sage-grouse or have marginal habitat suitability.

3.5 OREGON

The definitions of PHMA and GHMA have not changed since initially defined in the 2015 ARMPA. PHMA and GHMA are defined as follows:

PHMA: BLM-administered lands identified as having the highest value to maintaining sustainable GRSG populations. Areas of PHMA largely coincide with areas identified as Priority Areas for Conservation in the USFWS's COT report. These areas include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors.

GHMA: BLM-administered lands where some special management will apply to sustain GRSG populations; areas of occupied seasonal or year-round habitat outside of PHMA and connectivity corridors.

IM 2012-044 directed the BLM to collaborate with state wildlife agencies to identify and map GRSG Preliminary Priority Habitat and Preliminary General Habitat. In Oregon, the BLM developed maps for these habitats based on the Oregon Department of Fish and Wildlife's (ODFW) GRSG core and low-density habitat maps (Hagen 2011) for the 2015 BLM Oregon Greater Sage-Grouse Approved Resource Management Plan Amendment. The ODFW core and low-density habitats were initially delineated in 2011 and had not been updated since this initial mapping. Since 2011 Oregon has discovered over 150 new leks, acquired over a million locations from radio- and GPS- marked GRSG, and has benefitted from improved habitat suitability models. Additionally, there are many GRSG leks used in the 2011 mapping process that are no longer occupied by GRSG. Hence, in March 2022 ODFW notified the BLM, other partners, and the public that they would be reviewing and revising Oregon's GRSG core and low-density habitat designations and Oregon's Greater Sage-grouse Conservation Assessment and Strategy using new information and again using the methods and process published in Hagen 2011.

The ODFW's draft GRSG core and low-density habitat designation maps were not available for the BLM's Draft EIS analysis needs in early 2023. After coordinating with ODFW, Oregon BLM followed the steps described in the ODFW Greater Sage-grouse Conservation Assessment and Strategy for Oregon (Hagen 2011 pp. 79-83) using data collected up through the 2022 field season. The BLM developed maps that were conservative (i.e., few areas clipped or reduced to omit non-habitat and therefore likely to show more habitat than the ODFW map), and were rough estimates of expected core and low-density areas that were anticipated in the ODFW maps being drafted at that time.

For alternative 3 in the Draft RMPA/EIS all BLM identified core and low-density habitat from the model was considered draft Priority HMA. In addition to habitat identified by the model, the spring and summer kernel density estimates (90% utilization) from radio- or GPS-tagged GRSG marked in Oregon from 2000 through 2022 provided by ODFW was included as priority habitat. The areas defined as General HMA in the 2015 BLM Oregon Greater Sage-Grouse Approved Resource Management Plan Amendments, based on combining ODFW low density habitat layer with the Durtsche et al. 2010 model layer, were not edited and were added as Priority HMA.

For alternatives 4, 5, and 6 in the draft EIS, all BLM newly modeled core habitat was considered Priority PHMA minus non-habitat clipped areas. For alternative 4 the areas defined as General HMA in the 2015 BLM Oregon Greater Sage-Grouse Approved Resource Management Plan Amendments were not edited and were included as General HMA in addition to the newly modeled low-density habitat.

However, for alternatives 5 and 6 in the Draft RMPA/EIS the areas defined as General HMA used the newly modeled low-density habitat and Habitat Assessment Framework (HAF) mapped seasonal habitats (rather than the Durtsche 2010 model used in alternatives 1 through 4). The seasonal habitat maps the BLM developed with ODFW provide more accurate boundaries for GRSG distribution than maps generated from ODFW low density and Durtsche et al (2010). Not all Oregon GRSG areas had HAF seasonal habitats mapped as of February 2023 for the Draft RMPA/EIS, but all areas were completed in time to be included in the Proposed RMPA/Final EIS.

ODFW completed their GRSG core and low-density habitat designation map update, and the Oregon Fish and Wildlife Commission approved it in December 2023, which was not in time for incorporation into the BLM's Draft EIS analysis. Oregon BLM uses the final ODFW habitat designation for PHMA and GHMA in

the action alternatives and the Proposed RMP Amendment in the Proposed RMPA/Final EIS. Therefore, the HMA boundaries for PHMA and GHMA under alternatives 4, 5, 6, and the Proposed RMP Amendment are the same. Under Alternative 3, all of the ODFW habitat designation acres are identified as PHMA. The HMA acres identified utilizing the ODFW guidance available at the time the Draft EIS was being developed the can be found in Chapter 2, Table 2-3 of the Draft EIS. The Draft EIS can be accessed at the BLM National NEPA Register at https://eplanning.blm.gov/eplanning-ui/project/2016719/510. The HMA acres for Oregon that utilize the updated ODFW final data can be found in **Chapter 2**, **Table 2-14**. The range of variance between the acres identified between the Draft EIS and the Final EIS were within the range of alternatives analyzed in the Draft EIS.

3.6 UTAH

HMA definitions are defined below for both the 2015 and 2019 GRSG planning efforts. For HMA designations under Alternatives 3, 4, 5, 6, and the Proposed RMP Amendment, BLM Utah evaluated the GRSG new rangewide science and the State of Utah's 2019 SGMA boundaries to propose additions and subtractions consistent with the concepts for each alternative as identified below in each alternative discussion, and designated HMAs based on the 2019 ARMPA definition for PHMA and the 2015 definition for GHMA.

BLM Utah 2015 PHMA: BLM-administered lands identified as having the highest value to maintaining sustainable GRSG populations. Areas of PHMA largely coincide with areas identified as Priority Areas for Conservation in the USFWS's COT Report. These areas include breeding, late brood-rearing, winter concentration areas, and migration or connectivity corridors.

BLM Utah 2015 GHMA: BLM-administered lands where some special management will apply to sustain GRSG populations. Areas of occupied seasonal or year-round habitat outside of PHMA.

BLM Utah 2019 PHMA: Areas prioritized for managing greater sage-grouse populations (management is only applicable to actions on BLM-administered lands). These management areas include high-quality habitat, and may also include areas with poor quality, potential habitat, and non-habitat. PHMA largely coincides with the State of Utah's Sage-Grouse Management Areas (SGMAs). In the SGMA, the state identified areas of seasonal habitat, non-habitat, and opportunity areas, though management is focused on the habitat. PHMA are areas that include all the seasonal habitats for the corresponding greater sage-grouse populations, including breeding, late brood-rearing, winter areas, and migration or connectivity corridors.

BLM Utah 2019 GHMA: Not Applicable since GHMA was removed.

The BLM Utah coordinated closely with the State of Utah in developing HMA maps for this planning process. Both the BLM and the state prioritized GRSG populations and associated habitat into these two categories, though there varying levels of inclusion across the different alternatives. For all alternatives, PHMA represents areas of the highest value to maintaining sustainable GRSG populations, areas of seasonally or year-round occupied habitat, and/or areas where sagebrush restoration or rehabilitation can provide additional GRSG habitat. Based on new science and information discussed in coordination with cooperating agencies, local biologists, etc., GHMA and PHMA was adjusted across alternatives 3, 4, 5, and 6 using various alternative concepts/strategies. One of the primary differences among the alternatives is how GHMA is used. Of the 380 known occupied GRSG leks in Utah, the alternatives include the following within PHMA:

- Alternative 1: 353 (92.8%) are in PHMA
- Alternative 2: 354 (93.1%) are in PHMA
- Alternative 3: 380 (100%) are in PHMA

- Alternative 4: 366 (96.3%) are in PHMA
- Alternatives 5 and 6: 342 (90%) are in PHMA
- Proposed RMP Amendment: 366 (96.3%) are in PHMA

Alternative 1 in Utah would retain PHMA and GHMA as identified in the 2015 GRSG ARMPA. In that effort, the BLM used the State of Utah's Sage-Grouse Management Areas (SGMA) as the primary tool to identify PHMA (with a few exceptions such as the Tavaputs Plateau), and the state's 2009 occupied GRSG habitat map as the basis of the GHMA. The SGMAs and PHMA focused on managing the most important GRSG populations in the state, regardless of the quality of the habitat associated with those populations.

It is important to note that the State of Utah's 2009 occupied habitat data was very broad in nature, and was developed to identify the general areas of potential habitat where GRSG could potentially be found and may not have reflected where birds were actually known to exist. As such, some areas identified for GHMA in the 2015 GRSG ARMPA have subsequently been identified as non-habitat. This includes areas such as west of Sanpete Valley (west of Ephraim and Mt. Pleasant), Porphyry Bench near Price, and South Slope of the Uintah's Blue Bench area north of Duchesne. While these areas were identified as habitat during the 2015 planning effort and included as GHMA in that effort, they have not had any documented birds using them for over 20 years, have no occupied or historically known leks, are poor-quality habitat, and do not provide connectivity habitat for birds moving between population areas or seasonal habitats. Under Alternative 1, there are five occupied leks that occur outside of PHMA/GHMA boundaries: two are in the Box Elder area, one in Sheeprocks, and two in the Rich area.

In the 2015 ARMPA, 97.5 percent of the BLM's PHMA was contained in areas identified as habitat in the State of Utah SGMAs. Further, 99.5 percent of the state's mapped habitat within SGMAs is within PHMA. The major difference between the BLM and State of Utah maps was how areas of lower priority are depicted. The state chose not to map lower priority areas of occupied GRSG habitat outside SGMAs, whereas the BLM mapped these areas as GHMA. Further, based on the State of Utah's Conservation Plan, SGMAs "encompass more than 90 percent of Utah's breeding populations, seasonal movements and the landscapes that provide the greatest potential to increase sage-grouse "usable space" [through habitat protection and enhancements]" (State of Utah, 2019). The state determined that GRSG "habitats outside the SGMAs are not required for long-term conservation of the species. Much of this habitat has already been heavily disturbed by human and natural causes, and it is not suitable for enhancement or improvement. Therefore, sage-grouse populations in these areas are not considered essential to perpetuate the species in Utah" and the state did not provide any "specific management actions for this habitat" (State of Utah 2019).

Statewide (Alternative 1) - Habitat Management Area Acres

- 5,548,837 acres in PHMA
  - 2,079,470 of the BLM-administered surface acres are in PHMA
  - 1,197,778 of the BLM-administered mineral estate are in PHMA
- 1,684,818 acres in GHMA
  - 437,737 of the BLM-administered surface acres are in GHMA
  - 403,125 of the BLM-administered mineral estate are in GHMA
- 42,069 acres as Occupied Anthro Mountain (National Forest System lands)

Leks Under Alternative 1 HMAs:

- 353 (92.8%) of the 380 occupied leks in Utah are in PHMA
- 14 (3.7%) of the 380 occupied leks in Utah are in GHMA

- 7 (1.8%)of the 380 occupied leks in Utah are in Occupied Anthro Mountain
- 5 (1.3%) of the 380 occupied leks in Utah are outside any Utah habitat management area

Alternative 2 is based on the BLM's 2019 GRSG ARMPA. In that effort, the BLM sought to increase HMA alignment with the State of Utah's SGMAs and prioritized the importance of management prescriptions on PHMA. This was to focus protection in the state on the seasonal habitats that support over 95 percent of GRSG populations in Utah, while removing the designation and management of GHMA to de-emphasize management in areas that were less important or not habitat. Other than removal of GHMA, there were very few changes in the HMAs under Alternative 2, though some differences in the BLM's PHMA and the State's SGMA remained in the West Tavaputs area, where the BLM maintained PHMA in an area where the state did not include an SGMA. Under Alternative 2, based on 2023 occupied leks, 19 occupied leks would occur outside of PHMA boundaries: 2 in the Box Elder population area, 4 in the Rich County area, 1 in the Sheeprocks area, 5 in Morgan-Summit area, and 7 in South Slope of the Uintah's Blue Bench area north of Duchesne. Most of these leks do not occur on BLM-administered lands.

Statewide (Alternative 2) - Habitat Management Area Acres

- 5,548,837 acres in PHMA
  - 2,079,476 of the BLM-administered surface acres are in PHMA
  - 1,235,904 of the BLM-administered mineral estate are in PHMA
- 0 acres in GHMA
- 42,069 acres as Occupied Anthro Mountain (National Forest System lands)

Leks Under Alternative 2 HMAs:

- 354 (93.1%) of the 380 occupied leks in Utah are in PHMA
- 0 of the 380 occupied leks in Utah are in GHMA
- 7 (1.8%) of the 380 occupied leks in Utah are in Occupied Anthro Mountain
- 19 (5%) of the 380 occupied leks in Utah are outside any Utah habitat management area

Alternative 3 HMA boundaries were developed to represent the strongest GRSG management approach within the BLM's jurisdiction. All HMAs in Alternative 3 are managed as PHMA. PHMA under Alternative 3 encompasses a total of 9,802,136 acres. As compared to the other alternatives, the PHMA boundaries under Alternative 3 more closely aligns with the State of Utah's SGMA areas, though the management under Alternative 3 is more restrictive than what the state recommends. The state's SGMAs were developed to be inclusive of a variety of habitat types associated with the various GRSG populations throughout Utah. The state's plan clearly notes that the entirety of the SGMAs do not provide habitat for GRSG, but include areas of habitat, non-habitat, and potential habitat (opportunity areas). In the 2015 and 2019 planning efforts, the BLM focused PHMA in the areas the state coarsely mapped as "habitat" within the SGMAs in the original 2013 GRSG State Plan. Under alternative 3, the BLM included the entirety of the SGMAs as PHMA, as well as areas of restoration areas that occurred on the periphery of the 2015 HMAs. The following are additional concepts used to build alternative 3:

- Include in PHMA all areas of GHMA from the 2015 plans.
- Apply new science, especially research on habitat connectivity, resulting in inclusion of the State of Utah's opportunity habitats.
- Include all occupied leks in PHMA.
- Include areas of non-habitat that are encompassed in large parts by PHMA or could provide corridors between valleys and occupied habitat.

- Include areas of GRSG habitat treatments that occur on the periphery of 2015 HMAs.
- Remove municipalities >2,500 acres.

Alternative 3 is the only alternative where the GHMA from alternative 1 becomes PHMA. Expanding the GHMA designation in Alternative 1 to PHMA includes some areas of unoccupied habitat, historic habitat where birds have not been observed in 20 years or more or may have never occurred (e.g., habitat west of Sanpete Valley), areas of non-habitat (e.g., phase 3 pinyon-juniper, rock outcrops), areas which are currently not habitat but could become habitat through significant habitat restoration, etc., which raises the concern of "when applying leasing restrictions, the least restrictive constraint to meet the resource protection objective should be used" (2018 FEIS Appendix 2 p. 2-28). Under Alternative 3, there are no occupied leks that are not encompassed by PHMA.

Statewide (Alternative 3) - Habitat Management Area Acres

- 9,801,294 acres in PHMA
  - 3,567,018 of the BLM-administered surface acres are in PHMA
  - 2,379,058 of the BLM-administered mineral estate are in PHMA
- 0 acres in GHMA

Leks Under Alternative 3 HMAs:

- 380 (100%) of the 380 occupied leks in Utah are in PHMA
- 0 of the 380 occupied leks in Utah are in GHMA
- 0 of the 380 occupied leks in Utah are outside any Utah habitat management area

Alternative 4 would manage for a combination of PHMA and GHMA similar to alternatives 1 and 2. Some areas that were used to expand PHMA in alternative 3 were incorporated in alternative 4, such as the State of Utah's opportunity habitat, occupied leks, connectivity corridors based on the new science, as well as habitat improvement projects completed for the benefit of GRSG. However, many new areas of expansion would become GHMA where occupancy is uncertain or unknown (e.g., restoration areas, connectivity corridors). Under Alternative 4, there are no occupied leks that occur outside of PHMA or GHMA. The vast majority of leks are within PHMA, except for 2 leks in the Rich population area northeast of Mountain Green, 5 leks in Morgan-Summit area, and 7 leks on Tribal lands in South Slope of the Uintah's Blue Bench area north of Duchesne, which are in GHMA. Under Alternative 4, there are no occupied leks that fall outside PHMA or GHMA. The following are additional concepts used to build alternative 4:

- Adjust boundaries for PHMA to include areas where monitoring shows GRSG utilization.
- Remove some areas of GHMA that have not provided habitat for an extended period.
- Refine boundaries on the periphery of HMAs to more closely align with the Utah State University (USU) GRSG Seasonal Habitat Model.
- Remove municipalities >2,500 acres.

Statewide (Alternative 4) - Habitat Management Area Acres

- 5,833,555 acres in PHMA
  - 2,191,844 of the BLM-administered surface acres are in PHMA
  - 1,291,398 of the BLM-administered mineral estate are in PHMA
- 3,314,103 acres in GHMA
  - 1,195,069 of the BLM-administered surface acres are in GHMA
  - 990,776 of the BLM-administered mineral estate are in GHMA

Leks Under Alternative 4 HMAs:

- 366 (96.3%) of the 380 occupied leks in Utah are in PHMA
- 14 (3.7%) of the 380 occupied leks in Utah are in GHMA
- 0 of the 380 occupied leks in Utah are outside any Utah habitat management area

Alternatives 5 and 6 uses HMA boundaries developed, provided, and preferred by the State of Utah. The state incorporated agency biologist and stakeholder feedback to further refine the HMAs from alternative 4 and provide an expanded range of HMA delineation. This alignment prioritizes HMAs that encompass 95.6 percent of the male GRSG counted on leks during 2023 surveys. The following are additional concepts used to build this alternative:

- Expansion of HMAs to include active leks recently added to the state active sage-grouse lek data set;
- Expansion of HMAs to include wildlife management areas and other areas already subject to state-specific sage-grouse management;
- Refinement of HMAs using localized habitat assessment data and knowledge, including cross-state edge-mapping and review of existing BLM boundary adjustments;
- Updated HMAs to reflect changes in municipal boundaries; and
- Removal of large water bodies

Under alternatives 5 and 6, there are 25 occupied leks that are outside of PHMA or GHMA: 5 leks in Morgan-Summit on private lands, 7 leks in South Slope of the Uintah's Blue Bench area on Tribal lands, 7 leks in Anthro Mountain on National Forest System lands which are protected under the 2015 USFS Land Management Plan Amendment and Record of Decision, and 6 leks in West Tavaputs (5 on private, 1 on BLM). With this alignment, alternatives 5 and 6 would prioritize habitat management areas (PHMA and GHMA) that encompass 95.6 percent of the male GRSG counted on leks during 2023 surveys (not the percent of leks, but the percent of males counted on leks). This includes 2,740 (93.8%) males counted within PHMA, 54 (1.8%) counted in GHMA and 127 (4.3%) counted outside of any HMA.

Statewide (Alternatives 5 and 6) - Habitat Management Area Acres

- 4,876,186 acres in PHMA
  - 1,626,862 of the BLM-administered surface acres are in PHMA
  - 1,118,527 of the BLM-administered mineral estate are in PHMA
- 1,499,184 acres in GHMA
  - 645,971 of the BLM-administered surface acres are in GHMA
  - 348,908 of the BLM-administered mineral estate are in GHMA

Leks Under Alternatives 5 and 6 HMAs:

- 342 (90%) of the 380 occupied leks in Utah are in PHMA
- 13 (3.4%) of the 380 occupied leks in Utah are in GHMA (two in the Rich area, and 11 in the Sheeprocks area)
- 25 (6.6%) of the 380 occupied leks in Utah are outside any Utah habitat management area

Alternatives 5 and 6 do not include any HMA designation for portions of the Uintah population area south of Highway 40, including the Deadman's Bench, East Bench, and Book Cliffs areas. The GRSG populations within this area were steadily declining during the preparation of the 2015 FEIS; however, in Deadman's Bench, there were 2 leks that had less than 10 birds since 1989 and suggested that the population was

connected to other populations. Same with East Bench at the timing of the 2015 FEIS, "East Bench leks are the only known active leks in the last 10 years. However, it is unknown if there are leks on Tribal lands in the western portion of this area because UDWR does not have access." (2015 FEIS p. 3-25). In 2023, the leks in these areas were documented as unoccupied. In coordination with local biologists, there is some limited bird use in these areas; however, the extent of use is largely unknown and the leks are no longer considered occupied by the State of Utah.

Habitats in the South Slope of the Uintah's Blue Bench and Uintah Population Area (Deadman's Bench, East Bench, and Book Cliffs) have been fragmented due to mineral development activities through much of the area, which has likely contributed to loss of occupied leks within these areas since the 2015 plans. Under alternative 1 development could still occur in GHMA similar to what was analyzed in the 2015 Final EIS, "despite the…[greater sage-grouse] conservation measures, leasing and development in these areas could result in human alteration, direct loss, and fragmentation of seasonal [greater sage-grouse] habitats, which, in most cases, have already been fragmented by mineral development activities. Fragmentation could further limit the amount of usable habitat available for the small and declining population of [greater sage-grouse] that occupy this area [GHMA]" (2015 Final EIS, page 4-119). The limited information available for this area provides little insight into the population movements, important seasonal habitats, and connectivity with other populations. The BLM lacks regulatory discretion on resources within the South Slope of the Uintah's Blue Benchand Book Cliffs areas since they are predominantly private and Tribal lands. Split estate in this area is limited; therefore, the BLM does not have much regulatory responsibility over the mineral estate. The BLM has more jurisdiction in the Deadman's Bench and East Bench areas, removal of GHMA in these areas could result in further habitat loss, degradation, and direct disturbance to the small population of birds that occupy this area as a result of oil and gas leasing.

In addition to the differences in GHMA identified in Alternatives 5 and 6, Anthro Mountain and West Tavaputs have not been identified as either PHMA or GHMA.

Anthro Mountain-West Tavaputs – The Anthro Mountain area is predominantly National Forest System land and management would remain the same because USFS is not part of this current planning effort; however, there is a small sliver of BLM land (1,397 acres) in the very southern portion near the Bad Land Cliffs and predominantly Tribal lands in the very northernmost extent (Cottonwood Canyon/Cottonwood Ridge). Under alternatives 5 and 6, the BLM portion (1,397 acres) would not be managed as PHMA. The majority of telemetry use is on the USFS lands; however, some birds do use the BLM portions. The easternmost portion of Anthro Mountain has 7 occupied leks (all on USFS) and some birds have been documented moving up to 25 miles outside of the Anthro Mountain area.

The West Tavaputs area is a mix of BLM, State of Utah State Institutional Trust Lands Administration (SITLA), and private lands. There are 6 occupied leks in this area. "Telemetry data suggest some birds are moving large distances to separated areas of seasonal habitats, including movements off the plateau. These seasonal movements include Emma Park, West Tavaputs, Fruitland, and Blue Bench and can range between 14 and 33 miles" (2015 FEIS Section 3.3.5, p. 3-27). Similar to what was analyzed in the 2015 FEIS under Alternative E, "SGMAs would not include the Anthro Mountain and West Tavaputs populations. These populations may be important for redundancy and may provide connectivity to northeastern Utah GRSG populations. While there is documented movement between these two areas and other population areas (e.g., Emma Park and portions of the Uintah Population Area on private and Tribal lands), it is unknown what level of connectively is necessary to prevent isolation of populations and how important these areas are to maintaining genetic viability." (2015 FEIS, Section 4.3.6, p. 4-99).

The 2015 FEIS stated, "a total of 1,417 wells are predicted to be drilled from 709 pads within the occupied habitat of the Carbon Population Area, with a total disturbance estimated to be 6,384 acres. Development of 1,417 wells from 709 pads within occupied habitat in the Carbon Population Area would most likely impact some portions of the population to a greater degree than others. Removing management for Anthro Mountain and West Tavaputs would be similar to Alternative E from the 2015 Final EIS (Section 4.3.6 of the 2015 FEIS), which states "impacts would be the greatest in these areas because they have high oil and gas potential. The majority of the lands have already been leased, and they include GRSG habitat outside of PHMA and GHMA that would not be afforded any protection under this alternative." In the Carbon Population per the 2015 FEIS (4.3.2 p. 4-28 RFD), "most of the development is expected to occur in the Gasco, West Tavaputs, Gordon Creek, Drunkards Wash, and Brundage Canyon development areas. Developing 709 pads, additional wells, and ancillary facilities would likely cause direct habitat loss, functional habitat loss, and fragmentation and may impact the local GRSG population. The development in some of these areas may hinder the function of seasonal habitat for some of the local populations, causing localized population declines. The northern population that uses these areas for most of their life history needs would most likely decline. The population that is centered in the central region of the Carbon Population Area (Emma Park) would be impacted to a lesser degree because development is not currently focused in this area, this habitat would be left more intact, and the local birds are mostly nonmigratory." Potential connectivity for Tavaputs, Emma Park, and Tribal lands is unknown.

Sheeprocks – The Sheeprocks area is predominantly BLM, USFS, SITLA, and private land. There are 11 leks in this area. From 2007 to 2016, the 10-year running mean population of male birds on Sheeprock population area leks was 51 males, with 119 males in 2007 and 21 males in 2016. The 10-year decline went from an estimated 472 birds to 84 birds. Isolation and small-size was identified as a major causal factor in the Causal Factor Analysis [BLM 2021] for the Sheeprocks population. Since 2016 when Sheeprocks hit a hard population trigger under the 2015 ARMPA, the population has been augmented through translocations of sage-grouse from other populations in Utah. Telemetry data has been collected in association with the translocations. Translocations has led to a heavily augmented population that is isolated and shows no connectivity or movement corridors to other populations.

Under Alternatives 5 and 6, Sheeprocks would be entirely managed as GHMA. The boundary would also remove prior PHMA/GHMA north of Faust/Rush Valley and areas in the Little Sahara Recreation Area south of Old Highway 148 (Weiss Highway), which was identified in the 2019 planning effort. These are two small areas in the Sheeprocks area, which would be "managed as available for cross-country OHV use. Approximately 6,320 acres in the 5 Mile Pass area in GHMA on the northeastern portion of Sheeprocks, and 7,900 acres in the Little Sahara Sand Dunes area in GHMA on the southern portion of the Sheeprocks population would be managed as available for cross-country OHV use. The acres in both areas are directly adjacent to other areas that are also available to cross-country OHV use, and were originally part of the same open areas prior to 2015. The 2015 Final EIS notes that "habitat loss could occur associated with cross-country OHV use" (2015 Final EIS page 4-52). However, a review of GPS tracking data for GRSG in the Sheeprocks area indicates that none of the collared birds (a sub-sample of the total population) used the areas proposed to be made available to cross-country use again (Chelak and Messmer 2017). "Due to the long-term use in both of these areas prior to 2015, these areas have likely already experienced the habitat losses, so this change is not anticipated to result in impacts on greater sage-grouse or its habitat." [2018 FEIS p. 4-22].

Proposed RMP Amendment uses HMA boundaries that were coordinated with the State of Utah based on Alternatives 4 and 5.

The Proposed RMP Amendment would manage for a combination of PHMA, GHMA, and GHMA-Connectivity:

- Is similar to Alternative 5 and the State of Utah's Sage-grouse Management Areas (SGMA),
- incorporates 100% of occupied leks within PHMA or GHMA,
- incorporates connectivity corridors based on the new science as GHMA-Connectivity, which were GHMA in Alternative 4, and
- incorporates habitat improvement projects completed for the benefit of GRSG.

Under the Proposed RMP Amendment, there are no occupied leks that are outside of PHMA or GHMA. The Proposed RMP Amendment prioritizes habitat management areas (PHMA and GHMA) that encompass 100 percent of the occupied leks during 2023 surveys. There are no leks within GHMA-Connectivity.

Following coordination with Cooperating Agencies, the Proposed RMP Amendment:

- Retains Sheeprocks as PHMA rather than GHMA as it was identified in Alternative 5,
- Retains the importance of West Tavaputs as PHMA due to occupied leks and oil and gas remediation efforts completed as part of GRSG mitigation,
- Identifies areas that coincide with the State of Utah's SGMA as GHMA- Connectivity in between PHMA in Hamlin Valley, Bald Hills, Panguitch, Carbon, and Uintah population areas where the new science (Row et al. 2018) and telemetry indicate habitat importance for connectivity.
- Other GHMA habitat was retained where there were occupied leks, population connectivity across state borders, habitat restoration projects, and other known areas of occurrence (i.e seasonal habitat use).

3.6.1 Statewide (Proposed RMP Amendment) - Habitat Management Area Acres

Area Acres

- 5,778,435 acres in PHMA
- 2,134,470 of the BLM-administered surface acres are in PHMA
- 1,286,432 of the BLM-administered mineral estate are in PHMA
- 1,948,214 acres in GHMA
- 648,673 of the BLM-administered surface acres are in GHMA
- 529,664 of the BLM-administered mineral estate are in GHMA
- 411,219 acres in GHMA Connectivity
- 295,492 of the BLM-administered surface acres are in GHMA Connectivity
- 45,462 of the BLM-administered mineral estate are in GHMA Connectivity

Leks Under Proposed RMP Amendment HMAs:

- 366 of the 380 (96.3%) occupied leks in Utah are in PHMA
- 14 of the 380 (3.7%) occupied leks in Utah are in GHMA (2 in the Rich population area, 5 in Morgan-Summit, and 7 in the Blue Bench area of the Uintah population area on Uintah-Ouray Tribal lands)
- 0 of the 380 occupied leks in Utah are outside any Utah habitat management area

Proposed RMP Amendment Definitions in addition to those identified above:

General Habitat Management Areas (GHMA) – Connectivity are areas within GRSG GHMA habitat that contain an increased level of biological importance because they provide for connectivity between localized areas of PHMA, above that of regular GHMA, based on new science and telemetry studies. Management in GHMA-Connectivity is consistent with GHMA except for Utility Scale Wind and Solar and Major ROWs.

3.7 WYOMING

BLM Wyoming used the most current scientific information, GRSG leks, and local expertise to update and revise GRSG HMA's across the state. HMAs in Alternatives 5 and 6 in the Draft RMPA/EIS as well as the HMAs in the Proposed RMP Amendment /Final EIS were developed by the State of Wyoming and adopted by the BLM as developed. For Alternatives 3 and 4 in the Draft RMPA/EIS, the BLM first considered the existing HMA boundaries as identified in the 2015 and 2019 plans (Alternatives 1 and 2 respectively in the Draft EIS). Existing HMA boundaries were revised using the following data sources: (A) modeled GRSG lek persistence (Wann et al. 2023), (B) modeled sagebrush habitats that currently have high ecological integrity (Doherty et al. 2022), (C) modeled sagebrush habitats that are projected to have high ecological integrity into the near future (2030-2060) (Doherty et al. 2022), (D) genetic connectivity (Row et al. 2018; Cross et al. 2023), (E) sagebrush, invasive annual grass and conifer canopy cover (estimated in 2021; Rigge et al. 2022, Rigge et al. 2021b); (F) terrain ruggedness (i.e., a measure of the variation in terrain slope and aspect; Welty and Jefferies 2018); (G) fire perimeter data from 1985 to 2021 (National Interagency Fire Center); (H) active energy development data (Wyoming Oil and Gas Conservation Commission); (I) GRSG lek location and activity status (Wyoming Game and Fish Department; Whitford and Bish 2022); (J) National Agriculture Imagery Program (NAIP) aerial imagery (2019); and (K) local expertise and data.

The State of Wyoming's efforts to update GRSG core areas began in March 2023. The state generated Draft 1 of proposed changes to core areas the week of May 15. The state's Draft 1 polygons were overlayed with the BLM's HMA polygons so that the extent of both efforts was captured in Alternative 4.

Wyoming revised their core area designated habitats several times between release of Draft 1 in May and the version released October 18, 2023. The state's core area polygons from October were adopted by the BLM as Alternatives 5 and 6 in the Draft EIS. On April 4, 2024, Wyoming released the final version of the revised core area designated habitats, which the BLM adopted in the Proposed RMP Amendment in the Final EIS.

Three tiers of habitat designations were considered for HMAs: (1) Priority Habitat Management Areas (PHMA); (2) Stewardship Habitat Management Areas (SHMA); and (3) General Habitat Management Areas (GHMA). PHMA was the only designation considered in Alternative 3 in the Draft RMPA/EIS; PHMA and GHMA were designations considered in Alternative 4 in the Draft EIS; and PHMA, SHMA and GHMA were designations considered in Alternatives 5 and 6 in the Draft RMPA/EIS and in the Proposed RMP Amendment in the Final EIS. Definitions of PHMA and GHMA are the same as those in the 2019 sage-grouse plan, and the definition of SHMA is the same as that provided to the BLM by the State of Wyoming for the areas receiving this designation. Generalized management statements were added to the definitions of PHMA and GHMA for clarity and to align the information provided in these definitions with the definition of SHMA received from the state.

PHMAs: GRSG habitats that have the highest conservation value for maintaining or increasing GRSG populations. The management in these areas is focused towards maintaining, enhancing, and where necessary

restoring conditions suitable for GRSG across the seasonal ranges included as PHMA (breeding, brood-rearing, winter, and connectivity).

SHMAs: GRSG habitats that are generally characterized by large percentages of private land, existing disturbance and prior and existing rights, and fragmented landscapes but that continue to support substantial populations of GRSG, provide important connections between populations, and are important for maintaining GRSG populations. Management in SHMA is consistent with GHMA restrictions.

GHMA: all occupied and potential GRSG habitats not designated as PHMA or SHMA. Management in GHMA is focused on sustaining habitats suitable for GRSG populations using these areas.

Although the total area considered PHMA, SHMA and GHMA combined did not differ among Alternatives 3, 4, 5 and 6 in the Draft EIS, different combinations of habitat designations among the alternatives were considered to provide a range of alternatives and as such planning flexibility resulting from analyses in the Draft EIS. Alternative 3 was the conservation-forward alternative and the BLM analyzed all habitats occupied by GRSG plus habitats that provide suitable habitat conditions for the species in the State as PHMA. The overall extent of PHMA in alternative 3 was considered as the extent of PHMA, SHMA and GHMA combined in alternatives 4, 5, and 6.

Alternatives 4, 5, and 6 considered revisions to the current (Alternatives 1 and 2) PHMA (core area) designated areas. In general, Alternative 4 followed closely with the results of the research described above resulting in more habitats in the state being designated as PHMA compared to Alternative 5. Alternatives 5 and 6 put more weight on GRSG lek count information and existing and potential anthropogenic disturbance compared to Alternative 4 resulting in a more focused application of the PHMA designation to areas identified as being associated with GRSG leks supporting a greater percentage of the state's population of GRSG. An area in northeastern Wyoming was identified following the state's process as supporting high GRSG populations but was designated as SHMA in Alternative 5 because of high levels of existing disturbance and private lands. Revisions to the designation of areas currently considered PHMA (Alternatives 1 and 2) that no longer provide GRSG with suitable habitat conditions were incorporated into alternatives 4, 5, and 6. Designated HMAs (PHMA, SHMA and GHMA) in the Proposed RMP Amendment/Final EIS aligned closely with those analyzed in Alternative 5 (the preferred alternative) with some minor reductions in PHMA in southern and southwestern Wyoming.

Appendix 4. Lek Status Definition Comparison

Leks are traditional breeding display areas where male GRSG gather to attract and breed females (Connelly et al., 2011). Counts of males on leks are the primary method to monitor sage-grouse populations. Lek counts aid in estimating trend and potentially size of breeding populations and determine location of breeding habitats, informing conservation actions (Cook et al., 2022). Previous lek count guidelines (i.e., Autenrieth et al., 1982, updated by Connelly et al., 2003) have been adjusted by each state across the species' range, resulting in inconsistencies and unintentional biases that create challenges when calculating population trends across state lines (Cook et al., 2022). Given the importance of lek definitions and counts in guiding GRSG management across its range, the Western Association of Fish and Wildlife Agencies (WAFWA) has drafted new guidelines that provide consistent population trend analyses across political boundaries and management applications (Cook et al., 2022). Under all alternatives, including the Proposed RMP Amendment, the BLM is proposing to adopt the lek definitions developed by WAFWA to ensure consistency across the RMPs and with our State wildlife agency partners.

Lek Definition Comparison – Nevada/California, Utah, Idaho, Oregon, Colorado, Wyoming, North Dakota, and South Dakota

Term	WAFWA Definition	NV/CA (2015 BLM plan unless otherwise noted)	UT (2015 BLM Plan unless otherwise noted)	ID (2015 BLM Plan unless otherwise noted)	OR (2015 BLM Plan unless otherwise noted)	CO (2015 BLM plan unless otherwise noted)	WY (2015 9-Plan BLM plan unless otherwise noted)	ND (2015 BLM plan only, no 2019 plan)	SD (2015 BLM plan only, no 2019 plan)
Lek	A lek is a traditional location where at least 2 male greater sage-grouse congregate during at least 2 springs within a 10-year period to perform their strutting display and opportunistically breed with females. Although males are territorial on leks and occupy an area, not a point, the representative location for the lek is the estimated or calculated center of the display activity. The 'lek' is the standard reporting and analysis unit for evaluating population status and long-term trends. Because males may alter their display locations within and between years (for numerous possible reasons), these multiple locations 'within' the lek have been referred to as "sub-leks", "satellite leks", "alternative leks", or "temporary leks". The location provided for the overall 'lek' should represent the dominant, largest, and/or most recent annual activity center. The lek identifier is the critical piece of data to remain consistent over time, the location can shift over time.	2015 plan: A traditional courtship display area attended by male sage-grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Sub-dominant males may display on itinerant strutting areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al. 2000; Connelly et al. 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest. 2019 Plan: . A traditional display area where two or more male Greater Sage-Grouse have attended in 2 or more of the previous 5 years. The area is typically in an open site in or next to sagebrush-dominated habitats (Connelly et al. 2003). Generally, lek sites are traditional, with the same lek sites used year after year (Scott 1942; Batterson and Morse 1948; Wiley 1978;	2015 plan: A traditional courtship display area attended by male sage-grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Sub-dominant males may display on itinerant strutting areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al. 2000, 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest. Leks can be different shapes, may move, and may change size year to year. When specific information is available for lek edges that information would be used for determining management buffers. 2019Plan: An arena where male Greater Sage-Grouse display for the purpose of gaining breeding territories and attracting females. These arenas are usually open areas with short	2015 plan: A traditional courtship display area attended by male GRSG in or next to sagebrush-dominated habitat. A lek is designated based on observations of two or more male GRSG engaged in courtship displays. Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest. 2019 plan: An area where male Greater Sage-Grouse display for the purpose of gaining breeding territories and attracting females. These arenas are usually open areas with short vegetation within sagebrush habitats, usually on broad ridges, benches, or valley floors where visibility and hearing acuity are excellent. (Note – 2019 plan does not include other definitions)	2015 Plan: An area where male sage-grouse display during the breeding season to attract females (also referred to as strutting-ground). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. 2019 Plan: An arena where male sage-grouse display for the purpose of gaining breeding territories and attracting females. These arenas are usually open areas with short vegetation within sagebrush habitats, usually on broad ridges, benches, or valley floors where visibility and hearing acuity are excellent.	2015 plan: An arena where male sage-grouse display for the purpose of gaining breeding territories and attracting females. These arenas are usually open areas with short vegetation within sagebrush habitats, usually on broad ridges, benches, or valley floors where visibility and hearing acuity are excellent. Also called "strutting ground" (CPW 2008a). 2019 plan: Same as above, though omitted "Also called "strutting ground" (CPW 2008a)." (Note – 2019 plan does not include other definitions)	2015 plan: A courtship display area attended by male Greater Sage-Grouse in or adjacent to sagebrush dominated habitat. A lek is designated by two or more male sage-grouse engaged in courtship displays. For management purposes, leks with less than five males observed strutting should be confirmed active for two years to meet the definition of a lek (Connelly et al 2000, Connelly et al. 2003, 2004). 2019 Plan: An arena where male Greater Sage-Grouse display for the purpose of gaining breeding territories and attracting females. These arenas are usually open areas with short vegetation within sagebrush habitats, usually on broad ridges, benches, or valley floors where visibility and hearing acuity are excellent.	A traditional courtship display area attended by male Greater Sage-Grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male Greater Sage-Grouse engaged in courtship displays. Sub-dominant males may display on itinerant strutting areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al 2000, Connelly et al. 2003, 2004). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest.	For this RMP analysis, leks are areas used by sage-grouse during the mating season where males display to attract receptive females. Lek locations are typically used with great fidelity for decades or longer, though they may move some over time. These sites are characterized by low vegetation with sparse shrubs often surrounded by big sagebrush communities. Leks are considered to be the center of sage-grouse activities. Existence of a greater sage-grouse lek is supported by data collection. Supporting data defined as: a) minimum of 2 years with 2 or more males lekking on site (preferred); or b) 1 year with 2 or more males lekking on site followed with evidence of lekking (vegetation trampling, feathers, and droppings) during subsequent year. For the purpose of this RMP analysis, BLM follows South Dakota Game, Fish, & Parks in recognizing leks as active or inactive.

Term	WAFWA Definition	NV/CA (2015 BLM plan unless otherwise noted)	UT (2015 BLM Plan unless otherwise noted)	ID (2015 BLM Plan unless otherwise noted)	OR (2015 BLM Plan unless otherwise noted)	CO (2015 BLM plan unless otherwise noted)	WY (2015 9-Plan BLM plan unless otherwise noted)	ND (2015 BLM plan only, no 2019 plan)	SD (2015 BLM plan only, no 2019 plan)
Lek *(cont.)*	*(See above.)*	Autenrieth 1981). Taller sagebrush on the outskirts of the leks is necessary as a food source, escape cover, nesting cover for females, and loafing cover during the day (Patterson 1952; Gill 1965; Klebenow 1985).	vegetation within sagebrush habitats, usually on broad ridges, benches, or valley floors where visibility and hearing acuity are excellent.	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*	*(See above.)*
Active	A lek that has 2 or more males counted during two or more years within the last 10 years.	2015: Any lek that has been attended by 2 or more males at least twice in the last 5 years 2019: 2 or more male observed at least twice in the last 5 years.	Any lek that has been attended by male sage-grouse during the strutting season	Any lek that has been attended by more than one male GRSG during the breeding season.	A lek attended by 1 male sage-grouse or more during the breeding season. Acceptable documentation of sage-grouse presence includes observation of birds using the site or recent signs of lek attendance (e.g. fresh droppings, feathers). New leks found during ground counts or surveys are given an annual status of active.	An open area that has been attended by more than two male sage-grouse more than two of the previous five years (Connelly et al. 2000a). This definition is derived mainly from observations of leks in large, stable populations and may not be appropriate for small populations with reduced numbers of males attending leks in fragmented sagebrush communities. Therefore, for smaller populations (e.g., Meeker – White River) that are isolated or disjunct from larger, more stable populations, an active lek is defined as an open area where one or more sage-grouse have been observed on more than one occasion engaging in courtship or breeding behavior. An area used by displaying males in the last five years is considered an active lek (CPW 2008a).	Any lek that has been attended by male Greater Sage-Grouse during the strutting season.	Any lek that has been attended by male Greater Sage- Grouse during the strutting season.	No similar definition.
Occupied	No similar definition.	A lek that has been active during at least one strutting season within the prior 10 years.	A lek that has been active during at least one strutting season within the prior 10 years.	A lek that has been active during at least one breeding season within the prior 5 years.	A regularly visited lek that has had 1 male or more counted in one or more of the last 7 years. Designate and protect surrounding area as Category 1 habitat.	A lek that has been active during at least one strutting season within the prior 10 years.	A lek that has been active during at least one strutting season within the prior 10 years.	A lek that has been active during at least one strutting season within the prior 10 years.	No similar definition.

Term	WAFWA Definition	NV/CA (2015 BLM plan unless otherwise noted)	UT (2015 BLM Plan unless otherwise noted)	ID (2015 BLM Plan unless otherwise noted)	OR (2015 BLM Plan unless otherwise noted)	CO (2015 BLM plan unless otherwise noted)	WY (2015 9-Plan BLM plan unless otherwise noted)	ND (2015 BLM plan only, no 2019 plan)	SD (2015 BLM plan only, no 2019 plan)
Inactive	A lek at which all observations within the last 10 years have been less than 2 males and that has had at least 2 males recorded during a lek count between 11 to 20 years ago.	2015 Plan: Any lek where sufficient data suggests that there 0 or 1 male during every visit (minimum 2 visits) in the last 5 years. 2019 Plan: 0 or 1 male observed during every visit (minimum two visits) in the last 5 years.	Any lek where sufficient data suggests that there was no strutting activity throughout a strutting season. Absence of strutting sage-grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of either: 1) an absence of sage-grouses on the lek during at least 2 ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 (or other appropriate date based on local conditions), no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise) or 2) a ground check of the exact known lek site late in the strutting season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.	Any lek where sufficient data suggests that there was no strutting activity throughout a breeding season. Absence of male GRSG during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of one of the following scenarios: • An absence of GRSG on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under acceptable conditions (clear to partly cloudy and winds less than 10 knots per hour) and in the absence of obvious disturbance (April 1-May 7 or other appropriate date based on local conditions) • A ground check of the exact known lek site late in the breeding season that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.	A lek with sufficient survey data to suggest that there was no male attendance throughout a breeding season. Absence of male grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of either: 1) an absence of birds on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under acceptable weather conditions (clear to partly cloudy and winds less than 15 kilometers per hour [less than 10 miles per hour]) and in the absence of obvious disturbance or, 2) a ground check of the exact known lek site late in the strutting season that fails to find any sign (fresh droppings/feathers) of attendance. Data collected by aerial surveys alone may not be used to designate inactive status.	Any lek where sufficient data suggests that there was no strutting activity throughout a strutting season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of either: 1) an absence of sage-grouses on the lek during at least 2 ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7, or other appropriate date based on local conditions, no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise) or 2) a ground check of the exact known lek site late in the strutting season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.	Any lek where sufficient data suggests that there was no strutting activity throughout a strutting season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of either: 1) an absence of sage-grouses on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 (or other appropriate date based on local conditions), no precipitation, light or no wind, half-hour before sunrise to one hour after sunrise) or 2) a ground check of the exact known lek site late in the strutting season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.	Any lek where sufficient data suggests that there was no strutting activity throughout a strutting season. Absence of strutting grouse during a single visit is insufficient documentation to establish that a lek is inactive. This designation requires documentation of either: 1) an absence of Greater Sage-Grouses on the lek during at least two ground surveys separated by at least seven days. These surveys must be conducted under ideal conditions (April 1-May 7 (or other appropriate date based on local conditions), no precipitation, light or no wind, half- hour before sunrise to one hour after sunrise) or 2) a ground check of the exact known lek site late in the strutting season (after April 15) that fails to find any sign (tracks, droppings, feathers) of strutting activity. Data collected by aerial surveys should not be used to designate inactive status as the aerial survey may actually disrupt activities.	No similar definition.
Unoccupied lek	No similar definition.	A lek that has either been “destroyed” or “abandoned.”	A lek that has had no males counted in greater than 10 years.	An unoccupied lek is one that has not been active for 5 consecutive years. To be designated unoccupied, a lek must be inactive (see above criteria) for 5 consecutive breeding seasons.	A lek that has been counted annually and has had no birds for 8 or more consecutive years. Mitigation category based on habitat type and condition.	A lek that has either been “destroyed” or “abandoned.”	A lek that has either been “destroyed” or “abandoned.”	A lek that has either been “destroyed” or “abandoned.”	No similar definition.

Term	WAFWA Definition	NV/CA (2015 BLM plan unless otherwise noted)	UT (2015 BLM Plan unless otherwise noted)	ID (2015 BLM Plan unless otherwise noted)	OR (2015 BLM Plan unless otherwise noted)	CO (2015 BLM plan unless otherwise noted)	WY (2015 9-Plan BLM plan unless otherwise noted)	ND (2015 BLM plan only, no 2019 plan)	SD (2015 BLM plan only, no 2019 plan)
Historical	A lek at which all observations within the last 20 years have been less than 2 males, but previously met the definition of a lek. (Previously "Historic", Coates et al. 2021)	2015 Plan: Any lek that has been attended by 0 or 1 male during every visit (minimum 5 visits) in the last 30 years. 2019 Plan: 0 or 1 male observed during every visit (minimum five visits) in the last 30 years.	No similar definition.	No similar definition.	A lek that has been unoccupied prior to 1980 and remains so. Mitigation category based on habitat type and condition (1980 serves as the baseline for evaluating population objectives under ODFW's Sage-grouse Conservation Strategy, thus leks unoccupied prior to 1980 are not included in the baseline for population abundance and distribution.)	No similar definition.	(Former term for "unoccupied lek".) There are two types of unoccupied leks, "destroyed" or "abandoned." Management protection will not be afforded to unoccupied leks.	No similar definition.	No similar definition.
Pending Active	A lek with one observation of at least 2 males in the last 10 years and at least one observation of at least 2 males more than 10 years ago. This status captures leks insufficiently monitored to classify as Active, Inactive, or Historical but contains a more recent observation than Pending Historical. (Previously "Pending New", Coates et al. 2021)	2015 Plan: Any lek that has been attended by 2 or more males only once in the last 5 years. 2018 Plan: 2 or more males observed only once in the last 5 years.	No similar definition.	No similar definition.	(called "Occupied-pending") A lek not counted regularly in the last 7 years, but birds were present at last visit. Designate and protect surrounding area as Category 1 habitat. These leks should be resurveyed at a minimum of two additional years to confirm activity	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Pending Historical	A lek with insufficient observations in the last 10 years to classify as Active, Inactive, Historical, or Pending Active. This requires one observation of at least 2 males recorded 11 to 20 years ago and at least one observation of at least 2 males more than 20 years ago. (Previously "Pending Old", Coates et al. 2021)	No similar definition.	No similar definition.	No similar definition.	(Called "Pending Lek") A lek not counted regularly in the last seven years, but birds were present one or more years of that period.	No similar definition.	No similar definition.	No similar definition.	No similar definition.

Term	WAFWA Definition	NV/CA (2015 BLM plan unless otherwise noted)	UT (2015 BLM Plan unless otherwise noted)	ID (2015 BLM Plan unless otherwise noted)	OR (2015 BLM Plan unless otherwise noted)	CO (2015 BLM plan unless otherwise noted)	WY (2015 9-Plan BLM plan unless otherwise noted)	ND (2015 BLM plan only, no 2019 plan)	SD (2015 BLM plan only, no 2019 plan)
Lek Complex	Considered an "outmoded" definition. 1. A grouping of leks that likely have frequent movement of individuals between leks. 2. A single lek recorded in multiple locations in multiple years in relatively close proximity. Sub-lek is a lek whose location generally ≤ ¼ mile from other sub-leks is an activity center for a specific year or series of years. A lek can be represent multiple sub-leks, or may contain only one sub-lek.	2015 Plan: A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male GRSG may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004). 2019 Plan: (called "Lek Cluster") A group of leks in the same vicinity, among which Greater Sage-Grouse may interchange over time, and representing a group of closely related individuals.	A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male sage-grouse may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).	A lek or group of leks within 2.5 kilometers (1.5 miles) of each other between which male GRSG may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).	A collection of lek sites typically with small numbers of males which are associated with a larger lek site in the vicinity (less than or equal to 1 mile). A count of a lek complex generally includes systematically acquiring and recording information about all displaying males in a series of leks where no 2 lek sites are more than 1 mile apart.	A lek or group of leks within 2.5 km (1.5 mi) of each other between which male sage-grouse may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).	A lek or group of leks within 2.5 km (1.5 mi) of each other between which male sage-grouse may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).	A lek or group of leks within 2.5 kilometers (km) (1.5 miles) of each other between which male Greater Sage-Grouse may interchange from one day to the next. Fidelity to leks has been well documented. Visits to multiple leks are most common among yearlings and less frequent for adult males, suggesting an age-related period of establishment (Connelly et al. 2004).	No similar definition.
Destroyed lek	No similar definition.	A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for GRSG breeding	A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for sage-grouse breeding.	No similar definition	No similar definition.	A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for sage-grouse breeding.	A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for sage-grouse breeding.	A formerly active lek site and surrounding sagebrush habitat that has been destroyed and is no longer suitable for Greater Sage-Grouse breeding.	No similar definition.
Abandoned lek	No similar definition. Historical lek would be most similar.	A lek in otherwise suitable habitat that has not been active during a period of 10 consecutive years. To be designated abandoned, a lek must be "inactive" (see above criteria) in at least four non-consecutive strutting seasons spanning the 10 years. The site of an "abandoned" lek should be surveyed at least once every 10 years to determine whether it has been re-occupied by sage-grouse.	A lek in otherwise suitable habitat that has not been active during a period of 10 consecutive years. To be designated abandoned, a lek must be "inactive" (see above criteria) in at least four non-consecutive strutting seasons spanning the 10 years. The site of an "abandoned" lek should be surveyed at least once every 10 years to determine whether it has been re-occupied by sage-grouse.	No similar definition.	No similar definition.	A lek in otherwise suitable habitat that has not been active during a period of 10 consecutive years. To be designated abandoned, a lek must be "inactive" (see above criteria) in at least four non-consecutive strutting seasons spanning the 10 years. The site of an "abandoned" lek should be surveyed at least once every 10 years to determine whether it has been re-occupied by sage-grouse.	A lek in otherwise suitable habitat that has not been active during a period of 10 consecutive years. To be designated abandoned, a lek must be "inactive" in at least four non-consecutive strutting seasons spanning the 10 years. The site of an "abandoned" lek should be surveyed at least once every 10 years to determine whether it has been re-occupied by sage-grouse.	A lek in otherwise suitable habitat that has not been active during a period of 10 consecutive years. To be designated abandoned, a lek must be "inactive" (see above criteria) in at least four non-consecutive strutting seasons spanning the 10 years. The site of an "abandoned" lek should be surveyed at least once every 10 years to determine whether it has been re-occupied by Greater Sage-Grouse.	No similar definition.

Lek Status Definition Comparison – MT and WY 2015 Plans

Term	WAFWA Definition	Billings	Lewistown	HiLine	Miles City	Buffalo	Bighorn Basin	Lander
Lek	A lek is a traditional location where at least 2 male greater sage-grouse congregate during at least 2 springs within a 10-year period to perform their strutting display and opportunistically breed with females. Although males are territorial on leks and occupy an area, not a point, the representative location for the lek is the estimated or calculated center of the display activity. The 'lek' is the standard reporting and analysis unit for evaluating population status and long-term trends. Because males may alter their display locations within and between years (for numerous possible reasons), these multiple locations 'within' the lek have been referred to as "sub-leks", "satellite leks", "alternative leks", or "temporary leks". The location provided for the overall 'lek' should represent the dominant, largest, and/or most recent annual activity center. The lek identifier is the critical piece of data to remain consistent over time, the location can shift over time.	An assembly area where birds, especially sage-grouse, carry on display and courtship behavior. Also referred to as a "strutting ground".	A traditional courtship display area attended by male sage-grouse in or next to sagebrush dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Subdominant males may display on itinerant strutting areas during population peaks. Such areas usually fail to become established leks; therefore, a site where less than five males are observed strutting should be confirmed active for two years before meeting the definition of a lek (Connelly et al 20008; Connelly et al. 20039, Connelly, et al. 200410). Each state may have a slightly different definition of lek, active lek, inactive lek, occupied lek, and unoccupied leks. Regional planning will use the appropriate definition provided by the state of interest.	Data supports existence of lek. Supporting data defined as: (a) minimum of 2 years with 2 or more males lekking on site (preferred); or (b) 1 year with 2 or more males lekking on site followed with evidence of lekking (vegetation trampling, feathers, and droppings) during subsequent year.	A traditional breeding area for sage-grouse and sharp-tailed grouse in which males assemble to establish dominance, display, and breed. Also called dancing grounds or strutting grounds. Confirmed sage-grouse lek: • a minimum of 2 years with 2 or more males lekking on site (preferred), or • 1 year with two or more males lekking on site, followed with evidence of lekking (vegetation trampling, feathers, and droppings) during the subsequent year.	A traditional courtship display area attended by male Greater Sage-Grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male Greater Sage-Grouse engaged in courtship displays. Before adding the suspected lek to the database, it must be confirmed by an additional observation made during the appropriate time of day, during the strutting season. Sign of strutting activity (tracks, droppings, feathers) can also be used to confirm a suspected lek. Sub-dominant males may display on itinerant (temporary) strutting areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where small numbers of males (less than 5) are observed strutting should be confirmed active for two years before adding the site to the lek database.	A traditional courtship display area attended by male sage-grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Before adding the suspected lek to the database, it must be confirmed by an additional observation made during the appropriate time of day, during the strutting season. Sign of strutting activity (tracks, droppings, feathers) can also be used to confirm a suspected lek. Sub-dominant males may display on itinerant (temporary) strutting areas during population peaks. Such areas usually fail to become established leks. Therefore, a site where small numbers of males (<5) are observed strutting should be confirmed active for two years before adding the site to the lek database	No similar definition. (only "occupied Lek" below)
Active	A lek that has more than 2 males counted during two or more lek counts within the last 10 years.	Data supports existence of lek. Supporting data defined as: a) minimum of 2 years with 2 or more males lekking on site (preferred) or b) 1 year with 2 or more males lekking on site followed with evidence of lekking (vegetation trampling, feathers, and droppings) during subsequent year.	No similar definition.	Default assignment unless criteria are met for "inactive" or "extirpated."	Default assignment unless criteria are met for "inactive" or "extirpated."	No similar definition.	No similar definition.	No similar definition.
Occupied	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	A lek that has been active during at least one strutting season within the last 10 years.

Term	WAFWA Definition	Billings	Lewistown	HiLine	Miles City	Buffalo	Bighorn Basin	Lander
Inactive	A lek at which all observations within the last 10 years have been less than 2 males and that has had at least 2 males recorded during a lek count between 11 to 20 years ago.	10 years with no males or sign of lek activity - supported by surveys conducted during 3 or more years over the last 10 years. Sage grouse abundance patterns have generally fit within a 10-year time frame, encompassing both years of abundance and relative scarcity. For the purpose of assigning lek status, 10 years with 3 years of supporting data is minimal for characterizing a lek as inactive. However, the capacity for surveying leks at a greater annual frequency in 10 years is generally limited and therefore this Status Definition incorporates both biological (i.e., past abundance patterns) and current administrative factors.	No similar definition.	10 years with no sign of lek activity - supported by surveys conducted during 3 or more years over the last 10 years.	10 years with no sign of lek activity and supported by surveys conducted during 3 or more years over the last 10 years.	No similar definition.	No similar definition.	No similar definition.
Unoccupied lek	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Historical	A lek at which all observations within the last 20 years have been less than 2 males, but previously met the definition of a lek. (Previously "Historic", Coates et al. 2021)	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Pending Active	A lek with one observation of at least 2 males in the last 10 years and at least one observation of at least 2 males more than 10 years ago. This status captures leks insufficiently monitored to classify as Active, Inactive, or Historical but contains a more recent observation than Pending Historical. (Previously "Pending New", Coates et al. 2021)	No similar definition.	No similar definition.	No similar definition.	No similar definition	No similar definition.	No similar definition.	No similar definition.

Term	WAFWA Definition	Billings	Lewistown	HiLine	Miles City	Buffalo	Bighorn Basin	Lander
Pending Historical	A lek with insufficient observations in the last 10 years to classify as Active, Inactive, Historical, or Pending Active. This requires one observation of at least 2 males recorded 11 to 20 years ago and at least one observation of at least 2 males more than 20 years ago. (Previously "Pending Old", Coates et al. 2021)	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Lek Complex	Considered an "outmoded" definition. 1. A grouping of leks that likely have frequent movement of individuals between leks. 2. A single lek recorded in multiple locations in multiple years in relatively close proximity. Sub-lek is a lek whose location generally ≤ ¼ mile from other sub-leks is an activity center for a specific year or series of years. A lek can be represent multiple sub-leks, or may contain only one sub-lek.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Destroyed lek	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.	No similar definition.
Abandoned lek	No similar definition. Historical lek would be most similar.	("Confirmed Extirpated") Habitat changes have caused birds to permanently abandon a lek (e.g., plowing, urban development, overhead power- line).	No similar definition.	("Extirpated") Habitat changes have caused birds to permanently abandon a lek (e.g., plowing, urban development, overhead power line).	(Extirpated) habitat changes have caused birds to abandon permanently a lek (e.g., plowing, urban development, overhead power lines).	No similar definition.	No similar definition.	No similar definition.
Provisionally confirmed Greater Sage-Grouse lek	—	—	—	Only one year of survey data is available but more than 5 males were observed.	—	—	—	—
Unconfirmed Greater Sage-Grouse lek	—	—	—	Single count with no subsequent survey or a reported lek without supporting survey data.	—	—	—	—

Appendix 5

Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat

This page intentionally left blank.

Appendix 5. Areas of Critical Environmental Concern for Greater Sage-Grouse Habitat

5.1 INTRODUCTION

This appendix provides an overview of the potential Areas of Critical Environmental Concern (ACECs) considered in the Draft and Final EIS and describes the rangewide and state-by-state process the BLM undertook in identifying and addressing internal and externally provided ACEC nominations and evaluating areas for inclusion as potential ACECs in the RMPA. This appendix also provides an analysis of the effects of the alternatives on the potential ACECs that were considered under Alternatives 3 and 6.

The BLM identified 32 potential ACECs for consideration in the Draft EIS under Alternatives 3 and 6. Between the Draft EIS and the Final EIS the BLM refined the boundaries of some of the ACECs based on updated data and input and, in five instances in Idaho and Nevada/California, removed ACECs from consideration. All of the changes that occurred between Draft and Final EIS are described in the state-by state sections below. Following is a summary of the ACECs acres by state as identified in the Final EIS in both Alternatives 3 and 6.

Table 5-1. Summary of Potential GRSG ACECs by State

State	Acres of Potential ACEC in Draft EIS	Acres of Potential ACEC in Final EIS
Colorado	4,547	4,547
Idaho	3,438,307	1,689,386
Montana/Dakotas	726,062	726,050
Nevada/California	5,766,150	5,364,627
Utah	365,181	365,182
Wyoming	839,225	636,352
Total	**11,139,472**	**8,786,144**

Colorado

Case Flats – 4,547 acres

Idaho

Owyhee – 653,199 acres
Shoshone Basin – 244, 935 acres
Camas-Laidlaw – 457,724 acres
Big Desert – 333,528 acres
Triangle – 92,000 acres (identified in Draft EIS and removed from consideration in the Final EIS)
Antelope – 39,230 acres (identified in Draft EIS and removed from consideration in the Final EIS)
Mountain Valley Complex – 336,009 acres (identified in Draft EIS and removed from consideration in the Final EIS)
Upper Snake Complex – 247,491 acres (identified in Draft EIS and removed from consideration in the Final EIS)

Montana

South Valley Phillips – 615,888 acres
Carter Crook – 110,162 acres

Nevada/California
Warm Springs – 89,539 acres
North Fork O'Neil – 937,512 acres
Grass-Kobeh Valley –852,979 acres
South Fork Dixie Flats – 122,395 acres
Idaho Border – 49,019 acres
Hays Canyon – 340,850 acres
Vya-Massacre – 239,677 acres
Buffalo Skedaddle – 182,213 acres
Montana Mountain – 314,370 acres
Butte Long Valley – 606,293 acres
Eureka North and South – 66,905 acres
Monitor Valley – 173,507 acres
Reese River – 85,000 acres
Utah Border – 58,650 acres
Owyhee East - 487,122 acres
Owyhee West- 704,650 acres
Little Butte Long Valley – 85,510 acres (identified in Draft EIS and removed from consideration in the Final EIS)

Oregon
None identified.

Utah
Rich – 132,924 acres
Box Elder – 232,258

Wyoming
Golden Triangle/Little Sandy – 272,557 acres
Carter-Crook (border w/MT) – 19,400 acres
Sagebrush Focal Areas in South Central and Southwestern Wyoming – 33,166 acres
Greater South Pass and Upper Green River Basin – 311,229 acres

Management direction associated with these ACECs considered in Alternative 3 and Alternative 6 is summarized in **Chapter 2**, **Table 2-14** and detailed in **Appendix 21**, **Section 21.1.12** and **Table 2-14**. The management direction for ACECs under Alternative 3 and 6 is also summarized below in **Table 5-2**. Alternative 3 generally provides the highest level of protection. Under Alternative 3, the management protections for PHMA are the highest of all the alternatives and this direction would apply in the potential ACECs. This management direction includes closing the areas to the development of utility-scale solar, utility-scale wind, fluid minerals, non-energy leasable minerals, and saleable mineral/material management and proposing the areas for mineral withdrawal. In addition, ACECs under Alternative 3 also receive two additional protections not provided by the PHMA management direction: the exclusion for major rights-of-way with no exceptions (in PHMA under Alternative 3, designated corridors are avoidance areas) and for locatable minerals the requirement for operators to submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use as defined in 43 CFR Part 3809.5 (in PHMA under Alternative 3, plan of operations are not required).

Table 5-2. Summary of ACEC Management Direction

Management Category	Alternative 3	Alternative 6
Fluid Mineral (including geothermal)	Closed	Open, No Surface Occupancy with w/exception that must be applicable to entire ACEC
Saleable Minerals & Materials	Closed	Closed to new operations except for free-use pits in support of maintenance for existing local roads and public safety.
Nonenergy Leasable Minerals	Closed	
Coal	BLM determines suitability pursuant to 43 CFR Part 3461.5	
Locatable Mineral	Proposed for withdrawal. Operators must submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations (as defined in 43 CFR 3809.5).	Operators must submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations (as defined in 43 CFR 3809.5).
Major Rights of Way	Major and Minor Rights of Way - Exclusion	Major Rights of Way – Exclusion. Minor rights of way – Avoidance. Designated RMP ROW corridors in the ACECs would be open for new ROWs, but new ROWs within the corridor would require compensatory mitigation to offset direct and indirect impacts of the development.
Solar (utility scale)	Exclusion	
Wind (utility scale)	Exclusion	
Criteria-Based Management for Non-Habitat	Process by which potential non-habitat may be reviewed via a field inspection.	
Mitigation	Apply the mitigation hierarchy to address changes in existing development or new development as the result of valid existing rights. Where avoidance or minimization will not fully offset a project's impacts compensatory mitigation is required and will at minimum meet the requirements of the state wildlife agency or other appropriate state authority, and BLM/DOI mitigation policy. If the state agency does not require mitigation, BLM will require compensatory mitigation to achieve no net habitat loss.	The BLM will apply the mitigation hierarchy. Where avoidance or minimization will not fully offset a project's impacts compensatory mitigation is required and will at minimum meet the requirements of the state wildlife agency or other appropriate state authority, and BLM/DOI mitigation policy. If the state agency does not require mitigation, or state-sponsored mitigation is determined by BLM to be inconsistent with BLM/DOI policy, BLM will require compensatory mitigation to achieve no net habitat loss.
Adaptive Management	Soft and hard adaptive management threshold based on habitat and population trends. Causal factor analysis is conducted to identify causal factor(s) and adaptive management response are instituted.	
Habitat Objectives	The habitat objectives identify the desired outcome for habitat on BLM-administered lands in all GRSG HMAs to support suitable GRSG habitat at multiple scales in order to support connected mosaics of sagebrush and provide seasonal habitats and dispersal.	

Management Category	Alternative 3	Alternative 6
Disturbance Cap	3% cap for new and pre-existing authorizations in the project analysis area and within HAF Fine-Scale boundaries while honoring valid existing rights. Cap would include infrastructure, fire, and agriculture.	All states: 3% cap in PHMA in the HAF Fine-Scale boundaries (5% in WY and MT). Applicable only to infrastructure. No exceptions to the disturbance cap.
Predation	Collaborate with appropriate state Agencies and others in their efforts to minimize impacts from predators on GRSG. Avoid new infrastructure in undisturbed habitat. Minimize food sources. Predator management plan requirement.	Same as Alt. 3 but predator management plan may be required.
Livestock Grazing	Unavailable to livestock grazing.	Managing livestock grazing to meet land health standards and avoid direct impacts to GRSG habitats from livestock range improvements.
Wild Horse and Burro	Wild horse and burros would be removed.	Manage within established appropriate management levels (AML). Incorporate GRSG habitat objectives into plans. Prioritize WH&B activities - such as monitoring, gathers, AML adjustments (due to causal factor) etc.

Under Alternative 6, the PHMA management direction for Alternative 5 would be applied in the potential ACECs but, unlike PHMA under Alternative 5, the following additional protections would be provided: potential ACECs would be closed to development of utility-scale solar and utility scale wind and would include additional protections related to fluid mineral development, saleable mineral/material management, major rights of way, the application of the disturbance cap with no exceptions, and for locatable minerals the requirement for operators to submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use as defined in 43 CFR Part 3809.5.

Following is a comparative summary of the management direction for ACECs under Alternative 3 and 6. Refer to **Appendix 21**, **Section 21.1.12** and **Table 2-14** for full management descriptions.

5.2 AREAS OF CRITICAL ENVIRONMENTAL CONCERN (ACECS) POLICY AND REGULATIONS

The Federal Land Policy and Management Act (FLPMA) requires that priority shall be given to the designation and protection of areas of critical environmental concern (ACECs). ACECs are defined in FLPMA Section 103(a) (43 United States Code 1702) and in 43 Code of Federal Regulations (CFR) 1601.0-5(a) as "areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards.". The following analysis and the resultant findings for ACEC relevance and importance criteria has been performed pursuant to FLPMA Section 202(c)(3) (43 United States Code 1712) and BLM implementing regulations 43 CFR 1610.7-2 *Designation of areas of critical environmental concern*. The ACEC regulations were revised as part of the BLM's Public Lands Rule (PLR) in April 2024 and an updated BLM ACEC Manual 1613 was issued in August 2024. Although the Notice of Availability (NOA) for

the GRSG RMP Amendment and EIS was published prior to the effective date of the PLR, and is, therefore, not expected to incorporate all elements of the PLR as per BLM IB 2024-048, the GRSG Proposed RMPA/FEIS is largely consistent with the PLR and the updated ACEC manual.

5.3 ACEC CRITERIA

Nominated ACECs that are found by BLM to meet the relevance and importance criteria identified in 43 CFR 1610.7-2 (d) must be evaluated in at least one alternative in the EIS or EA for the RMP or relevant RMP amendment (where ACECs are within the scope of the amendment). Following are the relevance and importance criteria identified in 43 CFR 1610.7-2:

> ***(1) Relevance.*** *The area contains important historic, cultural, or scenic values; fish or wildlife resources; natural systems or processes; or natural hazards potentially impacting life and safety.*
>
> ***(2) Importance.*** *A historic, cultural, or scenic value; a fish or wildlife resource; a natural system or process; or a natural hazard potentially impacting life and safety has importance if it has qualities of special worth, consequence, meaning, distinctiveness, or cause for concern; national or more than local importance, subsistence value, or regional contribution of a resource, value, system, or process; or contributes to ecosystem resilience, landscape intactness, or habitat connectivity. A natural hazard can be important if it is a significant threat to human life and safety.*

To be designated as an ACEC, an area must meet the relevance and importance criteria and the need for special management attention criterion which is identified in 43 CFR 1610.7-2:

> ***(3) Special management attention.*** *The important historic, cultural, or scenic values; fish or wildlife resources; natural systems or processes; or natural hazards potentially impacting life and safety require special management attention. "Special management attention" means management prescriptions that:*
>
> > ***(i)*** *Protect and prevent irreparable damage to the relevant and important values, or that protect life and safety from natural hazards; and*
> >
> > ***(ii)*** *Would not be prescribed if the relevant and important values were not present. In this context, "irreparable damage" means harm to a value, resource, system, or process that substantially diminishes the relevance or importance of that value, resource, system, or process in such a way that recovery of the value, resource, system, or process to the extent necessary to restore its prior relevance or importance is impossible.*

In this RMP Amendment EIS, in compliance with 43 CFR 1617.7-2 and the updated Areas of Critical Environmental Concern Manual MS 1613, the BLM has evaluated the areas found to have relevance and importance and has proposed them for ACEC designation in Alternatives 3 and 6. The BLM has also analyzed the effects of the management direction to these potential ACEC areas under all of the alternatives, including the Proposed RMP Amendment, in this appendix. This effects analysis provides the State Directors who will be signing the Records of Decision for this RMP Amendment with the information needed to determine if special management attention is needed to protect and prevent irreparable damage to the relevant and important values identified for the areas as required by 43 CFR 1610.7-2(3).

5.4 IDENTIFICATION OF POTENTIAL ACECS

5.4.1 Internally Identified ACECs

In identifying ACECs for consideration in this RMPA, the BLM took into account the entirety of GRSG habitat on BLM-administered lands, with no distinction between habitat management areas, specific nominated areas, or prior identified areas. With all GRSG habitat as the starting point, BLM then considered available data at multiple spatial scales to determine what, if any areas met relevance and importance criteria.

The BLM began this ACEC identification process at the rangewide scale and made refinements to the identification of potential ACECs at the state-specific scale.

In considering the relevance, the BLM considered just two of the components of the relevance criteria: 1) a wildlife resource, and 2) a natural process or system – related to GRSG habitats. No cultural, scenic, values or natural hazards were evaluated. The BLM considered multiple lines of information, never relying on just one data set to conclude a criterion was met. Rangewide models were an important starting point, but incorporation of local information, and considerations of data accuracy and scale of application were carefully reviewed prior to making the preliminary delineations of potential ACECs. The consideration of relevance and importance was conducted in a two-step approach that started with rangewide scientific data and models, followed by a review by staff at the state and field office levels who are more familiar with the local habitat conditions.

Rangewide Review

In conducting the initial rangewide review, BLM did not rely on prior designations such as Priority Areas for Conservation (PACs) and Sagebrush Focal Areas (SFAs) to identify potential ACECs. Rather than using the composite results of prior mapping efforts, which were identified for purposes different than land use planning or ACEC evaluation, this evaluation sought to use primary datasets because previous designations were not developed using the regulatory and policy criteria associated with the BLM ACEC process. Additionally, PACs and SFAs were developed using data that was available at the time of their publication (2013 and 2015, respectively). The PACs were developed by the States and helped inform the BLM's habitat management areas in the 2015 GRSG amendment effort. Since the 2013 COT Report, the BLM has worked with state wildlife agencies to update habitat management area boundaries for this amendment, in particular the BLM worked with all the states to re-evaluate the habitat management areas based on new science and research products that have been completed since 2015. For these reasons, the BLM did not use PACs or SFAs as an automatic delineation of potential ACECs, but instead visually reviewed a series of rangewide spatial layers (see list below) across the entire GRSG range. This preliminary review did not consider SFAs because the intention was to do the SFA review with updated data at the state level during the next step in the evaluation process. The purpose of the review was to identify potential areas where multiple data sources indicated areas of high value or concern related to GRSG use and conservation. The resulting areas were identified as an initial screening for consideration by BLM state and field office staff in their identification of areas that met the relevance and importance criteria and should be identified as potential ACECs in the RMPA. Every layer in the list below was considered but some carried more importance in some areas than others. For example, areas that models indicated as important genetic connectivity may have resulted in that layer receiving more emphasis than others where genetic connectivity was not a factor.

Layers reviewed

- Rigge et al. 2021. Projected change in rangeland fractional component cover across the sagebrush biome under climate change through 2085 (https://esajournals.onlinelibrary.wiley.com/doi/full/10.1002/ecs2.3538)
- Cross et al. 2022. The ties that bind the sagebrush biome: integrating genetic connectivity into range-wide conservation of greater sage-grouse

After initial areas were identified, the size and extent of the polygons were reviewed in context of the presence of BLM-administered lands. Areas where the BLM had marginal or scattered parcels were removed, as the effectiveness of habitat management is such areas is low without cross-ownership coordination. Some areas extend beyond BLM lands simply for consideration of external factors that may influence the conservation value of the areas being considered. For each area, the information supporting the decision to identify that area for further consideration is outlined below in the description of the state evaluations.

Figure 5-1 shows the potential areas that were identified through this rangewide review in relation to the SFAs identified in the 2015 RMP Amendment.

Figure 5-1: Rangewide Review Areas (light orange) and SFAs (dark green areas)

The following list summarizes the areas identified through the rangewide review, organized by state. Bullets that are bolded indicated the most influential considerations in identifying areas for further consideration.

Colorado

- North Park
  - Most of the area is PHMA
  - High relative abundance
  - Entire area is modeled breeding habitats
  - High habitat connectivity for genetics.
  - Climate change models predict 5-25% sagebrush cover into the future, with moderate increase in sagebrush biomass.
  - Area anchored by National Wildlife Refuge
  - **Few current threats**
  - **Appears to be an isolated population on the "edge" of the range**
- Wyoming/Colorado Border
  - Areas within PHMA in Colorado, and mostly PHMA in Wyoming
  - High relative abundance
  - Modeled breeding habitats cover entire area in Colorado, most of the area in Wyoming

  - Many genetic nodes, including an important node in Colorado. **Genetic movement between these areas suggest extensive population movements**
  - **High habitat connectivity for genetics within and between the areas**
  - Climate change models predict 5-25% sagebrush cover into the future and a mix of mostly increasing sagebrush biomass

Montana/Dakotas

- Area bordering North Dakota
  - GHMA in Montana, PHMA in North Dakota
  - High relative abundance
  - Several connected genetic nodes
  - **May provide the only refuge for the North Dakota birds; important for that genetic subpopulation**
  - Future sagebrush cover models suggest 0-4%, but that is not atypical for this area.
  - Future sagebrush biomass to increase
- Area bordering Wyoming
  - RHMA in Montana, mostly GHMA in Wyoming
  - High relative abundance
  - lots of modeled breeding habitat
  - contains an important genetic node (maybe hub?); **may provide a connection with the GRSG in the Dakotas, and Southeast Montana.**
  - Future sagebrush cover models suggest 0-4%, but that is not atypical for this area
  - Future sagebrush biomass to increase in PHMA and RHMA, but decrease in GHMA

Nevada/California

- Central Nevada (Areas that are currently PHMA and high abundance only)
  - **High relative abundance**
  - High modeled breeding habitats
  - **High connectivity within the PHMA areas**
  - Two key genetic nodes and many other genetic nodes
  - Overlaps two genetic subpopulations
  - Climate change models predict 5-25% sagebrush cover, but decreasing biomass in most areas
- East-central California
  - Area is PHMA
  - **High relative abundance – likely the greatest number of males in California**
  - Breeding habitat mimics relative abundance
  - **Few genetic nodes but those indicate connection to the north (Oregon) and Southeast into Nevada**
  - Medium connectivity (combined models)
  - Climate change models predict reduction in sagebrush biomass, but sagebrush cover at 5-25%

Utah

- Northwest Utah
  - Area is PHMA
  - Some areas of high relative abundance

  - Breeding habitat model are in the same area of high relative abundance
  - Habitat connectivity for genetic is high throughout the area
  - **Area has two key genetic nodes and several others. The key nodes are connected with populations in Idaho and eastern Nevada, while other nodes are connected with southern Utah populations and northeastern Utah.**
  - **3 subpopulations overlap this area – may indicate value for maintaining connectivity.**
  - Climate change models predict 5-25% sagebrush cover into the future and increasing sagebrush biomass
  - **Looking at wintering habitat – breeding habitat is on private ground**
- Parker Mountain
  - Area is currently PHMA
  - High relative abundance
  - Area is modeled breeding habitat
  - **Contains one key genetic node and a few other nodes – appears to be connected both to the north and the west**
  - Habitat connectivity high within the outlined area
  - Climate change models predict 5-25% sagebrush cover and increase in sagebrush biomass.
  - **Likely has the largest population of GRSG in the subpopulation**

Wyoming

- Wyoming/Colorado border
  - Areas within PHMA in Colorado, and mostly PHMA in Wyoming
  - High relative abundance
  - Modeled breeding habitats cover entire area in Colorado, most of the area in Wyoming
  - Many genetic nodes, including an important node in Colorado. **Genetic movement between these areas suggest extensive population movements**
  - **High habitat connectivity for genetics within and between the areas**
  - Climate change models predict 5-25% sagebrush cover into the future and a mix of mostly increasing sagebrush biomass

- Wyoming Pinedale and Atlantic City area
  - Most of the area is PHMA, some in original SFA
  - **High relative abundance – likely the largest number of GRSG in the entire range**
  - Entire area modeled breeding habitat
  - Many genetic nodes including two important nodes
  - High habitat genetic connectivity
  - Climate change models project 5-25% sagebrush cover into the future and an increase in sagebrush biomass.
  - **Area of high risk for continued development**
  - Northern end of Green River watershed is mostly private land.
- Area bordering Wyoming – RHMA in Montana, mostly GHMA in Wyoming – Note this area overlaps with the area identified in Montana
  - High relative abundance,

- lots of modeled breeding habitat
- contains an important genetic node (maybe hub?); **may provide a connection with the GRSG in the Dakotas, and southeastern Montana.**
- Future sagebrush cover models suggest 0-4%, but that is not atypical for this area
- Future sagebrush biomass to increase in PHMA and RHMA, but decrease in GHMA

The rangewide review did not identify any areas in Idaho or Oregon outside the SFAs.

State-specific Review

The results of the rangewide review were shared with staff from each applicable BLM state office, with discussions reviewing the rationale behind the identification. The states used the information identified in the rangewide review, their own state-specific information and data, and externally nominated ACECs to identify potential ACECs for consideration. In identifying areas for consideration, the states evaluated potential areas to determine if they met the relevance and importance criteria.

Relevance Criterion

The states applied the relevance criteria described above for the rangewide review and also applied the importance criterion to their evaluations. In their relevance considerations, the states affirmed the presence of GRSG populations or associated sagebrush habitats with multiple data inputs (distribution maps, seasonal habitats, leks, etc.). All areas with GRSG and their habitats were determined to meet the relevance criteria. Areas of split surface and mineral estates, where the BLM manages the mineral estate but not the surface, were not included in the relevance consideration. Areas where the agency administers just the mineral estate would have no wildlife resource within the agency's jurisdiction, and therefore the area would not meet the relevance criterion.

Importance Criterion

Once the presence of GRSG and associated habitats was confirmed, the BLM then evaluated importance criteria. This evaluation effort focused on determining whether a given area of GRSG habitat being considered has characteristics that make it more than locally significant, and the evaluation compared areas of GRSG habitat to determine if any particular area had characteristics that were more than locally important. The importance criteria considerations are not an assessment of biological value of habitat to a given population, but how that habitat and its characteristics compare to other GRSG habitat throughout the species range. Rising to a level of national importance required multiple lines of evidence identifying and area as exemplary for GRSG.

The state-by-state sections below provide a summary of the evaluation process followed in each state and the ACECs that were identified for consideration in this RMPA within that state.

5.4.2 Externally Nominated ACECs

The BLM's Notice of Intent (86 FR 66331) for this greater sage-grouse (GRSG) amendment effort invited the public "to nominate or recommend areas that may be considered for designation as areas of critical environmental concern (ACEC), per 43 CFR 1610.7-2." Because this planning effort is only considering amending resource management plan (RMP) actions related to GRSG and its habitat, the invitation clarified that "nominations or recommendation of potential ACECs should be relevant to the preliminary purpose and need of this planning initiative." In other words, any ACEC nomination (or component thereof) that included values other than GRSG and its habitat were not evaluated or included as part of this planning effort. However, ACEC nominations that included GRSG as one of the nominated values were considered.

Nominations that were not related to GRSG will be considered by BLM during the next RMP or applicable RMP amendment process in the area where the ACEC was nominated.

The nominations received by the BLM during the scoping period are identified in the table below. The ACEC nominations were considered by the BLM states receiving the nomination and the evaluation process conducted in each state is described in the state specific sections below.

Table 5-3. ACEC Nominations Received During Scoping

Nominated ACEC	Location	Acres
Sagebrush Sea Reserve	Oregon, California, Nevada, Idaho, Utah, Wyoming, Washington, Montana, Colorado	48,202,418
Little Sandy	Wyoming	367,362
Red Desert	Wyoming	153,763
McDermitt Caldera	Nevada/Oregon	No specific area delineated
South Valley Phillips	Montana	
Frenchman Breaks Expansion	Montana	45,725
Musselshell Breaks	Montana	122,290
North of the Charles M Russell National Wildlife Refuge	Montana	185,055
Powderville Expansion	Montana	20,053

The 35 nominations received by the BLM during the Draft EIS comment period are identified in the table below. The ACEC nominations were considered by the BLM states receiving the nomination and the evaluation process conducted in each state is described in the state specific sections below.

Table 5-4. ACEC Nominations Received During the Draft EIS Comment Period

Nominated ACEC	Location	Acres
Nevada Department of Wildlife Population Management Units	Nevada	41,110,833
Firestone Basin	Oregon	135,171
Ibex Butte	Oregon	23,912
Packsaddle Draw-Horseshoe Ridge	Oregon	260,134
Coyote Hills	Oregon	110,203
Irish Hill-Big Lake	Oregon	120,375
Catlow Valley	Oregon	841,812
Beatys Butte	Oregon	595,796
Riddle Creek	Oregon	56,650
West Steens	Oregon	110,860
Grassy Ridge	Oregon	186,623
Oregon Canyon Mountains	Oregon	156,242
Hog Creek Ridge	Oregon	260,987
Star Mountain	Oregon	425,305
Willow (analyzed as a potential ACEC in the 2015 RMPA)	Oregon	53,803
Virtue Flat (analyzed 2015 RMPA)	Oregon	21,983
Trout Creek (analyzed in 2015 RMPA)	Oregon	675,218
Star Mountain (analyzed in 2015 RMPA)	Oregon	102,858
Red Hills (analyzed in 2015 RMPA)	Oregon	83,849
Lone Mountain (analyzed in 2015 RMPA)	Oregon	244,797
Jackass (analyzed in 2015 RMPA)	Oregon	428,057
Goose (analyzed in 2015 RMPA)	Oregon	4,785
Frederick Butte (analyzed in 2015 RMPA)	Oregon	527,739
East Warner (analyzed in 2015 RMPA)	Oregon	313,182
Diablo Peak (analyzed in 2015 RMPA)	Oregon	345,250
Cow Creek (analyzed in 2015 RMPA)	Oregon	42,776
Corner (analyzed in 2015 RMPA)	Oregon	355,598
Buck Creek (analyzed in 2015 RMPA)	Oregon	143,151
Beaty Butte (analyzed in 2015 RMPA)	Oregon	507,050
Antelope (analyzed in 2015 RMPA)	Oregon	117,076
Abert Rim (analyzed in 2015 RMPA)	Oregon	18,049
Louse Canyon	Oregon, Nevada	449,854
Table Mountain	Oregon, Idaho, Nevada	139,859
Juniper Ridge	Oregon, Idaho, Nevada	209,814
aa-Tiipi Flat	Oregon, Idaho, Nevada	61,743

Although the state-specific sections below address the nominations received by state, due to the multi-state nature of the Sagebrush Sea Reserve ACEC nomination, the BLM headquarters GRSG planning team evaluated the nomination. The Sagebrush Sea Reserve mirrors, to a large extent, the Priority Areas for Conservation (PACs) from the US Fish and Wildlife Service's (USFWS) 2013 Conservation Objectives Team Report (COT Report). However, in Wyoming the nominated area was expanded beyond the PACs to also include all the 75% breeding density areas from Doherty, et. al 2010[1], as well as new Wyoming Core Area designations from 2015. From all those areas in Wyoming the nominators removed areas with a density of

[1] Doherty, K.E., J.D. Tack, J.S. Evans, J.SN. and D.E. Naugle. 2010. Mapping breeding densities of greater sage-grouse: a tool for range-wide conservation planning. BLM completion report: Agreement # L10PG00911.

active oil and gas wells that exceeded five wells per square mile. For Nevada, the nominated area expanded beyond the PACs "to increase coverage of important seasonal habitats for [GRSG] and ensure connectivity between numerous patches of high-quality habitat that are separated by rocky mountain ranges, playas, and other expanses of marginal quality habitat." In addition to identifying the area for consideration, the proposal also included suggestions for how the nominated ACEC should be managed.

The BLM did not identify the Sagebrush Sea as potential ACEC in the Draft or Final EIS alternatives because the area does not meet the ACEC relevance and importance criteria (1610.7-2 (d)) because the BLM believes the PAC criteria utilized in identifying the Sagebrush Sea nomination no longer reflects the most up to date science on habitat connectivity, populations, effects to habitat from climate change, and genetic information across the range of the species. In this RMP Amendment effort, the BLM is choosing to focus management direction that protects and conserves GRSG in Priority and General GRSG Habitat Management Areas (PHMA, PHMA with limited exceptions, and GHMA). The BLM reviewed new scientific publications since our previous planning efforts on key population (e.g., Doherty et al. 2016, Coates et al., 2021), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021) and coordinated with state authorities (such as wildlife agencies) to identify and update GRSG habitat management areas (HMA). The HMAs are identified using inventory data on habitat use and occupancy and reflect the dynamic nature of the vegetation communities that make-up GRSG habitat. Analyzing the Sagebrush Sea would not meet the BLM's purpose and need to amend a subset of 2015 and 2019 GRSG RMP Amendment decisions based on new scientific information or changes in land use.

COLORADO

BLM Colorado considered the previous ACEC evaluation from the 2015 FEIS and discussed whether there was new information or resource values making any of the populations and subpopulations (Colorado Management Zones) eligible for ACEC nomination. BLM Colorado also considered two areas highlighted by the rangewide ACEC review process. The two highlighted areas were the North Great Divide and Fly Creek portions of the Northwest Colorado GRSG population and the North Park GRSG population. The North Great Divide and Fly Creek areas have contiguous habitat connecting north into the Wyoming Basin in Wyoming. BLM Colorado and BLM Wyoming coordinated during review of these areas, but separate determinations were made by the respective interdisciplinary teams.

BLM Colorado also coordinated with BLM Utah regarding the functional connectivity on the cross-border Blue Mountain habitat area. Row et al. (2018) demonstrates high connectivity between GRSG populations in CO and UT which is supported by bird collar location data (unpublished CPW data). However, Row et al. (2018) does not model a known connectivity area in the Diamond Mountain or Cold Springs Mountain areas to the north. For these reasons, the Blue Mountain connectivity area was not considered to be more than locally significant and was not carried forward for additional evaluation.

North Great Divide and Fly Creek

North Great Divide and Fly Creek are situated within the northeast extent of the Northwest Colorado GRSG population. These areas include high quality sagebrush with relatively low disturbance except for the Highway 13 designated corridor, which bisects the areas. North Great Divide and Fly Creek provide breeding, nesting, brood-rearing, and winter habitat for GRSG and include several active leks.

The North Great Divide and Fly Creek areas were highlighted by the range wide planning team because of the genetic and functional genetic connectivity between the Northwest Colorado population and the Wyoming Basin population (Cross et al. 2018, Row et al. 2018) and high likelihood of lek persistence (Wann et al. 2022). The area contains many genetic nodes, or leks that are important to maintaining gene flow in a population, including an important node in Great Divide (Cross et al. 2018). Important nodes maintain gene flow between populations in the species range (Cross et al. 2018). Genetic movement between these areas suggest that the habitat has previously supported population movements within and between populations. Row et al. (2018) and Cross et al. (2023) modeled high habitat connectivity for genetics between these areas and the Wyoming Basin.

Genetic and functional connectivity between Northwest Colorado and the Wyoming Basin are modeled in other portions of the Northwest Colorado population as well. Row et al. (2018) modeled connectivity areas between Northwest Colorado and the Wyoming Basin occurring in the Sand Wash/Powder Wash area and in the Cold Springs area. Sand Wash also contains a genetically important node (Cross et al. 2018). Strong population genetics between the Northwest Colorado and Wyoming Basin do not indicate that there is a risk of the populations becoming genetically distinct (Oyler-McCance et al. 2022).

The North Great Divide and Fly Creek areas provide valuable GRSG habitat that is well-connected to the Wyoming Basin, but several other areas in the Northwest Colorado Population also demonstrate habitat and genetic connectivity. For this reason, BLM Colorado determined that the area does not have more than local significance and is not recommended to move forward as a potential ACEC.

North Park

North Park is a large basin bounded by Medicine Bow Range on the east and by the Park Range on the west. The Rabbit Ears Range separates North Park from Middle Park to the south. BLM Colorado discussed all

areas of North Park for values important to GRSG. North Park provides well connected lekking, nesting, brood-rearing, and winter habitat for GRSG. A large majority of seasonal habitats for GRSG in North Park are suitable (North Park HAF Site-Scale Report, 2022). North Park has genetic connections to the Middle Park population to the south and a narrow connection north to the Wyoming Basin but is otherwise disjunct from the Northwest Colorado population (Cross et al. 2018; Row et al. 2018; Cross et al. 2023). The BLM Kremmling Field Office is implementing treatments to increase the value of GRSG habitat, particularly the extent of available mesic habitats.

Case Flats

BLM Colorado highlighted the Case Flats area, which is a known winter concentration area. CPW staff discovered the Case Flats winter concentration area while conducting GRSG research in the North Park Basin. For unknown reasons, GRSG from the entire basin congregate in large numbers at this location each year during late winter/early spring prior to lekking (CPW Wildlife Mitigation Plan, 2021). The area has been highlighted in conversations with Colorado Parks and Wildlife and outlined as a resource for concern in the CPW Wildlife Mitigation Plan with the local operator but has not been otherwise recognized for specific management by the BLM.

Case Flats includes unitized fluid mineral leases and is in proximity to active oil & gas development, Highway 14, and ex-urban development. The likelihood of lease development is high, which could have direct and indirect impacts on GRSG and winter concentration in the area.

Due to the unique nature of the winter concentration area, population-wide importance, and likelihood of lease development, BLM Colorado evaluated the area as a potential ACEC. This nominated area meets relevance and importance criteria for wildlife and a natural process or system as presented in the table below.

Importance Evaluations

Colorado GRSG ACEC Importance Evaluation: Case Flats Nominated ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	The area contains unique GRSG winter concentration areas, providing special worth to the North Park GRSG population.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened	Yes	Case Flats provides a unique winter concentration area for a BLM sensitive status species. The habitat provides for unique GRSG congregating behavior which may be irreplaceable because it is not known why GRSG concentrate in this area and may not be replicable in other habitats. The area contains several unitized oil and gas leases and could be adversely impacted by development.

Colorado GRSG ACEC Importance Evaluation: Case Flats Nominated ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
• Vulnerable to adverse change		
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The area is within Greater Sage-Grouse Priority Habitat Management Areas which have been at the focus of national planning efforts, and state and local land use plans.
Other Items		
Boundaries	South of Walden, bound by Highways 14 and 125, Bordering Arapaho Wildlife Refuge.	
Conclusion		
This internally nominated area meets both relevance and importance criteria for a fish and wildlife resource. Because Case Flats meets the relevance and importance criteria it was identified as a potential ACEC under Alternatives 3 and 6. Refer to BLM Colorado - ACEC Maps for Alternatives 3 and 6 that follow.		

Colorado GRSG ACEC Importance Evaluation: North Great Divide/Fly Creek Nominated ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	The areas are modeled as having high genetic and functional genetic connectivity between the Northwest Colorado population and the Wyoming Basin (Cross et al. 2018; Row et al. 2018; Cross et al. 2023) and high likelihood of lek persistence (Wann et al. 2022). The area contains many genetic nodes, including an important node in Great Divide (Cross et al. 2018). However, genetic and functional connectivity between Northwest Colorado and the Wyoming Basin are modeled in other portions of the Northwest Colorado population as well. Row et al. (2018) modeled connectivity areas between Northwest Colorado and the Wyoming Basin occurring in the Sand Wash/Powder Wash area and in the Cold Springs area. Sand Wash also contains a genetically important node (Cross et al. 2018). Strong population genetics between the Northwest Colorado and Wyoming Basin do not indicate that there is a risk of them becoming genetically distinct (Oyler-McCance et al. 2022). Because there are multiple points of connection cross-state between the populations and, this area is not more than locally significant.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	Because there are multiple points of connection cross-state between the populations, this area is not unique, rare, or irreplaceable.

Colorado GRSG ACEC Importance Evaluation: North Great Divide/Fly Creek Nominated ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The area is within Greater Sage-Grouse Priority Habitat Management Areas which have been at the focus of national planning efforts, and state and local land use plans. However, this area contains only a small portion of the PHMA within Colorado and of the Western US and the area has not been specifically addressed as a national priority.
Other Items		
Boundaries	Great Divide is bound by the Little Snake River to the west and Highway 13 to the east, and the Wyoming border to the north and Highway 40 to the south. Fly Creek is bound by the Elkhead Mountains to the south and connected sagebrush habitat moving north into Wyoming. Highway 13 bisects the areas.	
Conclusion		
The nominated area meets relevance criteria but does not meet importance criteria. Therefore, it is not recommended that the area be considered a potential ACEC for GRSG for analysis in the current range-wide planning effort.		

Effects of the Alternatives on the Potential Case Flats ACEC

In Colorado, the potential Case Flats ACEC, totaling 4,544 acres was the only ACEC identified for potential designation under Alternatives 3 and 6. This area provides a unique wintering habitat that supports the population in North Park, Colorado.

Table 5-5 displays the HMA allocations for this area under each alternative. Under the Proposed RMP Amendment, the entire area would be managed as PHMA with limited exceptions. Under Alternatives 2 the entire area would be managed as PHMA. Under Alternatives 3, the area would be proposed for designation as an ACEC and would receive PHMA management direction except where stronger, ACEC protections are identified related to developing plans of operations for locatable mineral development and major rights of way. Under Alternative 6, the area would be proposed for designation as an ACEC and would receive PHMA management direction identified for Alternative 5 except where stronger, ACEC protections are identified for locatable minerals, fluid minerals, non-energy leasables, saleable minerals, major rights of way, solar, wind, and disturbance cap. Under Alternatives 1, 4, and 5, 88% of the area would be managed as PHMA and 12% would be managed as GHMA.

Table 5-5. 4 HMA Allocations in the Colorado Potential ACEC by Alternative

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[2]
Case Flat							
PHMA with limited exceptions	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	4,547 acres (100%)
PHMA	3,988 acres (88%)	4,547 acres (100%)	4,547 acres (100%)	3,988 acres (88%)	3,988 acres (88%)	4,547 acres (100%)	4,547 acres (100%)
GHMA	559 acres (12%)	0 acres (0%)	0 acres (0%)	559 acres (12%)	559 acres (12%)	0 acres	0 acres (0%)
Total	**4,547 acres**	**4,547 acres**	**4,547 acres**	**4,547 acres**	**4,547 acres**	**4,547 acres**	**4,547 acres**

[2] PHMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.

This section details the effects of the alternatives on the potential Case Flats ACEC.

Fluid Mineral Development

Fluid mineral development is considered the primary threat to the Case Flats Potential ACEC. Under the Proposed RMP Amendment the Case Flats potential ACEC would be wholly managed under the PHMA with limited exceptions HMA designation and the No Surface Occupancy (NSO) with no exceptions management direction identified for that designation would protect the potential ACEC from the development threat. The fluid mineral direction protections identified under the Proposed RMP Amendment would be the same as identified under Alternative 3 which also closes the area to fluid mineral development without exception. Under Alternative 6, the area would also be subject to NSO but development could occur if an exception for the entire ACEC area could be met. Under Alternative 1, the PHMA within the potential ACEC would be managed as NSO without waiver or modification and within GHMA, any new leases would include stipulations to protect GRSG and there would be NSO within two miles of active leks. Under Alternative 2, areas would be open to leasing one mile from active leks subject to NSO with exceptions, waivers, and modifications. Under Alternative 1 and 2, in GHMA, new leases would include timing stipulations within four miles of leks during lekking, nesting, and early brood-rearing, and NSO within two miles of active leks, with waivers, exceptions, and modifications. Under Alternative 4, there would be an NSO stipulation within .6 miles of active leks in PHMA unless it could be demonstrated that it meets either a non-habitat, topographic, or co-location exception. Under Alternative 5, the NSO stipulation would be the same as under Alternative 4, but an exception could only be applied within 1 mile of active leks. Alternatives 1 and 2 would manage fluid minerals to avoid, minimize, and compensate for direct disturbance, displacement, or mortality of GRSG, direct loss of habitat and cumulative landscape level impacts and would prioritize fluid mineral development outside of PHMA and GHMA areas in non-habitat areas first and then in the least suitable habitat for GRSG, subject to valid existing rights.

The Proposed RMP Amendment and Alternative 3 provide the greatest amount of protections from fluid mineral development by prohibiting fluid mineral development. The second highest protections would occur under Alternative 6 followed by Alternative 5. Alternative 4 would provide the least amount of protections to the potential ACEC from fluid mineral development followed by Alternatives 1 and 2.

Solar, Wind, Major Rights of Way, Saleable Minerals/Material Management, and Locatable Minerals

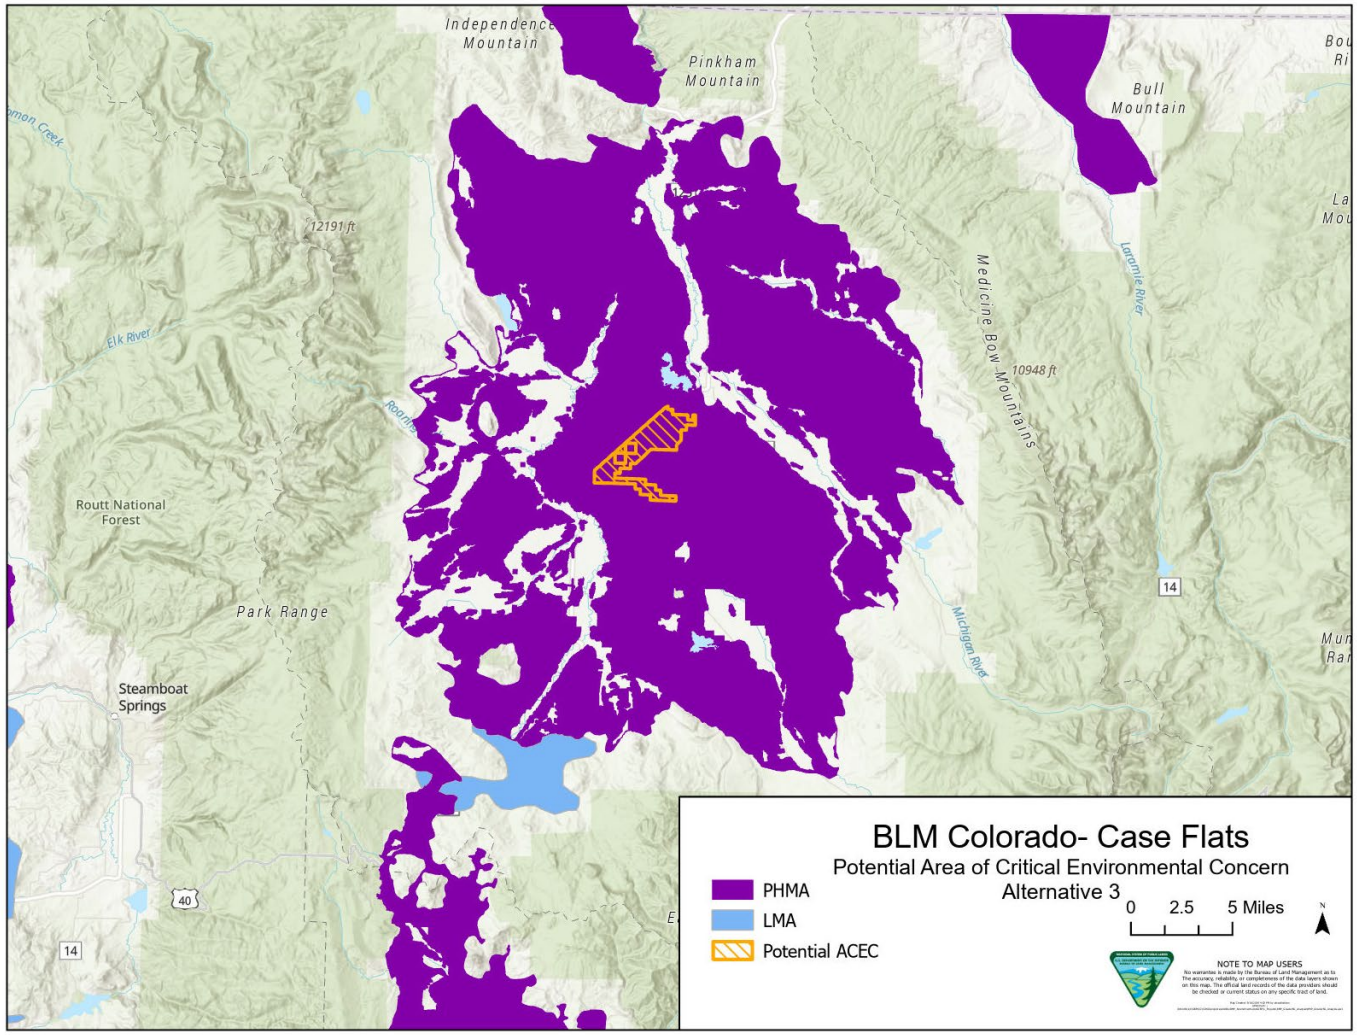
The Proposed RMP Amendment and Alternatives 3 and 6 would all provide additional protections to the potential ACEC by excluding solar, wind, and non-energy leasable mineral development. While all three alternatives also exclude major rights of way and close the area to saleable minerals/material management, Alternative 3 provides the greatest protection as Alternative 3 provides no exceptions to the rights of way exclusion or to the saleable closure. In addition, under Alternative 3, the area would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use.

Under Alternatives 1, 2, and 4, the area would be exclusion for solar and wind in PHMA and avoidance in GHMA and avoidance for major rights of way in PHMA and GHMA which would provide similar but slightly less protections than afforded under the Proposed RMP Amendment and Alternatives 3 and 6. Under Alternative 5, the area would be avoidance for solar and wind in PHMA and open with minimization measures in GHMA and would be avoidance for major rights-of-way in PHMA and open with minimization measures in GHMA. Therefore, Alternative 5 provides the least amount of protections from solar, wind, and rights of way development. Under Alternatives 1, 2, 4, 5, 6, and the Proposed RMP Amendment the area would be

open to locatable mineral development. Under Alternatives 1, 2, 4, 5, and the Proposed RMP Amendment, notice level exploration would be allowed without a plan of operations.

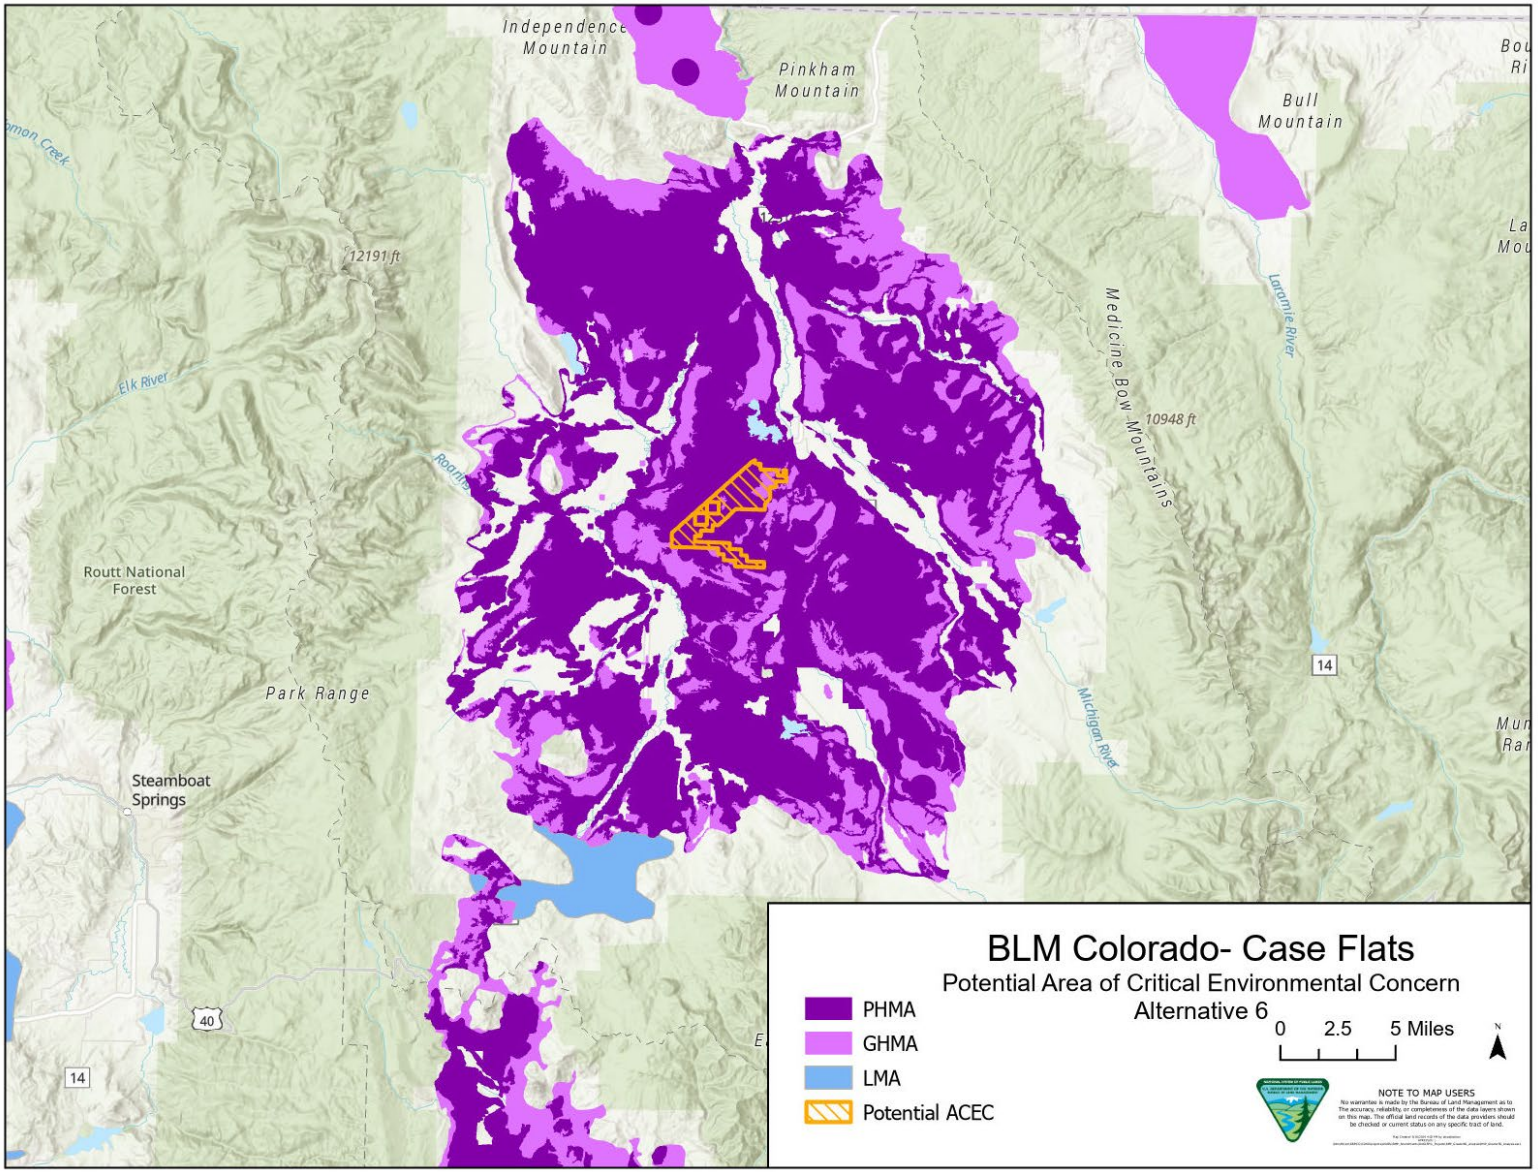
Disturbance Cap

The Proposed RMP Amendment sets a 3% disturbance cap at the Colorado Management Zone scale with exceptions and conditions. Alternative 6 sets the same disturbance cap for the area but there are no exceptions and Alternative 3 closes the area to new infrastructure projects and sets a 3% disturbance cap for existing developments. Alternatives 1 and 2 set a 3% disturbance cap in PHMA and the cap applies at both BSU-scale and at the project scale. Under Alternatives 4 and 5, in PHMA within area the disturbance cap is 3% at the project and Colorado Management Zone scale and projects would be deferred until disturbance in the areas has been reduced below the cap threshold or the projects could be redesigned to not result in additional surface disturbance or moved outside of PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to the disturbance cap.



Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing as required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the ACEC by removing any potential disturbance associated with livestock grazing.



Summary of Effects

Considered comprehensively, the management direction provided under Alternatives 3 and 6 and the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the potential Case Flats ACEC; with Alternative 3 providing the highest level of protection. Alternatives 1, 2, 4, and 5 provide a relatively high degree of protection within PHMA within the ACEC; however, fluid mineral development under all of these alternatives could negatively impact the relevant and important values of the potential ACEC.

Map 5.1: Colorado Alternative 3 Potential ACEC

Map 5.2: Colorado Alternative 6 Potential ACEC

IDAHO

The ACEC evaluation in Idaho had several unique aspects. Even though the rangewide evaluation did not identify any additional areas beyond the SFAs, the rangewide evaluation did include areas within the 2015 SFAs. The ACEC evaluation process at the Idaho State Office overlapped with the mapping effort of Idaho's three-tiered system of habitat management areas. At the state level, the Idaho State Office evaluated the following local datasets to help identify and delineate areas that meet the importance criteria:

- **Local scale data:**
    - Idaho BLM developed a Landscape Importance Model (LIM) in 2015 to prioritize areas of Low to Highest Importance related to GRSG. The LIM model incorporates 3 orthogonal datasets related to GRSG: State level Bird Breeding Density (BBD), State level Lek Kernel Density, and Lek Persistence (related to amount of sagebrush within a 5-km window). These datasets are recalculated every year. Individual datasets are scored 1-10 and the resulting combined dataset is Categorized 1 (lowest) to 5 (Highest). For ACEC delineation we used the 2022 LIM – moderate to highest values (3,4,5) to extract a base ACEC polygon, focusing on the top two values.
    - Idaho contains a significant proportion of the estimated GRSG population in the Great Basin (excluding WY); therefore, the current (2022) state-level Bird Breeding Density (BBD) data was used, with the top 25th percentile of the population selected as indicating areas that had high levels of importance. These leks were then buffered 10K and the resulting polygon was added to the ACEC base.
- **Regional scale data:** Recently published regional GRSG data (BBD, Lek Persistence, and Priority Genetic Pathways) was used to inform regional importance. These data were combined (i.e. 25% and 50% BBD; medium or high lek persistence; >90 or >95% Priority Genetic Pathways) to provide an overall score of 0-6, from which a subset was included only using values 4 – 6. The resulting polygon was added to the ACEC base.

In some areas, moderate LIM values or top 50th percentile of the population (from the BBD data) were added to polygons in order to connect the delineated areas identified above.

Between the Draft EIS and Final EIS, Idaho BLM refined the model for identifying and delineating areas that meet importance criteria:

- **Local scale data:**
    - For the Landscape Importance Model (see description above), RCMap (average for 2021-2023) was used for Lek Persistence within a 5-km moving window. In addition, state level BBD and lek kernel density were calculated from 2023 lek data.
    - Habitat Suitability Index (HSI) Models (general, spring, summer, winter; IDFG 2019) were used to identify areas with high habitat suitability.
- **Regional scale data:** same as specified above.

For delineation, larger blocks of land lacking sagebrush cover and areas with existing protections, such as wilderness areas, were excluded. Furthermore, areas that did not meet the regional importance criteria and were removed from further consideration. Three of the reviewed areas were not recommended as potential ACECs in the Draft EIS (Whiskey Mountain, South Mountain, Bear Lake) because they did not meet the criteria, i.e. not in the top 25% BBD rangewide in Idaho. Areas listed in the table below as 'not recommended for potential ACEC' are not included in the **Map 5.3** and **Map 5.4**.

The following table summarizes the areas that were identified for consideration through the state-level modeling effort and whether the areas met the relevance and importance criteria and were identified for consideration in the Draft EIS as potential ACECs in Alternatives 3 and 6. The table also identifies the Triangle, Antelope Valley, Mountain Valley Complex, and Upper Snake Complex areas that were identified as potential ACECs in the Draft EIS in Alternatives 3 and 6 but were removed from the alternatives in the Final EIS due to the refinements discussed above.

Importance Evaluations

Geographic Reference	Importance	Recommendation
Bear Lake	BLM lands not in 25% BBD; No adjacency with ACEC proposals with WY or UT. No important genetic nodes.	Not recommended as potential ACEC.
Whiskey Mountain	N/A. SW Idaho area. Poor habitat on OR side, per discussion with Oregon SO; Medusa, cheatgrass threats. Not in 25% BBD on ID or OR side.	Not recommended as potential ACEC.
South Mountain	N/A. Poor habitat on OR side per discussion with Oregon SO; small proportion high genetic connectivity on east side of polygon; Medusahead, cheatgrass threats. Not in 25% BBD on ID or OR side. Boulder Creek ACEC occupies high value regional genetic pathway.	Not recommended as potential ACEC.
Triangle	Good habitat; high Resistance and Resilience; BBD 25%, but 50% rangewide; High value in Combined model. Genetic hub and keystone. Adjoins Castle Creek Canyon Lands with Wilderness Characteristics. Threats are related to juniper encroachment and wildfire. Lacks importance criteria.	The area was identified as a potential ACEC in Alternatives 3 and 6 in the Draft EIS but was removed in the Final EIS because it did not meet the importance criteria. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Owyhee	West of the Jarbidge River of previous Owyhee-Shoshone Basin area. Significant representation of the 25% BBD rangewide and in Idaho (i.e., contains 17 of the 77 leks comprising the 25% BBD in Idaho including several leks in the 10% BBD in Idaho). High amount of genetic connections/nodes; Also represents a large area of contiguous BLM administered lands and large blocks of unfragmented intact sagebrush.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Shoshone Basin	East of Jarbidge River of previous Owyhee-Shoshone Basin area. Significant representation of the 25% BBD rangewide and in Idaho (i.e., contains 11 of the 77 leks comprising the 25% BBD in Idaho including several leks in the 10% BBD in Idaho). Several stable or increasing populations. Adjacent to NV Priority and Priority+ HMA; Significant contribution value from new regional datasets; High amount of genetic connections/nodes; Also represents a large area of contiguous BLM administered lands.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)

Geographic Reference	Importance	Recommendation
Camas-Laidlaw	Significant representation of the 25% BBD in Idaho (i.e., contains 6 of the 77 leks comprising the 25% BBD in Idaho); Several genetic nodes constituting linkage to NV and UT; High value priority genetic pathways; In the top 25% of the MZ IV GRSG population; Large area of contiguous BLM administered lands; Adjacent to a major regional genetic node.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Big Desert	Significant representation of the 25% BBD rangewide and in Idaho (i.e., contains 6 of the 77 leks comprising the 25% BBD in Idaho); Adjacent to a major regional genetic node; contains several genetic nodes with Sand Creek/Upper Snake, Mountain Valleys/Salmon, Craters Monument, and Utah.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Antelope Valley	Smaller, distinct area of 25% BBD in Idaho, but not rangewide; No genetic nodes; Relatively low anthropogenic disturbance; Surrounded by mostly private lands. Lacks importance criteria.	The area was identified as a potential ACEC in Alternatives 3 and 6 in the Draft EIS but was removed in the Final EIS because it did not meet the importance criteria. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Mountain Valley Complex	25-50% BBD in Idaho, but not rangewide; Middle section has large existing ACEC (Donkey Hills); High potential as a refugia for future climate change effects; NW polygon, per Arkle et al, shows a lek cluster with increasing Lambda (+ pop growth but other lek clusters declining); Surrounded by private lands. Relatively low anthropogenic disturbance and low threats. Lacks importance criteria.	The area was identified as a potential ACEC in Alternatives 3 and 6 in the Draft EIS but was removed in the Final EIS because it did not meet the importance criteria. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)
Upper Snake Complex	Significant representation of the 25% BBD rangewide and in Idaho (i.e., contains 15 of the 77 leks comprising the 25% BBD in Idaho); Contains a major regional genetic node; contains several genetic nodes with the Mountain Valleys, Snake River Plain and Montana. Good habitat/ high Resistance and Resilience. Captures Table Butte, a known important GRSG winter concentration area; Southern polygon provides significant movement connectivity corridor (based on telemetry) with the proposed Big Desert ACEC. Land ownership is extremely patchy in this area; most large leks are not on BLM lands; therefore, not considered further.	The area was identified as a potential ACEC in Alternatives 3 and 6 in the Draft EIS but was removed in the Final EIS because it did not meet the importance criteria. (Refer to BLM Idaho - ACEC Maps for Alternatives 3 and 6 that follow.)

Consideration of ACECs nominated during the public comment period

During the comment period on the Draft EIS, the BLM received ACEC nominations for the Table Mountain, Juniper Ridge, aa-Tiipi Flat areas that include acreage within Oregon, Idaho, and Nevada. The three states coordinated on the nominated ACECs and the BLM Oregon State Office took the lead on considering the nominations. It was determined that none of these areas warranted consideration as potential ACECs in the Final EIS. Additional details are provided in the **Oregon** section of this appendix.

Effects of the Alternatives on the Potential Shoshone Basin, Owyhee, Camas-Laidlaw, and Big Desert ACECs

In Idaho, the Shoshone Basin and Owyhee areas were identified in the Draft EIS as one potential ACEC in Alternatives 3 and 6 totaling 1,746,745 acres. Between the Draft and Final EIS, the acreage was refined as described above and the areas were considered separately in the Final EIS. In the Final EIS, the Shoshone Basin ACEC totals 244,935 acres and the Owyhee ACEC totals 635,199 acres.

Under the Proposed RMP Amendment, the 244,935-acre Shoshone Basin area would receive PHMA with limited exceptions protections and is proposed for ACEC designation under Alternatives 3 and 6. The Shoshone Basin is contiguous with the North Fork O'Neil Nevada population and is one of the largest intact habitat areas in that state. The area is threatened by rights of way and renewable energy development. The area has a significant representation of the 25% Bird Breeding Density (BBD) rangewide and in Idaho (i.e., contains 11 of the 77 leks comprising the 25% BBD in Idaho including several leks in the 10% BBD in Idaho), has a high amount of genetic connections/nodes and represents a large area of contiguous BLM administered lands. Considering the Shoshone Basin and the North Fork O'Neil areas in tandem allows for seamless conservation across state lines and supports the population of GRSG that use both areas (refer to Nevada section of this appendix for information on the North Fork O'Neil potential ACEC).

The potential Owyhee ACEC totaling 635,199 acres has a high amount of genetic connections/nodes and represents a large area of contiguous BLM administered lands and unfragmented intact sagebrush and is identified for potential ACEC designation under Alternatives 3 and 6. The potential Camas-Laidlaw ACEC was identified in the Draft EIS as a potential ACEC totaling 631,324 acres under Alternatives 3 and 6. Between Draft and Final EIS, the acreage was refined and totals 475,724 acres in the Final EIS. The potential Camas-Laidlaw ACEC has a significant representation of the 25% BBD in Idaho (i.e., contains 6 of the 77 leks comprising the 25% BBD in Idaho) and several genetic nodes constituting linkage to Nevada and Utah. The potential Big Desert ACEC was identified in the Draft EIS as a potential ACEC totaling 333,687 acres under Alternatives 3 and 6. Between Draft and Final EIS, the acreage was refined and totals 333,528 acres.

The potential Big Desert ACEC has a significant representation of the 25% BBD rangewide and in Idaho (i.e., contains 6 of the 77 leks comprising the 25% BBD in Idaho) and is adjacent to a major regional genetic node. Similar to the potential Shoshone Basin ACEC, the development threats to these three potential ACECs are primarily from major rights of way development but the development threat is not considered as high as under the potential Shoshone Basin ACEC. **Table 5-6** displays the HMA allocations for these four areas under each alternative. Under the Proposed RMP Amendment, the areas within the Owyhee, Camas-Laidlaw, and Big Desert potential ACECs would be managed entirely as PHMA and the area within the Shoshone Basin potential ACEC (as well as some surrounding areas) would be managed entirely as PHMA with limited exceptions. Under Alternatives 1, 2, 4, and 5 the areas within the Shoshone Basin, Owyhee, and Camas-Laidlaw potential ACECs would be entirely managed as PHMA. The area within the Big Desert potential ACEC would be managed as 86% PHMA and 14% IHMA in Alternatives 1 and 2. Under Alternative 3 and 6, all four areas would also be designated as ACECs. Under Alternatives 3, the potential ACECs would

receive PHMA management direction except where stronger, ACEC protections are identified related to developing plans of operations for locatable mineral development and major rights of way. Under Alternative 6, the potential ACECs would receive PHMA management direction identified for Alternative 5 except where stronger, ACEC protections are identified for locatable minerals, fluid minerals, non-energy leasables, saleable minerals, major rights of way, solar, wind, the disturbance cap, and the development of plans of operations for locatable mineral development.

Table 5-6. HMA Allocations in the Idaho Potential ACECs by Alternative

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[3,4]
Shoshone Basin

IHMA	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
GHMA	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
Total	**475,724 acres**	**475,724 acres**	**475,724 acres**	**475,724 acres**	**475,724 acres**	**475,724 acres**	**475,724 acres**

[3] PHMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.

[4] In some cases, the Proposed RMP Amendment establishes PHMA with limited exceptions management direction in areas larger than the potential ACECs to ensure adequate protection of GRSG habitat. In these instances, the acreage calculation includes the entirety of the potential ACEC and some adjacent areas.

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[34]
Big Desert							
PHMA	288,056 acres (86%)	288,056 acres (86%)	333,528 acres (100%)	333,528 acres (100%)	333,528 acres (100%)	333,528 acres (100%)	333,528 acres (100%)
IHMA	45,472 acres (14%)	45,472 acres (14%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
GHMA	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
Total	**333,528 acres**	**333,528 acres**	**333,528 acres**	**333,528 acres**	**333,528 acres**	**333,528 acres**	**333,528 acres**

This section details the effects of the alternatives on these areas considered for ACEC designation.

Major Rights of Way

All four of the potential ACEC areas in Idaho face threats from major rights of way development. Under the Proposed RMP Amendment, the potential Shoshone Basin ACEC would be wholly managed under the PHMA with limited exceptions HMA designation and, as such, major rights of way would be excluded from development unless a criterion and conditions can be met. A new major right of way could only be considered if the right of way is in an existing RMP designated corridor and is the same category of right of way for which the corridor was designated and co-location of the proposed authorization results in minimal impacts to those already associated with existing major infrastructure. Under the Proposed RMP Amendment, the Owyhee, Camas-Laidlaw, and Big Desert potential ACEC areas are all managed as PHMA, and major rights of way would be avoidance for new major rights of way that require criteria and conditions be met and would be subject to Idaho-specific anthropogenic disturbance screening criteria (MD SS 29).

Under Alternative 3, all of the potential ACEC areas would be managed as avoidance within designated corridors and exclusion outside of designated corridors within PHMA. Under Alternative 4, all four areas would be managed as avoidance for major rights of way and where development could not be avoided, it would not be allowed in breeding and nesting habitats unless habitat and impact criteria could be met. Where impacts could not be avoided, residual direct and indirect impacts would be mitigated through compensatory mitigation. Where major rights of way are collocated withing designated corridors, they would not need to comply with disturbance cap or compensatory mitigation requirements unless required by State regulations. Under Alternatives 1 and 2, all four areas would be managed as avoidance areas for major rights of way (even in the Big Desert area where the IHMA acres receive the same PHMA management direction as described for PHMA). Under Alternative 5, all four areas would also be managed as avoidance areas similar to Alternative 4 but without disturbance cap or compensatory mitigation requirements. Alternative 6, like Alternative 3, would be exclusion for major rights of way but unlike Alternative 3 it would be open for new rights of way in designated corridors with compensatory mitigation required to offset direct and indirect impacts.

Under the Proposed RMP Amendment and Alternative 3, the threats from rights of way development to all four ACECs would be prevented by the management direction provided. The management direction provided under Alternative 6 would also provide a high degree of protection, but to a lesser degree. The avoidance direction under Alternatives 1, 2, 4, and 5 would provide the least amount of protections from major rights of way development and the relevant and important values of the four potential ACEC areas could be impacted under these alternatives.

Solar and Wind

The threats from solar and wind development in these four areas are lower than those from major rights of way. Alternatives 3 and 6 would exclude utility scale solar and wind development in all of the four areas. Under the Proposed RMP Amendment, the Shoshone Basin ACEC would be managed as exclusion for solar and wind development and the other three areas would be managed as exclusion with exceptions.

Under Alternatives 1 and 2, all four potential ACECs would be managed as avoidance areas for wind. Alternatives 1 and 2 do not provide management direction for solar development in PHMA, however, general surface disturbance limits would exclude solar near leks (0.6 miles) and minimize (e.g., disturbance cap, mitigation) effects elsewhere. Under Alternative 4, the four areas would be managed as exclusion areas for wind and solar. Under Alternative 5, the areas would be managed as avoidance for solar and wind with criteria that would need to be met for development to occur.

For solar and wind development, Alternatives 3, 6, and the Proposed RMP Amendment provide the greatest amount of protection followed by Alternatives 4, 1, and 2. Alternative 5 provides the least amount of protection related to solar and wind development.

Non-energy Minerals, Saleable Minerals/Material Management, and Locatable Minerals

For non-energy minerals, under the Proposed RMP Amendment, the Shoshone Basin area would be closed to new leases and the expansion of existing leases. Under the Proposed RMP Amendment, the other three areas would also be closed to new leases but the expansion of existing leasing could occur. Under Alternatives 1 and 2, all four areas would be closed to new leases but the expansion of leasing could occur. Under Alternatives 3, 4, 5, and 6 areas all of the areas would be closed to new leases and expansion of existing. Therefore, the protections are strongest for all of the areas under Alternatives 3, 4, 5, and 6 and equally strong for the Shoshone Basin area under the Proposed RMP Amendment.

For saleable minerals and materials, under Alternative 1 and 2 all of the areas would be closed to saleable mineral and material development but open for free use permits and expansion of existing pits. Under Alternative 3, all of the areas would be closed. Under Alternatives 4, 5, and 6, all of the areas would be closed but open for free use permits and expansion of existing pits if screening and development criteria are met. Under the Proposed RMP Amendment, the Shoshone Basin area would be closed but open for free use permits and expansion of existing pits under stringent criteria and the rest of the areas would be closed but open for new free use permits and open for the expansion of existing pits with a slightly different, but similarly stringent criteria. As a result, Alternative 3 provides the most protections from saleable minerals and materials followed by the Proposed RMP Amendment.

Under Alternative 3, all four potential ACECs would be recommended for locatable mineral withdrawal and operators would be required to submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use as defined in 43 CFR Part 3809.5 (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use as defined in 43 CFR Part 3809.5. Under Alternative 1, any portions of the four areas that overlap with SFAs would be proposed for withdrawal. All other portions of these four areas that do not overlap SFAs under Alternative 1 would not be proposed for withdrawal and would be open for development (unless otherwise withdrawn) and there would be no requirement for a plan of operations. Under Alternative 2, 4, 5, and the Proposed RMP Amendment, all four areas would be open for locatable mineral development (unless otherwise withdrawn) and notice level exploration would be allowed without a plan of operations. Under Alternative 6, all of the areas would be

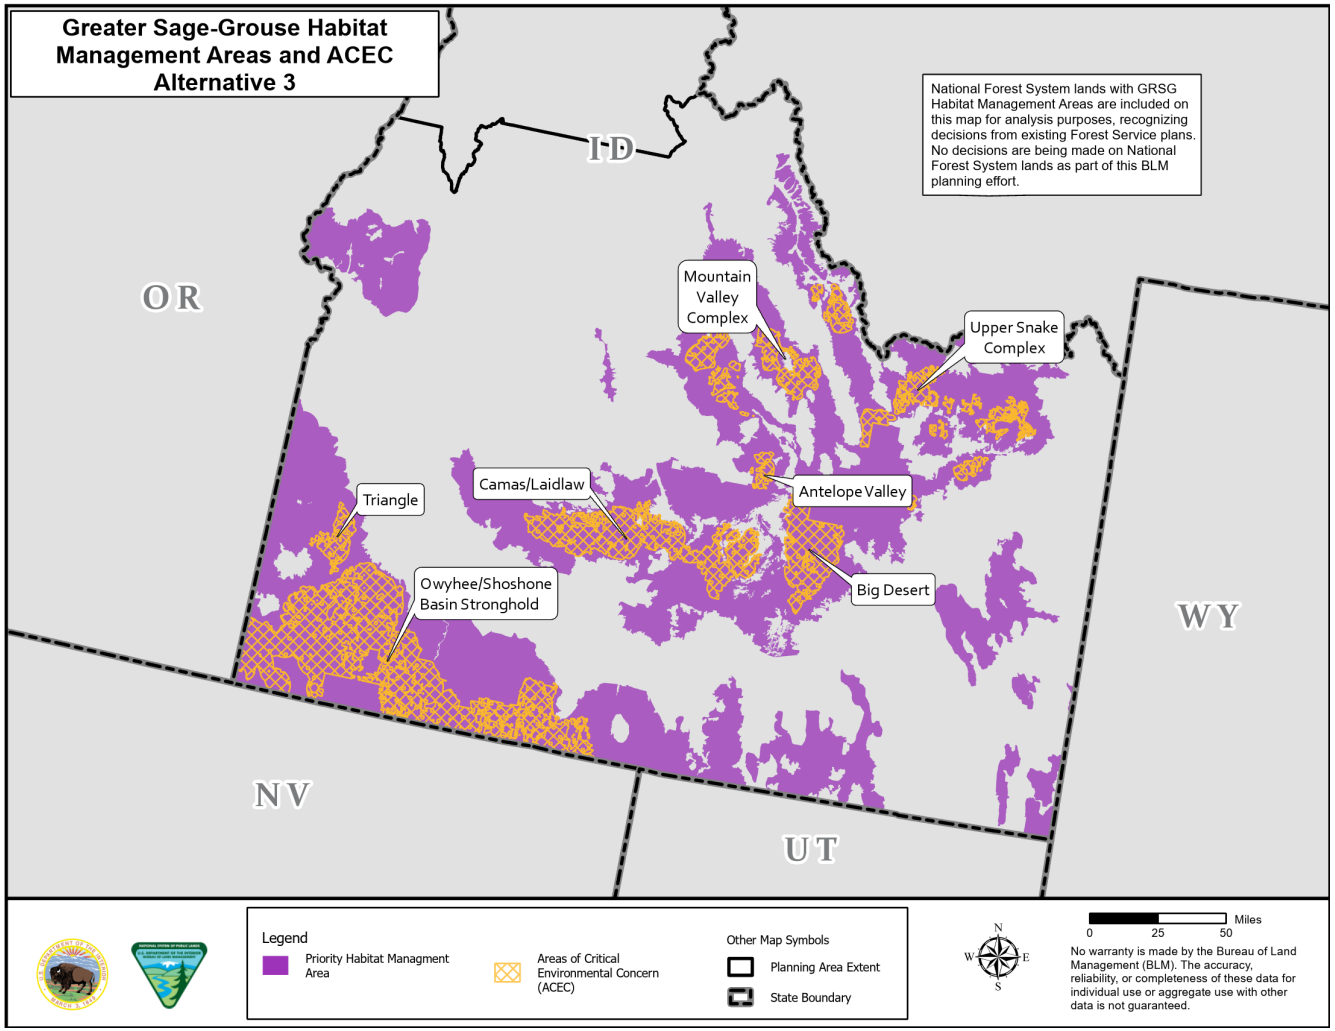
open for locatable mineral development (unless otherwise withdrawn) and, like under Alternative 3, operators would be required to submit a plan of operations (refer to 43 CFR Part 3809.11(c)(3)) and obtain BLM approval before beginning any operations causing surface disturbance greater than casual use as defined in 43 CFR Part 3809.5 (refer to 43 CFR Part 3809.11(c)(3)). As a result, Alternative 3 provides the highest amount of protection from locatable mineral development followed by Alternative 6.

Fluid Mineral Development

Under Alternatives 1 and 2 the four areas would be open to new leasing with no surface occupancy (NSO) stipulations with possible waivers, exceptions, and modifications. Under Alternative 3, all four areas would be closed to fluid mineral leasing. Under Alternatives 4 and 5, similar to Alternatives 1 and 2, the areas would be open to new leasing with NSO stipulations but Alternative 4 and 5 have updated waivers, exceptions, and modifications. Under Alternative 6, all four areas would be open to new leasing with NSO stipulations but under very stringent constraints. Under the Proposed RMP Amendment, the Shoshone Basin would be open to new leasing with NSO but there would be no waivers, exceptions, or modifications. Under the Proposed RMP Amendment, the other three areas would be open to new leasing with NSO with more protective waivers, exceptions, and modifications than under Alternatives 4 and 5. As a result, Alternative 3, 6, the Proposed RMP Amendment and Alternatives 1 and 2 provide the most protective measures from fluid mineral development.

Disturbance Cap

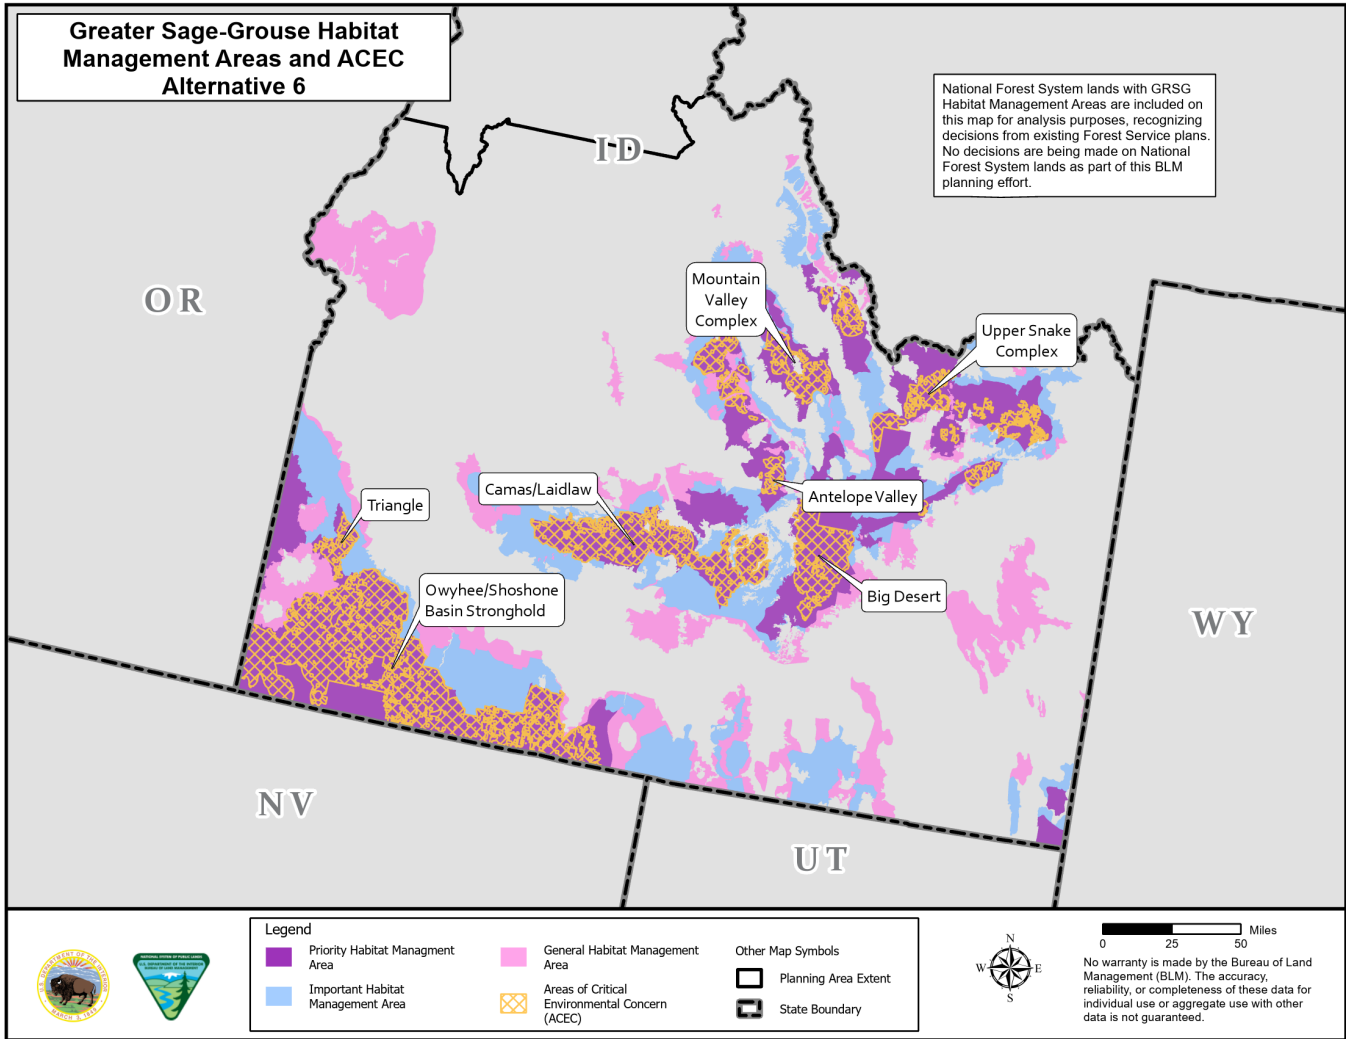
In Idaho, under Alternatives 1 and 2, there is a 3% disturbance cap that does not include fire or agriculture disturbance. This disturbance cap applies at both biologically significant units (BSU) scale and at proposed project analysis area within PHMA and can be exceeded in utility corridors if there is a benefit to GRSG. Under Alternative 3, there would be a 3% disturbance cap for new and pre-existing authorizations in the project analysis area within Habitat Assessment Framework (HAF) fine-scale boundaries and includes infrastructure, fire, and agriculture. Under Alternative 4, there would be a 3% disturbance cap and it only applies to infrastructure at the project analysis area and HAF fine scale. Under Alternative 5, there would be a 3% disturbance cap at the HAF fine-scale and project analysis area and the cap would not include fire or agriculture. Alternative 6 would apply the same management direction for disturbance cap as under Alternative 5, but in these four areas, there would be no allowable exceptions to the disturbance cap. Under the Proposed RMP Amendment, the 3% disturbance cap management direction is similar to that identified under Alternative 5 except that the exceptions align more closely with those identified under Alternative 4 which requires compensatory mitigation be in place when an exception is granted. As a result, Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance followed by the Proposed RMP Amendment and Alternative 4.



Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing as required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the potential ACECs by removing any potential disturbance associated with livestock grazing.

Summary of Effects



Considered comprehensively, Alternatives 3 and 6 would protect and prevent irreparable damage to the relevant and important values of all four of the potential ACECs. The application of PHMA with limited exceptions management direction under the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the Shoshone Basin potential ACEC and the application of the PHMA management direction in the Owyhee, Camas-Laidlaw, and Big Desert potential ACEC areas would protect and prevent irreparable damage to their relevant and important values. Alternative 4 provides a high degree of protection from development and would also protect and prevent irreparable damage to the relevant and important values of all four of the ACECs. Although Alternatives 1, 2, and 5 provide a relatively high degree of protection within these potential ACEC areas; fluid mineral, solar, wind, and major rights of way development under these alternatives is more likely to occur and could negatively impact the relative and important values of all four of the potential ACECs.

Map 5.3: Idaho Alternative 3 Potential ACECs

As described above, the Triangle, Antelope Valley, Mountain Valley Complex, and Upper Snake Complex were considered as potential ACECs in Alternatives 3 and 6 in the Draft EIS but were removed from consideration in the Final EIS.

Map 5.4*: *Idaho Alternative 6 Potential ACECs

As described above, the Triangle, Antelope Valley, Mountain Valley Complex, and Upper Snake Complex were considered as potential ACECs in Alternatives 3 and 6 in the Draft EIS but were removed from consideration in the Final EIS.

MONTANA/DAKOTAS

The Montana/Dakotas State Office considered new information and resource values in identifying habitat areas potentially eligible for ACEC nomination. Montana/Dakotas considered three areas highlighted by the range-wide planning team based on a review of new science and an evaluation of Sagebrush Focal Areas (SFAs) from the 2015 plans. The three areas that were evaluated are the South-Valley-Phillips (Sagebrush Focal Area), Cedar Creek, and Carter-Crook areas. Refer to the evaluations below.

Nominations were evaluated for habitat supporting 25-50% relative abundance and associated seasonal habitats, high lek persistence, key genetic nodes and/or concentration of genetic nodes and existing or potential land uses that would be a concern for persistence of GRSG.

While the scoping period closed on February 8, 2022, on July 21, 2023, BLM received an external ACEC submission for consideration of four additional ACECs in Montana. These nominations included expansion of two existing ACECs, the Powderville Expansion ACEC and the Frenchman Breaks Expansion ACEC. Two new areas were nominated, including the Musselshell Breaks ACEC and the North of Charles M. Russel National Wildlife Refuge ACEC. The nominations contained potential relevant and important values for these four proposed ACECs and suggestions for expanded, existing ACECs.

In addition to values related specifically to GRSG, the nominations contained potentially relevant values for grassland bird/mid-grass prairie habitat, ecological connectivity, intactness, paleontological resources and climate stability that are outside of the purpose and need of this planning effort. and will be considered in considered by the BLM during future planning efforts.

In considering the GRSG components of the four nominations received and the internally identified potential ACECs, the BLM considered multiple lines of evidence to determine if the GRSG habitat values had "more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern." Those values are present primarily in portions of the North of Charles M. Russel National Wildlife Refuge ACEC, which overlaps the internally developed South Valley-Phillips area, and was evaluated to determine if the area met the importance criteria (refer to importance evaluations below). The Frenchman Breaks Expansion ACEC nomination presents important connectivity values for GRSG, that are locally unique. However, the density of the GRSG population, genetic uniqueness, lek persistence, sagebrush conservation design, and other lines of evidence to identify "substantial significance" were not determined by the BLM to rise to the level of importance needed to move forward for evaluation in the alternatives of this RMP amendment. However, other HMA management direction for PHMA and CHMA is proposed across the alternatives in the EIS that conserve GRSG values in this area. The Musselshell Breaks ACEC and Powderville Expansion ACEC nominations fall primarily outside of GRSG PHMA, with some overlap with GHMA. The BLM determined that while these areas are adjacent to priority GRSG habitat they did not meet the relevance criteria for GRSG (the nominations are primarily for other values) and would not move forward for evaluation in the alternatives of this RMP amendment.

Importance Evaluations

Montana GRSG ACEC Importance Evaluation: Cedar Creek Anticline GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	Greater sage-grouse are distributed throughout the western United States. The portion of the distribution in Montana, Wyoming, North Dakota, South Dakota, Alberta, and Saskatchewan are designated as Management Zone I (Stiver et al. 2006). Management zones are delineations of greater sage-grouse populations and subpopulations within floristic zones with similar management issues. Within Management Zone I Montana, Wyoming, North Dakota, and South Dakota have designated core areas, and in 2015 BLM designated Priority, General, and Restoration Habitats. Since the 2015 BLM plans, new science addressing GRSG density and habitats has provided additional information about the locations of areas that may contain special worth, consequence, or distinctiveness. While higher density areas and genetic connectivity are considered important to greater sage-grouse conservation, areas with similar characteristics to the Cedar Creek area are dispersed throughout the region and are not significantly unique to a specific region or planning unit. In addition, greater sage-grouse habitat in the Cedar Creek area is owned by a number of different entities and habitat on BLM-administered lands is not distinct from habitat managed by other ownerships. While a portion of the area contains high relative abundance (Doherty et al. 2016), the size of the area is not distinct compared to other areas. Most leks have seen decreased counts since the 2010-14 period used to calculate relative density (e.g., FA-38: 34 males in 2010, now 0; FA-004A: 14 males in 2010 to 9 now; FA-013: 24 in 2011 to 6 now. In addition, this area is close to the small fringe population in North Dakota, However the Cedar Creek Anticline represents only a small portion of the lager population as defined by recent genetic work (Oyler-McCance 2022). Therefore, this area is not particularly distinct or critical to maintaining unique genetics for the SE Montana and Dakotas area relative to other PHMA. The Cedar Creek Anticline is a unitized oil and gas field that is predominantly leased, mostly developed, with a high level of anthropogenic activity. Additional substantial activity or development relative to current level is unlikely.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	The area is not particularly fragile or sensitive to change as compared to other sites in the Montana-Dakotas region. The area does not contain key or cluster of genetic nodes and represents a fringe population with genetic nodes as terminal sites (Cross et al 2018). Ongoing disturbance is high, including a high density of O&G wells, and is predominantly already leased. The area is found to have only a small area of core sagebrush as identified in Doherty (2022) Sagebrush Conservation Design and has only a small proportion as core relative to other areas in the region. Similarly, the MT GRSG Conservation Program's Habitat Quantification Tool identifies much of the area as low habitat value, with only a small portion providing high modeled habitat quality values.

Montana GRSG ACEC Importance Evaluation: Cedar Creek Anticline GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The BLM 2015, 2019, and current initiatives to conserve, enhance, and restore greater sage-grouse habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that greater sage grouse was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. Without multiple lines of evidence, including reasonably foreseeable development, valid existing rights, land ownership, crucial GRSG habitat characteristics from multiple science-based models, on-the-ground conditions/evidence this area does not have protection requirements beyond the standard approaches to implemented FLPMA and national priorities.

Other Items	
Boundaries	No proposed changes to the boundary.
Additional Notes	This area is a unitized oil and gas field, largely leased and developed, and with limited ability for the BLM to enhance GRSG habitat in the short term. The delineation as a RHMA is reflective of these challenges, the focus here is on longer-term objectives of the BLM to manage the area to maintain GRSG habitat and conduct restoration to provide for higher quality habitat (to support past bird density) in the future.

Conclusion
Due to current habitat conditions and limited evidence for the Cedar Creek Anticline to qualify as more distinct or critical than other HMAs, the BLM MT-Dak does not find the Cedar Creek anticline to meet relevance and importance for an ACEC nomination. While the area is part of a larger population with ND (and beyond) there are other areas within the population that are more likely to maintain any local genetics and be a source population for North Dakota. We do not recommend moving this area forward to identify and consider unique management.

Montana GRSG ACEC Importance Evaluation: Carter Crook GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	Greater sage-grouse are distributed throughout the western United States. The portion of the distribution in Montana, Wyoming, North Dakota, South Dakota, Alberta, and Saskatchewan are designated as Management Zone I (Stiver et al. 2006). Management zones are delineations of greater sage-grouse populations and subpopulations within floristic zones with similar management issues. Within Management Zone I Montana, Wyoming, North Dakota, and South Dakota have designated core areas, and in 2015 BLM designated Priority, General, and Restoration Habitats. Since the 2015 BLM plans, new science addressing GRSG density and habitats has provided additional information about the locations of areas that may contain special worth, consequence, or distinctiveness. A portion of the area contains high relative abundance (Doherty et al. 2016), a factor considered important to greater sage-grouse conservation. However these higher density areas in the Carter-Crook area are similar to other areas dispersed throughout the region and are not significantly unique to this unit. Greater sage-grouse habitat in the Carter-Crook area is owned by a number of different entities and habitat on BLM-administered lands is not distinct from habitat managed by other ownerships. While a limited portion of the Carter-Crook boundary contains high relative abundance (Doherty et al. 2016), the area has evidence it is a consequential genetic connection. Chiefly, it encompasses a keystone genetic node (Cross et al. 2018), and a potential corridor where genetic connections between the northern and southern portions of management Zone 1 are constricted (Row et al 2018, Cross et al. 2023). This area of genetic connectivity may provide the most likely link between GRSG in Montana-Dakotas and Wyoming.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The area is not particularly fragile or sensitive to change as compared to other sites in the Montana-Dakotas region. However, due to the key genetic node (Cross et al 2018), and constricted habitat, this area is the primary connectivity link between populations in northern portions of MZ1 with populations throughout the rest of the species' range. As such, loss of this area could isolate populations in the NE from populations in the rest of the range, which could have relatively dramatic impacts on populations in MT and the Dakotas. Ongoing disturbance in isolated portions nearby (see boundary discussion below) the area are high, primarily in a unitized oil and gas field in Wyoming and on Bentonite producing areas in Montana. Much of the area is core sagebrush as identified in Doherty (2022) Sagebrush Conservation Design with proportionally large core relative to other areas in the region. Similarly, the MT GRSG Conservation Program's Habitat Quantification Tool identifies much of the area in Montana as higher habitat value, with only a small portion providing low modeled habitat quality values due to development.

Montana GRSG ACEC Importance Evaluation: Carter Crook GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The BLM 2015, 2019, and current initiatives to conserve, enhance, and restore greater sage-grouse habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that greater sage grouse was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species, therefore, areas that meet national priority concerns or specific FLPMA mandates require multiple lines of evidence supporting more than local priorities and conservation value. The proposed Carter-Crook ACEC includes multiple lines of evidence, identifying the area as highly valuable GRSG habitat, especially for genetic connectivity. Therefore, this area likely provides a key connection between GRSG populations in multiple states. In addition, conserving habitat connectivity is a national priority for managing bureau sensitive status species (Manual 6840 and IM 2023-005).
Other Items		
Boundaries	The boundary for this ACEC began by considering the HQ proposal. To better reflect local information and concentrate on where the most likely, high-value, GRSG corridor falls, the boundaries were adjusted. In Montana this focused on removing active areas of bentonite development and adjusting the boundary to the north to capture key GRSG leks that would "supply" birds that would migrate through the corridor to Wyoming leks. In addition, the ID Team considered GRSG relative density models, the MT HCP Habitat Quantification Tool, Sagebrush Conservation Design Core Areas, and other models along with on-the-ground experiences and conditions. Adjustments to the WY portion of the ACEC included analysis of cheatgrass and other habitat conditions (wee Wyoming analysis). To avoid inconsistencies across jurisdictional boundaries, the MT-Dak and WY BLM State Offices met to edge map the revised boundaries produced by each state in cooperation with Cooperating Agencies and Field Offices. The ACEC boundary reflects an area focused on the area with the highest likelihood of facilitating long-distance (e.g., lek moving) GRSG dispersal and the and high-quality sagebrush habitat supporting leks in the area of the corridor.	
Additional Notes	Part of this original area is identified in an area that is one of the larger bentonite producing areas in the US. There are active claims, proposed additional projects, and a large amount of existing proven claims.	
Conclusion		
Due to meeting the relevance and importance criteria, this area, with a revised boundary from original proposal, was identified as a potential ACEC in Alternatives 3 and 6. Refer to BLM Montana/Dakotas – ACEC Maps for Alternatives 3 and 6 that follow.		

Montana GRSG ACEC Importance Evaluation: South Valley Phillips GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	Greater sage-grouse are distributed throughout the western United States. The portion of the distribution in Montana, Wyoming, North Dakota, South Dakota, Alberta, and Saskatchewan are designated as Management Zone I (Stiver et al. 2006). Management zones are delineations of greater sage-grouse populations and subpopulations within floristic zones with similar management issues. Within Management Zone I Montana, Wyoming, North Dakota, and South Dakota have designated core areas, and in 2015 BLM designated Priority, General, and Restoration Habitats. Since the 2015 BLM plans, new science addressing GRSG density and habitats has provided additional information about the locations areas that may contain special worth, consequence, or distinctiveness. Higher density areas and genetic connectivity are considered important to greater sage-grouse conservation, and small areas or lek clusters with limited connectivity are dispersed throughout the region. However, the greater sage-grouse habitat in the South-Valley Phillips area is owned predominantly by BLM and the state of Montana. The majority of the area contains high relative abundance, representing the largest high-density area in Management Zone I (Doherty et al. 2016). There are well connected genetic nodes (Cross et al. 2018) within the area, and to surrounding areas.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The area is not particularly fragile or sensitive to change as compared to other sites in the Montana-Dakotas region. Ongoing disturbance in the area is limited to a few Bentonite mined area. The area is mostly core sagebrush as identified in Doherty (2022) Sagebrush Conservation Design with proportionally large core relative to other areas in the region. Similarly, the MT GRSG Conservation Program's Habitat Quantification Tool identifies much of the area as higher habitat value. Furthermore, this area contains the wintering area for a unique GRSG population that exhibits long distance migration in the spring and fall (Newton et al. 2017, Tack et al. 2019)
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The BLM 2015, 2019, and current initiatives to conserve, enhance, and restore greater sage-grouse habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that greater sage grouse was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. With multiple lines of evidence, including land ownership, highly valuable GRSG habitat characteristics from multiple science based models, and supporting on-the-ground conditions and evidence, this area may provide habitat key to meeting national GRSG conservation goals.

Other Items	
Boundaries	The boundary for this ACEC began by considering the SFA in the area from the 2015 GRSG Planning Effort. To better reflect new information and GRSG habitat with the highest conservation value, the boundaries were adjusted. For example, isolated BLM parcels that fall in predominantly agricultural areas and lower value GRSG habitat were removed (e.g., areas south of the Missouri River). In addition, the ID Team considered GRSG relative density models, the MT HCP Habitat Quantification Tool, Sagebrush Conservation Design Core Areas, and other models along with on-the-ground experiences and conditions. Finally, a portion of this area is already designated as the Mountain Plover ACEC. To avoid duplicative, conflicting, or overlapping management, this existing ACEC was removed from the boundary. The ACEC boundary reflects an area focused on the highest density of GRSG, contiguous BLM lands, and high-quality sagebrush habitat.
Additional Notes	None.
Conclusion	
Due to meeting relevance and importance criteria, the area was identified as a potential ACEC in Alternatives 3 and 6. Refer to BLM Montana/Dakotas – ACEC Maps for Alternatives 3 and 6 that follow.	

Effects of the Alternatives on the Potential South Valley Phillips and Carter Crook ACECs

As described above, the 615,888-acre South Valley Phillips potential ACEC area is mostly core sagebrush as identified in Doherty (2022) Sagebrush Conservation Design with proportionally large core relative to other areas in the region. Similarly, the Montana GRSG Conservation Program's Habitat Quantification Tool identifies much of the area as higher habitat value. The majority of the area contains high relative abundance, representing the largest high-density area in Management Zone I (Doherty et al. 2016). There are well connected genetic nodes (Cross et al. 2018) within the area, and to surrounding areas, which include other protected federal lands (notably Charles M. Russell National Wildlife Refuge). This area also contains the wintering area for a unique GRSG population that exhibits long distance migration in the spring and fall (Newton et al. 2017, Tack et al. 2019), maintaining the persistence of those birds, which are listed as endangered in Canada (refer to **Appendix 5** for more information).

The 110,162-acre Carter Crook potential ACEC area encompasses a keystone genetic node (Cross et al. 2018), and a potential corridor where genetic connections between the northern and southern portions of management Zone I are constricted (Row et al 2018, Cross et al. 2023). This area of genetic connectivity may provide the most likely link between GRSG in Montana-Dakotas and Wyoming.

Table 5-7 displays the HMA allocations for these two areas under each alternative. Under the Proposed RMP Amendment, the South Valley Phillips area would be managed as PHMA with limited exceptions. Under the Proposed RMP Amendment, the Carter Crook area would be managed as 92% PHMA, 8% SCHMA, with a small amount managed as GHMA. Under Alternatives 1 and 2, the areas would be managed mostly as PHMA, with about 30% of the Carter Crook area as RHMA and 0.4% of the South Valley Phillips area managed as GHMA. Under Alternatives 4 and5 nearly all of these two areas would be managed as PHMA.

Under Alternative 3 and 6, both areas would also be designated as ACECs. Under Alternatives 3, the potential ACECs would receive PHMA management direction except where stronger, ACEC protections are identified related to developing plans of operations for locatable mineral development and major rights of way. Under Alternative 6, the potential ACECs would receive PHMA management direction identified for Alternative 5 except where stronger, ACEC protections are identified for locatable minerals, fluid minerals, non-energy leasables, saleable minerals, major rights of way, solar, wind, the disturbance cap, and the development of plans of operations for locatable mineral development.

Table 5-7. HMA Allocations in the Montana Potential ACECs by Alternative

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[5]
South Valley Phillips							
PHMA with limited exceptions	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	615,888 acres (100%)
PHMA	613,332 acres (99.6%)	613,332 acres (99.6%)	615,888 acres (100%)	615,888 acres (100%)	615,888 acres (100%)	615,888 acres (100%)	615,888 acres (100%)
GHMA	2,556 acres (0.4%)	2,556 acres (0.4%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
Total	**615,888 acres**	**615,888 acres**	**615,888 acres**	**615,888 acres**	**615,888 acres**	**615,888 acres**	**615,888 acres**
Carter Crook							
PHMA	77,108 acres (70%)	77,108 acres (70%)	110,162 acres (100%)	110,115 acres (100%)	110,115 acres (100%)	110,162 acres (100%)	101,444 acres (92%)
GHMA	47 acres (0%)	47 acres (0%)	0 acres (0%)	47 acres (0%)	47 acres (0%)	(0%)	47 acres (0%)
RHMA	33,007 acres (30%)	33,007 acres (30%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)
SCHMA	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	8,674 acres (8%)
Total	**110,162 acres**	**110,162 acres**	**110,162 acres**	**110,162 acres**	**110,162 acres**	**110,162 acres**	**110,162 acres**

This section details the effects of the alternatives on these areas considered for ACEC designation.

Solar, Wind, and Major Rights of Way

Under the Proposed RMP Amendment, as PHMA and SCHMA, the Carter Crook potential ACEC would be managed as exclusion for utility-scale solar and wind development with exceptions. For ROWs, the Carter Crook potential ACEC area would be managed as exclusion for surface disturbing or disruptive activities within 1 km (0.6 miles) of active leks or crucial winter range, and avoidance in existing corridors or ROWs. As PHMA with limited exceptions, the potential South Valley Phillips ACEC would be managed as exclusion for utility-scale solar and wind development and exclusion for major rights of way with no exceptions, providing additional protections to GRSG habitat.

Under Alternatives 1 and 2, both potential ACECs would be managed as avoidance areas for wind in PHMA and SCHMA. Alternatives 1 and 2 do not provide management direction for solar development in PHMA, general surface disturbance limits would exclude solar near leks (0.6 miles) and minimize (e.g., disturbance cap, mitigation) elsewhere in PHMA. The minor portions of the potential South Valley Phillips and Carter Crooks ACECs managed as GHMA under Alternatives 1 and 2 would be open for wind and solar. Under Alternative 4, the two areas would be managed as exclusion areas for wind and solar as PHMA. Under Alternative 5, in PHMA and SCHMA, the areas would be managed as avoidance for solar and wind with criteria that would need to be met for development to occur. Under Alternative 4, the areas would be

[5] PHMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.

avoidance areas for major rights of way and under Alternative 5, these areas would be avoidance for major rights of way in PHMA.

Alternative 3 and the Proposed RMP Amendment provide the greatest protection to GRSG habitat and protect and prevent irreparable damage to the relevant and important values of the South Valley Phillips ACEC by managing the area as exclusion for utility-scale solar, utility-scale wind, and major rights of way, with no exceptions. Alternative 3 also protects and prevents irreparable damage to the relevant and important values of the potential Carter Crook ACEC for the same reason. The Proposed RMP Amendment also provides strong protection to the relevant and important values, but some impacts could occur from utility-scale solar, utility-scale wind, or major rights of way developed under the exceptions. Alternative 4 provides the next highest level of protection by managing as exclusion areas for wind and solar and avoidance areas for major rights of way. Alternatives 1, 2, and 5 would provide the least protection to the potential ACECs from potential development given the allocation of avoidance for wind and solar.

Saleable Minerals/Material Management and Locatable Minerals

Under the Proposed RMPA, as PHMA and SCHMA, the potential Carter Crook ACEC would be closed to new non-energy leasable mineral development but allow expansion of existing operations and would be closed to saleable minerals/mineral materials but open for new free use permits and open for the expansion of existing pits. As PHMA with limited exceptions, the potential South Valley Phillips ACEC would be closed to new non-energy leasable mineral development leases, including fringe acreage leasing, and closed to saleable minerals/mineral materials but open for new free use permits and expansion of existing pits.

Under Alternative 3 and Alternative 6, both areas would be designated as ACECs. Under both these alternatives, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use in these areas. Under Alternative 3, the South Valley Phillips and Carter Crook potential ACEC areas would be closed to saleable minerals/mineral materials and non-energy leasable minerals, with no exceptions, and both potential ACECs would be recommended for locatable mineral withdrawal. Under Alternative 6, the areas would be closed to non-energy leasable minerals and closed to saleable minerals/material management for new operations for all sale types except for free-use pits in order to support maintenance needs for existing local roads to ensure public safety, with restrictions.

Under Alternatives 1, 2, 4, 5, and the Proposed RMP Amendment, these potential ACEC areas would be open to locatable mineral development and notice level exploration would be allowed without a plan of operation. For the 30% of the Carter Crook potential ACEC managed as RHMA in Alternatives 1 and 2, management direction varies, and some stipulations apply for saleable minerals/material management and for non-energy leasable minerals.

Alternative 3 would provide the greatest protection to GRSG habitat, protecting and preventing irreparable damage to the relevant and important values of the potential South Valley Phillips and Carter Crook ACECs from mineral development by closing the areas to saleable minerals/mineral materials and non-energy leasable minerals, with no exceptions, and by recommending locatable mineral withdrawal. The Proposed RMP Amendment and Alternative 6 also provide a high level of protection to the relevant and important values of the potential ACECs by closing the areas to these types of mineral development, with some exceptions. Alternatives 1, 2, 4 and 5 would provide the least protection to the potential ACECs from potential development.

Fluid Mineral Development

Under the Proposed RMP Amendment the South Valley Phillips potential ACEC would be managed under the PHMA with limited exceptions designation and the No Surface Occupancy (NSO) with no exceptions management direction identified would protect the potential ACEC from the threat of fluid mineral development. Under the Proposed RMP Amendment, as PHMA, the Carter Crook potential ACEC area would be managed as NSO for fluid mineral development within .6 miles of leks and season limitations (breeding, nesting, early brood-rearing and winter habitat) and Controlled Surface Use (CSU) (density and disturbance) outside of the 0.6-mi NSO buffer with exceptions.

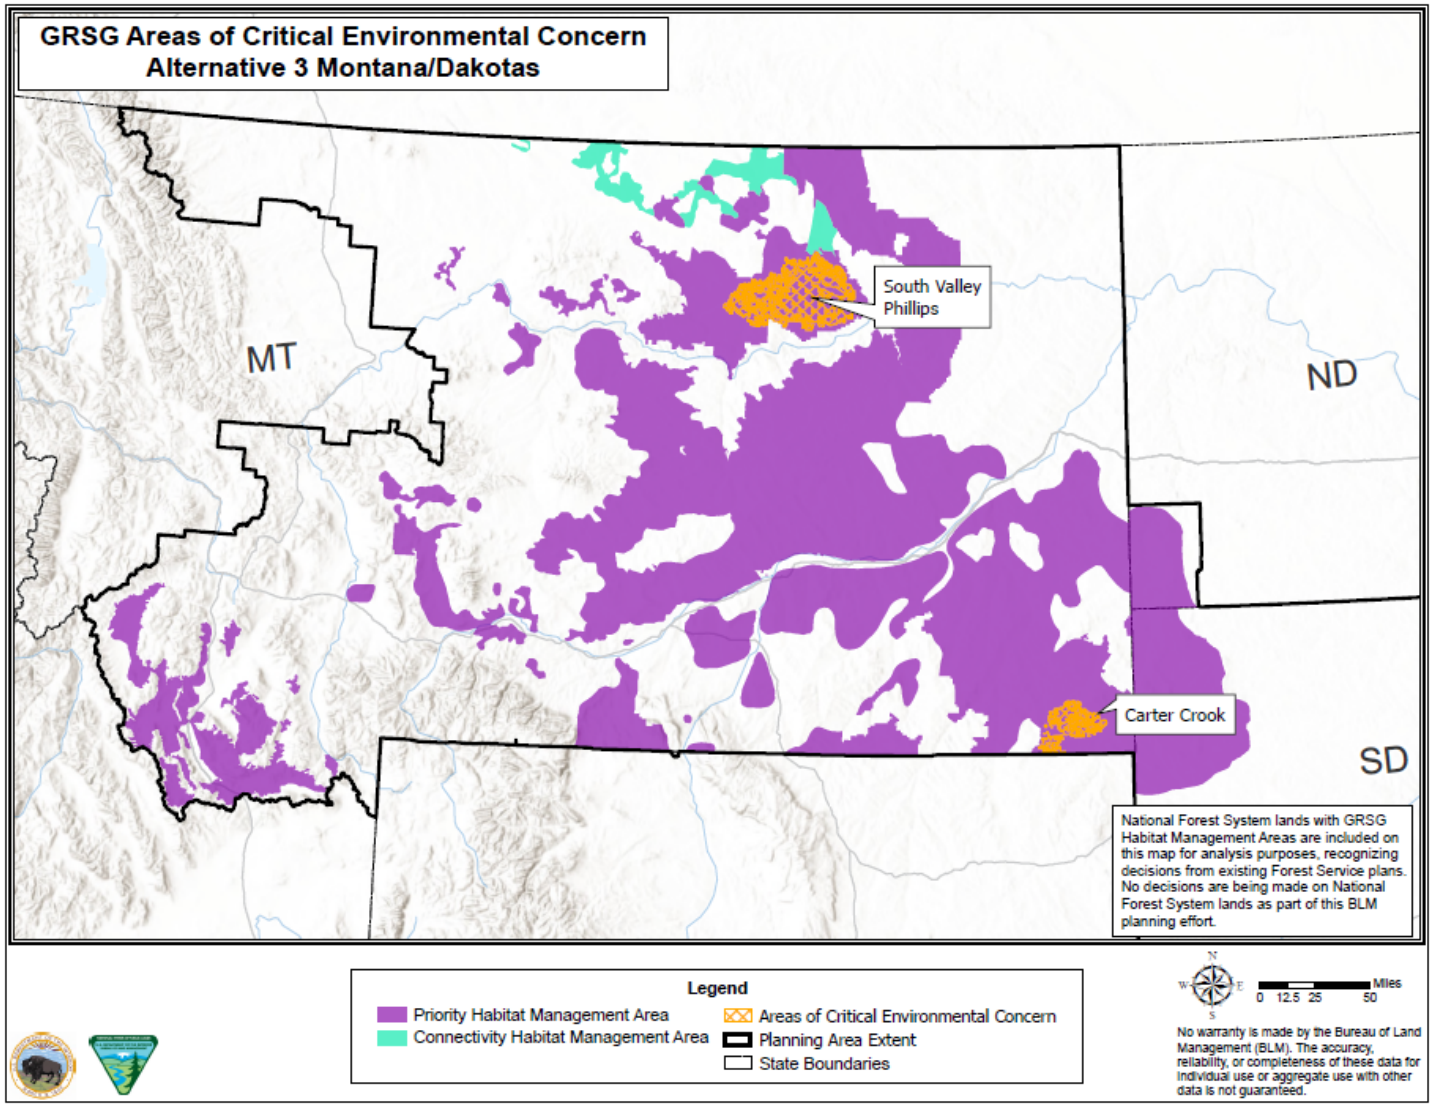
Under Alternative 3, the South Valley Phillips and the Carter Crook potential ACECs would be closed to fluid mineral development without exception. Under Alternative 6, both areas would also be subject to NSO but development could occur if an exception for the entire ACEC area could be met.

Under Alternatives 1, 2, and 5, in PHMA, which includes the majority of areas within these potential ACECs, NSO would be allowed within .6 miles of leks. PHMA outside .6 miles has season limitations (breeding, nesting, early brood-rearing and winter habitat) and CSU (density and disturbance). Under Alternative 4 there would be NSO in the potential ACEC areas. The 30% of the Carter Crook potential ACEC managed as RHMA, in Alternatives 1 and 2, would be open with variable stipulations (Open with Major stipulations/NSO in the West Decker and South Carter RMP planning areas, open with Major stipulations/0.6 m NSO from leks in Billings RMP planning area, open with moderate/CSU in the Billings and Cedar Creek RMP planning areas, but language varies, and open with Minor/TL w/in 3 miles of a lek in the Billings RMP planning area).

In the South Valley Phillips potential ACEC area, Alternative 3 provides the greatest protection from fluid mineral development by prohibiting fluid mineral development followed by the Proposed RMP Amendment that restricts fluid mineral development to NSO with no exceptions. In the Carter Crook potential ACEC area, Alternative 3 provides the greatest protections from fluid mineral development by prohibiting fluid mineral development, and the Proposed RMP Amendment and Alternative 6 both provide a high level of protection by establishing NSO with major constraints. Alternative 1, 2, and 4 would provide the least protections to the potential ACECs from fluid mineral development.

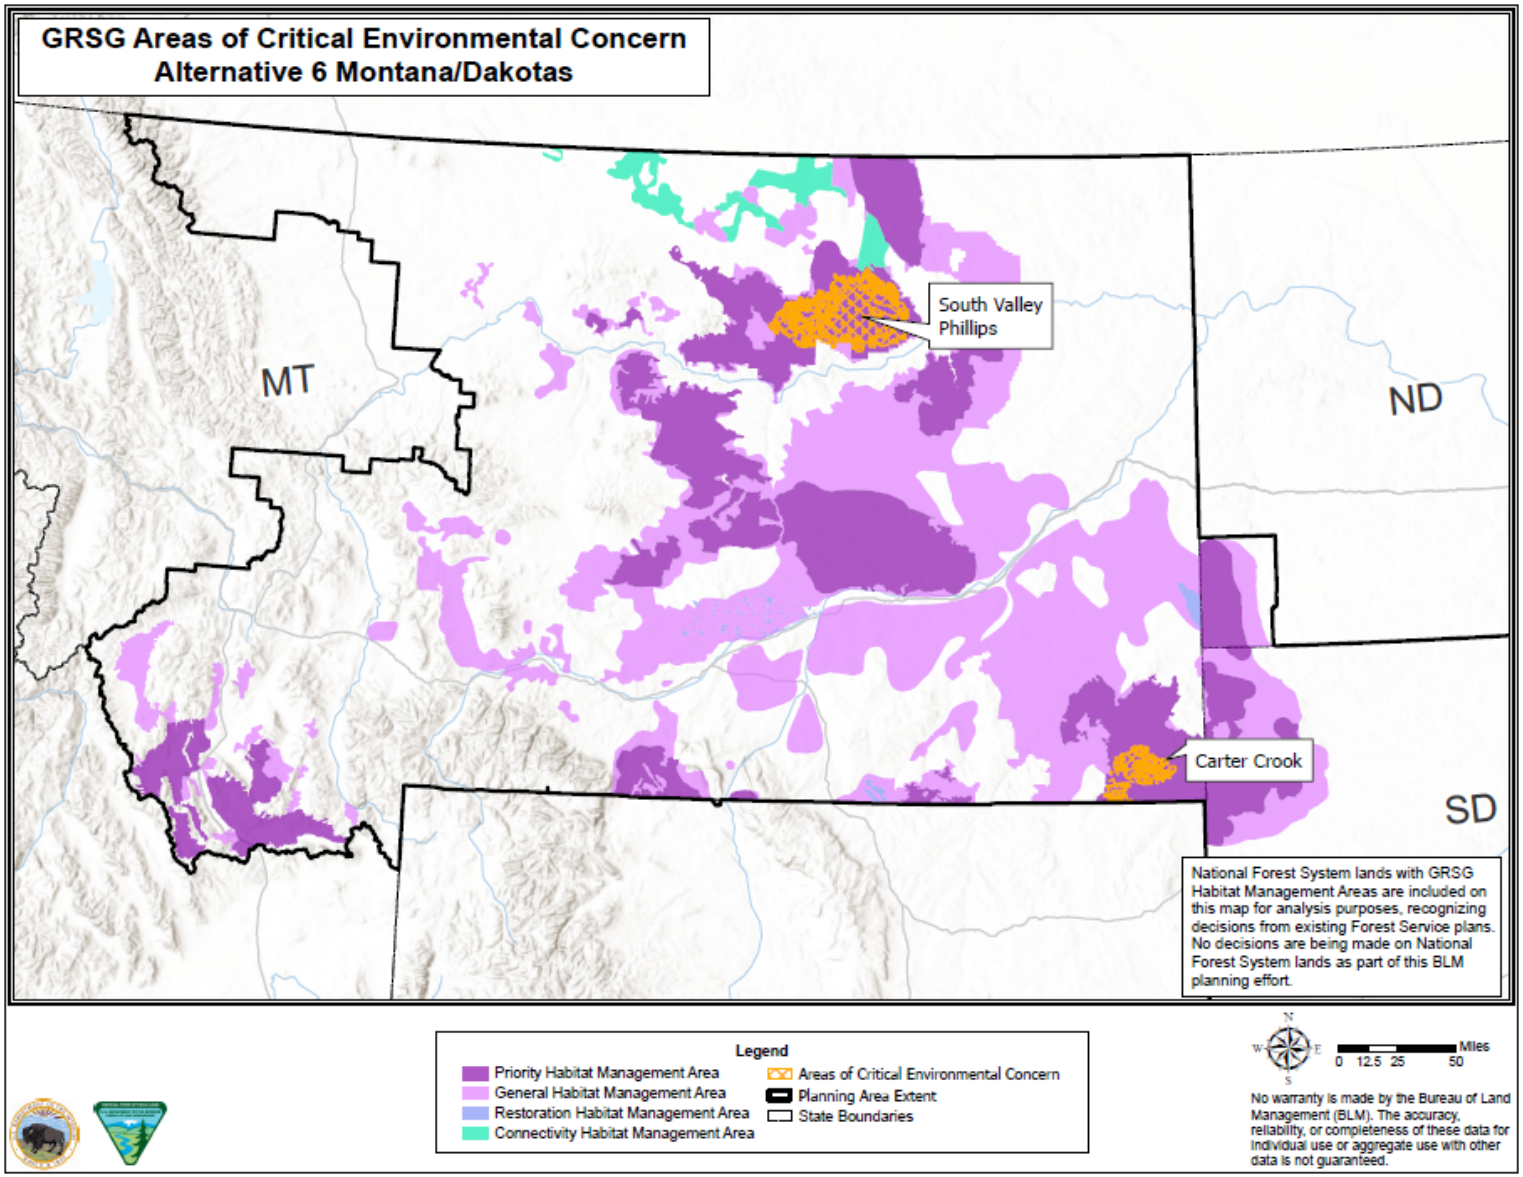
Disturbance Cap

In these areas managed as PHMA, the Proposed RMP Amendment utilizes two approaches/caps at the project scale, with specific modifications. These are a disturbance cap at 3% cap, following the rangewide approach, and a 5% cap, including fire and agriculture. The 3% fine scale HAF cap will also apply. Alternative 6 sets the same disturbance cap for the area but there are no exceptions and Alternative 3 closes the area to new infrastructure projects and sets a 3% disturbance cap for existing developments. Similar to the Proposed RMP Amendment, Alternatives 1 and 2 set a 5% disturbance cap in PHMA in MT/DKs, and with a 3% disturbance cap in PHMA for specific on specific anthropogenic activities such as development of minerals and renewable energy, as well as ROWs in the Dakotas. Under Alternatives 4 and 5, in PHMA the disturbance cap is 3% the project scale or 3% at the HAF Fine Scale selection area and projects would be deferred until disturbance in the areas has been reduced below the cap threshold or the projects could be redesigned to not result in additional surface disturbance or moved outside of PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.



Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing are required. For the 30% of the Carter Crook potential ACEC managed as RHMA in Alternatives 1 and 2, management direction varies. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the potential ACECs by removing any potential disturbance associated with livestock grazing.



Summary of Effects

Considered comprehensively, Alternatives 3 and 6 would protect and prevent irreparable damage to the relevant and important values of both potential ACECs. The application of PHMA with limited exceptions management direction under the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the South Valley Phillips potential ACEC and the application of the PHMA management direction in the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the Carter Crook potential ACEC. Although Alternatives 1, 2, 4, and 5 provide a relatively high degree of protection within PHMA management direction in most of these potential ACEC areas, disturbance from mineral, fluid mineral, solar, wind, and major rights of way development under these alternatives is more likely to occur and could negatively impact the relative and important values of the potential ACECs.

Map 5.5: Montana Alternative 3 Potential ACECs

Map 5.6: Montana Alternative 6 Potential ACECs

NEVADA/CALIFORNIA

Areas for consideration as potential ACECs in Nevada were identified through the rangewide preliminary evaluation and from input from the Nevada Department of Wildlife. The draft polygons were reviewed and refined in coordination with preliminary input from federal, state, and county cooperating agencies. The relevance and importance determinations were informed by the evaluation of both State- and Regional-level information.

The following datasets were used to help delineate the draft ACECs.

- **Local scale data:** Draft Nevada/California Habitat Management Area Map (USGS in preparation) –that provided updates to abundance and space use indices and provided an example of combining space use, habitat selection, and survival.
- **Regional scale data:** Recently published regional GRSG data (BBD, Lek Persistence, Priority Genetic Pathways, genetic nodes, R&R, probability of breeding habitat, TAWS) was used to inform regional importance.

The BLM updated the ACEC evaluations following public review of the Draft RMP Amendment/EIS, both in response to public comments and consistent with updates to Habitat Management Areas, as described in **Appendix 3**. The ACEC boundaries were adjusted and refined to comport with the updated habitat data. In some instances, this led to increases in acres in some of the potential ACECs and decreases in others.

Importance Evaluations

Geographic Reference	Importance	Recommendation
Warm Springs	Greater than 60% core habitat, remainder is growth; low to medium Resistance and Resilience; ~50% of area in 50% to 25% BBD; 1 neighborhood cluster with declining population (<0.95) and active pop warning; About 90% PHMA with some PHMA+; High to Medium lek persistence; Includes Warm Springs LWC; Partially includes and adjoins East Fork High Rock Canyon Wilderness; adjoins North Black Rock Range Wilderness; Low genetic connectivity; no nodes. Solid habitat that includes LWC and Wilderness. Population center but warning triggered for NC and population is in decline.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Montana Mountains	Strong representation of the 25% BBD in NV; Connects with OR population; High lek persistence; intersects three neighborhood clusters, primary neighborhood cluster shows population growth (lambda > 1.03), adjacent NCs nearly stable to declining (lambda = 0.99-0.95); Low R&R; mostly Growth area for sagebrush; about 10% of area includes Disaster Peak WSA. Source population likely supporting connection between OR/NV and ID/NV populations. Includes Disaster Peak WSA.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)

Geographic Reference	Importance	Recommendation
Owyhee West	Supports two separate population centers; provides regionally important genetic connectivity with eastern NV and ID to OR populations; Several genetic nodes including a Keystone node; Large area of contiguous BLM administered lands; includes North Fork Little Humboldt River and Little Humboldt River WSA; High value area for LCT. Regionally important genetic connectivity, includes two WSA, and provides important LCT habitat.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Owyhee East	Concentration of active leks and high lek persistence; near stable to growing population trend; provides regionally important genetic connectivity between ID and northeast NV to the remainder of NV populations; five genetic nodes; ~ 40% of the area is Core sagebrush and ~ 50% sagebrush Growth; Medium R&R Regionally important genetic connectivity, supports population centers and large tract of Core sagebrush.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
North Fork O'Neil	Adjoins ID proposed ACEC; provides regionally important genetic connectivity between ID and NV; population center with stable to growing trend; large area of contiguous BLM administered lands that is mostly Core and Growth sagebrush, PHMA and PHMA +; Medium R&R; includes Bad Lands WSA; Bisected by Proposed Designated Utility Corridor (possibly split ACEC into two separated by corridor).	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
South Fork Dixie Flats	Stepping-stone population between northern and southern NV; medium to high regional genetic connectivity; comprised of 25% and 50% BBD; high to medium lek persistence; about 40% of area in checkerboard private ownership or BLM administration; important high elevation brood rearing habitat (PHMA+); population declining (lambda = 0.97-0.99) but no warnings; L-M R&R; adjacent to Cedar Ridge and Red Spring WSA; proposed designated corridor bisects northeast corner.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Butte Long Valley	Provides regionally important genetic connectivity between northern and southeastern NV; adjacent to a keystone lek; supports three population centers; supports 5 NCs – 1 with increasing population trend and remaining 4 declining; H-M lek persistence; proposed designated utility corridor bisects southeastern quarter; adjacent to Goshute Canyon and Bristlecone Wilderness.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Little Butte Long Valley	Includes keystone genetic node; medium genetic connectivity; mostly 75% BBD; bisected by Hwy 93; 75% of area in proposed designated utility corridor. Between Draft and Final EIS, it was determined that due to the bisection of the area by Highway 93 and the presence of a major right of way that crosses a portion of the area that the area did not meet the importance criteria.	Identified as a potential ACEC in Alternatives 3 and 6 in the Draft EIS but not carried forward in the Final EIS. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)

Geographic Reference	Importance	Recommendation
Eureka North and South	High genetic connectivity between northern and southern NV; high elevation brood-rearing habitat; ~30% of northern area in PHMA+; 6 miles east of genetic node that is both a keystone and hub; northern area bisected by large proposed designated corridor and HWY 50 runs between north and south; supports three population centers across the entire area.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Grass-Kobeh Valley	Regionally important genetic connectivity between north and central NV; 4 genetic nodes; supports three 25% population centers and four 50% population centers; about 20% of area is PHMA+; H-M lek persistence; includes 5 NCs – 2 NCs have positive growth trend, remaining in decline; 2 NCs (about 15% of area) with active warnings; bounded on three sides by HWYs 305 (western side), 50 (south side), and 278 (eastern side); eastern side includes large proposed designated energy corridor; includes Simpson Park and Roberts Mountain WSA.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Monitor Valley	Supports three population centers (25-50% BBD) that are important to the southern portion of range in NV; provides genetic connectivity to central and northern NV; includes two genetic nodes; primarily core and growth sagebrush and PHMA; bordered by and supporting USFS GRSG populations/habitat; bisected by proposed designated utility corridor.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Reese River	Supports two population centers (25-50% BBD) that are important to the southern portion of range in NV; provides genetic connectivity to central and northern NV; includes two genetic nodes; primarily core and growth sagebrush and PHMA; bordered by and supporting USFS GRSG populations/habitat.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Hays Canyon	Stepping-stone population connecting the northern portion of MZ V (OR & NV) to the southern portion (CA); about 70% of area in 25%-50% BBD; one NC that is declining and has tripped an active warning; most of area is PHMA with about 25% of total area being PHMA+; primarily Growth with some Core sagebrush; M-H lek persistence; M-L R&R; bisected by proposed designated corridor (that includes an existing transmission line)	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Idaho Border	Provides continuity of habitat and population connectivity with neighboring states that have proposed ACEC areas. The Idaho Border area borders the potential Shoshone Basin ACEC identified in Idaho.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Utah Border	Provides continuity of habitat and population connectivity with neighboring states that have proposed ACEC areas. The "Utah Border" area is made up of two areas that border the potential Box Elder ACEC identified in Utah.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)
Vya-Massacre	See description in the "California GRSG ACEC Evaluation: Importance Criteria" below.	Identified as a potential ACEC in Alternatives 3 and 6. (Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.)

California GRSG ACEC Importance Evaluation: Buffalo Skedaddle Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	BLM CA included designated GRSG Priority, General, and Other Habitat Management Areas in the 2015 GRSG Plan Amendment. In 2022, updates to the GRSG Habitat Management Areas were initiated based on the best available science. These updates identified Priority Plus areas. Priority Plus are areas that are most productive to GRSG populations within Priority Habitat Management Areas (PHMA). PHMA plus includes modeled population performance, specifically survival of nests and broods and is informed by selection models and areas of increased survival. PHMA plus are considered "source" habitats. In addition to PHMA plus, other new science has emerged since the 2015 plans related to GRSG density, habitats, population trends, and genetic exchange among populations which has provided information on areas that may contain special worth, consequence, or distinctiveness within CA BLM managed lands.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The area is not particularly fragile or sensitive to change as compared to other areas on CA BLM managed lands. However, the area has been undergoing intensive restoration efforts due to the Rush Fire over 10 years ago. In addition, this area is on the western fringe of GRSG populations in California with documented genetic exchange with populations in Nevada.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse as Threatened or Endangered concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species, therefore, areas that meet national priority concerns or specific FLPMA mandates require multiple lines of evidence supporting more than local priorities and conservation value. The proposed Buffalo Skedaddle ACEC identifies the area as highly valuable for GRSG habitat and population persistence in northeastern California.

Other Items	
Boundaries	The boundary for this ACEC was initially delineated using the Population Management Unit (PMU) for the Buffalo Skedaddle PMU. The boundary was then refined to focus on the revised GRSG Habitat Management Area delineations, areas that have been successful in habitat restoration efforts since the Rush Fire and genetic exchange between CA and NV GRSG populations based on new science.
Additional Notes	—

Conclusion
Due to meeting the Relevance and Importance criteria, this area was identified as a potential ACEC under Alternatives 3 and 6. Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.

California GRSG ACEC Importance Evaluation: Vya/Massacre GRSG Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	BLM CA and NV included designated GRSG Priority, General, and Other Habitat Management Areas in the 2015 GRSG Plan Amendment. In 2022, updates to the GRSG Habitat Management Areas were initiated based on the best available science. These updates identified Priority Plus areas. Priority Plus are areas that are most productive to GRSG populations within Priority Habitat Management Areas (PHMA). PHMA plus includes modeled population performance, specifically survival of nests and broods and are informed by selection models and areas of increased survival. PHMA plus are considered "source" habitats. In addition to PHMA plus, other new science has emerged since the 2015 plans related to GRSG density, habitats, population trends, and genetic exchange among populations which has provided information on areas that may contain special worth, consequence, or distinctiveness within CA BLM managed lands.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The area is not particularly fragile or sensitive to change as compared to other areas on CA BLM managed lands. However, Bitner Ranch provides key brood-rearing habitat to GRSG in CA and connectivity between populations in NV, including the Sheldon Hart Refuge.

California GRSG ACEC Importance Evaluation: Vya/Massacre GRSG Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse as Threatened or Endangered concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species, therefore, areas that meet national priority concerns or specific FLPMA mandates require multiple lines of evidence supporting more than local priorities and conservation value. The proposed Vya-Massacre ACEC includes multiple lines of evidence, identifying the area as highly valuable GRSG habitat providing key brood-rearing habitat and connectivity among multiple states. In addition, conserving habitat connectivity is a national priority for managing bureau sensitive status species (Manual 6840 and IM 2023-005).
Other Items		
Boundaries	The boundary for this ACEC was initially delineated combining the Population Management Units (PMU) for Vya and Massacre PMUs. The boundaries were then refined to focus on the revised GRSG Habitat Area delineations, key brood-rearing habitat and additional new science.	
Additional Notes	—	
Conclusion		
Due to meeting the Relevance and Importance criteria, this area was identified as a potential ACEC under Alternatives 3 and 6. Refer to BLM Nevada/California - ACEC Maps for Alternatives 3 and 6 that follow.		

Consideration of ACECs nominated during the public comment period

BLM received nominations for the Table Mountain, Juniper Ridge, aa-Tiipi Flat areas that includes acreage within Oregon, Idaho, and Nevada. The three states coordinated on the nominated ACECs and the BLM Oregon State Office took the lead on considering the nominations. It was determined that none of these areas warranted consideration as potential ACECs in the Final EIS. Additional details are provided in the **Oregon** section of this appendix.

The BLM Nevada also received a nomination for the Nevada Department of Wildlife Population Management Units (PMU). The 59 PMUs totaling 41,110,833 acres include all habitat management areas as well as areas of non-habitat within the Nevada and northeastern California sub-region. The BLM evaluated the PMUs for consistency with ACEC policy and concluded that these areas generally meet the relevance criteria for fish and wildlife resource (specific to GRSG) but did not meet the importance criteria (more than locally significant). Because the nominated areas did not meet both relevance and importance criteria, and because GRSG habitat within the PMUs are already identified for GRSG-specific management, BLM did not identify the PMUs as a potential ACEC in the Final EIS.

Effects of the Alternatives on the Potential Warm Springs, North Fork O'Neil, Grass-Kobeh Valley, South Fork Dixie Flats, Idaho Border, Hays Canyon, Vya Massacre, and Buffalo Skedaddle ACECs

Nine areas identified as potential ACECs under Alternatives 3 and 6 would be managed as PHMA with limited exceptions under the Proposed RMP Amendment[6]. These are:

- Warm Springs: 89,539 acres, reduced from 92,727 acres in Draft RMPA/EIS
- North Fork O'Neil: 937,512 acres, increased from 894,940 acres in Draft RMPA/EIS
- Owyhee East: 487,122 acres
- Grass-Kobeh Valley: 852,979 acres, increased from 823,831 acres in Draft RMPA/EIS
- South Fork Dixie Flats: 122,395 acres, reduced from 138,060 acres in Draft RMPA/EIS
- Idaho Border: 49,019 acres, reduced from 74,971 acres in Draft RMPA/EIS
- Hays Canyon: 340,850 acres, reduced from 352,873 acres in Draft RMPA/EIS,
- Vya-Massacre: 293,677 acres, reduced from 307,495 acres in Draft RMPA/EIS, and
- Buffalo Skedaddle: 182,213 acres, reduced from 182,219 acres in Draft RMPA/EIS

These areas represent remaining intact sagebrush habitat with minimal anthropogenic disturbance, providing important regional genetic connectivity, high-quality brood-rearing habitat, and/or identified as highly valuable for GRSG habitat and population persistence, as detailed in the above evaluations. Given Nevada's basin and range ecology, GRSG habitat is naturally fragmented and GRSG have experienced significant habitat losses due to wildfire. Restoration is challenging due to the low elevation and dry climate, making conserving these remaining intact landscapes a conservation priority. These areas are primarily subject to threats from major rights of way, renewable energy, and mineral development.

Table 5-8 displays the HMA allocations for these nine areas under each alternative. Under the Proposed RMP Amendment, the areas within the Warm Springs, North Fork O'Neil, Grass-Kobeh Valley, South Fork Dixie Flats, Idaho Border, Hays Canyon, Vya Massacre, and Buffalo Skedaddle potential ACECs (as well as some surrounding areas) would be managed entirely as PHMA with limited exceptions. The Grass-Kobeh Valley potential ACEC areas would be managed mostly as PHMA with limited exceptions, with 40% of the area managed as PHMA.

Under Alternative 3 and 6, all nine areas would also be designated as ACECs and would be managed entirely as PHMA, with direction varying consistent with PHMA and ACEC direction in each alternative.

Under Alternatives 1, 2, 4, and 5 these areas would all be managed mostly as PHMA, with relatively small portions managed as GHMA, OHMA, and non-habitat. In Alternatives 1 and 2, these nine areas would be managed as 90% or more PHMA, with minor areas managed as other HMAs except for the Grass Kobeh potential ACEC, which would be managed as 87% PHMA, 10% GHMA, 2% OHMA, and 2% non-habitat and the Idaho Border potential ACEC, which would be managed as 76% PHMA, 23% GHMA, and 1% OHMA. Under Alternatives 4, and 5, these nine areas would be managed mostly as PHMA, with some GHMA, with under 5% as OHMA or non-habitat. In Alternatives 4 and 5, the Idaho Border potential ACEC would have the highest percentages of other HMA management, managed as 68% PHMA, 27% GHMA, and 5% OHMA.

[6] As the two areas are adjacent, the Owyhee East potential ACEC area was incorporated into the North Fork O'Neil PHMA with limited exceptions area in the Proposed RMP Amendment.

Table 5-8. HMA Allocations in the Nevada Potential ACECs by Alternative[7][8]

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[9][10]
Warm Spring							
PHMA with limited exceptions	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	0 acres (0%)	89,539 acres (100%)

[7] The areas identified in this table were identified as PHMA with limited exception areas in the Proposed RMP Amendment.
[8] Acreage calculated utilizing the USGS HMA model for NV/CA (Milligan et al. 2024) (Refer to Appendix 3).
[9] PHMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.
[10] In some cases, the Proposed RMP Amendment establishes PHMA with limited exceptions management direction in areas larger than the potential ACECs to ensure adequate protection of GRSG habitat. In these instances, the acreage calculation includes the entirety of the potential ACEC and some adjacent areas.
[11] As the two areas are adjacent, the Owyhee East potential ACEC area was incorporated into the North Fork O'Neil PHMA with limited exceptions area in the Proposed RMP Amendment.

This section details the effects of the alternatives on these areas considered for ACEC designation.

Solar, Wind, Major Rights of Way, Saleable Minerals/Material Management, and Locatable Minerals

The Proposed RMP Amendment and Alternatives 3 and 6 would all provide additional protections to the potential ACECs by excluding solar, wind, and non-energy leasable mineral development. While all three alternatives also exclude major rights of way and close the area to saleable minerals/material management, Alternative 3 provides the greatest protection as Alternative 3 provides no exceptions to the rights of way exclusion or to the saleable closure. In addition, under Alternative 3, the areas would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use. Under the Proposed RMP Amendment, as PHMA with limited exceptions, these nine areas would be managed as exclusion for utility-scale solar and wind development and exclusion for major rights of way with no exceptions, providing additional protections to GRSG habitat.

Under Alternatives 1, 2, and 4, the areas would be exclusion for solar and wind in PHMA and avoidance in GHMA and avoidance for major rights of way in PHMA and GHMA, which would provide similar but slightly less protections than afforded under the Proposed RMP Amendment and Alternatives 3 and 6. The portions of these potential ACEC areas that would be managed as OHMA and non-habitat would be open for utility-scale solar and utility-scale wind testing and development, with applicable minimization measures and compensatory mitigation. Under Alternative 5, the areas would be avoidance for solar and wind in PHMA and open with minimization measures in GHMA and would be avoidance for major rights-of-way in PHMA and open with minimization measures in GHMA. Therefore, Alternative 5 provides the least amount of protections from solar and wind development and Alternatives 1, 2, 4, and 5 would provide the least amount of protections from rights of way development. Under Alternatives 1, 2, 4, 5, and the Proposed RMP Amendment, the areas would be open to locatable mineral development and notice level exploration would be allowed without a plan of operations.

Fluid Mineral Development

Under the Proposed RMP Amendment these nine potential ACECs would be managed under the PHMA with limited exceptions, and the No Surface Occupancy (NSO) with no exceptions management direction identified for that designation would protect the potential ACECs from potential fluid mineral development.

Under Alternative 6, the area would also be subject to NSO but development could occur if an exception for the entire ACEC area could be met. Alternative 3 would close the areas to fluid mineral development without exception.

Alternatives 1 and 2 would manage fluid minerals to avoid, minimize, and compensate for direct disturbance, displacement, or mortality of GRSG, direct loss of habitat and cumulative landscape level impacts and would prioritize fluid mineral development outside of PHMA and GHMA areas in non-habitat areas first and then in the least suitable habitat for GRSG, subject to valid existing rights. Under Alternative 1, the PHMA within the potential ACECs would be managed as NSO without waiver or modification and within GHMA, any new leases would include stipulations to protect GRSG. Alternative 2 would be the same as Alternative 1, but additional exceptions to stipulations may be granted. Under Alternative 4, there would be an NSO stipulation within .6 miles of active leks in PHMA unless it could be demonstrated that it meets either a non-habitat, topographic, or co-location exception. Under Alternative 5, the NSO stipulation would be the same as under Alternative 4, but an exception could only be applied within 1 mile of active leks.

Alternative 3 provide the greatest protections from fluid mineral development by prohibiting fluid mineral development. The second highest protections would occur under the Proposed RMP Amendment and Alternative 6 followed by Alternative 5. Alternative 4 would provide the least protections to the potential ACEC from fluid mineral development.

Disturbance Cap

In these areas managed as PHMA, the Proposed RMP Amendment sets a disturbance cap if direct habitat disturbance from existing and proposed infrastructure developments exceeds either 3% the project scale or 3% at the HAF Fine Scale selection area, with exceptions and conditions. In Nevada, the Authorized Officer may grant an exception to the disturbance cap at the HAF fine scale if the project meets criteria associated with the project-scale assessment (including requirements for exceptions and conditions), is in compliance with the Nevada Greater Sage-grouse Conservation Plan and Conservation Credit System (CCS) as required by Nevada regulation (Nevada Revised Statutes (NRS) Chapter 232.16 and Nevada Administrative Code (NAC) 232.162-232.480), and the offsetting compensatory mitigation (or credits per the Nevada CCS Manual) occur within the HAF fine scale where the project occurs. Alternative 6 sets the same disturbance cap for the area but there are no exceptions and Alternative 3 closes the area to new infrastructure projects and sets a 3% disturbance cap for existing developments. Alternatives 1 and 2 set a 3% disturbance cap in PHMA and the cap applies at both BSU-scale and at the project scale. Under Alternatives 4 and 5, in PHMA the disturbance cap is 3% the project scale or 3% at the HAF Fine Scale selection area and projects would be deferred until disturbance in the areas has been reduced below the cap threshold or the projects could be redesigned to not result in additional surface disturbance or moved outside of PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.

Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing are required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the ACEC by removing any potential disturbance associated with livestock grazing.

Summary of Effects

Considered comprehensively, the management direction provided under Alternatives 3 and the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the potential Warm Springs, North Fork O'Neil, Owyhee East, Grass-Kobeh Valley, South Fork Dixie Flats, Idaho Border, Hays Canyon, Vya Massacre, and Buffalo Skedaddle ACECs. Alternative 3 provides the greatest amount of protection, as these areas would be closed to utility-scale solar, utility-scale wind, saleable minerals/materials management, non-energy leasable minerals, and major rights of way, with no exemptions. The Proposed RMP Amendment would protect and prevent irreparable damage to GRSG habitat in these areas by excluding utility scale solar and wind, and removing exceptions to the NSO occupancy requirement for fluid mineral development. The Proposed RMP also provides minimal exceptions to the major rights of way exclusion, prohibits non-energy mineral leasing, and provides only limited allowances for saleable mineral/material management. Alternative 6 provides the next highest level of protection, with slightly more exceptions to closures to mineral development and major rights of way and would also protect and prevent irreparable damage to the relevant and important values of the potential ACEC areas.

Alternatives 1, 2, 4, and 5 provide a relatively high degree of protection with PHMA management direction, which guides management of the majority of these potential ACECs. However, as major rights of way, renewable energy, and mineral development are more likely to occur under these alternatives, associated disturbances could negatively impact the relevant and important values of the potential ACECs.

Effects of the Alternatives on the Potential Montana Mountain, Butte Long Valley, Eureka North and South, Monitor Valley, Reese River, Utah Border, and Owyhee West Potential ACECs

Seven areas that are proposed for ACEC designation under Alternative 3 and 6 would be managed consistent with applicable HMA direction (and not as PHMA with limited exceptions) under the Proposed RMP Amendment. These are:

- Montana Mountain: 314,370 acres, increased from 92,727 acres in Draft RMPA/EIS
- Butte Long Valley: 606,239 acres, reduced 793,353 acres in Draft RMPA/EIS
- Eureka North and South: 66,905 acres, increased from 66,904 acres in Draft RMPA/EIS
- Monitor Valley: 173,507 acres, reduced from 267,325 acres in Draft RMPA/EIS
- Reese River: 85,000 acres, increased from 81,193 acres in Draft RMPA/EIS
- Utah Border: 58,659 acres, unchanged from Draft RMPA/EIS
- Owyhee West: 704,650 acres

These areas provide important regional genetic connectivity, high-quality brood-rearing habitat, and/or are highly valuable for GRSG habitat and population persistence, as detailed in the above evaluations.

Table 5-9 displays the HMA allocations for these seven areas under each alternative. Under the Proposed RMP Amendment, the areas within the potential Montana Mountain, Butte Long Valley, Eureka North and South, Monitor Valley, Reese River, Utah Border, and Owyhee West ACECs would be managed mostly as PHMA, with smaller percentages managed as GHMA, OHMA, and non-habitat.

Under Alternative 3 and 6, all seven areas would also be designated as ACECs. Under Alternatives 3 and 6, these seven areas would be managed entirely as PHMA, with direction varying consistent with PHMA direction in each alternative including the additional protections that are identified under each of these alternatives for ACECs. Under Alternatives 1, 2, 4, and 5 these areas would all be managed mostly as PHMA, with relatively small portions managed as GHMA, OHMA, and non-habitat, with the exception of Butte Long

Valley potential ACEC area (which is managed as 47% PHMA, 38% GHMA, 6% OHMA, and 9% non-habitat in Alternatives 1 and 2 and as 79% PHMA, 19% GHMA, 2% OHMA in Alternatives 4 and 5), Alternatives 4 and 5 have higher percents managed as PHMA in the Montana Mountain, Eureka North and South, Reese River, Utah Border potential ACEC areas. Alternative 1 and 2 have more acreage managed as PHMA in the Monitor Valley potential ACEC area. The Owyhee West potential ACEC area would receive96% PHMA management under Alternatives 1, 2, 4, and 5.

Table 5-9. HMA Allocations in the Nevada Potential ACECs by Alternative[12,13]

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[14]

[12] Unlike the areas identified in **Table 5-8**, these areas were not identified as PHMA with limited exception areas in the Proposed RMP Amendment.

[13] Acreage calculated utilizing the USGS HMA model for NV/CA (Milligan et al. 2024) (refer to Appendix 3).

[14] HMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.

This section details the effects of the alternatives on these areas considered for ACEC designation.

Solar, Wind, Major Rights of Way, Saleable Minerals/Material Management, and Locatable Minerals

The Proposed RMP Amendment and Alternatives 3 and 6 would all provide additional protections to GRSG habitat in the potential ACECs by excluding solar, wind, and non-energy leasable mineral development. While all three alternatives also exclude major rights of way and close the area to saleable minerals/material management, Alternative 3 provides the greatest protection as Alternative 3 provides no exceptions to the rights of way exclusion or to the saleable closure. In addition, under Alternative 3, the area would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use.

Under Alternatives 1, 2, and 4, the area would be exclusion for solar and wind in PHMA and avoidance in GHMA and avoidance for major rights of way in PHMA and GHMA, which would provide similar but slightly less protections than afforded under the Proposed RMP Amendment and Alternatives 3 and 6. The portions of these potential ACEC areas that would be managed as OHMA and non-habitat would be open for utility-scale solar and utility-scale wind testing and development, with applicable minimization measures and compensatory mitigation. Under Alternative 5, the area would be avoidance for solar and wind in PHMA and open with minimization measures in GHMA and would be avoidance for major rights-of-way in PHMA and open with minimization measures in GHMA. Therefore, Alternative 5 provides the least amount of protections from solar, wind, and rights of way development. Under Alternatives 1, 2, 4, 5, and the Proposed RMP Amendment, the areas would be open to locatable mineral development and notice level exploration would be allowed without a plan of operations.

Fluid Mineral Development

Fluid mineral development and associated potential impacts to GRSG habitat is least likely under Alternative 3, which closes the areas to fluid mineral development with no exception. Under the Proposed RMP Amendment and Alternative 6, PHMA management direction applies in most of these areas. Under the Proposed RMP Amendment, as PHMA, the majority of these ACEC areas would be managed as NSO for fluid mineral development within .6 miles of leks and season limitations (breeding, nesting, early brood-rearing and winter habitat) and Controlled Surface Use (CSU) (density and disturbance) outside of the 0.6-mi NSO buffer with exceptions. In the smaller portions managed as GHMA, OHMA, and non-habitat in the Proposed RMP Amendment, these areas would be open to fluid minerals development, with minor stipulations (including CSU for lek buffers and seasonal limitations). Under Alternative 6, the area would also be subject to NSO but development could occur if an exception for the entire ACEC area could be met.

Alternatives 1 and 2 would management fluid minerals to avoid, minimize, and compensate for direct disturbance, displacement, or mortality of GRSG, direct loss of habitat and cumulative landscape level impacts and would prioritize fluid mineral development outside of PHMA and GHMA areas in non-habitat areas first and then in the least suitable habitat for GRSG, subject to valid existing rights. Under Alternative 1, the PHMA within the potential ACEC would be managed as NSO without waiver or modification and within GHMA, any new leases would include TL stipulations to protect GRSG. Alternative 2 would be the same as Alternative 1, but additional exceptions to stipulations may be granted. Under Alternative 4, there would be an NSO stipulation within .6 miles of active leks in PHMA unless it could be demonstrated that it meets either a non-habitat, topographic, or co-location exception. Under Alternative 5, the NSO stipulation would be the same as under Alternative 4, but an exception could only be applied within 1 mile of active leks.

Alternative 3 provide the greatest protections from fluid mineral development by prohibiting fluid mineral development. The next highest protections would occur under the Proposed RMP Amendment and Alternative 6, followed by Alternative 5. Alternative 4 would provide the least protections to the potential ACEC from fluid mineral development.

Disturbance Cap

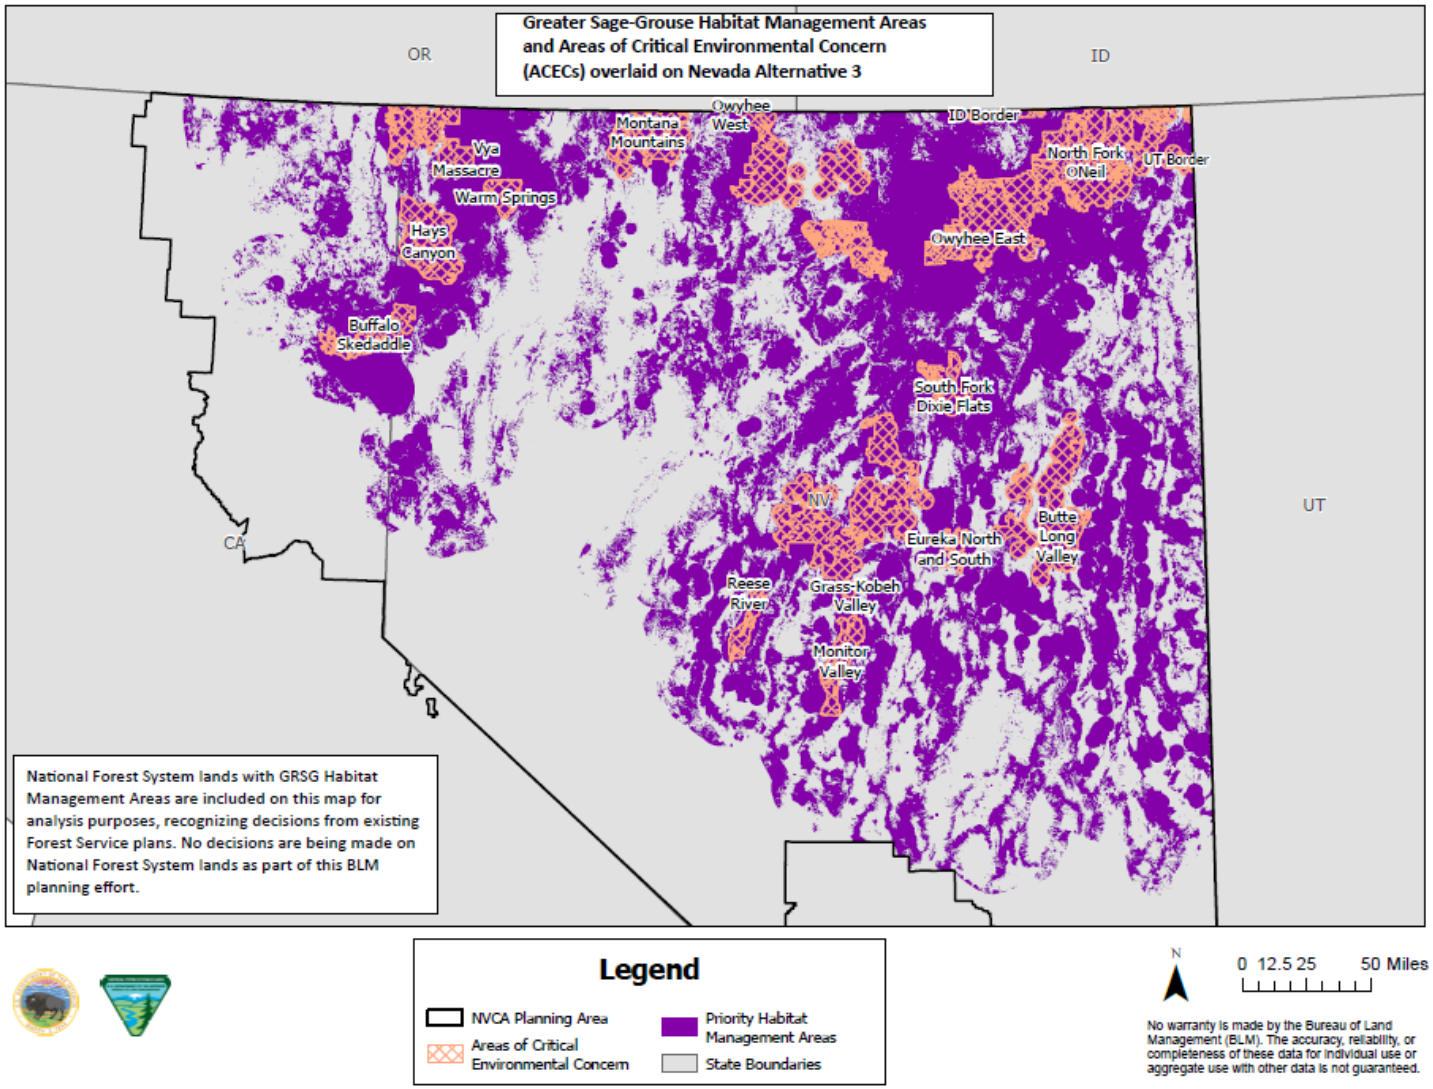
In these areas managed as PHMA, the Proposed RMP Amendment sets a disturbance cap if direct habitat disturbance from existing and proposed infrastructure developments exceeds either 3% the project scale or 3% at the HAF Fine Scale selection area, with exceptions and conditions. In Nevada, the Authorized Officer may grant an exception to the disturbance cap at the HAF fine scale if the project meets criteria associated with the project-scale assessment (including requirements for exceptions and conditions), is in compliance with the Nevada Greater Sage-grouse Conservation Plan and Conservation Credit System (CCS) as required by Nevada regulation (Nevada Revised Statutes (NRS) Chapter 232.16 and Nevada Administrative Code (NAC) 232.162-232.480), and the offsetting compensatory mitigation (or credits per the Nevada CCS Manual) occur within the HAF fine scale where the project occurs. Alternative 6 sets the same disturbance cap for the areas but there are no exceptions and Alternative 3 closes the areas to new infrastructure projects and sets a 3% disturbance cap for existing developments. Alternatives 1 and 2 set a 3% disturbance cap in PHMA and the cap applies at both BSU-scale and at the project scale. Under Alternatives 4 and 5, in PHMA the disturbance cap is 3% the project scale or 3% at the HAF Fine Scale selection area and projects would be deferred until disturbance in the areas has been reduced below the cap threshold or the projects could be redesigned to not result in additional surface disturbance or moved outside of PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.

Areas under GHMA, OHMA, and non-habitat would not be subject to the disturbance cap, potentially allowing more development and associated impacts to GRSG habitat. Overall, Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.

Livestock Grazing

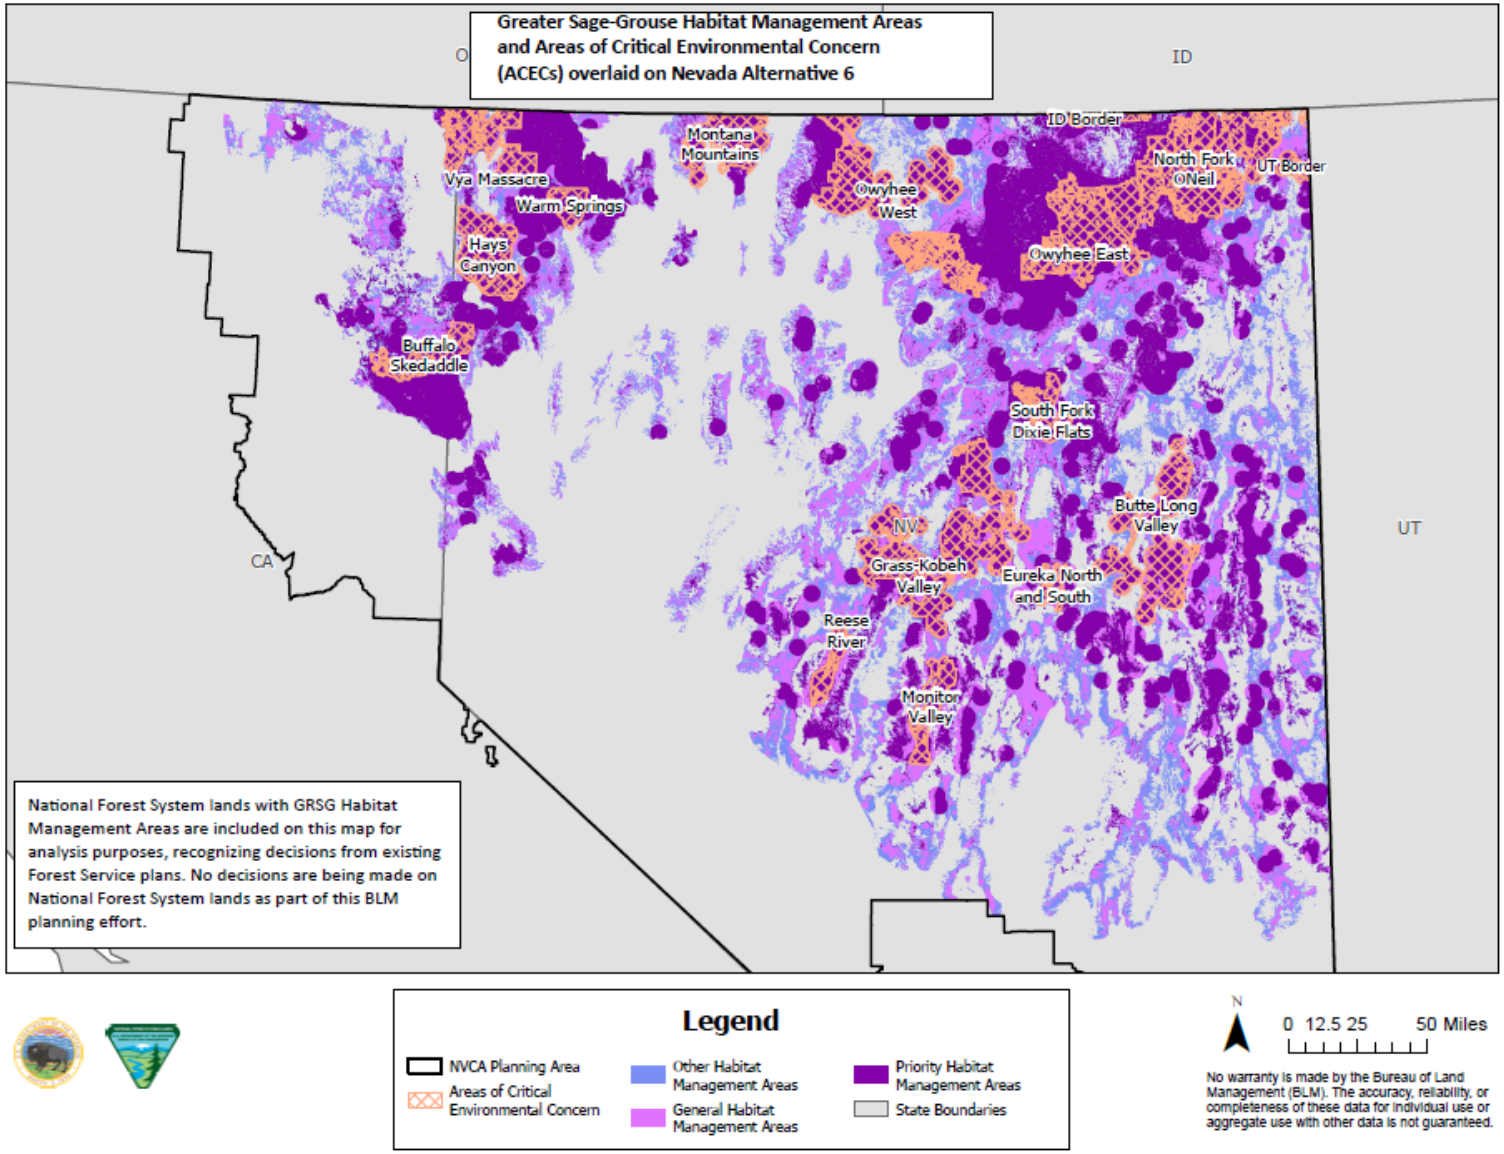
Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing are required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. In the portions of the Proposed RMP Amendment managed as GHMA, management direction is the same as in PHMA, except RM-3, which requires evaluation of all livestock management range improvement projects during the grazing renewal process, does not apply.

Alternative 3 provides the greatest protections to the ACEC by removing any potential disturbance associated with livestock grazing.



Summary of Effects

Considered comprehensively, Alternative 3 provides the greatest protection to the Potential Montana Mountain, Butte Long Valley, Eureka North and South, Monitor Valley, Reese River, Utah Border, Owyhee West ACECs by prohibiting utility-scale solar, utility-scale wind, major rights of way, non-energy leasable minerals leasing, saleable minerals/ material management, and fluid mineral development with no exceptions. The Proposed RMP Amendment and Alternative 6 would also protect and prevent irreparable damage to



the relevant and important values of the potential ACEC areas with protective PHMA management direction in most of these areas, limiting the risk of from the threats of major rights of way, renewable energy development, and mineral development.

Alternatives 1, 2, 4, and 5 provide a relatively high degree of protection with these alternatives' PHMA management direction, which guides management of the majority of these potential ACECs. However, as major rights of way, renewable energy, and mineral development are more likely to occur under these alternatives, and associated disturbances could negatively impact the relevant and important values of the potential ACECs.

Map 5.7: Nevada Alternative 3 Potential ACECs

Map 5.8: Nevada Alternative 6 Potential ACECs

OREGON

The BLM's evaluation of rangewide datasets in Oregon did not result in the identification of any areas that met the ACEC importance criteria. Oregon is unique compared to the other states in that there are several existing ACECs and Research Natural Area/ACECs (RNAs) that are already designated (through previous BLM RMP efforts) inside the 2013 PACs and 2015 SFAs. These areas were designated in RMPs that pre-dated the 2015 and 2019 GRSG amendment efforts. These previously designated areas, with GRSG and GRSG plant community relevant and important values, include the following two ACECs and five RNAs:

- High Lakes ACEC,
- Red Knoll ACEC,
- Lake Ridge RNA,
- North Ridge Bully Creek RNA,
- Rahilly-Gravelly RNA,
- South Ridge Bully Creek RNA, and
- Toppin Creek Butte RNA.

In addition, the 2015 GRSG ARMPA added special management considerations for several ACECs/RNAs relative to livestock grazing (refer to **Appendix 17**, Proposed RMP Amendment and Analysis for Key Research Natural Areas in Oregon).

Beyond considering the existing ACECs and RNAs, the BLM Oregon State Office staff examined areas identified as PHMA in Oregon as well previously identified Sagebrush Focal Areas (SFAs) and Priority Areas of Conservation (PACs) in order to determine if any areas within Oregon that were either newly nominated or previously nominated and evaluated in the 2015 RMP Amendment met the relevance and importance criteria. BLM Oregon's ACEC review, assessment, and evaluation process focused on the new GRSG scientific information on key population (e.g., Doherty et al. 2016, Coates et al., 2021), genetic (e.g., Cross et al., 2018, Oyler-McCance et al., 2022) connectivity (e.g., Row et al. 2018, Cross et al., 2023) habitat (e.g., Doherty et al., 2016, Wann et al., 2022, Doherty et al., 2022) and climate change (Palmquist et al., 2021, Rigge et al., 2021). Oregon BLM also coordinated with state wildlife authorities to identify and update GRSG habitat management areas (HMA) and consider potential ACEC areas.

The majority of the SFAs were determined to not contain multiple lines of evidence supporting a conclusion that the habitat was of more than local significance. The BLM state and district staff coordinated with the Oregon Department of Fish and Wildlife staff to identify characteristics that may meet the importance criteria and to identify potential ACEC locations/areas using their population and habitat criteria. An assessment of existing and proposed PHMA, new genetic information, and lek density clusters were all important components of the evaluation. The BLM Oregon also reviewed the McDermitt Caldera ACEC nomination received during the scoping period.

As a result of their comprehensive assessment, BLM Oregon found two areas that could potentially meet both the ACEC relevance and importance criteria for greater sage-grouse: Louse Canyon and Soldier Creek. After evaluating the two areas, the team concluded that both areas met the relevance criteria for fish and wildlife resource (specific to GRSG and the new science), but that neither area met the importance criteria (more than locally significant). Because none of the internally considered or externally nominated areas were identified as having relevance and importance, the BLM did not identify any new ACECs in Oregon in the Draft EIS or in the Final EIS.

The BLM Oregon ACEC review, assessment, and evaluation process did not consider or consider in detail potential historic, cultural, scenic, or non-GRSG fish and wildlife values in accordance with the purpose and need for this planning effort. ACEC nominations that addressed resource values beyond greater sage-grouse will be considered by the BLM during future planning efforts.

Importance Evaluations

Oregon GRSG ACEC Importance Evaluation: Soldier Creek Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	Greater sage-grouse are distributed throughout appropriate habitat in the western United States. This portion of the distribution located in Oregon (and Idaho) is designated as Management Zone IV (Stiver et al. 2006). Management zones are delineations of greater sage-grouse populations and subpopulations within floristic zones. Within Management Zone IV, Oregon has designated core areas, and in 2015 BLM designated Priority and General Habitat Management Areas. Since the 2015 BLM plans, new science addressing GRSG genetics, density, and habitats has provided additional information about areas that may contain special worth, consequence, or distinctiveness. OSO staff examined the genetic pathways data and connectivity (i.e., >80% cumulative connectivity) with GRSG priority areas for conservation in Idaho and that overlap with the very high lek density areas. In the Soldier Creek area south of Jordan Valley/Hwy 95, the Ecostate GIS shows fairly intact habitat and there are multiple areas of overlapping lek density. It's approximately 15 miles to a >95% genetic cumulative connectivity pathway in Idaho. The Soldier Creek area is mostly in the 80 to 85% cumulative connectivity genetic pathway range (Cross et al., 2023) and is similar to cumulative connectivity of the surrounding area (e.g. Cow Lakes) in Oregon. While high density lek/population areas and genetic connectivity are considered important to greater sage-grouse conservation, the connectivity areas are dispersed throughout Oregon and are not substantially unique to one specific region or planning unit. Greater sage-grouse habitat in the Soldier Creek area is not substantially distinct from habitat managed by other nearby BLM lands that have similar cumulative genetic connectivity values. Although a portion of the area contains medium relative abundance (Doherty et al. 2016), the size of the area is smaller than and not substantially distinct compared to other areas in Management Zone IV (e.g. Cow Lakes). There is a much larger, higher relative lek abundance area south and east (in Idaho) of the Soldier Creek area. See background notes and maps below.

Oregon GRSG ACEC Importance Evaluation: Soldier Creek Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	The area is not particularly fragile or sensitive to change when compared to other similar sites in the Oregon-Idaho region. The habitat is not rare, irreplaceable, exemplary, or unique. The area is vulnerable to adverse change, particularly wildfire and invasive annual grasses, but not more so than the surrounding habitat. The habitat is neither threatened or endangered. Cumulative connectivity pathways mapped in the Soldier Creek potential ACEC are thresholded below 85%, indicating low impedances to sage-grouse movements (Cross et al., 2023). Higher connectivity pathways are mapped >10 miles east of the Oregon border. The area does not contain key or clusters of genetic nodes,.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The BLM 2015, 2019, and current initiatives to conserve, enhance, and restore greater sage-grouse habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that 2010 finding, the USFWS concluded that greater sage grouse was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. Without multiple lines of evidence, including reasonably foreseeable development, valid existing rights, land ownership, and crucial GRSG habitat characteristics from multiple science-based models, on-the-ground conditions/evidence for this area does not currently need protection requirements beyond the standard approaches to implemented FLPMA and national priorities. In addition, the area currently has Priority Habitat Management Area designation and management under the 2015 ARMPA. Habitat loss and degradation due to wildfires and invasive annual grasses are primary threats to sage-grouse in this area. Significant amounts of high quality habitat in Oregon and Idaho has burned near this area.

Other Items	
Boundaries	Nomination boundaries have been provided to the NOC (see also notes below).
Additional Notes	We reviewed and then ruled out the Cow Lakes PAC area due to the high proportion of private lands mixed in with BLM lands, low amount of suitable habitat, and degraded seasonal habitat, as shown in the 2019-2021 Ecostate spatial data provided by SageCon/INR and reported in the Cow Lakes Habitat Assessment Framework Summary.

Conclusion
This potential ACEC provides important lekking, nesting, and early brood-rearing habitat for a high abundance of sage-grouse. However, the habitat, density of birds, and connectivity to sage-grouse priority habitat is not unique. Multiple pathways of potential gene flow connecting sage-grouse priority areas for conservation in southeast Oregon and southwest Idaho coalesce approximately 10 miles east of the Oregon border to form the high concentration gene flow pathway depicted in Cross et al. (2023 figure 4). Cumulative connectivity pathways coalesce here due to cultivation and tree cover impeding sage-grouse movements (Cross et al 2013 figure 7b).

Conclusion
These impendences decrease approaching the Oregon state border, and once inside Oregon, the cumulative connectivity pathways are more diffuse and non-distinct. In other words, the proposed ACEC does not appear to be vital to maintenance of range-wide connectivity. Moreover, the habitat is not unique, rare, irreplaceable, or exemplary. There are many areas of similar sage-grouse habitat in SE Oregon with similar genetic pathways depicted in Cross et al. 2023 intersecting areas of high lek density. BLM is actively managing juniper encroachment and other threats to GRSG in Oregon (e.g., fire, and invasive annual grasses). Thus, the Soldier Creek potential ACEC does not meet the criteria for special worth or importance with more than locally significant qualities of consequence, meaning, distinctiveness, or cause for concern due to its similarity, proximity, and connectedness with similar habitat, lek density areas, and modeled genetic pathways. Oregon GRSG ACEC Importance Evaluation: Upper West Little Owyhee Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	Greater sage-grouse are distributed throughout the western United States. This portion of the distribution located in Oregon (and Idaho) is designated as Management Zone IV (Stiver et al. 2006). Management zones are delineations of greater sage-grouse populations and subpopulations within floristic zones with similar management issues. Within Management Zone IV, Oregon has designated core areas, and in 2015 BLM designated Priority and General Habitat Management Areas. Since the 2015 BLM plans, new science addressing GRSG genetics, density, and habitats has provided additional information about the locations that may contain special worth, consequence, or distinctiveness. OSO staff examined the genetic pathways data and connectivity (i.e., >80% cumulative connectivity) with GRSG populations in Nevada and that overlap with the high lek density areas. Greater sage-grouse habitat in the Upper West Little Owyhee area is not substantially distinct from habitat managed by other nearby BLM lands that have similar cumulative connectivity pathway values (Cross et al. 2013). Although a portion of the area contains medium relative abundance (Doherty et al. 2016), the area is not substantially distinct compared to other areas in Management Zone IV and does not show strong nodes/networks to other areas (Cross 2018). In addition, the area shows a "very low" relative abundance (Doherty 2015, T25) breeding population index. While higher density areas and genetic connectivity are considered important to greater sage-grouse conservation, the areas are dispersed throughout the region and are not significantly unique to a specific region or planning unit; not to this potential ACEC nomination area.

Oregon GRSG ACEC Importance Evaluation: Upper West Little Owyhee Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	The area is no more fragile or sensitive to change than other sites in southeast Oregon. The area does not contain a key genetic node nor strong networks (Cross et al 2018). Similarly the area does not show substantially important cumulative connectivity pathways to other PHMA areas in Oregon and Nevada. The area is similar to much of the intact GRSG habitat in the area and has the same vulnerability to change as the surrounding area. The habitat is not irreplaceable, exemplary, unique, rare, endangered, threatened, nor vulnerable to adverse change when compared to other intact GRSG habitat in southeast Oregon.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The BLM 2015, 2019, and current initiatives to conserve, enhance, and restore greater sage-grouse habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that 2010 finding, the USFWS concluded that greater sage grouse was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. Without multiple lines of evidence, including reasonably foreseeable development, valid existing rights, land ownership, and crucial GRSG habitat characteristics from multiple science based models, on-the-ground conditions/evidence this area has not been identified for protection to implement FLPMA and national priorities.

Other Items	
Boundaries	Contiguous with a Nevada potential ACEC. An area of genetic connectivity to the north is disconnected from the Upper West Little Owyhee potential ACEC by lower quality habitat and that the southern area, contiguous with Nevada to the south, had more connectivity, although threshold cumulative values are moderate.
Additional Notes	—

Conclusion

This potential ACEC provides important lekking, nesting, and early brood-rearing habitat for a high abundance of GRSG. However, the habitat, bird density, and connectivity to GRSG priority areas of conservation are not unique in Oregon. The thresholded cumulative connectivity pathways in the potential ACEC are between 75 and 80 percent (Cross et al. 2013). GRSG movements are not impeded by tree cover or cultivation within the potential ACEC and in the surrounding landscape. There are no distinctive cumulative connectivity pathways intersecting areas of high lek density in this area. In other words, the proposed ACEC does not appear to be vital to maintenance of range-wide connectivity. Thus, the Upper West Little Owyhee potential ACEC does not meet the criteria for special worth or importance with more than locally significant qualities of consequence, meaning, distinctiveness, or cause for concern due to its similarity, proximity, and connectedness with similar habitat, lek density areas, and genetic considerations.

Consideration of ACECs nominated during the public comment period

During the comment period on the Draft EIS, 33 ACEC nominations were received in Oregon. BLM Oregon reviewed the nominations using the same criteria as described above during the development of the Draft EIS and discussed and coordinated cross border issues and locations with the BLM Nevada and the BLM Idaho, including discussions regarding three ACEC nominations that share acreage with those states: Table Mountain, Juniper Ridge, aa-Tiipi Flat areas. As a result of these reviews the BLM did not identify any of the nominated ACECs as having relevant and important values and did not identify them for inclusion in the Final EIS.

During the comment period on the Draft EIS, the BLM also received a comment that called for 23 existing ACECs in Oregon to receive additional GRSG protections. BLM Oregon, in reviewing potential areas for nomination as ACECs in the Draft EIS, had already considered whether existing ACECs should receive additional levels of protection than already afforded by their existing RMP decisions. As described above, two of the existing ACECs and five of the existing RNAs have relevant and important values that are specific to GRSG and GRSG plant communities (High Lakes ACEC, Red Knoll ACEC, Lake Ridge RNA, North Ridge Bully Creek RNA, Rahilly-Gravelly RNA, South Ridge Bully Creek RNA, and Toppin Creek Butte RNA.

During the assessment process for this EIS the team noted that the existing ACECs and the potential ACECs evaluated in the 2015 ARMPA ACECs/RNAs are in appropriate locations relative to the new science data. Through this evaluation process the BLM did not identify any increased level of protections needed for any of the identified ACECs due to the protections provided by the Priority Habitat Management Areas they are within. The only exception was in the High Lakes ACEC. Between the Draft and Final EIS, the BLM determined that the High Lakes ACEC warranted additional protections and the RMP Amendment identifies the area as receiving PHMA with limited exceptions management direction (refer to analysis that follows).

Effects of the Alternatives on the Existing High Lakes ACEC

The existing 38,952-acre High Lakes ACEC, which was designated as an ACEC in the 2003 Lakeview Resource Management Plan and Record of Decision, was, between Draft and Final EIS, identified as requiring PHMA with limited exception direction. The area was identified as requiring the additional PHMA with limited exceptions direction due primarily to the threats from major rights of way and renewable energy development. The effects of the alternatives on this area would be the same as the effects described throughout **Chapter 4** regarding the effects of the PHMA with limited protections but are also summarized below.

The additional restrictions in the High Lakes ACEC for GRSG that are provided by the PHMA with limited exceptions designation will help maintain the sagebrush landscape integrity in that area which supports dense populations of GRSG and other sagebrush associates such as pronghorn elk. Under the Proposed RMP Amendment, the PHMA with limited exceptions management direction:

- closes the area to utility-scale solar and utility-scale wind development;
- provides no exceptions to the no surface occupancy fluid mineral development (including geothermal) direction;

- closes the area to saleable minerals/materials management but are open to free use permits and the expansion of existing active pits only if the activity is with the Oregon PAC and project are disturbance cap and all applicable design features are applied in accordance with SSS13 from the 2015 GRSG RMPA for Oregon;
- excludes major rights of way with stringent exceptions; and
- closes the area to new leases including fringe acreage leasing (i.e., no expansion of existing leases).

The additional protections afforded by PHMA in the Proposed RMP Amendment in that area for the adaptive management, disturbance cap, predation, livestock grazing, wild horse and burro, and mitigation will, in combination with the PHMA with limited exceptions management direction, protect and prevent the irreparable damage to the relevant and important values of the High Lakes ACEC. The protective management direction provided under Alternatives 3 would also protect and prevent irreparable damage to the relevant and important values of the High Lakes ACEC. The lower levels of protection provided under Alternatives 1,2, 4, and 5, particularly as it relates to major rights of way and solar and wind development could result in could result in negative impacts to the relevant and important values of the High Lakes ACEC.

For additional information and a map of the High Lakes ACEC please refer to the Lakeview RMP and Record of Decision that can be accessed on the BLM National NEPA Register: https://eplanning.blm.gov/public_projects/lup/36322/174268/211780/Lakeview_RMP_Map_Packet.pdf.

UTAH

The 2015 GRSG ARMPA designated two Sagebrush Focal Areas (SFAs) in northern Utah, one on the eastern side of the state in Rich County bordering Wyoming and one on the western side of the state in Box Elder County, bordering Nevada. Both areas were evaluated by the Utah State office to determine if they met the ACEC relevance and importance criteria. In addition, the rangewide evaluation identified Parker Mountain as an area with characteristics that could result in meeting the importance criteria.

The Rich County area provides habitat for GRSG, a BLM sensitive species, and the area has also been identified as a Sage-Grouse Management Area (SGMA) in the State of Utah's state plan. The Rich population area is one of the strongholds for GRSG populations in Utah and is one of the largest populations in Utah connecting with larger populations in Idaho and Wyoming. The area also meets the criterion for a natural system or process because of the sagebrush habitat conditions in the area. The majority of intact sagebrush habitat is within a core area (Doherty et al. 2022). The Rich population area includes some of the largest core sagebrush habitat in Utah, which is why this area was identified as a focal landscape area.

The area in Box Elder County has also been identified as an SGMA by the State of Utah. The Box Elder population area is one of the largest of the GRSG populations in Utah connecting with larger populations in Idaho and Nevada. It is part of the Northern Great Basin sub-population (Utah, Idaho, and Nevada).

The Parker Mountain area is in Central Utah and provides one of the strongholds for GRSG populations in Utah and is one of the largest populations in the Great Basin. The area has also been identified as a SGMA by the State of Utah. The majority of the area is intact sagebrush habitat within a core area (USGS SEI) with minimal development.

Importance Evaluations

Utah GRSG ACEC Importance Evaluation: Rich GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	Since the 2015 GRSG ARMPA, new science addressing GRSG density and habitats has provided additional information about the locations areas that may contain special worth, consequence, or distinctiveness. The area is not particularly fragile or sensitive to change as compared to other sites in the State of Utah. It consists of a largely intact contiguous mid to high elevation sagebrush habitat with large mesic meadow complexes. The area is largely undeveloped and threats from development are low. Oil and gas development is low, as well as other minor infrastructure for roads, pipelines, and transmission lines. Primary land uses are livestock grazing, agriculture, and recreation. Mechanical sagebrush treatments that have occurred to promote livestock grazing have reduced the quantity of winter sagebrush habitat. The area is mostly core and growth opportunity areas within the sagebrush (Doherty 2022) Sagebrush Conservation Design with a significantly large core relative to other areas in the state. Much of the core habitat including diverse mesic habitat occurs on private lands with a mix of BLM jurisdiction. Similarly, the USU seasonal habitat model identifies much of the area as summer, winter, and nesting habitat. There are two key genetic nodes and other nodes (Cross et al. 2018), and the area covers an area where genetic connections exist between the northern (into Idaho) and western (into Wyoming) portions of management Zone II (Stiver et al 2006). There is a key genetic node to the south of the Rich population area in Morgan-Summit; however, no detailed telemetry studies are available in the Morgan-Summit area to understand sage-grouse movements and connectivity in this area. Climate change models (Palmquist 2021) show that the Rich population area has the highest value for retention of sagebrush biomass.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The Upper Bear River Watershed has been identified as a focal landscape area in Utah with a goal of improving the ecological health in the region. Bear Lake and the Bear River are large contributors to the Great Salt Lake. The area is largely undeveloped and threats from development are low, including oil and gas. The area is mostly core sagebrush (Doherty 2022) with a proportionally large core relative to other areas in the state. Much of the core habitat occurs on private lands and BLM jurisdiction within the core is fairly limited to the periphery. Similarly, the USU seasonal habitat model identifies much of the area as summer, winter, and nesting habitat. Climate change models (Palmquist 2021) show that the Rich population area has the highest value for retention of sagebrush biomass.

Utah GRSG ACEC Importance Evaluation: Rich GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	Yes	The Upper Bear River Watershed has been identified as a focal landscape area in Utah with a goal of improving the ecological health in the region. Bear Lake and the Bear River are large contributors to the Great Salt Lake. The BLM 2015, 2019, and current land use planning initiatives to conserve, enhance, and restore GRSG habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. The identification of the Upper Bear River Watershed as a focal landscape area acknowledges at least in part the importance of this area and recognition as a national priority.

Other Items	
Boundaries	Focus boundaries on the core, connectivity, genetic nodes, climate in relation to the BLM jurisdiction. Consider the Dingell Act Exchange and transfer of BLM lands. Also considered the existing Laketown ACEC in the boundary.
Additional Notes	Connectivity is with the larger subpopulations within Wyoming and Idaho. Since the 2015 GRSG ARMPA Utah BLM's PHMA has not lined up with PHMA in Wyoming as their populations are generally GHMA along the border as these areas are not part of their core. The Sagebrush Focal Area (SFA) boundary in the Rich population area included portions of the relevant and important values; consider the potential for an ACEC to include portions of this area which overlaps with the new science. Boundary adjustments would need to remove large portions of non-habitat on Monte Cristo. Other genetic nodes in checkerboarded land jurisdiction in the southern portion (south of Neponset Reservoir) were excluded from the boundary. This area is highly checkerboarded (BLM/private land jurisdictions) and the majority of the BLM parcels have authorized leases and were part of the Dingell Act Exchange.

Conclusion
Due to meeting the relevance and importance criteria, this area, with a revised boundary, was identified as a potential ACEC in Alternatives 3 and 6. Refer to Utah - ACEC Maps for Alternatives 3 and 6 that follow. Focusing boundaries on BLM jurisdiction, core, probability of breeding habitat, and climate sagebrush biomass. Items listed above provide multiple lines of evidence that these areas are more than locally significant to Utah and may provide importance to Management Zone II. Data most influential justifying the consideration as an ACEC and having more than local significance: high density breeding (Doherty et al. 2016); genetic connectivity (Cross et al. 2023); and genetic mixing (i.e., important area for connectivity well beyond the region being considered; Oyler-McCance et al. 2022).

Utah GRSG ACEC Importance Evaluation: Box Elder GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	Since the 2015 GRSG ARMPA, new science addressing GRSG density and habitats has provided additional information about the locations areas that may contain special worth, consequence, or distinctiveness. The area has experienced a relatively large wildfire since the 2015 ARMPA (Goose Creek Fire, 2018) increasing cheatgrass risk and sagebrush loss within the sagebrush habitat making it somewhat fragile or sensitive to change as compared to other sites in the State of Utah. Fire within management zone IV has been a significant threat in Idaho and Nevada. It boasts a relatively large diverse low elevation salt desert shrub to high elevation mountain sagebrush, mountain mahogany and aspen habitat. The Box Elder Population Area supports the southeastern extent of a larger population that extends beyond state boundaries into Nevada and Idaho and is primarily influenced by fire risk, especially in dry, dense juniper areas or in areas dominated by nonnatives. The area is largely undeveloped and threats from development are low. Oil and gas development is low, as well as other minor infrastructure for rock quarries, roads and transmission lines. Primary land uses are livestock grazing, agriculture, and recreation. The area largely contains core sagebrush with growth opportunity areas as identified in Doherty (2022) Sagebrush Conservation Design. Much of the core habitat occurs on private lands with a mix of BLM jurisdiction. Similarly, the USU seasonal habitat model identifies much of the area as summer, winter, and nesting habitat. There are two key genetic nodes and other minor nodes (Cross et al. 2018), and the area covers an area where genetic connections exist between the northern and western portions of management zone IV connecting to populations to the west in Nevada and north into Idaho. Climate change models (Palmquist 2021) show that the Box Elder population area has the highest value for retention of sagebrush biomass especially in the higher elevations. Box Elder has been a source population for greater sage-grouse translocations within the state and neighboring states. This source population may be attributing to some of the importance that shows up in the genetic connectivity models based on the new science.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	The area is largely undeveloped and threats from development are low. Ongoing disturbance in portions of the area are primarily due to livestock grazing infrastructure for wells and pipelines, rock quarries, and railroads. Similarly, the USU seasonal habitat model identifies much of the area as summer, winter, and nesting. Climate change models (Palmquist 2021) show that the population area has the highest value for retention of sagebrush biomass. Area has two key genetic nodes and several others. The key nodes are connected with populations in Idaho and eastern NV, while other nodes are connected with southern UT populations and NE UT.

Utah GRSG ACEC Importance Evaluation: Box Elder GRSG Habitat Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The BLM 2015, 2019, and current land use planning initiatives to conserve, enhance, and restore GRSG habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. Without multiple lines of evidence, including reasonably foreseeable development, valid existing rights, land ownership, crucial GRSG habitat characteristics from multiple science-based models, and on-the-ground conditions provide evidence this area has not been identified as warranting protection beyond the standard approaches to implemented FLPMA and national priorities.

Other Items	
Boundaries	Focus boundaries on the core, connectivity, genetic nodes, climate in relation to the BLM jurisdiction.
Additional Notes	Connectivity is with the larger subpopulations within Nevada and Idaho. Utah since the 2015 GRSG ARMPA has not lined up with PHMA in Nevada as their populations are generally Other Habitat Management Area (OHMA)/GHMA along the border as these areas are not part of their core. PHMA in Utah lines up fairly well with PHMA in Idaho. The SFA boundary in the Box Elder population area included portions of the relevant and important values; consider the potential for an ACEC to include portions of this area which overlaps with the new science. Boundary adjustments would need to include other relevant/important values based on the new science within BLM jurisdiction.

Conclusion
Due to meeting the relevance and importance criteria, this area, with a revised boundary, was identified as a potential ACEC in Alternatives 3 and 6. Refer to BLM Utah - ACEC Maps for Alternatives 3 and 6 that follow. Focusing boundaries on BLM jurisdiction, genetic nodes, core, probability of breeding habitat, and climate sagebrush biomass. Items listed above provide multiple lines of evidence that these areas are important in review of the new science/data sets. From BLM Headquarters' proposed boundary, consider larger tracts of BLM land jurisdiction within the northwestern portion of the PHMA area largely lining up with the 2015 SFA boundaries. Items listed above provide multiple lines of evidence that these areas are more than locally significant to Utah and may provide importance to Management Zone IV. Data most influential justifying the consideration as an ACEC and having more than local significance: high density breeding (Doherty et al. 2016); genetic connectivity (Cross et al. 2023); and genetic mixing (i.e., important area for connectivity well beyond the region being considered; Oyler-McCance et al. 2022).

Utah GRSG ACEC Importance Evaluation: Parker Mountain Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	Since the 2015 GRSG ARMPA, new science addressing GRSG density and habitats has provided additional information about the locations areas that may contain special worth, consequence, or distinctiveness. A portion of the area contains high relative abundance (Doherty et al. 2016), there is a key genetic node (Cross et al. 2018), and the area covers an area where genetic connections between the northern and western portions of management Zone III may be constricted (Row et al 2018, Cross et al. 2023). Based on further coordination and review of the new science, the Parker Mountain Population has been a source population for translocations throughout Utah; therefore, the genetic connectivity may not demonstrate that this population is more than locally significant and that these are natural dispersals. Per conversations with the State of Utah, they have indicated that natural dispersal may be limited based on the nature of the habitat in the area and that the genetic connectivity may be more likely attributed to the translocations.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	The area is not particularly fragile or sensitive to change and threats from land uses/authorizations are low as compared to other sites in the State of Utah, providing opportunity for retention of a relatively large expanse of intact sagebrush habitat. The area is largely undeveloped and threats from development are low. Oil and gas potential is low. Ongoing disturbance in the area is limited to a few minor rights-of-way (i.e., roads and small transmission lines), livestock grazing, and recreation. The area is mostly core sagebrush as identified in Doherty (2022) Sagebrush Conservation Design with a proportionally large core relative to other areas in the state. Much of the core habitat occurs on School and Institutional Trust Lands Administration (SITLA) lands and BLM jurisdiction within the core is fairly limited to the periphery. Similarly, the USU seasonal habitat model identifies much of the area as summer, winter, and nesting habitat. The core has a high probability of lek persistence; however, the majority of occupied leks are on SITLA administered lands. Uncertainty on SITLA administered lands could make the population vulnerable to adverse changes should SITLA management priorities change. Parker Mountain has been a source population for GRSG translocations within the state. This source population may be attributing to some of the importance that shows up in the genetic connectivity models based on the new science. The nature of the habitat in the area may limit natural dispersal to the north and west of the area. This area contains one of the largest populations of GRSG within the southernmost extent of the GRSG range and although it provides importance to those smaller populations that surround it, its importance to the larger overall range of GRSG within Management Zone III is relatively minor and therefore not more than locally significant.

Utah GRSG ACEC Importance Evaluation: Parker Mountain Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The BLM 2015, 2019, and current land use planning initiatives to conserve, enhance, and restore GRSG habitat is the result of the March 2010, US Fish and Wildlife Service (USFWS) 12 Month Finding for Petitions to List the Greater Sage-grouse (Centrocercus urophasianus) as Threatened or Endangered. In that finding, the USFWS concluded that GRSG was "warranted, but precluded" for listing as a threatened or endangered species. However, in the 2015 listing decision, the USFWS concluded in part that existing regulatory mechanisms, (i.e., "specific direction regarding sage grouse habitat, conservation, or management") in the BLM's Land Use Plans, were adequate to protect the species. Without multiple lines of evidence, including reasonably foreseeable development, valid existing rights, land ownership, crucial GRSG habitat characteristics from multiple science-based models, on-the-ground conditions/evidence this area has not been identified for protection beyond those implemented through FLPMA and national priorities.
Other Items		
Boundaries	No proposed changes to boundaries.	
Additional Notes	No maps provided due to no ACEC boundary identified.	
Conclusion		
The area meets relevance criteria but does not meet importance criteria. Items in bold listed above provide some lines of evidence that warranted a closer review of these areas to determine if Parker Mountain may be important and more than locally significant. In our review of the new science/data sets and coordination with the State of Utah, the lack of information particularly with the genetic connectivity suggests this area is not more than locally significant and does not have greater than local importance to the greater sage-grouse population within Management Zone III.		

Effects of the Alternatives on the Potential Rich and Box Elder ACECs

BLM identified two potential ACECs in Utah: the 132,924-acre Rich ACEC and the 232,258-acre Box Elder ACEC. The Rich population area is a stronghold for GRSG populations in Utah and connects larger populations in Idaho and Wyoming. Here, the majority of intact sagebrush habitat is within a core area; the Rich population area also includes some of the largest core sagebrush habitat in Utah. The Box Elder population area, part of the Northern Great Basin sub-population (Utah, Idaho, and Nevada), is one of the largest of the GRSG populations in Utah and connects larger populations in Idaho and Nevada. Box Elder has been a source population for greater sage-grouse translocations within the state and neighboring states. The areas were both determined to have more than local significance given their high-density breeding, genetic connectivity, and genetic mixing considerations in Rich County and Box Elder County, respectively.

Table 5-10 displays the HMA allocation for these areas under each alternative. Under Alternatives 1 through 6 and the Proposed RMP Amendment, these two areas would be managed as PHMA. Under Alternative 3 and 6, the areas would also be designated as ACECs.

Table 5-10. HMA Allocations in the Utah Potential ACECs by Alternative

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment
Rich							
PHMA	132,924 acres (100%)	132,924 acres (100%)	132,924 acres (100%)	132,924 acres (100%)	132,924 acres (100%)	132,924 acres (100%)	132,924 acres (100%)
GHMA	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)
Total	132,924 acres	132,924 acres	132,924 acres	132,924 acres	132,924 acres	132,924 acres	132,924 acres
Box Elder							
PHMA	232,258 acres (100%)	232,258 acres (100%)	232,258 acres (100%)	232,258 acres (100%)	232,258 acres (100%)	232,258 acres (100%)	232,258 acres (100%)
GHMA	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)
Total	232,258 acres	232,258 acres	232,258 acres	232,258 acres	232,258 acres	232,258 acres	232,258 acres

This section details the effects of the alternatives on these areas considered for ACEC designation.

Solar, Wind, Major Rights of Way, Saleable Minerals/Material Management, and Locatable Minerals

The Proposed RMP Amendment and Alternatives 3 and 6 would all provide additional protections to the potential ACEC by excluding solar, wind, and non-energy leasable mineral development, with exceptions. While all three alternatives also exclude major rights of way and close the area to saleable minerals/material management, Alternative 3 provides the greatest protection as Alternative 3 provides no exceptions to the rights of way exclusion or to the saleable closure. In addition, under Alternative 3, the area would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use.

Under Alternatives 1, 2, and 4, as PHMA, the area would be exclusion for solar and wind and avoidance for major rights of way in PHMA, both with exceptions, which would provide similar but slightly less protections than afforded under the Proposed RMP Amendment and Alternatives 3 and 6. Under Alternative 5, as PHMA, the areas would be avoidance for solar and wind and avoidance for major rights-of-way. Therefore, alternative 5 provides the least amount of protections from solar, wind, and rights of way development. Under Alternatives 1, 2, 4, and 5 the area would be open to locatable mineral development and notice level exploration would be allowed without a plan of operation which is the same as under the Proposed RMP Amendment.

Fluid Mineral Development

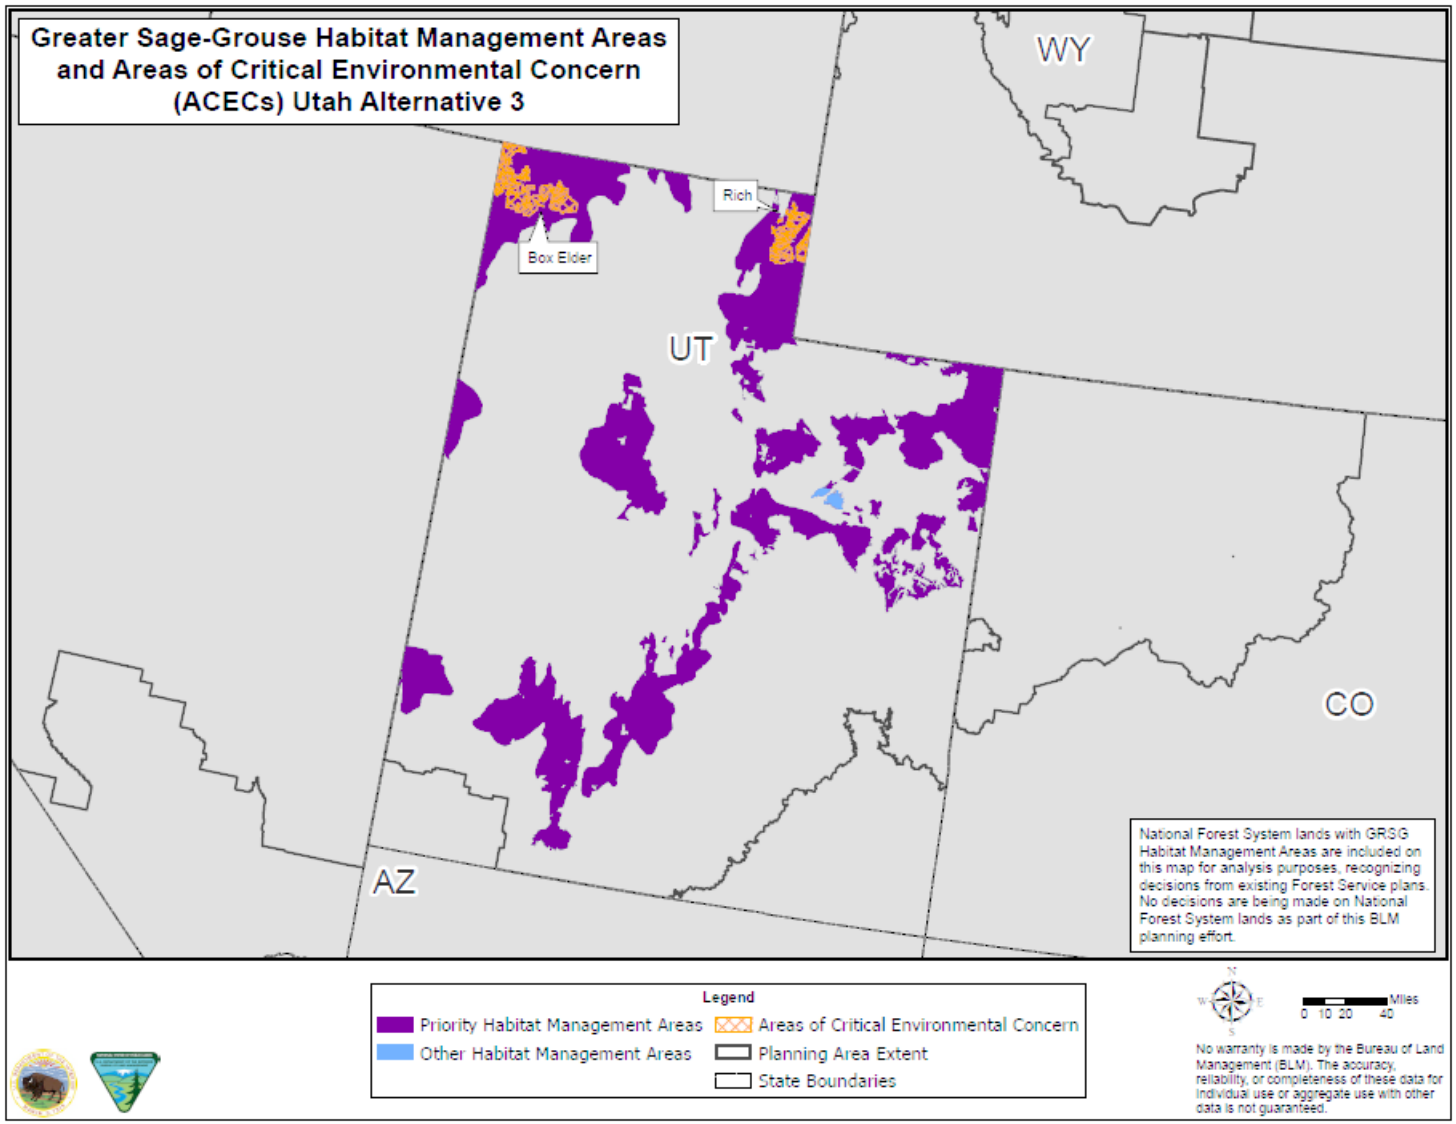
Under the Proposed RMP Amendment, these two potential ACEC area would be managed as PHMA. As PHMA, under the Proposed RMP Amendment and Alternatives 4, 5, and 6, these areas would be open to new fluid mineral leasing subject to NSO with Waivers, Exceptions, and Modifications. Under Alternative 4, a revised objective specified, "Manage fluid mineral leasing and development (including geothermal) in GRSG habitat management areas to avoid, minimize, and compensate for adverse impacts to GRSG habitat to the extent practical under the law and BLM jurisdiction.". Alternatives 5 and 6 do not specify any objectives or specific leasing prioritization language or a leasing strategy but maintain the desired condition to manage public lands to provide suitable GRSG habitat at the HAF mid-, fine- and site-scales. Under Alternative 3, all PHMA would be closed to new leasing. Under Alternatives 1 and 2, these areas would be managed as open

to new leasing, with NSO stipulations w/ Waivers, Exceptions, and Modifications. Alternative 1 additionally establishes an objective of "Priority will be given to leasing and development outside of PHMAs and GHMAs, or within the least impactful areas within PHMA and GHMA if avoidance is not possible.".

By closing all PHMA to new leasing, Alternative 3 would provide the greatest amount of protections from fluid mineral development.

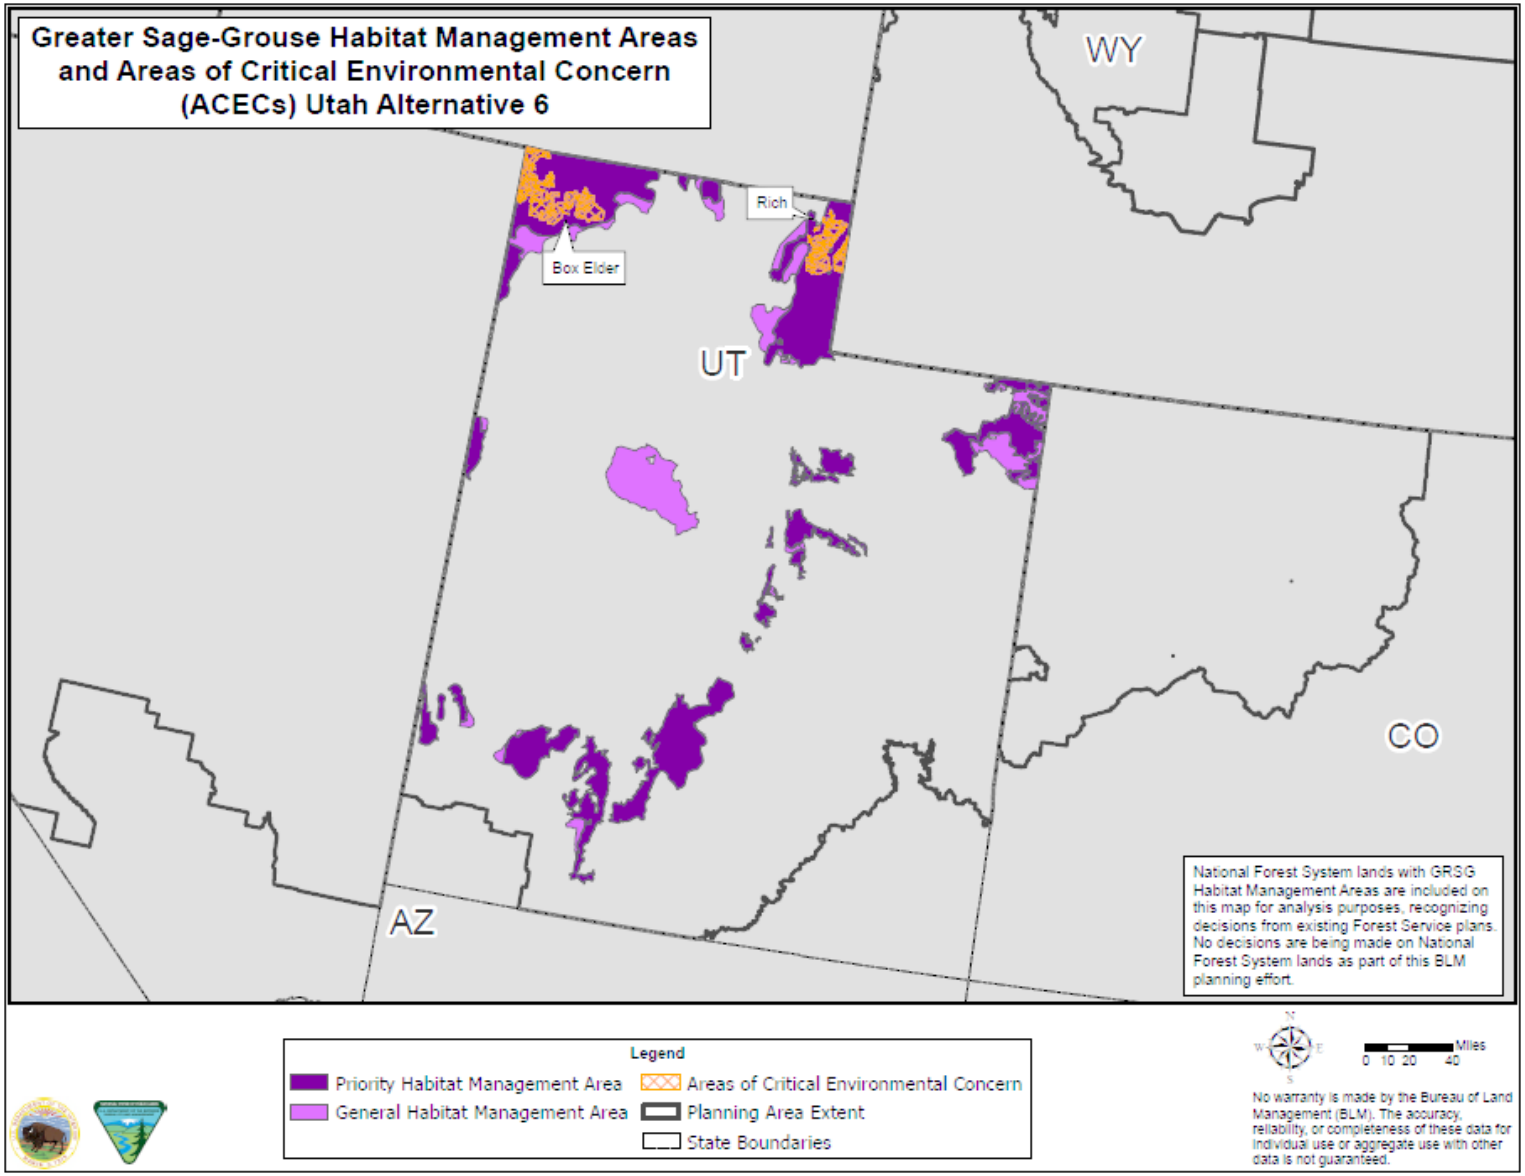
Disturbance Cap

In these areas managed as PHMA, the Proposed RMP Amendment sets a disturbance cap if direct habitat disturbance from existing and proposed infrastructure developments exceeds either 3% the project scale or 3% at the HAF Fine Scale selection area, with exceptions and conditions, Alternative 6 sets the same disturbance cap for the area but there are no exceptions and Alternative 3 closes the area to new infrastructure projects and sets a 3% disturbance cap for existing developments. Alternatives 1 and 2 set a 3% disturbance cap in PHMA and the cap applies at both BSU-scale and at the project scale. Under Alternative 2, the cap can be exceeded in Utah if it will benefit GRSG. Under Alternatives 4 and 5, in PHMA the disturbance cap is 3% the project scale or 3% at the HAF Fine Scale selection area and projects would be deferred until disturbance in the areas has been reduced below the cap threshold or the projects could be redesigned to not result in additional surface disturbance or moved outside of PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.



Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing are required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the potential ACECs by removing any potential disturbance associated with livestock grazing.



Summary of Effects

Considered comprehensively, the management direction provided under Alternatives 3 and 6 and the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the potential Rich and Box Elder ACECs; with Alternative 3 providing the highest level of protection. Alternatives 1, 2, 4, and 5 provide a relatively high degree of protection with PHMA management direction. However, as major rights of way and renewable energy development are more likely to occur under these alternatives, associated disturbances could negatively impact the relevant and important values of the potential ACECs.

Map 5.9: Utah Alternative 3 Potential ACECs

Map 5.10: Utah Alternative 6 Potential ACECs

WYOMING

BLM Wyoming considered the results of the rangewide assessment and evaluated the Carbon-Moffat, Little Sandy, Carter Crook, the Sagebrush Focal Areas (SFAs) in South-Central and Southwestern Wyoming, and the Greater South Pass and Upper Green River Basin areas to determine if they met the relevance and importance criteria. The Little Sandy area was both internally identified and nominated by an external group during the scoping period. The BLM also evaluated the Red Desert area that was nominated by an external group during the scoping period. Through the evaluation process, Wyoming BLM identified the Little Sandy, Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and the Greater South Pass and Upper Green River Basin as meeting the relevance and importance criteria. These areas were identified as potential ACECs in the Draft EIS in Alternatives 3 and 6.

Between the Draft and Final EIS, the BLM refined the acreage of the Little Sandy ACEC (which is also commonly referred to as the Golden Triangle) to align more closely with the boundaries that had been identified for the area in the concurrent plan revision for the Rock Springs RMP. This resulted in a change from 475,284 acres in the Draft EIS to 272,557 acres in the Final EIS. The selection of this ACEC boundary alignment for both planning efforts was in response to the proposed management direction in the Rock Springs RMP that would provide oil and gas leasing restrictions and viewshed protections for the 202,727 acres that were removed from the potential ACEC identified in the GRSG Draft RMPA/EIS. The change in boundary also responds to the special recreation management area direction proposed in the Rock Springs RMP.

Importance Evaluations

Wyoming GRSG ACEC Importance Evaluation: Carbon-Moffat GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	• The nominated area provides a genetic linkage between GRSG populations in NW CO with populations in central and western portions of the species' range (Cross et al. 2023). • However, models of potential movement among PHMA throughout the range of GRSG suggest additional movement pathways from CO populations in this region to population strongholds in WY (Crist et al. 2017; Oyler-McCance et al. 2022; Cross et al. 2023). • The nominated area contains several genetic nodes (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range; Fig. 6; Cross et al. 2018 and 2023). • GRSG population density is high in much of the nominated area with portions of the nominated area modeled as having the highest densities of breeding GRSG in WAFWA MZ 2; MZ 2 has the highest proportion of breeding GRSG in the range of the species (Doherty et al. 2016). • Lek densities are higher in this area than most other areas in WY, although many of the documented leks are currently unoccupied (as defined by the WGFD; Whitford and Bish 2022), especially those more closely associated with energy development. The data most likely to suggest the nominated area has more than locally significant qualities are the genetic linkage data. These data suggest the nominated area is a likely corridor for the functional movement of GRSG from habitats in NW CO to the rest of the species' range via population strongholds in WY. But the preponderance of evidence suggests other movement corridors between CO and WY likely exist (see Crist et al. 2017; Oyler-McCance et al. 2022) suggesting the nominated area does not have greater than local-level significance.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	GRSG population linkage (i.e., the functional movement of individuals between CO and WY) in this area may establish the area as being more than locally significant to the sustainability of GRSG populations in the broader region. However, other likely corridors exist allowing movement of individual GRSG between WY and CO so the nominated area is not unique, rare or irreplaceable.

Wyoming GRSG ACEC Importance Evaluation: Carbon-Moffat GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The nominated area meets relevance criteria but does not meet importance criteria. Therefore, it is not recommended that the nominated area as nominated nor as modified be considered a potential ACEC for GRSG for analysis in the Draft EIS in the current range-wide planning effort.
Conclusion		
This area did not meet importance criterion and was not identified as a potential ACEC in Alternatives 3 and 6.		

Wyoming GRSG ACEC Importance Evaluation: Little Sandy Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	• GRSG population density is very high especially in northern portions of the nominated area with most of the nominated area modeled as having the highest densities of breeding GRSG in WAFWA MZ 2; MZ 2 has the highest proportion of breeding GRSG in the range of the species (Doherty et al. 2016). • The nominated area contains a genetic node (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range) and includes portions of the most likely genetic linkage between GRSG populations in eastern and central WY with populations in southwestern portions of the State (Fig. 6; Cross et al. 2023). • However, models of potential movement among PHMA throughout the range of GRSG suggest east-west movement pathways are more likely to occur across southern portions of the State (Crist et al. 2017). The data most likely to suggest the nominated area has more than locally significant qualities are the GRSG breeding density data. These data suggest the nominated area, especially northern portions of the area, has some of the highest densities of breeding GRSG in the range of the species establishing the nominated area is more than locally important with special worth and is distinctive.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	High densities of breeding GRSG relative to the rest of the species' range establish the area as exemplary, rare, unique, and irreplaceable. The potential expansion of liquid and renewable energy development in the nominated area establishes the area as vulnerable to adverse change.

Wyoming GRSG ACEC Importance Evaluation: Little Sandy Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The proposed ACEC includes multiple lines of evidence identifying the area as valuable for the long-term population sustainability of GRSG. Because (1) the area has relatively (compared to the rest of the species' range) robust populations, (2) includes portions of the most likely genetic corridor between populations to the east and west of this region, (3) the loss of the ability of GRSG to move through this area could isolate GRSG populations in eastern and western portions of the species' range and the isolation of populations increases the probability of regional-level extirpation (Knick et al. 2013) and conserving habitat connectivity is a national priority for managing bureau sensitive status species (Manual 6840 and IM 2023-005), and (4) the area has high potential for energy development in the future, it is recommended that the nominated area as modified be considered a potential ACEC for GRSG for analysis under at least one alternative in the current range-wide planning effort.
Conclusion		
Due to meeting the relevance and importance criteria, this area was identified as a potential ACEC in Alternatives 3 and 6. Refer to Wyoming - ACEC Maps for Alternatives 3 and 6 that follow.		

Wyoming GRSG ACEC Importance Evaluation: Carter-Cook GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	• The nominated area provides the primary genetic linkage between GRSG populations in the entirety of northeastern portions of the species' range with populations in central and western portions of the species' range (Crist et al. 2017; Oyler- McCance et al. 2022; Cross et al. 2023). • The nominated area contains at least 2 genetic nodes (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range; Cross et al. 2018 and 2023). The data most likely to suggest the nominated area has more than locally significant qualities are the genetic linkage data. The nominated area is the most likely corridor and a bottleneck to functional movement of GRSG from habitats in most of Management Zone 1 to the rest of the species' range establishing that the nominated area is more than locally important with special worth and is distinctive.

Wyoming GRSG ACEC Importance Evaluation: Carter-Cook GRSG Connectivity Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	Potential genetic bottleneck of the most likely movement corridor between populations in northeastern portions of the GRSG range and the rest of the species' range establish the area as rare, unique, and irreplaceable. Energy development and mining (and the likely expansion of bentonite mining in the area) and invasive annual grass (and the increased risk of fire eliminating the sagebrush overstory) establishes the area as vulnerable to adverse change.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The proposed ACEC includes multiple lines of evidence identifying the area as valuable for the long-term population sustainability of GRSG, especially populations in MZ 1. Because (1) the area is the most likely genetic corridor between populations in eastern portions of the species range, (2) the loss of the ability of GRSG to move through this area could isolate MZ 1 populations, (3) the isolation of populations increases the probability of regional-level extirpation (Knick et al. 2013), and (4) conserving habitat connectivity is a national priority for managing bureau sensitive status species (Manual 6840 and IM 2023-005), it is recommended that the nominated area as modified be considered a potential ACEC for GRSG for analysis under at least one alternative in the current range-wide planning effort.
Other Items		
Additional Notes	While the New Castle FO (NFO) agrees with the premise of the rationale of regional-level extirpation (Knicks et al. 2013), the NFO believes that the added protection of an ACEC is not necessary to meet goals of the area. The NFO believes that goals can be met with the current Core Area strategy as the proposed ACEC area is located in a PHMA Connectivity Area. The protections include a 5% disturbance density threshold and associated NSOs and TLSs, which should allow existing GRSG populations to persist and maintain genetic connectivity between populations.	
Conclusion		
Due to meeting the relevance and importance criteria, this area was identified as a potential ACEC in Alternatives 3 and 6. Refer to Wyoming - ACEC Maps for Alternatives 3 and 6 that follow.		

Wyoming GRSG ACEC Importance Evaluation: Red Desert Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	No	• The nominated area does not contain high density GRSG populations, and only portions of the area provide suitable habitats for the species. • The nominated area is not important for genetic connectivity. Data suggest the nominated area does not have more than locally significant qualities for GRSG.

Wyoming GRSG ACEC Importance Evaluation: Red Desert Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	No	None of the data considered establish the nominated area as having rare, unique, or irreplaceable values for GRSG. Energy development (and the likely expansion of this development in the area) establishes the area as vulnerable to adverse change, but these potential threats are not likely to directly impact substantial numbers of GRSG.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The proposed ACEC does not include habitat conditions that meet relevance and importance criteria for GRSG. Therefore, it is not recommended that the nominated area be considered a potential ACEC for GRSG for analysis in the Draft EIS for the current range-wide planning effort.
Conclusion		
This area did not meet importance criterion and was not identified as a potential ACEC in Alternatives 3 and 6.		

Wyoming GRSG ACEC Importance Evaluation: Sagebrush Focal Areas in South-Central and Southwestern Wyoming Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	• GRSG population density is high in far western and far eastern portions of the SFA area with these areas modeled as having the highest densities of breeding GRSG in WAFWA MZ 2; MZ 2 has the highest proportion of breeding GRSG in the range of the species (Doherty et al. 2016). • The SFA area contains several genetic nodes (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range; Fig. 6; Cross et al. 2018 and 2023). • The general area in far western portions of the SFA area additionally appears to be a genetic mixing zone for populations farther to the south in UT, populations in CO and southern WY, and populations in eastern ID (Oyler-McCance et al. 2022). • The SFA area includes portions of the most likely genetic linkage between GRSG populations in eastern and central WY with populations in southwestern portions of the State (Cross et al. 2023). • However, models of potential movement among PHMA throughout the range of GRSG suggest east-west movement pathways are more likely to occur across southern portions of the State (Crist et al. 2017). • Models of climate impacts on sagebrush habitat integrity suggest that some of the habitats throughout the SFA area will not maintain high value conditions for GRSG into the near future (2030-2060; Doherty et al. 2022). The data most likely to suggest the SFA-designated area being considered has more than locally significant qualities are the GRSG breeding density data, the genetic mixing data, and the genetic connectivity data. These data suggest far western portions of the SFA area are more than locally important with special worth and are distinctive.
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	High densities of breeding GRSG relative to the rest of the species' range, GRSG population linkage (i.e., the functional movement of individuals between UT and WY), and genetic mixing which appears to be relatively unique to the species' range establish far western portions of the SFA area as exemplary, rare, unique, and irreplaceable. Models of habitat response to climate change in the far western region establish the area as vulnerable to adverse change.

Wyoming GRSG ACEC Importance Evaluation: Sagebrush Focal Areas in South-Central and Southwestern Wyoming Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	N/A	Far western portions of the SFA-designated area being considered includes multiple lines of evidence identifying the area as valuable for the long-term population sustainability of GRSG. Because (1) the area has relatively (compared to the rest of the species' range) robust populations, (2) is the most likely genetic corridor between populations to the east and west of this region, (3) the loss of the ability of GRSG to move through this area could isolate GRSG populations in eastern and western portions of the species' range and the isolation of populations increases the probability of regional-level extirpation (Knick et al. 2013), and (4) conserving habitat connectivity is a national priority for managing bureau sensitive status species (Manual 6840 and IM 2023-005), it is recommended that the SFA- designated area being considered as modified be considered a potential ACEC for GRSG for analysis under at least one alternative in the current range-wide planning effort.
Conclusion		
Due to meeting the relevance and importance criteria, this area was identified as a potential ACEC in Alternatives 3 and 6. Refer to Wyoming - ACEC Maps for Alternatives 3 and 6 that follow.		

Wyoming GRSG ACEC Importance Evaluation: Greater South Pass and Upper Green River Basin GRSG Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
More than locally significant qualities, especially compared to any similar resource, that give it: • Special worth: • Consequence • Meaning • Distinctiveness • Cause for concern	Yes	• GRSG population density is very high especially in western portions of the nominated area with most of the nominated area modeled as having the highest densities of breeding GRSG in WAFWA MZ 2; MZ 2 has the highest proportion of breeding GRSG in the range of the species (Doherty et al. 2016). • The nominated area contains several genetic nodes (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range; Cross et al. 2018 and 2023). • The nominated area provides the most likely genetic linkage between GRSG populations in eastern and central WY with populations in southwestern portions of the State (Cross et al. 2023). • However, models of potential movement among PHMA throughout the range of GRSG suggest east-west movement pathways are more likely to occur across southern portions of the State (Crist et al. 2017). The data most likely to suggest the nominated area has more than locally significant qualities are the GRSG breeding density data. These data suggest the nominated area, especially central and western portions of the area, has the highest densities of breeding GRSG in the range of the species establishing the nominated area is more than locally important with special worth and is distinctive.

Wyoming GRSG ACEC Importance Evaluation: Greater South Pass and Upper Green River Basin GRSG Proposed ACEC		
Importance Consideration	**Yes/No**	**Rationale for Determination**
Qualities or circumstances that make it: • Fragile • Sensitive • Rare • Irreplaceable: • Exemplary • Unique: • Endangered • Threatened • Vulnerable to adverse change	Yes	High densities of breeding GRSG relative to the rest of the species' range establish the area as exemplary, rare, unique, and irreplaceable. Energy development (and the potential expansion of liquid and renewable energy development in the nominated area) establishes the area as vulnerable to adverse change.
Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA	No	The proposed ACEC includes multiple lines of evidence identifying the area as valuable for the long-term population sustainability of GRSG. Conclusion		
Due to meeting the relevance and importance criteria, this area was identified as a potential ACEC in Alternatives 3 and 6. Refer to Wyoming - ACEC Maps for Alternatives 3 and 6 that follow.		

Effects of the Alternatives on the Potential Little Sandy/Golden Triangle, Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and Greater South Pass and Upper Green River Basin ACECs

In Wyoming, the Little Sandy/Golden Triangle area was identified in the Draft EIS as a potential ACEC in Alternatives 3 and 6 and totaled 475,284 acres. Between Draft and Final EIS, the acreage was refined as described above and totals 272,557 acres in Alternatives 3 and 6 in the Final EIS. Under the Proposed RMP Amendment the 272,557 acre area would receive PHMA with limited exceptions protections. The Little Sandy/Golden Triangle is a large expanse of intact sagebrush that supports portions of the densest population of GRSG across its entire range, has limited invasive annual grasses and anthropogenic infrastructure, and faces potential threats from fluid mineral development.

The potential Carter Crook ACEC, totaling 19,400 acres is identified for potential ACEC designation under Alternatives 3 and 6. The area contains at least 2 genetic nodes (i.e., leks most important to the overall genetic connectivity of GRSG populations across their range; Cross et al. 2018 and 2023) and is the most likely genetic corridor between populations in eastern portions of the species range. The potential Sagebrush Focal Areas in South Central and Southwestern Wyoming ACEC, totaling 33,166 acres is identified for potential ACEC designation under Alternatives 3 and 6. The area has: high densities of breeding GRSG relative to the rest of the species' range; GRSG population linkage (i.e., the functional movement of

individuals between UT and WY); and genetic mixing which appears to be relatively unique to the species' range. The far western portions of the SFA area as exemplary, rare, unique, and irreplaceable. Models of habitat response to climate change in the far western region establish the area as vulnerable to adverse change.

The potential Greater South Pass and Upper Green River Basin ACEC, totaling 311,229 acres is identified for potential ACEC designation under Alternatives 3 and 6. The area's high densities of breeding GRSG relative to the rest of the species' range establish the area as exemplary, rare, unique, and irreplaceable. Energy development, and the potential expansion of liquid and renewable energy development in the nominated area, establishes the area as vulnerable to adverse change.

Table 5-11 displays the HMA allocation for these areas under each alternative. Under the Proposed RMP Amendment, the Little Sandy/Golden Triangle area would be managed as PHMA with limited exceptions, and Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and Greater South Pass and Upper Green River Basin would be managed entirely as PHMA. Under Alternatives 1 through 6, the Little Sandy/Golden Triangle, Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming areas would be managed entirely as PHMA. Under Alternatives 1 and 2, 96% of the Greater South Pass and Upper Green River Basin area would be managed as PHMA and 4% of the area would be managed as GHMA. Under Alternatives 3 through 6, the Greater South Pass and Upper Green River Basin area would be managed entirely as PHMA. Under Alternative 3 and 6, all four areas would also be proposed for designation as ACECs and would receive the additional management protections identified for ACECs under those alternatives.

Table 5-11. HMA Allocations in the Wyoming Potential ACECs by Alternative

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[15]
Little Sandy/Golden Triangle

[15] HMA with limited exceptions are areas within PHMA where additional protections to support conservation of GRSG habitat would reduce impacts from highly probable resource threats. These acreages are therefore included in both PHMA and PHMA with limited exceptions.

Potential ACEC	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Alternative 6	Proposed RMP Amendment[15]
Sagebrush Focal Areas in South Central and Southwestern Wyoming

This section details the effects of the alternatives on these areas considered for ACEC designation.

Fluid Mineral Development

Under the Proposed RMP Amendment the Little Sandy/Golden Triangle potential ACEC would be wholly managed under the PHMA with limited exceptions designation. The No Surface Occupancy (NSO) with no exceptions management direction identified for these limited exception areas would protect the potential ACEC from the threat of fluid mineral development. Under the Proposed RMP Amendment the other three potential ACECs would be managed as NSO for fluid mineral development within .6 miles of leks and seasonal limitations (breeding, nesting, early brood-rearing and winter habitat) and Controlled Surface Use (CSU) (density and disturbance) in PHMA outside of the 0.6-mi NSO buffer. Under Alternative 3, all of the potential ACECs would be closed to fluid mineral development without exception. Under Alternative 6, the areas would also be subject to NSO but development could occur if an exception for the entire ACEC area could be met. Under Alternatives 1, 2, and 5, in PHMA, which includes the vast majority of areas within these potential ACECs, NSO would be allowed within .6 miles of leks. PHMA outside .6 miles has season limitations (breeding, nesting, early brood-rearing and winter habitat) and CSU (density and disturbance). Under Alternative 4, there would be NSO in the potential ACEC areas. The Proposed RMP Amendment and Alternative 3 provide the greatest amount of protections from fluid mineral development. The second highest protections would occur under Alternative 6. Alternatives 1, 2, and 4 would provide the least amount of protections to the potential ACEC from fluid mineral development.

The Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and Greater South Pass and Upper Green River Basin potential ACECs would not receive PHMA with limited protections under the Proposed RMP Amendment. Under the Proposed RMP Amendment, these areas would be managed as PHMA, there would be NSO for fluid mineral development within .6 miles of leks and season limitations (breeding, nesting, early brood-rearing and winter habitat) and Controlled Surface Use (CSU) (density and disturbance) outside of the 0.6-mi NSO buffer with exceptions. The fluid mineral management direction identified for the Little Sandy/Golden Triangle described above for Alternatives 1, 2, 3, 4, 5, and 6 would be the same for these three potential ACECs. As such, the greatest amount of protections from fluid mineral development for these three areas would occur under Alternatives 3. Alternative 6 and the Proposed RMP

Amendment provide the next highest level of protection. Alternatives 1, 2, and 4 would provide the least amount of protections to the potential ACECs from fluid mineral development.

Solar, Wind, Major Rights of Way, Saleable Minerals/Material Management, and Locatable Minerals

Alternatives 3 and 6 would provide additional protections to all of the potential ACECs by excluding solar, wind, and non-energy leasable mineral development. While these alternatives also exclude major rights of way and close the area to saleable minerals/material management, Alternative 3 provides the greatest protection as Alternative 3 provides no exceptions to the rights of way exclusion or to the saleable mineral closure. In addition, under Alternative 3, the areas would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use in these areas.

Under the Proposed RMP Amendment, the Little Sandy/Golden Triangle ACEC would be managed as exclusion for solar, wind, and non-energy leasable mineral development and exclusion with exceptions to major rights of way. Under the Proposed RMP Amendment, the other three potential ACECs would be managed as PHMA, and would be exclusion with exceptions for solar and wind. Under the Proposed RMP Amendment these three ACECs would be open to expansion of existing non-energy leasable minerals subject to occupancy, seasonal limitations, disturbance, and density, but closed to new leases except in situations required for human health and safety. Under the Proposed RMP Amendment these three ACECs would be avoidance areas for new major rights of way with criteria that must be met to authorize the right of way. Therefore, under the Proposed RMP Amendment, the protections resulting from the PHMA with limited exceptions management direction related to solar, wind, non-energy minerals, and major rights of way would provide greater protections for the Little Sandy/Golden Triangle than the protections provided by the PHMA management direction that would apply to the Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and Greater South Pass and Upper Green River Basin potential ACECs.

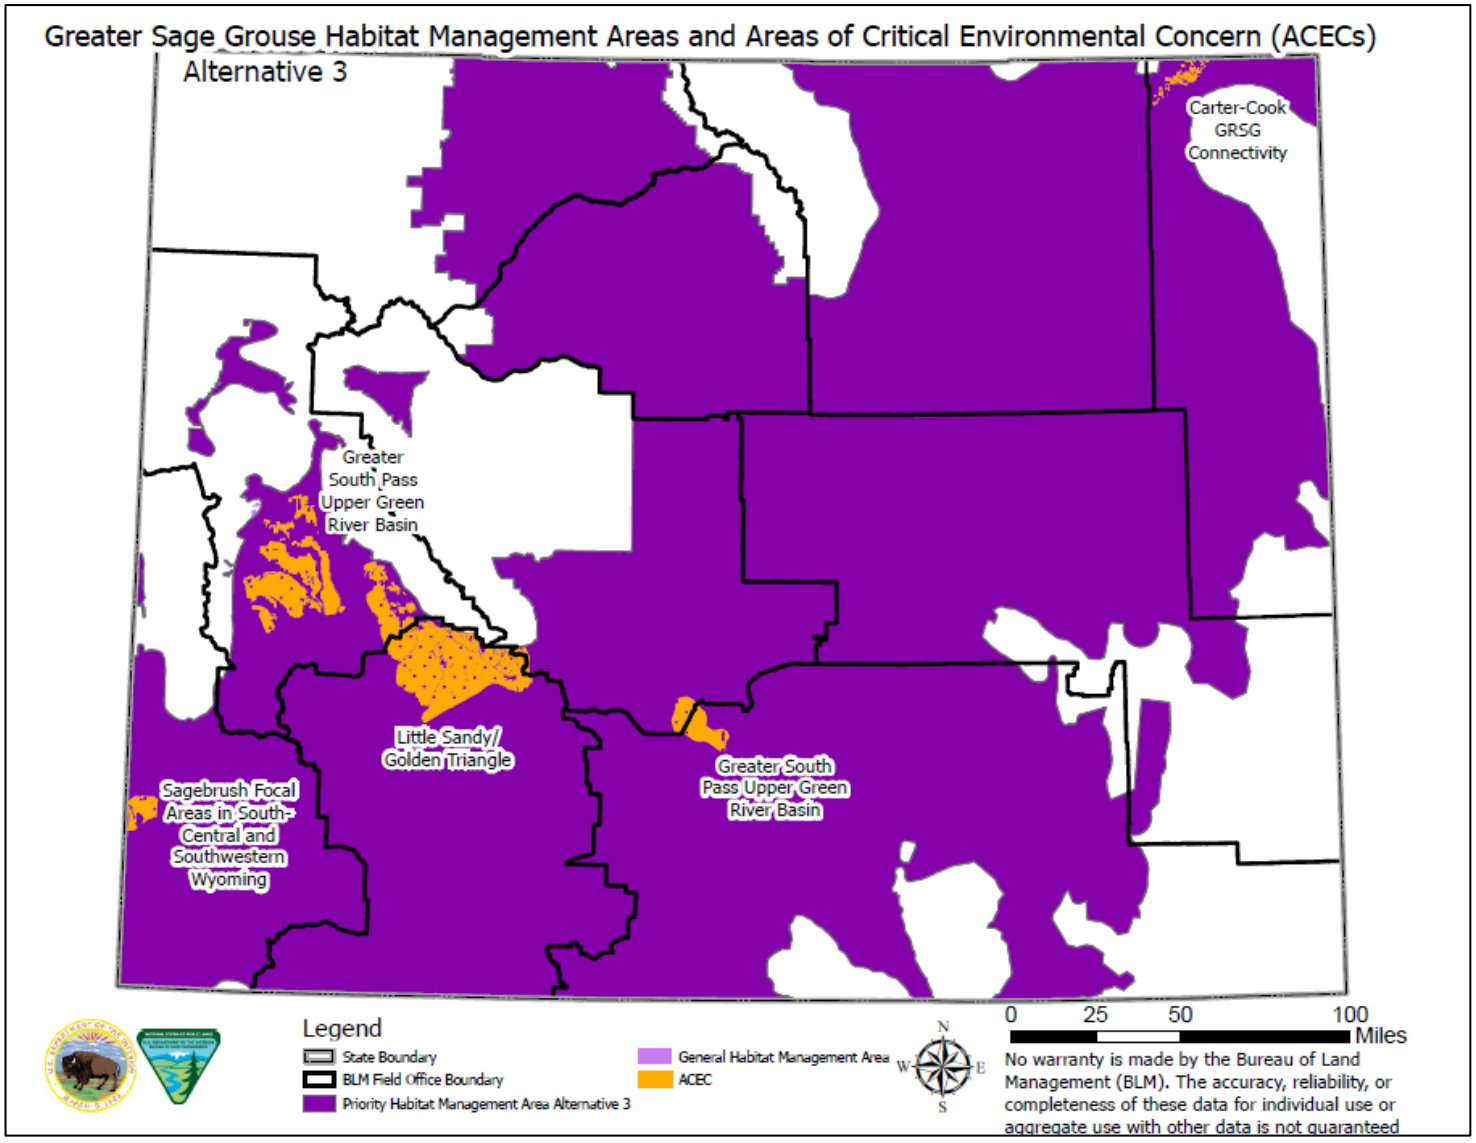
Under Alternatives 1 and 2, all four potential ACEC would be managed as avoidance areas for wind in PHMA. Alternatives 1 and 2 do not provide management direction for solar development in PHMA. General surface disturbance limits would exclude solar development near leks (0.6 miles) and minimize solar development disturbance through disturbance cap and mitigation requirements elsewhere in PHMA. The 4% of the potential Greater South Pass and Upper Green River Basin ACEC managed as GHMA under Alternatives 1 and 2 would be open for wind and solar. Under Alternatives 4, the four areas would be managed as exclusion areas for wind and solar as PHMA. Under Alternative 5, in PHMA, the areas would be managed as avoidance for solar and wind with criteria that would need to be met for development to occur. Under Alternatives 4 and 5, these areas would be avoidance areas for major rights of way.

Under Alternative 3, all four potential ACECs would be recommended for locatable mineral withdrawal. Under both Alternative 3 and 6, a plan of operations and BLM approval would be required before beginning any locatable mineral operations causing surface disturbance greater than casual use. Under Alternatives 1, 2, 4, 5, and the Proposed RMP Amendment, all four potential ACEC areas would be open to locatable mineral development and notice level exploration would be allowed without a plan of operations.

Disturbance Cap

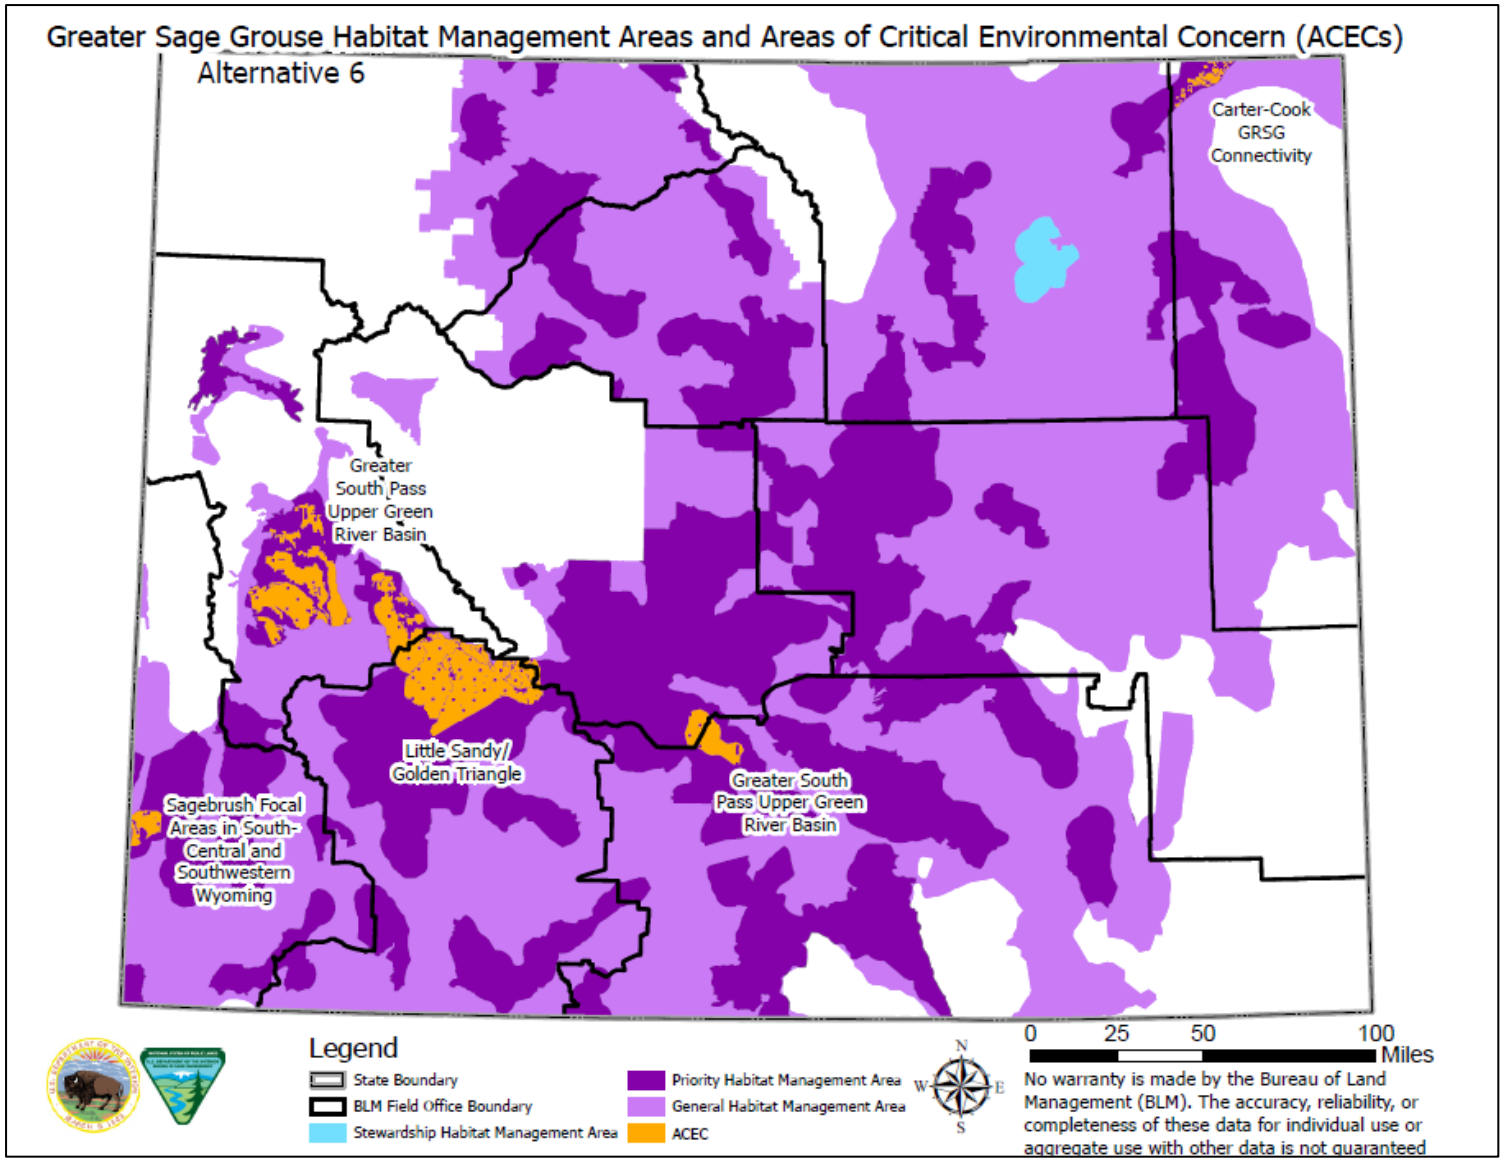
In Wyoming, the Proposed RMP Amendment sets a 5% disturbance cap at the project scale with exceptions that would apply to all four of the potential ACEC areas. Alternative 6 sets the same disturbance cap for the areas but there are no exceptions. Alternative 3 affords the most protections relative to the disturbance cap

by closing the areas to new infrastructure projects and setting a 3% disturbance cap for existing developments. Similar to the Proposed RMP Amendment, Alternatives 1 and 2 set a 5% disturbance cap in PHMA. Alternative 3, followed by Alternative 6, provide the highest degree of protection relative to disturbance.



Livestock Grazing

Under Alternative 3, GRSG habitat would be unavailable to livestock grazing. Under Alternatives 1 and 2, in PHMA, thresholds and responses that would allow the authorized officer to make adjustments to livestock grazing are required. Under Alternatives 4, 5, 6, and the Proposed RMP Amendment, thresholds and responses are also addressed but under these alternatives, more comprehensive guidance is provided for addressing areas not meeting the special status species land health standard due to livestock grazing and for addressing livestock improvements and fencing in a manner to reduce impacts to GRSG. Alternative 3 provides the greatest protections to the potential ACECs by removing any potential disturbance associated with livestock grazing.



Summary of Effects

Considered comprehensively, Alternatives 3 and 6 would protect and prevent irreparable damage to the relevant and important values of all four of the potential ACECs. The application of PHMA with limited exceptions management direction under the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the Little Sandy/Golden Triangle ACEC and the application of the PHMA management direction in the Proposed RMP Amendment would protect and prevent irreparable damage to the relevant and important values of the Carter Crook, Sagebrush Focal Areas in South Central and Southwestern Wyoming, and Greater South Pass and Upper Green River Basin potential ACECs. Alternative 4 provides a high degree of protection from development and would also protect and prevent irreparable damage to the relevant and important values of all four of the ACECs. Although Alternatives 1, 2, and 5 provide a relatively high degree of protection within PHMA within these potential ACEC areas, fluid mineral, solar, wind, and major rights of way development under these alternatives are more likely to occur and could negatively impact the relative and important values of all four of the potential ACECs. As 4% of the potential Greater South Pass and Upper Green River Basin ACEC would be open to wind and solar as GHMA, the likelihood of these potential disturbances and associated impacts to GRSG is slightly increased in this potential ACEC under Alternatives 1 and 2.

Map 5.15: Priority Habitat Management Areas with limited exceptions in the Proposed RMP Amendment

5.6 CUMULATIVE EFFECTS

This section presents an assessment of the cumulative effects on the ACECs proposed for designation under Alternatives 3 and 6. These potential ACECs were identified for their GRSG relevant and important values and, therefore, the cumulative effects to these areas will be similar to those identified for GRSG in **Chapter 4**, **Section 4.2.3**. This analysis considers the past, present, and reasonably foreseeable actions that may impact the ACECs and their relevant and important values. The cumulative effects analysis covers a 20-year timeframe, corresponding to the duration of the GRSG RMPA. The spatial scope encompasses the the 32 potential ACECs considered in this RMP Amendment and their immediate surroundings.

Surface-disturbing activities such as mining, renewable and fluid mineral energy development, rights of way, improper grazing, wild horses and burros, wildfires, and fuels management activities are examples of past and ongoing actions and conditions that have affected and could continue to affect the relevant and important values of the ACECs considered in this RMP amendment. Wildfires can impact relevant and important values due to the removal of vegetation, which can increase the risk of erosion. Fuels management projects, while aiming to reduce wildfire risk, can also help maintain soil stability by preventing large-scale vegetation removal that might lead to soil erosion. These projects can also contribute to preserving habitats for fish, wildlife, and other natural resources. Projects focused on managing vegetation and GRSG habitat can impact relevant and important values. Strategies like prescribed burns can help restore ecosystems, but they might also impact wildlife habitat temporarily.

The cumulative impacts of climate change could also negatively impact the potential ACECs' relevant and important values. Climate change is expected to impact temperatures and precipitation, which will have a number of cascading impacts on the ACECs' relevant and important values. These habitat impacts could include the loss of important plant species and the degradation of GRSG habitat.

Considering the different threats to these potential ACECs in combination with the management direction proposed under the Alternatives, the management protections identified under Alternatives 3, 6, and the Proposed RMP Amendment would provide the highest levels of protection to the potential ACECs and would protect and prevent irreparable damage to the relevant and important values of all 32 of the potential ACECs considered in this RMP amendment. Under Alternatives 1, 2, 4, and 5, the protections are not as strong as under Alternatives 3, 6, and Proposed RMP Amendment. However, because under these alternatives the areas are predominately managed as PHMA, these areas would receive a high degree of protection. Under alternatives 1,2, 4, and 5, there is just a higher likelihood that development activities (e.g., rights of way and renewable and fluid mineral energy development) could occur and these could result in negative impacts to the ACECs relevant and important values.

Appendix 6

NTT, COT, and USGS Science Incorporation

This page intentionally left blank.

This appendix outlines how the NTT and COT and reports factored into the prior GRSG planning processes, and how NTT, COT, and USGS science was incorporated into those efforts.

Appendix 6. NTT, COT, and USGS Science Incorporation

In 2010, the US Fish and Wildlife Service (USFWS) determined that greater sage-grouse (GRSG) warranted listing under the Endangered Species Act, in part due to insufficient regulatory mechanisms to conserve habitat, but the listing was precluded due to higher priorities. In response the BLM initiated a land use planning process in 2011. To help inform that process the BLM assembled a "National Technical Team" (NTT), comprised of state and federal resource specialists and scientists to review the scientific literature available at that time. On December 21, 2011, the NTT finalized a document entitled *A Report on National Greater Sage-Grouse Conservation Measures*, also known as the National Technical Team Report (NTT Report). The report was developed to summarize "the latest science and best biological judgement" from the available literature (NTT Report, Introduction, page 5).

Neither the NTT nor the BLM's policy intended the conservation measures in the NTT Report to be automatically applied across the range without intervening consideration through detailed land use planning and NEPA analysis. On December 27, 2011, the BLM issued Instruction Memorandum 2012-044 requiring BLM offices to "consider all applicable conservation measures when revising or amending its RMPs in Greater Sage Grouse habitat" (IM-2012-44, Policy/Action). IM-2012-044 also notes that "while these conservation measures are range-wide in scale, it is expected that at the regional and sub-regional planning scales there may be some adjustments of these conservation measures in order to address local ecological site variability." The NTT understood that the measures in its report would be evaluated alongside competing land use planning considerations and with follow-up environmental analysis relating to the conservation efficacy of its measures. As the NTT Report described, the conservation measures are not themselves management decisions but rather have been prepared "to assist [the BLM] in making management decisions." (NTT Report, Introduction, page 5.) IM-2012-044 states that "the NTT-developed conservation measures were derived from goals and objectives developed by the NTT" and that "these goals and objectives are a *guiding philosophy* that should *inform* the goals and objectives developed for individual land use plans. However, *it is anticipated that individual plans may develop goals and objectives that differ and are specific to individual planning areas*" (emphasis added).

IM-2012-44 stated "the conservation measures developed by the NTT…must be considered and analyzed, as appropriate, through the land use planning process" (ibid). The BLM's policy requiring consideration of the conservation measures in the NTT Report allowed for individual planning efforts to make adjustments to the report's conservation measures. IM-2012-44 notes that "while [the NTT Report's] conservation measures are range-wide in scale, *it is expected* that at the regional and sub-regional planning scales there may be some adjustments of these conservation measures in order *to address local ecological site variability*" (emphasis added). With specific consideration of this variability, each BLM planning and NEPA effort as part of the 2015 amendment efforts developed and analyzed a range of alternative approaches for GRSG habitat management in each sub-region/state. Through this process, the BLM considered local and regional differences, analyzing the effect of each alternative approach locally and cumulatively.

The NTT also developed its conservation measure recommendations without taking into consideration other legal and regulatory requirements associated with land use planning and NEPA. For example, the NTT's range-wide conservation measures did not consider State or local GRSG conservation efforts, the regulatory process to determine areas for unsuitability as outlined under 43 Code of Federal Regulations (CFR) 3461, or BLM planning guidance directing planning teams that "when applying leasing restrictions, the least restrictive constraint to meet the resource protection objective should be used" (BLM-H-1601 Appendix C page 24). In recognition of instances where the NTT Report's conservation measures were not consistent with law, regulation, or policy, the BLM's policy direction in IM-2012-044 directs that "when considering the [NTT Report's] conservation measures…BLM offices should ensure that implementation of any of the measures is consistent with applicable statute and regulation. Where inconsistencies arise, BLM offices should consider the conservation measure(s) to the fullest extent consistent with such statute and regulation."

Each BLM 2015 planning effort fully considered the broad, range-wide recommendations from the NTT Report through the required NEPA process. Through careful consideration of the NTT's conservation measures, as well as local expertise, monitoring, partnerships, and other resource and land uses, the BLM developed GRSG management goals, objectives, and management actions that accounted for the variability of habitat and resources across the range.

What the NTT Report and its Conservation Measures Are:

- The NTT Report included science-based management considerations for GRSG to promote sustainable GRSG populations.
- The conservation measures were to be considered and analyzed through the BLM's land use planning process.
- The conservation measures are range-wide in scale, not accounting for local variability.
- The conservation measures were a starting point to be used in the BLM's planning process.

What the NTT Report and its Conservation Measures Are Not:

- Unlike FLPMA's requirement that the BLM develop and modify Land Use Plans in coordination with state and local plans and policies, the NTT Report was not developed with input from or consideration of plans, policies, or programs of State, Tribal, or local government agencies.
- The conservation measures were not developed using a systematic interdisciplinary approach, as required by FLPMA for land use plans.
- The NTT Report presented conservation measures that would provide food and habitat for one species of wildlife but did not consider other FLPMA requirements for BLM to manage for other species and resources while also recognizing the need for sources of minerals, food, timber and fiber from public lands.
- The NTT Report is not a land use plan, or an amendment or revision to a land use plan.
- The conservation measures were based on best available science at the time and do not provide for future updates in scientific knowledge or technological advancements.
- When preparing the NTT Report, the NTT did not complete a NEPA analysis on its conservation measures. Instead, the BLM completed NEPA and land use planning processes in 2015 and 2019 to assess the environmental consequences of the NTT Report's conservation measures, as well as alternatives to those measures—and to account for competing land management considerations.

6.1 US FISH AND WILDLIFE CONSERVATION OBJECTIVES TEAM REPORT (2013)

In 2012 the director of the USFWS convened a Conservation Objectives Team (COT) of state and USFWS representatives. The team developed a peer-reviewed report (COT Report) that delineated objectives based on the "best scientific and commercial data available at the time of its release" (COT Report, page ii). The COT Report, released in March 2013, identifies conservation objectives, measures, and options for each of the GRSG threats assessed. The COT Report also identified Priority Areas for Conservation (PACs) which were identified as "the most important areas needed for maintaining GRSG representation, redundancy, and resilience across the landscape" (ibid, page 13). Unique compared to the NTT Report, the COT Report identified threats to each PAC, recognizing that threats vary across the range, and therefore corresponding management should vary to address those threats. The preface of the report is clear that it "is guidance only" and that the "identification of conservation objectives and measures does not create a legal obligation beyond existing legal requirements" (ibid, page ii). Further, the preface notes that the objectives "are subject to modification as dictated by new findings, changes in species' status, and the completion of conservation actions" (ibid, page ii).

The COT Report clearly identifies the necessity to adapt GRSG conservation goals, objectives, and measures due to variability across the range. The COT noted that "due to the variability in ecological conditions and the nature of the threats across the range of the sage-grouse, *developing detailed, prescriptive species or habitat actions is not possible at the range-wide scale*" (emphasis added) (COT Report, Section 5- Conservation Objectives, page 31). The COT Report summarizes the relationship between its range-wide conservation goals, objectives, and measures and the state-specific planning efforts, noting that "specific strategies or actions necessary to achieve the following conservation objectives must be developed and implemented at the state or local level, with the involvement of all stakeholders" (ibid).

The BLM received the COT Report when developing its 2013 Draft EIS and fully considered it prior to Draft EIS publication, providing for public review of the BLM's evaluation. The BLM evaluated the range of alternatives and determined that the threats and impacts to GRSG addressed by the COT Report were addressed in the Draft EISs. Following public comments and development of the 2015 Proposed Plans, the Final EISs updated the crosswalk between the USFWS threats and the BLM program areas, showing that all the threats for which the BLM has discretion were addressed. A table was added to the 2015 Final EISs Executive Summary that showed the management actions from the 2015 Proposed Plans that addressed the COT Report threats.

On October 2, 2015, the USFWS determined that "listing the sage-grouse as a threatened or endangered species is not warranted…" (Federal Register Vol. 80, No. 191, 59936). One of the reasons for this determination was that "the new Federal land-management paradigm is established in 98 amended Federal Plans that reduce and minimize threats to the species in the most important habitat for the species" (ibid).

What the COT Report and its Objectives, Measures and Options Are:

- The COT Report is a compilation of reasonable objectives, based upon the best scientific and commercial data available at the time of its release, for the conservation and survival of GRSG.
- The COT Report is guidance to federal land management agencies, state GRSG teams, and others developing efforts to achieve conservation for GRSG.
- The COT Report was clear that its objectives were subject to modification based on new findings, changes in species' status, and the completion of conservation actions.

- The COT Report was developed by a team of state and USFWS representatives selected by their respective state or agency.

What the COT Report and its Objectives, Measures and Options Are Not:

- The COT Report is not a recovery plan, conservation strategy, or conservation agreement.
- The COT Report did not include input from BLM biologists or BLM field staff familiar with local habitat conditions and threats.
- When preparing the COT Report, the USFWS did not complete a NEPA analysis on its conservation objectives, measures, and options. Instead, the BLM completed NEPA and land use planning processes in 2015 and 2019 to assess the environmental consequences of the COT Report conservation objectives, measures, and options, as well as alternatives to those objectives, measures, options—as they applied to the development of affected BLM land use planning decisions.

Appendix 7. Greater Sage-grouse Monitoring Framework

7.1 FORWARD

The revised BLM Greater Sage-Grouse (GRSG) Monitoring Framework was developed after five years of implementing the 2015 BLM and USFS GRSG Monitoring Framework which culminated in the 2020 Greater Sage-Grouse Five-year Monitoring Report. Since implementing the monitoring efforts described in the original Monitoring Framework, new data has become available and new approaches to analyzing these data have been developed. This update maintains the existing measures included in the original document and expands upon them to include this new science. Measures for monitoring are identified at two scales: the rangewide scale and land use plan scale. The former will provide insight into habitat conditions and BLM management actions across jurisdictional boundaries which will, in turn, provide context to the smaller scale land use plan monitoring described herein. For each scale of monitoring a suite of 6 measures are identified and a methodology which the BLM will utilize to collect information informing each measure is described. Importantly, specific datasets and analysis approaches may be modified through the implementation of this monitoring framework so that BLM can adapt to new information as it becomes available. The data collected and analyzed for each of the measures described at both scales will vary in spatial extent. For example, measures leveraging remotely sensed data can and will be examined across all habitat management areas within the planning area as well as the BLM managed subset of these habitats. Other measures will apply specifically to BLM managed habitats or subsets thereof (i.e. disturbance and density caps). Further, land use plan decisions may identify specific spatial extents at which some measures are analyzed and tracked, such as to inform adaptive management threshold status. As such, during the implementation of this monitoring framework, the spatial extent of all monitoring and analyses addressing the identified measures will be documented and communicated during effectiveness evaluation efforts.

This Monitoring Framework is related to several other pieces of larger land use plans and associated management direction they provide. The GRSG Monitoring Framework leverages data, information, and assessments to monitor land use plan implementation. Appendix 8 of this Land Use Plan (LUP) establishes GRSG habitat objectives, indicators, and benchmarks. These indicators and benchmarks are utilized in the Habitat Assessment Framework (HAF). The results of these habitat assessments inform the wildlife and/or sensitive species component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2). The GRSG Monitoring Framework provides a consistent format for reporting if the LUP objectives are being met or making progress to being met, based on the results of these assessment and planning tools.

Table 7-1. Relationships of LUPs, HAF, LHS, and MF

Land Use Plan (LUP)	GRSG Habitat Assessment Framework (HAF)	Land Health Standards Evaluation (LHS)	GRSG Monitoring Framework (MF)
Sets GRSG habitat objective(s) and identifies the GRSG habitat indicators and benchmarks from best available science for evaluating progress toward meeting the objective.	Provides methods to assess GRSG habitats at multiple scales, using the indicators and benchmarks from the applicable LUP Habitat Indicators appendix.	Evaluates if the sage-grouse portion of the Special Status Species Land Health Standard is achieved or significant progress towards achievement is made. These evaluations utilize HAF results along with other data.	Provides framework for reporting progress toward achieving the objective(s) of the LUP, including habitat suitability.

7.2 SECTION I: RANGEWIDE MONITORING

7.2.1 Introduction

This rangewide monitoring section of the BLM Revised Greater Sage-Grouse (GRSG) Monitoring Framework is an update from the original BLM and USFS GRSG Monitoring Framework (2015) expands and clarifies the BLM's GRSG rangewide habitat condition monitoring and reporting. Described here are the six measures (**Table 7-2**), and associated updated methodologies, incorporating the original monitoring measures from 2015 (habitat condition and habitat degradation) with additional measures (land cover, habitat indicators, habitat suitability and population trend) that guide the BLM's GRSG monitoring and reporting.

The information gathered from monitoring and reporting on the six rangewide measures (**Table 7-2**) is intended to inform an evaluation of BLM's effectiveness (Section III of this BLM Revised GRSG Monitoring Framework) toward meeting the BLM's overarching goal for greater sage-grouse: *to conserve and manage greater sage-grouse habitats to support persistent, healthy populations, consistent with BLM's sensitive species policy and in cooperation with other conservation partners. Conservation and management should maintain existing connectivity between GRSG populations.*

Table 7-2. The Six Rangewide Monitoring Measures, Associated Sub-Measures, Monitoring Questions and Data Sources for BLM Monitoring of GRSG Habitat Conditions and Population Trends

Measures	Monitoring Questions	Data
Measure 1: Vegetation Availability and Condition		
Measure 1a: Vegetation Condition and trend	What is the status and trend of the habitat indicators describing habitat characteristics important to GRSG as well as ecological threats to GRSG (e.g., annual invasive grasses, bare ground) on BLM lands?	AIM
Measure 1b: Current and Historical Amounts of Sagebrush	What is the current versus historical extent of sagebrush within GRSG habitat? How have recent disturbances (fires and treatments) affected the extent of sagebrush?	LANDFIRE
Measure 1c: Percent Sagebrush Cover and Trend	What is the percent cover of sagebrush and trend in sagebrush percent cover?	RCMAP
Measure 1d: Percent Annual Herbaceous Cover and Trend	What is the percent cover and trend of annual herbaceous cover?	RCMAP

Measures	Monitoring Questions	Data
Measure 1e: Percent Tree Cover within Sagebrush	What is the percent cover and trend of tree cover in sagebrush communities?	RCMAP
Measure 2: Habitat Degradation and Development Intensity in GRSG Habitat		
Measure 2a: Habitat degradation	What is the estimated amount of habitat degradation rangewide and the estimated change in the amount?	Geospatial analysis using datasets representing anthropogenic development
Measure 2b: Intensity of degradation	What is the estimated density of energy development activities and the change in the estimated density?	Geospatial analysis using datasets representing anthropogenic development
Measure 2c: Degradation cap compliance	Were any disturbance or density caps above project scale exceeded?	Geospatial analysis using datasets representing anthropogenic development
Measure 2d: Reclamation	What is the amount of reclaimed energy-related degradation on BLM lands and the change in the amount?	Geospatial analysis using datasets representing reclamation on BLM-managed lands
Measure 3: GRSG Habitat Suitability		
Measure 3a: Habitat assessment status	What is the status of GRSG habitat assessments at the mid- and fine-scales across the range?	BLM's Habitat Assessment Framework (HAF) tracking system
Measure 3b: Habitat suitability at mid and fine scales	What is the suitability of GRSG habitats at mid and fine spatial scales across the range?	BLM's HAF tracking system
Measure 4: Achievement of Land Health Standards in GRSG Habitat		
Measure 4a: Status of land health evaluations	How many acres were evaluated for achievement of the SSS/Wildlife Habitat Land Health Standard in GRSG habitat across the range?	BLM's Land Health Standards Database
Measure 4b: Status of land health standards	For areas that have been evaluated in GRSG habitat, what is the status of land health and what are the causes of non-achievement (as applicable)?	BLM's Land Health Standards Database
Measure 5: BLM On-The-Ground Conservation and Restoration Efforts for GRSG		
Measure 5a: Summary of conservation efforts	How many acres/miles were conserved or restored by treatment or action type in GRSG habitat across the range?	NFPORS/VMAP, Other BLM Project Tracking
Measure 6: GRSG Population Trend Rangewide		
Measure 6a: Annual Range-wide Trend	What is the rangewide average annual population trend?	USGS Rangewide Population Trend Analysis for Greater Sage-Grouse
Measure 6b: Cumulative Range-wide Trend	What is the rangewide cumulative population trend?	USGS Rangewide Population Trend Analysis for Greater Sage-Grouse

7.2.2 Methods

The datasets used, and the land ownerships included in the data, vary by monitoring type. For example, the monitoring of habitat indicators uses on-the-ground data and information from BLM lands only. Conversely, the rangewide monitoring of landcover, sagebrush availability and disturbance use geospatial data covering all land ownerships. The population trend monitoring uses state wildlife agencies' data that also covers all land ownership in GRSG habitat. Best available datasets outlined here will be used to analyze the monitoring measures and for reporting on GRSG habitat however BLM reserves the right to change data and analysis methods as it deems appropriate.

Measure 1. Vegetation Availability and Condition

Sagebrush availability and vegetation condition analyses are analyzed rangewide for GRSG, excluding the Bi-State Distinct Population Segment and the Columbia Basin population. Analyses differ in the timeframe and type of data used (remotely sensed products vs collected on the ground), the lands to which the analyses apply (all lands vs BLM-managed lands), and in GRSG habitat.

Datasets selected for monitoring must meet key criteria to ensure consistent and accurate monitoring:

- The dataset must be consistent rangewide
- There must be a known accuracy level or level of confidence for the dataset
- The dataset must be based in peer-reviewed science
- The dataset must be maintained and have a known update plan
- The dataset must be readily available
- Consistent methodology must have been used to derive datasets that are compared; different datasets may be used to calculate different measures.

The following datasets, which meet the key criteria, should be analyzed for Measure 1; however, additional data and analyses may also be considered, if justified and documented:

1. BLM Assessment Inventory & Monitoring (AIM) for 1a,
2. LANDFIRE (Picotte et al. 2016) for 1b and
3. Rangeland Condition Monitoring Assessment and Projection (RCMAP; Rigge, 2020) for 1c, 1d, and 1e.

We considered three types of fractional datasets for calculating Measures 1c, 1d, and 1e. Fractional datasets contain pixels or cells that represent areas on the ground which may each contain vegetation cover types such as sagebrush, trees, or herbaceous. A fractional dataset represents the percentage of one vegetation cover type that is present in each pixel (e.g., 50 percent sagebrush, 25 percent trees, or 25 percent herbaceous). The three datasets considered, that are new since the 2015 BLM/USFS GRSG Monitoring Framework, are:

- Landscape Cover Analysis and Reporting Tools (LandCART; Zhou et al 2020),
- Rangeland Analysis Program (RAP; Allred et al 2021), and
- RCMAP.

Accuracies and applicability for the three types of datasets are similar but mixed. BLM Tech Note 456, which compares these datasets, recommends that users consider their individual data needs and uses when selecting from them (Savage et al 2022). **Table 7-3** summarizes some characteristics of the datasets specifically considered for this BLM Revised GRSG Monitoring Framework and, although not comprehensive, reflects the intent to use RCMAP. RAP does not have a sagebrush dataset and it is currently difficult to obtain rangewide data from LandCART but improvements are in progress. Importantly, BLM partners with USGS to fund RCMAP, ensuring the reliability of readily available data, regular updates and maintenance, and data suited for use in this BLM Revised GRSG Monitoring Framework. See **Appendix B, Table B2** for the RCMAP Accuracy Assessment. We recommend using only one data type (for 1c, 1d, & 1e) such that data can be overlaid or compared without concern for different methods that created the data. If additional fractional datasets become available and fit the key criteria above, they may be considered for use in calculating the Measures 1c, 1d, and 1e.

Table 7-3. Dataset Characteristics For Measure 1c, 1d, And 1e

Dataset Characteristics	LandCART	RAP	RCMAP
Annual herbaceous	Y	Y	Y
Sagebrush	Y	N	Y
Tree cover	Y	Y	Y
Rangewide extent	Difficult	Y	Y
Trend	Y	User calculates	Y

Measure 1a: What is the status and trend of the habitat indicators and threats to GRSG (e.g., non-native invasive grasses, bare ground) on BLM lands?

The vegetation condition monitoring is based on estimates for 6 greater sage-grouse habitat indicators (e.g., sagebrush cover) and estimates of 7 threat indicators (e.g., invasive species) (Herrick et al. 2017). These estimates will be based on field data collected through the BLM's national monitoring efforts on BLM-managed rangeland ecosystems. These data are part of the Assessment, Inventory, and Monitoring (AIM) program including the National AIM Survey (also known as the Landscape Monitoring Framework (LMF), Yu Li et al. 2020 and generally described in Karl et al. 2016). The AIM estimates provide consistent and standardized data about vegetation conditions broadly across the range.

The 6 GRSG habitat indicators are:

1. Percent cover of sagebrush
2. Mean sagebrush species height
3. Proportion of sagebrush that is spreading shaped
4. Percent cover of perennial grasses and perennial forbs
5. Mean herbaceous plant species height
6. Percent of lands where native plants make up 95% or more of vegetation cover

The 7 threat indicators are:

1. Proportion of sagebrush that is columnar shaped
2. Percent cover of bare ground
3. Proportion of nonnative invasive species present
4. Proportion where ≥5% of foliar cover is comprised of nonnative invasive species

5. Proportion of vegetation composed of annual grasses
6. Proportion of vegetation composed of nonnative invasive plant species
7. Percent of lands with >3% cover of pinion – juniper.

The vegetation condition summary is reported for BLM-managed GRSG habitats. Also of importance is that the data is collected in areas that retain rangeland vegetation and exclude areas physically converted to agriculture or disturbance from development.

The estimates combine indicator data from all sampling locations collected within a given year. An analysis for trend will be performed for each of these indicators. Analysis details will be included in monitoring reports.

Measure 1b: What is the current versus historical extent of sagebrush within the range of greater sage-grouse? How have recent disturbances affected the extent of sagebrush?

Measure 1b estimates both historic and current extent of sagebrush. The datasets to calculate these metrics are the most recent LANDFIRE Biophysical Setting (BpS), Existing Vegetation Type (EVT), Existing Vegetation Cover (EVC), and Existing Vegetation Height (EVH). EVT will be adjusted for recent fires and BpS will be adjusted for Sagebrush areas in EVT (see below for details). LANDFIRE data meets the key criteria defined above and has ample thematic resolution with several different sagebrush vegetation classes. For the 2015 Monitoring Framework, vegetation classes from LANDFIRE EVT and BpS were selected to use in the sagebrush and sagebrush potential or historic layers by identifying the classes that include sagebrush species and that could provide suitable seasonal habitat for greater sage-grouse (See **Appendix A, Table A1**). In these classes, sagebrush may not be the dominant species, but it is an attempt to include the maximum likely geographic extent and some of the uncertainty on the ground captured by products derived from remotely sensed data (see **Appendix B, Table B1** for Agreement Assessment details). The sagebrush layer used for reporting will be created using these selected classes from EVT. The following two metrics will be reported for each year:

1) 1.b.1. The amount of sagebrush in GRSG habitat compared with the amount of sagebrush that GRSG habitat could historically support without disturbance, that is, the existing sagebrush versus the potential sagebrush. The measure will be calculated as [the existing area of sagebrush] divided by [the potential area of sagebrush expected pre-Euro American settlement]. The data will be summarized including a histogram, mean and standard deviation, and median and quartiles for GRSG habitat.
2) 1.b.2. Recent vegetation treatments (NFPORS and VMAP data) are integrated into some LANDFIRE data causing changes in EVH and EVC datasets but these changes are not reflected in EVT for now, although this may change (personal communication Daryn Dockter, Brian Tolk, May 2023). BLM will use EVH and EVC with EVT to determine how recent treatments affect the extent of sagebrush using the guidelines:
    a. If EVT = sagebrush but EVH or EVC = 0 for shrubs, then disturbance has likely removed the sagebrush. These pixels will be removed from the EVT dataset annually.
    b. If EVT = sagebrush and EVH = grass < 1.0 m, past disturbance has likely removed the sagebrush and grass or forbs are growing. These pixels will be removed from the EVT dataset annually.
    c. If EVT = sagebrush and EVH = shrub 1-3 m then there is likely sagebrush here. These pixels will be retained in the EVT dataset annually.
    d. These changes will be summarized across GRSG habitat.

LANDFIRE EVT includes fires burned up to the end of the previous fiscal year so updates will be needed for more recent fires and can be made using NIFC WFIGS *yyyy*, Interagency Fire Perimeters to Date (where *yyyy* is the current year). LANDFIRE processes postfire change detection using satellite imagery and MTBS. See below for LANDFIRE data accuracy and update details.

In EVT there are small areas that show sagebrush and sagebrush associated classes which are not matched in the BpS dataset. Based on the assumption that sagebrush is unlikely to expand in the short term, we assume that BpS is in error and these classes in BpS need to be adjusted to the classes shown in EVT. This adjustment supports the simple division of existing by potential sagebrush that is described above.

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in **Appendix A, Table A1** will be aggregated into three groups that represent sagebrush, sagebrush associated, and other vegetation types. With all ecological systems aggregated, the combined accuracy, measured as an agreement assessment, of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately (LANDFIRE 2016 Remap EVT Agreement Assessment). We used the Southwest (AZ, CA, NV, UT, west CO, and west NM) and Northwest GeoAreas (ID, MT, OR, WA, and WY) to estimate sagebrush assessment agreements where sagebrush, sagebrush associated, and other field data are assigned autokeys and these are compared to LANDFIRE EVT (**Appendix B, Table B1**). The Southwest GeoArea agreement assessments were 55% for sagebrush, and 50% for sagebrush associated. The Northwest GeoArea agreement assessments were 69% for sagebrush and 57% for sagebrush associated.

LANDFIRE maintains a substantial disturbance spatial database using agency and other data; refinements to the process were made in 2020 with plans to update annually. LANDFIRE also uses National Landcover Database (NLCD) roads and urban classes, Monitoring Trends in Burn Severity (MTBS), Burned Area Reflectance Classification (BARC), and Rapid Assessment of Vegetation Condition after Wildfire (RAVG) to apply changes to the data on a yearly basis. LANDFIRE uses a change algorithm to account for fires and models postfire vegetation recovery. While LANDFIRE intends to update annually, refinements may still be made to the EVT data for more recent changes due to wildfire (see above) and anthropogenic disturbances such as agriculture and urban, using the processes and datasets recommended below.

LANDFIRE uses the National Land Cover Database (NLCD) (Fry et al. 2011) to make urban adjustments including imperviousness dataset, high, medium, and low development, roads, open space, and broad vegetation types. NLCD is prioritized over other datasets if there is a discrepancy in land cover. NLCD impervious data has a roads description including primary, secondary, and tertiary; two track roads are not included. NLCD obtains building footprints from Microsoft data and USGS processing. NLCD data are generated on a 5-year cycle and are specifically designed to support monitoring efforts but the lag in NLCD may limit LANDFIRE data. To determine agricultural areas and types, LANDFIRE uses the annually updated National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL). The LANDFIRE disturbance processing will also pick up agricultural expansion and treatments when they are reported.

Measure 1c: What is the percent cover of sagebrush and trend in sagebrush percent cover?

Sagebrush fractional cover data will be used to estimate the current proportion of sagebrush in GRSG habitat. The most recent RCMAP fractional sagebrush cover will be used to calculate this measure (Rigge et al. 2022).

For each year of monitoring, the statistical distribution of percent sagebrush cover will be calculated and reported including a histogram, mean and standard deviation, and median and quartiles at spatial scales

relevant to BLM land use plan decisions and management, for example, Habitat Assessment Fine-scale extents. If updated literature suggests levels of percent sagebrush cover that are more appropriate to GRSG, these thresholds will be applied in addition to the standards described above. For example, if less than x% sagebrush is determined to be unsuitable for GRSG across GRSG habitat, assessment of the area of and distribution that is above and below this x% cover threshold will be conducted.

Shi et al (2022) modeled time-series trends in RCMAP continuous vegetation using two methods: 1) linear regression and 2) breaks and stable states modeling. We recommend using the linear trends results because, while accuracy was similar between the two modeling versions, linear trend results are more easily interpreted (Shi et al. 2022). For each pixel in the linear trends data, the slope represents the average percent cover change and the p-value is the confidence in the change value for each year. Within GRSG habitat, the trend of sagebrush cover will be monitored using the time-series linear trends data from RCMAP for all years of data to calculate the summary statistics as described above.

Measure 1d: What is the percent cover and trend of annual herbaceous cover?

The most recent RCMAP Annual Herbaceous fractional data will be used to estimate the current area, distribution, and proportion of annual forbs and grasses in GRSG habitat. In the Western US, the RCMAP annual herbaceous dataset primarily represents annual invasive species such as Cheatgrass, Medusahead, Red Brome, and annual mustards (MLRC RCMAP website, https://www.mrlc.gov/data/rcmap-annual-herbaceous-cover-1, accessed March 2023). At higher elevations and in California, the annual herbaceous cover dataset may also represent native annual herbaceous vegetation types. (https://www.mrlc.gov/data/rcmap-annual-herbaceous-cover-1, accessed March 2023).

For each year of monitoring, the statistical distribution of percent annual herbaceous cover will be calculated including a histogram, the mean and standard deviation, and median and quartiles at spatial scales relevant to BLM land use plan decisions and management, for example, at Habitat Assessment Fine-scale extents. If updated literature suggests levels of percent annual herbaceous cover that are more appropriate to GRSG, apply these thresholds in addition to the standards described above. For example, if less than x% annual herbaceous cover is determined to be unsuitable for GRSG across GRSG habitat, assessments of and distribution of annual herbaceous cover that is above and below this x% cover threshold will be conducted.

The trend of annual herbaceous cover will be reported for all years of data using the annual time-series linear trends data from RCMAP to calculate the summary statistics described above. The trend of annual herbaceous cover will be compared to the trend in sagebrush cover in GRSG habitat.

Measure 1e: What is the percent cover and trend of tree cover in sagebrush communities?

Over the past several decades, many studies have found that GRSG avoid habitat near conifers (Nisbet et al 1983, Doherty et al, 2010; Fedy et al 2014; Doherty et al 2016; Westover et al 2016; Baxter et al 2017; Picardi et al 2020; Roth et al 2022;), survival tends to increase when GRSG inhabit areas further away from conifers (Brussee et al 2022), and that populations have increased when conifers are removed (Olsen et al 2021).

For the purposes of the Monitoring Framework, an upper limit threshold is needed to determine the percent of conifer cover within a certain distance of sagebrush that still provides suitable habitat for GRSG (see **Appendix C, Table C1** for summaries). Peer-reviewed findings are summarized in the following bullets:

- **0%** In NV, GRSG preferred areas with no conifer cover for lekking (Nisbet et al 1983) and for brood rearing to areas with 1 to 10% conifer cover (Brussee et al, 2022).

- **2%** In CA GRSG preferred < 2% conifer cover year-round (Coates et al 2017) and in NV/UT, GRSG preferred areas with < 2% conifer cover for breeding and summer season (Beers at al 2022).
- **3%** In OR and UT < 3% conifer was found to be more suitable for GRSG lekking and nesting within 800m and 1000m (Cook et al 2017), within 560m for lekking (Doherty et al 2021), and within 800m for nesting (Severson et al 2017).
- **4%** In OR, NV, UT, areas with < 4% conifer cover were found to be more suitable for nesting (Sandford et al 2017; Severson et al 2017) or found to be more suitable year-round within 400m and 800m and while there was sagebrush contiguity (Beers et al 2022). Areas with > 4% had no active leks (Baruch-Mordo et al 2013) or were found to be less suitable for lekking (Cook et al 2017).

We examined other work that obtained values outside of this range and determined that they were not useful for our purposes. In CA, large-scale evidence suggested that GRSG avoided areas with >5% conifer cover for brood rearing but 5% was set as a value instead of being determined by the data and the subsequent modeling was inconclusive (Casazza et al 2011). In NV/UT, Beers et al (2022) found that during winter GRSG selected areas with < 11% conifer cover but year-round 4% was a more appropriate threshold. In NV, GRSG avoided areas with > 30% conifer cover and selected areas with 10-30% cover within 1000m; the authors speculated that these unusually high conifer cover values may have been in areas where heterogenous shrub communities thrived and, in the absence of predators, attracted GRSG (Gibson et al 2015).

The range of 0 to 4% of tree canopy cover has been shown to have the lowest impacts on GRSG year-round in several states (**Appendix C, Table C1**). Within GRSG habitat the extent and summary statistics (histogram, mean and standard deviation, and median and quartiles) of tree cover that is within 1000m of sagebrush and 1) less than 4% and 2) greater than 4% will be calculated.

Within GRSG habitat, the trend of tree cover that is greater than 4% and is within 1000m of sagebrush will be calculated and reported for all years of data using the annual time-series linear trends data from RCMAP to calculate the summary statistics described above. The trend of tree cover will be compared to the trend in sagebrush cover in GRSG habitat at spatial scales relevant to BLM land use plan decisions and management, for example, at Habitat Assessment Fine-scale extents.

Measure 2. Habitat Degradation and Development Intensity in GRSG Habitat

Rangewide disturbance estimates

The measure of habitat degradation will be calculated by combining estimated footprints of, or the counts of, threats identified in **Table 7-4** within GRSG habitat. Footprints are estimated to be the direct area of influence of "active" energy and infrastructure and, in combination with feature counts, will be used as a surrogate for human activity. Data sources for each threat are found in **Table 7-4**, Geospatial Data Sources for Habitat Degradation and Intensity Calculations (Measure 2) in GRSG Habitat Excluding the Bi-State Distinct Population Segment and the Columbia Basin Population. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodologies are described below. All datasets will be updated annually to monitor changes through time and to inform adaptive management.

Table 7-4. Geospatial Data Sources for Habitat Degradation and Intensity Calculations (Measure 2) in GRSG Habitat Excluding the Bi-State Distinct Population Segment and the Columbia Basin Population

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300
Energy (coal)	Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/ Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Energy (wind)	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM WO-300
Energy (solar)	Fields/Power Plants	Platts (power plants)	7.3ac (3.0ha)/MW	NREL
Energy (geothermal)	Wells	IHS	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Mining	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
Infrastructure (roads)	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2ft (73.2m)	USGS
Infrastructure (railroads)	Active Lines	Federal Railroad Administration	30.8ft (9.4m)	USGS
Infrastructure (power lines)	1-199kV Lines	Platts (transmission lines)	100ft (30.5m)	BLM WO-300
	200-399 kV Lines	Platts (transmission lines)	150ft (45.7m)	BLM WO-300
	400-699kV Lines	Platts (transmission lines)	200ft (61.0m)	BLM WO-300
	700+kV Lines	Platts (transmission lines)	250ft (76.2m)	BLM WO-300
Infrastructure (communication)	Towers	Federal Communications Commission	2.5ac (1.0ha)	BLM WO-300
Infrastructure (other vertical structures)	Tall Structures	Federal Avian Administration	2.5 acres (1.0ha)	Knick et al 2011

Rangewide Habitat Degradation Datasets and Assumptions

Energy (Oil and Gas Wells And Development Facilities)

This dataset will compile information from three oil and gas databases: the proprietary IHS database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS (hereafter, Platts) database of power plants.

Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be separated from the active oil and gas well dataset but retained for analysis inclusion if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed).

Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

Wells marked as plugged and abandoned within the last 10-years will also be segregated from the "active" and "active within the last 10 years" well data described above. These data attempt to quantify energy-related degradation that may have been reclaimed, but not necessarily fully restored to sage-grouse habitat. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014) be included in analyses.

Energy (Coal Mines)

Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring.

Coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

Energy (Wind Energy Facilities)

This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where attribution indicates the feature is a windmill will be included. The direct area of influence of these point features will be a circular totaling 3 acres (1.2ha) centered on each tower point. See the BLM's "Wind Energy Development Programmatic Environmental Impact Statement" (BLM 2005). Additionally, the Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with the same 3-acre (1.2ha) direct area of influence.

Energy (Solar Energy Facilities)

This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), "Land-Use Requirements for Solar Power Plants in the United States" (Ong et al. 2013).

Energy (Geothermal Energy Facilities)

This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

Mining (Active Developments; Locatable, Leasable, Saleable)

This data theme is notably lacking in a comprehensive source spanning the range of GRSG. Currently, there are no known complete databases available for leasable or saleable mining sites beyond coal mines. Aerial imagery will be used to manually digitize large active mining surface disturbance in or near known occurrence areas originally informed by the proprietary InfoMine database. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Other data sources will be evaluated and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

Infrastructure (Roads)

This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture paved and "crowned and ditched" roads. The surface street data have been demonstrated to include some "two-track" and 4-wheel-drive routes. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011).

Infrastructure (Railroads)

This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct are of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

Infrastructure (Power Lines)

This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as "buried" will be removed from the disturbance calculation. Only "In Service" lines will be used; "Proposed" lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

Infrastructure (Communication Towers)

This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed (duplicates within the FCC dataset). Points will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

Infrastructure (Other Vertical Structures)

This point dataset will be compiled from the FAA's Digital Obstacles point file. This dataset generally captures all tall structures over 200 meters, with additional structures below this threshold captured in areas surrounding airports which could pose an aviation risk. For additional information please visit the FAA DOF FAQs site. Points where attribution indicates the feature is a windmill will be removed. Duplicate points from the FCC communication towers point file will be removed. The remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

Other Developed Rights-Of-Way

Currently, no additional data sources for other developed rights-of-way have been identified. Roads, power lines, railroads, pipelines, and other known linear features are represented in the categories described above. If additional features representing human activities are identified representing developed rights-of ways outside of the themes described above, they will be added to the degradation analyses using similar assumptions to those used with the threats described above.

Disturbance Inventories

The BLM has partnered with the USGS and, over the past several years, has begun inventorying existing disturbances via "heads-up" digitization using aerial imagery within current Priority Habitat Management Areas. This inventory includes several disturbance types in addition to those used in the rangewide analyses as outlined in the 2015 land use plan disturbance appendices:

Coalbed Methane and Other Energy-Related Retention Ponds

The footprint boundary will follow the fence line and includes the area within the fence line surrounding the impoundment. If the pond is not fenced, the impoundment itself is the footprint. Other infrastructure associated with the containment ponds (roads, well pads, etc.) will be captured in other disturbance categories.

Meteorological Towers

This feature includes long-term weather monitoring and temporary meteorological towers associated with short-term wind testing. The footprint boundary includes the area underneath the guy wires.

Nuclear Energy Facilities

The footprint boundary includes visible facilities (fence, road, etc.) and undisturbed areas within the facility's perimeter.

Airport Facilities and Infrastructure (Public And Private)

The footprint boundary will follow the boundary of the airport or heliport and includes mowed areas, parking lots, hangers, taxiways, driveways, terminals, maintenance facilities, beacons and related features. Indicators of the boundary, such as distinct land cover changes, fences and perimeter roads, will be used to encompass the entire airport or heliport.

Military Range Facilities and Infrastructure
The footprint boundary will follow the outer edge of the disturbed areas around buildings and includes undisturbed areas within the facility's perimeter.

Hydroelectric Plants
The footprint boundary includes visible facilities (fence, road, etc.) and undisturbed areas within the facility's perimeter.

Recreation Areas and Facilities
This feature includes all sites/facilities larger than 0.25 acres in size. The footprint boundary will include any undisturbed areas within the site/facility.

Where this inventory is complete in GRSG habitat and if the digitization is within an acceptable timeframe (ie. not deemed outdated), these disturbance data will also be used to evaluate the existing disturbance footprint and density of development.

Rangewide Habitat Degradation and Development Intensity Data Combination and Calculation Approaches
The threats targeted for measuring human activity (**Table 7-4**) and intensity of activities will be converted to direct area of influence polygons as described for each data source above. These threat polygon layers will be combined to create one overall polygon layer representing footprints of estimated active human activity in GRSG habitat. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation. For intensity calculations, source data locations will be preserved with no additional removal beyond the methodology described above. Thus, overlapping inputs will be retained such that the density calculation reflects an overall intensity of development.

More complex disturbance and density estimation approaches may also be implemented, leveraging datasets described above, to facilitate a more complete picture of the level anthropogenic disturbance within GRSG habitat and potential impacts to GRSG habitats. For example, moving window analyses, estimating development density within multiple spatial extents, can facilitate an understanding of potential direct and indirect effects of development on GRSG habitats (e.g., see Decker et al (2014) and Leinwand, I., Carr, N. B., & Wood, D. J. A. (2016)).

Measure 2a: What is the estimated amount of habitat degradation rangewide and the estimated change in the amount?
Within GRSG habitats, divide the combined estimated area of the active/direct footprint by the total area of GRSG habitat at spatial scales relevant to BLM land use plan decisions and management, for example, at Habitat Assessment Fine-scale extents. (% disturbance in GRSG habitats).

Measure 2b: What is the estimated density of energy development activities and the change in the estimated density?
Within GRSG habitats, divide the total count of energy and mining locations (identified in **Table 7-4**) by the total area of GRSG habitat at spatial scales relevant to BLM land use plan decisions and management, for example, at Habitat Assessment Fine-scale extents. The resulting density will be reported in units of "count per square mile".

Measure 2c: Were any disturbance or density caps above project scale exceeded?
Leveraging the outcomes of analyses performed to answer 2a and 2b, summaries of any disturbance or density caps, as articulated in each land use plans, will be created.

Measure 2d: What is the amount of reclaimed energy-related degradation on BLM lands and the change in the amount?

Currently no single data repository exists which captures BLM's reclamation accomplishments in a spatial manner. As data becomes available depicting reclamation activities in sage-grouse habitats, they will be summarized.

Measure 3: Greater Sage-Grouse Habitat Suitability

Measure 3.a. What is the status of GRSG habitat assessments at the mid-, fine- and site scales across the range?

BLM will provide a rangewide summary of the total number of GRSG habitat assessments at the mid-, and fine-scales that are either completed or underway.

Measure 3.b. What is the suitability of GRSG habitats at mid and fine spatial scales?

BLM will summarize the results of the completed mid- and fine-scale assessments across the range of GRSG. Site-scale summaries are addressed in the Land Use Plan section of the BLM Revised GRSG Monitoring Framework.

Measure 4: Achievement of Land Health Standards in GRSG Habitat

Measure 4.a. How many acres were evaluated for achievement of the SSS/Wildlife Habitat Land Health Standard in GRSG habitat across the range?

BLM will evaluate Land Health Standards on BLM-managed lands that contain GRSG habitat. Reporting will include the number of acres: evaluated in the reporting period, evaluated prior to the reporting period, and not evaluated.

Measure 4.b. For areas that have been evaluated in GRSG habitat, what is the status of land health and what are the causes of non-achievement (as applicable)?

BLM will summarize the results of land health assessments conducted within the reporting period as follows: achieving, making progress towards achieving, or not achieving land health standards. Further, BLM will summarize the causes for not achieving land health when a causal factor analysis has been completed. As available, management responses will also be summarized.

Measure 5: BLM On-The-Ground Conservation and Restoration Efforts for GRSG

Measure 5.a. How many acres/miles were conserved or restored by treatment or action type in GRSG habitat?

BLM implements a variety of efforts to conserve and restore GRSG habitat. These efforts range from conifer removal and habitat restoration to riparian exclosures and fence modifications. BLM will use several existing databases to summarize the number of actions and number of acres/miles of conservation efforts by type.

Measure 6: GRSG Population Trend Rangewide

Measure 6.a. What is the rangewide average annual population trend?

The BLM will report rangewide population trends for GRSG. For rangewide populations trends, the BLM will report results from the most current version of the *Range-wide Population Trend Analysis for Greater Sage-Grouse (Centrocercus urophasianus)* conducted by the USGS (e.g., Coates et al. 2022). This analysis estimates annual rangewide populations trends using these scales:

- Range-wide average annual trend (e.g., 2.9% average annual decline from 1953-2021)
- Range-wide cumulative trend across three time periods:
  - Short (two oscillations, ~19 years) (e.g., 42.5% decline)
  - Medium (four oscillations, ~35 years) (e.g., 65.6% decline)
  - Long (six oscillations, ~55 years) (e.g., 80.1% decline)

7.3 SECTION II: LAND USE PLAN IMPLEMENTATION MONITORING

7.3.1 Introduction

One key goal of monitoring BLM land use plan implementation is to produce data and information to inform the GRSG portion of BLM land use plan (LUP) evaluations (as required by 43 CFR 1610.4-9 and the BLM H-1601-1 Land Use Planning Handbook). This section of the GRSG Revised Monitoring Framework describes the monitoring methodology for BLM to implement three types of monitoring and reporting across GRSG planning areas in 10 western states (CA, CO, ID, MT, ND, NV, OR, SD, UT, and WY):

- Land use plan implementation monitoring focuses on the primary cross-cutting GRSG conservation commitments (LUP objectives, decisions, and desired conditions) contained in the BLM 2023 GRSG LUP Amendments.
- Planning area GRSG habitat monitoring focuses on assessing suitability of habitat at the mid-, fine- and site scales. Planning area habitat monitoring also focuses on GRSG habitat availability to determine the status of BLM adaptive management habitat thresholds.

Planning area population monitoring focuses on GRSG population trends (tracked in partnership with state wildlife agencies and similar entities) to determine the status of BLM adaptive management population thresholds.

This Revised GRSG Monitoring Framework builds on the BLM's experience of annual monitoring and reporting on the first 5 years of GRSG BLM LUP implementation (2016 – 2020) published in the 5-year monitoring report (BLM Rangewide Monitoring Report, Herren et al. 2021). The structure for this section of the framework carries forward the monitoring questions from the Greater Sage-Grouse Monitoring Framework (Interagency Disturbance and Monitoring Subteam, May 2014) that have been modified to reflect the data, methods and information that has become available since 2015. Two additional monitoring questions have been added. The six monitoring questions are summarized in **Table 7-5**.

Table 7-5. The Six Land Use Plan Monitoring Measures, Associated Sub-Measures, Monitoring Questions and Data Sources for BLM Monitoring of GRSG Habitat Conditions And Population Trends

Measures	Monitoring Questions	Data
Measure 1: Status of greater sage-grouse habitat suitability within the planning area relative to the LUP objectives		
Measure 1a: Site-scale Habitat Suitability	What are the seasonal habitat suitability ratings as assessed by the Habitat Assessment Framework (HAF, Stiver et al. 2015, BLM TR 6710-1, as revised) and the combination of site-scale indicators?	State Office and National tracking of completed habitat assessments.
Measure 1b: Mid- and Fine-scale Habitat Suitability	What are the mid- and fine-scale suitability ratings for GRSG habitats that overlap with the planning area as assessed by the mid- and fine-scale indicators?	State Office and National tracking of completed habitat assessments.
Measure 1c: Status of Habitat Assessments	What is the status of habitat assessments completed within the planning area?	State Office and National tracking of completed habitat assessments.

Measures	Monitoring Questions	Data
Measure 2: Special Status Species/Wildlife habitat (SSS/WL) standard being achieved, or making progress towards being achieved, in allotments that contain greater sage-grouse habitats where evaluations have been completed since the 2024 ROD within the planning area		
Measure 2a: Achieving, Making progress towards achieving, or not achieving the SSS/WL standard.	What is the number of allotments evaluated in the planning area and how many are achieving, making progress towards achieving, or not achieving the SSS / WL standard?	State Office and National tracking of completed land health evaluations.
Measure 2b: If grazing allotments include areas that are not achieving the standard and current grazing was identified as a significant causal factor.	How many livestock grazing authorizations or allotments had management adjusted and what type of action was taken?	State Office tracking of grazing authorizations.
Measure 2c: If grazing allotments include areas that are not achieving the standard and current grazing was identified as a significant causal factor.	How many permits/leases include an adaptive management strategy that incorporates specific thresholds and defined responses?	State Office tracking of grazing authorizations.
Measure 3: BLM LUP disturbance and density measures (e.g., surface disturbance caps)		
Measure 3a: Disturbance Caps	Were the disturbance caps for BLM authorizations exceeded at any scale in GRSG HMAs in the planning area? If so, which projects that exceeded the disturbance cap were authorized and why?	State office tracking of authorizations requiring a disturbance cap. SDARTT or State managed disturbance databases.
Measure 3b: Density Caps	If applicable, were the density caps for BLM authorizations exceeded at any scale in GRSG HMAs in the planning area? If so, which projects that exceeded the density cap were authorized and why?	State office tracking of authorizations requiring a disturbance cap. SDARTT or State managed disturbance databases.
Measure 4: BLM LUP Adaptive Management habitat or population thresholds		
Measure 4a: Count of tripped thresholds	How many soft or hard BLM LUP adaptive management habitat or population thresholds were tripped in the planning area annually?	State office tracking of adaptive management thresholds.
Measure 4b: Count of Untripped / reversed thresholds	How many thresholds were reversed ("untripped") annually in the planning area?	State office tracking of adaptive management thresholds.
Measure 4c: Responses to tripped thresholds taken by BLM	In areas where thresholds were tripped or untripped, what responses as described in the BLM LUP were taken initially? Were the response implementation actions modified after a causal factor analysis, if applicable?	State office tracking of responses to adaptive management thresholds being tripped or untripped.
Measure 4d: Status of causal factor analyses	What is the status of causal factor analyses? For completed causal factor analyses, what factors were identified as possible causal factors?	State office tracking of causal factor analysis in response to adaptive management thresholds being tripped.

Measures	Monitoring Questions	Data
Measure 5: Compensatory Mitigation		
Measure 5a: Use of compensatory mitigation.	How many projects included compensatory mitigation annually? Which projects included compensatory mitigation?	State office tracking of compensatory mitigation.
Measure 6: Use of Waivers, Exceptions or Modifications (WEMs)		
Measure 6a: Projects where WEMs are granted	Of the stipulations in the land use plan developed for GRSG, which projects had a Waivers, Exceptions or Modification granted? Of these projects, which type of stipulation and in which type of GRSG Habitat Management Area were the WEMs granted?	State office tracking of WEMs associated with authorizations.

7.3.2 Methods

The following methods, datasets and reporting units apply to implementation, habitat and population monitoring across all BLM GRSG planning areas including variations that occur in some BLM GRSG planning areas due to partnerships with the states. Additional monitoring of GRSG conservation commitments may be implemented in BLM planning areas. The following descriptions of monitoring and reporting will be implemented to inform the six measures:

Measure 1: Status of greater sage-grouse habitat suitability within the planning area relative to the LUP objectives

Summaries of habitat suitability ratings, as assessed by the Habitat Assessment Framework (HAF, Stiver et al. 2015, BLM TR 6710-1, as revised), will be aggregated from National and State Office tracking mechanisms.

Measure 1a: What are the seasonal habitat suitability ratings as assessed by the Habitat Assessment Framework (HAF, Stiver et al. 2015, BLM TR 6710-1, as revised) and the combination of site-scale indicators?

The BLM will summarize the results of site-scale assessment reports that overlap with the planning area, reported in 5-year intervals. Example reporting would be: 50% suitable/ 20% Marginal/ 30% Unsuitable (proportional area estimates) or 50 plots S/ 20 plots M/ 30 plots U (plot counting).

Measure 1b: What are the mid- and fine-scale suitability ratings for GRSG habitats that overlap with the planning area as assessed by the mid- and fine-scale indicators?

The BLM will summarize the results of mid and fine-scale assessment reports that overlap the planning area.

Measure 1c: What is the status of habitat assessments completed within the planning area?

The BLM will summarize and report on the number of completed habitat assessments that overlap the planning area using the BLM National Operations Center tracking system.

Measure 2: Special Status Species/Wildlife habitat (SSS/WL) standard being achieved, or making progress towards being achieved, in allotments that contain greater sage-grouse habitats where evaluations have been completed since the 2024 ROD within the planning area.

Summaries of allotments achieving, making progress towards achieving, or not achieving the SSS/WL standard.

Measure 2a: What is the number of allotments evaluated in the planning area and how many are achieving, making progress towards achieving, or not achieving the SSS / WL standard?

The BLM will use the BLM's Land Health Standards database and State Office tracking mechanisms to monitor and report the achievement of the Special Status Species/Wildlife Habitat standard in completed

land health evaluations in GRSG habitat within the planning area and whether livestock grazing was identified as a significant causal factor in non-achievement.

Measure 2b: For grazing allotments with areas not achieving SSS/Wildlife Habitat standard and livestock grazing is a causal factor, how many livestock grazing authorizations or allotments had management adjusted and what type of action was taken?

The BLM will use available BLM databases and State Office tracking mechanisms to report on the number of livestock grazing authorizations or allotments that had management actions taken in each planning area. BLM Field, District and State Offices will coordinate to report on the type of actions taken (e.g., changes to season of use or amount of use, changes to infrastructure).

Measure 2c: For grazing allotments with areas not achieving SSS/Wildlife Habitat standard and livestock grazing is a causal factor, how many permits/leases include an adaptive management strategy that incorporates specific thresholds and defined responses??

BLM Field, District and State Offices will coordinate to report on the number of permits/leases that were modified to incorporate an adaptive management strategy that includes specific thresholds and defined responses in each planning area.

Measure 3: BLM LUP disturbance and density measures (e.g. surface disturbance and density caps)

The BLM field offices will use disturbance tracking databases (e.g., Surface Disturbance and Reclamation Tracking Tool (SDARTT)) or other methods to track the amount of disturbance authorized by the BLM. The BLM State Offices/BLM NOC will compile the results and summaries of habitat disturbance calculations conducted at the project and larger scale management areas within the planning area to include in monitoring reports.

Measure 3a: Were the disturbance caps for BLM authorizations exceeded at any scale in GRSG HMAs in the planning area? If so, which projects that exceeded the disturbance cap were authorized and why?

For projects that exceeded the disturbance cap, the BLM SOs will identify those projects, and the reason(s) why the disturbance cap was exceeded using available databases and project records (NEPA etc).

Measure 3b: If applicable, were the density caps for BLM authorizations exceeded at any scale in GRSG HMAs in the planning area? If so, which projects that exceeded the density cap were authorized and why?

If the land use plan includes a cap on the density of anthropogenic disturbances, the BLM SOs will identify the projects that were authorized which exceeded the density cap and provide the reason for the exceedance using available databases and project records (NEPA etc).

Measure 4: BLM LUP Adaptive Management habitat or population thresholds

BLM State Offices will complete adaptive management threshold and causal factor (as required) analyses annually as described in each land use plan.

Measure 4a: How many soft or hard BLM LUP adaptive management habitat or population thresholds were tripped in the planning area annually?

BLM State Offices, in coordination with BLM Field and District Offices, will report on annual calculations and counts of land use plan adaptive management thresholds tripped.

Measure 4b: How many thresholds were reversed ("untripped") annually in the planning area?
BLM State Offices, in coordination with BLM Field and District Offices, will report on annual calculations and counts of land use plan adaptive management thresholds reversed / untripped.

Measure 4c: In areas where thresholds were tripped or untripped, what responses as described in the BLM LUP were taken initially? Were the response implementation actions modified after a causal factor analysis, if applicable?
The BLM State Office, in coordination with BLM Field and District Offices, will summarize and report on the action(s) taken, as described in the land use plan, in response to each threshold being tripped or reversed.

Measure 4c: What is the status of causal factor analyses? For completed causal factor analyses, what factors were identified as possible causal factors?
The BLM State Office, in coordination with BLM Field and District Offices, will summarize the number and status of causal factor analyses required in response to adaptive management thresholds being tripped / untripped as required in the land use plan. For completed causal factor analyses, the BLM State Office, in coordination with BLM Field and District Offices, will also report on the identified causal factors (if known) and the responses or implementation actions taken to address the causal factors if different than those taken in response to a threshold being tripped / untripped (as applicable).

Measure 5: Compensatory Mitigation
BLM State Offices will track the implementation of the use of compensatory mitigation for individual authorizations.

Measure 5a: How many projects included compensatory mitigation annually? Which projects included compensatory mitigation?
The BLM State Office, in coordination with BLM Field and District Offices, will report on the number of authorized projects that included compensatory mitigation and report on which projects included compensatory mitigation.

Measure 6: Use of Waivers, Exceptions or Modifications (WEMs)
BLM State Offices will track the use of Waivers, Exceptions and Modifications (WEMs) in GRSG habitat.

Measure 6a: Of the stipulations in the land use plan developed for GRSG, which projects had a Waiver, Exception or Modification granted? Of these projects, which type of stipulation and in which type of GRSG Habitat Management Area were the WEMs granted?
The BLM State Office, in coordination with BLM Field and District Offices, will report on which projects had a Waivers, Exceptions or Modification granted for the stipulations in the land use plan developed for GRSG. Of these projects, the type of stipulation and in which type of GRSG Habitat Management Area the WEMs were granted will also be reported.

Table 7-6. Example Reporting Structure for WEMs

Waivers, Exceptions, Modifications granted by BLM by stipulation type and GRSG Habitat Management Type			
Project NEPA ID	**Stipulation Type (NSO, CSU, TL)**	**WEM Type (Waiver, Exception, Modification)**	**Habitat Type (PHMA, IHMA, GHMA)**
Example: NEPA number	TL	Exception	PHMA

7.4 SECTION III: EVALUATION OF EFFECTIVENESS

The information collected at the rangewide scale will be used by the BLM to provide a cohesive look at conditions across administrative boundaries. Measures which are analyzed across all lands (vegetation availability and condition, disturbance estimates, etc.) will be also analyzed on BLM managed lands so that BLM management influence on each can be inferred. Similarly, trend analyses and monitoring of changes through time for several measures will facilitate an understanding of BLM's influence on sage-grouse habitats. Conceptually, if rangewide monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing, there is evidence that the BLM's goal to conserve and maintain habitats for healthy populations and connectivity of populations have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in sage-grouse areas is increasing, and/or populations are declining relative to the baseline, there is evidence that the BLM's goal is not being achieved. Given the variety of measures this Framework outlines, the inherent challenges of establishing cause-and-effect relationships in mixed ownership landscapes and the complexity of population dynamics, such straight forward interpretations are expected to be minimal. To the best of the BLM's ability, factors driving observed changes will be identified and discussed when each measure is examined and synthesized with BLM's role in observed change identified (ie. Were changes due to drought or other climactic drives or directly related to BLM's management).

The information collected under the six land use plan questions of this monitoring framework will be leveraged in the broader land use plan effectiveness evaluation required in 43 CFR 1610.4-9 and as described in the BLM Land Use Planning Handbook (BLM H-1601-1, 2005). BLM State Offices will include sage-grouse specific sections in these evaluations of effectiveness for areas where sage-grouse management goals and objectives are applicable. The complexity of these evaluations may be based on the amount of sage-grouse habitats within the area, known issues within sage-grouse habitats or other factors deemed important by the State Office. The sage-grouse specific components of these evaluations will include, at a minimum, the information collected to inform the six land use plan measures. Additional local information that supports or clarifies the conclusions or effectiveness summaries shall also be considered. Information from the range wide effectiveness section of this monitoring framework will be used to inform the effectiveness evaluation at the land use plan level as applicable. This information will also be used to place the field office's effectiveness evaluation conclusions in context with how the implementation of sage-grouse management decisions are supporting the overall BLM's goals to conserve and manage greater sage-grouse habitats to support persistent, healthy populations, consistent with BLM's sensitive species policy and in cooperation with other conservation partners and maintain existing connectivity between sage-grouse populations. The interdisciplinary team will develop and recommend a suite of actions, as appropriate, the BLM can take to address any conclusions made within the sage-grouse portion of the larger effectiveness evaluation. These recommendations may vary from land use plan implementation changes to land use plan revision as described in the Land Use Planning Handbook, section VI.

APPENDIX A. LANDFIRE ECOLOGICAL SYSTEMS CAPABLE OF SUPPORTING SAGEBRUSH

Table A1. Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing	Sagebrush (SB) or Sagebrush Associated (SBA)
Colorado Plateau Mixed Low Sagebrush Shrubland	*Artemisia arbuscula* ssp. *longiloba* *Artemisia bigelovii* *Artemisia nova* *Artemisia frigida* *Artemisia tridentata* ssp. *wyomingensis*	SB
Columbia Plateau Low Sagebrush Steppe	*Artemisia arbuscula* *Artemisia arbuscula* ssp. *longiloba* *Artemisia nova*	SB
Columbia Plateau Scabland Shrubland	*Artemisia rigida*	SBA
Columbia Plateau Steppe and Grassland	*Artemisia* spp.	SBA
Great Basin Xeric Mixed Sagebrush Shrubland	*Artemisia arbuscula* ssp. *longicaulis* *Artemisia arbuscula* ssp. *longiloba* *Artemisia nova* *Artemisia tridentata* ssp. *wyomingensis*	SB
Inter-Mountain Basins Big Sagebrush Shrubland	*Artemisia tridentata* ssp. *tridentata* *Artemisia tridentata* ssp. *xericensis* *Artemisia tridentata* ssp. *vaseyana* *Artemisia tridentata* ssp. *wyomingensis*	SB
Inter-Mountain Basins Big Sagebrush Steppe	*Artemisia cana* ssp. *cana* *Artemisia tridentata* ssp. *tridentata* *Artemisia tridentata* ssp. *xericensis* *Artemisia tridentata* ssp. *wyomingensis* *Artemisia tripartita* ssp. *tripartita* *Artemisia frigida*	SB
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland	*Artemisia tridentata* ssp. *vaseyana* *Artemisia arbuscula* *Artemisia tridentata*	SBA
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Shrubland	*Artemisia tridentata* ssp. *vaseyana* *Artemisia arbuscula* *Artemisia tridentata*	SBA
Inter-Mountain Basins Mixed Salt Desert Scrub	*Artemisia tridentata* ssp. *wyomingensis* *Artemisia spinescens*	SBA
Inter-Mountain Basins Montane Sagebrush Steppe	*Artemisia tridentata* ssp. *vaseyana* *Artemisia tridentata* ssp. *wyomingensis* *Artemisia nova* *Artemisia arbuscula* *Artemisia tridentata* ssp. *spiciformis*	SB
Inter-Mountain Basins Semi-Desert Shrub-Steppe	*Artemisia tridentata* *Artemisia bigelovii* *Artemisia tridentata* ssp. *wyomingensis*	SBA
Northwestern Great Plains Mixed Grass Prairie	*Artemisia cana* ssp. *cana* *Artemisia tridentata* ssp. *vaseyana* *Artemisia frigida*	SBA

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing	Sagebrush (SB) or Sagebrush Associated (SBA)
Northwestern Great Plains Shrubland	*Artemisia cana* ssp. *cana* *Artemisia tridentata* ssp. *tridentata* *Artemisia tridentata* ssp. *wyomingensis*	SBA
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	*Artemisia tridentata*	SBA
Rocky Mountain Lower Montane-Foothill Shrubland	*Artemisia nova* *Artemisia tridentata* *Artemisia frigida*	SBA
Western Great Plains Sand Prairie	*Artemisia cana* ssp. *cana*	SBA
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	*Artemisia arbuscula* ssp. *longiloba* *Artemisia nova* *Artemisia tridentata* ssp. *wyomingensis* *Artemisia tripartita* ssp. *rupicola*	SB
Artemisia tridentata ssp. *vaseyana* Shrubland Alliance (EVT only)	*Artemisia tridentata* ssp. *vaseyana*	SB
Quercus gambelii Shrubland Alliance (EVT only)	*Artemisia tridentata*	SB

APPENDIX B. DATA ACCURACY ASSESSMENTS FOR LANDFIRE AND RCMAP

LANDFIRE Agreement Assessment

In the monitoring framework we will use the most recent version of LANDFIRE EVT data (EVT 2.2.0) which currently is based on the 2016 EVT Remap with updates due to disturbances. The 2016 EVT Remap data were reviewed using agreement assessments that compared individual sample field plots with EVT classes for pixels at plot locations using the Auto-Key EVT assignment. The plot data used for the agreement assessment was not used in the 2016 remap process by LANDFIRE so this was formulated as the most independent and robust test possible for the data. More details of this process are here: https://landfire.gov/remapevt_assessment.php.

Agreement assessments of all classes of data in northwest (NW) and southwest (SW) GeoAreas provide overall results of 47% and 42% respectively (**Table B1**). However, for GRSG purposes we also aggregated all classes into sagebrush (SB), sagebrush associated (SBA), or nonhabitat using LANDFIRE's process of collapsing categories. This aggregation caused the agreement assessments to increase substantially for both the NW and SW GeoAreas (**Table B1**).

Table B1. Agreement assessments of sagebrush (SB), sagebrush associated (SBA), nonhabitat, and overall classes in LANDFIRE EVT data showing the increased accuracy estimated when classes are grouped.

GeoAreas	SB	SBA	SB and SBA	Nonhabitat	Overall
NW	85%	49%	86%	92%	47%
SW	75%	45%	71%	92%	42%

RCMAP Accuracy Assessment

Rigge et al (2020) accuracy metrics, using 1860 independent field measurements, are shown in the table under Published. The BLM-conducted accuracy assessment used more than 3,000 data points from the AIM

2.0 database in 2021 and compared them to RCMAP 2020 predictions that used training data to 2019 (Savage and Slyder, 2022).

Table B2. Results of RCMAP published and BLM-conducted accuracy assessments (Savage and Slyder, 2022). R2 is the coefficient of determination; RMSE is the root mean squared error; and MAE is the mean absolute error.

Indicator	Published			BLM-conducted		
	R2	RMSE	MAE	R2	RMSE	MAE
Annual Herbaceous	0.58	9.8	-	0.13	14.21	7.59
Sagebrush	0.4	7.5	-	0.33	8.41	5.51
Trees	-	-	-	-	-	-

APPENDIX C. LITERATURE SUMMARY OF CONIFER EFFECTS ON SAGE-GROUSE

Table C1. Summary of the literature on the effects of conifer cover on GRSG.

Name	% Conifer Cover	Distance /Area	State	Leks	Nesting	Brood Rearing	No Season Given
Baruch-Mordo et al 2013	>4%	-	OR	No active leks	-	-	-
Baxter et al 2017	-	-	UT	-	-	Selected areas far from trees	-
Beers et al. 2022	<2%, <11%, <4%	400m, 800m	NV UT	Summer & breeding Winter Year-round, selected for sagebrush patch contiguity			
Brussee et al. 2022	0%	-	NV	-	-	Preferred no PJ to 1-10% conifer	-
Casazza et al 2011	<5% (threshold was selected by the scientists based on Miller et al 2005)	7.9 ha (20 acre, 160m radius); 226.8 ha (560 acre, 850m radius)	CA	-	-	SG avoided PJ at large scale, but models were unsuccessful at explaining this	-
Coates et al 2017	< 2%	-	CA	-	-	-	SG tolerate < 2% but less may be better for survival
Cook et al 2017	4% >3 %	1000m 800m	UT	Lower suitability	Lower suitability	-	-
Doherty et al 2010	-	100m	MT, WY	-	Strong avoidance of conifer within	-	-
Doherty et al 2016			MZs	Strong neg relationship between SG occurrence and tree canopy cover			

Name	% Conifer Cover	Distance /Area	State	Leks	Nesting	Brood Rearing	No Season Given
Doherty et al 2021	>3%	560m	OR	Lower suitability	-	-	-
Fedy et al 2014	-	-	WY	SG avoided forested areas			
Gibson et al 2015	>30%, 10-30%	1000m	NV	-	Avoided 10-30% areas were selected	-	-
Nisbet et al 1983	0%	-	NV UT	Lek model preference for sites with no conifer	-	-	-
Olsen et al 2021	-	-	OR	SG population increased where conifer was removed, suggest limit to < 10% cover			
Picardi et al 2020	-	-	UT	Modeled relationship found that areas with no conifer cover would be selected and areas with high conifer cover would be avoided			
Roth et al 2022	-	-	NV	-	SG selected PJ class (1-10%) was below average	-	-
Sandford et al 2017	>4%	-	UT	-	Less suitable for nesting habitat	-	-
Severson et al 2017	> 3%, >4%	800m	OR	-	Lower suitability, Marginal/unsuitable	-	-
Westover et al 2016	-	-	UT	SG avoided areas with hi % trees SG broods found further from trees

Appendix 8. Greater Sage-Grouse Habitat Indicators and Benchmarks

8.1 Incorporating the Best Available Science into the Habitat Assessment Framework Process

The Habitat Assessment Framework (HAF/ BLM TR 6710-1, as revised) provides a standardized, scientifically based methodology to assess sage-grouse habitat suitability at multiple scales (broad, mid, fine, and site-scales, Levels 1, 2, 3 and 4 respectively). Habitat suitability occurs along a gradient ranging from unsuitable to suitable and is rarely uniform within and across the scales. Using multi-scale evaluations is important for assessing GRSG habitat by considering the entire suite of conditions that contribute to high quality habitat, the success of past conservation actions, and prioritizing future land uses and conservation actions. Descriptions of the scales of habitat selection (broad-, mid-, fine-, and site-) and the associated indicators for habitat assessment at each scale are available in the HAF (BLM TR 6710-1, as revised).

8.2 Habitat Indicators and Benchmarks for Site-Scale HAF

The vegetation characteristics associated with site-scale habitat suitability vary across the range of GRSG. For example, characteristics (both indicators and benchmarks) in the grasslands of Montana are different than the characteristics in the sagebrush shrublands in the southern Great Basin of Utah and Nevada. The HAF technical reference includes general site-scale forms for the indicators and benchmark values for suitable site scale habitat ratings. The indicators and benchmark values used in these forms at the site scale should be updated to incorporate the best available research related to habitat suitability applicable to the regional and local variability.

The Habitat Indicators Tables (**Tables 8-1.A-G**) provide a list of indicators and benchmarks, derived from local and regional research on GRSG habitat selection, that collectively are used to inform habitat suitability. BLM offices will use the indicators and benchmarks in **the tables below** to assess each monitoring location within seasonal habitats for site-scale suitability, with data collected during the appropriate corresponding seasonal use period, as applicable to address phenological changes. Not all areas within a given habitat management area will be capable of meeting the identified seasonal habitat values in the Habitat Indicators Table due to inherent variation in vegetation communities and ecological potential. Habitat Indicators and Benchmarks are habitat conditions that are based on habitat selection that may not be achievable or applicable in all areas. Site-specific benchmarks must be based on the site's ecological potential informed by ecological site descriptions and associated state-and-transition models and the site's current ecological state.

When completing site-scale assessments, **it is *inappropriate* to use a single indicator** from any of the below **Tables 8-1.A-G** or the HAF habitat suitability form to determine overall habitat suitability of the plot (i.e., suitable, marginal, or unsuitable) unless sagebrush is absent or limiting. Instead, BLM staff must consider all the indicators using multiple lines of evidence, as described in the HAF and in the training materials, to determine the plot's overall habitat suitability. The measured habitat indicator values will vary seasonally, driven largely by use and environmental conditions (e.g., ecological site potential of the monitoring plot), including factors such as annual rainfall, drought, annual production, and natural disturbances, such as high intensity wildfires and flooding. In addition, a site may not meet the suitable rating if many indicators are impacted by annual climate variability (e.g., drought conditions), which is independent of management. Thus, it is critical to document environmental factors when completing the habitat suitability forms. This

information is essential to inform land health assessments and evaluations. Factors to inform assessments and evaluations could also include grouping portions of the landscape based on ecological characteristics that influence their impact to and recovery from changes on the landscape (e.g., fire, drought and other extreme weather events, insect outbreaks, soil disturbance, etc.). Use of such disturbance response groupings (considering disturbance in the ecological sense, not based on the RMP disturbance cap) may also be appropriate to scale ecological site descriptions for larger planning areas and provide context to HAF assessments (Stringham et al. 2016).

Indicators are assessed following the methods described in the Sage-grouse Habitat Assessment Framework. BLM will leverage the terrestrial Assessment, Inventory, & Monitoring (AIM) methods (Herrick et al. 2021), additional monitoring approaches for wetland & riparian habitats, credible partner data, and supplemental long-term monitoring data and guidelines developed by the BLM to collect data on site-scale habitat condition (**Tables 8-1.A-G**). Not all monitoring locations within a given seasonal habitat area will be able to achieve all suitable benchmark values in the Habitat Indicators Table due to the inherent variation in vegetation communities and ecological site potential. The intent is not to meet all habitat requirements at all monitoring locations, but to provide seasonal habitat requirements sufficiently across the landscape. Marginal or unsuitable ratings may still provide, or have the capacity to provide, one or more of the habitat components.

As research becomes available, new data could refine or clarify GRSG selection for vegetation structure and composition in seasonal habitats for certain populations. Because of this, the Habitat Indicators Table(s) (**see below in the remainder of Section 8.2**) will be periodically reviewed to incorporate the best available science in coordination with applicable federal, state, local, and tribal agencies. The addition or adjustment to indicators or benchmarks in the Habitat Indicators Table must include the reference or basis for which the changes are made. Edits should only be made if warranted by scientific evidence, in coordination with the applicable state agency.

8.2.1 Colorado GRSG Habitat Indicators Table

Table 8-1.A. Colorado GRSG Seasonal Habitat Indicators and Benchmarks

Attribute	Indicators	Benchmark	Reference
BREEDING AND NESTING [1,2] Seasonal Use Period for Arid sites: March 1-June 15 Seasonal Use Period for Mesic sites: March 15-June 30 Apply 4 miles from active leks. [12]			[1] Doherty 2008 [2] Holloran and Anderson 2005

	Upland and riparian perennial forb availability [4,5]	Preferred forbs are common with several preferred species present [9]	[4] Stiver et al. 2015 [5] Connelly et al. 2000
WINTER (Seasonal Use Period November 1-February 28) Seasonal Use Period for Arid sites: November 1-February 28 Seasonal Use Period for Mesic sites: November 1-March 14			
Cover and Food	Sagebrush canopy cover above snow [4,5,6] Arid sites [7] Mesic sites [8]	>20% [14] >25% [14]	[4] Stiver et al. 2015 [5] Connelly et al. 2000 [6] Connelly et al. 2003 [14] CO GRSG Steering Committee 2008
	Sagebrush height above snow [4,5,6]	>10 inches (25 cm) [11]	[4] Stiver et al. 2015 [5] Connelly et al. 2000 [6] Connelly et al. 2003
	Conifer	0 (Absence of conifer)	[17] BLM synthesis of research

Notes:
[1] Doherty 2008
[2] Holloran and Anderson 2005
[3] Baruch-Mordo et al. 2013
[4] Stiver et. al. 2015
[5] Connelly et al. 2000
[6] Connelly et al. 2003
[7] 10–12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site [4].
[8] >12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site [4].
[9] Preferred forbs are listed in Habitat Assessment Framework Table III-2 [4]. Overall, total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.
[10] Existing land management plan desired conditions for riparian areas/wet meadows (spring seeps) may be used in place of properly functioning conditions, if appropriate for meeting GRSG habitat requirements.
[11] The height of sagebrush remaining above the snow depends upon snow depth in a particular year. The intent is to manage for a mosaic of sagebrush stands with tall, healthy, sagebrush present in swales or bottoms.
[12] Buffer distance may be changed only if 3 out of 5 years of telemetry studies indicate the 4 miles is not appropriate.
[13] Measured as "droop height"; the highest naturally growing portion of the plant.

[14] Colorado Greater Sage-grouse Steering Committee 2008
[15] If sagebrush cover exceeds 30%, this would not be cause to consider the site as less than suitable unless total shrub cover is above 40%[14]
[16] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[17] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.2.2 Idaho GRSG Habitat Indicators Table

Table 8-1.B. Idaho GRSG Seasonal Habitat Indicators and Benchmarks

Attribute	Indicator	Benchmarks	Reference
LEK HABITAT (Seasonal Use Period March 1 – May 15) [1]			
Lek Security	Proximity of trees	Trees (i.e., mainly juniper, conifers, and does not include old- growth juniper, pinyon pine and mountain mahogany) absent or uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.	Baruch-Mordo et al. 2013 Stiver et al. 2015
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. 2015
NESTING/EARLY BROOD REARING [1,5] (Seasonal Use Period May 1 – June 30) [1]			
Cover and Food	Sagebrush cover [2]	15-25%	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007 Stevens et al. 2023
	Sagebrush height Arid sites [3] Mesic sites [4]	 12-31 inches (30-80cm) 16-31 inches (40-80cm)	Connelly et al. 2000
	Predominant sagebrush shape	Predominantly spreading shape [5]	Stiver et al. 2015
	Perennial grass cover (such as native bunchgrasses) [2] Arid sites [3] Mesic sites [4]	 ≥10% ≥15%	Connelly et al. 2000 Stiver et al. 2015
	Perennial grass (and forb) height (includes residual grasses)	≥ 7 inches (18 cm)	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007 Stiver et al. 2015
	Perennial forb cover [2] Arid sites [3] Mesic sites [4]	 ≥5% ≥10%	Connelly et al. 2000
	Perennial forb availability	Preferred forbs are common with several species present [6]	Stiver et al. 2015
	Invasive annual grass cover	<2% cover	BLM synthesis of research [9]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]
LATE BROOD-REARING/SUMMER [1, 7] (July-October) [1] Late brood-rearing areas, such as riparian, meadows, springs, higher elevation mesic uplands, etc. may occur within other mapped seasonal habitat areas. Apply late brood rearing/summer habitat desired conditions locally as appropriate.			
Cover and Food	Sagebrush cover [2]	Uplands 10-25% Riparian/Meadow: Sagebrush cover within 100 m	Connelly et al. 2000
	Sagebrush height	16 to 32 inches (40-80cm)	Connelly et al. 2000
	Perennial grass and forb cover [2]	>15%	
	Upland and riparian perennial forb availability [2]	Preferred forbs are common with appropriate numbers of species present [6]	Stiver et al. 2015
	Riparian and/or meadow habitat condition	Proper Functioning Condition	Stiver et al. 2015
	Invasive annual grass cover	<2% cover	BLM synthesis of research [9]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]

Attribute	Indicator	Benchmarks	Reference
WINTER[1] November-March[1] (Apply to areas of known or likely winter-use)			
Cover and Food	Sagebrush cover and height above snow.	Sagebrush is at least 10 inches (25 cm) above snow and ≥10% cover [8]	Connelly et al. 2000 Stiver et al. 2015
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]

Notes:
[1] Seasonal dates can be adjusted by local unit according to geographic region.
[2] Since plant species and/or life forms may overlap, total vegetative cover, inclusive of shrubs, forbs and grasses may exceed 100%. Note that sagebrush cover objectives may exceed 25% in some areas, for example in areas with higher precipitation, and/or where local science is available demonstrating sage-grouse use of areas with sagebrush cover > 25%.
[3] Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub- species for this type site (Stiver et al. 2015).
[4] Mesic corresponds to the ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. 2015).
[5] Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *2015*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.
[6] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[7] Some late brood habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.
[8] Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.
[9] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[10] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.2.3 Montana/Dakotas GRSG Habitat Indicators Tables

MT-Dak did not amend RMPs in 2019 and Butte/UMRBNM were not included in the 2015 amendment process. Original 2015 Tables are provided in Appendix 2 for reference but have been modified/adjusted for the Proposed Plan to take into account ecological boundaries, experience implementing the HAF, BLM review of recent range wide and local research, and additional comments/information provided during the planning process. Montana/Dakotas BLM offices will utilize three sets of boundaries, mostly aligned with one or multiple mid-scale HAF boundaries. These areas and associated offices are:

Name	Boundary and Offices
Headwaters	SW Montana: Dillon and Butte (Headwaters HAF Midscale)
North-Central Prairies	HiLine, Lewistown, UMRBNM, and parts of Billings and Miles City FOs (Northern Border and Midrivers HAF Midscale)
Bighorn-Custer High Plains	North and South Dakota, Billings and Miles City south of Yellowstone River (Custer midscale with extension to WY border)

Table 8-1.C.1. Headwaters Habitat Indicators and Benchmarks

Attribute	Indicator	Benchmarks	Reference
LEK HABITAT (Seasonal Use Period March 1 – May 15) [1]			
Lek Security	Proximity of trees	Trees and tall structures (> 3m [10 ft.]) are absent within 0.65 km (.388 miles) of active leks (line of sight).	Stiver et al. 2015
	Tree Cover in the Landscape	Tree canopy cover is < 1% within 3 kilometers (1.86 miles) of occupied Sage-grouse leks	Baruch-Mordo et al. 2013 Stiver et al. 2015
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. 2015

Attribute	Indicator	Benchmarks	Reference
NESTING/EARLY BROOD REARING (Seasonal Use Period May 1 – June 30) [1]			
Cover and Food	Sagebrush cover [2]	15-25%	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007
	Sagebrush height Arid sites [3]	12-31 inch (30-80cm) with taller individual sagebrush available within stand (for nesting) and a variety of heights (including those <30 cm)	Connelly et al. 2000 Scroff 2016 Boccadori et al. 2023 Scroff et al. 2018
	Mesic sites [4]	16-31 inch (40-80cm) with taller individual sagebrush available within stand (for nesting) and a variety of heights (including those <40 cm)	
	Predominant sagebrush shape	Predominantly spreading shape [5]	Stiver et al. 2015
	Perennial grass cover [2, 5] Arid sites [3] Mesic sites [4]	 >10% >15%	Connelly et al. 2000 Stiver et al. 2015
	Perennial grass height (includes residual grasses) [5]	≥ 7 inches (18 cm)	Connelly et al. 2000 Connelly et al. 2003 Hagen et al. 2007 Stiver et al. 2015 Smith et al. 2018
	Perennial forb cover [2] Arid sites [3] Mesic sites [4]	 >5% >10%	Connelly et al. 2000
	Perennial forb availability	Preferred forbs are common with several species present [7]	Stiver et al. 2015
	Invasive annual grass cover	<2% cover	BLM synthesis of research [10]
	Trees (e.g. Conifer)	0 (Absence of conifer trees)	BLM synthesis of research [11]
LATE BROOD-REARING/SUMMER (Seasonal Use Period June 16th-October 31)[1] Late brood-rearing areas, such as riparian, meadows, springs, higher elevation mesic uplands, etc. may occur within other mapped seasonal habitat areas. Apply late brood rearing/summer habitat desired conditions locally as appropriate.[8]			
Cover and Food	Sagebrush cover [2]	Uplands 10-25% Riparian/Meadow: Sagebrush cover within 100 m	Connelly et al. 2000
	Sagebrush height	16 to 32 inches (40-80cm)	Connelly et al. 2000
	Perennial grass and forb cover [2]	>15%	Connelly et al. 2000 Hagen et al. 2007 Sant et al. 2014
	Upland and riparian perennial forb availability [2]	Preferred forbs are common with appropriate numbers of species present (e.g., > 5)[7]	Stiver et al. 2015
	Riparian and/or meadow habitat condition	Proper Functioning Condition	Stiver et al. 2015 BLM 1997 Prichard et al. 1999 Prichard 1998 Gonzalez and Smith 2020
	Invasive annual grass cover	<2% cover	BLM synthesis of research [11]
	Conifer	0 (Absence of conifer trees)	BLM synthesis of research [12]

Attribute	Indicator	Benchmarks	Reference
WINTER November-March [1] (Apply to areas of known or likely winter-use) [9, 10]			
Cover and Food	Sagebrush cover	≥15% cover	Connelly et al. 2000 Stiver et al. 2015 Dusek et al. 2002
	Sagebrush height	>16 inch (40cm) with multiple tall sagebrush available within stand	Connelly et al. 2000 Stiver et al. 2015 Dusek et al. 2002
	Invasive Annual Grass Cover	<2%	BLM synthesis of research [11]
	Conifer	0 (Absence of conifer trees)	BLM synthesis of research [12]

Notes:
[1] Seasonal dates can be adjusted by local unit according to geographic region.
[2] Since plant species and/or life forms may overlap, total vegetative cover, inclusive of shrubs, forbs and grasses may exceed 100%.
[3] Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyoming*ensis is a common big sagebrush subspecies for this type site (Stiver et al. 2015).
[4] Mesic corresponds to the >12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. 2015).
[5] Adequate nesting cover may be provided by a mix of shrub and herbaceous. For sites with sagebrush canopy cover and/or heights at the low end or below the benchmark values, higher herbaceous cover may provide suitable conditions for nesting. Conversely, for sites with preferred nesting shrubs (height, width, branch distribution, etc.) grass cover may not be predictive of suitable nesting locations.
[6] Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. 2015. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.
[7] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[8] Some late brood-rearing habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.
[9] Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.
[10] Winter habitat generally taller and denser stands relative to availability
[11] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[12] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

	Upland and riparian perennial forb availability WY/Silver Sage [4,5] Saline/Acid Shale/Clay [6]	 Preferred forbs are common with several species present (≥5) [7] Preferred forbs are common with several species present (≥2) [7]	Connelly et al. 2000 Stiver et al. 2015
	Riparian and/or meadow habitat condition	Majority of sites are in Proper Functioning Condition	BLM 1997 Prichard et al. 1999 Prichard 1998 Gonzalez and Smith 2020
	Invasive annual grass cover	<2% cover	BLM synthesis of research [10]
	Conifer presence	0 (Absence of conifer)	BLM synthesis of research [11]
WINTER (Seasonal Use Period: November 1 to February 28) [8, 9]			
Cover and Food	Sagebrush cover	≥15% cover, or cover supported based on ecological site potential	Connelly et al. 2000 Stiver et al. 2015 Dusek et al. 2002
	Sagebrush height	Multiple tall sagebrush available (>12 inch, 30cm) within stand [7,8]	Connelly et al. 2000 Stiver et al. 2015 Dusek et al. 2002
	Invasive Annual Grass Cover	<2%	BLM synthesis of research [10]
	Trees (i.e., Conifer)	0 (Absence of conifer trees)	BLM synthesis of research [11]

Notes:
[1] Seasonal dates can be adjusted by local unit according to geographic region.
[2] Adequate nesting cover may be provided by a mix of shrub and herbaceous. For sites with sagebrush canopy cover and/or heights at the low end or below the benchmark values, higher herbaceous cover may provide suitable conditions for nesting. Conversely, for sites with preferred nesting shrubs (height, width, branch distribution, etc.) grass cover may be less important towards providing suitable nesting locations. Overall cover and height may be lower based on ecological site potential but still provide important components of suitable GRSG habitat as part of the heterogeneous landscape.
[3] WY Big Sage - Unglaciated, semiarid (10-14 inches annual precipitation) plains where the dominant, most common, shrub is Wyoming Big Sage. Characterized by frigid soil temperature regime and the overlap of Great Plains rhizomatous grasslands and sagebrush ecosystems
[4] Silver sage – Predominantly areas north of the Milk River in Montana. Characterized by mixed grass prairie habitat containing silver sage (most common shrub, species of sagebrush)
[5] Saline/Acid Shale/Clay – Low productivity sites due to site limitations, soils. However, provide brood rearing and foraging habitat for sage-grouse as part of the heterogeneous landscape.

[6] In silver sage communities, both sagebrush and total shrub cover should be considered. Studies of nesting GRSG indicate that up to half of shrub cover may be of other species in silver sage habitats.
[7] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[8] Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.
[9] Winter habitat generally taller and denser stands relative to availability
[10] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[11] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

WINTER (Seasonal Use Period November 1-February 28) [8,9]			
Cover and Food	Sagebrush cover	≥10% cover, or cover supported based on ecological site potential	Swanson 2009 Foster et al. 2014 Schroeder et al. 2020 Dusek et al 2002
	Sagebrush height	Multiple tall sagebrush available (>12 inch, 30cm) within stand [8,9]	Doherty et al. 2011 Schroeder et al. 2020
	Invasive Annual Grass Cover	<2%	BLM synthesis of research [6]
	Trees (i.e., Conifer)	0 (Absence of conifer trees)	BLM synthesis of research [7]

Notes:
[1] Seasonal dates can be adjusted by local unit according to geographic region.
[2] Adequate nesting cover may be provided by a mix of shrub and herbaceous. For sites with sagebrush canopy cover and/or heights at the low end or below the benchmark values, higher herbaceous cover may provide suitable conditions for nesting. Conversely, for sites with preferred nesting shrubs (height, width, branch distribution, etc.) grass cover may be less important towards providing suitable nesting locations. Ecological site, including site potential and state, and additional GRSG information may inform suitability and benchmarks for individual sites.
[3] High Plains - Unglaciated, rolling, semiarid (10-14 inches annual precipitation) plains. Characterized by frigid soil temperature regime and the overlap of Great Plains rhizomatous grasslands and sagebrush ecosystems
[4] Transitional Prairie - Fringe areas on the edge of sagebrush range (far east Montana into the Dakotas) and Desertic Basins (more arid areas)
[5] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.
[6] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[7] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)
[8] Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.
[9] Winter habitat generally taller and denser stands relative to availability

8.2.4 Nevada/California GRSG Habitat Indicators Table(s)

Table 8-1.D. Nevada/California GRSG Habitat Indicators Table

Attribute	Indicators	Benchmarks	Reference
GENERAL/LANDSCAPE-LEVEL [1]			
All life stages	Rangeland health assessments	Meeting all standards[2]	
Cover (nesting)	Seasonal habitat needed	>65% of the landscape in sagebrush cover	Aldridge and Boyce 2007
	Annual grasses	<%5	Blomberg et al. 2012
Security (nesting)	Conifer encroachment	<3% phase I (>0 to <25% cover) No phase II (25 to 50% cover) No phase III (>50% cover)	Casazza et al. 2011 Coates et al. 2016
Cover and food (winter)	Conifer encroachment	<5% phase I (>0 to <25% cover) No phase II (25 to 50% cover) No phase III (>50%)	Coates et al. 2016
	Sagebrush extent	>85% sagebrush land cover	Doherty et al. 2008
LEK (Seasonal Use Period: March 1 to May 15) [1]			
Cover	Availability of sagebrush cover	Adjacent sagebrush provides escape cover	Blomberg et al. 2012 Connelly et al. 2000 Stiver et al. 2015
Security [3]	Pinyon or juniper cover	<2% landscape cover within .6 mile of leks	Connelly et al. 2000 (modified) Stiver et al. 2015 Baruch-Mordo et al. 2013 Coates et al. 2017b
	Proximity of Linear Features	>3.1 miles	Manier et al. 2014
	Proximity of Surface Disturbance	>3.1 miles	Manier et al. 2014
	Proximity of Tall Structures	>2 miles	Coates et al. 2013 Manier et al. 2014
	Proximity of Low Structures	>1.2 miles	Manier et al. 2014
NESTING (Seasonal Use Period: April 1 to June 30) [1]			
Cover [6]	Sagebrush cover	Arid [8]: ≥20% Mesic [8]: ≥20%	Kolada et al. 2009a, 2009b Coates et al. 2017a
	Residual and live perennial grass cover (such as native bunchgrasses)	Arid [8]: ≥7% if shrub cover is >20% [5] Mesic [8]: ≥13% if shrub cover is >20% [5]	Coates et al. 2013; 2017a Coates and Delehanty 2010 Kolada et al. 2009a, 2009b
	Annual grass cover	Arid [8]: <3% Mesic [8]: <3%	Coates et al. 2017a
	Total shrub cover	Arid [8]: >28% Mesic [8]: >26%	Coates and Delehanty 2010 Kolada et al. 2009a Coates et al. 2017a
	Perennial grass height (includes residual grasses)	Arid [8]: 12 cm Mesic [8]: 18 cm	Connelly et al. 2000, 2003 Hagen et al. 2007 Stiver et. al. 2015 Coates et al. 2017a
Security [2]	Proximity of tall structures [4] (3 feet [1 meter] above shrub height)	Use Manier et al. 2014, Conservation Buffer Distance Estimates for GRSG-A Review; preference is 3 miles	Coates et al. 2013 Gibson et al. 2013 Manier et al. 2014
	Pinyon or juniper cover	<3% within 800 meters	Severson et al. 2017
	Invasive annual grass cover	<2% cover	BLM synthesis of research [9]
	Conifer	0 (Absence of conifer at site)	BLM synthesis of research [10]

Attribute	Indicators	Benchmarks	Reference
BROOD-REARING/SUMMER (Seasonal Use Period: May 15 to September 15; Early: May 15 to June 15; Late: June 15 to September 15) [1]			
UPLAND HABITATS			
Cover [6]	Sagebrush cover	Arid [8]: ≥20% Mesic [8]: ≥15%	Connelly et al. 2000 Coates et al. 2017a
	Perennial grass and forb cover	Arid [8]: >19% Mesic [8]: >25%	Connelly et al. 2000 Hagen et al. 2007 Coates et al. 2017a
	Deep rooted perennial bunchgrass (within 522 feet [200 meters] of riparian areas and wet meadows)	Arid [8]: 12 cm [7] Mesic [8]: 14 cm [7]	Hagen et al. 2007 Casazza et al. 2011 Coates et al. 2017a
Cover and food [6]	Perennial forb cover	Arid [8]: >5% Mesic [8]: >9%	Casazza et al. 2011 Lockyer et al. 2015 Coates et al. 2017a
	Invasive annual grass cover	<2% cover	BLM synthesis of research [9]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]
RIPARIAN/MEADOW HABITATS [1]			
Cover and food [6]	Riparian areas/meadows	PFC	Dickard et al. 2015 Gonzalez and Smith 2020 Prichard 1998 Prichard 1999 Stiver et al. 2015
Security [6]	Upland and riparian perennial forb availability and understory species richness	Preferred forbs are common with several species present and high species richness (all plants)	Stiver et al. 2015
	Riparian area/meadow interspersion with adjacent sagebrush	Has adjacent sagebrush cover within 200 meters	Casazza et al. 2011 Stiver et al. 2015
	Invasive annual grass cover	<2% cover	BLM synthesis of research [9]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]
WINTER (Seasonal Use Period: November 1 to February 28)[1]			
Cover and Food	Sagebrush cover	≥10%	Connelly et al. 2000 Stiver et al. 2015
	Sagebrush height	> 25 cm above snow depth	Connelly et al. 2000 Stiver et al. 2015
	Conifer	0 (Absence of conifer)	BLM synthesis of research [10]

Notes:
[1] Any one single habitat indicator does not define whether the habitat objective is or is not met. Instead, the preponderance of evidence from all indicators within that seasonal habitat period must be considered when assessing GRSG habitat objectives.
[2] Upland standards are based on indicators for cover, including litter, live vegetation, and rock, appropriate to the ecological potential of the site in context of the site's current ecological state and using the associated state and transition model/disturbance response group.
[3] Applicable to Phase I and Phase II pinyon and/or juniper.
[4] Does not include fences.
[5] In addition, if upland rangeland health standards are being met.
[6] Ecological site potential to meet habitat objectives should be considered when determining if objectives are feasible for the site. .
[7] In drought years, 4-inch perennial bunchgrass height with greater than 20 percent measurements exceeding 5 inches in dry years.
[8] Arid is defined as areas that received >35.0 cm of average annual precipitation.
Mesic is defined as areas that received ≤35.0 cm of average annual precipitation.
[9] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[10] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.2.5 Oregon GRSG Habitat Indicators Table

Table 8-1.E. Oregon GRSG Habitat Indicators Table

Attribute	Indicators	Benchmarks	Reference
Breeding Including Lekking, Pre-nesting, Nesting, and Early Brood Rearing (Seasonal Use Period March 1 – June 30)			
Lek Security	Proximity of trees or other tall structures	No conifers or tall structures[1] within 1.0 mile of lek center and conifer cover ≤4% within 4.0 miles of lek, excluding pre-settlement trees	Connelly et al. 2000 Fresse 2009 Baruch-Mordo et al. 2013 Knick et al. 2013
	Proximity of sagebrush to leks	Lek has adjacent sagebrush cover	Connelly et al. 2000
Cover	Sagebrush cover (%)	10 to 25	Doescher et al. 1986 Gregg et al. 1994 Hanf et al. 1994 Coggins 1998 Crawford and Carver 2000 Bates and Davies 2014 BLM 2015a
	Sagebrush height (inches) Arid sites (warm-dry) Mesic sites (cool-moist)	 11 to 31 15 to 31	Gregg et al. 1994 Hanf et al. 1994 Coggins 1998 Crawford and Carver 2000 Freese 2009
	Predominant sagebrush shape	Spreading	Connelly et al. 2000
	Perennial grass cover (such as bunchgrass) (%) Arid sites Warm-dry Shallow-dry Mesic sites Cool-moist Warm-moist	 ≥10 ≥10 ≥20 ≥20	Gregg at al. 1994 Coggins 1998 Crawford and Carver 2000 Freese 2009 NRCS 2015 Bates and Davies 2014 Jon Bates, USDA ARS, pers. comm. 2/10/2015 BLM 2015a BLM 2015b
	Perennial grass and forb height (inches, including residual grasses) – most important in nest areas; excludes shallow-dry sites[2] Arid sites (warm-dry) Mesic sites (cool-moist)	 ≥7 ≥9	Gregg et al. 1994 Hanf et al. 1994 Crawford and Carver 2000 Hagen et al. 2007 Jon Bates, USDA ARS, pers. comm. 2/10/2015
	Perennial forb cover (%)[3] Arid sagebrush Warm-dry Shallow-dry Mesic sagebrush Cool-moist Warm-moist	 ≥2 ≥2 ≥6 ≥5	Drut 1992 Drut et al. 1994 Crawford and Carver 2000 Freese 2009 NRCS 2015 Bates and Davies 2014 BLM 2015a Jon Bates, USDA ARS, pers. comm. 2/10/2015 BLM 2015b
	Invasive annual grass cover	<2% cover	BLM synthesis of research[7]
	Conifer	0 (Absence of conifer)	BLM synthesis of research[8]

Attribute	Indicators	Benchmarks	Reference
Food	forb diversity and availability [3]	Palatable forbs are common (≥6 individual plants) with ≥5 species present[4] and ≥2% forb cover	Hanf et al. 1994 Crawford and Carver 2000 Freese 2009 Bates and Davies 2014 BLM 2015a Jon Bates, USDA ARS, pers. comm. 2/10/2015
Brood-rearing/Summer Including Late-brood Rearing, Summering, and Early Autumn (Seasonal Use Period July 1- October 31)			
Cover	Sagebrush cover (%)	10 to 25	Doescher et al. 1986 Drut et al. 1994 Connelly et al. 2000 Crawford and Carver 2000 Bates and Davies 2014 Jon Bates, USDA ARS, pers. comm. 2/10/2015
	Sagebrush height (inches)	15 to 31	Gregg et al. 1994 Hanf et al. 1994 Crawford and Carver 2000 Freese 2009
	Perennial herbaceous (grass and forbs) cover (%) Arid sagebrush Warm-dry Shallow-dry Mesic sagebrush Cool-moist Warm-moist Riparian [5]	 ≥15 ≥10 ≥20 ≥30 ≥50	Drut et al. 1994 Bates and Davies 2014 NRCS 2015 BLM 2015b Jon Bates, USDA ARS, pers. comm. 2/10/2015
	Riparian areas/mesic meadows	Majority of areas are in PFC	Stiver et al. 2015, or as updated
	Invasive annual grass cover	<2% cover	BLM synthesis of research[7]
	Conifer	0 (Absence of conifer)	BLM synthesis of research[8]
Food	Upland and riparian perennial forb availability [3]	Palatable forbs are common (≥6 individuals present) with ≥5 species present [4] and ≥2% forb cover in upland habitat and ≥4% forb cover in riparian habitat [5]	Hanf et al. 1994 Freese 2009 Bates and Davies 2014 BLM 2015b Jon Bates, USDA ARS, pers. comm. 2/10/2015
Winter Including Late Autumn and Winter (Seasonal Use Period November 1 – February 28)			
Cover and Food	Sagebrush cover (%)	≥10	Willis 1990 (in Hagen 2011) Bruce 2011
	Sagebrush height above snow (inches) [6]	≥10	Willis 1990 (in Hagen 2011) Bruce et al. 2011
	Conifer	0 (Absence of conifer)	BLM synthesis of research [8]

Notes:

[1] Tall structures are any man-made structure that has the potential to disrupt lekking or nesting birds by creating perching and nesting opportunities for predators (e.g., raptors and ravens) or that decrease use of an area by sage-grouse, including communication towers, meteorological towers, electrical transmission or distribution towers, power poles, wind turbines, and associated structures.

[2] Perennial grass and forb minimum height may not be achievable in years with below normal precipitation. Other indicators of desired condition may still render the site suitable, however.

[3] In drought years, forb cover and availability may not be at the desired condition. In certain plant associations, such as Wyoming big sagebrush/Needle and Thread, these indicators may rarely be achieved even in years with normal precipitation.

[4] Native plant species important for sage-grouse in Oregon are listed in Appendix I of the 2015 Oregon Greater Sage-Grouse Approved Resource Management Plan Amendment. This partial list may be revised and expanded with additional plant species as new information becomes available.

[5] Riparian includes swales, wet meadows, and intermittent/ephemeral streams.

[6] Low sagebrush vegetation types (average sagebrush height <12 inches) found along slopes that are cleared of snow by prevailing winds are potentially important winter foraging areas.

[7] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)

[8] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.2.6 Utah GRSG Habitat Indicators Table

Table 8-1.F. Utah GRSG Habitat Indicators Table

Attribute	Indicators	Benchmarks	Reference
Breeding and Nesting (February 15-June 15)			
Lek Security	Proximity to conifers	Conifers are absent or uncommon on shrub/grassland ecological sites within 1.8 miles (approx. 3 kilometers) of occupied leks.	Stiver et al. 2015 Baruch-Mordo et al. 2013 Connelly et al. 2000
	Proximity of sagebrush to leks	Has adjacent sagebrush cover.	Stiver et al. 2015
Cover	Sagebrush cover	Low [2]: ≥ 7% Mid [3]: ≥ 18% High [4]: ≥ 14%	Dahlgren et al. 2019
	Total shrub cover	Low [2]: ≥ 17% Mid [3]: ≥ 22% High [4]: ≥ 19%	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Sagebrush Composition	Low [2]: ≥ 36% Mid [3]: ≥ 71% High [4]: ≥ 83%	Dahlgren et al. 2019
	Shrub height	Low [2]: ≥ 12 inches (30 cm) Mid [3]: ≥ 5.9 inches (15 cm) High [4]: ≥ 9 inches (23 cm)	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Perennial grass cover (such as native bunchgrasses, rhizomatous grasses called for on applicable ecological site descriptions, or other perennial grasses that provide similar functionality)	Low [2]: ≥ 5% Mid [3]: ≥ 4% High [4]: ≥ 8%	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Perennial grass and forb height (includes residual grasses)	Provide overhead and lateral concealment from predators.[5]	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Perennial forb canopy cover	Low [2]: ≥ 2% Mid [3]: ≥ 1% High [4]: ≥ 4%	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Invasive annual grass cover	<2% cover	BLM synthesis of research [7]
	Conifer	0 (Absence of conifer)	BLM synthesis of research[8]
Brood-Rearing/Summer (April 15-August 15) [1]			
Cover	Sagebrush cover	Low [2]: ≥ 4% Mid [3]: ≥ 16% High [4]: ≥ 15%	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Total shrub cover	Low [2]: ≥ 10% Mid [3]: ≥ 19% High [4]: ≥ 17%	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Sagebrush Composition	Low [2]: ≥ 28% Mid [3]: ≥ 77% High: ≥ 77%	Dahlgren et al. 2019
	Shrub height	Low [2]: ≥ 10.25 inches (26 cm) Mid [3]: ≥ 4.3 inches (11 cm) High [4]: ≥ 8 inches (20 cm)	Stiver et al. 2015 Connelly et al. 2000 Dahlgren et al. 2019
	Perennial grass cover	Low [2]: ≥ 5% Mid [3]: ≥ 6% High: ≥ 8%	Dahlgren et al. 2019
	Perennial forb cover	Low [2]: ≥ 2% Mid [3]: ≥ 2% High [4]: ≥ 6%	Dahlgren et al. 2019
	Riparian areas/mesic meadows	Proper Functioning Condition	
	Upland and riparian perennial forb availability	Preferred forbs are common with several preferred species present [6]	Stiver et al. 2015

Attribute	Indicators	Benchmarks	Reference
Cover *(cont.)*	Invasive annual grass cover	<2% cover	BLM synthesis of research[7]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [8]
Winter (November 15-March 15) [1]			
Cover and Food	Sagebrush cover above snow	≥10%	Stiver et al. 2015 Connelly et al. 2000
	Shrub height	Low [2]: ≥ 12 inches (30 cm) Mid [3]: ≥ 5.9 inches (15 cm) High [4]: ≥ 9 inches (23 cm)	Connelly et al. 2000
	Conifer	0 (Absence of conifer)	BLM synthesis of research [8]

Notes:
[1] Specific dates will be based on site-specific conditions and may be modified due to documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, and long and/or heavy winter), in coordination with the appropriate State of Utah agency.
[2] Low is equivalent to the *Low* cluster from Dahlgren et al. 2019. It covers lower elevation areas (~1,200–2,200 m) in Utah, consisting primarily of Wyoming big sagebrush communities, with some basin big sagebrush included.
[3] Mid is equivalent to the *Parker* cluster from Dahlgren et al. 2019. It occurs primarily on the plateau of Parker Mountain (~2,300–2,800 m) in south-central Utah, dominated by black sagebrush communities.[4] High is equivalent to the *Wasatch* cluster from Dahlgren et al. 2019. It covers mid- to high-elevation areas (~2,200–3,000 m) in Utah, consisting primarily of basin (mid-elevation) and mountain big sagebrush (high elevation), as well as other mesic and higher elevation vegetation communities.
[5] Specific height requirements needed to meet the objective will be set at the time of watershed assessments.
[6] Preferred forbs are listed in Stiver et al. 2015. Overall total forb cover may be greater than that of preferred forb cover, since not all forb species are listed as preferred.
[7] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)
[8] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.2.7 Wyoming GRSG Habitat Indicators Table

Table 8-1.G. Wyoming GRSG Habitat Indicators Table

Attribute	Indicators [1]	Benchmarks [2]	Reference
Breeding (Seasonal Use Period March 1 – June 15; Doherty 2008, Holloran and Anderson 2005) [3]			
Lek Security	Proximity of trees	Conifer cover in shrub/grassland ecological sites <4% in each 125-acre (50.6-ha) segment within 3.1 miles (5 km) of occupied leks [4]	Baruch-Mordo et al. 2013 Stiver et al. 2015 Beers and Frey 2022 Severson et al. 2017
	Proximity of sagebrush to leks	Protective sagebrush cover within 330 ft. (approx. 100 m) of occupied leks	Stiver et al. 2015
Cover	Sagebrush cover [5]	5 to 25%	Connelly et al. 2000 Hagen et al 2007 Hanser et al. 2018
	Sagebrush height	12 to 31 in (30 to 80 cm) Arid sites [6] 16 to 31 in (40 to 80 cm) Mesic sites [7]	Connelly et al. 2000
	Sagebrush shape	Predominantly spreading shape [8]	Stiver et al. 2015
	Perennial grass cover [5,9]	>10% Arid sites [6] >15% Mesic sites [7]	Connelly et al. 2000 Stiver et al. 2015 Cagney et al. 2010
	Perennial grass and forb height (including residual grasses)	Reference state as determined by ecological site potential in consideration of annual variability; robust cool-season bunchgrass understory necessary for adequate herbaceous height [9]	Connelly et al. 2000 Coates et al. 2017 Doherty et al. 2014 Hagen et al. 2007 Stiver et al. 2015 Cagney et al. 2010
	Forb cover [5]	>5% Arid sites [6] >10% Mesic sites [7] Preferred species [10] present in upland nesting/early brood-rearing areas	Connelly et al. 2000 Stiver et al. 2015 Hagen et al. 2007
	Invasive annual grass cover	<2% cover	BLM synthesis of research [13]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [14]

Attribute	Indicators [1]	Benchmarks [2]	Reference
Late Brood-Rearing/Summer (Seasonal Use Period June 16 – October 31) [3]			
Cover and Food	Sagebrush cover [5]	5 to 25% in adjacent sagebrush stands within 200 ft. (approx. 60 m) of late brood-rearing/summer feeding sites [11]	Connelly et al. 2000 Slater 2003
	Sagebrush height	16 to 31 in (40 to 80 cm) in adjacent sagebrush stands within 200 ft. (approx. 60 m) of late brood-rearing/summer feeding sites [11]	Connelly et al. 2000 Slater 2003
	Perennial grass and forb cover [5]	>25% in late brood-rearing/summer feeding sites [11]	Connelly et al. 2000 Coates et al. 2017
	Riparian areas; Mesic meadows	Proper functioning condition	Stiver et al. 2015
	Forb availability	Preferred species [10] present in late brood-rearing/summer feeding sites [12]	Stiver et al. 2015
	Invasive annual grass cover	<2% cover	BLM synthesis of research [13]
	Conifer	0 (Absence of conifer)	BLM synthesis of research [14]
Winter (Seasonal Use Period November 1 – February 28) [3]			
Cover and Food	Sagebrush cover above snow [5, 12]	>5%	Connelly et al. 2000 Stiver et al. 2015
	Sagebrush height above snow [12]	>10 in (>25 cm)	Connelly et al. 2000
	Conifer	0 (Absence of conifer)	BLM synthesis of research [14]

Notes:

[1] The indicators included represent the minimum habitat requirements that should be considered. When assessing the suitability of a seasonal use area (e.g., HAF site-scale polygon), practitioners are encouraged to use a multiple lines of evidence approach that references all relevant data, expertise, and locally-relevant habitat indicators (BLM Technical Note 453; Kachergis et al. 2020).

[2] Collectively the indicators for sagebrush (cover, height, and shape), perennial grasses, and forbs (cover, height and/or availability) represent the desired condition for the seasonal habitats described. Connected habitats allowing for GRSG dispersal and migration among the seasonal ranges is needed to meet habitat objectives. GRSG habitats in northeastern Wyoming are ecologically limited in terms of sagebrush production and the ability to support dense stands of sagebrush (i.e., sagebrush canopy cover rarely exceeds 15%) and require additional consideration of local conditions, ecological site potential, and GRSG seasonal habitat selection (State of Wyoming Executive Order 2019-3).

[3] Where credible data support different seasonal dates than those identified, dates may be shifted but the amount of days cannot be shortened or lengthened by the local unit.

[4] Conifer reduction treatments should consider and limit potential impacts of those activities on populations of other sensitive species (e.g., pinon jay). Treatments where the likely impacts to habitats important for other sensitive species are not clearly outweighed by the likely benefits to GRSG habitat suitability should be reconsidered.

[5] Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportion of each species and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) of interest to determine suitability of habitat for sage-grouse. Overall cover at the site may be greater than that sampled for sage-grouse habitat due to the presence of other species.

[6] Arid corresponds to the 10 – 12-inch precipitation zone; Wyoming big sagebrush (*A. t. wyomingensis*) is a common big sagebrush subspecies for this type site (Stiver et al. 2015).

[7] Mesic corresponds to the ≥12-inch precipitation zone; Mountain big sagebrush (*A. t. vaseyana*) is a common big sagebrush sub-species for this type site (Stiver et al. 2015).

[8] Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. 2015). Some sagebrush plants are naturally columnar (e.g., Basin big sagebrush; *A. t. tridentata*), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant habitat management investigation or adjustments at site-specific scales.

[9] The intent is to manage for the long-term maintenance of sagebrush habitats in or restoration of sagebrush habitats to the reference state in combination with annually maintaining sufficient standing crop (i.e., current year's herbaceous growth) to provide residual hiding cover for the following nesting season (reference Cagney et al. 2010). A robust cool-season bunchgrass understory is necessary to achieve adequate herbaceous heights for suitable GRSG breeding habitats.

[10] Forb availability and diversity in sagebrush upland habitats used by GRSG during pre-laying (Barnett and Crawford 1994), nesting, and early brood-rearing (Hagen et al. 2007) is important for nesting success and chick survival; preferred forbs as established in the Habitat Assessment Framework (Stiver et al. 2015) as updated with state-specific information.

[11] Sage-grouse feed in habitats that maintain moist soils and high forb and insect availability throughout the summer (e.g., wet meadows, riparian areas, irrigated hay meadows, springs/seeps) that are closely associated with protective sagebrush cover (Connelly et al. 2011).

[12] Sage-grouse habitat availability and selection during winter is influenced by snow conditions (e.g., depth, hardness) and topography (elevation, aspect) in addition to sagebrush height and cover and can vary widely depending on winter severity (Connelly et al. 2011). The intent is to manage habitats for a mosaic of sagebrush stands across a variety of topographic conditions as windswept ridges with low-stature sagebrush and/or draws with tall sagebrush can provide access to sagebrush above snow for sage-grouse during any given winter.

[13] BLM synthesis of research on the impacts invasive annual grasses have on sage-grouse habitat suitability (**Attachment 8-1**)

[14] BLM synthesis of research on the impact conifer have on sage-grouse habitat suitability (**Attachment 8-2**)

8.3 USING THE HABITAT INDICATORS TABLE(S)

The Habitat Indicators Tables are to be used as follows:

- To inform habitat suitability at one point in time, as defined by the processes described in the Habitat Assessment Framework and BLM HAF Implementation Guidelines.
- To inform measurable project objectives during implementation-level planning for BLM-permitted and BLM-initiated actions in HMAs, as applicable.
- To inform agency decision-makers regarding consideration of whether a project or proposal should be approved, denied, or modified based on how it would affect an area's existing habitat suitability status.

Additional guidance on the use of the Habitat Indicators Table and the associated products is available in the Habitat Assessment Framework (Stiver et al. 2015, BLM TR 6710-1, as revised) and BLM Sage-grouse HAF Implementation Guidelines.

When assessing seasonal habitat suitability, the BLM will summarize and report the number of monitoring locations, or amount of seasonal habitat in the analysis area, that are suitable, marginal, or unsuitable. Based on the monitoring locations rated as suitable, marginal, or unsuitable and the documentation of conditions across the entire analysis area such as ecological site potential (using appropriate ecological site descriptions, State and Transition Models, reference sheets, etc.), weather, and land ownership patterns, the BLM will determine if a given seasonal habitat is a limiting factor for sage-grouse. All rationale will be documented in a HAF summary report.

Relationship of the Habitat Indicators Table to other assessment and planning tools

The indicators and benchmarks in the Habitat Indicators Table are meant to inform the wildlife and/or sensitive species component of the Land Health Standards evaluation process (LHS, 43 CFR 4180.2; **Figure 8-1**). The Habitat Indicators are not land health standards and do not replace land health assessments. The indicators relating to vegetative cover are assessed using AIM methodology (Herrick et al. 2021). The HAF, GRSG Monitoring Framework (see **Appendix 7**), and land health assessments all incorporate AIM data to monitor existing conditions and track changes over time. The Land Use Plan (LUP) indicators use AIM methods to measure several of the GRSG habitat indicators.

Table 8-2. Relationships of LUP, HAF, LHS, and MF relative to the GRSG Habitat Objectives

Land Health Standards (LHS) Evaluation	Land Use Plan (LUP)	GRSG Habitat Assessment Framework (HAF)	GRSG Monitoring Framework (MF)
Evaluates if the sage-grouse portion of the Special Status Species Land Health Standard is achieved or significant progress towards achievement is made. These evaluations utilize HAF results along with other data.	Sets GRSG habitat objective(s) and Identifies the GRSG habitat indicators (see **Tables 8-1.A-G** above) and benchmarks from best available science for evaluating progress toward meeting the objective	Provides methods to assess GRSG habitats using the LUP indicators and benchmarks from this appendix (see **Tables 8-1.A-G** above)	Provides framework for reporting progress toward achieving the objective(s) of the LUP

8.4 INAPPROPRIATE USES OF THE HABITAT INDICATORS TABLE

- Using the indicator value(s) as default desired conditions to inform LUP effectiveness without considering the current state compared to ecological potential of the site and relevant local information where measurements were taken.
- Using a single measured indicator value to determine sage-grouse habitat suitability.
- Using a single indicator as a criterion to modify grazing management or any other use.
- Adjusting use authorizations based on measured indicator values without adequate monitoring data.
- Adjusting use authorizations before determining whether the change will help move towards suitable habitat.

Attachment 8-1. Justification for Invasive Annual Grass as a Habitat Suitability Indicator at the Sage-grouse Habitat Assessment Framework (HAF) Site-Scale

Written by: Megan McLachlan, Wildlife Biologist, Bureau of Land Management (BLM) National Operations Center (NOC)

Reviewed by: Anthony Titolo (BLM-NOC), Paul Makela (BLM-ID), Kaitlin Lubetkin (BLM-NOC), Sam Litschert (BLM-NOC), Leah Waldner and Chris Domschke (BLM-CO), David Wood (BLM-MT/DK), Glenn Frederick and Matthew Shirley (BLM-OR/WA), and Matt Holloran (BLM-WY)

Finalized on: October 12, 2023

BACKGROUND

Invasive annual grasses, such as cheatgrass, medusahead, and ventenata species, are a recognized threat to sagebrush ecosystems (Chambers et al. 2016, Remington et al. 2021, Rowland et al. 2019) causing reduced ecosystem function, displacement of native vegetation, increased fire risk and reduced rates of post-fire recovery (D'Antonio and Vitousek 1992, Bradely et al. 2018) all of which can lead to degradation and/or loss of sage-grouse habitat (Nelle et al. 2000, Wik et al. 2002, Coates et al. 2015, Coates et al. 2016, Lockyer et al. 2015, Steenvoorden et al 2019, Brussee et al. 2022, Poessel et al. 2022). The Bureau of Land Management (BLM) uses the Sage-grouse Habitat Assessment Framework (HAF; Stiver et al. 2015) to assess sage-grouse habitat suitability at multiple spatial scales (mid-, fine- and site-scale) by examining scale-specific indicators that represent both habitat requirements (i.e., food, water, cover, security) and threats to habitat (i.e., anthropogenic disturbances, proximity of trees to leks). However, invasive annual grasses are not included as an indicator of habitat suitability at any scale of the HAF (Stiver et al. 2015). This omission has been recognized by both authors and implementors of the HAF as a shortcoming that should be remedied, as supported by scientific literature.

The purpose of this document is to:

- Provide scientifically based rationale for including invasive annual grass cover as an additional indicator in HAF site-scale habitat assessments (Stiver et al. 2015, revised), and
- Recommend scale-specific benchmarks for invasive annual grass cover for HAF site-scale assessments based on scientific literature relevant to that scale.

RATIONALE

Research has shown that invasive annual grasses can reduce habitat suitability for sage-grouse, at the site-scale (i.e., microhabitat), by displacing native vegetation and altering habitat composition and structure (Chambers et al. 2016, Coates et al. 2017, Brussee et al. 2022). This degradation can cause sage-grouse to avoid areas with invasive annual grasses (Lockyer et al. 2015, Coates et al. 2017, Poessel et al. 2022) and can cause lower occupancy and survival rates in areas with invasive annual grasses (Wik et al 2002, Kirol et al. 2012, Lockyer et al. 2015). General speaking, studies have shown that greater sage-grouse will use areas with relatively low amounts of invasive annual grasses for nesting and brood-rearing; however, in areas with relatively higher amounts of invasive annual grasses, rates of occupancy and/or survival are lower (Coates et al. 2017, Dinkins et al. 2016, Lockyer et al. 2015, Schreiber et al. 2015, Stonehouse et al. 2015, Wik 2002).

For example, a study conducted in Nevada and California found that cheatgrass abundance was the single greatest micro-habitat feature distinguishing greater sage-grouse nest sites from random sites in the study area and that average cheatgrass cover at nest sites (7.1%; SE=1.0) was lower than at random sites (13.3%; SE=1.2) (Lockyer et al. 2015). A study in Idaho found that successful nests had lower average cheatgrass cover (1%) than unsuccessful nests (4%) while successful broods had lower average cheatgrass cover (2%) than unsuccessful broods (6%) (Wik et al. 2002). In Nevada and California, a study indicated that > 5% annual grass cover was unsuitable for GRSG during nesting and brood-rearing (Coates et al. 2017). They also recommended suitability categories for invasive annual grasses in nesting habitat specific to xeric sites (<2.5% invasive annual grass cover is suitable, 2.5 – 4.8% is marginal, >4.8% is unsuitable) and mesic sites (<2.5% invasive annual grass cover is suitable, 2.5 – 5.2% is marginal, >5.2% is unsuitable).

Although individual studies reported different values of invasive annual grass cover associated with sage-grouse site selection and nest/brood success, there was notable overlap. In studies that examined site selection (not success), they reported mean values ranging between <1% to 17% cover of invasive annual grasses at used sites (regardless of success), with most reporting <7% cover (**Table 1**). In studies that examined nest and/or brood success relative to invasive annual grasses, they reported mean values between 1% to 7% for successful sites (Wik et al. 2002, Lockyer et al. 2015) (**Table 1**). Of note, some studies have shown that sage-grouse exhibit maladaptive site selection to invasive annual grasses and other habitat indicators due to nest site fidelity (Coates et al. 2017, Brussee et al. 2022, Cutting et al. 2019) so nest/brood success may be a more accurate indicator of the impacts of invasive annual grasses to sage-grouse habitat suitability.

Collectively, this research indicates that invasive annual grasses can reduce habitat suitability for nesting and brood-rearing greater sage-grouse at the site-scale and that habitat suitability generally decreases as invasive annual grass cover increases. It is recommended that invasive annual grass cover be included as a habitat suitability indicator for sage-grouse habitat assessments conducted at the HAF site-scale, as described in the Recommendations section below.

Table 1. The table below lists and describes key aspects and findings from research that has examined the relationship of invasive annual grass cover to greater sage-grouse habitat selection and/or survival at the site-scale (i.e., microhabitat). Note that no studies specifically examined the potential impacts of invasive annual grasses on Gunnison sage-grouse.

Citation	State	Scale/ Extent	Season	Applicable Findings
Coates et al. 2017	NV	10m of nest	Nesting	Mean invasive annual grass cover at nests was 4.8% in xeric sites and 5.1% in mesic sites. Authors recommended suitability categories: • xeric sites (suitable is <2.5%, marginal is 2.5 – 4.8%, unsuitable is >4.8%) and • mesic sites (suitable is <2.5%, marginal is 2.5 – 5.2%, unsuitable is >5.2%)
		10m of brood	Brood-rearing	Mean invasive annual grass cover at brood sites was 4.3% in xeric 4.79% in mesic. Authors recommended suitability categories: • xeric sites (suitable is <2.5%, marginal is 2.5 – 4.3%, unsuitable is >4.3%) and • mesic sites (suitable is <2.5%, marginal is 2.5 – 4.8%, unsuitable is >4.8%)

Citation	State	Scale/ Extent	Season	Applicable Findings
Dinkins et al. 2016	WY	5m of nest	Nesting	Mean invasive annual grass cover at nests 2.14% (SE=0.11) which was higher but similar to random sites with a mean of 1.75% (SE=0.10).
