1022	1022-5	Unfortunately, the preferred alternative in the DRMP is unlikely to prevent further population declines in sage-grouse. The plan concurs that the more habitat conserved, the greater the benefit to species, and that prohibiting surface-disturbing and disruptive activities in sage-grouse habitats is more protective of grouse than "avoiding," let alone permitting, continued development that may harm the species (DRMP 4-221). But the preferred alternative does not specially protect remaining tracts of sagebrush steppe on public land and would permit livestock grazing and a host of energy and non-energy mineral development in key habitat areas to within 0.6 miles of sage-grouse leks (see Table 1). The plan acknowledges that small lek buffers are less effective for conserving sage-grouse than larger buffers (DRMP 4-228). The preferred alternative instead relies on additional restoration and reclamation requirements to conserve sagebrush habitats in development areas (rather than restricting surface-disturbing activities) (DRMP 4-222, 4-246), even though it is difficult to successfully restore xeric sagebrush steppe (DRMP 4-223). Threats to sage-grouse from various land uses and development of public resources under the preferred alternative would generally be the same as current management in the planning area (SEIS 4-155, Table 2b).	3035_1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1022	1022-3	Finally, we noticed that neither the SEIS (nor the DRMP) considered important new research on sage-grouse and sagebrush steppe. The BLM's National Sage-Grouse Habitat Conservation Strategy (2004) commits the agency to "use the best available science and relevant information to develop conservation efforts for sage-grouse and sagebrush habitats." Planning criteria in the SEIS assures that the BLM will use "appropriate resources ... to identify greater sage-grouse habitat requirements and management practices" (SEIS 1-5). We have identified new information in Appendix 1 related to sage-grouse and sagebrush steppe that was published during preparation of the SEIS and should be considered in the proposed RMP/final EIS.	3035_2
1022	1022-1	The BLM produced the SEIS more than two years after releasing the DRMP. We are concerned that new information analyzed in the SEIS to develop Alternatives E and F was not also considered in development of the other four alternatives (Alternatives A-D) in the DRMP. The resultant, bifurcated plan is comprised of a SEIS that incorporates most of the latest research on sage-grouse and a DRMP that is outdated by the voluminous new information produced on sage-grouse since the draft was released in 2011. Alternatives A-D, including the preferred alternative (Alternative D) would be improved by incorporating information in the NTT report, Greater Sage-Grouse Conservation Objectives Team Final Report (COT report), Summary of Science, Activities, Programs, and Policies that Influence the Rangewide Conservation of Greater Sage-Grouse (<i>Centrocerats urophasianus</i>) (aka "Sage-Grouse Baseline Environmental Report") (Manier et al. 2013), and GREATER SAGE-GROUSE: ECOLOGY AND CONSERVATION OF A LANDSCAPE SPECIES AND ITS HABITATS" (aka "greater sage-grouse monograph") (Knick and Connelly 2011).	3035_2
1023	1023-17	The Supplemental Draft RMP/EIS should state that: "The BLM will determine how to apply RMP management direction to split estate lands on a case-by-case basis. The BLM will generally defer to the resolution of surface use issues reached between the surface owner and the operator. "	3019
1023	1023-16	The Supplemental Draft RMP/EIS states that, under Alternatives E and F, the BLM is to:"Incorporate BLM required design features or mitigation for any authorized mineral activity for federal mineral estate, regardless of surface ownership." Supplemental Draft RMP/EIS at 2-16 (emphasis added). This statement is inappropriate, inadequately respects private property rights, and is inconsistent with BLM policy. Under the procedure contemplated in Onshore Order Number 1, an operator must engage in good-faith negotiations with the private surface owner to reach an agreement for the protection of surface resources and reclamation of the disturbed areas. The BLM should respect this process. The Final RMP/EIS should expressly state that surface use issues on private surface will be resolved primarily between the surface owner and the operator and that the BLM will not apply RMP management direction that conflicts with the agreement reached between the surface owner and operator.	3019

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1023	1023-13	But after adopting the State of Wyoming habitat designations, Alternative F abandons the State of Wyoming management direction for those areas. For example, Alternative F adopts management direction to limit the density of disturbance to 3 percent of sagebrush habitat per 640 acres. See Supplemental Draft RMP/EIS at 2-17. Under State of Wyoming EO 2011 -5, the density disturbance cap is 5 percent rather than 3 percent. The BLM should not deviate from the Wyoming Greater Sage-Grouse Core Area Protection plan in this manner.	3035_4
1023	1023-12	Alternative F of the Supplemental Draft RMP/EIS states that it adopts the habitat designations contained in "Version 3 of the State of Wyoming EO Greater Sage Grouse Core Area of Protection." See Supplemental Draft RMP/EIS at 2-1. As explained above, Denbury supports the adoption of Version 3 of the Wyoming Plan because Version 3 takes into account past management decisions to authorize oil and gas development in certain areas.	3035_1
1023	1023-10	Second, a one million acre ACEC would be incredibly burdensome to manage. For example, the BLM must report annually to the Director on the management of the ACEC. BLM Manual 1613.63. The report must address, among other things, "management measures undertaken and completed during the previous fiscal year " Preparing this report alone for an area covering 1,000,000 acres would be incredibly burdensome. And where does it stop? If the BLM designates an ACEC covering priority habitat for Sage Grouse, why would it not designate an ACEC covering priority habitat for other species? Wildlife management should not occur through the ACEC mechanism in this manner.	3001
1023	1023-9	First, ACECs have historically been used for discrete smaller portions of a BLM planning area that are carved out for special or enhanced management. This allows the BLM to manage the ACEC in accordance with BLM policy, which directs the BLM to: "give priority to the designation and protection of ACECs." See BLM Manual 1613.6. How can the BLM give "priority" to an area that covers one third of the planning area?	3001
1023	1023-8	Alternatives E and F of the Supplemental Draft RMP/EIS would designate ACECs for Greater Sage Grouse covering over one million acres. The Greater Sage-Grouse Key Habitat Area ACEC would cover 1,231,383 acres while the Greater Sage-Grouse Core Habitat Area would cover 1,116,124 acres. See, e.g., Supplemental Draft RMP/EIS at 3-6. These ACECs would cover approximately one-third of the 3.3 million acre planning area. Designation of these ACECs would achieve no purpose, would create management difficulties, and sets a bad precedent for future BLM management.	3001
1023	1023-7	1 Similarly, under Exhibit E the BLM must apply an NSO condition of approval to proposals to develop existing leases, subject to limited exceptions. See Supplemental RMP/EIS at 2-30. Such a use restriction violates valid existing oil and gas lease rights and cannot lawfully be imposed.	3023-2

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1023	1023-6	The Final RMP/EIS should expressly state that all sage grouse mitigation will be evaluated on a case-by-case basis prior to being imposed on existing lease development and will only be imposed where consistent with existing lease rights.	3035-7
1023	1023-5	The Final RMP/EIS should recognize and disclose the BLM's limited authority to impose new management direction on proposals to develop existing oil and gas leases.	3023-2
1023	1023-2	When identifying lands for inclusion in Priority Habitat, the BLM should exclude those lands in developed fields with potential for future CO2 EOR projects. These are lands that have already been disturbed, but that can produce large volumes of oil from within the existing development footprint. Designating these lands as "Priority Habitat" has a high cost, with little biological reward. The BLM can better meet its multiple use mandates by focusing its conservation efforts elsewhere, while allowing resource development to occur within developed fields. Page 6 of Exhibit 1 is a map of the largest oil producing fields in the BHB. The BLM should exclude the areas in and around these fields from Priority Habitat designation because these fields have high CO2EOR potential. At the very least, the BLM should help harmonize its Priority Habitat designations with future potential CO2 EOR projects by adopting Version 3 of the State of Wyoming Core Habitat Areas maps (which takes into account certain existing land uses such as oil and gas development).The BLM should exclude areas with future CO2 EOR potential from priority habitat designation	3023-3

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-21	The Supplement is a high level planning document that must maintain management flexibility to address multi-use of public lands. Anadarko recommends the Supplement incorporate the concept of and programmatic flexibility to develop enhanced sage-grouse mitigation coupled with expanded use authorizations ("Enhanced Mitigation/Expanded Use Authorizations"). Anadarko encourages the BLM to utilize the concepts provided in the recent draft BLM Regional Mitigation Policy in conjunction with ensuring reasonable access for energy development. See DRAFT-REGIONAL MITIGATION MANUAL SECTION-1794 (IM No. 2013-142).Anadarko strongly encourages the BLM to incorporate in the RMP management objectives and directive that permit development of an Enhanced Mitigation/Expanded Use Authorizations Program. Such a program should be developed in coordination with the State of Wyoming, promote the policy objective in the JM-2013-142, and seek input from stakeholders including industry. Tools that could be utilized in such a program could include: - A biologically-based framework for mitigating impacts associated with a reasonable access mitigation program that includes exceptions to wildlife timing stipulations. - Allowance for the prioritization of potential mitigations sites. IM 2013-142. For example one idea could be to utilize a two-mile buffers within core areas. - Possibly structure mitigatory efforts within two-mile buffers around sage-grouse leks, consistent with the work by Doherty et al. (2010). This possible approach would provide tangible benefits to sagebrush steppe species at a regional landscape level. - Possibly target restoration of habitats within the two-mile buffer around sage-grouse leks. Within these two-mile lek buffers, existing disturbance and fragmentation profiles could be mapped so that reclamation and enhancement efforts can be focused, monitored, and assessed. Consider case-by-case focused habitat improvements within two-mile lek buffers. This mitigation could be exchanged for timing stipulation exceptions granted by the BLM.	3035-7
1024	1024-20	General Comment 4: Definition of Occupied leks s should Be Supported by Data and Analysis The BLM needs to define "occupied lek," a term used throughout the Supplement and Draft RMP, and the process by which leks are deemed unoccupied. In particular, the BLM appears to be applying stipulations (see Map 31 thru 34) to leks where male-grouse have not been observed for many years. Does lek monitoring continue when a lek nears a status of being non-occupied to allow determination of unoccupied status? How and who makes a determination of how a lek is going to be monitored? Recommendation: The BLM should include in the Final RMP a table indicating the status of all PRB leks. Leks that have had no birds in attendance for three years should be considered unoccupied when applying timing stipulations. Anadarko also recommends the BLM include in the Final RMP a map indicating all unoccupied leks. If leks that have had no birds in attendance for multiple years are still treated as occupied, Anadarko recommends the Final RMP include an explanation for that determination.	3035_2

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-19	General Comment 4: Definition of Occupied leks should Be Supported by Data and Analysis The BLM needs to define "occupied lek," a term used throughout the Supplement and Draft RMP, and the process by which leks are deemed unoccupied. In particular, the BLM appears to be applying stipulations (see Map 31 thru 34) to leks where male-grouse have not been observed for many years. Does lek monitoring continue when a lek nears a status of being non-occupied to allow determination of unoccupied status? How and who makes a determination of how a lek is going to be monitored?	3035_2
1024	1024-18	2. Impacts to Sage-Grouse Will Be Reduced During Future Development Due To Technological Changes In How Reservoirs Are Targeted, Wells Are Drilled, And Field Operations Are Conducted. Technological changes over the past ten years have dramatically shifted drilling technology from vertical well bores to directional and horizontal well bores, with the consequence that disturbance and fragmentation levels are declining at the same time that reservoir recovery rates are increasing. This technological shift is reflected in Figure 6 where oil and gas drilling permits issued in the State of Wyoming over the last decade are shown. Figure 6 indicates that horizontal drilling permits have increased 40-fold over the last decade, while directional drilling permits have increased by a factor of eight. On the other hand, vertical well permits and completions have decreased by approximately 50 percent over that same time period.	3035_9
1024	1024-17	In summary, oil and gas impacts to sage-grouse in Wyoming are not uniform across its entire range and depend heavily on the proximity to development. Suggesting oil and gas development has led to wholesale sage-grouse population declines across Wyoming is not supported by the degree of historic development in comparison to the overall sage-grouse range in addition to the best available scientific information. The Supplement provides no basis for the assertion that oil and gas development has caused sage-grouse declines in the BHB planning area.	3035_2
1024	1024-16	When considering impacts and mitigation measures for sage-grouse one method of assessing oil and gas impacts is to look at the development intensity within the two-mile buffer around a lek, as done by Doherty et al. (2010). Following this methodology, statistical analysis regression models of lek attendance and well density have been developed. Their results indicate a greater than 80 percent probability that leks will persist in the Wyoming Basin when the well count within the two-mile radius around a lek is less than 60 well pads. This corresponds to a spacing density of approximately five well pads per square mile (60 wells/12.4 square miles). Perhaps more importantly, their results indicate that at one well pad per square mile or less (corresponds to as many as 12 wells per the two-mile radius or within 32.2 km ² of a lek) impacts from oil and gas development on sage-grouse are not detectable: "Impacts were indiscernible at 1 -12 wells per 32.2 km ² ." This result is consistent with the proposed one well-pad per square mile criterion for sage-grouse core areas outlined in the Wyoming Core Area Policy, and provides insight into the nature of localized impacts associated with oil and gas development within a two-mile buffer around a lek.	3035_4

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-15	General Comment 3: Oil and Gas Activities Must Be Considered Under the Lens of Today's Technologies in Use and Actual Development 1. Spacing Density through Wyoming's Core-Area Policy Protects Sage-Grouse from Impacts The Supplement suggests a primary threat to sage-grouse is energy development at 3-2, 3-3, 4-1 52, and 4-153 Impacts associate with oil and gas development as presented in the Supplement does not consider the most current and available data. As presented below, peer reviewed literature indicates that 75 percent of all leks (current and historic, active and inactive) in Wyoming are not expected to have discernible impacts from oil and gas activities according to the criterion of less than 12 wells within the two-mile buffer. Moreover, no less that 89 percent of all Wyoming leks are expected to persist given current levels of oil and gas development.	3035_2
1024	1024-14	Anadarko disagrees with the necessity and justification of the BLM to propose sage-grouse conservation measures that go beyond the requirements of Wyoming's Core Area Policy. The BLM should not expand development restrictions to sage-grouse populations outside of core areas. See discussion below in Section !J.D. Given the success of the Core Area Policy, any proposed measures that exceed those within the Core Area Policy are unwarranted and unnecessarily restrict other important uses of public lands, such as oil and gas development.	3035_1
1024	1024-13	General Comment 2: The Wyoming Core Area Policy, Endorsed by the FWS, Is Effective to Conserve Sage-Grouse on a Landscape Scale. Energy development impacts in Wyoming on sage-grouse are, and will continue to be, mitigated by the Wyoming Core Area Policy. The Wyoming Core Area Policy is designed to protect sage-grouse populations and important habitats on which they depend into the future and provide certainty for the species. Table 3 indicates that 1,508 leks or 64 percent of all leks in Wyoming are afforded protection through the Core Area Policy. Considering the number of lek that had over ten males counted in 2012, 483 (from a total of 626) or 70 percent of the most productive leks were in core areas. There were 741 active leks in core and 272 active leks in non-core. Hence, 73 percent of active leks counted in 2012 were in core areas. A recent analysis of future urbanization and energy development in Wyoming concluded, "No leks located within core areas are predicted to be extirpated with the core policy in place" (Copeland et al., 2013).	3035_1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-12	In summary, earlier scientific information based population predictions on a constant rate of decline that in retrospect is flawed. This constancy is represented in Figure 4 above, where the log linear decline curve of negative 3.4 percent as suggested by Garton et al (2011) is employed to project forward populations, hardwiring the population to go to extinction levels in the future. If historical decline rates have not been constant, then future rates of annual decline cannot be based on an assumption of a constant rate of decline over the previous 42year period. Garton et al. (2011) recognized this limitation when they noted "Forecasting future viability requires the assumption that future conditions will continue the same trajectory or trend observed in the past. We reiterated this assumption repeatedly in our presentation of results." The BLM has incorrectly relied on Garton et al. (2011) for modeled future population trends and fashioned mitigation measures to address supposed downward trends. See Supplement at 3-4. With the information presented herein, the BLM should reexamine the necessary mitigation measures based on the updated information on sage-grouse populations.	3035_2
1024	1024-11	Historical Rate of Decline Modeling Is Inaccurate Sage-grouse population modeling data relied upon in the Supplement is inaccurate, raising concerns that the management decisions based on the modeling is overly burdensome and unreasonable given the actual facts. For example the Supplement references USFWS conclusions based on modeled population estimates prepared by Garton et al. (2011) that directly contradict actual data. The Supplement further suggests that sage-grouse are threatened in some areas by wildfire, encroachment of native conifers, overstocking of domestic livestock, and both renewable and non-renewable energy development. See Supplement at 3-3. No data is provided to indicate that these threats -present in some parts of the overall sage-grouse range -are present and to what degree they are present in the BHB planning area. Such generalizations about threats do not meet the "hard look" requirements of NEPA. For example, Figure 3 below indicates fire perimeters in 2012. No significant fires occurred in priority sage grouse habitat in the Wyoming Basin SMZ in 2012. Speculating that fire is a significant threat in the BHB planning area requires more analysis than simply stating it is a threat. A geographical analysis of historical fire perimeters and data suggesting this is increasing in the BHB planning area, juniper encroachment perimeters, renewable energy footprints and other data should be added to the Supplement to support the conclusion therein. Connection of these data to population trends would indicate whether BLM assertions have merit. The BLM should use the most accurate and current data when developing mitigation measures that have significant impacts restricting other uses of public lands.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-10	Finally, taking historical hunting harvest rates into account, the trends forward from 1995 may represent the best scientifically available data from which to make persistence projections and encompass modern temporal changes in species management that promote more appropriate management of sage-grouse populations. As indicated above on Figure 1 and Figure 2, this more recent data suggest that sage-grouse populations overall are relatively stable to increasing over this time period in the Wyoming Basin SMZ.	3035_2
1024	1024-9	Anadarko comments that the BLM must consider the more recent scientific data as provided herein and not solely rely on Garton's conclusions when making management decisions. Forward looking projections based on this modeling are predicated upon an assumption of constancy and in review of the significant pressures of past overharvest and more recent temporal changes in species management, the ability to project forward population parameters is burdened by an inappropriate analysis that in its current form biases the foreseeable future to provide for a negative outcome. The fundamental nature of the modeling exercise and assumptions it is built upon demand caution in its utilization as a tool by which management decisions should be based.	3035_2
1024	1024-8	"An appropriate harvest rate has not been determined for Greater Sage-Grouse populations. Harvest equal to 5-10% of the fall population may be appropriate but assumes detailed and specific knowledge of population size in September or October. Given the uncertainty in abundance estimates for breeding season population, expecting any state to adequately determine the size of any population of Greater Sage-grouse in fall is not realistic ...Thus, harvest management should be based on spring populations size. Managers could propose harvest of a percentage of the spring breeding population estimate, perhaps 5%; devise and implement survey protocols to obtain breeding season population size (Reese and Bowyer 2007); and subsequently be assured that hunter harvest would not likely exceed the threshold to become additive." Recent scientific data, as noted above, suggest that a harvest percentage of "perhaps five percent" of the spring population may be appropriate if state wildlife agencies "devise and implement survey protocols" to "be assured that hunter harvest would not likely exceed the threshold to become additive." This new information sharply contrasts the USFWS 2010 Listing Decision conclusions (which relied heavily on Garton et al. 2011 data) relied upon in the Supplement at 3-4 to identify future population projections. The Supplement at page 3-4 notes that populations have remained stable over the last decade yet: "Even so, population modeling suggests that declines will continue over the long-term (USFWS (2013))."	3035_2
1024	1024-7	Historical sage-grouse data identified that decline rates correlate with periods of potential overhunting as shown in Figure 2. Unfortunately upon a survey of scientific literature on sage-grouse populations this information appears to have been overlooked and not taken into consideration in projecting future populations. Figure 2 represents the U.S. Fish and Wildlife Services (FWS) hunting harvest data and breeding population estimates as derived from Garton et al. (2011). Harvest as a percentage of reconstructed population estimates is also shown on the secondary y-axis.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1024	1024-6	1. Reduced Hunting Harvest Rates Correlate with Increasing Sage Grouse Populations Historical sage-grouse populations have been affected by a number of factors, including hunting. A reduction in hunting pressure in the mid-1990s correlates with stable to increasing sage-grouse populations since that time. Figure 1 shows historical population trends within the Wyoming Basin Management Zone (SMZ), which encompasses the BHB. The "rate of population change" fundamentally shifted around 1995 for not only the Wyoming Basin SMZ but also for each of the six additional SMZs that encompass the entire range of the sage-grouse. Of note, hunting regulations also changed in 1995 for some portions of the range, including Wyoming, which limited hunter harvest rates, altered season dates, and lowered overall hunter participation. (see FIGURE 1 in PDF) Wyoming Basin SMZ Population estimates (minimum number of males) (from Garton et al. 2011)	3035_2
1024	1024-5	General Comment 1: The BLM Must Consider Data That Demonstrate Sage-Grouse Populations Are No Longer Declining As Suggested By Earlier Literature. Review of available lek count data and historical hunting harvest rates indicate sage-grouse populations are stabilizing and, in fact, are likely to increase in the future without further restriction on oil and gas activity and development. This is due to a combination of factors Increased costs and reduced access to oil and gas resources result in reduced tax revenue to state and Federal governments. including: (1) the Wyoming Core Area Policy, (2) BMPs used by the oil and gas industry, and (3) changes in the management of hunter harvest rates as implemented since the mid1990s, which are discussed in more detail in General Comments 2 to 5. Studies3 predicting future decreasing population trends are demonstrably flawed and fail to account for historical hunting harvest data. The BLM must recommend land management practices not on past flawed data, but on current more accurate data as presented herein.	3035_2
1024	1024-3	The BLM is obligated to manage lands for multi-use. 43 C.F.R. § 1732(a)-(b). This obligation must be reflected in the Supplement. In balancing multiple uses, the BLM should not require conservation measures that are unsupported by science and that unnecessarily infringe on leaseholder rights. Anadarko requests that the BLM reconsider the sage-grouse measures set out in the Supplement at Appendix G (page G-1), among others, and discussed in more detail in Section II.D below, in light of the scientific information contained in these comments and the practical and economic implications of imposing mitigation measures not supported by scientific data.	3035_2
1024	1024-2	Current scientific information discussed herein establishes that sage-grouse populations in the BHB planning area are not at as great a risk as once considered to be. This updated and crucial information must be incorporated in to the planning decisions and proposed mitigation of the Supplement.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-89	Under EPCA BLM is required to identify impediments to oil and gas development. It was the intent of Congress that access to energy resources be improved as indicated in EPCA and EPAct. BLM recognized the intent of the both Phases I and II of the EPCA review when it issued Instruction Memorandum 2003-233, Integration of the Energy Policy and Conservation Act (EPCA) Inventory Results, into the Land Use Planning Process. Consequently, BLM Field Offices are now required to review all current oil and gas lease stipulations to make sure their intent is clearly stated and that stipulations utilized are the least restrictive necessary to accomplish the desired protection. Moreover, the IM directs that stipulations not necessary to accomplish the desired resource protection be modified or dropped using the planning process. Since the purpose of integrating the EPCA results into planning is intended to determine whether existing resource protection measures are inadequate, adequate or excessive, we recommend that BLM reevaluate its management decisions accordingly and make requisite changes to the final planning documents	3027-1
1025	1025-88	COMMENT: As history has shown, as the technology of any given industry evolves so does the science that creates BMP's. The oil and gas industry developed the concept of BMPs whereby unique, state-of-the-art mitigation measures could be utilized voluntarily by an operator on a project-by-project basis while taking into account cost, feasibility and desired outcomes. BLM has since hijacked this effort, which was initially directed at devising innovative solutions, by attempting to mandate these measures on all projects without the flexibility needed to determine their efficacy and feasibility. The mandatory application of BMPs/RDFs as outlined in the SEIS is a perfect example of this unworkable approach. Appendix L contains design features found in the NTT report that require a myriad of measures aimed at protecting Sage-grouse. However, no documentation is provided showing that any of these RDFs have been proven effective over time. Where is the scientific evidence available that demonstrates these RDFs would result in a reduction of impact to Sage-grouse and its habitat? Similar to the approach taken by the BLM's Washington Office, the NTT is relying upon a one-size-fits-all approach that fails to take into account local conditions, including unique habitat and threats, and socio-economic factors. As such, the NTT BMPs are needlessly restrictive, scientifically unfounded, and ignore specific cause and effect mechanisms. Most egregiously, they were designed without any benefit of tracking and testing of the effectiveness of currently required BMPs and mitigation measures. Moreover, many the NTT BMPs fail to acknowledge that a variety of valid existing rights are held throughout the planning area. It is crucial for BLM to acknowledge these rights and honor them, regardless of the BMP(s) selected for implementation, and that the Bureau may not have the legal authority to require implementation of these measures unilaterally.	3035_3-1
1025	1025-87	We support BLM's intention to adopt EO 2011-5 with respect to adaptive management strategies. However, monitoring/adaptive management objectives would only be appropriate for large scale projects, e.g., 500 well EIS, not individual wells. It would be impossible to correlate a population decline with a project of one or two wells, even over a 5-year period.	3035-7

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-86	APPENDIX T In accordance with the Authority outlined in the Federal Land Policy and Management Act (43 U.S.C. 1701-1782) P.L. 98-450 (98 STAT 2718), the Federal Government (BLM) existing in cooperation between the State of Wyoming Oil and Gas Conservation Commission (WOGCC), entered into a Memorandum of Understanding (MOU) concerning well spacing. Specifically, the MOU provides that "BLM will offer input for state spacing hearings, regarding Federal minerals, and will accept WOGCC spacing decisions with no formal ratification measures." We recommend that BLM specifically address how it intends to comply with this MOU with respect to mineral development and surface disturbance as described in Appendix T.	3023-2
1025	1025-83	The NTT recommends management of produced water through removal or re-injection. COMMENT: 40 CFR 435.50 (Subpart E) provides that produced water from onshore facilities west of the 98th meridian may be used in agriculture or wildlife propagation. There is a considerable lack of surface water in semi-arid Bighorn Basin and beneficial use of surface discharge water by ranchers and wildlife is essential. The suggested management of removing produced waters as suggested by the NTT would result in huge habitat and water resource losses to Sage-grouse. Moreover, the Wyoming Department of Environmental Quality, Water Quality Division, already has jurisdictional oversight of the surface discharge monitoring program on non-tribal lands in Wyoming. Therefore, it would be wholly inappropriate for BLM to attempt to implement this poorly conceived NTT BMP in the Bighorn Basin. It is important for BLM to clarify how the BMPs/RDFs will interface with the specific NSO and CSU requirements outlined in the preferred Alternative D of the RMP/EIS, as well as the NSOs and CSU requirements in Alternatives E and F which are the subject of the Supplement. Moreover, the SEIS does not specify whether all of the RDFs apply to core (priority) habitats only or whether some (or all) apply to both core/priority as well as general Sage-grouse habitat. BLM needs to clarify where it envisions each of these measures would be applied. Additionally, BLM needs to specify whether there will be a process for granting waivers, exceptions or modifications due to site limitations or engineering considerations which establish the design approach as infeasible. The SEIS has failed to incorporate the qualifiers "if feasible, where feasible and unless technically unfeasible" in order to acknowledge that not all measures will have blanket applicability in all cases and that feasibility is a valid concern. Instead, the SEIS mandates measures with no attention given to whether the practice is even feasible based on project-specific factors.	3044
1025	1025-82	The NTT also recommends pest management through a number of pesticide applications. However, mosquitos are already sufficiently managed and there are new technologies other than larvicides that have been proven effective to controlling mosquito populations.	3035_3-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-81	NTT suggests management of a number of structural modifications for water impoundments. COMMENT: Such a program can only be viewed as a needless waste of federal taxpayer dollars because the Wyoming State Engineer's Office (WSEO) already has the legal jurisdiction to review and approve construction plans associated with State waters. Additionally, the NTT recommends management of produced waters through re-injection at facilities through Underground Injection Control (UIC) Permitting which would also constitute a needless duplication of the UIC Permitting Program already under the jurisdiction of the Wyoming Oil and Gas Conservation Commission (WOGCC). Establishing these new federal programs would be a waste of manpower and tax dollars because they would merely attempt to duplicate State programs.	3044
1025	1025-80	"Increase the size of freshwater ponds to accommodate a greater volume of water than is discharged" COMMENT: In an effort to avoid Cx. Tarsalis breeding, this BMP would increase larval habitat for Culicoides sonorensis, a vector of blue tongue disease. The proposal to trade one viral vector habitat for another can hardly be construed as beneficial to the Bighorn Basin. Without question, the mortality impact of Culicoides sonorensis on wild ruminants' populations would be far more devastating than WNV in Wyoming's Bighorn Basin semi-arid region. In fact, not only are food sources such as white-tail and mule deer populations currently under attack in Montana by epizootic hemorrhagic disease virus (EHDV), cattle infections have also been reported resulting in economic loss due to EHDV elsewhere (Ruder, M.G., Parasites and Vectors 201, 5:236). Therefore, these management approaches on produced waters clearly are not in the best interests of the Bighorn Basin mammalian food sources or mammalian related economics.	3023-1
1025	1025-79	The NTT suggests a multitude of BMPs (16) to manage West Nile Virus. COMMENT: According to data from the Centers for Disease Control (CDC) the risk to avian species from West Nile virus (WNV) has declined to virtually nothing since 2003. This is an example of where only a portion of the available information is used to address the impacts, in this case of WNV on Sage-grouse, resulting in onerous and unfounded mitigation requirements. We recommend that rather than focusing on the minimal threat of WNV, BLM more appropriately focus its attention on the highly significant issue of rampant predation of Sage-grouse.	3035_3-1
1025	1025-78	Remove standing and encroaching trees within at least 100 meters of occupied sage grouse leks and other habitats (e.g., nesting, wintering, and brood rearing) to reduce the availability of perch sites for avian predators, as appropriate, and resources permitted. COMMENT: Apparently, the NTT is unaware that trees are actually rare occurrences within the Bighorn Basin. Consequently, we question the advisability of removing a tree simply because a lek exists.	3035_2

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-77	Power-washing all vehicles and equipment involved in vegetation treatment and firefighting activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species. COMMENT: This BMP fails to describe how the wash areas and runoff associated with wash stations will be handled. Can the fluid and associated substances be hauled off, injected or disposed of at a facility onsite and are special permits required? This BMP attempts to address concerns regarding a perceived problem but fails to fully consider the ramifications of such a requirement. What solution does BLM intend to utilize for the general public or recreationalist crossing Public Lands on motorized and non-motorized forms of transportation and how this issue will be enforced?	3014
1025	1025-76	Use only close-loop systems for drilling operations. COMMENT: Closed loop systems for drilling operations are utilized in most sensitive areas already where they are technically feasible and economically viable for the operator. We recommend that BLM consider the impact that additional truck traffic hauling fluids out of the area could have on Sage-grouse habitat. It must also be recognized that additional truck traffic may require road upgrade, which could defeat the purpose of the BMP. It may be more reasonable to install Sage-grouse safe fences in the majority of instances.	3035_9
1025	1025-75	Cluster disturbances, operations and liquid gathering facilities outside priority areas. COMMENT: Based on the recent release of IM 2013-152 "Commingling" and existing rules governing "Off Lease Measurement", does the BLM have a plan in place to approve these requests for commingling and off lease measurement of oil and gas for areas where wells may be located within priority areas and the pipelines and treating facilities are located outside priority areas? Due to the limited disturbance and parameters outlined throughout this document, this will likely become an issue for future development within the Sage-grouse habitat and BLM needs to have a plan in place to address these issues.	3035_9
1025	1025-74	It is important for BLM to collaborate with WGFD and to also recognize that as a landowner, the Bureau must also be a contributor to the overall collection of information. Additionally, we recommend that the State maintain a database of information and recommendations for BMP's, additional studies and monitoring activities that are based upon the best available science. Limiting the data repository to one entity that handles information, mapping and recommendations will eliminate confusion for the public, multiple conflicting reports and overall mistrust.	3035-7
1025	1025-73	It is unclear why there is a discrepancy (males and females versus males only) between the two referenced planning documents in their protocols regarding monitoring of Sage-grouse, particularly if Wyoming Game and Fish is responsible for data collection in both cases. If this information is to be used to "identify connections between the overall monitoring program and then management decision process", there should be single set of recommended indicators to detect change in resource conditions range wide. We recommend that Wyoming BLM adopt a strategy that includes the monitoring of females and males rather than just males. Appendix C acknowledges that "state fish and wildlife agencies have the primary responsibility for population level management of wildlife, including population monitoring"	3035-7

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-72	The SEIS does not provide any relevant detail regarding the type of monitoring strategy BLM is contemplating. Nor does it explain how its monitoring strategy will interface with BLM's AIM strategy and how monitoring will be utilized to gauge the effectiveness of RDFs which are the subject of Appendix L (See further comments below). Further, it is not specified what entity will be charged with collecting the monitoring data on oil/gas leases. BLM needs to explain in the SEIS how this data could be used to adaptively feed back into the monitoring process and refine adaptive management needs on a planning area basis. Also, BLM needs to include a discussion on what types of findings, or more specifically, what type of numeric thresholds, might trigger adaptive management.	3035-7
1025	1025-71	Page 4-144: "Projected tax revenues for Alternative F due to oil and gas production on BLM-administered surface would average \$35.5 million per year for federal royalties, \$17.1 million per year for state severance taxes, and \$19.7 million per year for local ad valorem taxes." COMMENT: This is a decrease across the board in tax revenue (federal, state and local). This represents a total reduction of over \$5 million in annual royalty and tax revenue. The local tax decrease from Alternative A to Alternative F would be almost \$3 million, an impact the Bighorn Basin communities would most certainly notice.	3036-2
1025	1025-70	Alternative F Page 4-143 : "...regional earnings and output under Alternative F for the modeled sectors (oil and gas, grazing, and recreation) would be similar to but slightly less than under Alternative D due to additional NSO restrictions for oil and gas development in greater Sage-grouse Core Habitat Areas. This NSO restriction would reduce estimated oil and gas development when compared to alternatives A and D." COMMENT: Here again is another instance of attempting to downplay the differences between alternatives D and F. Table 4-22 on page 4-139 shows a decrease under Alternative F in regional earnings of \$5 million and a decrease in output of \$33 million annually. These numbers are significantly less, and cannot be characterized as similar or just slightly less.	3036-1
1025	1025-68	4.8.2.2 Summary of Impacts by Alternative Page 4-137: "Alternative A would result in the second-highest level of economic activity, and alternatives D and F the third-highest." COMMENT: Both alternatives D and F cannot rank third-highest, they should be listed as ranking third and fourth highest respectively. This is another instance of the attempt to align Alternatives D and F as similar and only slightly different, when a review of the BHB SEIS shows there are some significant modifications in the land management which result in significantly different socio-economic impacts .	3036-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-67	Page 4-137: "As described under Alternative D, Alternative F employs a balanced management approach and would continue BLM's current practice of allowing multiple-uses of public lands, as opposed to a single species management. However, under Alternative F, additional measures related to conservation of resources (particularly in greater Sage-grouse Core Habitat Areas) would place additional emphasis on wildlife habitat concerns over economic development compared to management under alternatives A or D." COMMENT: BLM continually states with regard to Alternative F that it represents a balanced management approach, however, additional measures related to conservation of resources place additional emphasis on wildlife habitat. Many of these additional measures related to conservation of Sage-grouse habitat referenced are scientifically unsupported and inconsistent with EO 2011-5.	3036-1
1025	1025-66	Page 4-137: "Economic opportunities in the Planning Area under Alternative F would be slightly less than under alternatives A and D. Alternative F would also result in greater beneficial effects to air quality, wildlife, and other resources that improve quality of life related to natural characteristics than under alternatives A, C, or D." COMMENT: Yet again, this paragraph illustrates BLM's continued alignment of Alternative F with Alternative D. It states that economic opportunities would be "slightly less" under Alternative F in comparison to Alternative D. However, review of Table 4-21 on page 4-134 of the BHB SEIS reveals that under Alternative F, there would be a decrease in annual earnings due to activities on BLM-administered surface of \$4.9 million. This number does not support the statement "slightly less", but rather "significantly less" would be a much better characterization. Further, with regard to the second sentence in this paragraph which states, "Alternative F would also result in greater beneficial effects to air quality, wildlife, and other resources that improve quality of life related to natural characteristics than under alternatives A, C, or D," there is the insinuation that less oil and gas development will result in better air quality, wildlife, and other resources. We would like to point out that responsible oil and gas development will not adversely impact air quality, wildlife or natural characteristics. Oil and gas development in the Bighorn Basin has a very favorable historical record of responsibility for all environmental concerns. It is objectionable that the agency is sacrificing the growth of the Bighorn Basin by relying upon flawed assumptions with no science to back them up.	3036-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-65	Page 4-137: "Alternative F would also result in slightly reduced tax base from oil and gas production compared to alternatives A and D. Geographically, the change in job opportunities-and related impacts on housing and community services-would be spread across the Planning Area and would be spread over time." COMMENT: This statement is erroneous in that the impacts to job opportunities, and the related impacts on housing and community services, would be more immediate and not something that would take place over time. Table 4-25 on page 4-142 shows focal ad valorem production tax revenue from Alternative A to Alternative F will decrease by close to \$3 million annually and the decrease from Alternative O to Alternative F will be \$1.5 million annually. These are large decreases in local tax revenue that would be felt right away by the communities in the Bighorn Basin.	3036-2
1025	1025-64	Page 4-136: "Alternative F may result in a slight decrease in job opportunities compared to Alternatives A and D, potentially causing a slight decrease in population compared to those alternatives. At this time, the impact to individual communities is not known until further research is conducted." COMMENT: Again there is the attempt to align Alternative F with alternatives A and D, when clearly they are different. The social and economic impacts from Alternative F have been shown throughout this section of the BHB SEIS to be more than slight. Also, it is again stated that further research is needed to understand the true impacts, showing the analysis to be incomplete and, therefore, inaccurate.	3036-1
1025	1025-63	Alternative F Page 4-136: "For purposes of this analysis it is assumed that ROW; transportation, and seasonal restrictions would not impact commercial or recreational activities, although the impact is unknown at this time." COMMENT: The BHB SEIS is mainly about the addition of restrictions on disturbance in greater Sage-grouse Core Habitat Areas, which will include ROW, transportation and seasonal restrictions. All parts of this analysis need to take into consideration the impacts these additional restrictions WILL incur. For example, decreasing the allowable disturbance threshold in Sage-grouse Core Habitat Areas from 5% to 3% will cause severe impacts to oil and gas development, which will, in turn, cause severe impacts to the communities of the Bighorn Basin. Failure to fully and adequately review the economic and social impacts that could result from changes in public land management make this analysis seriously flawed, rendering this report incomplete and inaccurate.	3036-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-62	Alternative E Page 4-134: "...impacts on population would be the same as those described under Alternative 8, which would include a decrease of 669 jobs (approximate 46 percent decrease) compared to Alternative A." Impacts on Housing and Community Services, Page 4-135, Line 6: "The exact geographic distribution of these changes is not possible to predict because tax losses in specific jurisdictions would be driven by undetermined well locations; however, the restriction on oil and gas development under Alternative E affect broad areas of land throughout the Planning Area, so the reductions in tax revenues would likely affect all communities that currently produce oil and/or gas." COMMENT: As with Alternative B, Alternative E would adversely affect the economic and social well-being of all communities in the Bighorn Basin. This can be seen in the substantial decrease in jobs (46%) and resulting reduction in tax revenues. The overarching implications of decreases at this level would be detrimental to the area and its culture.	3036-2
1025	1025-61	Page 4-133: Alternative F in the table is listed as having, "Low to medium impact (due to restrictions and requirements for livestock grazing operators in Core Habitat Areas.)" COMMENT: This statement is deliberately misleading. BLM knows full well that the additional restrictions and requirements in Core Habitat Areas imposed by Alternative F would also be impactful to oil and gas activities, and as stated above, oil and gas development is the largest contributor to the social and economic well-being of the communities of the BHB.	3036-1
1025	1025-60	Page 4-132: "Alternatives D and F balance management emphasis between resource conservation and resource use, but are generally closer in line with resource use and development. Alternative F imposes additional constraints on disturbance in greater Sage-grouse Core Habitat Areas when compared to Alternative D. Based on analysis in the Economic Conditions section, these additional constraints would restrict further economic activity in the oil and gas sector when compared to Alternative D. Impacts of Alternative F on population and public services associated with impacts on economic activity would be slightly more restrictive than those of Alternative D." COMMENT: This paragraph claims that "impacts on economic activity would be slightly more restrictive than those of Alternative D." However, a review of Table 4-20 on page 4-133, lists the impacts from Alternative D as being low, whereas impacts from Alternative F are listed as low to medium. If the statement above were truly the case, Alternative F would be listed as having low impact. Of note is the fact that alternatives B and E, the alternatives that would pose the greatest impact to the social conditions in the Bighorn Basin, with the highest reductions in oil and gas workforce numbers and tax benefits, are both listed as having medium impact. No matter which way you look at it, any additional restrictions to oil and gas development, the largest contributor to the social and economic well-being of the BHB, would have adverse effects on the BHB communities. We again point out that Alternative F would impose additional constraints that are both largely unsupported by science and inconsistent with the Governor's Sage-grouse Executive Order 2011-5.	3036-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-59	Section 4.8.1.2 Summary of Impacts by Alternative Page 4-131: "Social conditions are fundamentally influenced by economic conditions. Employment and income improve or detract from social conditions and quality of life; communities in the Planning Area have developed cultures associated with economic activities such as natural resource extraction, ranching and recreation. Given the large portions of public land within the counties of the Planning Area, BLM management decisions have the potential to influence the community character and identity, even if the economic impact is measured by this analysis is minimal. " COMMENT: We agree that BLM management decisions, as well as employment and income, have significant influence on the quality of life and social conditions of the Bighorn Basin communities. These areas area is dependent on high paying oil and gas jobs in addition to the tax revenue realized from oil and gas exploration and production activities. The addition of more restrictive policies for oil and gas development, as described in alternatives E and F, will seriously limit economic development and job creation in the planning area, detracting from the social conditions and quality of life in these communities.	3036-2
1025	1025-58	Our previous comments to the Bighorn Basin DEIS/RMP dated September 7, 2011 regarding socio-economics remain the same and by this reference are incorporated herein. We would like to further add the following with regard to the Bighorn Basin Supplemental EIS (BHB SEIS) and alternatives E and F. BLM has failed to adequately disclose the importance of oil and gas resources in the Bighorn Basin.	3036-2
1025	1025-57	The publication of Samson et al (2004) does not address sagebrush ecosystems in Sage-Grouse MZL. This paper addresses prairie grasslands in the Great Plains, which represents a much larger area. Samson et al (2004) also does not differentiate between prairie grasslands and sagebrush steppe. Therefore, it is unsuitable as a reference. We recommend that final RMP/EIS present information (including a map) on the amount of sagebrush habitat that has been converted to agricultural uses within the Bighorn Basin planning area specifically. The SEIS does not specify whether all of the RDFs apply to core (priority) habitats only or whether some (or all) apply to both core/priority and general Sage-grouse habitat. BLM needs to clarify where each of these measures is envisioned to be applied and identify whether, consistent with the Lander Proposed RMP/EIS and EO 2011-5, 5 Taylor, Dzialak and Hayden-Wing, Greater Sage-grouse Populations and Energy Development in Wyoming, 2007; Greater Sage-grouse Populations and Energy Development In Wyoming-2010 Update Taylor, Russell and Taylor 2011 there will be a process to consider exceptions due to site limitations or engineering considerations which establish the design approach as infeasible.	3035_2
1025	1025-56	We recommend that BLM fully consider the results of the studies conducted by Ramey et al (2011) and Taylor et al (2007) in addressing the effects of oil and gas development on Sage-grouse and Sage-grouse habitat. In addition, most of the recorded effects on Sage-grouse populations have been based on lek counts. These studies indicate that oil and gas activities have reduced lek counts in the vicinity of oil and gas developments but have not shown that population losses have occurred.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-55	Alternatives E and F in the SEIS do not directly address Sage-grouse winter concentration areas/habitat since these Alternatives are focused on management within Sage-grouse CHA and KHA ACECs. However, Alternatives B and D in the BHB Draft RMP provide stipulations that apply within Sage-grouse winter concentration areas under Alternatives E and F, respectively.	3035_2
1025	1025-54	It is important for BLM to limit the application of this TLS to "suitable" Sage-grouse habitat. EO 2011-5 specifies that activities in nesting and early brood rearing habitat may be approved year round on a case-by-case basis in "unsuitable habitat." Seasonally restricting oil and gas operations to protect unsuitable Sagegrouse habitat is entirely unjustified. As such, we recommend that BLM place the same qualifier, "suitable habitat," on this TLS as outlined in Record 77. The prohibitions on surface disturbing/disruptive activities in nesting and early brood-rearing habitat are unwarranted. While there may be some discrepancy in nesting/brood-rearing seasons due to elevation, geography, etc., the overall length of the season will be consistent regardless of location. For example, Sagegrouse in lower elevations tend to start mating approximately two weeks earlier than Sage-grouse at higher elevations; but, the overall length of the mating season remains the same. We are not opposed to starting or ending this TLS on different dates to account for geographic differences in Sage-grouse behavior. However, we oppose arbitrarily extending a TLS for nesting/early-brood rearing habitat by 2 Y. months because it is not biologically justified. We point out that the SGIT has determined that a 3 Y. month TLS for nesting/early-brood rearing is adequate throughout Wyoming.	3035_9

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-53	Sage-grouse habitat management for activities outside of Core Populations Areas is straight forward under EO 2011-5 -a maximum Y.-mile NSO and 2-mile seasonal buffer applied to occupied leks. It does not mandate the application of any stipulations outside of Core Areas. Additionally, EO 2011-5 provides that incentives to enable development of all types outside Core Areas should be established, including stipulation waivers or modifications, even if it results in reduced numbers of Sage-grouse outside of Core Areas. We are concerned that management outside of KHAs under Alternatives B and E is inconsistent with and greatly exceeds what is provided for under EO 2011-5. Specifically, the 0.6 mile NSO around occupied Sage-grouse leks, CSU for discretionary actions, ROW exclusion areas around leks, and TLS in nesting and early brood rearing habitat within 3-mile lek buffer were not contemplated by EO 2011-5 because such stipulations directly contradict the foundational principal of the Sage-grouse Core/Key Habitat Area concept -control and restrict operations within these areas to protect important Sage-grouse habitat, while promoting and incentivizing development in less desirable Sage-grouse habitat outside these areas. EO 2011-5 recognizes this principal by providing incentives to enable development outside of Core Areas. The overly restrictive Sage-grouse habitat stipulations outside of Key Habitat Areas as proposed under Alternatives Band E conflict with this principal. Therefore, rather than adopting any variation of these management options, we urge BLM to adopt the Core Area Strategy contained in EO 2011-5 in the final planning documents because it represents the most scientifically valid approach to protecting important Sage-grouse populations and habitats.	3035_1
1025	1025-52	Neither the NTT nor the SEIS specify what activities will be included in the surface disturbance calculation. Properly managed livestock grazing on federal land has been shown to have beneficial impacts on the surface. This positive impact of livestock grazing has been acknowledged by BLM and the Wyoming Governor's Office. As such, it is not appropriate to consider livestock grazing as a disturbance that will count against the surface disturbance cap. Additionally, the surface disturbance cap is focused specifically on limiting surface impacts created by oil and gas operations. Therefore, the only surface disturbance that should be included in the disturbance cap calculation is that caused by oil and gas development.	3017-1
1025	1025-51	We recommend that BLM specify what mitigation and/or reclamation efforts will be considered, the process for determining what efforts will be considered, and how an operator will receive credit for restored habitat and offset mitigation. This will provide operators with certainty and an incentive for pursuing such projects. We also suggest BLM expand this exception to include reclamation of Sage-grouse habitat in addition to mitigation; reclaimed Sage-grouse habitat has been returned to its previous condition and thus should not be counted as disturbed in the surface disturbance calculation.	3035-7
1025	1025-50	Another discrepancy between Alternatives E and F and EO 2011-5 is the extent of the surface disturbance cap. Alternatives E and F propose a 3% cap while EO 2011-5 (and Alternative D) provides for a 5% cap on surface disturbance.	3035_4

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-49	We recommend that BLM modify Alternatives D, E and F to comport with EO 2011-5. EO 2011-5 went through careful deliberations to ensure that a practical and scientific basis was utilized when identifying appropriate Sage-grouse protection measures. Using language such as "sage brush habitat" or "total Sage-grouse habitat" is unacceptably broad because it fails to focus on the real purpose of the surface disturbance cap, which is to protect the Sage-grouse. We urge BLM to acknowledge in the planning documents that not all sage brush habitat is Sage-grouse habitat and not all Sage-grouse habitat is suitable Sage-grouse habitat. To achieve protection of the Sage-grouse and its habitat, the surface disturbance cap need only apply to "suitable Sage-grouse habitat." As provided for in EO 2011-5, it is crucial for BLM to eliminate unsuitable Sage-grouse habitat from consideration when calculating the surface disturbance cap.	3035_1
1025	1025-48	The SEIS states that Key Habitat Areas outlined in Alternative E were based upon Version 2 of EO 2011-5 while the Core Habitat Areas described in Alternative F were based upon Version 3 of EO 2011-5. It is unclear why BLM would base one of the two new alternatives upon an outdated version of EO 2011-5 when Version 3 was available during the supplemental planning process. Further, we oppose the expansion of BLM's Key Habitat under Alternative E which encompasses nearly 72,000 additional acres because there is no scientific justification for this arbitrary expansion of habitat. Moreover, an ACEC designation coupled with a 3 percent disturbance cap would effectively prohibit any new oil and gas exploration and development within the highly important Bighorn Basin. We encourage BLM's adoption of the Version 3 Core Area provided in EO 2011-5 in the final planning documents, including the 5 percent disturbance cap.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-47	It is clearly inappropriate for BLM to dictate a specific technique for conducting geophysical operations. While heliportable drilling for seismic operations can be a useful BMP in certain, limited situations, there are abundant and equally effective BMPs that allow for the same or similar impact mitigation in Sage-grouse habitats which the SEIS fails to even mention, much less analyze. The following is an abbreviated BMP list that is recommended and applied by both BLM and the geophysical industry. These techniques have proven to be highly effective in minimizing or in many cases eliminating impacts to sage brush/Sage-grouse: Off-set tracking for all wheeled vehicles; Smooth or non-aggressive tires (vibrators); Limited or no "back-tracking" on the same route(s); Elimination of ATVs/OHVs off-road; Vibrating on existing roads; On-snow or frozen ground buggy drilling/vibrating; Hand raking of buggy/vibrator tracks visible from traveled roads. Application of a reasonable mix of the above techniques has been shown to successfully avoid impacts to sage brush. Extensive monitoring has shown that balloon tired four wheelers and foot traffic have very diffuse impacts, indeed much less effect on the environment than cattle grazing and wild horse traffic on public lands. Moreover, we question whether BLM has fully considered the safety, noise or economic ramifications of this proposal We also question BLM's justification for requiring helicopter-portable seismic exploration when seasonal restrictions will be utilized. BLM needs to clearly explain in the SEIS what is meant by "other restrictions that may apply." A mere statement that other restrictions may be imposed is far from adequate because it fails to meet the disclosure requirements under the National Environmental Policy Act (NEPA) and precludes the opportunity for public review and comment.	3039-2
1025	1025-46	Attempting to limit collection and use of scientific information would have no practical effect on mitigation of Sage-grouse impacts. We remind BLM that geophysical data and its interpretation do not stop at an arbitrary line on a map. Any attempt limit its interpretation would compromise the usefulness of the data on both sides of that boundary definition. This proposed wording and concept is totally unacceptable and beyond the BLM's authority to regulate and must be dropped in its entirety.	3023-4
1025	1025-45	This wording is dangerously confusing because it could be interpreted to prohibit the use and interpretation of geophysical information for areas within Sage-grouse core areas, which would be inconsistent with valid existing lease rights for oil and gas leases.	3023-4
1025	1025-44	The SEIS fails to discuss the application of both BLM and industry recommended BMPs and their effectiveness or the abundant independent monitoring of such BMPs in sagebrush ecosystems. It also fails to analyze less stringent mitigation to Sage-grouse population and habitat goals. Finally, such a restriction could abrogate valid existing lease rights granted because prohibiting geophysical exploration would be a major "taking" of lease rights.	3023-4

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-43	Closure of these vast and substantial key Sage-grouse habitats to geophysical exploration is not a stated objective of the IM 2012-044 or the U.S. Fish and Wildlife Service (FWS) "Conservation Objectives: Final Report." Moreover, we found no language in any of these documents that recommends the wide-ranging requirement to disallow use of geophysical information either in or outside Sage-grouse habitat.	3023-4
1025	1025-42	RECORD 85 - Where the federal government owns the surface, and the mineral estate is in non-federal ownership in priority habitat, apply appropriate Fluid Mineral BMPs to surface development.COMMENT: In addition to the concern expressed regarding the previous record, we are concerned that in taking this action, the federal government be denying a mineral owner the ability to develop his minerals. Case law has already established that the mineral estate is dominant over the surface estate. It is agreed that, in the case of separate ownership of minerals and surface, the mineral owner may enter and use that part of the surface that is reasonably necessary for the efficient removal of the minerals. Further, such use does not require any payment for damages caused to the surface by the mineral owner so long as the use is reasonable.	3019
1025	1025-41	RECORD 84 -Where the federal government owns the mineral estate and the surface is in non-federal ownership, apply the conservation measures applied on public lands. COMMENT: The imposition of the identified conservation measures on federal minerals/private surface demonstrates DOI's intention to limit at all costs future oil and gas activities within the planning area, and indeed the entire Rocky Mountain region, while all other uses on private surface will proceed as the surface owner sees fit. We strongly object to this approach because it is predicated upon the scientifically flawed assumptions promoted by the NTT as discussed previously in these comments.	3023-2
1025	1025-40	RECORD 83 -Any oil, gas, geothermal activity will be reviewed based on evolving scientific knowledge of impacts. COMMENT: BLM can review any activity it wishes, but the agency must still honor valid existing rights as previously discussed in these comments. It does not have the authority to modify the lease agreement simply because new science may evolve.	3019
1025	1025-39	RECORD 80 -Consider offers to amend, cancel or buy out leases. RECORD 81 -Include conditions that require relinquishment of leases/authorizations if doing so will mitigate the impact of a proposed development or mitigate the unanticipated impacts of an approved development. COMMENT: We point out that while BLM may have the authority to approve offers to buy out a lease, the ultimate decision rests with the lessee rather than agency. Moreover, any attempt by BLM to amend, cancel, buy out or force relinquishment of a lease would constitute a breach of the federal lease contract and would found by any court to be an illegal "taking" and the lessee would be due just compensation. Valid existing rights must be honored regardless of any new mitigation measures that would exceed the terms of the lease. Additionally, what is meant by an "unanticipated impact?"	3023-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-38	RECORD79 Limit proposed surface disturbance to 3 percent for an area when permitting APDs on existing leases that are not yet developed. Consider an exception if additional mitigation is demonstrated to offset the resulting loss of Sage-grouse habitat. Implement additional mitigation when necessary in priority sage-grouse habitat. Implement additional mitigation first within the same population area where the impact is realized, and if not possible, then conduct mitigation within the same Management Zone as the impact, per 2006 WAFWA Strategy (page 2 17). COMMENT: See our previous comments regarding our opposition to the imposition of a 3 percent disturbance cap and the adoption of a Sage-grouse ACEC. Once again, we support the language in EO 2011-5, which provides that existing activities in areas already disturbed or approved for development within Core Areas prior to August 1, 2008 will not be made subject to new Sage-grouse stipulations. Existing activities in areas already disturbed or approved for developments include those within a defined project boundary such as: a recognized federal oil and gas unit, drilling and spacing unit, mine plan, subdivision plat, etc. Under EO 2011-5, they would be allowed to continue within the existing boundary, even if the use exceeds recommended stipulations recognizing that all applicable federal actions shall be allowed to continue. Additionally, we question BLM's authority to impose mitigation measures that a inconsistent with the rights granted under the lease.	3035_4
1025	1025-37	RECORD 78 -Complete Master Development Plans in lieu of APD-by-APD processing for all but wildcat wells. COMMENT: Such a provision is poorly reasoned and is particularly inappropriate for use in the Bighorn Basin. While master development plans (MDP) may be acceptable and beneficial in areas where new drilling takes place year round or where there is long term development planned, BLM has failed to consider the greater likelihood of periodic drilling or drilling within existing Federal Units on a well-by-well basis within the Bighorn Basin. Currently, the operator of a federal unit is required to submit a Plan of Development and a Review of Operations on a yearly basis. BLM needs to recognize that most Bighorn Basin operators drill only on occasion, rather than continuously. Very few, if any, are solely exploration companies. Therefore, we recommend BLM eliminate the requirement for an MDP within the Bighorn Basin.	3023-6
1025	1025-36	RECORD 71 -Apply a TLS condition of approval to prohibit surface-disturbing exploratory drilling activities during the nesting and early brood-rearing season in priority Sage-grouse habitat. COMMENT: First, this record fails to establish what timeframes BLM is considering. Second, BLM does not have the authority to impose a TLS COA on existing leases if the COA would exceed the terms of the lease. While BLM may believe the Yates decision gave it the authority to apply new restrictions at will, that belief is false. The case simply upheld the application of a COA based upon a site-specific circumstance. The decision did not give BLM authority to impose any COA it wishes on any lease. (See Yates, 176 IBLA at 157; William P. Maycock, 177 IBLA 1, 16-17 (2009). Case law has clearly established that once the BLM has issued an oil and gas lease that grants the right to access and develop, BLM has no authority to modify the terms of the lease in such a manner that would abrogate the lease rights granted.	3023-2

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-35	<p>RECORD 76-Apply an NSO condition of approval within 0.6 mile of occupied or undetermined Sage-grouse leks. Apply TLS condition of approval to restrict disruptive activity within 0.6 mile of occupied or undetermined Sagegrouse leks from March 15 to June 30. COMMENT: Each oil and gas lease contains lease covenants made by the lessee, which can be express or implied. Implied covenants are unwritten promises that impose duties on the lessee and protect the lessor. The courts generally recognize implied covenants such as the right to produce and market, protect from drainage, to reasonably develop, further explore, to operate prudently and properly, and to explore based on economic justification. BLM has no legal authority to impose mitigation measures, such as an NSO Condition of Approval (COA) if it would exceed the terms and conditions of previously issued lease. The BLM must acknowledge that it has no authority to abrogate the valid existing lease rights. We strongly recommend that BLM eliminate this record from the final planning documents. The surface occupancy stipulations proposed under Alternative E, including the 4-mile NSO around a lek, are entirely unreasonable because there is no scientific rationale to support such extreme measures. The 0.6 mile NSO around the perimeter of occupied Sage-grouse leks within KHAs provided under EO 2011-5 is adequate to protect Sage-grouse habitat. Increasing the size of a lek buffer by almost 700% is excessive and wholly unjustified. Placing a 4-mile NSO around all leks would unreasonably preclude development on thousands of acres of unsuitable Sage-grouse habitat. We recommend a more focused NSO of 0.6 miles that allows for a case-by-case analysis and determination of where development is feasible after consideration of habitat suitability and other site specific conditions. We strongly urge BLM to remove the Sage-grouse surface disturbance stipulations provided for in Alternative E from consideration for inclusion in the final planning document. In so doing, BLM would prevent undue restriction of surface use while ensuring consistent management of Sage-grouse habitat throughout Wyoming and clearly illustrate that the State of Wyoming and the BLM are dedicated to protecting and preserving Sage-grouse habitat to prevent a listing of the species under the Endangered Species Act. The 4.0-mile NSO under Alternative E and the 0.6 mile NSO under Alternative F refer to placing limitations on "surface disturbance" and "disruptive activity" respectively. This is in addition to precluding "surface occupancy" within these lek buffers. Since it is possible to have surface disturbing activities without actually occupying the surface (e.g. buried pipelines, buried power lines), this is a notable discrepancy between the SEIS and EO 2011-5 because it will unduly restrict potential surface uses in these areas. While EO 2011-5 prohibits "surface occupancy," it does not prohibit "surface disturbing activities;" rather it allows for authorization of "other activities" if protected resources are not adversely affected. It provides that for activities outside of Core Population Areas, no more than a .25 mile no surface occupancy standard will be applied to occupied leks. The BLM's proposed 0.6 mile COA directly conflicts with the 0.25 mile buffer provided for by the State for leks outside core areas, which allows much needed flexibility in the application of this stipulation and potential land use. We urge BLM to remove "surface disturbance" and "disruptive activity" from these stipulations to achieve consistency with the State.</p>	3035_1

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-34	RECORD 75 -Implement management actions regarding unitization and requirements for full reclamation bonds through implementation decisions (e.g., approval of an APD, Sundry Notice, etc.) and upon completion of the environmental record of review (43 CFR 3162.5), including appropriate documentation of compliance with NEPA. Evaluate, among other things: Whether the conservation measure is "reasonable" (43 CFR 3101.1-2) with the valid existing rights. Whether the action is in conformance with the approved RMP COMMENT: See comments on Records 72 and 73.	3023-2
1025	1025-33	RECORD 73 -Require a full reclamation bond specific to the site in accordance with 43 CFR 3104.2, 3104.3, and 3104.5. Ensure bonds are sufficient for costs relative to reclamation that would result in full restoration of the lands to the condition it was found prior to disturbance. Base the reclamation costs on the assumption that contractors for the BLM or USFS will perform the work. COMMENT: Current bonding requirements already fully address reclamation in accordance with current regulation; therefore this proposal is excessive and unjustified. If an operator is in good standing and has a Statewide/Nationwide bond in place, there is no need to require any additional bonding. Moreover, this is inconsistent with IM 2013-151 which prohibits automatic bond increases without conducting a site-specific review that demonstrates an operator has failed to conduct all operations in a prudent manner and has a definitive history of serious noncompliance. We are concerned that BLM is attempting to unilaterally modify existing regulations without going through the rulemaking process to achieve the changes proposed in the SEIS. We strongly recommend that BLM eliminate this flawed proposal from the planning documents. We ask BLM to explain its plans for granting roll-over credits. Is BLM willing to give credit for interim reclamation efforts toward the total disturbance cap allowance? For example, as outlined in the EO 2011-5, reclamation credit is to be given for completion of habitat enhancements once a bond is released. These habitat enhancements may be used as credit for reclamation that is slow to establish in order to maintain the disturbance cap or to improve nearby Sage-grouse habitat.	3023-2

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-32	RECORD 72 -Require unitization when deemed necessary for proper development and operation of an area or to facilitate more orderly (e.g., phased and/or clustered) development as a means of minimizing adverse impacts to resources, including greater Sage-grouse, so long as the unitization plan adequately protects the rights of all parties including the United States, according to the Federal Lease Form, 3100-11, Sections 4 and 6. COMMENT: This Record misinterprets the legal purpose of unitization as established by law as well as BLM's legal authority to require unitization. According to BLM's own draft Handbook on Unitization and findings by the Interior Board of Land Appeals, the principal purpose of establishing a unit is to facilitate exploration in undeveloped areas and to maximize the production of oil and gas and revenue for the federal government. Units are not established for the protection of resources but are based on economics and reservoir engineering designed to provide technical benefits to all unit participants. Moreover, significant surface acreage and mineral estate within the Bighorn Basin are held privately; and, BLM has no authority to require non-federal lessee and mineral owners to enter into federal units. Furthermore, EO 2011-5 provides that existing land uses within Core Population Areas will be recognized and respected prior to August 1, 2008, which directs that oil and gas activities will not be managed under Core Area stipulations.	3023-3

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-31	<p>RECORD 71 -Apply an NSO stipulation within 0.6 mile of occupied or undetermined Sage-grouse leks (Map SEIS15). Apply a minimum lease size of 640 contiguous acres of federal mineral estate within sage-grouse Core Habitat Areas. Leasing smaller parcels only when 640 contiguous acres of federal mineral estate is not available and leasing is necessary to remain in compliance with laws, regulations, and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements. Apply a TLS to restrict disruptive activity within 0.6 mile of occupied or undetermined sage-grouse leks from March 15 to June 30. COMMENT: It is unclear why BLM intends to utilize both an NSO and a timing stipulation within 0.6 miles of a lek. EO 2011-5 requires an NSO stipulation with 0.6 miles of a lek and a 4-mile TLS around a lek. It is confusing, however, why BLM would need a TLS if surface activities are already precluded through the imposition of an NSO stipulation within 0.6 miles of a lek. Leasing is allowed within Sage-grouse Core Area Habitat subject to Sage-grouse stipulations and the DDCT/ PIAA process established under EO 2011-5. Rather than making vast acreage administratively unavailable to oil and gas development through NSO lease restrictions, EO 2011-5 scrutinizes oil and gas development within Sage-grouse Core Populations Areas at the permitting stage and applies carefully reasoned Sage-grouse mitigation to such operations. The fluid mineral leasing restrictions proposed under Alternatives E and F are unnecessary and excessive. We recommend that BLM utilize the direction contained in EO 2011-5. Additionally, the proposal to make lands within the Sage-grouse KHA ACEC administratively unavailable for mineral leasing under Alternatives B and E is unwarranted and conflicts with BLM's multiple use mandate. There are circumstances under which leasing and development within these areas can occur without resulting in a negative impact to Sage-grouse habitat as discussed in EO 2011-5. While Sage-grouse Priority Habitat Areas (KHA and CHA) contain important Sage-grouse habitat, these areas also contain vast acreage of "unsuitable" habitat. It is of vital importance for unsuitable habitat to be identified in both a seasonal and landscape context, on a case-by-case basis, outside the 0.6 mile buffer around leks. This will provide proponents an incentive to locate projects in unsuitable habitat in order to avoid creating additional disturbance acres. At a minimum, BLM should make lands within Sage-grouse habitat available for possible leasing even if it is on a case-by-case basis. Moreover, developed acreage in unsuitable habitat must not be included in calculated disturbance acres as provided in EO 2011-5. Ongoing oil and gas operations within KHA boundaries in Wyoming must be allowed to continue subject to reasonable mitigation measures to protect the Sage-grouse. As such, we recommend that BLM adopt an oil and gas leasing policy consistent with EO 2011-5. Lastly, what is an undetermined lek? BLM must be able to determine whether or not a lek exists. Protecting undetermined leks is irresponsible and not scientifically valid. Unless the Game and Fish Department has identified an occupied lek in its annual report, there is no lek to protect. This comment applies to all subsequent references to undetermined leks in the SEIS .</p>	3035_1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-30	RECORD 62 - Consider closing designated roads in Sage-grouse priority habitat. COMMENT: Once again, BLM must recognize valid existing rights of lease holders and operators when considering new road closures. It is crucial for operators to have access to their well locations to perform routine maintenance and other production activities. Furthermore, prior to closing any existing roads in Sage grouse habitat, it is crucial for BLM to actually analyze whether the road in question is having a significant effect on the current Sage-grouse population in the vicinity. It may be found that there is no scientifically valid need to close a road, which would deny public access to public lands. BLM's proposed road closure proposal unnecessarily deviates from EO 2011-5 which states that areas already disturbed or approved for development in Core Areas prior to August 1, 2008 are not subject to new Sage-grouse restrictions. We recommend that BLM management remain consistent with EO 2011-5.	3039-1
1025	1025-29	RECORD 58 -Use existing roads or realignments in greater Sage-grouse priority habitat to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in the priority area. If that disturbance exceeds 3 percent for that area, then evaluate and implement additional, effective mitigation necessary to offset the resulting loss of sage-grouse habitat. COMMENT: The 3 percent threshold cap must be changed to comport with the EO 2011-5 requirement of 5 percent. Also, before requiring additional mitigation, BLM must first ascertain what specific impacts new road construction may have on nearby leks to determine whether they are significant enough to warrant additional mitigation. The blanket assumption that impacts would be severe has not been scientifically or site-specifically confirmed.	3039-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-28	<p>RECORD 52 -Locate new primary and secondary roads greater than 1.9 miles from the perimeter of occupied Sage-grouse leks inside core areas. Additionally, for new proposals, consider and evaluate an alternative that would locate new tertiary roads greater than 0.6 mile from the perimeter of occupied leks. COMMENT: The standard contained in EO 2011-5 for road construction and use within Sage-grouse Core Habitat Areas has already been adopted by the USFWS and applied by BLM Wyoming. The restrictions proposed under Alternatives E and Fare excessive, particularly where they would prohibit new road construction within 4 miles of active Sage-grouse leks and new road construction in occupied Sage-grouse habitat as proposed under Alternative E. This 4-mile protective buffer around leks is over two times the 1.9 mile buffer provided under EO 2011-5 for road construction. This buffer has not been scientifically documented as necessary. Precluding road construction in "occupied Sage-grouse habitat" and closing designated roads in Sage-grouse priority habitat also exceed the provisions of EO 2011-5. We also point out that a precise definition of "occupied" is not included in the SEIS. Moreover, application of these restrictions in sage-brush habitat that is used only seasonally or intermittently is not warranted. We recommend that BLM retain its use of the parameters established in EO 2011-5. We also recommend that BLM evaluate new road construction and its use in Sage-grouse habitat on a case-by-case basis assessing habitat suitability, Sage-grouse presence, and need. Further, we recommend that the SEIS clearly explain the significant difference between the requirement of 1.9 miles for a primary and secondary road and the 0.6 mile for a tertiary road and explain how each was derived. It also needs to clarify the widths of the roads as well as the uses that classify them as primary, secondary and tertiary. We also recommend that BLM adopt the guidance contained in EO 2011-5, which states that main roads shall be located for transporting production and/or waste products greater than 1.9 miles from the perimeter of occupied Sage-grouse leks. For example, other roads are to be located to provide facility site access and maintenance greater than 0.6 miles from the perimeter of occupied Sage-grouse leks.</p>	3039-1
1025	1025-27	<p>RECORD 23 -Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Where probability of success or adapted seed availability is low, nonnative seeds may be used as long as they support Sage-grouse habitat objectives. COMMENT: We appreciate that BLM has acknowledged that some native seeds may be unavailable at times. However, we recommend that BLM provide a general description of what would constitute acceptable alternative seed mixes in the SEIS.</p>	3035-7

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-26	RECORD 21 -Include Sage-grouse habitat parameters as defined by Connelly et al. (2000), Hagen et al. (2007), or if available, State Sage-Grouse Conservation Plans and appropriate local information in habitat restoration objectives. Make meeting these objectives within priority Sage-grouse habitat areas the highest restoration priority. COMMENT: This record is somewhat confusing because it fails to specifically acknowledge EO 2011-5, which already provides BLM with the habitat parameters required for the protection of the Sage-grouse. We advise against relying upon of the habitat parameters defined by Connelly and Hagen because these studies are overly broad and include marginal habitats that do not warrant the same level of protection as priority habitat areas. As provided for in EO 2011-5, BLM needs to focus its attention on site-specifically identified nesting, brood rearing and winter concentration areas. Furthermore, use of the term "restoration" instead of "reclamation" is of concern because regulatory expectations referenced in this record are vague. BLM needs to distinguish the between the terms "restoration" and "reclamation" because under Onshore Order No. 2, industry is not required to "restore" areas use for oil and gas operations. We presume that restoration activities in core areas is referring to previous disturbances, on-site or off-site, that were created prior to current standards of reclamation, which may be restored for reclamation credit. An opportunity for restoration would then provide the possibility of reclamation credits which could then be used to for future activities as provided for in EO 2011-5.	3035_1
1025	1025-25	RECORD 17 -Any existing towers must undergo review for adverse effects. Review will include minimizing wires and other collision hazards for sage-grouse and migratory birds, as well as adverse impacts of night lights (FAA requirement). COMMENT: Upon what scientific basis was this requirement derived? Does BLM have scientific documentation that demonstrates a high level of collisions with existing towers has occurred in the last 5 years by Sage-grouse or migratory birds? How does the mortality rate compare between existing towers (radio, TV, Cell, etc.) to those of wind farms, buildings and other fixed objects? We also recommend that BLM fully consider the FAA minimum standards for tower safety and lighting before adopting this type of requirement.	3033-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-24	RECORD 12 -Relocate existing designated ROW corridors crossing priority Sage-grouse habitat void of any authorized ROWs, outside of the priority habitat area. If relocation is not possible, undesignate that entire corridor during the planning process. COMMENT: BLM must recognize that some designated ROW corridors are already in use and that valid existing rights must be honored. Under what authority can BLM require modification of an existing ROW? In addition, given the recent release of IM 2013-152 "Commingleing" and existing rules governing "Off Lease Measurement", what plan does BLM have in place to approve requests for commingleing and off lease measurement of oil and gas where wells may be located within priority Sage-grouse habitat and the pipelines and treating facilities are to be located outside priority Sage-grouse habitat? Due to the limited disturbance and parameters outlined throughout the SEIS, this will likely become an issue for future development within priority Sage-grouse habitat and BLM needs to have a plan in place to adequately address these concerns. Further, BLM needs to clarify whether efforts to remove existing power lines and/or reclamation of unused features within existing leases or ROWs would be used as a means to offset the calculated disturbance threshold discussed in the Alternatives.	3033-2
1025	1025-23	RECORD 10 -Manage the ACEC as a ROW avoidance/mitigation area. Allow ROWs where it best minimizes Sage-grouse impacts, build new roads to the minimum standard necessary, and add the surface disturbance to the total disturbance in the Greater Sage-Grouse Core Habitat Areas ACEC if valid existing rights cannot be accessed via existing roads. If disturbance exceeds 3 percent for that area, implement additional effective mitigation on a case-by-case basis to offset the resulting loss of Sage-grouse habitat. Use existing roads to access valid existing rights that are not yet developed to the extent practicable. Allow new ROWs to access valid, existing rights and private and state inholdings where needed. COMMENT: We support BLM's recognition of valid existing rights and constructing roads to the minimum standard needed for the activity; but we object to the designation of an ACEC and BLM's proposed use of a 3 percent disturbance cap. We recommend that BLM adopt the requirements contained in EO 2011-5.	3033-1

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-22	<p>RECORD 9 "Allow only below ground ROWs within designated ROW corridors. Do not limit the width of below ground ROW corridors as long as new linear facilities are constructed adjacent to existing linear facilities accounting for adequate separation for operating system integrity; safety (construction and operations); appropriate federal, state, and local statutes, regulations, and policies; and land use constraints. If a linear facility is moved away from an adjacent utility to avoid a resource conflict, the new linear facility will still be considered to be within the ROW corridor." "Construct new transmission lines between July 1 and March 14 (or between July 1 and November 30 in winter concentration areas) and within 0.5 miles on either side of existing 115 kV or larger transmission lines (Map SEIS-23)." COMMENT: Industry has offered to bury pipelines for years. However, BLM is proposing that multiple operators use the same ROW. It is unclear whether BLM has considered the legal implications of this requirement. First, how will it be determined which party will be responsible for a joint ROW. Has BLM considered how the liability with multiple facilities will be addressed, such as cost, safety and potential environmental risks? Only until these factors are clearly addressed would BLM's proposal be ripe for consideration.</p>	3033-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-21	<p>RECORD 8 -Evaluate and remove, bury, or modify existing power lines within priority Sage-grouse habitat areas on a case-by-case basis.</p> <p>COMMENT: Apparently, the NTT failed to consider the role valid existing rights would play in such decisions. It also failed to consider the existence of circumstances where the removal or modification of an existing right-of-way could result in more damage to the habitat than no action at all. Moreover, in some circumstances, above ground power lines are the best and only option that can be considered. For example, topography or terrain may limit the ability to bury power lines. Additionally, continued use and/or construction of new above ground power/transmission lines can be accomplished without negatively impacting priority Sage-grouse habitat (e.g. when placed in unsuitable Sage-grouse habitat identified within priority habitat boundaries or through the use of other, reasonable requirements). The prohibition on constructing above ground transmission lines in Sage-grouse Priority Habitat Areas as proposed under both alternatives is unwarranted and overly restrictive. We recommend that BLM retain needed flexibility by considering the use and construction of power/transmission lines on a case-by-case basis. This will allow BLM to account for site specific circumstances (e.g. topography and terrain) and actual Sage-grouse habitat suitability. Further, we remind BLM that it would likely be economically impossible for operators to modify existing power lines in mature fields due to the fact they produce significantly less income compared to new fields or those that have yet to be developed. Further, BLM does not have legal authority to require such changes. We also remind BLM that Recent State Director Review (SDR) decisions clarify the limits of the BLM's authority as it relates to overhead power lines built and operated by utilities on non-federal surface. SDR No. WY-2009-006 provides that BLM has no authority or jurisdiction over a third-party public utility company installing non-lease facilities on fee surface estate. While it may consider a non-Federal action through analysis and disclosure pursuant to NEPA, BLM's denial of overhead power is not binding on the third-party public utility company (SDR No. WY-2011-001, pg. 16). Even though BLM could find that significant impacts may occur if the overhead power lines were to be constructed; once approval has been granted for the power drops, the agency has no authority to preclude construction of infrastructure that is not a lease production facility (SDR No. WY-2011-001, pg. 16). BLM simply lacks jurisdiction to approve or deny non-lease facilities that are not owned or controlled by the operator and are located on split-estate fee surface (SDR No. WY-2011-001, pg. 17). Mandating burial of all power lines within Sage-grouse Priority Habitat, as proposed under Alternative E, will potentially preclude construction of infrastructure that is not a lease production facility and may prohibit a public utility from installing non-lease facilities on adjacent fee surface estate. As such, this stipulation exceeds the limits established in recent SDR decisions and must be modified.</p>	3033-2

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-20	Consolidate anthropogenic features from development and transmission on the landscape, regardless of land ownership patterns or whether proposed actions occur in the Greater Sage-Grouse Core Habitat Areas ACEC. Allow high profile structures (higher than 12 feet) within greater Sage-grouse nesting habitat on a case-by-case basis. COMMENT: Once again, valid existing rights must be honored. Under what authority can BLM force the consolidation of development features or transmission line? We point out that EO 2011-5 recognizes valid existing rights: "Existing activities in areas already disturbed or approved for development within Core Areas Prior to August 1, 2008 are NOT subject to new Sage-grouse stipulations with the exception existing operations may not initiate activities resulting in new surface occupancy within 0.6 mile of the perimeter of a Sage-grouse lek. Any existing disturbance will be counted toward the calculated disturbance cap for a new proposed activity. The level of disturbance far existing activity and rollover credit may exceed 5%". The EO was carefully crafted to respect valid existing rights and we strongly recommend that BLM adopt this same approach.	3035_4
1025	1025-19	RECORD 7-In the Greater Sage-Grouse Core Habitat Areas ACEC, the density goal includes either: Maintain or reduce the existing level of density of energy production and/or transmission structures on the landscape in sagebrush communities, or Manage the existing level of density of disturbance on the landscape so that anthropogenic disturbances do not exceed one disturbance per 640 acres within the Density and Disturbance Calculation Tool (DDCT) analysis (or best available tool) and cover less than 3 percent of sagebrush habitat. COMMENT: This proposal conflicts with EO 2011-5 and must be modified to remain consistent, particularly with respect to the disturbance cap. Moreover, we question how BLM intends to reduce the existing level of density of energy production and/or transmission structures while honoring valid existing rights. According to the Federal Land Policy and Management Act (FLPMA), the Mineral Leasing Act (MLA) and BLM's Planning 1600 Handbook, BLM does not have the authority to impose new stipulations on leases after they have been issued or to require abandonment of existing operations. Nor does BLM have authority to impose mitigation measures, such as COAs, that exceed the terms and conditions of previously issued leases. In sum, BLM cannot deprive operators of their rights to develop pre-existing leases in accordance with the terms under which they were issued. BLM is limited to negotiating with existing rights owners when seeking to impose newly developed restrictions.	3035_4
1025	1025-18	RECORD 6 -Designate greater Sage-grouse priority habitat within Core Habitat Area as the Greater Sage-Grouse Core Habitat Areas ACEC (Map SE/S-31 and Appendix F of the Draft RMP and Draft EIS; 1,161,234 acres). COMMENT: As previously stated, we object to the designation of an ACEC within the planning area because it would be unmanageable and would conflict with the process already established in EO 2011-5.	3001

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-17	RECORD 4 -Where suitable conservation actions cannot be achieved in priority habitat, seek to acquire state and private lands with intact subsurface mineral estate by donation, purchase, or exchange in order to best conserve, enhance, or restore sage -grouse habitat. COMMENT: We strongly object to BLM seeking to acquire state and private lands with intact mineral estate because the agency does not currently receive adequate funding to fully manage the lands already in federal ownership. Instead, we recommend that BLM work with private landowners to arrive at mutually agreeable programs while recognizing and respecting existing rights as well as acknowledging that a federally managed conservation approach is not always preferable or needed.	3016-2
1025	1025-16	RECORD 3-Examine applicability of categorical exclusions in priority habitat COMMENT: Categorical exclusions (CE) are provided by law and are intended to benefit the operator as well as BLM during the permitting process. Therefore, we object to BLM's proposal to consider excluding the use of CEs even in priority habitat. The decision to exclude the use of a CE must be made based upon site-specific conditions and the scope of a project proposal rather than on a unilateral decision in a planning document.	3027-1
1025	1025-15	Finally, it has been industry's experience that BLM rarely uses monitoring data of any type collected at BLM's direction. While we don't object to reasonable monitoring activities, it is incumbent upon BLM to establish a system or database whereby the monitoring data is available for future use by other government agencies, industry and the public. Otherwise, the effort is simply an expensive exercise in futility.	3035-7
1025	1025-14	With respect to split estate lands, BLM needs to specify how the rights of private landowners will be protected. As such, BLM needs to incorporate proper mechanisms for working with landowners and lessee's so as not to unnecessarily delay development activities. In addition, specific parameters need to be clearly articulated for any monitoring and mitigation plan, i.e., scope, requirements, costs and timing. We recommend that BLM work with operators, other land users as well as the Wyoming Game and Fish Department (WGFD) in order to establish a reasonable and workable monitoring program. Moreover, in order to avoid conflict and confusion, the monitoring program must be well-defined before it is required for project activities.	3019
1025	1025-13	In addition to eliminating or modifying RDFs to establish consistency with EO 2011-5, we recommend that BLM adopt limitations to the application of RDFs similar to the Lander Proposed RMP/EIS to institute consistency across BLM Field Offices.	3023-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-12	RECORD 2 Incorporate BLM required design features or mitigation for any authorized mineral activity for federal mineral estate, regardless of surface ownership. Require development of wildlife monitoring and mitigation plan to address potential impacts from mineral development on wildlife populations COMMENT: We recommend that BLM revisit its design features and mitigation to ensure they are technically feasible and appropriate and that they maintain the level of flexibility required when their use is considered on a site-specific basis. In accordance with current law and regulation, it is inappropriate for the RMP to establish site-specific requirements at a project level as is proposed in the SEIS. Moreover, many of the design features (addressed later in these comments) outlined in the NTT report reflect a distinct lack of understanding of the activity requirements during the oil and gas exploration and development process.	3023-3
1025	1025-10	According to BLM Manual 1613-ACEC, such designations are used to highlight areas where special management attention is needed to protect, and prevent irreparable damage to important values or processes. The description cited in the SEIS is inadequate. The ACEC included in the SEIS needs to be discussed and justified in more detail, including recognition of the wide scope of mitigation measures BLM has at its disposal to lessen the impacts on the Sage-grouse in areas where it is believed they pose a threat. Ironically, the statement fails to acknowledge that the single, greatest threat to the survival of the species is predation. Moreover, we seriously question BLM's ability to manage nearly 2 million acres as an ACEC and it is unclear why such a designation was even considered. BLM needs to more fully discuss this concept in the SEIS. Our opposition to an ACEC does not mean we do not support the delineation of Sage-grouse Core Habitat Areas and non-Core Habitat Areas as a Sage-grouse management strategy provided it is consistent with EO 2011-5. Labeling this area as an Area of Critical Environmental Concern (ACEC) (e.g. the KHA ACEC under Alternative E and CHA ACEC under Alternative F) is inconsistent with EO 2011-5 and is, clearly, unjustified to ensure adequate protection of Sage-grouse habitat. We are concerned that an ACEC designation of Sage-grouse Priority Habitat Areas has resource management implications that reach far beyond the Sage-grouse Core Habitat Area strategy, which already provides more than adequate protection of Sage-grouse habitat. As such, we urge BLM to abandon the use of an ACEC designation on Sage-grouse Priority Habitat Areas (i.e. Core Habitat Areas and Key Habitat Areas).	3001
1025	1025-9	RECORD 1 -ACEC-Proposed Greater Sage-grouse Priority Habitat: 1,786,244 acres; COMMENT: BLM has provided no clear rationale for designating Core Habitat Areas as an ACEC. In Appendix F, BLM simply provides the following statement regarding the proposed ACEC, "The area contains sagebrush habitat used by sensitive bird species and other wildlife, including the greater sage-grouse, a candidate species for listing under provisions of the ESA. These habitats are under threat from surface disturbance associated with mineral (including gravel pits) and ROW development, renewable energy developments, heavy recreational and motorized vehicle use, and invasive and nonnative species infestations. These activities threaten important greater Sage-grouse habitats, including breeding, later brood-rearing, and winter concentration areas."	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-8	<p>Alternatives F. 2-1-Chapter 2 of the Draft RMP and Draft EIS is supplemented to include two new alternatives (alternatives E and F). COMMENT: We are strongly opposed to both of the new, unreasonably restrictive alternatives analyzed in the SEIS. Neither Alternative E nor Alternative F represent suitable management plans for the Bighorn Basin because both are unnecessarily restrictive on oil and gas resources and conflict with BLM's multiple-use mandate under FLPMA. Specifically, they would gratuitously limit the continued exploration and development of oil and gas resource, 2,296,279 acres under Alternative E and 291,294 acres under Alternative F. Moreover, an additional 1,320,277 acres under Alternative D and 261,282 acres under Alternative F would be available for oil and gas leasing only with NSO or other major constraints. The adoption of either of these alternatives would stymie future oil and gas development in the Basin creating a huge economic impact on local communities as well as compromising the continued generation of revenue to the US Treasury. Clearly, the significant loss of continued development of domestic oil and gas resources as described in this SEIS fails to recognize the ever-increasing need for domestic energy supplies which defies the requirements of the Energy Policy Act of 2005 and the needs of the nation as a whole. In addition to the comments above regarding the alternatives, we question why the SEIS does not present a new agency-preferred alternative based on the supplemental analysis. BLM tied the analyses of Alternatives E and F to the previously analyzed Alternatives B and D, respectively, and it is unclear whether Alternative F should be considered the new preferred Alternative, replacing Alternative D. We request BLM to clarify its intent. Nevertheless, we are opposed to implementation of or inclusion of management elements from either of these two newly analyzed alternatives because they are overly restrictive, unjustified and fail to meet BLM's multiple use mandate as detailed subsequently in these comments.</p>	3023-3
1025	1025-7	<p>Section 1.4.2 -The BLM will utilize the COT Report (USFWS 2013), the Western Association of Fish and Wildlife Agencies (WAFWA) Conservation Assessment of Greater Sage-grouse and Sagebrush Habitats (Connelly et al. 2004), and any other appropriate resources, to identify greater Sage-grouse habitat requirements and best management practices. Page 2-1 - Management approaches applied to the new greater sage-grouse priority habitat ACECs were derived from recommendations on the management of greater sage-grouse by the Sage-Grouse National Technical Team (Sage-grouse NTT 2011) and public comments. COMMENT: While the SEIS states in Chapter 1 that it would use several different appropriate scientific sources to formulate its management options for Sage-grouse, apparently the reliance upon these other sources was either extremely limited or nonexistent. The fact that BLM has relied solely upon the extreme recommendations contained in the NTT report rather than utilizing all available science to develop its alternative management options is patently objectionable as previously stated. Our comments below cite several additional scientific references and studies which must be considered when developing a management approach for the Sage-grouse and its habitat areas.</p>	3035_1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-6	The SEIS offers no explanation of what constitutes valid existing lease rights and how they relate to the new land use management options considered in the SEIS. We recommend that BLM clearly state in the Final EIS that the new stipulations proposed in the Preferred Alternative will not apply to lands already under oil and gas lease. Moreover, it must be made clear that BLM has no authority to impose these new restrictions through the use of Conditions of Approval (COA) on applications for permit to drill (APD) if they would abrogate the valid existing lease rights. These principles are particularly important given the fact that discussions regarding new protections for the proposed Areas of Critical Environmental Concern (ACEC) could impose debilitating limitations on existing leases that were not anticipated at the time the leases were purchased in good faith from the federal government. Such qualifiers are consistent with current rules and policies of the BLM and must be clearly disclosed in the planning documents. An acceptable example of appropriate language is included in the Rawlins RMP adopted in 2008, page 20.	3019
1025	1025-5	In addition to many of the design features included in the SEIS, of particular concern is BLM's departure from the disturbance cap of 5 percent provided in EO 2011-5. The SEIS suggests a 3 percent disturbance threshold be imposed that does not exceed one disturbance per 640 acres using the DDCT regardless of the use. The WY EO specifies a 5 percent disturbance threshold per 640 acres using the DDT and it does not limit such disturbance to one occurrence. This is an issue of significant concern because it will essentially shut off the Bighorn Basin to future oil and gas activities as well as other uses, such as grazing. Additional concerns with BLM's departure from the standards and stipulations provided in EO 2011-5 are discussed in detail below. Given the above concerns, we object to the management and mitigation proposals contained in the SEIS because they demonstrate a problematic disregard of the need for continued development of domestic energy resources, the tremendous economic impact implementation of either of these alternatives would have on the region, a lack of understanding of how the federal oil and gas program works as evidenced by ill-conceived measures that are either impossible to implement or are unduly restrictive and the fact that oil and gas activities do not have the catastrophic impacts on Sage-grouse assumed by the NTT report. We strongly recommend that BLM's final RMP/DEIS establish clear consistency with EO 2011-5.	3035_4

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1025	1025-4	CONSISTENCY WITH WYOMING EXECUTIVE ORDER 2011-5, GREATER SAGE-GROUSE CORE AREA PROTECTION, IS OF PARAMOUNT IMPORTANCE COMMENT: As BLM is aware, EO 2011-5 was developed through an extensive collaborative process in which all affected parties were represented. It has also garnered the support of USFWS, which stated in a letter to Wyoming Governor Matt Mead (June 24, 2011), that "if fully implemented, we believe the EO can provide the conservation program necessary to achieve your goal of precluding listing of the Sage-grouse in Wyoming." Moreover, the Service also noted in the letter that "the core population area strategy (EO 2011 -5) is a sound framework for a policy by which to conserve greater sage grouse ... " Additionally, the BLM Wyoming State Office issued a revised Greater Sage Grouse Habitat Management Policy, WYSO 2012-019, in February 2012 that applies EO 2011-5, and entered into a Memorandum of Understanding (MOU) with the State of Wyoming for use and implementation of EO 2011-5 on federal projects. As such, a Sage-grouse habitat management strategy on federal lands in Wyoming that is inconsistent with EO 2011-5 is unacceptable and unjustified.	3035_1
1025	1025-3	We are also confused by the BLM's SEIS press release, which indicates the agency was required to supplement the draft Bighorn Basin RMP/EIS "to allow the public to nominate areas within the study area as areas of critical environmental concern for Sage-grouse." We ask BLM to clarify the legal requirement that directs the Bureau to reopen the planning process to allow the "public" to specifically nominate a Sage-grouse ACEC simply because it was not considered in the original planning documents.	3001
1025	1025-2	We are concerned that BLM limited its analysis to the overly restrictive conservation measures recommended by the NTT during the planning process; we strongly oppose the inclusion of these conservation measures in the agency's preferred alternative and their adoption in the Final RMP/ROD. Additionally, it is our understanding that a planning document such as this is intended to be a programmatic overview of actions that could occur throughout the life of the plan. As such, the SEIS is far too prescriptive for a land use plan.	3035_1
1025	1025-1	We object to the two new alternatives analyzed in the SEIS to the Bighorn Basin Draft RMP and Draft EIS because they were limited to the scientifically unfounded conservation measures identified in the Greater Sage-grouse National Technical Team (NTT) Report on National Greater Sage-Grouse Conservation Measures (Sage-grouse NTT 2011). BLM Instruction Memorandum (IM) No. 2012-044, BLM National Greater Sage-grouse Land Use Planning Strategy, contains a very clear provision which allows BLM to adopt Wyoming Executive Order EO 2011-5, Greater Sage-Grouse Core Area Protection, in its entirety.	3035_1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-96	Finally, Devon encourages the BLM to eliminate BMP's for phased development. The United States Court of Appeals for the Tenth Circuit, which has authority over all of Wyoming, recently affirmed a BLM decision not to require a phased leasing resource management plan in the Buffalo Field Office specifically because such an alternative would delay the production of energy resources and was not otherwise practical. Biodiversity Conservation Alliance, et al. v. Bureau of Land Management, et al., 608 F.3d 709, 715 (10th Cir. 2010). The BLM need not analyze such an unreasonable and impartial alternative. Further, allowing oil and gas developers to secure leases in only one portion of a geologic basin or area at a time will limit and preclude exploration and development activities. Before an oil and gas operator will be willing to commit the millions of dollars necessary to drill even a single exploratory oil and gas well, it must secure a large enough lease position to justify the expense. If phased leasing was mandated by the BLM, the operator may be unable to secure such lease positions and new exploration would come to a halt, along with the economic benefits associated therewith.	3023-3
1026	1026-95	Finally, BLM should consider the adverse air quality impacts potentially associated with this management action. In many cases, oil and gas operators install power lines in order to reduce potential air emissions from compressors and other facilities. Requiring these lines to be buried in all circumstances may make it uneconomic to use electrical power which could lead to more air quality impacts from compressors.	3033-2
1026	1026-94	Appendix L., Best Management Practices and Required Design Features, Reclamation No. 4 "Implement irrigation during interim or final reclamation for sites where establishment of seedlings has been shown or is expected to be difficult due to dry conditions. Utilize mulching techniques to expedite reclamation." This RDF should be reworded to reflect that irrigation needs to be done in a way that will prevent vegetation from being unable to withstand drought conditions after the irrigation has been removed.	3042
1026	1026-93	Appendix L., Best Management Practices and Required Design Features, Reclamation No. 3 "Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community." If the disturbance is on private land, this requirement needs to be subject to the preferences of landowners.	3023-1
1026	1026-92	Appendix L., Best Management Practices and Required Design Features, Noise No. 3 "Locate new compressor stations outside priority habitats and design them to reduce noise that may be directed towards priority habitat." This requirement is overly broad and unnecessarily prescriptive. There are many items to consider when siting compressor stations, such as the engineering and design constraints inherent to gas gathering systems. With regard to directing compressor station noise away from priority habitat, proximity to other receptors, such as homes, also needs to be considered. This item needs to be subject to technical feasibility, as well as landowner preferences when private land is involved. Furthermore, it is inconsistent with Wyoming Executive Order and BLM Instruction Memorandum 2012 -019, and should be removed.	3035_3-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-91	Appendix L, Best Management Practices and Required Design Features, Noise No. 2 "Require noise shields when drilling during the lek, nesting, brood-rearing, and wintering seasons." This requirement is too broad and vague. First, the measure does not define the types of noise shields that are required. Further, the shield can take any number of shape and form. It is also important to realize that noise shields cannot be used at a site without being engineered for safety factors such as wind load. Shields are not merely installed near a noise source. They must be carefully anchored, potentially with a foundation, to meet wind load requirements depending upon the material used to build a "shield." Additionally, larger well pads may be needed to accommodate the configuration of a "shield" while increasing surface disturbance. It is also important to consider the attenuation of noise from a site to receptors such as leks, nesting, and brood rearing. Moreover, simply stating that noise shields are required during "wintering seasons" may not be necessary if the drilling is occurring where the noise attenuation would not be a problem. This requirement needs to be completely reworded to provide more direction and flexibility.	3035_3-1
1026	1026-90	Appendix L, Best Management Practices and Required Design Features, West Nile No. 3 "Build steep shorelines to reduce shallow water (greater than 60 em) and aquatic vegetation around the perimeter of impoundments. Construction of steep shorelines also will create more permanent ponds that are a deterrent to colonizing mosquito species like Cx. tarsalis which prefer newly flooded sites with high primary productivity." While the intent of steep shorelines may be advantageous for the control of mosquito species, it presents a hazard to mammals being able to escape from the impoundment. This is something that needs to be considered in administering this measure. This entire section on West Nile Virus is missing any reference to insecticide are effective in controlling mosquito larvae. We recommend this measure be included on the list of requirements.	3035_3-1
1026	1026-89	Appendix L, Best Management Practices and Required Design Features, West Nile No. 2 "Increase the size of freshwater ponds to accommodate a greater volume of water than is discharged. This will result in un-vegetated and muddy shorelines that breeding Cx. tarsalis avoid. This modification may reduce Cx. tarsalis habitat but could create larval habitat for Culicoides sonorensis, a vector of blue tongue disease, and should be used sparingly. Steep shorelines should be used in combination with this technique whenever possible." These requirements need to be subject to the preferences of landowners. On split estate lands where the surface is owned by private landowners, BLM must defer decisions regarding what facilities remain on the land and the size of ponds to those private landowners.	3035_3-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-88	Appendix L, Best Management Practices and Required Design Features, Operations No. 22 "Use only closed-loop systems for drilling operations, with no reserve pits." It is not always reasonable or feasible to require closed loop mud systems for drilling. Many drilling rigs are not equipped for closed loop drilling, which could complicate development in some situations. Further, even if a closed system were available on a drilling rig, some type of pit will be needed for placement of drilling cuttings. This requirement must provide the flexibility to allow this as an option.	3023-1
1026	1026-87	Appendix L, Best Management Practices and Required Design Features, Operations No. 21 "Design or site permanent structures to minimize impacts to sage-grouse, with emphasis on locating and operating facilities that create movement (e.g., pump jacks) or attract frequent human use and vehicular traffic (e.g., fluid storage tanks) in a manner that will minimize disturbance of sage-grouse or interference with habitat use." This requirement is unreasonable and lacks scientific justification. We are unaware of any studies on sage-grouse which correlate movement and distances relative to sage-grouse response. Considering the existing NSO from leks, pump jacks at a distance of at least 0.6 mile will not create an issue. We recommend this requirement be removed. Again, this requirement is inconsistent with the Wyoming Executive Order and BLM Instruction Memorandum 2012 -019 and needs to be removed.	3023-1
1026	1026-86	Appendix L, Best Management Practices and Required Design Features, Operations No. 20 "Restrict the construction of tall facilities, distribution powerlines, and fences to the minimum number and amount needed." It is unclear what is meant by "tall". Certain facilities, particularly those for compression or natural gas treatment, require the use of designs which incorporate vessels or equipment that, by their design, can involve height. Furthermore, fences are typically installed for reasons of security and safety. Although some flexibility is mentioned such as the "minimum amount needed", this requirement lacks specificity and the reality of what is needed to construct a facility and needs to be removed.	3023-1
1026	1026-85	Appendix L, Best Management Practices and Required Design Features, Operations No. 19 "Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use." Remotely monitoring a site may not always identify all operational considerations, so sometimes there is the need to go out and look at a well or facility. In order to conduct safe and effective oil and gas operations, certain inspection and maintenance activities must be conducted regularly. We recognize that limitation on some disruptive activities and access to well locations during critical seasons may be necessary, such as prohibiting construction activities (e.g. well pads, roads, pits) or limiting the number of trips allowed. Basic maintenance and operation activities are necessary to maintain safe, effective, and environmentally sound operations. Further, the economics associated with some leases may not allow telemetry to be installed. This requirement should be subject to operational considerations and economic viability. Moreover, this requirement is inconsistent with Wyoming Executive Order and BLM Instruction Memorandum 2012-019 and needs to be removed.	3023-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-84	Appendix L, Best Management Practices and Required Design Features, Operations No. 17 "Place liquid gathering facilities outside of priority areas. To reduce truck traffic and perching and nesting sites for ravens and raptors do not place tanks at well locations within priority habitat areas." This requirement is confusing. Placing liquid gathering facilities inside priority areas would reduce truck traffic which would be advantageous in priority areas. Further, if liquid gathering or trucking is not allowed inside priority areas, there is no way to remove liquid production from the lease. This requirement conflicts with standard operational practices and is not feasible and needs to be removed.	3023-1
1026	1026-83	Appendix L, Best Management Practices and Required Design Features, Operations No. 16 "Apply a phased development approach with concurrent reclamation." The term "phased development" needs clarification. This means different things to different people. Devon opposes phased development which only allows certain portions of a leasehold or unit to be developed over time until that portion is plugged or abandoned before proceeding to another portion of the leasehold or unit. This is a clear violation of existing lease terms since this type of terminology has not been used in lease language before.	3023-2
1026	1026-82	Appendix L, Best Management Practices and Required Design Features, Operations No. 14 "Use directional and horizontal drilling to the extent feasible as a means to reduce surface disturbance in relation to the number of wells." The phrase "technically feasible and as part of the downhole design objectives" should be added to provide necessary flexibility to this requirement.	3023-1
1026	1026-81	Appendix L, Best Management Practices and Required Design Features, Operations No. 5 "Cover all fluid-containing pits and open tanks with netting (maximum 1.5-inch mesh size) regardless of size to reduce sage-grouse mortality." This requirement is not practical. Fine mesh netting is not only extremely difficult to deploy, but difficult to maintain, especially during winter with snow accumulation. It is unclear why tanks are included here, unless this is referring to open-top tanks. We urge BLM to remove this requirement or revise it reflecting these concerns. This is another requirement that exceeds the parameters of Wyoming Executive Order and BLM Instruction Memorandum 2012 -019 and, therefore, we recommend it be removed.	3023-1
1026	1026-80	Appendix L, Best Management Practices and Required Design Features, Operations No. 3 "Bury power lines to the extent technically feasible." This requirement is excessive and cost-prohibitive. We urge BLM to add flexibility that takes into account technical feasibility and economic considerations.	3033-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-79	Appendix L, Best Management Practices and Required Design Features, Roads No. 6 "Establish trip restrictions or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition)." Remotely monitoring a site may not always identify all operational considerations, so there is sometimes the need inspect a well or facility. In order to conduct safe and effective oil and gas operations, certain inspection and maintenance activities must be conducted regularly. We recognize that limitation on some disruptive activities and access to well locations during critical seasons may be necessary, such as prohibiting construction activities (e.g. well pads, roads, pits) or limiting the number of trips allowed. Basic maintenance and operation activities are necessary to maintain safe, effective, and environmentally sound operations. Further, the economics associated with some leases may not allow telemetry to be installed. This requirement should be subject to operational considerations and economic viability.	3039-2
1026	1026-78	Appendix L, Best Management Practices and Required Design Features, Roads No. 2 "Locate roads to avoid important areas and habitats." This requirement needs to be subject to the preferences of landowners on split estate lands where the surface is owned by private landowners. BLM must defer decisions regarding road location with those private landowners.	3039-2
1026	1026-76	Devon is particularly opposed to the Required Design Features and Best Management Practices affecting fluid minerals on pages L-2 -L-3 of Appendix L. It would be impossible for an oil and gas operator to economically utilize all of the proposed Required Design Features contained in this section. The BLM needs to specifically modify Appendix L to indicate that it does not and cannot impact existing leases. Given the fact that the BLM cannot modify or alter Devon's existing rights, Devon is very concerned regarding the language in Appendix L suggesting that the Required Design Features will be imposed on both existing and new oil and gas development projects and leases within the Bighorn Planning Area. BLM does not have the authority to modify existing lease rights through the RMP planning process. As noted above, Devon is particularly concerned regarding the BLM's Required Design Features related to fluid minerals on pages L-2 -L-3 of Appendix L. Not only are some of the Required Design Features inconsistent, i.e. requiring closed-loop systems and requiring all pits to be fenced, the requirement to use all of the Design Features would be cost prohibitive and not possible in many situations. For example, in certain circumstances, it is impossible to use closed-loop systems for drilling operations because surfactants and other additives are included within the drilling mud making the use of tanks extraordinarily difficult. In other situations, closed-loop drilling systems cannot be utilized because of the amount of water produced during drilling operations would make it impossible to utilize closed-loop systems.	3023-2
1026	1026-75	In the revised Bighorn RMPs and accompanying EISs, the BLM should also state clearly that an oil and gas lease is a contract between the federal government and the lessee, and that the lessee has certain rights thereunder.	3023-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-74	Appendix L -Best Management Practices and Required Design Features The BLM has not adequately explained how the proposed Best Management Practices contained in Appendix L will be applied to existing leases. The BLM must expressly recognize that oil and gas leases are existing rights that cannot be modified.	3023-2
1026	1026-73	Because the monitoring framework is unquestionably a "substantial change" when compared to any of the alternatives included in the Draft EIS, the BLM should prepare and release for comment another supplement to the Draft EIS.	3035-7
1026	1026-72	Appendix C -Monitoring and Evaluation Devon applauds the BLM's decision to develop a monitoring framework for sage-grouse as part of the Bighorn RMPs. Unfortunately, in its rush to release the supplement to the Bighorn Basin Draft RMP, the BLM has likely violated the terms of NEPA. The BLM indicates that it will include a new monitoring framework in the proposed RMPs and Final EIS. Bighorn RMP/SDEIS, Appd. C-2. If the monitoring framework will be included in the proposed RMPs for the first time, Devon will not have an opportunity to review or submit comments regarding any of the specific monitoring criteria before they were proposed for inclusion in the Final EIS. It is wholly inappropriate under NEPA for the BLM to introduce radically new and different concepts and procedures in the Final EIS for the Bighorn RMPs, especially given the limited ability for companies such as Devon to submit comments or react to the new measures once a proposed RMP has been issued.	3035-7

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-71	Section 4.8 -Socioeconomic Resources Devon agrees with the BLM's analyses demonstrating that Alternative F would have more negative socioeconomic impacts than Alternative D. Bighorn RMP/SDEIS, pg. 4-132. Devon strenuously disagrees with the BLM's assertion that Alternative E would have essentially the same economic impacts as Alternative B. Given the significant limitations on oil and gas development under both Alternative E and Alternative F, Devon has no doubt it would have far greater negative impacts than Alternative B or Alternative D. As the BLM is well aware, oil and gas development has a significant role in the economic well-being of the Bighorn Planning Area. The BLM's analysis demonstrates that oil and gas operations would provide between 63% and 74% of total employment under Alternative E or Alternative F. Bighorn Page 20 RMP/SDEIS, pgs. 4-135, 4-136. Given the importance of oil and gas development on the local economy, BLM should not adopt either Alternative E or Alternative F as both alternatives would cause significant decreases in employment within the area. Bighorn RMP/ SDEIS, pg. 4-134. Just as the economy is beginning to recover from the difficulties of the last several years, the BLM should ensure it is doing everything to foster, not limit, future employment within the Planning Area. For that reason alone, the BLM must not select Alternative E or Alternative F in the planning process. The BLM's analysis also demonstrates that oil and gas development also contributes significantly to earnings within the Planning Area. Bighorn RMP/SDEIS, pg. 4-139. The adoption of either Alternative E or Alternative F would have significant negative impacts to local earnings within the Planning Area. Bighorn RMP / SDEIS, pgs. 4-193 -4-140. The BLM should not adopt an alternative that would lead to either a ten percent or 40% decrease in employment as compared to Alternative A. Bighorn RMP / SDEIS, pgs. 4-134, 4-136, 4-140. Alternative E and Alternative F would also result in a significant decrease in federal mineral royalties, state severance taxes and ad valorem taxes and should not be adopted. Bighorn RMP /SDEIS, pg. 4-142. Given the significant adverse impacts associated with either Alternative E or Alternative F, neither must be adopted by the BLM.	3036-2
1026	1026-70	Section 4. 7 -Special Designation and Other Management Areas Devon is opposed to the creation of any new ACECs within the Bighorn RMPs. Devon is particularly opposed to the creation of a sage-grouse habitat area or greater sage-grouse key habitat areas under Alternative E and Alternative F. Bighorn RMP/SDEIS, pg. 4-122. Devon appreciates that the BLM tried to exclude private lands and developed oil and gas fields from its key habitat area ACEC, but Devon believes the ACEC is still far too large. Devon urges the BLM not to create any additional ACECs within the Planning Area. Once again, Devon is opposed to the BLM's description of Alternative F as placing a moderate constraint on oil and gas development. Bighorn RMP /SDEIS, pg. 4-127. Given the significant limitations imposed under Alternative F, it would be more accurate to describe the alternative as placing major constraints on oil and gas development. The BLM's assertion that Alternative F places only moderate constraints on oil and gas development is disingenuous and should be corrected in the final EIS.	3001

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-69	Section 4.6.3 -Rights-of-Way and Corridors When developing the final EIS for the Bighorn RMPs, the BLM should also ensure that it has identified ROW exclusion and avoidance areas as major constraints for oil and gas development. Limiting the access to and from federal oil and gas leases will have the very real impact of eliminating oil and gas development. For that reason, Devon is strenuously opposed to Alternative E that would restrict almost three million (3,000,000) acres within the Planning Area with either ROW exclusion or avoidance areas. Bighorn RMP /SDEIS, pg. 4-104, Map SEIS-22. Precluding ROWs with over 42% of the Planning Area would decimate oil and gas development. The BLM has not adequately analyzed the potential socio-economic impacts of effectively prohibiting oil and gas development on almost three million (3,000,000) acres within the Planning Area. Devon urges the BLM not to adopt Alternative E.	3033-2
1026	1026-68	Section 4.5.2-Paleontological Resources The BLM appropriately recognizes that the surface disturbing operations associated with oil and gas development often lead to the discovery of paleontological resources. Bighorn RMP /SDEIS, pg. 491. The BLM must ensure it does not impose unreasonable restrictions on oil and gas development as such responsible development may actually lead to the discovery of new paleontological resources within the Bighorn Planning Area.	3028
1026	1026-66	Section 4.4. 9 -Special Status Species -Wildlife As described earlier, Devon supports the BLM's creation of oil and gas management areas under Alternative C and Alternative D. Bighorn RMP/SDEIS, pg. 4-76. Devon believes the oil and gas management area under Alternative D should be enlarged to the same size as that under Alternative C. Further, Devon does not believe that big game restrictions should apply within the ACEC areas to the extent they overlap the oil and gas management areas. The BLM effectively eliminates the benefits associated with the oil and gas management areas by making them subject to seasonal restrictions.	3023-6
1026	1026-65	Section 4.4.5 -Fish and Wildlife Resources The BLM admits in Table 4-9 that it would be closing significant portions of the Planning Area to future leasing and development, not making them "administratively unavailable" as suggested elsewhere in the document. Bighorn RMP/SDEIS, pg. 4-57. As also described earlier, the BLM inaccurately suggests that under Alternative F, the greater sage-grouse core habitat area ACEC imposes only moderate constraints on oil and gas development. The limitations on surface disturbance, timing restrictions, and ROW restrictions make it abundantly clear that the sage-grouse ACEC restrictions under Alternative F should be described as major, not moderate. Devon urges the BLM to correct this misinformation when preparing the final EIS.	3035_9
1026	1026-64	Section 4.4.4 -Invasive Species Management The BLM should clarify that under all of the alternatives, including the no action alternative reclamation plans are required for all oil and gas drilling operations under Onshore Order Number 1, Section III, 4, j, 72 Fed. Reg. 10308, 10333 (Mar. 7, 2007). As currently described on page 4-51, the public may have the impression that reclamation plans are not always required for oil and gas development activities. Under current regulations, oil and gas operators will be required to prepare and submit reclamation plans with any and all applications for permits to drill.	3014

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-63	Figure 4.3 and Map SEIS-7 must be updated and corrected for inclusion in the Final EIS for the Bighorn RMPs. The BLM suggests that under Alternative F, the vast majority, of the Planning Area would be open with only moderate constraints. Bighorn RMP/SDEIS, pgs. 4-22, 4-26. Given the significant limitations on surface disturbance imposed by the proposed Alternative F, the vast majority of the Planning Area, including the entire greater sage-grouse core area ACEC, should be identified as a major constraint for oil and gas development. It is disingenuous of the BLM to suggest that the area is subject to only moderate constraints when limiting the entire area to only three percent surface disturbance, especially when combined with the ROW avoidance area, limitations on the construction of transmission lines, and the other significant limitations imposed within the ACEC. The BLM must prepare new information in the final EIS clearly indicating that the lands within the greater sage-grouse core area ACEC are subject to major, not moderate, constraints.	3035_9
1026	1026-61	Section 4.2.5 -Leasable Minerals-Oil and Gas As already described above, Devon is opposed to the amount of lands that oil and gas development under Alternative E and Alternative F. The BLM needs to analyze and disclose to the public the significant impacts closing such a large area to oil and gas development will have not only on the area closed to leasing, but upon other lands. No reasonable operator will conduct exploratory development within the Bighorn Planning Area if it will be unreasonably difficult, if not impossible, to secure additional leases within the Planning Area. BLM must provide additional analyses regarding the negative impacts Alternative E and Alternative F would have upon oil and gas development within the entire Planning Area.	3023-6
1026	1026-60	Section 3.7.1 -Areas of Critical Environmental Concern As already discussed above, Devon does not believe the greater sage-grouse key habitat ACEC or the greater sage-grouse core habitat area ACEC meets the relevance or importance criteria necessary to establish a new ACEC. 43 C.F.R. § 1610.7-2.	3001
1026	1026-59	It was a significant mistake for the BLM to release this document prior to completing its review of Version III of the sage-grouse data. If there are substantial changes between the current BLM core habitat area and that proposed in the final EIS, the BLM may again be required to provide a supplement to the DEIS in order to ensure the public has the opportunity to carefully examine and understand the proposed changes to the RMPs.	3035_1
1026	1026-58	Devon is strenuously opposed to the BLM's use of the Core Habitat Area Version II to establish the BLM's key habitat areas for greater sage-grouse. As discussed earlier, Core Habitat Area Version II has been replaced by Version III. Wyoming Executive Order 2011 -5. The Wyoming Governor, in conjunction with experts and other operators, specifically developed Version III based on more recent and correct information. It is entirely inappropriate for the BLM to utilize Version II when describing its own key habitat areas. Further, it was inappropriate for the BLM to insist on the release of the Bighorn Basin Supplement to the DEIS prior to the agency completing its review of the Core Habitat Area Version III. Bighorn RMP/SDEIS, pg. 3-3. It would have been far more appropriate for the BLM to complete its review of Version III prior to releasing this document.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-57	Given the fact the Wyoming population of sage-grouse is relatively healthy, and already protected by existing regulatory measures, Devon encourages the BLM not to adopt the onerous management restrictions provided for in Alternative E and Alternative F in the Bighorn RMP /SDEIS. Both alternatives provide excessive and unnecessary protections on greater sage-grouse to the detriment of all other resources. The BLM specifically recognizes that, within the Planning Area, sage-grouse habitat is largely intact. Bighorn RMP/SDEIS, pg. 3-3. Devon urges the BLM not to adopt either Alternative E or Alternative F in the Bighorn RMPs given the significant protections already provided.	3035_1
1026	1026-56	The language in the Bighorn RMP /SDEIS does not sufficiently recognize the fact that geophysical surveys are designed to have very little impact and rarely cause adverse impacts to the natural environment. The BLM should develop language to encourage seismic exploration in the Bighorn RMPs.	3023-4
1026	1026-55	The BLM should ensure that nothing in the Bighorn RMPs eliminates or discourages the use of geophysical exploration or the approval of such exploration using categorical exclusions.	3023-4
1026	1026-54	Devon does not agree that the BLM should close the entire greater sage-grouse key habitat area ACEC to geophysical exploration or propose unnecessary restrictions on geophysical exploration. Bighorn RMP /SDEIS, Record No. 86, pg. 2-31. Overall, Devon believes that seismic exploration can actually reduce impacts to the environment because operators will be less likely to drill unsuccessful wildcat wells in previously undisturbed areas. The BLM should not place unnecessary requirements, limitations, or procedures on seismic and geophysical surveys.	3023-4
1026	1026-53	Devon also does not support the language in Record No. 83 that suggests that all oil and gas activities would be conducted to maximize the avoidance of impacts based on the evolving scientific knowledge. Bighorn RMP/SDEIS, Record No. 83, pg. 2-71. Such a restriction does not recognize Devon's valid existing rights. Read broadly, this language could be construed by opponents of oil and gas development to prohibit virtually any oil and gas development within the Planning Area even if unrelated research demonstrates there may be adverse impact. The BLM should modify this language to specifically state that oil and gas activities would be conducted in a manner to minimize impacts while still protecting existing rights.	3023-2
1026	1026-52	Devon is completely opposed to BLM's proposal that would explore options to amend, cancel, or buy-out leases, or include as COAs the relinquishment of leases within the Bighorn Planning Area. Bighorn RMP/SDEIS, Record Nos. 80, 81, pg. 2-31. The BLM simply does not have the authority to require operators to relinquish leases or to cancel existing leases.	3023-2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-51	Devon is concerned about BLM's proposal to require Master Development Plans ("MDP") on all but wildcat wells. Bighorn RMP/SDEIS, Record No. 78, pg. 2-30. First, the BLM has not defined a wildcat well. How will operators know when it will apply? Second, the BLM should allow infill development within existing fields without a MDP. Often only one or two wells are needed within existing fields to continue production levels, so a full MDP would not be an appropriated use of the BLM or operator's resources. Finally, Devon does not believe MDP should be required in designated oil and gas development areas.	3023-6
1026	1026-50	Devon is also opposed to the BLM's proposal to include timing limitations on existing leases to the extent they may be inconsistent with existing lease rights. Bighorn RMP/SDEIS, Record No. 77, pg. 2-30. Devon cannot use a RMP to develop COAs or other limitations that are inconsistent with existing lease rights.	3023-2
1026	1026-49	Devon is opposed to the BLM's proposal to include NSO restrictions within the entire sage-grouse key habitat area ACEC under Alternative E. Bighorn RMP /SDEIS, Record No. 76, pg. 2-30. As set forth above, the BLM does not have the authority to impose such radical restrictions on Devon's existing leases, even within a newly created ACEC. BLM does not have the authority to impose restrictions or limitations on Devon's existing leases. Devon is also concerned about the ACEC because it applies a four-mile NSO around leks, which is inconsistent with Wyoming Executive Order No. 2011-5. The Wyoming Executive Order and Sage-grouse Policy was carefully drafted with federal, state, and local scientists, experts, and users of the public lands. It is inappropriate to propose a management objective or alternative that is inconsistent with the State of Wyoming's Executive Order. This is particularly true since BLM has clearly signaled its intent to adopt the Wyoming Sage-grouse Policy. See Memorandum WY-2012-019 (Feb. 10, 2012). While the BLM may have been required to analyze this alternative to fulfill its requirements under NEPA, it is inappropriate for the BLM to select this alternative.	3035_1
1026	1026-48	As already discussed above, Devon is strenuously opposed to closing the entire sage-grouse key habitat area ACEC to future oil and gas leasing. Bighorn RMP/SDEIS, Record No. 74, pg. 2-29. This closure will have significant impacts on future oil and gas operations, particularly where operators are not able to secure a sufficient acreage block to develop the area.	3035_9
1026	1026-47	Devon is significantly opposed to Record No. 73 that would require full reclamation bond for all oil and gas operations. Bighorn RMP/SDEIS, Record No. 73, pg. 2-29. First, such a requirement is not consistent with the BLM regulations regarding the amount of bonds. Under the BLM's existing regulations, the agency is only to increase bond amount when an operator has a history of previous violations, a notice from the Office of Natural Resources Revenue that there are uncollected royalties due, or where there is a significant reason to believe the operator will default. 43 C.F.R. § 3104.5(b). Additionally, the proposed management objective is not consistent with the BLM's recently released Instruction Memorandum regarding bonds. Instruction Memorandum 2013-151 (Jul. 3, 2013).	3023-2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-46	Second, requiring unitization for the protection of resources other than oil and gas is not appropriate or practical. The BLM Draft Handbook on Unitization recognizes that a central reason for unitization is the promotion of exploration in unproven areas.	3023-3
1026	1026-45	Devon is strenuously opposed to the BLM's management objective that would require unitization would be necessary to protect other resources. Bighorn RMP /SDEIS, Record No. 72, pg. 229. First, as set forth above, the BLM cannot impose new requirements on Devon's existing leases. Requiring operators to join federal units is a radical mitigation measure because it requires those lessees not designated as the unit operator of the federal exploratory unit to surrender control over all development operations to another party.	3023-3
1026	1026-44	As set forth above, the BLM needs to carefully define and explain the extent to which the proposed stipulations and management objectives contained in Alternative E and Alternative F would be applied to existing federal leases. The language in Table 2.2-5 suggests that the new requirements would only be applied to unleased federal minerals. Bighorn RMP/SDEIS, pg. 2-28. The majority of language in the remainder of the document suggests, however, that the limitations will be applied on both existing and new federal oil and gas leases within the Bighorn Planning Area. In particular, the language in Appendix L suggests that the Required Design Features will be imposed on both existing and new federal leases. As set forth above, in significant detail, given the limitations of its authority under FLPMA, the BLM cannot impose new stipulations or COAs inconsistent with Devon's existing lease rights.	3023-2
1026	1026-43	Devon is also opposed to the BLM's prohibition on new road construction within four (4) miles of active sage-grouse leks. Bighorn RMP/SDEIS, Record No. 54, pg. 2-25. Such a restriction is inconsistent with Wyoming Executive Order 2011-5 and should be eliminated.	3039-1
1026	1026-42	Finally, the BLM has not justified the seasonal closures proposed under Alternative E. The BLM specifically admits that winter conditions are generally not a limiting factor in the Bighorn Basin for sage-grouse because snow depths are not as severe as in other parts of Wyoming. Bighorn RMP /SDEIS, pg. 3-4. Given this fact, the BLM has not justified the seasonal closures and the closures should not be implemented under any alternative in the Bighorn RMPs.	3023-3
1026	1026-41	It also appears the BLM failed to consider the significant detrimental impact seasonal prohibition on oil and gas operations could have upon the local economy. By precluding production during several months of the year, the BLM would force operators to significantly reduce their workforces on an annual basis. The management action would create a seasonal boom and bust cycle with routine maintenance workers and pumpers being laid off annually. The inconsistent nature of the work would almost certainly reduce the number of local employees lessees are able to hire, which would restrict or eliminate the long-term beneficial impacts of the oil and gas development to the local economy. The BLM's current socio-economic analysis does not account for this cycle. The BLM must eliminate this proposed management action under Alternative E and Alternative F.	3036-2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-40	The BLM would effectively eliminate all oil and gas development in areas where production would be limited. Further, the BLM has not analyzed or considered the damage that could be done to oil and gas wells if they are shut-in on an annual basis. The BLM has also not analyzed the very real threat that federal minerals would be effectively drained by offsetting wells on State of Wyoming and private lands if federal wells are annually shut-in. The BLM must prepare this analysis in order to disclose the significant adverse impacts that would be associated with the closure of oil and gas development on a seasonal basis, including the potential loss of federal reserves and royalties.	3023-3
1026	1026-38	Road closures will also prevent year-round production operations. Even the very threat of such a radical and unjustified restriction on production operations would seriously hamper future oil and gas development in the Bighorn Planning Area because oil and gas operators would be unwilling to invest the millions of dollars necessary to drill an oil and gas well if they would be unable to produce the wells throughout the year. The BLM's belief that any oil and gas wells would be drilled in big game winter range given such overly restrictive limitations on future production is specious.	3039-1
1026	1026-37	Further, seasonal road closures may prohibit routine maintenance operations. As the BLM is aware, many types of routine oil and gas operations and maintenance activities occur year-round on active, producing oil and gas wells. BLM must recognize the routine nature of these activities, many of which do not even require BLM approval prior to the operations. See 43 C.F.R. § 3162.3-2 (subsequent well operations). Under the current BLM regulations, no prior approval and, thus, no timing limitations, are imposed upon routine activities including routine fracturing or acidizing jobs, recompletions in the same interval, routine well maintenance, or bottom hole pressure surveys. 43 C.F.R. § 3162.3-2(b), (c). The Bighorn RMP/ SDEIS does not indicate whether, or if, it intends to impose timing limitations on these routine activities in apparent violation of the BLM's regulations. Further, the BLM has not indicated whether it intends to impose timing limitations on other routine subsequent operations including those that require prior approval. 43 C.F.R. § 3162.3-2(a). In the Bighorn Planning Area the BLM routinely approved subsequent well operations quickly and efficiently and without the imposition of timing limitations. Devon is concerned the BLM intends to prohibit such activities during certain portions of the year, which may strand production, limit operational efficiencies, and otherwise reduce development potential. In certain circumstances, the inability to quickly conduct repairs and other operations on producing wells may even lead to loss of a well or permanent damage to a reservoir. The ability to conduct repair and maintenance operations is also a significant safety and environmental issue because as issues arise, operators need to be able to quickly respond to the situation. Forcing operators to comply with seasonal limitations for these otherwise routine issues may create or exacerbate significant safety and environmental issues.	3039-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-36	Devon is also concerned that the BLM's proposed management action to apply seasonal road closures would propose significant safety concerns to existing facilities. To the extent the BLM applies the limitation on even routine maintenance in this action, it is very possible minor issues necessitating repairs will not be timely corrected, which could contribute to significant or even catastrophic spills and other hazards. Devon encourages the BLM not to adopt this radical alternative.	3039-1
1026	1026-35	Devon is strenuously opposed to the BLM's proposed management action under Alternative E that would impose seasonal road closures from March 15 to June 30. Bighorn RMP /SDEIS, Record No. 52, pg. 2-25. As the BLM is aware, current seasonal stipulations in most RMPs prohibit construction and drilling activities in specific crucial winter ranges, but do not prohibit routine production operations necessary to safely maintain facilities or other routine operations. It would be inappropriate for the BLM to preclude all production operations in crucial winter range areas. Such a decision would essentially preclude year-round production operations and would lead to a significant decrease in domestic energy production. Moreover, many species such as pronghorn and mule deer have been found to habituate to increased traffic so long as the movement remains predictable. See Reeve, A.F. 1984. Environmental Influences on Male Pronghorn Home Range and Pronghorn Behavior, PhD. Dissertation; Irby, L.R. et al., 1984; "Management of Mule Deer in Relation to Oil and Gas Development in Montana's Overthrust Belt" Proceedings III: Issues and Technology in the Management of Impacted Wildlife. The BLM has not justified seasonal limitations on production operations.	3023-3
1026	1026-33	Devon supports the BLM's desire to eliminate invasive and noxious weeds within the Bighorn Planning Area. Devon believes, however, BLM should modify the language in Record No. 33 under Alternative E suggesting it will restrict activities in sage-grouse habitat that may facilitate the spread of invasive plants. Bighorn RMP /SDEIS, Record No. 33, pg. 2021. Read broadly, opponents of oil and gas development could utilize this management action to suggest that any and all surface disturbing operations, including those associated with oil and gas operations, should be prohibited. The BLM should modify this language to specifically include that activities in sage-grouse habitat will only be modified to the extent appropriate given BLM's multiple use management objectives.	3014

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-31	Devon is opposed to the BLM's proposed management in Record Nos. 20 through 26 requires the "restoration" of sage-grouse habitat rather than reclamation as is normally required. See e.g., Onshore Oil and Gas Order No. 1, III, D.4.j, 72 Fed. Reg. 10308 (Mar. 7, 2007); "Wyoming Instruction Memorandum 2012-032 (Mar. 27, 2012). First, the BLM has not adequately identified or defined the difference between restoration and reclamation. Second, existing BLM policies for oil and gas development, including Onshore Order No. 1, do not require restoration of areas disturbed by oil and gas operations. See e.g., Onshore Oil and Gas Order No.1 , III, D.4.j, 72 Fed. Reg. 10308 (Mar. 7, 2007); Wyoming Instruction Memorandum 2012 -032 (Mar. 27, 2012). Rather, BLM regulations and Onshore Orders specifically require the development of adequate reclamation plans. See e.g. , Onshore Oil and Gas Order No. 1, III, D.4.j, 72 Fed. Reg. 10308 (Mar. 7, 2007); Wyoming Instruction Memorandum 2012-032 (Mar. 27, 2012). The BLM must ensure that its proposed management actions under Alternative E and Alternative F are entirely consistent with existing BLM regulations and policies. See e.g., Onshore Oil and Gas Order No. 1, III, D.4.j, 72 Fed. Reg. 10308 (Mar. 7, 2007); Wyoming Instruction Memorandum 2012-032 (Mar. 27, 2012). Requiring restoration rather than reclamation suggests a very different standard.	3035-7
1026	1026-30	Devon appreciates, and encourages the BLM to adopt, portions of Record No. 10 that recognize that valid existing rights must be honored and that the BLM should not prohibit access to federal oil gas leases. As discussed above, unless the BLM authorizes access to leased lands within the Bighorn Planning Area, the federal government, the State of Wyoming, and local governments would be deprived of significant oil and gas revenue. Devon does not support the BLM's proposal under Alternative E and Alternative F to require maintenance or amendments to existing ROWs within grouse habitat. Bighorn RMP/S DEIS, Record No. 16, pg. 2-19. As set forth above, the BLM should not modify existing rights within the Planning Area. Absent a request for renewal of such authorization} Devon also questions whether the BLM has the authority to require modification of an existing ROW.	3039-1
1026	1026-29	Devon is strenuously opposed to the limitations on new rights-of-way ("ROW") within the Planning Area under both Alternative E and Alternative F. Bighorn RMP /SDEIS, Record Nos. 9, 10, 11, 12, pgs. 4-103 -4-106. Devon believes BLM has not sufficiently analyzed the significant extent these limitations on future ROW will have upon oil and gas operations. In particular, Devon is concerned about the management of the ACECs under Alternative E and Alternative F as ROW exclusion and avoidance areas. The BLM has not justified this substantial increase in the number of acres subject to ROW exclusion and avoidance areas. Devon is particularly concerned that the ROW excludance and avoidance areas will be utilized to significantly hamper or decrease oil and gas operations. The BLM must be willing to work with oil and gas lessees and operators to design access routes for proposed oil and gas development projects. Future limitations on road construction could impact Devon's valid and existing lease rights or its rights as the operator of a federal exploratory unit within the Bighorn Planning Area.	3033-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-28	Devon objects to the BLM's decision to require operators and other users to remove, bury, or modify existing power lines within priority sage-grouse habitat under Alternative E and Alternative F. Bighorn RMP/SDEIS, Record No. 8, pg. 2-17. Requiring operators to modify even existing power lines will require significant additional surface disturbance within sage-grouse priority habitat which may cause adverse impacts to the species.	3033-2
1026	1026-27	Devon is strenuously opposed to the density and disturbance limitations proposed under Alternative E and Alternative F. Bighorn RMP/SDEIS, Record No. 7, pg. 2-17. The proposed three percent disturbance threshold is inconsistent with Wyoming Executive Order 2011-5 and has not been independently justified by sufficient science.	3035_4
1026	1026-26	Devon also does not support the BLM's proposal to designate the greater sage-grouse core habitat area ACEC under Alternative F. Bighorn RMP/SDEIS, Record No.6, pg. 2-17. The existing state of Wyoming Core Area Policy provides sufficient protection for sage-grouse within Wyoming. The designation of an ACEC is neither necessary nor warranted. Further, Devon does not believe that the BLM has sufficiently justified the creation of an ACEC using the relevance and importance criteria contained in the BLM's planning regulations. 43 C.F.R. § 1610.7-2. Devon encourages the BLM not to create an ACEC to protect greater sage-grouse.	3035_1
1026	1026-25	Devon is very concerned about, and thus opposed to, BLM's proposal to designate the greater sage-grouse key habitat areas of critical environmental concern ("ACEC") under Alternative E. Bighorn RMP/SDEIS, Record No. 6, pg. 2-17. The greater sage-grouse key habitat ACEC is not only based on an outdated outline of the State of Wyoming Executive Order Greater Sage-grouse Core Area, the boundary has been further modified by the BLM to include additional productive habitats identified by the BLM. Bighorn RMP/SDEIS, pg. 4-122. The Wyoming sage-grouse Implementation Team and the Governor of Wyoming carefully developed the Core Area Policy for sage-grouse based on the best scientific information available and in cooperation with operators and the Wyoming Game and Fish Department ("WGFD"). The United States Fish and Wildlife Service approved the core area strategy. It is inappropriate to modify or alter the boundaries of the core area in a BLM Land Use Plan. Devon encourages the BLM to revise its boundaries to correspond directly with the State of Wyoming policy.	3035_1
1026	1026-24	Devon is opposed to BLM's proposal to acquire private lands within the Planning Area in order to protect sage-grouse habitat. Bighorn RMP/SDEIS, Record Nos. 4, 5, pg. 2-17. The BLM already owns and manages the vast majority of the surface and mineral estate within the Planning Area, owning 3.1 million acres of surface lands and 4.2 million acres of federal minerals estate out of the approximately 5.6 million acres within the Planning Area. Bighorn RMP/DEIS, pg. 1-1. It is inappropriate for the BLM to attempt to acquire any additional public lands within the Planning Area.	3016-2

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-23	The BLM should clarify its proposed management action regarding categorical exclusions within priority sage-grouse habitat. Bighorn RMP/SDEIS, Record No. 3, pg. 2-16. The BLM should specifically state that the agency is free to utilize categorical exclusions established by section 390 of the Energy Policy Act of 2005 without applying the extraordinary circumstances as provided for in the CEQ regulations (40 C.F.R. § 1508.4) and the BLM's NEPA regulations (43 C.F.R. § 46.205).	3027-1
1026	1026-22	Devon is additionally opposed to the BLM's proposal under Record No. 2 to require development of wildlife resource monitoring and mitigation plans to address mineral development. First, the BLM has not justified that such a wildlife monitoring plan is necessary for each and every development activity on federal lands. Such an assumption presumes that oil and gas development will always have a negative impact on wildlife and wildlife habitat. The BLM has failed to support the position that all mineral development negatively impacts wildlife. Second, Devon believes the BLM should create a threshold for when wildlife mitigation and monitoring plans may be necessary. For example, if a single infill well is proposed within an established oil and gas area, the development of an entirely separate wildlife mitigation and monitoring plan is likely not justified.	3023-2
1026	1026-21	For the same reasons, Devon is opposed to Record No. 2 in the Bighorn RMP /SDEIS that would require the incorporation of BLM Design Features into mineral development activities on federal minerals, regardless of surface ownership. Bighorn RMP /SDEIS, Record No. 2, pg. 2-16.	3023-2
1026	1026-20	Given its nature and purpose, the BLM should carefully consider what decisions need to be made in the Bighorn RMPs. The BLM should not attempt to make site-specific decisions, but should develop only broad management goals and objectives. Further, the BLM should not expend unnecessary resources attempting to analyze the potential impacts of oil and gas development on a site-specific basis more than necessary given the uncertainty associated with the location and extent of future development.	3023-3
1026	1026-19	Devon also objects to the BLM's attempt to impose site-specific mitigation measures in a RMP. Pursuant to FLPMA, the BLM is required to develop land use plans to guide the agency's management of federal lands under its administration.	3027-1
1026	1026-18	In the revised Bighorn RMPs and accompanying EIS, the BLM should also state clearly that oil and gas lease is a contract between the federal government and the lessee, and that the lessee has a certain rights there under	3023-2
1026	1026-17	Table 2-5 -Detailed Alternatives Devon is opposed to Record No. 1 and the imposition of the Required Design Features contained in Appendix L to the Bighorn RMP/SDEIS. Bighorn RMP/SDEIS, Record No. 1, pg. 2-16. The BLM must clarify the extent to which the so-called Required Design Features will be applied to operations on existing leases. The BLM must recognize that oil and gas leases are existing rights that cannot be modified.	3023-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-16	Further, the BLM has not analyzed or disclosed the potential impacts the restrictions on future leasing may have upon operations on existing leases. As the BLM acknowledges in Map SEIS 9 and Map SEIS 10, a significant portion of the Bighorn Planning Area is currently leased for oil and gas development. Some leases, however, are isolated making them virtually impossible and not economically feasible to develop in their current state. Any responsible oil and gas producer who decides to take the risk of exploring by drilling a wildcat area must do so only after assembling a large enough block of leasehold acreage so that, if the drilling is successful, it can obtain an adequate return on the high-risk dollars invested. The BLM has, in another context, recognized the need for control of a reasonable acreage block. See Prima Oil Et Gas Co., 148 IBLA 45, 51, (1999) (BLM policy to suspend leases when "a lessee is unable to explore, develop, and produce leases due to the proximity, or commingling of other adjacent Federal lands needed for logical exploration and development that are currently not available for leasing"). The BLM must recognize, study, and report the economic impact of its decision to close significant portions of the Planning Area to leasing, or to make significant portions of the Planning Area only available with major constraints will have upon future exploration and development in the area. It is not enough for the BLM to simply assert that existing lease rights will be protected, the BLM must analyze further how existing lease rights will be impacted by future limitations on leasing and development and what protection it will afford existing leases in the above-described scenario.	3036-1
1026	1026-15	The removal of vast areas of lands from future oil and gas development and potential restrictions on existing leases under Alternative E, and, to a lesser extent, Alternative F, would also significantly restrict regional earnings, jobs, and tax revenue. According to the information presented in the Bighorn RMP/SDEIS, the adoption of Alternative E would reduce regional earnings significantly and reduce local jobs by a staggering 46% over the current management. See Bighorn RMP /SDEIS, Table 4-21, pg. 4-134. In these difficult economic times, it is inappropriate for the BLM to significantly restrict economic development opportunities. The Obama Administration has repeatedly indicated that its first priority is to create jobs for the American people, yet the BLM is proposing alternatives, including Alternative E and Alternative F, that would actually reduce jobs in the Bighorn Planning Area. Such alternatives are inappropriate and should be eliminated. The BLM must not adopt an alternative that would reduce economic development, decrease domestic energy supplies, and harm the local tax base.	3036-2
1026	1026-14	The adoption of Alternative E, and, to a lesser extent Alternative F, would significantly curtail domestic production compared to both the baseline scenario and any of the other alternatives analyzed by the BLM. Bighorn RMP/DEIS, pg. 4-22.	3023-3

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-13	The overall minerals management under Alternative E and Alternative F are inappropriate because they unreasonably limit oil and gas development. As noted above, the BLM is significantly limiting potential future oil and gas development in the Planning Area by making 2,296,279 acres under Alternative E and 291,294 acres under Alternative F unavailable for oil and gas leasing. The BLM is additionally making 1,320,277 acres and 261,282 acres available to oil and gas leasing only with major constraints under Alternatives E and F, respectively. Alternative E in particular eliminates almost the entire Planning Area for mineral development and must not be selected by the BLM.	3023-3
1026	1026-12	Under FLPMA, BLM is required to foster and develop mineral development, not stifle and prohibit such development. Alternative E and Alternative F do not comply with the BLM's multiple use mandate and must be eliminated.	3027-1
1026	1026-11	Overall, Alternative E and Alternative F are overly restrictive, unnecessarily limiting oil and gas development in the Bighorn Basin, and should be eliminated from further consideration. Oil and gas development is one of the primary employment and tax revenue sources in the Bighorn Basin, Bighorn RMP/DEIS, pgs. 3-214 -3-217; 4-456 -4-477; Bighorn RMP/DEIS, pgs. 4-135 -4-144. In these trying economic times, the BLM should take every action to promote and foster the employment and revenue opportunities in Wyoming, not limit economic development and job creation. The BLM's adoption of Alternative E or Alternative F would have devastating economic impacts upon the region, State of Wyoming, and even the nation. Bighorn RMP/SDEIS, pgs. 4-134 -4-144. Oil and gas development, even on existing leases, would be significantly hampered by the BLM's management actions under Alternative E or Alternative F. Although Devon understands the importance of having a wide range of alternatives to satisfy the requirements of NEPA, the BLM must not adopt Alternative E or Alternative F.	3023-3
1026	1026-10	Given the release of the Bighorn RMP/SDEIS, it is no longer entirely clear whether Alternative D from the Bighorn RMP/DEIS remains the Preferred Alternative. The BLM should clarify the extent to which Alternative D is still the Preferred Alternative so that the public and operators like Devon can provide more specific comments.	3027-1
1026	1026-9	Under Alternative E and Alternative F, the BLM would make over 100,000 acres of oil and gas leasing unavailable for a period of two years or more, yet BLM has not complied with the clear and unequivocal requirements of FLPMA. BLM must notify Congress of its intent to close significant areas to future oil and gas development prior to finalizing the Bighorn RMPs.	3027-1
1026	1026-8	To date, the Department of the Interior has not complied with the requirements set forth in section 204 of FLPMA. Prior to approving the Bighorn RMPs, the BLM must comply with these provisions and inform the public how it will be impacted.	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-7	The BLM cannot escape the withdrawal requirements imposed by FLPMA by suggesting lands are not "closed" to development, but merely "administratively unavailable" to leasing for several reasons. First, the BLM's Land Use Planning Handbook does not recognize or authorize the BLM to make lands administratively unavailable. Rather, the Handbook only recognized closed or open with varying levels of constraint. BLM Land Use Planning Handbook H-1601, Appd. C.II.H., pgs. 23-24 (Rel. 1-1693 03/11 /05). Second, the BLM admits throughout the document that administratively unavailable areas are actually closed to leasing. Bighorn RMP/SDEIS, pgs. ES-6, 4-21, 4-22, 4-23, 4-57, 4-70, 4-79. There is simply no distinction between areas administratively available for leasing and those that are closed. Finally, regardless of whether the BLM terms the closure as "administratively unavailable," eliminating the land from oil and gas leasing for the life of the plan still meets the definition of a withdrawal" because they make large areas of the public lands unavailable for a significant period of time making a conscious, deliberate choice not to allow leasing in these areas. It is not merely deferring a few parcels from a particular lease sale. Such a formal closure constitutes a withdrawal. 1702(j). The BLM must comply with the withdrawal requirements set forth in FLPMA.	3023-2
1026	1026-6	Under Alternative E and Alternative F, the BLM proposes to make large areas of land unavailable to oil and gas leasing. Closing an area to fluid mineral leasing constitutes a withdrawal under FLPMA. Unbelievably, under Alternative E, the BLM proposes to close almost 2,300,000 acres and render them unavailable for oil and gas leasing. Because closing areas to oil and gas leasing constitutes a withdrawal, the Department of the Interior will be required to comply with the procedural provisions of section 204 of FLPMA. 43 U.S.C. § 1714.	3023-2
1026	1026-5	For example, overly stringent restrictions or conditions of approval ("COAs"), such as requiring all directional drilling regardless of technical or economic considerations, may render development uneconomic and need not be analyzed. The restrictions included in both Alternative E and Alternative F are not appropriate, and, thus, are not reasonable alternatives.	3023-1
1026	1026-4	Given the drastic limitations both Alternative E and Alternative F would have upon oil and gas development, neither alternative is reasonable and must not be selected. Devon urges the BLM not to adopt either Alternative E or Alternative F because of the drastic adverse impacts they would have upon oil and gas development and, thus, on the economy of the Bighorn Planning Area.	3023-5

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1026	1026-2	Devon is strenuously opposed to the BLM's adoption of either Alternative E or Alternative F in the Big Horn RMP /SDEIS. It is Devon's assessment that both Alternative E and Alternative F will unreasonably limit if not preclude oil and gas development, even on existing leases. Devon is aware of the difficulties inherent in managing the public lands for multiple use, but believes that the proposed alternatives are not adequate. Devon is particularly concerned that both Alternative E and Alternative F will not honor existing lease rights in violation of federal law. As the BLM is aware, a significant portion of the Bighorn Planning Area has high potential for oil and gas development. See Reasonable Foreseeable Development Scenario for Oil and Gas for the Bighorn Basin Draft Report, May 6, 2009 ("RFD Report"), Figure 20. The BLM should not unreasonably restrict access to this important source of domestic energy. Devon opposes Alternative E and Alternative F because they place far too many onerous and unreasonable restrictions on future oil and gas development. In particular, Alternative E inappropriately and unreasonably proposes to close much of the Bighorn Basin to future oil and gas leasing and places overwhelming operational restrictions and timing stipulations on the remainder of the lands. Bighorn RMP/SDEIS, Record No. 71 , pg. 2-28, Map SEIS 7. Devon is also opposed to Alternative E and Alternative F because they do not comply with the Energy Policy Act of 2005, Energy Policy and Conservation Act of 2000 ("EPCA"), the National Energy Policy, and Executive Order Number 13212 (66 Fed. Reg. 28357 (May 18, 2001)) to reduce rather than increase impediments to federal oil and gas leasing. Devon strongly opposes the adoption of Alternative E or Alternative F, or any elements thereof.	3023-3
1027	1027-25	Tri-State requests that existing authorizations and pending access authorizations be excluded from the ACEC designation under Alternatives E and F. Utilities should be allowed under their existing and future authorizations to upgrade existing facilities and improve/construct access roads associated with their facilities under either alternative. Rights-of-way in some cases might need to be expanded anywhere from 50-150 feet to allow for upgrades to these facilities.	3033-1
1027	1027-24	Tri-State is concerned that the proposed Alternatives E and F have incorporated mitigation measures that are not based on peer-reviewed science and in some cases are not a feasible option for utilities to implement (burying, modifying, or removing existing transmission lines). Tri-State is also concerned that Alternatives E and F could place restrictions on our ability to safely operate and maintain our existing facilities in violation of other federal requirements	3033-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-23	Routing and siting of new facilities is a complex process that involves consideration of meeting system planning requirements, numerous environmental resource concerns as well as land use, property rights, safety, cost, and engineering constraints. Tri-State recommends that the DEIS and supplemental FEIS documents acknowledge this complex process and work directly with local utilities owners, operators, and local governments and municipalities when evaluating future corridors designated for use. The outcome of this approach will be a better understanding of future energy demands and a balanced approach to conserving sage-grouse and their habitat and identifying corridors that will meet customer demands.	3033-2
1027	1027-22	Tri-State requests that the BLM consider an adaptive management approach whenever requiring seasonal buffers for sage-grouse. There is a lack of peer-reviewed data to show effective buffer distances for tall structures. There has been a push in the past year by APLIC, electric utilities, and agencies alike to conduct further research to understand what man-made and other environmental variables might play a role in how tall structures may or may not affect sage-grouse. Research is also evaluating lek proximity to existing power lines which may help inform discussions on appropriate and effective lek buffers. Designation of suitable No Surface Occupancy Buffers and seasonal buffers should take into consideration the existing environment (disturbance, topography, vegetation type, etc) and the latest peer-reviewed research available.	3033-2
1027	1027-21	Tri-State requests that the BLM FEIS and RMP consider other forms of mitigation in their conservation "tool box". Mitigation in the form of funding research studies would be beneficial to both the agencies and industry in helping both groups understand the issues as well as identifying effective mitigation measures that could minimize potential effects. All stakeholders agree there are a number of factors affecting sage-grouse across the western U.S. from habitat loss to disease to predation. Connelly and Braun 1997 and Connelly et. al 2000c, state "the effect of predation on the fluctuations and viability of sage-grouse populations has never been investigated. The National Technical Team report states that raptor predation from power poles could be a significant factor in sage-grouse mortality, yet there is still no clear understanding of the extent of these impacts on overall sage-grouse populations. Additional research funds could be used to better understand natural mortality rates from predation and would enable us to better understand, to what extent raptor predation from increased perching on power poles may affect sage-grouse populations.	3027-3

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-20	A second issue requiring additional research is the incidence of sage-grouse collisions with power lines. To date, grouse collision risk with fences has been established. Sage-grouse collisions with power lines have been few, isolated, and anecdotal. Information to date infers no population-level impacts to grouse, but this has not been thoroughly studied. Tri-State requests that the BLM engage with members of the utility industry to gain a better understanding of utility construction and operational constraints relative to the recommended conservation measures to ensure they are reasonable and feasible given other federal and state requirements as well as general operational requirements.	3033-1
1027	1027-19	Tri-State requests that the FEIS include a review of the results of these studies and incorporates adaptive management to identify appropriate and effective mitigation measures for potential impacts associated with tall structures. The BLM's National Technical Team states that tall structures "may" negatively impact grouse populations. The availability of the science to date does not provide sufficient information for land management agencies across the West to make educated decisions relative to sage-grouse and their responses to aboveground structures. This lack of data has resulted in and could continue to exacerbate agency decisions that are not only infeasible for the electric utility industry (e.g., burying power lines), but also are not structured to support grouse in the long term. Increased communication among all the stakeholders is encouraged in order to identify the process by which new research and data is obtained and shared between the agencies and utilities.	3033-1
1027	1027-17	Tri-State requests that the BLM address in the FEIS and RMP that there is a critical lack of information and research on the effects of tall structures on sage-grouse. There are very few peer-reviewed, experimental studies designed specifically to evaluate the landscape effects of tall structures on sage-grouse according to a review conducted by the Utah Wildlife in Need, a nonprofit foundation working in cooperation with Utah Department of Natural Resources and Rocky Mountain Power (2010). Although raptors prey on adult sage-grouse, chick and egg predation typically increase following power line construction (Stahlecker 1978, Knight and Kawashima 1993, Steenhof et al 1993, Oles 2007), however, such changes have not yet been linked to population-level impacts on sage-grouse.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-16	<p>Despite their declining use by electric utilities to prevent avian electrocution, perch discouragers are now being required on transmission lines by resource agencies to be installed in sage-grouse habitats to dissuade raptors and corvids from perching or nesting on power poles in areas with sage-grouse or other special status species. Perch discourager research has shown limited effectiveness in preventing perching. Discouragers actually increase the potential for nesting on structures because they provide a firm foundation for nest material. Furthermore, use of discouragers to avoid perching on a structure may increase electrocution risk, particularly on lower voltage distribution lines by forcing raptors to perch in unsafe areas (the discourager reduces the separation required to prevent bird contact from phase to phase or phase to ground). In areas where raven predation on sage-grouse nests is a concern, perch discouragers may aid in the accumulation of nest material (APLIC 2006), and could potentially increase raven predation pressure due to nest construction on discouragers in sensitive areas. The negative impacts of perch discouragers must be weighed against the limited benefits, if any, they may provide, particularly if they are contributing to mortalities of protected birds and facilitating increases in predator nesting opportunities. Hunting techniques and strategies of avian predators of sage-grouse should also be considered, because they differ for different prey species. For example, golden eagle diet is largely mammalian (80-90%, Kochert et al. 2002). Golden eagles prey on sage-grouse opportunistically, and typically hunt sage-grouse by stooping from a high soar (Watson 1997, Kochert et al. 2002). Consequently, power poles may not play an important role in eagle predation of sage-grouse. Golden eagles are vulnerable to electrocution mortality (APLIC 2006) and perch discouragers have been correlated with increased eagle electrocution risk (PacifiCorp, in prep.). Common ravens are known predators of sage-grouse nests, yet ravens are able to overcome perch discouragers, will perch on wires, and may experience higher nesting rates on poles with perch discouragers. Because of these concerns, Tri-State requests that the BLM consider other more effective alternatives to sage-grouse conservation, such as habitat conservation or enhancement efforts, which are compatible with conservation measures for other protected species (e.g. electrocution prevention measures for raptors and other migratory birds). Consideration must be given to other federally protected species and should not result in impacts to migratory birds, including eagles.</p>	3033-1
1027	1027-15	<p>These proposed mitigation measures would have a significant impact on utilities ability to provide reliable power at a reasonable rate. Existing data has not shown to date that overhead power lines and raptor predation from these lines has had a significant effect on sage-grouse populations. Proposed mitigation measures need to be based on the best available science and must be proven to effectively mitigate impacts to sage-grouse and their habitat.</p>	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-14	These same issues apply to the suggestion to re-locate transmission lines outside of priority habitats for sage-grouse. Re-locating a multi-million dollar facility is cost-prohibitive and not a viable option for Tri-State and its members in almost all situations. Transmission lines are routed to avoid impacts to the natural and human environment to the greatest extent feasible. Relocating and removing existing power lines requires local, state, and federal permits; the acquisition of new easements on private lands; and complete environmental compliance under the National Environmental Policy Act, often for facilities that have been in operation for decades. Re-locating a transmission line can cost millions of dollars in permitting, engineering, and construction fees. All of these costs are passed along to the rate payers in the community. Potential line re-location also could result in cumulative impacts to Greater Sage-Grouse from increased habitat fragmentation across the landscape for power lines that cross federal and private lands and, therefore, could not be moved entirely out of a geographic area (due to engineering constraints or established electrical paths).	3033-2
1027	1027-13	Direct impacts to sagebrush habitats increase when burying a transmission line versus building an overhead line. The ROW required to construct and operate an underground transmission line is generally wider and would result in more direct impacts to sagebrush habitats, increasing habitat fragmentation for sage-grouse. Burying transmission lines can result in greater ground disturbance and more regular maintenance in seeding and weed prevention. It is important to consider the other resources (biological and cultural) and conservation objectives associated with burying a high voltage transmission line compared to the ground disturbance for an overhead line. Restoring sagebrush habitat and weed control in a wide linear corridor is inherently difficult and the BLM has acknowledged that sagebrush restoration can take decades to reach pre-construction results/conditions. Minimizing impacts to sagebrush habitats is identified in the Greater Sage-Grouse Interim Management Policies and Procedures (JM 2012-043), and the Conservation Objectives Team Final Report, but the recommendation to bury transmission lines contradicts this approach	3033-2
1027	1027-12	Other factors regarding the feasibility of building an underground transmission line include longevity, maintenance and operational issues, and increased habitat fragmentation effects. Underground transmission lines typically have half the life expectancy of an overhead transmission line and when an outage occurs on an underground line, it takes much longer to respond because it is difficult to pinpoint and reach the source of the outage. Repairs will take longer and require additional ground disturbance, potentially increasing disturbances to sensitive habitats.	3033-2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-11	Construction costs per mile for a new overhead 115kV transmission line average between \$270,000-\$300,000 dollars per mile (based on two new lines constructed in the San Luis Valley and Telluride area). Increasing these costs by 6 -10 times would create a significant economic impact to our member entities and individual rate payers. If the new lines were required to be constructed underground the costs would increase to an average range of \$1,620,000-\$3,000,000 dollars per mile. Tri-State recently completed the Nucla-Sunshine transmission line project that required 9 miles of line to be constructed underground. The cost for undergrounding the 9 miles of the Nucla-Sunshine line was \$19,000,000 dollars or just over \$2.1 million dollars per mile. In another project, the cost for re-building 30-miles of existing transmission line (construction labor and material only) was \$12.6 million dollars. Here, underground construction would increase those costs to between \$2,520,000 and \$4,200,000 dollars. For this reason it is imperative that mitigation for sensitive species is proven to be necessary and effective as our entire cooperative network shares these costs.	3033-2
1027	1027-10	The Supplemental EIS calls for co-locating power lines within existing ROWs. For operational and safety reasons, utilities frequently cannot co-locate facilities within existing ROWs. Utilities are required to maintain clearances identified in the National Electric Safety Code for the safe and reliable operation of our transmission system. The Final EIS should recognize requirements, policies and guidelines defined by the North American Electric Reliability Corporation (NERC) and the Federal Regulatory Energy Commission (FERC) for the safe and reliable operation of transmission systems. Tri-State requests the RMP is clarified to state that linear facilities should parallel existing ROWs (not co-located within) to the greatest extent feasible, in order to make this a viable management option and to comply with utilities' other federally mandated operation standards and guidelines.	3033-2
1027	1027-9	Tri-State is unclear on how the BLM would implement management directive #8 in Table 2-5 under Alternative E: Managing sage-grouse Key Habitat Areas ACEC so that anthropogenic disturbance does not exceed one disturbance per 640 acres and cover less than 3% of total sage-grouse habitat regardless of ownership. The management directive also recommends prohibiting further disturbance in Key Areas ACEC where the 3% threshold is already exceeded until enough habitat has been restored to reduce impacts below the 3% disturbance threshold. How would these disturbance thresholds apply to both existing authorizations and for future transmission line authorizations that may occur in Core or Key Areas? If existing utility corridors are included in the ACEC designation regardless of alternative, Tri-State is concerned that if improving an existing access road within 4 miles of an active lek exceeds the 3% disturbance allowance for any given area, access could be restricted by the BLM. Tri-State currently builds access roads to the minimum standard required for operation and maintenance purposes and complies with seasonal restrictions in sensitive areas. Additional mitigation for existing access rights or prohibiting access improvements will affect our ability to safely maintain and operate existing facilities.	3035_4

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-8	Tri-State's comments on travel management for Alternative F are similar to those discussed above for Alternative E. It is imperative that TriState is able to access its facilities and in some cases build new roads to access these facilities. Tri-State appreciates that Alternative F acknowledges the ongoing use of existing access roads. We request that roads that are currently being proposed for authorization for our Lovell-Big George transmission line are considered in this category. Tri-State has provided this data to the BLM for review.	3039-1
1027	1027-7	Tri-State regularly complies with seasonal restrictions to reduce impacts to sensitive species; however, we request that the BLM acknowledge that in an emergency situation (line outage), Tri-State is required by federal law to get the facility repaired immediately regardless of weather or season to ensure the safe, reliable transfer or power to our member systems.	3039-1
1027	1027-6	Road improvement and creation would be conducted to the minimum standard to reduce impacts to sage-grouse habitat. Alternative E would also not allow the upgrading of existing routes that would change route category. If a road has been authorized for administrative use only, Tri-State requests that maintenance and road improvements be approved (when necessary for maintenance activities) for the safe access and operation of our maintenance vehicles and equipment.	3039-1
1027	1027-5	Alternative E prohibits new road construction within 4 miles of an active lek site and requires the development of travel management plans that minimize impacts to sage-grouse habitat. In addition, Key Habitat areas would be managed under a seasonal closure restricting motorized use from February 1 through July 31. Tri-State is concerned that this alternative could prevent access to and therefore, maintenance of our existing facilities. Tri-State requests if this alternative is selected that existing permittees are allowed to improve and build new roads to access transmission structures when required.	3039-1
1027	1027-4	Table 2-5 of the DEIS recommends closing designated roads in sage-grouse priority habitats (which includes BLM Key Habitat Areas and State of Wyoming Core Areas) under both Alternatives E and F. The ability to safely maintain, operate, and access our existing electric delivery facilities is crucial to providing a reliable source of electricity to our customers. Tri-State requests that the BLM acknowledge in the final RMP supplement that access is a critical component to existing facility authorizations and that the BLM would not close designated or non-designated roads that may be critical to maintaining our existing electrical facilities in Core and Key Areas.	3039-1
1027	1027-3	As discussed above, Tri-State requests coordination with the BLM to incorporate existing facilities into planning efforts and into the Rights-of-Way and Corridor designation. We also request that if these existing transmission line corridors and substations occur in areas proposed as Areas of Critical Environmental Concern (ACEC) under Alternatives E and F; that the BLM consider these corridors and facilities excluded from this ACEC designation.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1027	1027-2	In reviewing the maps associated with the Supplemental EIS (Current Management Right-of-Way and Corridors), it appears that the lines listed above are not in the BLM's database and were not recognized as existing utility corridors during planning efforts (Figure 3). Tri-State requests that these transmission lines be included under the Current Right-of-Way and Corridors designation.	3033-2
1027	1027-1	In reviewing the maps associated with the Supplemental EIS (Current Management Right-of-Way and Corridors), it appears that the eastern portion of the Lovell-Big George transmission line is not in the BLM's database and was not recognized as an existing utility corridor during planning efforts. Figure 1 shows the remainder of the line as it travels towards the Lovell Substation. Tri-State requests that the entire line be included under the Current Right-of-Way and Corridors designation.	3033-2
1028	1028-52	Manier et al. (2013) provides a fairly comprehensive review of potential impacts of livestock grazing on sage grouse. ⁶⁴ Manier et al. (2013) point out that a reduction in livestock stocking rates can directly increase residual vegetation substantially, potentially assisting in meeting this target level for grasses. BLM should include residual grass requirements inside all sage-grouse habitats to be applied as automatic amendments to permit terms and conditions and Allotment Management Plans. Due to their reliance on sagebrush, sage-grouse are great indicators of the health of the sagebrush steppe ecosystem on which they depend. Literature previously cited indicates that sage-grouse need higher levels of sagebrush canopy cover than the RMP indicates and livestock reduce that cover.	3017-3
1028	1028-51	The chosen alternative for the RMP should also include specific direction and language authorizing the permanent retirement of voluntarily waived BLM grazing permits, regardless of the location within the planning area. The BLM Worland Field Office should utilize the process outlined by BLM IM No. 2013-184, released on September 9, 2013 and incorporate the Relinquishment Decision Tree as an Appendix in the plan, relieving the agency of the need for a subsequent plan amendment when site-specific relinquishments are offered. The Final EIS/RMP should also include suggested language for permit retirement authorizations as follows: Grazing privileges for allotments that are wholly or partially located within the Cody and Worland Field Offices planning area that are lost, relinquished, canceled, or have base property sold without transfer shall have attached AUMs held for watershed protection and wildlife habitat.	3017-1
1028	1028-49	The DRMP meets requirements of this IM because the conservation alternative considers meaningful reduction in lands available for grazing or forage amounts. Alternatives B and E contemplate closing 1,988,927 acres to livestock grazing, leaving about 1.2 million acres still available for grazing. ⁸⁸ The other alternatives do not consider meaningful reductions in lands available for grazing. ⁸⁹ Of the proposed alternatives, Alternatives B and E present the most meaningful protection of sage-grouse and sage-grouse. While the consideration of reduction in Alternatives B and E may meet the requirements of the IM, the other alternatives do not provide sufficient protection of sage-grouse and sage-grouse habitat.	3017-2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-47	The EIS and RMP must also address the fact that livestock sizes, and thus forage consumption, have increased dramatically since the AUM was defined. Failure to address this critical issue will lead to legal vulnerability under NEPA, Administrative Procedure Act and the False Claims Act.	3017-2
1028	1028-46	Meaningful alternatives must define specific measurable terms and conditions for livestock grazing. BLM must develop alternatives and adopt that alternative that charts a rapid, site-specific path forward to ensure protection of remaining native vegetation communities through passive restoration. BLM must prioritize areas based on habitat recovery needs, connectivity (reducing habitat fragmentation) and population viability needs, and other vital information necessary to maximize sagebrush ecosystem protections and efficiency of recovery and protection.	3035_1
1028	1028-45	BLM must fully analyze environmental effects of the No Grazing Alternative in depth. This includes conducting a full and fair capability and suitability analysis, where lands with significant conflicts with grazing are removed and retired from grazing disturbance impacts. This analysis is essential to set a solid comparative effects baseline and fully understand the significant ecological toll of any continued grazing use.	3017-2
1028	1028-44	Furthermore, meeting the requirements of the Wyoming Standards for Healthy Rangelands does not equate to protecting sage-grouse and sage-grouse habitat, as these standards were not written to protect sage-grouse habitat. A hard look must be taken at whether the Standards for Rangeland Health are even sufficient measures of sage-grouse habitat value; a recent ruling in the Office of Hearings and Appeals (Department of Interior) suggests that BLM's qualitative and inconsistent monitoring methods do not assure habitat protection and cannot be the full measure of grazing impacts to this species.	3035_6
1028	1028-43	The BLM must at least analyze the no grazing alternative to determine whether it is a viable alternative. Considering the scientific evidence demonstrating that the elimination of grazing is the only way to protect and restore many areas, the BLM should provide analysis of that important option.	3017-2
1028	1028-42	The Purpose and Need of the DEIS states an intent "to thoroughly consider the conservation measures identified in the Greater Sage-grouse National Technical Team (NTT) Report on National Greater Sage-Grouse Conservation Measures (Sage-grouse NTT 2011), as referenced in BLM IM 2012-044."85 However, the DEIS fails to considers a reasonable range of alternatives. The most likely alternatives considered propose no meaningful, enforceable, regulatory changes to livestock grazing practices in the planning area, despite the numerous and severe impacts of livestock grazing on sage-grouse habitat and other values.	3035_1
1028	1028-40	In accordance with its multiple use mission, the BLM must consider land uses other than grazing in its calculation of the economic and social values of each alternative, including administrative costs and environmental impacts to water, wildlife, plants, recreation, potential species loss, intrinsic land value, and beauty. WWP asks that the social and economic calculations presented in the RMP address these important issues.	3036-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-39	The Supplemental DRMP states that under Alternative E livestock grazing would contribute 134 jobs, and under Alternative F livestock grazing would contribute 186 jobs. 84 However, this comparison, like the comparison of annual earnings and output of each alternative, fails to account for agency administrative costs, increased recreational income due to improved environmental conditions from decreased grazing, and other factors that WWP urges that BLM consider in its analysis.	3036-1
1028	1028-38	Furthermore, there is great potential for administrative cost savings for BLM from reduced grazing. Decreased grazing would save the BLM costs associated with environmental analysis, litigation, grazing permit administration, predator control, weed spraying, and costly efforts to preserve species harmed by grazing. The GAO found that it cost the federal agencies approximately \$23.50 per AUM to administer the livestock grazing program yet only .67 cents of the grazing fee goes towards covering those expenses.77 Disappointingly, RMPs tend to calculate economic and social values based almost exclusively on potential profits or lost profits of buying and selling cattle. The Bighorn Basin RMP should consider these important factors.	3036-1
1028	1028-37	The current grazing utilization level (what is it? I think they dumped the old RMP utilization limits) is unsustainable, and restoration of the land will require costly action by the BLM. A thorough economic calculation must consider the value lost from negative environmental impacts to: water quality and quantity, wildlife habitat quality and quantity, and native vegetation. The costs of further exotic species and weed expansions, diminished recreational opportunities, potential species loss, intrinsic land value, and beauty must also be calculated.	3036-1
1028	1028-36	The economic and social value of public lands livestock grazing often receives disproportionate weight in BLM RMPs. The importance of public lands grazing to the economy is often grossly overestimated. In the Final RMP, the comparison of social and economic values of the proposed alternatives should demonstrate a clear understanding and consideration of the conflicts between continued grazing and other uses of the public lands.	3036-1
1028	1028-35	Furthermore, the DEIS analysis includes no discussion of the other ways that cattle contribute to climate change, such as impacts to the carbon sequestration or storage of the lands themselves, and the effect of allowing livestock to utilize an unspecified percentage of the vegetation each year. The Final RMP/EIS must address the issue of climate change.	3002
1028	1028-34	The Supplemental DRMP acknowledges the issue of methane emissions from cattle, stating that "Animal Unit Month (AUM) projections under alternatives A, C, D, and F are similar, and therefore would result in similar CH ₄ [methane] emissions. Alternatives B and E would reduce AUMs by about 50 percent, resulting in a proportional reduction in CH ₄ emissions from enteric fermentation." Only the selection of Alternative B or E would address the climate change impacts of livestock grazing.	3002

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-33	The document provides appendix L on Best Management Practices but fails to provide information regarding how these will be implemented and whether they are required components of any alternative(s). Furthermore, this section completely ignores any requirements related to the primary impact across the Bighorn basin which is livestock production.	3035_3-1
1028	1028-32	The document fails to provide the monitoring requirements stating that the BLM is "currently in the process of finalizing a monitoring framework". The result is that this critical component is not available for public review. This does not comply with NEPA.	3035-7
1028	1028-31	Unfortunately, the document fails to address the issue of livestock grazing as a contributor to the spread of West Nile virus among sage-grouse. Water developments installed on public lands for livestock serve as breeding grounds for mosquitoes and can thus increase the spread of West Nile virus, and "[e]liminating mosquito breeding habitat from anthropogenic water sources is crucial for reducing impacts. ⁵⁴	3035_6
1028	1028-29	Despite admissions of the negative impacts of livestock grazing, the DEIS, particularly the preferred alternative, fails to address livestock grazing in a way that would protect sage-grouse and sage-grouse habitat. In the Supplemental DRMP, BLM appropriately recognizes: There are many sources of habitat alteration, all of which may affect the greater sage-grouse... Livestock grazing, fuels treatments, and weed infestations are factors that may cause habitat degradation depending upon severity, intensity, and design. 51 Despite this acknowledgement of the impact of livestock grazing on sage-grouse habitat, DRMP's preferred alternative would continue grazing at high levels and allow vegetation treatments to the detriment of sage-grouse. Furthermore, the Affected Environment section later acknowledges threats to special status species and vegetation, but fails to mention livestock grazing.	3017-3
1028	1028-28	The EIS states that "alternative F manages grazing lands consistent with alternative D, except in greater sage grouse core habitat areas ACEC where the BLM prioritizes the consideration of sage grouse habitat objectives and management considerations over livestock grazing objectives through the imposition of restrictions on livestock grazing location and timing, and range improvement projects." ⁴⁵ However this critical issue, prioritizing sage grouse habitat objectives over livestock grazing, has not been declared within the proposed RMP.	3035_6
1028	1028-27	In our reading of the supplemental EIS, we could find no evidence that the BLM has shifted its preferred alternative from alternative D to one of the two alternatives that attempt to deal with this sage grouse issue, so it appears that the BLM is using this only as an exercise and does not plan to even implement the weak measures in the two new alternatives.	3027-1
1028	1028-26	The DEIS states "despite the long-term declines in populations, implementation of the Wyoming governor's executive orders for sage grouse may help alleviate these declines," ⁴⁴ but this statement is not supported by evidence.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-25	The DEIS does not sufficiently address the issue of species recovery. The DRMP states that "the highest level objective ... [is] reversing negative population trends." 3 However, Record # 115 discusses adaptive management and sage grouse populations. Here the BLM attaches itself to State of Wyoming population objectives, which it says are "to maintain at least 67% of the 2005 to 2008 sage grouse core area population within the state of Wyoming". So the BLM here is admitting that the actions proposed are meant to achieve a one third reduction in the populations that the US Fish and Wildlife Service had determined made the species warranted for listing under the ESA. Further, the BLM's population objectives are only within core areas and do not even apply to areas excluded from core areas.	3035_2
1028	1028-24	Record # 101 fails to implement any trigger to "analyze" existing water developments and as such it will never happen and therefore from a sage grouse recovery perspective the direction provided is worthless. The same applies to #103 and #106.	3035_6
1028	1028-23	Record #97 provides that in those few riparian areas that do meet the minimal level of PFC the BLM well "strive" to attain further improvements. Such direction to "strive" is meaningless.	3034
1028	1028-22	Record #95 proposes to manage "riparian areas and wet meadows for proper functioning condition". This objective has been BLM policy since the mid-1990s and has rarely been achieved. In addition, PFC as defined in the technical reference, is merely the minimum physical functioning to withstand a 20 year flood event and is well below the condition necessary to provide fisheries or wildlife habitat needs.	3034
1028	1028-21	The DEIS suffers from flaws in its logic regarding impact analyses in riparian areas. As an example in the executive summary the document states that "alternative E would result in the greatest beneficial impacts to riparian-wetland resources through restrictions on surface disturbing activities". 2 These are not beneficial impacts, but reduced negative impacts. Furthermore, because the BLM has arbitrarily defined surface disturbing activities to exclude livestock grazing, the primary impact within riparian-wetland areas, livestock grazing, is ignored.	3017-3
1028	1028-20	The BLM must modify its preferred alternative that protect and restore sage-grouse habitat, native plants, particularly in riparian areas. This should be done, not with fencing that poses other problems for sage-grouse and other wildlife, but through reduction and removal of livestock grazing in pastures that include riparian areas. The Final RMP should include stipulations prioritizing riparian habitat protection for sage-grouse and other species.	3035_6
1028	1028-19	The DRMP states: "livestock grazing in greater sage grouse habitat can have both adverse and beneficial impacts".39 No references are provided to support the statement that livestock grazing has beneficial effects on sage grouse habitat. As described and referenced in this document, livestock grazing in sage grouse habitat increases fragmentation, causes fence strike mortality, causes direct disturbance to nesting habitat, reduces residual cover, causes long-term plant community changes which degrade sage grouse habitat and other impacts. We could find no support whatsoever in the literature that livestock grazing improves sage grouse habitat.	3035_6

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-18	Stunningly, the document contains no data whatsoever regarding current sage grouse habitat conditions or population data nor how these compare to the objectives laid out in the proposed RMP. There is no information regarding the discrepancy between these two nor any examination of the effectiveness of the proposed actions. This clearly does not comply with the "hard look" requirement of NEPA .	3035_2
1028	1028-17	The Supplemental DRMP virtually ignores the threat of livestock grazing to sage-grouse habitat, stating that "the primary threats to this portion of the population are energy development and transfer including both renewable and nonrenewable resources, long-term drought and sagebrush eradication programs." ³² However, this completely ignores the fact that energy development occurs on a small percentage of the sagebrush habitat, while livestock grazing occurs on many more acres. The primary long-term threat is the widespread conversion of mid-stature cool season bunchgrasses, that did not evolve with significant herbivory, to short stature, grazing tolerant species. This conversion has occurred throughout much of the Bighorn basin already and is the primary source of habitat degradation across the planning area.	3035_6
1028	1028-16	This information should be integrated into the "No Grazing" or "Reduced Grazing" alternatives and, given these findings, the BLM should analyze the impacts of long-term authorized grazing and its impacts on sagebrush communities and obligates compared to the impacts of removing livestock and allowing these communities to recover naturally.	3017-2
1028	1028-15	The DRMP/DEIS fails to fully consider the impact of livestock grazing on the full suite of resources in the project area.	3017-3
1028	1028-14	The BLM is responsible for "Ensuring that BLM activities affecting Bureau sensitive species are carried out in a way that is consistent with its objectives for managing those species and their habitats at the appropriate spatial scale." ²³ This is true for every Sensitive Species in the field office, not just sage-grouse, and the DRMP/DEIS does not place enough emphasis on minimizing and eliminating threats from livestock grazing.	3017-3
1028	1028-13	WWP is concerned that no alternative will uphold BLM's obligation to manage Sensitive Species to "minimize or eliminate threats," and not "contribute" to the need for listing, either within or outside of sage-grouse Core Area habitats. As detailed elsewhere in these comments, mitigation measures applied under the proposed alternatives will inevitably lead to serious impacts to sage grouse populations within Core Areas and elsewhere and, for the most part are unenforceable, and therefore not "adequate regulatory mechanisms". This result represents an unnecessary and undue degradation of key sage grouse habitats.	3035_9

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-12	The U.S Fish and Wildlife Service will consider the Policy for Evaluating Conservation Efforts ("PECE Policy") as the yardstick to determine the adequacy of existing regulatory mechanisms when considering whether listing is warranted. Implementation must be certain and the proposed plan in question must be known to be effective. According to the PECE policy, "We will make this evaluation based on the certainty of implementing the conservation effort and the certainty that the effort will be effective."8 The BLM must incorporate this certainty into the current planning effort. The current supplement fails to provide any information regarding these two key factors.	3035_2
1028	1028-11	The BLM National Sage-grouse Habitat Conservation Strategy is entitled "Guidance for the Management of Sagebrush Plant Communities for Sage-Grouse Conservation," and hence is directly applicable to the Bighorn Basin planning area. The Strategy includes a host of enforceable limitations and requirements on livestock grazing to protect sagebrush habitats, and to maintain, enhance or restore sagebrush habitat, including: Avoid constructing livestock management facilities (i.e., corrals, tanks, troughs, pipelines, fences, etc.) next to leks; Design and locate the placement of fences for livestock . . . so as not to disturb important sage-grouse habitat areas; Consider seasonal closures to protect priority sage-grouse habitat if other alternatives will not achieve desired objectives; Use grazing practices that promote the growth and persistence of native shrubs, grasses and forbs needed by sage-grouse for seasonal food and concealment. . . Vegetation structure (height) should be managed so as to provide adequate cover for sage-grouse during the nesting period; Maintain seeps, springs, wet meadows, and riparian vegetation in a functional and diverse condition for young sage-grouse; Maintain sagebrush and understory diversity . . . adjacent to crucial season sage-grouse habitat unless removal is necessary to achieve sage-grouse habitat management objectives; Where other grazing management options are not achieving, or cannot achieve, the desired objectives, a short-term option may be livestock exclusion These measures must be directly incorporated in the current plan.	3035_6
1028	1028-10	According to BLM IM 2012-44, "The conservation measures developed by the NIT and contained in Attachment 1 must be considered and analyzed, as appropriate, through the land use planning process by all BLM State and Field Offices that contain occupied Greater Sage-Grouse habitat." This must be done fully in the Bighorn Basin RMP EIS. IM 2012-44 does not provide an option not to analyze these measures in at least one alternative unless a clear finding is provided that the measure is not appropriate, and BLM has provided no such findings in the context of the RMP.	3035_1
1028	1028-8	The BLM is required to meet the water quality standards of every state in which it administers public lands. Livestock grazing in and near streams results in increased E. coli and fecal coliform bacteria. The Final EIS and RMP must explain how the plan complies with Wyoming surface water quality standards for E. coli and fecal coliform bacteria.	3044

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-7	The National Environmental Policy Act ("NEPA") requires that the BLM consider a reasonable range of alternatives. See 42 U.S.C. § 4332(2)(C)(iii). Considering the presence of endangered, special status, and sensitive species in the planning area, a no grazing alternative and 50% reduction from actual use, in permitted grazing should be included within the reasonable range of alternatives for the Bighorn Basin DRMP.	3035_1
1028	1028-6	The EIS/DRMP fails to explicitly state that the desired outcome of the RMP is to recover sage grouse and its habitat to insure that the species is no longer warranted for listing under the ESA. As such the "allowable uses and actions" do not directly address the desired outcome.	3035_1
1028	1028-5	The DRMP fails to provide specific measurable terms and conditions related to livestock management sufficient to meet the requirements of FLPMA's unnecessary or undue degradation and multiple uses provisions. Western Watersheds Project urges the BLM to add specific measurable objectives for livestock grazing specific to riparian areas, uplands, and impacts on sensitive species habitat in order to comply with FLPMA, beginning with the terms and conditions mentioned above.	3017-2
1028	1028-4	The preferred alternative does not meet the requirements of FLPMA. FLPMA requires the BLM "take action necessary to prevent unnecessary or undue degradation of the lands[.]" 43 U.S.C. § 1732 (b). FLPMA also requires that the BLM manage lands for multiple uses, "without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output." 43 U.S.C. § 1702(c). Permitting ongoing livestock grazing cannot be justified under these parameters.	3017-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-3	In regard to livestock grazing, Western Watersheds Project urges the BLM to add the following to the Final EIS and RMP: (1) Specific measurable terms and conditions for livestock grazing in riparian areas, uplands, and wildlife and fisheries habitat. The 2010 US Fish and Wildlife Service "warranted but precluded" decision stated that sufficient management terms and conditions were not in place to protect the sage-grouse. Because NEPA analysis is rarely performed on grazing allotments, due to the BLM's addiction to the 2005 Appropriations Rider, the terms and conditions must be immediately incorporated into any existing use authorizations in order to meet adequate regulatory mechanisms of ESA. These terms and conditions must be specific to sage-grouse habitat, and include: (i) A minimum of 7" stubble height remaining on hydric soils riparian greenlines after livestock grazing; (ii) A 10% maximum annual bank or wetland alteration from all sources for streams and wetland hydric and mesic soil areas of upland seeps, springs, wet meadows and aspen clones; (iii) A maximum annual woody browse utilization by all browsing ungulates of 15% on cottonwood, aspen, woody shrubs, and willows; (iv) A maximum annual grazing utilization of perennial grass species on upland landscapes by all grazers of 25%; (v) A minimum 9" residual perennial native grass cover for ground-nesting birds; (2) Additional alternatives that represent a range of grazing levels; and (3) Authority for the permanent retirement of voluntarily waived grazing permits in every alternative of the Final EIS. (4) Standards and Guidelines assessments must be completed on all allotments within sage grouse habitat within 5 years of signing the Record of Decision ("ROD"). These assessments in addition to the standard procedures, must gather habitat condition data to be used in the decision-making process. Allotments within sage grouse habitat that are not in HCPC or >75% Similarity Index must have significant reductions in AUMs in order to allow recovery cool season grasses in order to provide sage grouse habitat. Much of the Bighorn Basin has been converted from grazing intolerant cool season bunch grasses to short stature increasers. Management changes that immediately address this issue must be implemented in order to provide for sage grouse habitat recovery. (5) Given the importance of changes in livestock management, the RMP must require full processing of all permits within sage grouse habitat or else all the actions proposed will never be implemented due to the BLM's addiction to the Appropriations Rider. Without this requirement in the RMP none of the livestock related actions could be considered "adequate regulatory mechanisms".	3035_6

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1028	1028-2	Responsible land management requires the use of ecologically sound, science-based analysis in the determination of appropriate livestock grazing levels. Unfortunately, the Bighorn Basin DRMP fails to sufficiently address the environmental impacts of livestock grazing. From the NEPA prospective, the BLM has failed to sufficiently discuss the effectiveness of its proposed actions or provide sufficient information regarding their effect on sage grouse populations and their habitat. The DRMP document falls short of providing the depth of analysis and consideration of grazing alternatives warranted by a land use plan that will govern lands managed by the Worland and Cody BLM Field Offices. A reader of the document is provided almost no information regarding the outcome for sage grouse of the various alternatives nor is there any population viability analyses provide added as references. This does not fulfill the "hard look" requirement of NEPA.	3035_6
1028	1028-1	Unfortunately, the DRMP fails to meet this purpose and need. The proposed DRMP fails to significantly address the "present and threatened destruction, modification, or curtailment of the habitat or range of the greater sage-grouse." In addition, RMP fails to implement the "regulatory mechanisms" that would be necessary for the recovery of the species. Regulatory mechanisms under the ESA must be mandatory and enforceable. The vast majority of the supposed actions proposed do not fit either of these requirements.	3035_1
1029	1029-18	Phased development and phased leasing are two important means for limiting environmental impacts. Phased development can "leave areas of habitat undisturbed by ongoing construction and drilling activity while other areas are developed" and developed areas "would be required to undergo interim reclamation before drilling could move on to the next area." Manual Phased leasing "could provide the opportunity to lease a limited and less sensitive for development in order to determine the area's production potential." /d. at V-6. This should be part of an adaptive management approach "so that if oil and gas were successfully discovered and produced there would then be the opportunity to analyze the impact of additional leasing." Id.	3023-3
1029	1029-14	We believe the DEIS and the Supplement define resource condition objectives that should be applied and sought in the A-B Front, Fifteen Mile Basin, and Bighorn Front MLPs. For example, under alternative E, which we think is appropriate for application to these three areas, anthropogenic disturbance will not exceed 640 acres and it will cover less than 3 percent of total sage-grouse habitat	3023-6

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1029	1029-13	These disturbance level specifications and habitat structural specifications establish resource condition objectives for these three MLP areas. Notably, they would help ensure greater sage-grouse conservation, among the many other resource values that would benefit from development of MLPs. Importantly, these Resource Condition Objectives must be based on the "vision" for the Master Leasing Plans. If the vision in these MLPs prioritizes (and it should prioritize) the avoidance of potential impacts on lands with wilderness characteristics, crucial big game winter habitat, wildlife migration corridors, greater sage-grouse core areas, recreational opportunities, scenic viewsheds, and more, the resource Condition Objectives should provide clear standards (numeric or otherwise) and measures for implementing that vision. A Resource Condition Objective must be developed for each of the values recognized in the MLP area: thus, a Resource Condition Objective for Lands with Wilderness Characteristics should be developed and prioritized with the conditions for the other recognized issues, in accordance with the MLP vision.	3023-6
1029	1029-7	In both the DEIS and SEIS, the BLM has examined a variety of management decisions to recognize and/or protect these resource values. As shown on maps in both the DEIS and the Supplement, there are, or will be, a large number of special recreation areas and ACECs in the MLP areas. These special designations demand special management of oil and gas leasing and development in these areas. There are large areas of inventoried lands with wilderness characteristics (LWC) in these MLP areas. DEIS Map 63. The Wyoming Outdoor Council advocates that all LWC be managed to protect their wilderness characteristics in the Master Leasing Plans. The Absaroka-Beartooth Front and the Bighorn Front border Forest Service lands, some of which are wilderness areas or roadless areas; cross-jurisdictional consistency of resource values and associated management are key in these two landscapes. Cultural resources are equally important as ecological values; the Nez Perce National Historic Trail traverses the northern part of the Absaroka-Beartooth Front and must be considered in the "A-B Front" MLP. DEIS Map 73. The extraordinary fisheries and wildlife values of these MLP areas are undeniable. DEIS Maps 30, 32, 34, and 35. Supplement Maps -14 and -15. The Bighorn Basin is obviously a sage-grouse stronghold where many potential conflicts are presented between conservation of this species and oil and gas development. The visual qualities of the MLP areas are also undeniable. DEIS Maps 39 and 41. Supplement Maps SEIS-16 and -17. And as to soils, at a minimum the extensive badlands and "hoodoos" in the Fifteen Mile Basin certainly present potential resource conflicts. All of these resource values should be recognized as BLM develops MLPs for these areas.	3023-6
1029	1029-3	The vision statement for these three Master Leasing Plans should also acknowledge the need to address conflicts not only with future leasing, but with future development, including developments on existing leases. The Supplement provides for a range of alternatives regarding resource protection measures that can be incorporated into these MLPs for existing leases. For example, Alternative E considers adding no surface occupancy (NSO) stipulations to APDs for the Greater Sage-Grouse Key Habitat Area of Critical Environmental Concern.	3023-6

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1030	1030-11	Additional peer-reviewed, scientific literature on sage-grouse is constantly developing addressing new behavioral patterns, habitat requirements, management implications, and population statistics. It would be appropriate for the BLM to provide itself with decision space in the Bighorn Basin RMP that allows for increased management stipulations and disturbance restrictions if research shows current approaches to be inadequate to protect sage-grouse populations from energy development. The greater flexibility inherent in such a system should allow for improved decision-making regarding the appropriate scale and extent of energy development in priority (core) sage-grouse areas.	3035_9
1030	1030-10	In order for Adaptive Management to be best utilized, adequate monitoring and data collection must be implemented. We recommend a tiered approach to monitoring, starting locally and working up to a national level. The local level would encompass geographically related habitats (for example, the Bighorn Basin) and data collection by Wyoming Game and Fish Department (WGFD) in collaboration with local working groups, BLM, U.S. Forest Service (USFS), and private land owners would monitor population trends and habitat integrity on a local level. The next level of management would be at the state level, under the Executive Order and in collaboration with WGFD, to monitor state-wide trends in population. Third would be trends on a regional scale recognizing the cross-state boundaries of Management Zones set by the USFWS Conservation Objectives Team (USFWS 2013), and finally at the national level as trends are monitored between states and management zones. The only way that Adaptive Management will function as a regulatory mechanism will be if trigger actions and trigger points for population trends and sagebrush ecosystem health are pre-determined, data are faithfully collected, analyzed, and compared to both trigger points and target population numbers, and management actions are strictly and effectively monitored and implemented properly. We strongly recommend that Adaptive Management be included in the final RMP and not as part of an alternate document.	3035-7
1030	1030-9	Adaptive Management is critical when addressing future threats to sage-grouse, primarily when considering declining population numbers. We recommend setting trigger points for identifying management action if and when population numbers reach a certain level of decline. When the trigger point is reached, additional management actions that provide further protections-such as treating non core area leks as core area leks, establishing core areas as Administratively Unavailable for oil and leasing within 4 miles of active and undetermined leks, etc.-should be implemented. The Wyoming Outdoor Council strongly advocates the inclusion of Adaptive Management in the Big Horn Basin RMP to allow for the best management decisions to continually be made as emerging research provide information over the life of the plan.	3035-7

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1030	1030-8	We advocate the BLM incorporate Alternative E's decisions regarding rights-of-way into the preferred alternative and FEIS-regardless of whether the ACEC designation is forwarded to the FEIS. Managing the priority habitats of the proposed Greater Sage-Grouse Key Habitat Area ACEC as exclusion areas for rights-of-way, see Supplement Map 22, provides the necessary protection for this species from aboveground transmission line impacts (predation, avoidance, and habitat fragmentation) and from construction-related impacts from below-ground pipelines (habitat fragmentation and loss). At the same time, there are ample opportunities for north-south or east-west rights-of-way to traverse the planning area but not impact these priority habitat areas; these provide adequate continuity with right-of-way decisions for public lands surrounding this planning area. We recognize the importance of the route identified for Energy Corridor 79-216; this is the only right-of-way that crosses the sage-grouse key habitats for which we could support avoidance/mitigation rather than exclusion.	3033-1
1030	1030-7	Enhanced BLM protections are likely required if ESA listings of the sage-grouse, or other sagebrush obligates, are to be avoided in the long-term. As recognized in the scientific literature, "[t]he simplest and most cost effective first step in conservation is to halt the largescale actions that further reduce or eliminate the largest populations in the best remaining landscape" (Doherty et al. 2010). Therefore, we advocate that the Field Offices included in the Bighorn Basin RMP and Supplement should err on the side of conservation when making management decisions in regard to oil and gas development. To accomplish this, provisions from Alternatives E and F should be incorporated into Alternative D, the preferred alternative, even if the corresponding ACECs are not designated.	3035_1
1030	1030-6	To slow population declines of sage-grouse, more effective conservation efforts must be considered if listing under the Endangered Species Act is to be avoided. The BLM should consider five specific actions to avoid impacts from oil and gas development. These include: 1) increase buffer zones surrounding both active and undetermined leks in areas designated Core Area by EO 2011-5 from 0.6 miles to a minimum of 2 miles; 2) apply an Administratively Unavailable determination or NSO stipulation in place of a TLS stipulation surrounding leks (Holloran 2005; Aldridge & Boyce 2007; Doherty et al. 2008); 3) reduce the maximum disturbance allowed within Core Areas from 5% disturbance per 640 acres to 3% per 640 acres with further disturbance prohibited in sections where disturbance has exceeded 3% (Knick et al 2013); 4) implement similar restrictions outside Core Areas, particularly where habitat is still mostly intact and unfragmented to maintain both habitat and population connectivity within the Bighorn Basin and between populations in Wyoming and Montana; and 5) implement a surface disturbance cap in non-core areas. Further protections to sagebrush ecosystems and wildlife habitats and protection from increased surface disturbance are essential to maintaining habitat and landscape integrity as more and more acres are fragmented and lost throughout the state and across the region.	3035_9

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1030	1030-5	The proposed plans to monitor habitat health lack standardized data collection and analysis of critical sagebrush habitats. This is a shortcoming that can and should be corrected. Fixing this flaw will also help the BLM to better plan for its multiple use objectives. Additional research has shown that percent cover in sagebrush habitats as determined by BLM is 2.6 times greater than sagebrush cover from research applications (Wambolt 2007 and references therein). Considering the additional proposed disturbances in sagebrush habitats, accurate information regarding current sagebrush cover and distribution is needed for BLM to make responsible management decisions. Implementation and enforcement of data sampling and analysis, utilizing Ecological Site Descriptions, will provide accurate data necessary to address sagebrush ecosystem health, and will benefit all wildlife and plant species reliant on sagebrush ecosystem	3042
1030	1030-4	Utilization of Ecological Site Descriptions also discourages subjective application associated with applying numerical percentages to classification ratings. According to this rating system, the classifications represent percent similarity to the Historic Climax Plant Community (poor= 0-25%, fair= 26-50%, good= 51-75%, and excellent= 76-100%). By using this ranking system, BLM is striving for 65% of HCPC in alternatives D and F, and 75% of HCPC in alternative B. The RMP and Supplement propose to "[m]anage to achieve or make progress toward achieving [65% or 75%] or more of Historical Climax Plant Community" (BLM 2011, p. 2-65, Record# 4031). This is flawed, in our opinion, because it gives no incentive to strive for better habitat, perpetuating the sentiment that "good is good enough." Ecological Site Descriptions reflect new understandings about ways in which vegetation changes over time. Instead of describing vegetation change as a gradual linear process, the state-and-transition models included in Ecological Site Descriptions reflect the sudden and unpredictable changes that sometimes occur on landscapes, providing resource managers with better information about ecological changes resulting from specific disturbances, response following disturbance, and how landscapes change over time.	3042
1030	1030-3	We are also concerned with the basic premise behind the Timing Limitation Stipulation (TLS) presented in alternative D. The TLS offers only the minimum to reduce direct disturbance to sage-grouse during critical times of year, primarily focusing on bird behavior, but does nothing to protect habitat. Since habitat degradation and fragmentation are considered primary threats to continued sage-grouse population resilience and survival, we object to the use of a TLS on principle. Habitat disturbance may occur at all other times of year not included in the TLS. Imagine spending the winter in Florida, only to return home to Wyoming to find that half of your house is missing. The loss of shelter and food is significant, even if the disturbance happened while you were not there. It is for these reasons that TLS is an 'inappropriate' management tool in this context. In its place, we urge the BLM to utilize unavailability determinations or No Surface Occupancy (NSO) stipulations. These administrative tools will better provide the protections needed to ensure the greater sage-grouse continues to be precluded from Endangered Species Act protections.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1030	1030-2	Providing a buffer in non-core areas that peer-reviewed scientific research has shown will neither ensure lek persistence nor maintain grouse populations, runs counter to Wyoming Executive Order 2011-5, which states: "[d]evelopment scenarios should be designed and managed to maintain populations, habitats and essential migration routes ..." We believe the Bighorn RMP should avoid taking undue risks with non-core populations and should provide alternatives that would adopt scientifically validated stipulations that afford sage-grouse inside and outside core areas with levels of protection that would satisfy core area conservation strategy objectives.	3035_1
1031	1031-6	Record # 50--It is unrealistic to assert that an entire allotment should be shut off from grazing if the burned area can't be fenced. This is completely unnecessary and extreme. It reflects an absence of on the ground reality. These allotments can be huge, burned areas can be huge and fencing unrealistic. It again reflects the obvious agenda against livestock grazing under the guise of caring about restoration.	3011
1031	1031-5	Record #49 " Alternative F: It is counterproductive for sage grouse to exclude livestock from grazing in burned areas until wood and herbaceous plants achieve sage-grouse habitat objectives. Woody shrubs in this ecology could take as long as 60 years to re-establish and in the meantime grasses could compete with them. Livestock grazing should be permitted during this time. If in fact sage grouse stewardship is on the radar screen.	3011
1031	1031-4	Chapter 4.3 Fire and Fuels Management: Proactive Management section-Marginalizing and restricting the use of fire within areas of environmental concern will only worsen the invasive weed problem already ahead of land managers. We need all tools to help control invasive weeds and not worsen the problem by slowing management. Proactive fire management must not move slowly, it must continue at a rapid and consistent pace to improve habitat.	3011
1031	1031-3	Chapter 2, Table 2.3: Alternatives E & F: Not necessary to put 1,857,485 acres or 1, 786.241 acres under the restrictions of Areas of Environmental Concern. While sage-grouse may be present, it does not mean that they will be negatively impacted or the area degraded if left open to the public. These alternatives seek to manage for one species only, the sage-grouse to the detriment of all other resources. Alternative E adds 9 additional Areas of Critical Environmental Concern (ACECs) to the restricted use picture: The nine proposed ACECs are Chapman Bench, Clarks Fork Basin/Polecat Bench West Paleontological Area, Clarks Fork Canyon, Foster Gulch Paleontological Area, McCullough Peaks South Paleontological Area, Rainbow Canyon, Rattlesnake Mountain, Sheep Mountain, and Greater Sage-Grouse Key Habitat Areas. Where is the demonstrated justification for this closeout?	3001
1031	1031-2	Chapter 2, Table 2.2: There are no lands open for Desert Land Entry. No justification for this, as any such entries would take into account the sage-grouse life cycle, if they were present. These entries, while underutilized should remain an option to the American public.	3016-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1032	1032-1	No Lands open for desert land entry” In Chapter 2, Table 2.2, although the entries may be under utilized, stopping entry is not justified because if sage grouse were present, any such entries would take into account their life cycles.	3016-1
1035	1035-1	Economic Fall out: Chapter 2, Table 2.2 proposes the closure of almost 2 million acres of livestock grazing. This alternative is not supported scientifically, nor does it take into account the economic fallout to local communities, communities who are sustained by the livestock industry throughout the Big Horn Basin.	3036-2
1036	1036-1	#1” If for some reason you choose alternative E. “Fire-Fuels” got my attention and its effect on grazing. If it (BLM land) has to recover fully to pre-fire condition, that could take up to 50 years for sagebrush to come back. Therefore our grazing would be cut up to 1/2 meaning we would also have to reconsider how we manage our private lands. One option is we would either cut way back on stocking rate & use more of our own resources for cattle, graze more intense leaving less habitat for the Prairie Chickens and other wildlife elk, deer, moose, antelope, etc. One other option is to subdivide or lease private land out, therefore cutting off habitat again. As far as the “science” that go into these decisions, it seems to change as the political and emotional winds shift.	3011
1037	1037-51	Alternative B/E provides the most appropriate protections for raptors, with improvements. Record #4124 states, “To protect nesting raptors, apply a TLS to prohibit surface-disturbing and disruptive activities within: 1 mile of active raptor nests (543,945 acres) during specific species nesting period, or until young birds have fledged ... 2 miles of active ferruginous hawk nests (47,365 acres) from March 1 to July 31, or until young birds have fledged.” [DRMP at 170]. Audubon encourages that the definition of “active nests” be clarified to include being those that have been active within the past 7 years as raptors may abandon a nest but either return themselves in following years or have the nest taken over by another pair. These temporarily inactive nests identify areas containing quality combinations of nesting and foraging habitats that should be protected for use by future nesting raptors. Audubon also requests for the inclusion of winter roost sites.	3038
1037	1037-48	Despite being a BLM sensitive species and referenced as being within the Planning Area, Golden Eagles were woefully addressed within the RMP. The Final RMP should include analyses on Golden Eagle populations and use within the planning area and improve the protective buffers. Especially in light of USFWS currently authorizing take permits only under “no net loss” requirements, surface-disturbing activities should be prohibited within 1 mile of Golden Eagle nests, as is recommended by Alternative B.	3038
1037	1037-44	The Bighorn Basin Draft RMP and SRMP fails to reference the Avian Power Line Interaction Committee. Audubon was one of the original members of this committee and has participated in recent training workshops. Please note that a newer APLIC guideline manual was released in 2012 and should be referenced. Suggest contacting Rick Loughery (rloughery@eei.org) as this committee has developed resources that should be incorporated in the FEIS.	3027-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-42	For non-core/general habitat, protections should still be provided regarding powerlines. The Lander RMP FEIS Record #4102 (Alternative B): Prohibit new, permanent, high-profile structures (higher than 12 feet) within 1 mile of occupied greater sage-grouse nesting habitat (Map 64). FEIS at 130. Similarly in the Miles City Draft RMP, while high voltage power lines are allowed within General Habitat, they should avoid areas within 1 mile of a lek to minimize grouse avoidance behavior and increased predation pressure. Research indicates approximately one-third of juvenile sage-grouse mortality is directly attributed to collisions with power lines (Beck, Reese, Connelly, and Lucia 200617; Flake, Connelly, Kirschenmann, and Lindbloom 201018). Miles City DEIS at 4-133. In addition, a study in Idaho found that power line collisions resulted in 33 percent of juvenile sage-grouse deaths in the study area (Beck et al. 2006; Flake et al. 2010). Miles City DEIS at 4-158. We support this provision as a means to prevent area avoidance by sage-grouse. These powerline provisions should all be incorporated into BLM's final decision.	3035_8
1037	1037-41	High voltage powerlines should be avoided within high priority habitats, such as ACECs, as proposed in the SRMP. While they are allowed within general habitat, they should be prohibited within 1 mile of a lek to minimize grouse avoidance behavior and increased predation pressure. The SRMP also endorses burying powerlines. While eliminating perching opportunities for avian predators, burying power lines may well be more detrimental in regards to volume of surface disturbance occurring in such proximity to leks. Audubon requests additional analyses compare the impacts to sage-grouse from burying versus vertical structures. Audubon remains concerned at the amount of habitat lost or fragmented, resulting in direct and indirect impacts, resulting from a uniform stipulation of burying powerlines within 1 mile of leks.	3033-1
1037	1037-39	We recommend deterrent devices on H-frame structures because recent research indicates they are effective tools in reducing perch use of such structures (Lammers and Collopy 200715, Slater and Smith 201016). Record #17, which applies to both Alternative E and F, in the SRMP specifies that "Any existing towers must undergo review for adverse effects. Review will include minimizing wires and other collision hazards for sage grouse and migratory birds, as well as adverse impacts of night lights." [SRMP at 2-19]. While this is an important step forward, Audubon is cognizant that resources are limited and towers should be prioritized by distance from leks.	3033-2
1037	1037-38	Anti-perching devices should be required for on all new overhead powerlines in Greater Sage-grouse habitats to reduce predation from raptors. In addition, the BLM should work ROW holders to identify conflict areas and get anti-perching devices installed on existing overhead powerlines in these same habitats. These two minimizing techniques are noted in the Lander RMP (DEIS at 882). Because approximately 74-80% of sage-grouse females nest within 4 miles of leks (Moynahan 200413, Holloran and Anderson 200514), this measure will help to reduce predatory pressures on nesting and foraging grouse.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-35	The USFWS recommends that all existing guy wires be marked with recommended bird deterrent devices. ¹¹ Although the use of bird deterrent devices has been particularly important in raptor and waterfowl concentration areas, such devices also are useful in preventing songbird and perhaps even sage-grouse collisions with guy wires. Sage-grouse probably are far more likely to strike met tower guy wires than wind turbines (efforts currently are underway to mark rangeland fencing, which accounted for 18% of sage-grouse deaths in a Utah study, ¹² to prevent grouse collisions with wires). Due to the impacts to raptor populations, we encourage strict exclusion language for raptor concentration areas.	3032
1037	1037-34	BLM should avoid siting new temporary meteorological (met) towers near leks and other important sage-grouse habitat. Where wind turbines or met towers are considered appropriate and properly sited, guy wires should be marked with recommended bird deterrent devices and other state-of-the-art best practices applied to minimize impacts. Guyed meteorological (met) towers have been known to cause more bird fatalities than associated wind turbines in a number of instances. For example, at Foote Creek Rim in Wyoming, researchers found an estimated 8.1 bird fatalities per met tower per year, whereas they found an estimated 1.5 bird fatalities per wind turbine per year. ¹⁰ Given these findings and the U.S. Fish and Wildlife Service (USFWS)'s recommendations for using bird diverters to prevent avian collisions and remain in compliance with the Migratory Bird Treaty Act (16 U.S.C. 703-712), bird diverters should be more commonly used met towers.	3032
1037	1037-33	In 2004, the USFWS used several scientific studies to develop recommendations about impacts of wind energy development on grouse species. Due to various structural factors, including height, the USFWS recommended avoiding placement of wind turbines within 5 miles of greater sage-grouse and Columbian sharp-tailed grouse leks. See, e.g., Comments of USFWS on Antelope Ridge Wind Project, May 17, 2010, at 3 (noting that the "5-mile protective zone for wind project features helps buffer sage-grouse against increased mortality (both human-caused and natural), habitat degradation and fragmentation, and disturbance"); Audubon supports these recommendations for placement of turbines within non-core/general habitat.	3032

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-30	Audubon supports a proactive approach to systematically inventory and close unnecessary roads and trails, and prescribe rehabilitation/reclamation for them to benefit wildlife habitat. However, simply closing an eroding road without alleviating soil compaction and reseeded can be successful in some cases and very unsuccessful in others, leading to more adverse impacts from INNS invasion. Lander RMP FEIS at 810. We also recognize the BLM’s staff and resource limitations. A combination of protection (no new infrastructure), especially in relatively undeveloped areas, and rehabilitation will best achieve habitat goals. The HiLine RMP noted for the Grassland Bird/Greater Sage-Grouse ACEC and Greater Sage-grouse ACEC, that “Where leases or rights-of-way have some level of development (e.g., road, fence, well, etc.) that are no longer in use, the site would be reclaimed by removing the features and restoring the habitat. Upon project completion or right-of-way expiration, roads built and maintained for commercial use across BLM land would be reclaimed, unless based on site-specific analysis, the route provides specific benefits to the public and the continued public use does not contribute to resource conflicts.” DEIS at 156.	3039-1
1037	1037-29	Furthermore, BLM should specifically require that priority stretches of existing fences, especially those in proximity to leks, will be identified for use of sage-grouse fence diverters/markers to prevent collisions. BLM should adopt the provision which avoids construction of new infrastructure (such as fencing) and instead focuses on livestock grazing management throughout seasons of use and lower forage utilization. Lander RMP FEIS at 43.	3035_8
1037	1037-28	The BLM should also increase the visibility of existing fences to reduce hazards to flying greater sage-grouse and require the installation of fence markers on new wire fences constructed in greater sage-grouse habitat to increase fence visibility and reduce collision potential. When fences are authorized, the BLM should require a design that has the fewest adverse impacts to greater sage-grouse including features to reduce greater sage-grouse strikes and mortality. Audubon is very supportive of these requirements, all of which are in the Lander RMP FEIS (Record #4039, Record#4083, and Record #4101).	3035_8
1037	1037-27	In addition, fence surveys in the Lander and Rock Springs Wyoming BLM Field Office areas have shown that Greater Sage-grouse can be injured or killed as a result of flying into fence wires. Lander RMP FEIS at 969. To address this, the Bighorn Basin SRMP should include the option to remove identified wildlife hazard fences that are adversely affecting wildlife, such as sage-grouse where opportunities exist. This option was provided in the Miles City RMP, “Fences in high-risk areas (based on proximity to leks, lek size, and topography) would be removed, modified, or marked to reduce outright sage-grouse strikes and mortality.” DEIS at 2-49.	3035_8

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-25	In addition, protective stipulations should be extended to maintenance and operations actions. Lander RMP FEIS notes that “wildlife seasonal protections from surface-disturbing and disruptive activities apply to maintenance and operations actions when the activity is determined to be detrimental to wildlife.” FEIS at 117. This is an important timing due to the longer period of time associated with maintenance and operations actions, beyond the usual development-specific stipulations. BLM supports this, “Beyond initial exploration (including geophysical activities), land clearing, and aboveground facility construction, continued human disturbance to special status wildlife could occur from activities such as equipment maintenance and site operations, which are especially disruptive during sensitive times (wintering, breeding, and nesting).” FEIS at 931. Furthermore, BLM notes that “it would not preclude development or limit the number of wells and would result in no more adverse impacts than management under Alternative A, which does not have timing limitations on O&M.” FEIS at 707. The Miles City Draft RMP noted that in areas where development occurred, “there would be no restrictions to operation and maintenance activities, which would potentially result in the reduction or extirpation of populations.” DEIS at 4-134 (emphasis added).	3035_9
1037	1037-24	Given the plethora of scientific research which has documented the negative impacts of energy development on sage-grouse, Audubon is strongly opposed to the delineation of Oil and Gas Management Areas. The pursuit of full development of resources in existing fields while exempting these areas from seasonal development and other restrictions flies in the face of the BLM’s sage-grouse conservation objectives.	3035_9
1037	1037-23	Pump stations and other permanent structures should be placed a minimum of 2 miles (3.2 km) from the nearest lek, with a preferred distance of greater than 4 miles (6.4 km) from active leks, based upon the best-available data from Naugle et al. (2011)9.	3035_9
1037	1037-22	The use of 0.6 mile buffer around leks and 0.25 mile NSO for leks in occupied habitat is inadequate to maintain lek activity, as has been repeatedly shown by science (Holloran 20056, Walker et al. 2007)7.The Lander RMP DEIS and FEIS both recognized this as did the Miles City RMP.	3035_9
1037	1037-21	Audubon commends the BLM’s approach for special status species management in Alternative E - which manages disturbances (e.g., roads, oil and gas wells, pipelines, etc.) in the Greater Sage-Grouse Key Habitat Areas ACEC to not exceed one disturbance per 640 acres and cover less than 3 percent of the total sage-grouse habitat [SRMP 2-13], thus protecting priority sage-grouse habitats from anthropogenic disturbances that will reduce distribution or abundance of sage-grouse. Recently released research by Knick et al. 20135, while they did not examine Wyoming, did further emphasize the intolerance of grouse to human disturbance and development. Specifically, the researchers reported that ninety-nine percent of active leks in the species’ western range were in landscapes with < 3% disturbance.	3001

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-19	While Audubon commends the BLM for the recognition of the three new important sources of data that became available since the release of the draft RMP, in comparison to other recently released draft RMPs there is a startling lack of scientific background presented on the known development impacts to sage-grouse, despite the references made (as noted above) within the document as to the severity of the impacts. For example, oil and gas development has been identified as a cause of declining greater sage-grouse populations (Doherty et al. 2006, Walker et al. 2007, Naugle et al. 2009, Harju et al. 2009). Impacts to leks from energy development were most severe near the lek, remained discernible out to distances >6 km (Holloran 2005, Walker et al. 2007), and have resulted in the extirpation of leks within gas fields (Holloran 2005, Walker et al. 2007). Surface disturbance is anticipated to have adverse impacts to sagebrush habitats including temporary and permanent loss of habitats across all alternatives. Fragmentation and degradation of habitat for greater sage-grouse also is anticipated from surface-disturbing activities and associated development. Therefore, protective stipulations within the planning area deserve careful attention.	3035_2
1037	1037-18	The designation of Restoration Habitat should be considered, as was proposed for the HiLine RMP. Audubon is extremely supporting of application of management actions within these areas that would emphasize restoration for the purpose of establishing or restoring sustainable sage-grouse populations.	3035_8
1037	1037-15	Audubon respectfully notes that specific records related to riparian/wetland resources appears to be missing from Table 2-5 in the SRMP, thus it is unclear the details of the protections being proposed. Given this missing information, Audubon presents the following protections proposed in other draft RMPs (many of which would be appropriate outside the ACEC): . Oil and gas leasing would be offered with a CSU stipulation within 300 feet of riparian and wetland areas. Miles City DEIS at 2-23 and 2-24. . Surface disturbing activities should be prohibited within 1,329 feet (0.25 mile) of playas and 100-year floodplains where mapped. The Lander BLM noted that a set-back of 1,329 feet would not result in any substantial adverse impact because most drilling operations would be able to accommodate the setback distance and still adequately recover the oil and gas resources. Lander RMP FEIS at 706. New livestock water developments (troughs or tanks) would be located at least 0.25 miles from riparian and wetland areas, waterbodies, and streams. Miles City DEIS 2-24 and 2-25. This should be expanded to include no new range improvement projects within ½ mile of water and riparian-wetland areas, so as to avoid providing perching locations for raptors, while hens and their broods are foraging. Avoidance of introducing or expanding invasive nonnative species through disturbances/degraded habitat is another important land management consideration.	3034

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-12	Because of the importance of this habitat to grouse, Audubon Rockies suggests protections for these areas based on what has been presented in the Lander RMP (Record # 3006): "In identified greater sage-grouse winter range, vegetation treatments should emphasize strategically reducing wildfire risk around or in the winter range and maintaining winter range habitat quality;" FEIS at 101;	3035_8
1037	1037-11	In addition to assessing the spatial distribution/acreage of current winter habitat and concentration areas for sage grouse, the BLM should also consider the current quality of this habitat as this will likely drive selection of appropriate protective measures and prioritize restoration activities. The Governor-appointed Wyoming Sage-grouse Implementation Team recently commissioned the Wyoming Chapter of the Wildlife Society, a non-profit organization of wildlife biologists, to review current protocol for identifying and mapping sage-grouse winter concentration areas. This report would be helpful for consideration in the Bighorn Basin's planning efforts going forward.	3035_2
1037	1037-10	Upon designation of special status species, the species's distribution, key habitat areas, and special management needs should be identified prior to developing resource management plans. While winter concentration areas were referenced in the document (Table 2-2, SRMP 2-4), maps displaying the location of these were not provided which seriously limited reviewers's understanding and ability to provide substantive comments.	3035_2
1037	1037-8	In June 2013, the BLM issued a new interim policy on regional mitigation, effective immediately (http://www.blm.gov/pgdata/etc/medialib/blm/wo/Information_Resource_s_Management/policy/im_attachments/2013.Par.57631.File.dat/IM2013-142_att1.pdf). The new manual covers regional mitigation strategies, planning, and implementation. In the planning portion, the goal is to incorporate sites and measures and mitigation strategies into land use plans, including a regional baseline, mitigation objectives, land use allocations or "areas for landscape-level conservation and management actions." Relevant to the HiLine RMP, ACECs and sage-grouse priority habitat are used as examples of these. In the implementation portion, this is described as part of approving specific land uses, which may be "within (onsite) or outside of the area of impact." The manual emphasizes that on-site mitigation is always the first choice (including a "mitigation priority order", then discusses off-site mitigation comprising replacing or providing similar or substitute resources or values through "restoration, enhancement, creation, or preservation." As the RMP process proceeds in the Bighorn Basin Planning Area, Audubon respectfully requests clarification on how this new interim regional policy on mitigation will be incorporated.	3035-7

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-7	Given the number of times "mitigation" is referenced in DRMP/SRMP and the misconception that mitigation is limited to compensatory, the RMP should provide a clear description of the Mitigation Hierarchy (Council on Environmental Quality 2000). This has been done in other RMPs and is important to note in the Bighorn Basin RMP as well, that before impacts can be restored or off-set, good faith efforts must be made to avoid or minimize impacts. Environmentally responsible development will limit environmental impacts by guiding projects away from the most environmentally sensitive sites and species. Where avoidance is impossible or impracticable, mitigation measures should generally lead to increasing or stable populations in the project area, as well as at the regional/planning level. Mitigation, which should be monitored to determine effectiveness, should enhance long-term health and viability of the impacted populations through permanent protections and through other protections that last at least throughout the life of a proposed project.	3035-7
1037	1037-6	We are encouraged that the BLM and USFS are currently in the process of finalizing a Monitoring Framework, which will ultimately provide clarity on how the BLM and USFS will monitor and track implementation and effectiveness of planning decisions (e.g., tracking of waivers, modifications, site level actions) to meet conservation objectives. While it is in the process of being finalized, with a goal of being included in the FEIs, we stress that it must be meaningful and have specific measures/thresholds. It is imperative that the BLM require and enforce the implementation of a science-based adaptive management program. The purpose of an adaptive management program is to reduce uncertainty about the effects of specific development projects on wildlife and wildlife habitat.	3035-7
1037	1037-5	In addition, clarification is needed on how mitigation documents being currently developed by the BLM (this may be the Monitoring Framework) and USFWS, in regards to Greater Sage-grouse, will be applied to this proposed RMP.	3035-7

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1037	1037-4	<p>With the cooperation of key experts (including staff from Wyoming Game and Fish Department and WY BLM), the following Important Bird Areas were identified within the planning area. Several are described in greater detail due to overlap with GRSG Core Areas, thus further emphasizing their ecological importance.</p> <p>Chapman Bench IBA. This IBA overlaps GRSG Core Area. Land ownership is all federal. The area contains sagebrush habitat that supports at least 12 sensitive species, including three BLM sensitive species GRSG, long-billed curlew, and mountain plover. This area provides nesting habitat for one of the highest concentrations of sagebrush-obligate species in the Bighorn Basin. The area has limited development. This is a proposed ACEC and Audubon strongly supports its nomination for the retention, enhancement, and success of GRSG and mountain plover. Heart Mountain IBA. This IBA overlaps GRSG Core Area. Land ownership is a mix of federal, state, and private. Due to the wide elevational range, Heart Mountain is able to support abundant wildlife populations despite the presence of relatively little water. The Nature Conservancy maintains ranching operations on these lands. Ornithological species of note and BLM sensitive species in the area include GRSG, long-billed curlew (breeding), golden eagle (breeding), swainson's hawk, ferruginous hawk, prairie falcon, sage thrasher, and Brewer's sparrow. Loch Katrine Wetland IBA. This IBA overlaps GRSG Core Area. Land ownership is all federal. Prairie grassland and shrub communities surround the lake and the adjacent rock hills and cliffs provide raptor-nesting habitat. Because the site exists in a high desert ecosystem, Loch Katrine is the most productive lacustrine complex in Wyoming's Big Horn Basin and supports a diverse community of migratory and nesting waterfowl and shorebirds. The area produces an estimated 100-150 broods of waterfowl and 50-100 broods of shorebirds on a "normal year" and is considered to have an above average reproductive success rate. Breteche Creek IBA. Land ownership is a mix of federal and private. This IBA is noted for containing GRSG. Ornithological species of note and BLM sensitive species in the area include GRSG, Brewer's sparrow, golden eagle (breeding), and bald eagle. Beck Lake/Alkali Lake IBA. TenSleep Preserve IBA. Yellowtail Wildlife Habitat Management Area IBA.</p>	3049
1037	1037-3	<p>While two Important Bird Areas (IBAs) are briefly referenced in the DRMP and SRMP, others are missing. IBAs have been incorporated in other RMPs and BLM planning documents, and are increasingly being included in landscape scale planning efforts. This program, which reflect critical avian habitat, should be incorporated in BLM decisions going forward for the Bighorn Basin Planning Area.</p>	3049

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1039	1039-7	The Conservancy supports implementation of the Best Management Practices in the adopted Alternative, as specified in Appendix L and expressed in Alternatives E and F as required design features for all projects (Table 2-5, Record#1-2) to reduce disturbance and manage landscapes to benefit sage-grouse population health. We suggest, however, that these BMPs be updated and modified as needed to reflect the most recent sage-grouse science as reflected in the COT report and recent publications such as Baruch-Mordo et al. (2013), Knick et al. (2013), Manier et al. (2013), and Taylor et al. (2013). We also encourage BLM to be as specific as possible when implementing these BMPs (e.g., by providing quantitative guidelines and timeframes) in projects.	3035_3-1
1039	1039-6	In order to measure success at conserving sage-grouse, the Conservancy believes that the BLM Field Offices in each state and associated RMPs must demonstrate specific actions taken or implemented to reduce key threats to sage-grouse, as outlined in the COT report, to USFWS. Many specific measures are proposed in Alternatives E & F (Table 2-5) that could address threats to Greater Sage-Grouse (e.g., fire, invasive species) and that support the COT goal of “the long-term conservation of sage-grouse and healthy sagebrush shrub and native perennial grass and forb communities by maintaining viable, connected, and well-distributed populations and habitats across their range, through threat amelioration, conservation of key habitats, and restoration activities. (COT Report, Section 4.2)” While the Conservancy is not currently able to comment on or endorse the specific measures identified in Alternatives E & F relative to these threats, we acknowledge their importance and fundamental role in the mitigation hierarchy of avoid, minimize, restore and offset and strongly encourage the BLM to choose an alternative that tangibly supports goals outlined in the COT report and addresses these threats. More specifically, the Conservancy supports those measures proposed within Table 2-5 for Alternative F that recommend management of the ACEC to mitigate impacts on BLM land, including records 10, 18, 58, 79, and 115, and offers elements of a compensatory mitigation program, attached as Appendix A, for implementation in the adopted Alternative.	3035-7
1039	1039-4	The Conservancy also supports the recommendation detailed in Table 2-5, Record 7, under Alternative F to “Consolidate anthropogenic features from development and transmission on the landscape, regardless of land ownership patterns or whether proposed actions occur in the [...] ACEC” and recommends that this instruction be included in whichever Alternative is finally adopted. However, we believe that no exceptions for high-profile structures should be granted in the Core/Key Habitat ACEC under any circumstances, due to the well-documented tendency of sage-grouse to avoid such structures and their ability to provide predator perches.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1039	1039-3	In the calculation of the number and extent of disturbances in sage-grouse habitat to determine compliance with the cap, the Conservancy encourages the BLM to develop a methodology that, while maintaining the proposed restrictions on anthropogenic disturbance, allows measurement of other disturbances that render habitat unusable by sage-grouse. Particularly important in this regard are acres burned by wildfire; BLM should refine its calculations of the disturbance cap to include these other forms of disturbance in a way consistent with the Wyoming Core Area Strategy.	3035_4
1039	1039-2	The Conservancy recommends BLM follow the COT Report's recommendation and implement an avoidance first strategy in Priority Areas for Conservation (PACs) (COT Report, pg. 14). Since PAC boundaries correspond with boundaries from Version 3 of the Wyoming Governor's Executive Order (Greater Sage-grouse Core Area of Protection; WY EO 2010-4) and therefore the Greater Sage-Grouse Core Area ACEC and in general Key Habitat Areas (SEIS, pg. 89, Section 3-3; pg. 216, Section 4.7.1) proposed in Alternatives E and F, the Conservancy recommends limiting density of disturbance within the Greater Sage-Grouse Core/Key Habitat Areas ACEC in accordance with the Wyoming Core Area Strategy, to one disturbance per 640 acres and capping all disturbance at 3% or less of total sage-grouse habitat in accordance with recent scientific findings on sage-grouse sensitivity to human disturbance above 3% (Knick et al. 2013) (Table 2-5; Record #7). In our opinion, actions to reduce disturbance within sage-grouse core areas consistent with the Wyoming Core Area Strategy (Executive Orders 2010-4 and 2011-5) will be essential toward any effort to convince the USFWS that listing the sage-grouse is unwarranted.	3035_4
1042	1042-2	Lastly, Alternatives E and F are not only counterproductive to the resource, but would have a significant impact on local business. Our small rural communities are struggling. The loss of land use would greatly hinder the livelihood of those who exist in the communities adjacent to those resources.	3036-2
1042	1042-1	I also question most of the fire management in relation to grazing. While I do believe some rest after a fire might be needed, I think it is short-sighted and unwise to limit management tools across the board. Every sight is unique and should be managed as such by the people on the ground. These kinds of policies seem to give a no confidence vote to those in the local federal offices tasked with actually managing the resource. It is generally difficult to get the most qualified personnel to work under such conditions. I have little doubt that upon initiating policies such as these will bring an immediate and lengthy downward trend in the same areas you wish to improve.	3011
1043	1043-8	Page 2-32, Record #87 Alternative E "Close the Greater Sage-Grouse Key Habitat Areas ACEC to livestock Grazing." This is an unacceptable alternative because it goes against the BLM multiple use mandate. Also, there seems to be conflicting studies as to what affect grazing has on Greater Sage-Grouse populations.	3017-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1043	1043-7	Page 2-24, Record #49 Alternative F "Livestock grazing should be excluded from burned areas until woody and herbaceous plants achieve sage-grouse habitat objectives." In some cases in the Big Horn Basin woody plants can take decades to grow. In these cases livestock grazing will be eliminated entirely. This is an unacceptable alternative	3011
1043	1043-6	Page 2-24, Record #49 Alternative E Same as above. "Page 2-24, Record #48 Alternative F "Post fire recovery must include establishing adequately sized exclosures (free of livestock grazing) that can be used to asses recovery." Will these exclosures prevent grazing from wildlife as well? Grazing is a part of the system, and therefore, should not be excluded while assessing recovery"	3011
1043	1043-5	Page 2-24, Record #48 Alternative F "Post fire recovery must include establishing adequately sized exclosures (free of livestock grazing) that can be used to asses recovery." Will these exclosures prevent grazing from wildlife as well? Grazing is a part of the system, and therefore, should not be excluded while assessing recovery	3011
1043	1043-4	Page 2-24, Record #48 Alternative E "Close the Greater Sage-Grouse Key Habitat Areas ACEC to livestock grazing" This goes against the BLM's multiple-use mandate.	3017-3
1043	1043-3	Page 2-23, Record #40 Alternative F "Manage to achieve or make progress towards achieving 65 percent or more of Historical Climax Plant Community." Will it be determined if reaching Historical Climax Plant Community is even possible? For example, if cheatgrass is present Historical Climax Plant Community is probably no longer an option. What happens if this percentage is not reached or no progress is being made?	3011
1043	1043-2	Page 2-23, Record #40 Alternative E "Lands will be managed to be in good or better ecological condition to help minimize adverse impacts of fire." How is this assessment done? Is this even reasonable?	3011
1043	1043-1	Page 2-23, continuation of Record #39 Alternative F "Limit the use of fire to treat sagebrush in areas receiving less than 12 inches annual precipitation". Is this an average, if so over how many years? This is not stated. Fire is one of the most cost effective management tools for sagebrush treatment. All of the allotments Hoodoo Ranch uses have an annual "average" precipitation of less than 12". It would be a shame to throw a useful tool like fire out of the toolbox.	3011
1044	1044-2	Utilizing sage grouse, which may be present, ha, "also which may not be present", is a way of indoctrinating opinions rather than facts. Entries to public and desert lands already underutilized should be open to public and agricultural people as asset to living, working, and surviving within the state as a Wyoming Resident. No one single animal or bird should be constituted as necessity for closure to public land.	3016-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1045	1045-1	am strongly opposed to the possible negative effects of the two alternatives E and F in the final resource document. Closing off lands to multiple use, such as grazing and general public use of Public Land is unnecessary and unwarranted. Livestock, humans, horses and other users have co-existed for years. There is no substantial and credible scientific evidence that this type of multiple use cannot continue without harm to the sage grouse or the environment. If the grazing is an issue, then the Wild Horses will need to be removed because I have witnessed the horses of the McCullough Peak area chasing and harassing sage grouse. There is no need to over react and try to fabricate information to keep the best use of the PUBLIC LANDS viable and for the benefit of the people.	3017-3
1046	1046-14	Recommendations (In addition to management under the current IMP) · WWA Preferred Management Prescriptions—WSA lands containing Sage Grouse Core Area (See Map 1, Appendix A) are closed to motorized and mechanized vehicle use (Alternative B). · WWA Minimum Management Prescriptions—Motorized and mechanized vehicle use on WSA lands containing Sage Grouse Core Area is limited to existing roads and trails with seasonal closures from February 1st-July 31st (Alternative E).	3035_10
1046	1046-13	Given the focus on sage grouse conservation policy options, we have identified five WSA's that contain portions of sage grouse core areas stipulated by Version 3 of Wyoming Executive Order (WY EO) 2011-5 Greater Sage-grouse Core Area of Protection (See Map 1, Appendix A). In the interest of achieving the best management plan in light of the BLM's multiple use mandate, we recommend that these particular Sage Grouse Core Areas, which fall within WSA boundaries, have additional resource use restrictions placed upon them. The five Sage Grouse Core Areas contained within WSA boundaries are identified below, and detailed recommendations applicable to all five areas follow the descriptions of these areas	3035_10
1046	1046-12	There are nine designated Areas of Critical Environmental Concern (ACEC's) in the planning area. Of these, we have identified five that contain Sage Grouse Core Areas (proposed ACEC's under Alternatives E and F), one of which merits additional special management (See Map 4, Appendix D). We suggest that the following stipulation be incorporated into the preferred alternative in order to address both the needs of sage grouse and the unique features of the existing ACEC for which "special management attention is required:" ² Brown/Howe Dinosaur ACEC . Sage Grouse Core Areas within the Brown/Howe Dinosaur Area ACEC are administratively unavailable for mineral leasing and closed to mineral materials disposal.	3001

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1046	1046-11	In addition to providing comprehensive sage grouse preservation, implementing WWA's preferred stipulations on sage grouse core areas that fall within CWP boundaries would preserve wilderness qualities, including naturalness and excellent opportunities for solitude and primitive recreation. These delicate and easily disturbed values are especially apparent within Citizens' Proposed Wilderness boundaries, which stand out to Wyoming Wilderness Association and our constituency as exceptional among BLM wild lands. In fact, we contend that these areas possess all of the necessary qualities for a wilderness designation. However, current management is not sufficient to keep these values intact, so future wilderness designation may be in jeopardy. WWA's preferred stipulations, if incorporated into the agency preferred alternative, would help preserve CWP areas' eligibility for a wilderness designation while significantly benefitting sage grouse vitality.	3046
1046	1046-10	Our recommendations for sage grouse core areas located within CWP's emphasize the same points as our recommendations for core areas in LWC's, namely mitigation or elimination of motorized and mechanized vehicle use, mineral leasing, exploration, and disposal, and oil and gas leasing. As previous analysis has demonstrated, these land use activities pose a legitimate threat to sage grouse populations, notably during breeding and nesting seasons. Therefore, we recommend that policies implemented in our areas of interest within the planning area eliminate or mitigate these resource uses, thereby ensuring sage grouse vitality and complying with the multiple use mandate.	3046
1046	1046-9	We recommend that the Agency Preferred Alternative be modified to instate special management of Sage Grouse Core Areas that fall within Citizen's Proposed Wilderness areas. Specifically, we advise that these lands within the planning area be managed with the following stipulations. Suggested at minimum stipulations. Motorized and mechanized vehicle use in the Sage Grouse Core Areas within these CWP Boundaries is limited to existing roads and trails with seasonal closures from February 1st -July 31st (Alternative E) . Sage Grouse Core Areas within CWP's are managed as VRM Class II. . Sage Grouse Core Areas within CWP's are unavailable for oil and gas leasing. . Sage Grouse Core Areas within CWP's are closed to mineral leasing, but horizontal drilling that originates outside these boundaries and has no impact to surface may be allowed.. Sage Grouse Core Areas within CWP's are managed as ROW mitigation/avoidance zones. WWA preferred stipulations. Sage Grouse Core Areas within CWP Boundaries are closed to motorized and mechanized vehicle use. . Sage Grouse Core Areas within CWP's are managed as VRM Class I. . Sage Grouse Core Areas within CWP's are administratively unavailable for locatable, salable, and leasable mineral leasing. . Sage Grouse Core Areas within the CWP Boundaries are closed to mineral materials disposal and geophysical exploration (Alternative E). . Sage Grouse Core Areas within the CWP Boundaries are managed as ROW and Renewable Energy exclusion zones (Alternative E).	3046

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1046	1046-8	<p>Given the focus on sage grouse conservation policy options, we have identified six CWP's, five of which abut existing WSA's that contain portions of Version 3 of WY EO 2011-5 Greater Sage-grouse Core Area of Protection (See Map 2, Appendix B). In the interest of achieving the best management plan in light of the BLM's multiple use mandate, we recommend that these particular Sage Grouse Core Areas, which fall within CWP boundaries, have additional resource use restrictions placed upon them. The Sage Grouse Core Areas contained within CWP boundaries are identified below, and detailed recommendations applicable to all six areas follow. Alkali Creek CWP Abuts Alkali Creek WSA to the West. The BLM already recognizes most of the Alkali Creek CWP as part of the Alkali Creek NW CP LWC as of a 2011 inventory. According to Table 3.46 in the Draft RMP/EIS, oil and gas development potential within this LWC is low, and there are no valid existing rights (BLM, 2011). Bobcat Draw CWP Abuts Bobcat Draw WSA, primarily to the South. The BLM already recognizes nearly all of the Bobcat Draw CWP as part of the Bobcat Draw West CP and Bobcat Draw South II CP, 508 AK LWC's as of a 2011 inventory. According to Table 3.46 in the Draft RMP/EIS, oil and gas development potential within both of these LWC's is low and there is no locatable mineral development potential (BLM, 2011). Buffalo Creek CWP Buffalo Creek is a classic example of the wide open plains unique to and characteristic of Wyoming. The big game species inhabiting the area make it an excellent location for hunting, and 32 outfitters have permits for day use. Honeycombs CWP Surrounds Honeycombs WSA. The BLM already recognizes most of the Honeycombs CWP and nearly the entirety of the CWP portion we address in these comments as Lands with Wilderness Characteristics as of a 2011 inventory. The LWC Honeycombs South CP in particular overlaps a very substantial portion of the area we address in these comments. Moreover, according to Draft RMP/EIS Table 3.46, there is no locatable mineral development potential within any of the LWC's in the Honeycombs CWP region (BLM, 2011). Medicine Lodge CWP Abuts Medicine Lodge WSA to the North and South. According to a 2011 BLM inventory, most of the Medicine Lodge CWP is contained within the Medicine Lodge North CP LWC. This LWC has no valid existing rights or locatable mineral development potential and has low oil and gas development potential (BLM, 2011). McCullough Peaks CWP Abuts McCullough Peaks WSA, primarily to the Southwest. The McCullough Peaks WSA consists of pink badlands at the foot of cascading solitary peaks. The citizens's western addition includes striking breaks and additional winding drainages, which create beautiful patterns of erosion. Mule deer and white tail deer find winter habitat in the area, which also provides habitat for mountain lions, pronghorn antelope, jackrabbits, coyotes, a variety of raptors, and sage grouse. The National Park Service has identified this area as a potential National Natural Landmark. The BLM already recognizes most of the McCullough Peaks CWP as part of the Rough Gulch LWC, including the entire portion of the CWP addressed in these comments. According to Table 3.46 in the Draft RMP/EIS, oil and gas development potential is low within the Rough Gulch LWC, and no locatable mineral development potential exists (BLM, 2011).</p>	3046

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1046	1046-7	Figure 1. Decreasing nest site probability with increased gas field development (Holloran, 2005). Implementing WWA preferred stipulations on sage grouse core areas that fall within LWC's would provide the most comprehensive protection for sage grouse populations. Eliminating disruptions to breeding and nesting imposed by anthropogenic noise and infrastructure as well as related increases in predation is the only way to ensure lasting vitality of sage grouse populations in core areas. This, in turn, will help prevent listing of the sage grouse as an endangered species under the Endangered Species Act. Similarly, our recommended preferred management stipulations would preserve existing naturalness and excellent opportunities for solitude and primitive recreation.	3046
1046	1046-6	Our recommendations for sage grouse core areas located within LWC's focus on motorized and mechanized vehicle use, mineral leasing, exploration, and disposal, and oil and gas leasing, because limitation or elimination of these land uses within our recommended portions of the planning area would serve the dual purpose of preserving wilderness qualities and protecting sage grouse. In addition to suggesting that roads and traffic volume disturb sage grouse breeding and nesting, studies also show that the number of displaying males correspondingly decreases with decreased distance from gas field infrastructure (Holloran, 2005). Moreover, nest initiation rates for sage grouse hens at leks at least three kilometers (1.86 miles) from gas development sites are approximately 25% higher than initiation rates for hens at leks within three kilometers of gas development (Anderson & Lyon, 2003). Mineral extraction is similarly disruptive, and Holloran predicts that leks located near extractive mineral sites will eventually become unoccupied. Consequently, we recommend that policy implementations aim to reduce anthropogenic development and noise disturbances, especially oil and gas infrastructure, mineral extraction, and traffic volume within sage grouse core areas in LWC's.	3046
1046	1046-5	We recommend that the Agency Preferred Alternative be modified to instate special management of Sage Grouse Core Areas that fall within Lands with Wilderness Characteristics. Specifically, we advise that these lands within the planning area be managed with the following stipulations. Suggested at minimum stipulations. Motorized and mechanized vehicle use is limited to existing roads and trails with seasonal closures from February 1st-July 31st (Alternative E). . Sage Grouse Core Areas within LWC's are managed as VRM Class II. . Sage Grouse Core Areas within LWC's are designated No Surface Occupancy. WWA Preferred stipulations. Sage Grouse Core Areas within LWC's are closed to motorized and mechanized vehicle use. . Sage Grouse Core Areas within LWC's are managed as VRM Class I. . Sage Grouse Core Areas within LWC's are administratively unavailable to locatable, salable, and leasable mineral leasing. Sage Grouse Core Areas within LWC's are closed to mineral materials disposal and geophysical exploration (Alternative E). . Sage Grouse Core Areas within LWC's are managed as ROW and Renewable Energy exclusion zones (Alternative E).	3046

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1046	1046-4	Given the focus on sage grouse conservation policy options, we have identified 22 LWC's -Trout Creek; Rough Gulch; Whistle Creek; N. Yu Bench; Cedar Ridge; 639 AK; 652 Lower, Upper AK; 676 AK PR; Bobcat Draw West CP; Bobcat Draw South II CP, 508 AK; Bobcat Draw South CP, 626 AK; 665 CW; 0048 PR; Honeycombs South CP; 0008 DH; 130 JW; 069 JW; Honeycombs 164 CP; 005 PR; Medicine Lodge North CP; Alkali Creek NW CP - that contain portions of sage grouse core areas stipulated by Version 3 of WY EO Greater Sage-grouse Core Area of Protection (See Map 3, Appendix C). In the interest of achieving the best management plan in light of the BLM's multiple use mandate, we recommend that these particular Sage Grouse Core Areas, which fall within LWC boundaries, have additional resource use restrictions placed upon them.	3046
1046	1046-3	The best management directive, which we recommend be incorporated into the agency preferred alternative, is closure of the areas identified to motorized and mechanized vehicle use. However, at a minimum, motorized and mechanized vehicle use in these areas should be limited to existing roads and trails with seasonal closures during breeding and nesting seasons.	3035_10
1047	1047-9	Public Record #50" It is unrealistic and extreme to assert that an entire allotment/pasture should be shut off from grazing if the burned area can't be fenced. This is completely unnecessary and extreme. It reflects an absence of knowledge of on-the-ground realities. These allotments can be huge, burned areas can be huge and fencing unrealistic. It again reflects the obvious agenda against livestock grazing under the guise of caring about restoration. Neither the rangelands nor the livestock component deserve this clear bias.	3011
1047	1047-8	Public Record #49" Alternative F: It is counterproductive for sage grouse to exclude livestock from grazing in burned areas until woody and herbaceous plants achieve sage-grouse habitat objectives. Woody shrubs in this ecology could take as long as 60 years to reestablish and in the meantime grasses would compete with them. Having livestock graze these areas during the grow-back would be helpful to habitat not harmful appropriate grazing would lessen the competition for woody component to re-establish!	3011
1047	1047-7	Chapter 4.3 Fire and Fuels Management: Proactive Management section: Marginalizing and restricting the use of fire within areas of environmental concern will only exacerbate the invasive weed problem already ahead of land managers. We need all tools to help control invasive weeds and not worsen the weed problem by slowing management. Proactive fire management must not move slowly, it must continue at a rapid and consistent pace to improve habitat. Fire should be used and post fire conditions should be well managed, and that would include good livestock grazing to encourage range health and vigor.	3011

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1047	1047-6	Appendix L, Best Management Practices, Vegetation Treatments/Fire and Fuels Management, #24,-25, p L-7: The reference to "annual grasslands" under Best Management Practices seems inappropriate. Annual grasslands in this context are an ecosystem that exists in California and not in Wyoming. GOR suggests that you use wording more along the line of "areas infested with undesirable annual grasses". This change should help to minimize possible confusion.	3042
1047	1047-5	4.4.2 Vegetation Grassland and Shrubland Communities. 4.4.2.3 Detailed Analysis of Alternatives, Alternative F, Resource Uses, p. 4-46: This wording serves to require that the BLM ensure that standards and guidelines be met for wildlife including greater sage-grouse habitat. This is inappropriate. The agency already is required to make certain that allotments do meet standards and guidelines for healthy rangelands. To try and expand this for wildlife, including greater sage-grouse is not appropriate and should be removed. Again it seems to be another action with is fully intended to discriminate again livestock grazing under the guise of greater sage-grouse conservation	3042
1047	1047-4	Table 2.5. Detailed Alternatives, 7000 Special Designations (SD) "ACECs" Proposed Greater Sage-Grouse Priority Habitat Area (ACECs, Record #110, p 2-35. Alternative F " Again proposing action such as retirement of grazing allotments reflects clear bias and negative discriminatory actions toward livestock grazing as a valid management tool for sage-grouse conservation. This push to "retire" and identify allotments for retirement should not be part of the RMP. Such inclusion into the document seeks to include all allotments and to use the platform of an RMP as the place to proceed with such actions. This is inappropriate and insulting.	3017-1
1047	1047-3	Table 2.5. Detailed Alternatives, 7000 Special Designations (SD) "ACECs" Proposed Greater Sage Grouse Priority Habitat Area ACECs, Record #31, p. 2-21. Alternative E "The clear bias against all things livestock are alive and well in this. The wording clearly indicates that getting rid of livestock will solve any trampling damage to soils, mitigate spread of weeds and reduce the creation of thatch in an allotment; and this strongly infers that all are attributable to livestock grazing. Any credible environmental document should propose looking at more than one method of managing these factors. This bias against livestock grazing is appalling and should not be carried forward as an action item.	3042

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1047	1047-2	We request the BLM incorporate language into the final document that is consistent with EO 2013-3, Greater Sage-Grouse Core Area Grazing Adjustments, which supplements EO-2011-5. We support the suggested language of the Wyoming Department of Agriculture: "The BLM will collaborate with appropriate Federal agencies, and the State of Wyoming as contemplated under Governor Executive Order 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where Greater Sage-grouse conservation objectives are now being achieved on federal land, to determine if a significant causal relationship exist between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-based action to achieve Greater Sage-Grouse conservation objectives within the framework." We strongly recommend the BLM add the above language as a standalone management action in the preferred alternative.	3017-1
1047	1047-1	We strongly oppose the designation of the Greater Sage-Grouse Key Habitat Areas ACEC (Alternative E), the Greater Sage-Grouse Core Habitat Areas ACEC (Alternative F) and their associated restrictions on livestock grazing and associated range improvements. These alternatives (E&F) are replete with actions that connote only negative impacts on sage-grouse associated with livestock grazing. This is patently unfair and incorrect. Where is the balance of good science and pragmatic assessment relative to livestock grazing and sage-grouse.	3017-3
1048	1048-36	Chapter I of the SEIS states "BLM will utilize the COT Report (USFWS 20 13), the Western Association of Fish and Wildlife Agencies (WAFWA) Conservation Assessment of Greater Sage-grouse and Sagebrush Habitats (Connelly et al. 2004), and any other appropriate resources, to identify greater sage-grouse habitat requirements and best management practices." It seems that the "other resources" and their inclusion in the document are limited at best. Page 3-2 clearly demonstrates this lack of consideration of additional data, as it reads "primary threats to this portion of the population are energy development and transfer. . . ." A significant amount of research clearly indicates this is not the case, but was not included in the document. For example, Ramey et al (20 11) and Taylor et al (2007) provide valuable data that was not included.	3035_2
1048	1048-35	Any additional restrictions to oil and gas development will have adverse effects on the Bighorn Basin communities. Alternatives E and F would impose additional constraints that seem to have no scientific basis and are instead based on the poor information contained in the NIT report. BLM should consider the severity of the economic impacts these new restrictions, especially the implementation of a new ACEC, would have on the communities in the Bighorn Basin.	3036-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-34	Fidelity agrees with PLA's statements regarding monitoring, which read "the SEIS states that GSG would be monitored via site visits to leks on an annual basis to determine the number of males and females (emphasis added) as well as whether a lek is occupied/unoccupied. This data would be used to make a determination of whether there is a declining trend in the number of males and females. The document states that Wyoming Game and Fish is responsible for data collection. However, the Buffalo Draft RMP/EIS in Table B.I (Special Status Species, Wildf-6) states that GSG would be monitored via site visits and aerial and field inspections to leks on an annual basis to count the number of males and make a determination of whether there is a declining trend in the number of males. The document also states that Wyoming Game and Fish is responsible for data collection." We question why one document will track only males and the other both males and females, and why monitoring techniques will be different, especially since Wyoming Game and Fish will be collecting the data for both documents. There should be a single set of data used to detect changes in resource conditions.	3035-7
1048	1048-33	P. 2-31, Record 86, Alternative E, proposes to "Close the Greater Sage-Grouse Key Habitat ACEC to geophysical exploration." Fidelity questions why geophysical exploration would be prohibited in this vast area. There is no real explanation why this new restriction is necessary, and BLM does not acknowledge that there is virtually no surface disturbance associated with geophysical activities. Additionally, closing this area off could violate valid existing rights. Alternative F states it will "Allow geophysical exploration in the Greater Sage-Grouse Core Habitat Areas ACEC to obtain exploration information for areas outside of and adjacent to priority sage-grouse habitat areas." This is confusing, as it implies the prohibition of the use and interpretation of geophysical information for areas within core areas, which could violate valid existing lease rights. Alternative F would "Allow geophysical operations only by helicopter-portable drilling methods and in accordance with seasonal timing restrictions and/or other restrictions that may apply." BLM must recognize this could be unfeasible and cost prohibitive. These operations may also cause more disturbance (i.e., noise) to habitat than other equally effective methods. The term "other restrictions" needs to be clearly explained, as it is unclear what would constitute these restrictions.	3023-4

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-32	As mentioned above, BLM does not demonstrate any compelling reasons to designate the sage-grouse Core Habitat Areas an ACEC. We concur with PLA's statement that "According to BLM Manual 1613-ACEC, such designations are used to highlight areas where special management attention is needed to protect and prevent irreparable damage to important values or processes. The description cited in the SEIS is inadequate. The ACEC included in the SEIS needs to be discussed and justified in more detail, including recognition of the wide scope of mitigation measures BLM has at its disposal to lessen the impacts on the GSG in areas where it is believed they pose a threat." According to the BLM's Land Use Planning Manual and Land Use Planning Handbook, II.A.7, pg. 22 (Rei. 1-1693 03/11/05), BLM must identify how the Preferred Alternative best meets the multiple use and sustained yield requirements of FLPMA and creating this ACEC clearly conflicts with this mandate, as mineral leasing would be virtually eliminated. Fidelity also doubts the ability of BLM to manage the nearly 2 million acres of this proposed ACEC. The Core Habitat strategy in the EO provides a much more sensible framework for management. BLM should be consistent with the EO and eliminate this proposed ACEC.	3001
1048	1048-31	P. L-6, 7, Best Management Practices, "Power-washing all vehicles and equipment involved in vegetation treatment and firefighting activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species." There are many questions as to how this would function. What would operators need to do with the fluids used to wash vehicles? Would they need to dispose of it in a certain way or get a permit for the facility and/or disposal? How would the infrastructure for such a site look and how will an operator obtain the fluids needed for the wash station? Surely recreational vehicles, animals grazing, and local traffic will also bring invasive plant species in, so how will they be effected? How would one determine if they should wash the vehicle? Would it be within a certain radius or a certain number of travel miles? This entire statement seems unclear and unfeasible and should be removed.	3023-1
1048	1048-30	P. L-3, Best Management Practices, 22-"Use only close-loop systems for drilling operations, with no reserve pits." Closed-loop systems are appropriate in many situations, however not all rigs are equipped for closed-loop systems and require a reserve pit. A pit is necessary for cuttings even for closed-loop systems. BLM should allow for flexibility when a closed-loop system is not possible. BLM must review the document to make sure all of their proposed design features and mitigation are technically feasible.	3023-1
1048	1048-29	P. 2-31, record 84 - "Where the federal government owns the mineral estate and the surface is in non-federal ownership, apply the conservation measures applied on public lands." Fidelity is very disturbed by the concepts addressed in this record. The identified conservation measures clearly show intentions to limit future oil and gas activities in the planning area while all other multiple-uses may proceed as the surface owner chooses. As already discussed in these comments, this is based upon the incorrect assumptions contained in the NTT report. This concept should be omitted from the final document.	3023-2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-28	P. 2-31, Record 81 -"Include conditions that require relinquishment of leases/authorizations if doing so will mitigate the impact of a proposed development or mitigate the unanticipated impacts of an approved development." BLM does not have the authority to require relinquishment of leases/authorizations. Additionally, the term "unanticipated impacts" is very broad and open for interpretation. As noted above, the implication is that BLM will make a decision based on what they feel is in the best interest for the parties involved, which is inappropriate. This should be removed in the final document.	3027-1
1048	1048-27	P. 2-31, Record 80-"Consider offers to amend, cancel or buy out leases." This statement seems to indicate a "takings" or eminent domain, which is very concerning. The implication is that BLM will make a decision of what they feel is in the best interest of the parties involved. The lessee is currently the one who makes the decision to approve such offers. This could have serious implications and Fidelity asks BLM clarify its role in such decisions.	3023-2
1048	1048-26	P. 2-30, Record 78-"Complete Master Development Plans in lieu of APD-by-APD processing for all but wildcat wells." Fidelity strongly supports PLA 's statement that "this provision is inappropriate for use in the Bighorn Basin. While master development plans (MDP) may be acceptable and beneficial in areas where drilling takes place year round or where there is long term development planned, BLM has failed to consider the greater likelihood of periodic drilling or drilling within existing Federal Units on a well-by-well basis within the Bighorn Basin. Currently, the operator of a federal unit is required to submit a Plan of Development and a Review of Operations on a yearly basis. BLM needs to recognize that most Bighorn Basin operators drill only on occasion, rather than continuously. Very few, if any, are solely exploration companies. Therefore, we recommend BLM eliminate the requirement for an MDP within the Bighorn Basin."	3023-6
1048	1048-25	P. 2-29, Record 73 -"Require a full reclamation bond specific to the site in accordance with 43 CFR 3104.2, 3104.3, and 3104.5. Ensure bonds are sufficient for costs relative to reclamation that would result in full restoration of the lands to the condition it was found prior to disturbance. Base the reclamation costs on the assumption that contractors for the BLM or USFS will perform the work." This seems totally unnecessary, as current bonding requirements already address reclamation.	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-22	P. 2-29, Record 72 -"Require unitization when deemed necessary' for proper development and operation of an area or to facilitate more orderly (e.g., phased and/or clustered) development as a means of minimizing adverse impacts to resources, including greater sage-grouse, so long as the unitization plan adequately protects the rights of all parties including the United States, according to the Federal Lease Form, 3100-11, Sections 4 and 6." Unitization generally takes place when, due to economics and reservoir engineering, all mineral owners will benefit. What are the benefits of unitizing, per the proposed Alternative E? Will other stipulations be relaxed if unitization occurs? BLM needs to discuss why this is beneficial, who would decide when this would occur, and how it will be applied. Fidelity also agrees with PLA's comments that "The State of Wyoming BLM Office knows that it cannot tell or require multiple owners to bond together under one (I) unit. How is this reflected in Record 72? This Record not only implies that the right to decide what is in the owner's best interest in fact will be dictated by the BLM, but it also implies that the BLM will require state and/or fee lands to additionally unitize. How does this protect the rights of all parties if the BLM determines what is in the owner's best interests?" and "Furthermore, the State of Wyoming has primacy over all well spacing. If a well comes in as non-producing in a unit and the BLM removes it from the unit, then the area goes back to spacing-then what? For example, will the unit dissolve immediately or contract in the middle of a unit? How are wells drilled still to pay for the unit?"	3023-3
1048	1048-21	P. 2-28, Record 71 -"Apply an NSO stipulation within 0.6 mile of occupied or undetermined sage-grouse leks (Map SEIS-15). Apply a minimum lease size of 640 contiguous acres of federal mineral estate within sage-grouse Core Habitat Areas. Lease smaller parcels only when 640 contiguous acres of federal mineral estate is not available and leasing is necessary to remain in compliance with laws, regulations, and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements. Apply a TLS to restrict disruptive activity within 0.6 mile of occupied or undetermined sage-grouse leks from March 15 to June 30." BLM proposes the use of both an NSO and a timing stipulation within 0.6 miles of a lek. The TLS already provides an appropriate amount of protection, thus we are confused why BLM would need a TLS if surface activities are already precluded through the imposition of an NSO stipulation?"	3035_3-2
1048	1048-19	P. 2-20, Record 23 -"Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success. Where probability of success or adapted seed availability is low, nonnative seeds may be used as long as they support sage-grouse habitat objectives." We are pleased that BLM has recognized seeding is not a one-size-fits-all process and appreciate the flexibility to use different types of seed as is appropriate. We request that BLM provide a list or description of acceptable seed mixes for planning purposes.	3035-7

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-18	P. 2-19, Record 17 -"Any existing towers must undergo review for adverse effects. Review will include minimizing wires and other collision hazards for sage-grouse and migratory birds, as well as adverse impacts of night lights (FAA requirement)." Fidelity questions the need for these reviews, as there is no data provided demonstrating high mortality rates for towers. This statement is also overly broad, and does not indicate what types of towers will need to undergo review. Additionally, BLM does not provide the height and/or size a tower would meet to warrant review.	3033-1
1048	1039-9	The Conservancy supports implementation of a compensatory mitigation program to offset impacts to sage-grouse habitat identified in Alternatives E and F (Table 2-5; Record #4-5) As stated previously, the Conservancy recommends BLM seek to avoid, to the greatest extent possible, impacts to high value ecological resources, fragmentation of intact habitats and conflicts with other uses, designations and legal mandates, while facilitating land uses including energy and mineral development. Where impacts to greater sage-grouse habitat are unavoidable, the Conservancy strongly recommends that BLM implement a compensatory mitigation program and, as a result, supports the recommendation in Alternative F of the SEIS where BLM will manage an extensive amount of the planning area as mitigation areas. The Conservancy believes such a program to be a critical part of successful sage-grouse conservation planning and recommends BLM consider implementing the attached elements of a compensatory mitigation program, attached as Appendix A. We also note that implementation of such a mitigation program could allow, and serve as an incentive for, resource developers to restore or reclaim habitat in areas that are presently over a disturbance cap so that such areas come under the cap and might therefore be developable at some future time. Please note; the attached recommendations (Appendix A) are made from Conservancy staff with expertise in mitigation policy and practice. However, the Conservancy recognizes that many of the following recommendations are consistent with BLM's interim Regional Mitigation Manual, which we support as a partial alternative to the recommendations we offer below. Additionally, we are aware that BLM's interim Manual has been, at least partially, incorporated into the Northwest Colorado Greater Sage-Grouse Draft Resource Management Amendment and EIS, and we believe this inclusion supports incorporation of a compensatory mitigation program in the Bighorn Basin RMP [or participation of the Bighorn Basin in a regional mitigation program involving other adjacent Field Offices].	3035-7
1048	1048-17	P. 2-17, Record 4 -In the Greater Sage-Grouse Core Habitat Areas ACEC, the density goal includes either: Maintain or reduce the existing level of density of energy production and/or transmission structures on the landscape in sagebrush communities, or Manage the existing level of density of disturbance on the landscape so that anthropogenic disturbances do not exceed one disturbance per 640 acres within the Density and Disturbance Calculation Tool (DDCT) analysis (or best available tool) and cover less than 3 percent of sagebrush habitat." How does BLM propose to honor valid existing lease rights while reducing the existing level of density? This is also inconsistent with the EO and should be removed.	3001

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-16	P. 2-17, Record 4-"Designate greater sage-grouse priority habitat within Core Habitat Area as the Greater Sage-Grouse Core Habitat Areas ACEC (Map SEIS-31 and Appendix F of the Draft RMP and Draft EIS; 1,161,234 acres)." This ACEC is unreasonable, does not promote multiple-use, and is inconsistent with the EO.	3001
1048	1048-15	P. 2-17, Record 4-"Where suitable conservation actions cannot be achieved in priority habitat, seek to acquire state and private lands with intact subsurface mineral estate by donation, purchase, or exchange in order to best conserve, enhance, or restore sage -grouse habitat." There is already a lack of adequate BLM funding and Fidelity finds it difficult to believe the funds BLM already receives will be adequate to acquire state and private lands. BLM should instead focus on acknowledging valid existing lease rights and working with private landowners to find appropriate programs.	3016-2
1048	1048-14	P. 2-16, Record 3- "Examine applicability of categorical exclusions in priority habitat." Categorical exclusions (CX) are provided by law and are intended to benefit the operator as well as BLM during the permitting process. The decision to exclude the use of a CX must be made based upon site-specific conditions on a case-by-case basis and the proposed project. The use of CX's should therefore always be included in a general guidance document.	3027-1
1048	1048-13	There is no justification for the expansion of habitat under Alternative E. This would increase habitat by 72,000 acres with no scientific justification. An ACEC [Area of Critical Environmental Concern] designation with a 3% disturbance cap would essentially prohibit new oil and gas exploration and development. The final document should follow the plan outlined in the EO.	3035_1
1048	1048-12	Livestock grazing on federal land, for example, has been shown to have beneficial impacts on the surface as acknowledged by BLM. This should, therefore, not be considered as contributing to the surface disturbance cap. Since the surface disturbance cap is focused on limiting surface impacts from oil and gas operations, the only surface disturbance that should be included in the disturbance cap calculation is that caused by oil and gas development.	3017-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-11	Page 2-30, Record 79, Alternatives E and F offer an exception to the surface disturbance caps "if additional mitigation is demonstrated to onset the resulting loss of sage-grouse habitat." There is no discussion as to what activities will constitute this additional mitigation, if it will apply to both on- and off-site mitigation, or if it will be a requirement in specific habitats. There is no description of how credit will be calculated for operators. BLM must also address reclamation credits for interim reclamation efforts toward the total disturbance cap allowance. In the EO, reclamation credit is to be given for completion of habitat enhancements on bond release or minimally functional habitat. Per the EO, these habitat enhancements may be used as credit for reclamation that is slow to establish in order to maintain the disturbance cap or to improve nearby sage-grouse habitat. It makes sense from a biological perspective to remove reclaimed and/or mitigated acres from the surface disturbance calculation because these acres are no longer disturbed BLM should also include reclamation as an exception to the surface disturbance caps. Fidelity requests BLM provide more detail regarding these processes. There is no discussion of what types of activities will be included in the surface disturbance calculation.	3035_4
1048	1048-10	As noted previously, BLM 's proposed 0.6 mile condition of approval (COA) directly conflicts with the 0.25 mile buffer provided for by the State for occupied leks, which would allow much needed flexibility in the application of this stipulation and potential land use. We urge BLM to remove "surface disturbance" and "disruptive activity" from these stipulations to achieve consistency with the State.	3035_1
1048	1048-9	BLM should clearly explain the significant difference between the requirement of 1.9 miles for a primary and secondary road and the 0.6 mile for a tertiary road and provide background as to where these numbers came from. If BLM chooses to include such stipulations, detailed information needs to be provided as to why scientific evidence shows a need for such restrictive management.	3039-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-8	We are concerned that proposed management outside of Key Habitat Areas under Alternatives B and E greatly exceeds and is inconsistent with what is provided for under the EO. The 0.6 mile NSO around occupied sage-grouse leks, controlled surface use (CSU) for discretionary actions, Right-of-Way (ROW) exclusion areas around leks, and Timing-Limit Stipulations (TLS) in nesting and early brood rearing habitat within a 3-mile lek buffer were not included in the EO. These limitations contradict the core area concept to protect important habitat while promoting and incentivizing development in less desirable habitat outside of these areas. The restrictions in Alternatives B and E clearly conflict with this principal. We urge BLM to adopt the Core Area Strategy contained in the EO. The restrictions proposed under Alternatives E and F are very excessive and, as stated above, do not reflect those outlined in the EO. Alternative E proposes a 4-mile NSO around a lek, which is hardly reasonable. This 4-mile protective buffer around leks is more than twice the 1.9 mile buffer provided under the EO. The 0.6 mile NSO around the perimeter of occupied sage-grouse leks within key habitat areas provided under EO provides adequate protection. Increasing the size of a lek buffer by almost 700% is excessive, unjustified, and would prevent development on thousands of acres. New road construction within 4 miles of active sage-grouse leks and new road construction in occupied GSG habitat is also prohibited under Alternative E. No documentation is provided as to why this additional stipulation would be necessary, and this is entirely unreasonable.	3035_1
1048	1048-7	Fidelity is particularly concerned with the suggested 3% disturbance cap threshold, not exceeding one disturbance per 640 acres using the Density Disturbance Calculation Tool (DDCT) regardless of the use. The EO has a disturbance cap threshold of 5% per 640 acres using the DDCT and it does not limit such disturbance to one occurrence. This is very worrisome, as it will essentially shut off the Bighorn Basin to future oil and gas activities and other multiple uses. Alternatives D and F apply a surface disturbance cap, 5% and 3% respectively, to "sage brush habitat," while Alternative E applies a 3% cap to "total greater sage-grouse habitat." The EO applies a 5% surface disturbance cap to "suitable greater sage-grouse habitat." Alternatives D, E and F should all be modified to be consistent with the EO. Not all sage brush habitat is greater sage-grouse habitat and not all sage-grouse habitat is considered suitable sage-grouse habitat. In order to provide ample protection, the surface disturbance cap should only apply to suitable sage-grouse habitat.	3035_4
1048	1048-6	Many of the stipulations in DEIS/RMP are much more restrictive than the IM and EO, which leads Fidelity to wonder why BLM feels additional stipulations are necessary. Many sage-grouse management plans are currently being drafted and the State of Wyoming has become an example of what a good, comprehensive plan looks like; yet BLM seems to believe more stipulations are necessary, and do not provide reasons as to why this is so. Fidelity strongly recommends these unnecessary, inconsistent restrictions be removed and management instead follows the stipulations in the IM and EO.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-5	Fidelity is concerned about BLM's reliance on data from the National Technical Team (NIT) report. A variety of peer-reviewed, scientific information should be included in the DEIS in order to produce the best planning effort. Instead, it seems BLM relies almost solely on information from the NIT report. The Northwest Mining Association (NWMA) recently published a report which questions the validity of the NIT report, as the USFWS' "warranted but precluded" determination was based on the conservation measures already in place in BLM manual 6840 - Special Status Species Management. Ramey et al (2011) ¹ report that the implication in the NTT report stating "impacts are universally negative and typically severe" clearly demonstrates a bias against the oil and gas industry. An overview of the Cooper Ornithological Society's Monograph: Studies in Avian Biology, the primary source of information relied upon by the NTT, was conducted by the Center for Environmental Science, Accuracy and Reliability (CESAR) in February 2012 and entitled "Science or Advocacy?". This found significant mischaracterization of previous research, errors and omissions, lack of independent authorship and peer review, methodological bias, invalid assumptions and analysis is and inadequate data. Separate reviews conducted by scientists commissioned by the State of Colorado found the same defects.	3027-1
1048	1048-4	Fidelity would like to remind BLM that new stipulations cannot be imposed on valid existing leases simply because a plan amendment has been prepared, as is implied in several statements in the document (please see the examples below). BLM must acknowledge that when a lease is issued, it constitutes a valid existing right which cannot be unilaterally changed, including surface and timing restrictions beyond those identified in 43 CFR 3101.0.	3027-1
1048	1048-3	Fidelity would also like to remind BLM that, Per the Energy Policy Act, the least restrictive stipulations necessary to protect resource values should be implemented. This was clearly not the case in the Supplement when it came to oil and gas resources. The Federal Land Policy and Management Act (FLPMA) identifies mineral exploration and development as a principal or major use of the public lands, thus BLM must consider mineral exploration in the plan. As written, the RMP seems to consider this development a problem, not a potential asset, in the planning area.	3027-1
1048	1048-2	We are also confused as to why BLM did not select a new preferred alternative, in light of Alternative E and F being proposed in the Supplement. By failing to identify a preferred alternative in the DEIS, BLM has caused a disservice to operators and the public. Without a known preferred alternative, it is difficult to properly comment on future development options within the project area. This leaves the public with only a 30 day window to review BLM's preferred alternative during the protest period, which is not a substantial amount of time for proper review. A preferred alternative should be selected to indicate the perceived appropriate balance of development and environmental protection and the public relies on BLM's expertise in such matters. Fidelity is very disappointed in BLM's decision to omit a new preferred alternative from the Supplement.	3027-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1048	1048-1	We therefore request BLM give an explanation of why they felt additional time and resources were necessary to supplement the previous draft.	3027-1
1049	1049-4	Finally, WSGA is concerned that the socioeconomic analysis of Alternative F fails to properly address the impacts of the ACEC designation on the ranching industry and, by extension, communities within the Big Horn Basin. While Table 4-17 indicates minimal loss of AUM's under Alternative F, the true long-term impacts of the proposed limitations on range improvements, including water development and fencing, and the management constraints resulting from travel restrictions will inevitably be a significant reduction in livestock grazing.	3036-1
1049	1049-3	The Supplement fails to acknowledge the Wyoming Governor's 2013 Executive Order (EO 2013-3) developed in close collaboration with Wyoming BLM. The EO states: 1. It is Wyoming's primary premise that grazing activities are compatible with Greater Sage-Grouse conservation and may improve habitat for Greater Sage-Grouse. Grazing is considered a de minimus practice (Executive Order 2011-5, Attachment C). Grazing management practices maintain or enhance Wyoming rangelands. Properly managed rangelands are capable of sustaining viable Greater Sage-Grouse populations and a diversity of plant species appropriate to suitable Greater Sage-Grouse habitat. 2. The State of Wyoming will collaborate with appropriate Federal agencies in defining a framework for evaluating situations to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives where conservation objectives are not being achieved on federal land. The State of Wyoming will also collaborate with appropriate federal agencies on appropriate site-based action to achieve Greater Sage-Grouse conservation objectives within the framework. Monitoring data will at minimum reflect 5 years of information, include rangeland health assessments and require conclusion or action to be based on 3 out of 5 years of data. WSGA requests that BLM incorporate the language of EO 2013-3 into Alternative F as the management prescription for livestock grazing within the Greater Sage Grouse Core Habitat Area.	3017-1
1049	1049-2	WSGA strongly opposes the designation of this entire area as an Area of Critical Environmental Concern. The flexibility and adaptation embodied in the Executive Order is lost through the ACEC designation. Specifically to the interest of our members, the proposed ACEC designation will inevitably lead to further restrictions on livestock grazing as recognized in Table 4-20. This is in direct contradiction to the recognition by the EO that grazing has a de minimus impact on sage grouse habitat.	3001
1050	1050-77	NWMA maintains that BLM's failure to include consideration and detailed analysis of conservation measures other than those in the NTT Report represents a pre-determined decision by BLM to implement the NTT conservation measures without giving proper and detailed analysis to alternative conservation measures – including those developed by USFWS and USGS, which may produce equal or better results for sage-grouse conservation, while complying with FLPMA.	3035_2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-76	In addition, throughout the DRMP and DSEIS, BLM seems to describe acreage subject to special designations and withdrawals in a way that is unclear or inconsistent with the total mineral acreage, which would be affected by the special designations or withdrawals. For example, the ACECs have overlapping boundaries, and under Alternatives B and E all ACECs are proposed for withdrawal; however it is unclear how much mineral acreage is actually subject to the withdrawal due to the overlapping boundaries. An example of this is where Alternative E carries over all management actions, outside the Sage Grouse Key Habitat ACEC, from Alternative B. Alternative B proposes 325,102 acres subject to withdrawal. The sage-grouse ACEC under Alternative E totals 1,231,383 surface acres and 1,519,859 mineral acres. If the sage-grouse ACEC mineral acres are added to the proposed withdrawals from Alternative B the proposed withdrawal would be 1,844,961; instead BLM reports that 1,764,621 acres are proposed for withdrawal under Alternative E (DSEIS Ch.4 at 4-101). One assumes this discrepancy is a result of overlapping boundaries; however this must be made clear in order for the reader to analyze the impact to hardrock mining due to land withdrawals.	3001
1050	1050-75	NWMA also contends that the NTT Report contains data that is not directly applicable to the planning area, and assumes that habitat and species conditions are consistent throughout the range, which may not be the case. For example, the NTT Report does not take into account that sage-grouse populations may be stable or even increasing in portions of the range in the Big Horn Basin resource area. In situations where this is the case, the conservation measures in the NTT Report are not warranted, regardless of whether they represent the “Best Available Science,” as required under 40 C.F.R §1502.24. Therefore additional baseline data, which includes population trends of sage-grouse, and alternative conservation measures should be analyzed specific to the planning area. BLM must explain why the NTT Report conservation measures are warranted, since reportedly, Wyoming contains the largest population of sage-grouse across its range and are at low risk for decline (See DSEIS Ch.3).	3035_2
1050	1050-73	The EIS Must Evaluate Ways to Minimize Adversely Affecting Private Property Rights-The land use restrictions, prohibitions, and withdrawals proposed pursuant IM 2012-044 and the NTT Report have significant potential to diminish landowners' rights to develop their private property if their lands have key/core sage-grouse habitat or are located near key/core sage-grouse habitat. The EIS must evaluate ways to minimize interfering with private property rights, including the rights associated with owning patented mining claims and fee mineral estates located in, adjacent to or near key/core sage-grouse habitat.	3020
1050	1050-72	For each alternative, the EIS documents must re-evaluate the socioeconomic benefit or harm each alternative will have and disclose and quantify any adverse effects to job creation and local economies in light of BLM's own assertion that implementation of Alternatives B, E, and F will have significant adverse impacts to locatable mineral development	3036-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-71	The EIS documents for the Planning Area do not consider the adverse impact on small businesses of requiring validity exams in withdrawn or segregated lands, and are devoid of any analysis or discussion of the impact of sweeping and cumulative land withdrawals in key/core sage-grouse on small entities. This is a significant omission that must be addressed in the socioeconomic analysis in the final EIS documents, especially because the proposed land withdrawals are co-located in areas with moderate to high mineral potential. As BLM discovered in <i>Northwest Mining Association v. Babbitt</i> , 5 F.Supp.2d 9 (D.D.C. 1998), failure to comply with the RFA and SBREFA will invalidate a rulemaking. Therefore the Final EIS/RMP risks being invalidated if this issue is not addressed	3036-1
1050	1050-70	In addition, NWMA contends that the socioeconomic analysis related to locatable minerals is completely inadequate, especially with respect to small entities, and does not comply with the CEQ regulations as cited in BLM's NEPA Handbook	3036-2
1050	1050-69	The DSEIS also states: it is not possible to quantify effects from locatable and salable minerals management changes among the alternatives, for lack of reliable production forecasts (DSEIS Ch. 4 at 4-142). The above statement is not adequate and does not eliminate the requirement to include locatable minerals in the socioeconomic impact analysis, especially considering that BLM's own Mineral Report clearly establishes that bentonite production is expected to remain steady or increase based on demand trends (See Mineral Report Ch. 3). BLM's above claim shows a complete lack of due diligence; BLM could have obtained the necessary information to conduct a trend analysis from Wyoming's Department of Revenue, or the published USGS mineral reports, which would have provided a reasonable alternative to the "lack of reliable forecasts." It seems clear that Alternatives B, E, and, F will have an extremely adverse impact on the locatable mineral industry due to land withdrawals and surface use restrictions, which will in turn adversely affect the economic stability of the counties which rely on mining.	3027-1
1050	1050-68	the DSEIS and DRMP fail to include locatable minerals in the socioeconomic analysis, which is particularly perplexing in light of the above statements, and when locatable mineral mining contributes to 11% of the jobs and 22% of the earnings in Big Horn County. To that end, the Bighorn Basin EIS documents fail to adequately address the economic impact it will have on the counties in the Planning Area, especially Big Horn, Washakie and Hot Springs Counties, where the locatable mineral industry would be crippled if Alternatives B, E, or F, were implemented. In addition, BLM must explain its rationale for concluding that "no high impacts" were identified in the socioeconomic impact analysis especially when Alternative E proposes to withdrawal at least 43% of the mineral estate in the Planning Area, and subject existing mining claims to validity exams.	3020

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-67	Analyze, Disclose, and Provide Convincing Rationale of the Impacts to Mineral Development Under Each Alternative-BLM failed to identify or provide useful explanation of impacts to locatable minerals required by 40 CFR §§1502.16(a)(b),1508.7 (See DSEIS Ch. 4; DRMP/DEIS Ch. 4). While NWMA agrees that land withdrawals and restrictions will have an adverse direct impact on locatable mineral development, NWMA contends that the cumulative impacts related to mineral withdrawals, and surface use restrictions in sage-grouse habitat across the range were not adequately considered, analyzed and disclosed. In Kettle Range Conservation Group v. U.S. Forest Service, 148 F. Supp.2d (D.C. Cir. 2001) the court held that agencies must locate, describe, and consider other projects (or in this case RMPs, and other special designations like Wilderness Study Areas) that could have cumulative impacts when combined with the project under consideration. In Muckleshoot Indian Tribe v. U.S. Forest Service, 177 F.3d 800, (9th Cir. 1999) the court discusses in dicta “the problem is compounded by the very general and one-sided analysis of the cumulative impact information...these sections merely provide very broad and general statements devoid of specific, reasoned conclusions.” The court then held that the 12 cumulative impact statements contained in the EIS were “too general and one-sided to meet NEPA requirements.” NWMA maintains that the cumulative impact to locatable minerals from the combined land withdrawals, segregations, and de facto withdrawals currently in place, as well as the future land withdrawals proposed in dozens of RMP revisions will have an inadequately defined and significant adverse effect on the hardrock mining industry, and this must be given thorough analysis in the DSEIS; otherwise it represents a significant flaw that will render the final NEPA documents incomplete. NWMA further contends that the direct, indirect, and cumulative impact analysis is inadequate and lacks convincing data as well as rationale, as described above.	3020
1050	1050-66	Alternatives E and F propose surface use restrictions that are not proposed under Alternatives B and D, and which would debilitate mineral development that is co-located within special designation areas and key/core sage-grouse habitat. Simply referring the reader to the DRMP for the impacts of management actions proposed in the does not provide the detailed analysis required under NEPA, and thus is a fatal flaw that must be addressed before the final NEPA documents are released. The Final EIS must provide detailed analysis in order to withstand legal scrutiny,	3020

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-65	the impact analysis lacks any useful discussion regarding locatable mineral development, surface use restrictions, and land withdrawals within key/core sage-grouse habitat, and instead uses overly simplistic and comparative terms like - adverse impacts to locatable mineral development would be substantially greater under Alternative E(DSEIS Ch. 4 at 4-19), and then describes impacts to minerals outside the proposed sage-grouse ACECs would be the same as those under Alternatives B and D (DSEIS Ch. 4 at 4-18, 4-19). The impact analyses under B and D are insufficient as well, as they describe the impacts to locatable minerals as "similar to Alternative A." BLM needs to explain the rationale for concluding that the impacts of withdrawing approximately 174,000 acres from mineral entry (Alternative A) and nearly two million acres (Alternative E) are similar. In addition, there is no meaningful discussion of how the proposed land withdrawals, prohibitions, and surface use restrictions will affect individuals attempting to assert their pre-discovery rights, as discussed above.	3020
1050	1050-64	BLM must evaluate the substantially adverse consequences of making it impossible to explore and develop pre-discovery unpatented mining claims and lands that are currently open to location on which there are no unpatented mining claims that would be withdrawn from mineral entry and location of mining claims. BLM must recognize the rights granted in Section 22 of the Mining Law and the Section 22 VERs associated with access to and use and occupancy of pre-discovery claims.	3027-1
1050	1050-63	The Bighorn Basin EIS documents should discuss how the conservation measures proposed in the NTT Report, and included in the DSEIS, as well as the proposed land withdrawals, validity exams, and surface use restrictions detailed in Alternatives B, E, and F are in compliance with rights under the General Mining Law to allow access to public lands for prospecting, mining and processing and uses reasonably incident thereto	3027-1
1050	1050-61	Furthermore, BLM provides no baseline data to provide context to these arbitrary thresholds. Do these thresholds apply to occupied habitat or potential habitat? At what scale are these thresholds applied -planning area wide, state-wide, range-wide, MZ-wide, key/core habitat only? How can the public possibly be expected to gauge the potential impacts as a result of these conservation measures, if there is insufficient baseline data? NWMA contends that the habitat thresholds (3% surface disturbance and 15% sagebrush canopy cover) are derived from flawed studies, and in some cases are completely arbitrary.28 BLM must provide how and where these thresholds were determined, and re-evaluate the impacts they will have on other resources in the planning area as well as the socioeconomic impact they will have on the planning area, or else the Final EIS documents will not likely withstand legal or scientific scrutiny.	3035_2
1050	1050-60	In addition, NWMA believes that the 3% disturbance threshold proposed in key/core sage-grouse habitat, and 1 disturbance per 640 acres, (DSEIS Ch.2 at 2-13) puts an overly restrictive and unrealistic burden on mining operators exercising their rights under the General Mining Law, and creates a de facto withdrawal which is outside BLM's authority and contrary to law.	3035_4

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-59	BLM recommends the following substantial acreages be withdrawn from locatable mineral entry or subject to surface use and disturbance restrictions, and prohibitions primarily for the purpose of sage-grouse conservation (See Table 2. 6): . Alternative B: 325,102 acres (8%) of mineral estate (DRMP Ch. 4 at 4-48); . Alternative E:26 1,764,621 acres (42%) of mineral estate (DSEIS Ch.4 at 418); . Alternative F: 271,529,955 mineral acres (36% BLM mineral acres). BLM identifies locatable minerals as a principle industry or use in the decision area, especially in Big Horn County (DRMP/DEIS Ch. 3 at 3-2), yet BLM fails to identify compliance with the General Mining Law and the Mining and Minerals Policy Act as a way of addressing issues through policy or administrative action. NWMA contends that BLM has a legal obligation to comply with the General Mining Law, Mining and Minerals Policy Act, and FLPMA to recognize the Nation's need for domestic sources of minerals and the right to explore. It is at best careless and at worst remarkably disingenuous to identify locatable minerals as a "principle use" and then fail to identify the applicable laws for managing them and then propose management actions that are contrary to the General Mining Law and outside BLM's discretion as described above.	3020
1050	1050-58	NWMA contends recommendations contained in the Bighorn Basin EIS documents are not consistent with rights under the General Mining Law which allow citizens of the United States the opportunity to enter, use and occupy public lands open to location to explore for, discover, and develop certain valuable mineral deposits	3027-1
1050	1050-57	Furthermore, FLPMA expressly provides that none of its other provisions "shall in any way amend the Mining Law of 1872 or impair the rights of any locators or claims under that Act, including, but not limited to, rights of ingress and egress" (43 U.S.C. § 1732(b)). Therefore, the Bighorn Basin EIS documents proposed land withdrawals, prohibitions, and restrictions are contrary to provisions under FLPMA and Section 22 of the General Mining Law (discussed below) and must be revised.1. NWMA Recommendation No. 5: Demonstrate Compliance with FLPMA. The DRMP/DEIS/DSEIS should discuss how the proposed land withdrawals and surface disturbing restrictions in sage-grouse key/core and general habitat areas contained in Alternatives B, E, and F comply with the FLPMA mandate to balance a wide range of resource values and uses of public lands including the directive in the Mining and Minerals Policy Act at 43 U.S.C. §1701(a)(12) and 30 U.S.C. §21(a) to recognize the Nation's need for domestic sources of minerals. In addition, as previously discussed, BLM states that environmentally responsible mineral development is a primary goal and a key objective of the RMP; however, Alternatives B, E, and F severely limit the possibility of hardrock mineral development by way of land withdrawals, validity exams, and surface use restrictions in order to protect and conserve sage-grouse, which is inconsistent with the stated goals and objectives of the RMP. The Final EIS must eliminate this inconsistency.	3019

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-56	BLM must recognize that the need for mineral development to reduce the Nation's reliance on foreign sources of the minerals, to maintain our way of life and defend the country, may in fact be greater than the need to conserve millions of acres of sage-grouse habitat. As such BLM must demonstrate its compliance with the mandate under the Mining and Minerals Policy Act	3019
1050	1050-55	Moreover, the proposed restrictions and withdrawals from mineral entry in the DSEIS directly conflict with FLPMA's requirement that the Secretary must manage public lands to respond to the Nation's needs for minerals. Instead, the proposed restrictions and withdrawals place more importance on aesthetics and conservation of resources over other uses, like mineral development. Again, BLM must acknowledge that it is required to fully consider the need for mineral development along side with the need for conservation of other resources.	3019
1050	1050-54	NWMA recognizes that BLM appropriately identified mineral development as a key issue in the DRMP/DEIS (Ch. 1 at 1-10). However, BLM fails to provide for environmentally responsible mineral exploration and development, or recognize the Nation's need for domestic mineral sources, under Alternatives, B, E, and F. BLM must acknowledge that it is required to fully consider the need for future mineral development along side with the need for conservation of resources.	3019
1050	1050-53	NWMA contends that applying an emphasis on one resource, sage-grouse, across an entire planning area is not consistent with FLPMA, and BLM must resolve this issue before the Final EIS is published. The EIS must evaluate how the land use restrictions, prohibitions, and withdrawals recommended in the DSEIS pursuant to IM 2012 -044 and the NTT Report achieve the required balance in managing the public lands.	3027-1
1050	1050-51	Based on these findings reported by BLM as the current status of sage-grouse within the Planning Area, and USFWS's findings in the biological assessment, the conservation measures to protect sage-grouse proposed under Alternatives B, E and F go beyond what is necessary or reasonable to protect sage-grouse within the Planning Area; and calls into question the appropriateness of the NTT conservation measures pursuant to IM 2012-044. BLM must provide convincing data to support the proposed land withdrawals, surface use restrictions, and explain its rationale for inappropriately targeting mineral development in the DSEIS, when it is not identified as a primary or secondary threat to sage-grouse in the Planning Area (DSEIS Ch.4 at 4-152), and where habitat fragmentation has not rendered habitat unsuitable.	3035_1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-50	Alternatives B, E, and F, severely limit the possibility of hardrock mineral development by way of land withdrawals, validity exams, and surface use restrictions in order to protect and conserve sage-grouse, despite the USFWS's conclusion that locatable mineral development with mitigation would not lead to a listing under the ESA. In addition, these proposed restrictions do nothing to address the primary threats to sage-grouse. The application of conservation measures or restrictions (to protect sage-grouse) placed upon locatable mineral development should be proportionate to the threat -if any-that responsible resource development with proper mitigation measures that include re-vegetation with appropriate species and monitoring plans to identify and eradicate invasive species in the reclaimed areas poses to sage-grouse. BLM's proposed prohibition against mineral development in key/core sage-grouse habitat areas is disproportional to the amount of land used for mineral development and the impacts associated with mineral exploration and development, especially considering that the projected long term surface disturbing activities related to locatable mineral development are small in the context of the habitat area.	3020
1050	1050-49	Policy Issues that Must be Evaluated in the EIS BLM policies regarding sage-grouse conservation measures must be consistent with the agency's statutory authorities and the regulations and policies that implement those authorities. As described below, NWMA is concerned that the land use restrictions and prohibitions incorporated into the DSEIS pursuant to IM 2012-044 and in the NTT Report exceed BLM's authority under FLPMA, or conflict with the multiple use mandate under FLPMA, rights under the General Mining Law, and BLM Manual 6840.	3027-1
1050	1050-47	The Alternatives Described in Detail Should Consider Other Conservation Measures Besides those in the NTT Report-NWMA recognizes that BLM reports that it will analyze all applicable conservation measures submitted to BLM and USFS by state governments and citizens during the public scoping process (DSEIS Ch.1 at 12); however NWMA contends that this is wholly inadequate given the emergence of new data - BLM's stated "Need" for the DSEIS--as well as newly implemented conservation measures by local working groups and private citizens. All current and applicable conservation measures must be considered, not just those presented during the scoping process which took place four years ago. 24 At least one additional alternative should be included that analyzes conservation measures and regulatory mechanisms that are not described in the NTT Report, and which have been updated and/or implemented since the original scoping process and release of the 2011 DRMP. Analysis of existing regulatory authorities including but not limited to BLM's Surface Management Regulations for locatable minerals at 43 CFR 3809 that allows for hardrock mineral development with mitigation to prevent unnecessary or undue degradation needs to be included. In addition, IM 2012044 itself even recognizes that the NTT Report conservation measures may not be appropriate in all situations:	3035_1

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-46	The Council on Environmental Quality regulations require agencies to use the best available science when preparing EIS documents 40 C.F.R §1502.24.19 NWMA has learned a peer review of the NTT Report suggests that the NTT Report ²⁰ does not in fact represent the "Best Available Science" but rather relies on studies that have been criticized for: significant mischaracterization of previous research; . substantial errors and omissions; . lack of independent authorship and peer review; . methodological bias; . a lack of reproducibility; . invalid assumptions and analysis; and . inadequate data. ²¹ NWMA is concerned that the Alternatives described in the DSEIS rely entirely on the NTT Report conservation measures.	3035_2
1050	1050-45	In addition, BLM must demonstrate compliance with Manual 6840. The proposed fire management actions under Alternatives B, E, and F are likely to harm sage-grouse in the short-term and probably the long-term, as discussed above, which is contrary to BLM's obligations under Manual 6840 and the ESA.	3011
1050	1050-44	NWMA believes Manual 6840 goes beyond what the ESA requires for candidate species, like the sage-grouse, and is a significant formalized conservation effort if implemented properly. Therefore proper implementation of Manual 6840 must be included in the detailed Alternatives and Environmental Consequences analyses of the EIS documents as well as in the proposed alternatives suggested herein.	3035_1
1050	1050-43	b. NWMA Recommendation No. 3: The DRMP/DEIS Must Include a Manual 6840 Alternative (Better Implementation of Manual 6840) - Consideration of specific provisions pursuant to Manual 6840 must be referenced in the Alternatives and Environmental Consequences chapters, and described in detail in an appendix, so that the public can objectively evaluate the potential effectiveness of the sage-grouse conservation measures in Manual 6840. BLM should not ignore or replace the existing regulatory tools it already has without demonstrating why the existing regulations are not functioning properly or are inadequate. Important aspects of Manual 6840 that apply to sage-grouse and should be discussed include the following: [See bullet list in letter pg. 19]	3035_1
1050	1050-42	none of the alternatives give proper analysis to the existing conservation measures or authorities the BLM already has to protect sage-grouse and its habitat. BLM must not ignore Manual 6840. NWMA recognizes that BLM generally describes Manual 6840 (DRMP/DEIS Ch. 3 at 3-103), but then fails to provide a discussion within the context of impacts of how any of the specific provisions of Manual 6840 meet or fail to meet the objectives and goals set for the planning area. The DRMP/DEIS and DSEIS documents should evaluate the numerous directives in BLM Manual 6840 in the context of each Alternative Considered in Detail, and include an additional alternative that analyzes full and consistent implementation of Manual 6840, existing BMPs, 2004 Strategy, and Fundamentals for Standards for Rangeland Health	3027-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-40	The Final EIS documents should not be published without a full and detailed analysis of an additional alternative, that incorporates and analyzes a full range of conservation measures, including existing strategies, and will provide future monitoring data that will satisfy USFWS's requirements. NWMA contends that this additional alternative would fit the Purpose, Need, and Objectives of the DRMP/DEIS and would be consistent with FLPMA, the Mining Law of 1872, the Mining, Minerals and Policy Act, and BLM's sage-grouse conservation goals and objectives.	3027-1
1050	1050-39	Contrary to the WBP finding which indicates that fire suppression activities can benefit sage-grouse, Alternatives B and E do not focus on fire suppression; rather they propose passive management which is expected to have adverse impacts to sage-grouse in the short-term. BLM must explain how subjecting sagebrush ecosystems/sage-grouse habitats to increased fire potential in the short-term will benefit sage-grouse in the long-term; especially if sage-grouse are incapable of persisting in fragmented habitat, devoid of sagebrush cover, which is what the NTT Report contends. Under this assumption, most if not all the sage-grouse would die; therefore there would not be sage-grouse in the long-term.	3011
1050	1050-37	NWMA agrees that the USFWS identified conservation measures in RMPs as BLM's primary mechanism for protecting sage-grouse; however, BLM continues to mischaracterize the USFWS's WBP determination by saying that USFWS's determination concluded that BLM lacks adequate regulatory tools to conserve sage-grouse, and therefore new regulatory mechanisms must be developed (See DSEIS Ch. 1 at 1-2; Ch.3-2). Using this as a premise, BLM maintains the NTT Report conservation measures are required to respond to the WBP determination. The NTT Report does not use Manual 6840 or ESA as a foundation upon which to build. In fact, the NTT Report never references Manual 6840, nor does it explain the need for an entirely new regulatory approach. As such, it inappropriately discards an existing agency policy without ever justifying the radical change advanced in the NTT Report, and is thus arbitrary and capricious. Throughout the Warranted but Precluded (WBP) determination, specific to BLM regulatory mechanisms, USFWS repeats over and over its inability to assess the regulatory mechanisms because of how information was being reported to them.	3035_1
1050	1050-35	The alternatives analysis in the DRMP/DEIS and DSEIS does not satisfy requirements under NEPA to analyze all reasonable and viable alternatives, BLM's own requirements for analyzing alternatives as set forth in its NEPA Handbook, H-1790-1, or the above-noted Purpose of the document because it fails to recognize the Nation's need for domestic sources of minerals, violates FLPMA, does not balance BLM's goals and objectives, and fails to incorporate appropriate management actions by opting for a one-size fits-all approach to conservation. The Final EIS documents must include a revised and expanded alternatives analysis.	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-34	This language is clear that mineral development is to be pursued and that exploration and development be conducted in an environmentally sound manner in compliance with the FLPMA mandate at 43 U.S.C. 1732(b) to prevent unnecessary or undue degradation of the lands. However, precluding mineral development by way of, surface use restrictions, validity exams and land withdrawals (See DSEIS Ch. 2 at 2-12; 2-19) does not accomplish the DRMP/DEIS' stated goal, or provide consistency with the mandate under FLPMA or the Mining and Mineral Policy Act to recognize the Nation's need for domestic mineral sources or balance resources. NWMA contends that full implementation of existing regulatory tools "including required conservation and mitigation measures" are adequate to ensure environmentally sound mineral development that is compatible with sage-grouse conservation. To that end, only alternatives that will incorporate appropriate and implementable management actions that will conserve sage-grouse and its habitat, and at the same time recognize the nation's needs for domestic sources of minerals, among other management goals described in the DRMP/DEIS can be considered in the DSEIS. The DSEIS should carefully evaluate a reasonable range of alternatives, which are consistent with the stated purpose of the RMP revision, and consider conservation measures that are within the boundaries of the law. Conservation measures that are inconsistent with the law are not implementable. They cannot be part of BLM's Preferred Alternative, must be rejected out of hand, and therefore must be eliminated from detailed analysis.	3019
1050	1050-33	NWMA contends that in order for the alternatives to be considered a "reasonable range" of alternatives, then the alternatives must provide a reasonable range of area-specific conservation measures appropriate for the Bighorn Basin Planning Area and not rely almost entirely on the conservation measures recommended in the NTT Report. Moreover the alternatives must consist of management actions that are supported by the "Best Available Science." NWMA contends that the NTT Report does not constitute the Best Available Science.	3035_1
1050	1050-32	In addition, BLM prepared the DSEIS to consider the conservation measures identified in the NTT Report pursuant BLM Instruction Memorandum No. 2012044 (DSEIS at ES-1). IM-2012-044 requires BLM to consider all applicable conservation measures when revising or amending its RMPs in sage-grouse habitat. The conservation measures developed by the NTT must be considered and analyzed, as appropriate, and a reasonable range of conservation measures must be considered in the land use planning alternatives.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-31	The "alternatives" portion of an EIS is considered the "heart" of the NEPA process and requires an agency to rigorously explore and objectively evaluate all reasonable alternatives so that decision-makers and the public are fully informed (40 C.F.R. §1502.14(a)). ¹⁴ Substantial case law exists regarding the range of alternatives that need to be included in an EIS. For instance in <i>Natural Resource Defense Council v. Morton</i> , 458 F. 2d 827 (D.C. Cir. 1972) the court found that an agency must look at reasonable alternatives sufficient to allow for a reasoned decision; it is not appropriate to disregard an alternative merely because it does not offer a complete solution to a broad problem, like sage-grouse conservation. In <i>Dubois v. USDA</i> , 102 F. 3d 1273 (1st Cir. 1997) the court held that the Forest Service acted arbitrarily and capriciously when its Final EIS did not sufficiently explore all reasonable alternatives, and that an "agency has duty to study all alternatives that appear reasonable and appropriate for study... as well as significant alternatives suggested by other agencies or the public during the comment period." ¹⁵ Further, in <i>Resources Ltd. v. Robertson</i> , 35 F.3d 1300, 1307 (9th Cir. 1993) the court held "The existence of a viable but unexamined alternative renders an environmental impact statement inadequate." ¹⁶ To that end, BLM must examine the viable alternatives suggested herein, otherwise it will not likely withstand legal scrutiny pursuant to NEPA case law.	3027-1
1050	1050-30	Thoroughly Evaluate the No Action Alternative -The EIS documents must include a detailed discussion of the habitat conservation improvements currently being achieved under the existing policies, the socioeconomic benefits that would result from continued private-sector authorized uses of public lands with sage-grouse habitat, and the possibility that in light of the numerous habitat conservation measures already in place, the USFWS will determine in 2015 that the sage-grouse should not be listed as a threatened or endangered species. The No Action Alternative must discuss, in detail, specific conservation measures like those in Manual 6840 (see discussion infra at 17-20) and explain and quantify the deficiencies (if any) associated with these conservation measures/BMPs and/or the way in which they are being implemented and documented. Without this analysis, it is impossible for the public to gauge and understand the need (if any) for land use management changes in BLM's Preferred Alternative. The EIS documents must also include detailed discussion of the mitigation measures currently in place pursuant to FLPMA's "unnecessary or undue degradation" provisions (43 U.S.C. §1732(b)) within the context of the No Action Alternative. BLM must not propose new or different regulatory mechanisms if any of the apparent shortcomings or gaps in the existing regulations are due mainly to uneven or incomplete implementation of existing policies.	3035_1
1050	1050-29	However BLM fails to include other management actions or conservation measures currently in effect in the planning area that would have a positive effect on wildlife, such as habitat conservation improvements and the various conservation measures required under the Wyoming Sage-grouse Strategy.	3035_1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-28	The No Action Alternative analysis in the DRMP/DEIS should quantify the impacts associated with ongoing implementation of the many existing local, state, and federal conservation measures and the existing BLM policies to protect sage-grouse habitat.	3035_1
1050	1050-26	The continuation of existing management and conservation measures and existing regulatory policies including the directives in BLM Manual 6840 define the No Action Alternative and provide a baseline upon which useful analysis may take place. It seems apparent that BLM has prematurely concluded that these existing regulatory policies are inadequate. However, BLM provides no discussion based upon on-the-ground data that this is the case. BLM should not presume (as it currently has) that using the existing tools or better implementation of the existing regulatory tools would not provide adequate sage-grouse and sagebrush habitat conservation.	3035_1
1050	1050-25	BLM fails to fully explain or analyze adequately how existing regulatory mechanisms are either adequate to conserve sage-grouse or inadequate to conserve sage-grouse, and therefore provides no useful baseline against which each of the proposed alternatives can be compared.	3035_1
1050	1050-24	As the DRMP/DEIS currently stands, insufficient explanation and discussion of current regulatory mechanisms or conservation strategies are described with respect to sage-grouse, which makes it impossible to compare the effects of the management actions proposed in the DSEIS.	3027-1
1050	1050-23	NWMA contends that Alternatives B, E, and F are inconsistent with the language contained in the DRMP/DEIS relating to BLM policy on land withdrawals, fails to recognize the Nation's need for domestic mineral sources, and fails to comply with FLPMA, the General Mining Law, Mining and Minerals Policy Act, BLM's own policy pursuant Manual 6840, IM 2012-044, DOI 603 Departmental Manual 1, withdrawal regulations at 43 Code of Federal Regulations (CFR) Part 2300, and NEPA. Moreover, the alternatives contained in the DSEIS and Alternative B of the DRMP/DEIS do not satisfy the Purpose and Need for the RMP revision, and should therefore, be revised to demonstrate that they are legal and fit the Purpose and Need before the Final EIS documents are published	3027-1
1050	1050-22	Alternatives considered in detail address management actions that include closure or prohibition of various resource uses over portions of the Planning Area (Id. at 2-8, emphasis added). Following the same line of reasoning, BLM should have eliminated Alternatives B, E and F from detailed analysis rather than evaluate them as alternatives that could be selected.	3027-1
1050	1050-21	NWMA agrees with BLM that alternatives that pursue sweeping land withdrawals within the Planning Area are overly restrictive, unreasonable and contrary to law and BLM policy; which calls into question the validity of Alternatives B, E, and F, which propose sweeping land withdrawals, or de facto withdrawals due to special designations, or unreasonable surface use restrictions. As such, Alternatives B, E, and F are inconsistent with FLPMA, and the Property Clause of the United States Constitution, ¹³ which gives Congress sole power to regulate the public lands.	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-19	BLM has failed to demonstrate how any of the Alternatives best satisfy statutory requirements; balance BLM goals, objectives, and policies; and which alternative represents the best way to satisfy the Purpose and Need, addresses key issues, and considers cooperating agencies recommendations (DRMP/DEIS Ch. 2 at 2-2, 2-3). NWMA believes Alternatives B, E and F, do not satisfy statutory requirements, do not balance BLM goals, objectives and policies, and are not the best fit for the Purpose and Need. The lack of meaningful analysis contained in the DSEIS as well as the DRMP/DEIS constitutes a serious shortcoming that must be addressed. Consequently, the DSEIS and DRMP/DEIS are "inadequate as to preclude meaningful analysis" (40 CFR §1502.9(a)); and therefore the BLM must prepare and reissue a revised draft which provides the analysis necessary to support each of the management alternatives, including identifying the Preferred Alternative.	3027-1
1050	1050-18	BLM has failed to indicate whether Alternative D, the agency's Preferred Alternative in the DRMP/DEIS, remains the agency's Preferred Alternative in the DSEIS, or whether there is no longer a Preferred Alternative. Instead BLM states in the DRMP/DEIS "The Agency Preferred Alternative or new alternative may be a combination of existing alternatives or an alternative within the range of alternatives already analyzed" (DRMP/DEIS Ch. 2 at 2-3, emphasis added). NWMA recognizes that BLM is only required to identify a Preferred Alternative at the time the final EIS documents are published (40 CFR § 1502.14(e)); however NWMA contends that a "Preferred Alternative or new alternative" which is introduced at the time the final NEPA documents are published precludes public involvement and the detailed analysis/disclosure required under NEPA, and as a result does not satisfy the agency's procedural obligations under NEPA. BLM must provide detailed analysis that supports why the Preferred Alternative is in the best interest of the agency as well as the public.	3027-1
1050	1050-17	Additionally, the CEQ regulation at 40 CFR § 1502.16(c) requires BLM to include discussion of "[p]ossible conflicts between the proposed action and the objectives of Federal, regional, State, and local (and in the case of a reservation, Indian tribe) land use plans, policies, and controls for the area concerned." NWMA contends that the surface use restrictions and land withdrawals proposed within sage-grouse habitat under Alternatives B, E and F described in the DSEIS conflict with BLM's own policy in Manual 6840, the General Mining Law, and its multiple use mandate under FLPMA (discussed in detail below), and represents a fatal flaw which renders the DRMP/DEIS and DSEIS both inadequate and inconsistent with existing laws and policies. The conflict between sage-grouse conservation and the prohibition through administrative fiat against mineral, oil and gas and other commodity development in the planning area must not be ignored. Unfortunately, the DSEIS fails to recognize and disclose this conflict. Detailed discussion of the impacts to each of the resources with respect to the proposed mitigation measures for sage-grouse found throughout the DSEIS must be thoroughly developed and analyzed before the Final EIS is published.	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-16	<p>Alternatives E and F, which are based on recommendations in the NTT Report, lead to an absurd outcome that makes long-term restoration of sagebrush habitat (which will take a couple of decades to achieve) BLM's primary objective - rather than protecting sage-grouse populations now and in the next decade or so. NWMA vehemently opposes this misguided objective and urges BLM to recognize that conservation measures to minimize habitat loss are the only logical path forward - as well as the best opportunity to minimize the likelihood of the USFWS determining it is necessary to list the Greater sage-grouse as a threatened or endangered species. The likelihood that USFWS will determine it is necessary to list the Greater sage-grouse increases significantly if BLM fails to develop appropriate conservation measures to address the fire and invasive species cycle - one of the main threats to sage-grouse habitat range wide. Unfortunately, the conservation measures in the NTT Report do not mainly address habitat threats due the wildfire - invasive species cycle and focus inappropriately on restrictions and prohibitions on land uses and the regulated community. NWMA is also concerned that the assumptions used in the Special Status Species analysis are flawed, partly due to the way in which the NTT Report mischaracterizes other studies in order to support arbitrary habitat and disturbance thresholds. The analysis also contains broad generalization that the level of disturbance directly correlates to the level of adverse impact to species generally (DSEIS Ch. 4 at 4-70), but does not provide data to support that assertion. Based on the above mentioned flaws, the DSEIS and DRMP/DEIS are "inadequate as to preclude meaningful analysis" (40 CFR §1502.9(a)); and therefore the BLM must prepare and re-issue a revised draft which provides the analysis necessary</p>	3035_1
1050	1050-15	<p>Surprisingly, the flawed impact analysis is not one-sided. The impacts to sage-grouse due to the passive management of invasive species proposed under Alternatives B, E, and F which severely limit fire suppression methods, is expected to adversely affect sage-grouse in the short term, but provide long-term beneficial impacts to sage-grouse habitat due to restoration of a natural fire regime. However, no rationale or evidence is provided. (DSEIS Ch. 4 at 4-78). BLM must explain its rationale for concluding that sage-grouse will benefit in the long term "but certainly not in the short term" because fire suppression restrictions are likely to increase the potential for catastrophic fire; which in turn would increase the potential for the spread of invasive species, which would then take decades to restore sagebrush ecosystems after wildfires.¹² The impact analysis is fatally flawed and must be revised before the final EIS documents are published.</p>	3011

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-14	Furthermore, the DSEIS omits any discussion or analysis of impacts the proposed withdrawals, segregations, and restrictions will have on sage-grouse except to say they will be beneficial, but provides no quantitative analysis, data, convincing rationale or evidence of this assertion. There is no attempt to quantify the impacts whether beneficial or adverse, instead broad generalizations are used. NWMA opposes any impact analysis that does not quantify the cumulative impacts the proposed management decisions will have on all uses of public lands, including locatable minerals exploration and development. Detailed discussion of the impacts to locatable mineral operations and development, as well as to other land uses, must be thoroughly analyzed and developed, otherwise the Final EIS documents will be vulnerable to legal challenges.	3020
1050	1050-13	BLM may have presented impacts (i.e. environmental consequences) by resource and alternative in the DSEIS, however the DSEIS completely fails to include any detailed or meaningful analysis of the impacts to resources under Alternatives E and F, especially the socioeconomic impacts of withdrawing millions of acres to locatable mineral development (See DSEIS Chapter 4), which is discussed in detail below.	3020
1050	1050-12	Regrettably, DOI decision-makers did not heed warnings like this from DOI staff and peer reviewers and proceeded with publishing the NTT Report knowing that there were significant internal concerns about the report. If the legal, scientific and procedural flaws are not addressed and cured, the Final EIS and RMP will not stand up to legal challenges.	3035_2
1050	1050-9	Additionally, the failure to provide a detailed evaluation of Manual 6840 and other BLM policies pertaining to sage-grouse conservation is inconsistent with the guidance in Section 6.6 of BLM's NEPA Handbook(H-1790-1): The range of alternatives explores alternative means of meeting the purpose and need for the action...The broader the purpose and need statement, the broader the range of alternatives that must be analyzed. You must analyze those alternatives necessary to permit a reasoned choice (40 C.F.R 1502.14...In determining the alternative to be considered, the emphasis is on what is "reasonable"... Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense... (BLM Handbook H-1790-1 at 49 – 50). NWMA believes the entire DRMP/DEIS/DSEIS process is fraught with substantial procedural, legal and scientific flaws, which again, were recognized by DOI employees and discussed in internal emails questioning the legality of some of the conservation measures recommended in the NTT Report: But, does the NTT really want to recommend something that is blatantly illegal(?)...9	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-8	The NEPA process requires an agency to rigorously explore and objectively evaluate all reasonable alternatives so that decision-makers and the public are fully informed. NEPA documents are intended to be used as a tool during the planning and decision-making process (40 C.F.R. §§1502.14(a), 1502.14(b),(d)). Substantial case law exists regarding the range of alternatives that need to be included in an Environmental Impact Statement (EIS), and "[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate" (Resources Ltd. v. Robertson, 35 F.3d 1300, 1307 (9th Cir. 1993)). To that end, failing to analyze full and consistent implementation of existing policies and conservation measures, like those contained in Manual 6840, IM2005-024: National Sage-Grouse Habitat Conservation Strategy (2004 Strategy), Fundamentals for Standards for Rangeland Health (43 C.F.R. §4180.1), and existing Best Management Practices (BMPs) as an alternative (a "Manual 6840 Alternative"), and an alternative which complies with USFWS's "Warranted but Precluded" finding for sage-grouse in the EIS documents is arbitrary and capricious and does not comply with NEPA requirements (discussed infra, Section II). Consequently, the Final EIS documents should not be published for public review until a detailed analysis of the above alternatives are included.	3027-1
1050	1050-7	We also believe that IM 2012-044 and the NTT Report inappropriately jettison BLM's existing policies to protect candidate species, including the policies contained in BLM Manual 6840, "Special Status Species Management" (Manual 6840). Instead, the DSEIS arbitrarily imposes a completely new regulatory framework without providing a reasonable explanation for doing so, and is therefore arbitrary and capricious.	3027-1
1050	1050-6	In addition to being inconsistent with FLPMA and the General Mining Law Alternatives E and F propose surface-disturbing restrictions that are not scientifically supported as required by the regulations that implement the National Environmental Policy Act (NEPA)	3027-1
1050	1050-5	As described below, NWMA does not support any of the Alternatives as they are drafted. Specifically, Alternative B, Alternative E, and Alternative F do not recognize rights provided to individuals under the Mining Law of 1872 (General Mining Law, 43 U.S.C. 21a et seq), and are not consistent with provisions under the Federal Land Policy and Management Act of 1976 (FLPMA, 43 U.S.C 1701 et seq).	3027-1
1050	1050-4	However, Alternative B is reported as having the least potential for long-term beneficial impacts from restoration of historic fire regimes due to the threat of invasive species out-competing native species in fire disturbed areas,7 which seems odd because all the Alternatives are subject to the same post-fire stabilization and rehabilitation requirements. The above statement assumes post-fire stabilization will thus be more effective under Alternative E, without providing any support.	3011

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-3	In addition, NWMA believes that in light of the May 16, 2013 letter the Western Association of Fish and Wildlife Agencies (WAFWA) sent to Department of the Interior Secretary, Sally Jewell, expressing concern with relying solely on the conservation measures recommended in the NTT Report, the DSEIS should be revised to consider other alternatives and reissued to give the public another opportunity to comment on the draft EIS documents. The concerns expressed in the WAFWA letter are echoed in NWMA's report entitled, BLM's NTT Report: Is It the Best Available Science or a Tool to Support a Pre-Determined Outcome, published in May 2013 which raises significant questions as to whether the NTT Report represents Best Available Science. Internal inconsistencies must be addressed. For example, BLM concludes: Compared to the other alternatives, management methods applied under Alternative E for the protection of greater sage-grouse (severe restrictions on fire suppression) may result in the greatest short-term adverse impact to fire and fuels management by limiting the types of treatments used, but would decrease the risk of large, catastrophic fires in the long term through a return to natural fire regimes (DSEIS at 4-31; 4-32).	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1050	1050-2	<p>The conservation measures proposed by the Sage-grouse National Technical Team (NTT) in the NTT Report are draconian and will have severe negative impacts on NWMA members, other multiple-users of federal lands, and numerous resource-dependent communities in the ten state area . The limit in the NTT Report on the percent of land that can be disturbed is unsupported, arbitrary and will have a dramatic adverse impact on multiple-use activities; . The draconian conservation measures proposed in the NTT Report will further stifle investment in the U.S. mining industry and exacerbate the Nation's mineral import dependency. NWMA also encouraged BLM to address the following issues in subsequent EISs: . Incorporate the continuation of existing Federal, State and Local management and conservation measures into the No Action Alternative - "with an emphasis on specific provisions of Manual 6840 such as, Section 1(3); . Making State-led conservation measures a mandatory and enforceable alternative; . The EIS must analyze impacts to interference with expectation-backed investments; . Analyze the cost of validity exams and the cost of regulatory takings if lands are withdrawn from mineral entry; . The EIS documents must include a thorough discussion of how the NTT Report conservation measures are based on: 1) the best available scientific and commercial data; and 2) take into account the existing state and local conservation measures; . The EIS must evaluate whether and how the conservation measures and regulatory mechanisms recommended in the NTT Report achieve the required balance in managing the public lands.. The proposal to withdraw lands within key/core habitat from mineral entry is not supported by any authority under the ESA or FLPMA and should not be included as part of BLM's Preferred Alternative; . The EIS needs to include a full range of alternatives.2 However, BLM has failed to address any of these concerns or issues raised during the regional call for public comment (76 Fed. Reg. 77008 (December 9, 2011). NWMA believes Alternatives E and F, which were developed to incorporate the recommendations contained in the NTT Report, are inappropriate. The NTT Report creates policies that assume that sage-grouse conservation is the highest and best use of the land, while subordinating other interests, like locatable mineral exploration and development, without adequate analysis of the economic impacts these policies will have on the area as well as the hardrock mining industry as a whole (discussed in detail below), as recognized in internal emails between Department of the Interior (DOI) employees who were involved with developing the NTT Report:</p>	3035_1
1051	1051-3	<p>First, the overarching goals of the MLPs, which should be stated explicitly in the "vision," is to resolve potential resource conflicts within each of the analysis areas. Those conflicts include potential impacts on lands with wilderness characteristics, Greater sage-grouse "key" habitat (and other critical wildlife habitat), open space, recreation, and working ranches.</p>	3023-6

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1052	1052-18	We suggest BLM utilize additional published articles and guidance, particularly the use of the Western Association of Fish and Wildlife Agencies recommendations on mule deer habitat guidance and energy development (Lutz et al. 2011), the recently approved technical review by The Wildlife Society on impacts of oil and gas development on wildlife (Riley et al. 2012), and a recent USGS synthesis of sage grouse research (Manier et al. 2013). Other relevant articles on sage grouse we did not see in the RMP include Doherty et al. (2008, 2010), Holloran et al. (2010), Kirol (2012), Naugle et al. (2011), and Walker et al. (2007).	3049
1052	1052-17	The TRCP FACTS recommendations (see attached document) and recent economic studies on the impacts of hunting, fishing and the outdoor industry on the economy (Southwick Associates 20012 a, b) should be incorporated in the analysis and decision making process. We encourage the BBFOBLM to use of best available and most contemporary science, particularly for sage grouse and mule deer management, when making evaluations, developing alternatives, and finalizing decisions.	3036-1
1052	1052-15	We fully support a management action that would designate a Sagebrush Ecosystem ACEC: public lands within 4.0 miles of the perimeter of occupied or undetermined Greater Sage-Grouse leks and winter concentration areas.	3035_1
1052	1052-14	We support a stipulation that would impose an NSO restriction prohibiting surface-disturbing activities, disruptive activities, and occupancy within 4.0 miles of the perimeter of occupied or undetermined Greater Sage-Grouse leks and wintering areas.	3035_1
1052	1052-13	We suggest that prior to allowing such activities as additional development to take place, the BBFO must work with all appropriate wildlife management agencies, federal and state, to determine current populations and objectives while establishing criteria and developing thresholds to help minimize and mitigate any adverse impacts that could result from extraction and associated developments.	3006

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1052	1052-3	The report's findings identifies that natural resource development has been and will continue to be an important benefit to Wyoming's economic health. Employment in some of the commodity production on public lands has been cyclical, unlike the jobs and revenue generated by people fishing, hunting and recreating on public lands which have helped expand economic growth. The report showed that the case study community of Cody, WY, benefits by as much as \$30 million (2010-2011, Southwick Associates) through fish and wildlife related activities. The natural amenities have served as a magnet for and businesses looking for a high-quality lifestyle. The diverse economy provides a buffer against cyclical markets. This is dependent in part on the surrounding public-lands. Sustaining the economic diversity will depend on the conservation of the regions natural resources. Fishing, hunting, and wildlife related activities are a sustainable part of the economy and must be considered in the decision of whether or not to move forward with energy development and other activities, and to what level in the BBFO administered area. The importance of our public lands - is identified in the TRCP's Sportsman Values Mapping Project where sportsmen and women from around the state participated in a data collection that prioritized areas of importance for their passions of hunting and angling. In this case, the area in and around the proposed project area is important to sportsmen.[see figure in comment] The highlighted areas demonstrate an importance to sportsmen. More importantly, the area possesses high fish and wildlife values.	3036-1
1052	1052-2	This guidance clearly indicates BLM already has policy in place to work in close coordination with state agencies to set population goals for wildlife species and that important habitats for game species, as well other species of wildlife, should be designated for special management or protection. We recommend the BLM's BBFO 1) coordinate with Wyoming Game and Fish Department more closely to establish land use planning and habitat management objectives that are tied to achieving and maintaining the state wildlife agency's population management objectives, and 2) ensure commitments made in the proposed RMP are flexible enough to change if state needs require such management flexibility. This includes coordination with WAFWA recommended dates for big game restrictions and for sage grouse management.	3006

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1054	1054-1	MY CONCERNS IS WITH ALTERNATIVE E, F OF THE E.I S. THE PRIMARY IMPACTS TO LIVESTOCK GRAZING WOULD RESULT FROM MANAGEMENT THAT ALTERS THE AREA AVAILABLE TO LIVESTOCK GRAZING, CONSTRAINS ON THE PLACEMENT OR TYPES OF RANGE IMPROVEMENTS, OR CHANGES THE NUMBER OF ANIMALS UNIT MONTHS (AUMS) AVAILABLE TO THE OPERATORS. THE REASONS FOR THESE REGULATION ARE NOT BASED ON GOOD SCIENTIFIC DATA. WHEN I WORKED ON COPPER MTN IN 1956-57 AND AGAIN IN 1960-63. THERE WERE A LOT OF SAGE GROUSE. THERE WAS MORE PEOPLE, SHEEP AND COWS THERE AND MORE ACTIVITY THEN, THEN THERE IS NOW. WE MOVED ON TO THIS PLACE IN 1968. (AT THE END OF COUNTY RD 9, HOT SPRINGS CO.) IN 1970 WE PLANTED POTATOES ON THE SOUTH SIDE OF MUD CREEK AND THE SAGE GROUSE DUG THEM UP AND ATE THEM. THERE WERE PLENTY OF SAGE GROUSE UNTIL SOME TIME IN THE 80'S. THE COONS SKUNKS AND RAVENS WERE NONEXISTING, ON MUD CREEK AT THAT TIME. THERE WAS A LOT OF ACTIVITY THEN AND MORE EVEN THEN NOW.	3017-3
1057	1057-15	Annual grasslands are referenced throughout the document Wyoming doesn't really have much in the way of annual grasslands, even following fire disturbance. Annual Grassland ecosystems in the West are predominately found in California. Changing the language to "areas with undesirable annual grasses" will differentiate the discrete areas of annual grasses occurring on Wyoming's rangelands from the "ecosystem type" that is generally associated with the term Annual Grasslands.	3042
1057	1057-14	We would like to see 4.4.2 Vegetation - Grassland and Shrubland Communities. 4.4.2.3 Detailed Analysis of Alternatives, Alternative F, Resource Uses, page 4-46 removed ("Livestock grazing management in this ACEC includes multiple management actions that would benefit grasslands and shrublands, including requirements for land health assessments to determine whether rangeland health standards are being met"). BLM is currently required to determine whether rangeland health standards are being met for wildlife habitat, including the sage grouse. Alternative F does not change or enhance this requirement its inclusion here is redundant.	3042
1057	1057-13	There is so much in this document that expresses a bias against livestock grazing. Grazing is not a surface disturbing activity; it is a management tool. In table 2.5, Detailed Alternatives, 7000 Special Designations (SD) "ACECs" Proposed Greater Sage Grouse Priority Habitat Area ACECs, Record #110, page 2-35 it states, "Identify the specific allotment(s) where retirement of grazing privileges is potentially beneficial". Appendix P goes on to list all grazing allotments in the Core Habitat Area; not just those currently identified for retirement. WyFB is concerned about identifying allotments through a resource management planning process in which retirement of grazing privileges is "potentially beneficial". Rangelands have always been grazed - removing grazing tends to have a detrimental effect over the medium and long term.	3017-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1057	1057-10	In the third paragraph on page 3-3, it states "Declines of sage grouse near oil and gas fields in this area have been well documented (USFWS 2013). However, recent conservation actions, including the Wyoming Governor's EO designating protective stipulations for Core habitat Areas and the implementation of conservation easements within these areas have reduced the threat risk to populations in the Wyoming portion of the Wyoming Basin Management Zone (USFWS 2013). Designated state Core Habitat Areas adequately capture redundancy and representation for the Wyoming portion of the Wyoming Basin Management Zone population. Due to the large size of this population, the presence of large, contiguous habitats, and regulatory measures providing habitat protection, this population is considered low risk (USFWS 2013). Within the planning area, greater sage grouse are distributed in habitat that has not been rendered unsuitable due to fragmentation and degradation". We feel this discussion supports our comment that you defer to the state and state agencies in determining management strategies for the greater sage grouse in your planning area.	3035_1
1057	1057-9	Oil and gas development and conversion of sagebrush to grasslands are also identified as a primary source of decline in MZ I (Great Plains Management Zone). Why are they included when the majority of your planning area lies within MZ II (Wyoming Basin Management Zone), and the majority of the sage grouse habitat managed by the BLM in the planning area also lies within MZ II, which covers about two thirds of the State of Wyoming? Primary threats in MZ II are identified as energy development and transfer, including both renewable and non-renewable resources, long-term drought and brush eradication programs; quite different from those in MZ I.	3035_2
1057	1057-8	Encroachment of conifers and juniper is blamed on changes in fire return intervals and overstocking of domestic livestock (page 3-3). Where is this overstocking? Permitted AUMs and actual use AUMs have declined on federally managed lands over the last several decades. Proper stocking rates and use of the land by domestic livestock actually serves to alleviate some of the things on your list, including weed and annual grass invasion and conifer and juniper encroachment	3017-3
1057	1057-6	The closure of priority sage grouse habitat to surface uses under Alternative E and B is unacceptable (page 2-14). Even the moderate constraints on resource uses under Alternatives F and D may prove detrimental to the sage grouse. These restraints are not supported by scientific data, especially in the case of livestock grazing and range improvements. Livestock grazing can be managed to meet sage-grouse habitat objectives and management considerations. This has been proven over a long period of time on Wyoming's privately managed agricultural lands.	3017-3

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1057	1057-5	We ask that Wyoming Executive Order 2011-5 and its supplement 2013-3; the Bighorn Basin Sage Grouse Conservation Plan, and the individual county Land Use and Management Plans be published in their entirety in the Final RMP. The economy of the basin relies greatly on the proper management of BLM lands occurring in Big Horn, Hot Springs, Park and Washakie counties. As stipulated in Executive Order 2011-5 (and all other orders before it), "State and federal agencies, including the U.S. Fish and Wildlife Service, Bureau of Land Management, U.S. Forest Service, and other federal agencies shall work collaboratively to ensure a uniform and consistent application of this Executive Order to maintain and enhance Greater Sage Grouse habitats and populations"§.	3027-2
1057	1057-4	On page 2-1 in paragraph 3, the supplement 2013-3 to Wyoming Executive Order 2011-5 is badly misrepresented as outlining a process to remove livestock grazing if sage grouse conservation objectives are not achieved and improper livestock grazing is suspected. What it really says is "The State of Wyoming will collaborate with Federal agencies in defining a framework for evaluating situations to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives where conservation objectives are not being achieved on federal land. The State of Wyoming will also collaborate with appropriate federal agencies on appropriate site-based action to achieve Greater Sage-Grouse conservation objectives within the framework. Monitoring data will at minimum reflect 5 years of information, include rangeland health assessments and require conclusion or action to be based on 3 out of 5 years of data". It also states that "It is Wyoming's primary premise that grazing activities are compatible with Greater Sage-Grouse conservation and may improve habitat for Greater Sage-Grouse. Grazing is considered a de minimus practice (Executive Order 2011-5, Attachment C). Grazing management practices maintain or enhance Wyoming rangelands. Properly managed rangelands are capable of sustaining viable Greater Sage-Grouse populations and a diversity of plant species appropriate to suitable Greater Sage-Grouse habitat". The true focus of the supplement is coordination among Land Management Agencies when Grazing Adjustments are Believed Necessary to Benefit Greater Sage-Grouse; not the removal of livestock grazing. We are more likely to experience damaging grazing practices from feral horses than from domestic livestock.	3017-1

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1057	1057-3	Throughout the supplement it is stated that "BLM manages the density of disturbance to not exceed an average of one disruptive activity location per 640 acres and cover less than 3 percent of the total greater sage grouse Core Habitat Areas". Wyoming Executive Orders state, "Surface disturbance will be limited to 5% of suitable sage grouse habitat per an average of 640 acres". We would like to remind the BLM that U.S. Fish and Wildlife Service has been collaborating with the State of Wyoming and the Wyoming Game and Fish Department, and that BLM has agreed to this process. We would like to see you defer to Wyoming's management desires for the sage-grouse. It is far more beneficial to the sage grouse if Wyoming's sage grouse management scheme; the Bighorn Basin Sage Grouse Conservation Plan, and the individual counties' Land Use and Management Plans are relied upon to inform management decisions made by BLM. These documents are appropriate resources to use to identify sage grouse habitat requirements and best management practices in the Bighorn Basin, and should be included in section 1.4.2 Planning Criteria #33.	3035_4
1057	1057-2	We strongly object to the use of Areas of Critical Environmental Concerns (ACECs) as a management approach for sage grouse. ACECs tend to not move across the landscape; sage grouse do, and so does their habitat. The proposed increased restrictions of activities (grazing, oil and gas, recreation, etc.), on ACECs promotes a single dominant use of 1.4 million acres (under Alternative F; page ES-4); almost 45 percent of the surface acres managed by BLM in the Bighorn Basin. This violates your mandate to manage for multiple uses. The increased restrictions also violate the management desires set forth in every Wyoming Executive Order issued.	3001
1057	1057-1	On page ES-1 in the third paragraph, there is a discussion of the State of Wyoming Executive Orders used to determine the boundaries and potential management of the greater sage grouse Key Habitat Areas ACEC (Alternative E), and the greater sage grouse Core Habitat Areas ACEC under Alternative F. WY Executive Order 2008-02 used for Alternative E; and WY Executive Order 2010-04, used for Alternative F were made available at the time of the ACEC nomination. These two Executive Orders have been replaced (2011-05 replaces 2010-04), or rescinded (2008-02) was rescinded on April 27, 2011. The current Executive Order in place is 2011-5. This order remains in effect until August 18, 2015; we feel EO 2011-5 should be used to inform sage grouse management decisions by the BLM in the Big Horn Basin.	3001
1062	1062-4	Record # 50" It is unrealistic to assert that an entire allotment/pasture should be shut off from grazing if the burned area can't be fenced. This is completely unnecessary and extreme. It reflects an absence of on the ground realities. These allotments can be huge, burned areas can be huge and fencing unrealistic. It again reflects the obvious agenda against livestock grazing under the guise of caring about restoration.	3011

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1062	1062-3	Record #49 " Alternative F: It is counterproductive for sage grouse to exclude livestock from grazing in burned areas until wood and herbaceous plants achieve sage-grouse habitat objectives. Woody shrubs in this ecology could take as long as 60 years to re-establish and in the meantime grasses could compete with them. Livestock grazing should be permitted during this time frame, in fact sage-grouse stewardship is on the radar screen.	3011
1062	1062-2	Proactive Management section - Marginalizing and restricting the use of fire within areas of environmental concern will only worsen the invasive weed problem already ahead of land managers. We need all tools to help control invasive weeds and not worsen the weed problem by slowing management. Proactive fire management must not move slowly, it must continue at a rapid and consistent pace to improve habitat.	3011
1062	1062-1	Alternatives E&F Not necessary to put 1,857,485 acres or 1,786,241 acres under the restrictions of Areas of Environmental Concern (ACECs). While sage-grouse may be present, it does not mean that they will be negatively impacted or the area degraded if left open to the public. This document and these alternatives seek to manage for one species---the sage-grouse to the detriment of all other resources	3001
1063	1063-6	Record#50 - It is unrealistic to assert that an entire allotment/pasture should be shut off from grazing if the burned area can't be fenced. This is completely unnecessary, extreme, and reflects an absence for consideration of on-the-ground realities. The allotments can be huge; burned areas can be huge; fencing costly and unrealistic.	3011
1063	1063-5	Record#49-(Alternative F) would exclude livestock from grazing on burned areas until woody and herbaceous plants have reached projected goals for sage grouse habitat objectives. In some areas, that could take 60 years for re-establishment of all woody type cover, during which time, livestock could and should be grazing off competitive grasses and forbs, thereby allowing for earlier realization of expected goal	3011
1063	1063-4	Chapter 2, Table 2.3 (Alternatives E & F): Both of these Alternatives would seek to manage for one species (sage grouse) to the detriment of all other resource uses. It is not necessary to put 1,857,485 acres or 1,786,241 acres under the restrictions of Areas of Critical Environmental Concern. This maneuver has been used in the past to create defacto wilderness areas in perpetuity, a power given only to the Congress of the United States. While sage grouse MAY BE present on the proposed lands, livestock, the oil & gas industry, the mining extraction industry, and the public in general can and have demonstrated co-existence is readily accomplished and has been for decades. Where is the justification and science to support the closeout of nine additional areas as proposed by Alternative E?	3001
1063	1063-3	Chapter 2, Table 2.2 (Alternative E), would lock up Desert Land Entry opportunities to the public. Though these entries have been under utilized, not allowing this option would be unjustified. Any entry would be supposedly managed so as to consider the life cycle of sage grouse, IF they were present, before any grants were made.	3016-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1063	1063-2	In particular, Chapter 2, Table 2.2, (Alternative E), would result in the closure of 1,988,927 acres of grazing land. The greatest impact would immediately be reduced oil and gas exploration and development, constraints on mineral exploration and mining operations, as well as huge reductions in livestock grazing. Livestock and sage grouse, as well as other wildlife, have co-existed sustainably on public and private lands for decades. There is no credible scientific data included in the EIS to support or back up this land use proposal, but appears to be only an idea dreamed up by someone very biased.	3001
1064	1064-2	Chapter 2, Table 2.3: Alternatives E & F It is not necessary to put 1,857,485 acres or 1,786,241 acres under the restriction of Areas of Environmental Concerns. While sage-grouse may be present, it does not mean that they will be negatively impacted or the area destroyed if left open to the public. This document and these alternatives seek to be managed for one species - the sage-grouse to the detriment of all other resources.	3001
1065	1065-2	Chapter 2, Table 2.3: Alternatives E & F It is not necessary to put 1,857,485 acres or 1,786,241 acres under the restriction of Areas of Environmental Concerns. While sage-grouse may be present, it does not mean that they will be negatively impacted or the area destroyed if left open to the public. This document and these alternatives seek to be managed for one species - the sage-grouse to the detriment of all other resources.	3001
1068	1068-3	Moreover, when examining the difference between Alternatives D and F there exists a \$5 million net reduction (a calculation the four counties call into question as being significantly undervalued) to the counties' bottom line. Further, all analytical values should aspire to represent current conditions to avoid relying on an inaccurate baseline analysis. To aid in achieving this, we encourage BLM to use present dollar value rather than undertaking its analysis based on 2008 dollars.	3036-2
1068	1068-2	Socioeconomic concerns of the counties in the Planning Area. In examining two proposed alternatives, Alternative D (BLM's preferred alternative) and Alternative E, the contrast and potential implications for the counties in the Planning Area could not be more distinct. BLM projects earnings from resource development in the Planning Area to be \$70.8 million under Alternative D; while under Alternative E BLM projects earnings \$36.9 million. No doubt a reduction in revenue to the tune of \$34 million will affect the four counties' fiscal bottom line, and will bring with it significant impacts to the social and cultural fabric of the Planning Area.	3036-2

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1068	1068-1	Consistency with the Wyoming Sage Grouse Executive Order. We ask that BLM ensure full consistency with the Wyoming Greater Sage-Grouse Core Area Protection Executive Order (EO). The EO has been recognized by the Fish and Wildlife Service as a "sound framework for a policy by which to conserve greater sage-grouse in Wyoming." Further, the EO was developed in partnership with key stakeholders, including BLM, and represents an agreement made by all parties to implement and abide by the core area strategy, including any subsequent EO supplements. Actions that require core area protections outside of core areas, or actions that add additional protective stipulations inside of core areas are inconsistent with the EO and are therefore contrary to the fundamental agreements included in the EO that the stakeholders, again, including BLM, reached.	3035_1
1069	1069-15	There is no way to disconnect the path pursued by the BLM from the economic future of the cities, towns and counties in the Bighorn Basin. The alternatives analyzed in the Supplement, if adopted in whole, will have severe consequences to the economic base of Bighorn, Hot Springs, Park and Washakie Counties and inextricably alter the custom and culture of the Bighorn Basin. Now is the time to pursue an alternative that promotes additional employment and revenue opportunities and celebrates Wyoming's historic fabric. I	3036-2
1069	1069-14	In the Summary of Environmental Consequences by Alternative (p. 2-43), Table 2-6, the BLM projects annual earnings of \$75 million under the no action alternative, Alternative A. For comparison, the BLM projects annual earnings under Alternative C (BLM's resource development alternative) to be \$83.4, Alternative D (BLM's preferred alternative) to be \$70.8 million and under Alternative E to be \$36.9 million. Over the life of the RMP (projected to be 20 years) the overall impact of implementing Alternative E would be a reduction of more than \$678 million, in comparison to the BLM's preferred alternative. In consideration of impacts to quality of life and local culture the BLM considers the selection of Alternative C to have a medium impact, while the selection of Alternative E to have low impact. The BLM does not justify this conclusion. A reduction of more than half of all revenues generated from BLM lands does not constitute a "low impact" to the quality of life and local culture in the Bighorn Basin. The BLM has significantly understated the impact such an action would have. The impact will not just be felt by these sectors. Industries supporting energy, as well as government services, recreation, local businesses and other indirect beneficiaries and local communities will feel the impact. Collectively, energy, tourism, and agriculture in the Bighorn Basin form a balanced economic base that, when supported by federal land management agencies, will grow, expanding into the future. Alternatives E and F disrupt that balanced use in major ways and should be rejected.	3036-2

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1069	1069-13	Hot Springs County estimates that approximately 80 percent of its operating budget is generated from oil and gas revenues and property taxes. The majority of oil and gas production in Hot Springs County is production on BLM lands. In the Bighorn Basin Draft RMP and EIS (p. 3241) the BLM reported that mineral and severance taxes and federal mineral royalties represented 49 percent of total state revenues in fiscal year 2009. The BLM's analysis, as indicated in Table 4-25 (p. 4-142), provides that under Alternative E federal mineral royalties' will be reduced by approximately \$20 million per year in comparison to the BLM's preferred alternative, Alternative D. Further, there would be a reduction of \$9.5 million in state severance taxes and a reduction of \$11 million in local ad valorem production taxes. These are significant figures and are not easily replaced by other revenue streams.	3036-2
1069	1069-11	Record# 9 (p. 2-18) was developed to conform with EO 2011-5. I request that it be modified as follows: Allow only below ground ROWs within designated ROW corridors that cross Greater Sage-Grouse core area. Do not limit the width of below ground ROW corridors as long as new linear facilities are constructed adjacent to existing linear facilities accounting for adequate separation for operating system integrity; safety (construction and operations); appropriate federal, state, and local statutes, regulations, and policies; and land use constraints. If a linear facility is moved away from an adjacent utility to avoid a resource conflict, the new linear facility will still be considered to be within the ROW corridor. Construct new transmission lines between July 1 and March 14 (or between July 1 and November 30 in mapped Greater Sage-Grouse winter concentration areas) and within 0.5 miles on either side of existing 15 kV or larger transmission lines (Map SEIS-23).	3033-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1069	1069-10	Grazing management practices maintain or enhance Wyoming rangelands. Properly managed rangelands are capable of sustaining GSG populations and a diversity of plant species appropriate to suitable GSG habitat. EO 2013-3 is consistent with the 2010 FWS identification of improper grazing practices as a potential threat. The language recently added to EO 2013-3 addresses this issue in a manner acceptable to permittees, land management agencies and conservation interests. I request that the BLM incorporate the following language in the section for Sensitive Species: The BLM will collaborate with appropriate Federal agencies, and the State of Wyoming as contemplated under Governor Executive Order 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where Greater Sage-Grouse conservation objectives are not being achieved on federal land, to determine if a significant causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site-based action to achieve Greater Sage-Grouse conservation objectives within the framework. While this language is not a verbatim recitation of the directive contained in EO 2013-3, it is, however, generally consistent with EO 2013-3 and was developed in consultation with the BLM. As contemplated in the proposed language, the State and BLM Wyoming, along with other appropriate federal agencies, will need to coordinate actions during implementation of the Final RMP in order to achieve maximum consistency with EO 2013-3.	3017-1
1069	1069-9	Under Alternative E, the BLM analyzes the closure of the Greater Sage-Grouse Key Habitat Areas ACEC [Area of Critical Environmental Concern] to livestock grazing, even where rangeland health standards have been achieved. This management prescription would apply to 1,988,927 acres—nearly two-thirds of the 3.2 million acres of the public lands managed by the BLM in the Bighorn Basin. Alternative F, although not as egregious, layers additional and unreasonable management constraints on livestock producers. These management actions are not consistent with the BLM's multiple-use mandate and should be dismissed from further consideration.	3017-3
1069	1069-8	Alternative E of the Supplement analyzes the withdrawal of 1,764,621 acres from locatable mineral development. This action would preclude locatable mineral development in areas of known occurrence, including 141,563 acres of bentonite (41 percent reduction) and 17,867 acres of uranium (97 percent reduction). Such an action will have far-reaching impacts on the bentonite industry, which is important to the Bighorn Basin economy. Uranium production which is increasing throughout Wyoming will be eliminated on federal land. Producers of locatable minerals will face additional constraints (i.e., timing) under the management prescriptions outlined in Alternative F. The mining industry, including bentonite producers, has contributed to our understanding of the Greater Sage-Grouse. The BLM should reject Alternatives E and F.	3020

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1069	1069-7	In Record# 76 (p. 2-30) the BLM considers applying a no surface occupancy (NSO) stipulation on all existing leases with lease acreage within 0.6 miles of occupied or undetermined Greater Sage-Grouse leks as a condition of approval. This is contrary to EO 2011-5, stipulation 9, which states: "Existing rights should be recognized and respected." The BLM should dismiss from further consideration this management action.	3019
1069	1069-6	The BLM introduced Record# 72 (p. 2-29) in the Proposed Lander RMP and Final EIS. If the BLM carries this management action forward I request the following modification: Encourage Require unitization when deemed advantageous necessary for proper development and operation of an area or to facilitate more orderly (e.g., phased and/or clustered) development as a means of minimizing adverse impacts to resources, including greater sage-grouse, so long as the unitization plan adequately protects the rights of all parties including the United States, according to the Federal Lease Form, 3100-11, Sections 4 and 6.	3019
1069	1069-5	It appears that Record# 71 (p. 2-28) was intended to conform to EO 2011-5 stipulations. If the BLM carries Record# 71 forward I request the following modifications: Apply an NSO stipulation within 0.6 mile of occupied or undetermined sagegrouse leks (Map SEIS-15). Lease fluid minerals dependent upon lease location and habitat suitability. Ensure that leasing activities in core and connectivity areas comply with Greater SageGrouse resource management plan actions and remain in compliance with laws, regulations, and policy. Apply a minimum lease size of 640 contiguous acres of federal mineral estate within sage grouse Core Habitat Areas. Lease smaller parcels only when 640 contiguous acres of federal mineral estate is not available and leasing is necessary to remain in compliance with laws, regulations, and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or commtmitization agreement Apply a TLS to restrict disruptive activity within 0.6 mile of occupied or undetermined sage-grouse leks from March 15 to June 30.	3019
1069	1069-4	EO 2011-5, Attachment A, Sage-Grouse Core Breeding Areas Version 3, defines boundaries of Greater Sage-Grouse core areas in the Bighorn Basin. The core area delineation in Attachment A was not analyzed in the Draft RMP and EIS. This analysis was conducted in the Supplement, Alternative F. I request that the BLM adopt the Version 3 core area geographic boundaries in its final plan.	3035_1
1069	1069-2	Unfortunately, Alternatives E and F of the draft Bighorn Basin RMP Supplement, if adopted, will erode the multiple-use balance Wyoming has achieved. Ninety-seven percent (5,483,281 acres) of the Bighorn Basin planning area is Greater Sage-Grouse occupied habitat. I request that the BLM reject Alternatives E and F. These Alternatives are unreasonable and are inconsistent with EO 2011-5 and 2013-3. The Federal Land Policy and Management Act (FLPMA) provides that land use plans of the BLM "shall be consistent with State and local plans to the maximum extent possible he [Secretary of the Interior] finds consistent with federal law and the purpose of this Act." (43 U.S.C. § 1712 (c)(9)) If the BLM is unable to achieve consistency with EO 2011-5 and 2013-3, I request the BLM to explain how achieving consistency would have resulted in a violation of federal law.	3027-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1069	1069-1	I request that the BLM provide its analysis of NTT management actions and other conservation measures as set forth in the BLM's Proposed Lander RMP and Final EIS and noted above in the BLM's Proposed Bighorn Basin RMP and Final EIS. Further, the BLM should provide consideration of other wildlife protections or protections of other resources analyzed which would provide secondary benefit to Greater Sage-Grouse.	3035_1
1070	1070-7	In Alternative E and F, folks will need special permits to recreate, in the proposed Greater Sage-Grouse Key Habitat Areas ACEC - would those permits apply to hunting and trapping? For example could you restrict wolf or cougar hunting in Key Habitat Areas ACEC?	3030
1071	1071-5	In Alternative E and F, folks will need special permits to recreate, in the proposed Greater Sage-Grouse Key Habitat Areas ACEC - would those permits apply to hunting and trapping - for example could you restrict wolf or cougar hunting in Key Habitat Areas ACEC?	3030
1073	1073-15	The purposes of the BLM's Resource Management Plans are "to ensure the best balance of uses and resource protections for America's public lands". Wind farms provide clean, renewable energy for the nation and generate lease revenue on public lands. Power lines provide needed electricity to residential, agricultural and industrial customers. Pacificorp urges the BLM to recognize the values of wind energy to the American public in conjunction with available and effective management of potential impact to the landscape. Wind energy does not necessarily constitute an industrial setting to citizens enjoying public land. Observing a wind turbine can create a profound reminder of the strength of natural forces in on lookers, and it should not be assumed that siting wind turbines will create an industrial setting for everyone who sees them. The value of wind development for the public good should be evaluated in comparison to the value of visual areas for the public good. Pacificorp encourages BLM not to automatically override one resource over another.	3032
1073	1073-14	Wind energy projects typically have surface disturbance of less than 3% of the project area, leaving most of the land and vegetation within a project undisturbed. Road and turbine site locations can be designed to minimize surface impacts near water resources, and erosion mitigation techniques can be effectively utilized to reduce erosion during construction. If forest cover needs to be removed for development of a wind project, turbine site, and associated infrastructure layout can be designed to minimize disturbed areas. Areas used only during construction, such as equipment laydown areas, could be restored and allowed to grow to forest after construction was complete. Assuming that all habitats within a wind facility project boundary would be impacted for the life of the project is incorrect. Additionally, wind farm construction can be scheduled to limit disturbance to big game, sage-grouse and other pertinent wildlife habitat, particularly during crucial winter months, or breeding seasons.	3032
1073	1073-13	Co-location of transmission lines in existing or designated corridors can be applied in some circumstances, but may not always be feasible due to conflicts with other mandated reliability and redundancy requirements. Pacificorp recommends that co-location be considered a possible BMP, but not a requirement.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1073	1073-11	Pacificorp supports the statement in BLM's Alternative F, that allows motor vehicle access to existing roads, however discourages the prohibition of new road construction within 1.9 miles of Greater Sage-Grouse Core Habitat Areas as it may have a negative impact on Pacificorp customers by limiting access for outage response and maintenance activities.	3039-1
1073	1073-10	In order to provide reliable service to customers, and maintain access to power lines, Pacificorp requests the BLM to provide exceptions to Alternative E that currently prohibit new road construction within four miles of an active lek site, and currently restrict motorized use from February 1 through July 31. Additionally, Alternative E would prevent upgrading existing routes and would change route categories. Pacificorp requests the use of existing roads and the authority to make maintenance improvements to access roads associated with our facilities and ROWs. Access to respond to outages and emergencies is necessary in order for Pacificorp and other electric utilities to meet federal mandates for reliability.	3039-1
1073	1073-9	Consequently, utilities often seek conservation partnerships that serve a specific conservation need, provide a benefit to the species and/or habitats considered, provide a cost-effective benefit to ratepayers, and are reasonably commensurate with the level of impact. Pacificorp encourages the BLM to develop incentives for industry that meet these conservation and customer goals. Numerous state sage-grouse plans have either included or are developing incentive programs for industry and private landowners, as these are critical to the overall conservation of sage-grouse and their habitat. Pacificorp encourages the BLM to consider mitigation banks and offsite mitigation as mechanisms to pool habitat conservation resources and target conservation efforts in highest priority areas. Likewise, Pacificorp encourages the BLM to adopt measures consistent with the Wyoming state's efforts regarding mitigation efforts and incentives for early mitigation. Because habitat is the primary factor influencing sage-grouse populations, habitat conservation and enhancement efforts should be a primary focus of minimization and mitigation efforts. For unknown impacts of power lines, Pacificorp recommends that the BLM provide opportunities and incentives to conduct additional research using the research protocols developed by Utah Wildlife in Need (UWIN) in 2012 and endorsed by the Western Association of Fish and Wildlife Agencies (WAFWA). As indicated by WAFWA, such research should be acceptable as a component of a mitigation package for unknown project impacts. In addition, Pacificorp encourages the BLM to continue to work with APLIC to identify potential sage-grouse conservation partnership opportunities with the electric utility industry.	3027-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1073	1073-8	APLIC has been working with a group of member utilities and state/federal agency representatives including the BLM to develop Best Management Practices for electric utilities in sage-grouse areas. The APLIC model of collaborative, voluntary efforts -such as the Avian Protection Plan Guidelines, short courses, and guidance documents developed in partnership with the FWS -is serving as a framework for the sage-grouse BMPs. These BMPs are intended to be a living document that is updated and refined as new research is available. Consequently, these BMPs would be easier to update (compared to a RMP) to reflect new science and technology. PacifiCorp and its peers in APLIC are interested in working with the BLM, FWS, and other agencies to develop measures that are practical, effective, science-based, and justifiable to customers and public service commissions. PacifiCorp applauds the BLM for its continued involvement in this BMP effort and encourages the BLM to recognize these BMPs in the Big Horn Basin RMP as an adaptive tool to address sage-grouse/power line issues	3033-1
1073	1073-7	PacifiCorp has agreements in place with FWS regarding our Avian Protection Plans (APP) and efforts to prevent electrocutions of raptors and other protected migratory birds. The use of perch discouragers is precluded in our APPs and agreements with FWS due to associated electrocution concerns. Therefore, PacifiCorp recommends that the BLM remove stipulations that require or recommend perch discourager use in the RMP revision. PacifiCorp also recommends that the BLM seek additional information from APLIC and FWS regarding these concerns; PacifiCorp environmental staff are also available to discuss these concerns with BLM staff and provided associated documentation. Rather than call for the use of perch discouragers, PacifiCorp recommends that the BLM reference the BMPs (see below) currently being developed for power lines in sage-grouse habitat. Likewise, current APLIC guidance should be applied to minimize avian electrocution and collision risks.	3033-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1073	1073-6	Perch discouragers were originally designed to reduce raptor electrocutions by moving birds from an unsafe (electrocution risk) perching location to a safer alternative, either on the same structure or an alternate structure located nearby. Recent data has documented poor effectiveness in perch discouragers and greater effectiveness of covers for preventing electrocutions (see Suggested Practices for Avian Protection on Power Lines: The State of the Art in 2006 (APLIC 2006), pages 17-18). Despite their declining use by electric utilities, perch discouragers have been installed in attempts to dissuade raptors and corvids from perching or nesting on power poles in areas with sage-grouse or other sensitive prey species. Perch discourager research has shown limited effectiveness in preventing perching, potential for increased nesting on discouragers, and increased electrocution risk associated with perch discouragers. In areas where raven predation on sage-grouse nests is a concern, perch discouragers may aid in the accumulation of nest material (APLIC 2006), and could potentially increase raven predation pressure due to nest construction on discouragers in sensitive areas. The negative impacts of perch discouragers must be weighed against the limited benefits they may provide, particularly if they are contributing to mortalities of protected birds and facilitating increases in predator nesting populations. The avian predators of sage-grouse should also be considered, as different species “exhibit different hunting strategies, and employ different hunting techniques for different prey species. For example, golden eagle diet is largely mammalian (80-90%, Kochert et al. 2002). Golden eagles prey on sage-grouse opportunistically, and typically hunt sage-grouse by stooping from a high soar (Watson 1997, Kochert et al. 2002). Consequently, power poles may not play an important role in eagle predation of sage-grouse. Golden eagles are vulnerable to electrocution mortality (APLIC 2006) and perch discouragers have been correlated with increased eagle electrocution risk (PacifiCorp, in prep.). Common ravens are known predators of sage-grouse nests, yet ravens are able to overcome perch discouragers and may experience higher nesting rates on poles with perch discouragers. Because of these concerns, Pacificorp requests that the BLM consider other more effective alternatives to sage-grouse conservation, such as habitat conservation or enhancement efforts, that are compatible with conservation measures for other protected species (e.g. electrocution prevention measures for raptors and other migratory birds).	3033-1

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1073	1073-5	Installing new power lines underground or converting existing lines from overhead to underground are often raised as possible permit stipulations or mitigation options. However, underground power lines result in increased cost, reduced reliability, greater ground disturbance during construction and repairs, and longer outage periods for customers, and may not always be feasible from an engineering and operations perspective. Underground power lines require a continuous excavation through all habitat types. In sagebrush habitat, this would result in ground disturbance for the entire line route. This is in contrast to overhead lines, which result in a disturbance only at the structure locations. Underground lines would also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporally over the life of the line, not just during initial construction. Ground disturbance during construction, repairs, and maintenance can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. A University of California study (Bumby et al. 2009) found that underground power lines have more environmental impacts than overhead power lines for all categories and most scenarios in southern California. For more detailed discussion of environmental and engineering constraints associated with underground power lines, see Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC 2012), pages 62-63. PacifiCorp encourages the BLM to allow overhead power lines an acceptable alternative in the Wind River/Big Horn Basin District and requests that requirement for placement of lines underground be removed.	3033-2
1073	1073-4	PacifiCorp has been actively engaged with the U.S. Fish and Wildlife Service, BLM, and state agencies on sage-grouse conservation efforts related to projects, planning documents, and utility Best Management Practices (BMPs). This has resulted in consideration of sage-grouse habitat in line siting, efforts to schedule activities to minimize disturbance impacts to sage-grouse, and other conservation measures. PacifiCorp is also working with other APLIC-member utilities and resource agencies (including the BLM, FWS, and state agencies) in the development of Best Management Practices for electric utilities in sage-grouse areas (see discussion below). PacifiCorp encourages the BLM to reference these BMPs in the Big Horn Basin RMP.	3035-7
1073	1073-3	PacifiCorp encourages the BLM to ensure that sage-grouse stipulations included in the Big Horn Basin RMP are consistent with the Wyoming Governor's Executive Order for Sage-grouse.	3035_1
1073	1073-2	PacifiCorp requests that the BLM consider these studies, which use current telemetry techniques and specifically investigate sage-grouse responses to power lines, when addressing power lines in its RMP update.	3033-1

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1074	1074-14	We urge the agency to focus further analysis on an improved Alternative E and the designation of Areas of Critical Environmental Concern for Greater Sage-Grouse and to make these the basis for the final Big Horn Basin RMP. The draft EIS analyzed conservation measures that can be included in the final plan to ensure sustainable management and provide an adequate regulatory mechanism to ensure conservation of the grouse. These include requiring a three percent disturbance standard and designating protected areas.	3035_4
1074	1074-12	e. The Wyoming Core Area Strategies are unlikely to conserve sage-grouse. The new Sage-Grouse Conservation Objectives Draft Report (COT), an accompaniment to the NTT report prepared by a team of federal and state sage-grouse scientists, recommends conserving all sage-grouse populations and avoiding anthropogenic disturbances in key sage-grouse habitat (COT 2012, draft: 29, 33, 35). The COT report indicates that Wyoming's sage-grouse populations must be maintained or restored to help support the species's long-term persistence (COT 2012, draft: 35). The Wyoming Core Area strategies will fail to achieve these goals. New research (Copeland et al, submitted) projects continued sage-grouse population declines at 14-29 percent in Wyoming. The same study estimates that, even when bolstered by \$250 million in targeted conservation easements on private property (a very unlikely assumption), the Core Area policies would only cut anticipated sage-grouse population declines by half in Wyoming, and by two-thirds within high abundance areas.	3035_2
1074	1074-11	d. The Wyoming BLM Core Area strategy's 11-square-mile fluid mineral leasing loophole leaves much core sage-grouse habitat unprotected. The Wyoming BLM Core Area strategy proscribes future leasing of fluid minerals in Core Areas, but only in areas of 11 contiguous square miles of unleased, BLM-managed minerals (BLM IM WY-2012-019). Unfortunately, many sage-grouse Core Areas were already encumbered with prior existing oil and gas leases at the time of their establishment, and the BLM is in many cases citing the existence of these prior existing leases (the majority of which are undeveloped paper assets that have yet to have any effect on sage-grouse habitat on the ground) as a justification for allowing new leasing inside Core Areas. As of July 10, 2012, twelve of the 31 Core Areas in Wyoming were at least 20 percent leased according to WGFD data, ranging up to 66 percent leased. These 12 Core Areas represent almost 4.5 million acres of sage-grouse habitat. Compounding this problem, all but three of the 31 Core Areas have at least 20 percent non-federal mineral ownership, meaning that a large proportion of Core Area is exempt from protection from future leasing. The NTT report takes a much stricter approach to future mineral leasing. It recommends two alternatives: closing all priority habitat (Core Areas) to future leasing, or closing all priority habitat to future leasing unless it could be shown that proposed development would result in a net gain in sage-grouse populations for that Core Area.	3023-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1074	1074-10	c. Sage-grouse lek buffers in the Wyoming Core Area strategies are too small. Protecting sage-grouse leks and associated nesting and brooding habitat are fundamental to conserving the species. The best available science has recorded significant negative impacts from producing oil and gas wells drilled within 1.9 miles from active leks (Holloran 2005), [footnote:1 Calculations derived from data presented in the Lost Creek In Situ Recovery Project Final EIS at ES-2, 4.9-8, 4.9-27, and Appendix D.] measureable impacts from coalbed methane fields extend out to 4 miles (Walker 2008), and new research has recorded effects as far away as 12.4 miles from leks (Taylor et al. 2012). WGFD, using lek buffers of 0.25 mile, 0.5 mile, 0.6 mile, 1.0 mile, and 2.0 mile, estimated lek persistence of 4, 5, 6, 10, and 28 percent, respectively (Christiansen and Bohne 2008, memorandum). Unfortunately, both the State and Wyoming BLM Core Area strategies only require protective buffers of 0.6 miles around leks in designated core habitat. By comparison, the NTT report generally recommends a 4-mile lek buffer for siting industrial development in sage-grouse habitat (SGNTT 2011), a prescription in greater accord with the science.	3035_9
1074	1074-9	b. The Wyoming Core Area strategies allow too much development density in core sage-grouse habitat. Scientific research has determined that one energy site per square mile is the density threshold at which significant impacts to sage-grouse populations begin to occur. In accordance with these findings, the Wyoming Core Area strategies set a limit of one energy development site per square mile in core habitat. The same DDCT area used to determine a project's disturbance limit is also used to calculate the density of sites (e.g., number of well sites) that may be developed per square mile. But the DDCT only calculates site density per square mile, rather than capping density at one site per square-mile of land. In cases where the DDCT area is very large, the Core Area strategies may allow more than one well or mine site to be developed in a given square mile as long as the surrounding Core Area lands are relatively free from other development disturbance.	3035_4

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1074	1074-8	The five percent disturbance threshold is not known to conserve sage-grouse long-term and is only a best guess by agencies and others seeking to accommodate development in sage-grouse habitat. Past projects approved prior to implementation of the Wyoming Core Area strategies indicate that sage-grouse are adversely affected at lower levels of disturbance. For example, for the Continental Divide/Wamsutter II Natural Gas Project approved in 2000, 3,000 wells were proposed with 22,400 acres of new surface disturbance, representing 2.1 percent of the planning area (with an average well density of 4 well sites per square mile) (BLM 2000); today, sage-grouse are virtually extirpated in this area, although more than 50 leks existed prior to the project. In contrast to the Wyoming Core Area strategies, the NTT report recommends managing priority sage-grouse habitat so that discrete anthropogenic disturbances cover less than three percent of any single square-mile section regardless of ownership (SGNTT 2011 at 7). Furthermore, once the three percent limit is reached, additional surface-disturbing projects are precluded, and in cases where the three percent limit is already exceeded, restoration must occur to meet this threshold under the NTT recommendations.	3035_4
1074	1074-7	The Wyoming Core Area Strategy Needs Strengthening A study by Copeland et al. (2013) assessing the Wyoming "core area" conservation strategy, which Bureau of Land Management (BLM) plans including the Buffalo draft RMP have generally adopted as the preferred alternative, predicted that recommended conservation measures will reduce the rate of sage-grouse's decline, but will not stabilize grouse numbers or provide for the species's recovery. This indicates that the preferred alternative must be modified. Another study by Knick et al. (2013) concluded that sage-grouse appear to need greater protection, a three percent disturbance standard, rather than the five percent standard provided by the Wyoming core area strategy. The State and Wyoming BLM have failed to incorporate new scientific information in their strategies to enhance sage-grouse conservation "even, in the case of Wyoming BLM, that produced by their own agency. In 2011, the BLM convened a Sage-Grouse National Technical Team (NTT) to review scientific and management information on sage-grouse and sagebrush steppe and produce" A Report on National Greater Sage-grouse Conservation Measures" (SGNTT 2011). The report recommended new management prescriptions that are more conservative than the Wyoming Core Area strategies. The NTT report is a scientific benchmark against which the Wyoming Core Area strategies can be measured.	3035_2
1074	1074-6	Proposed measures for livestock grazing management under Alternatives F represent a strong step in the right direction, and they need to be further strengthened. There are a number of allotments in the Bighorn Basin that are not meeting Healthy Rangeland standards, and these sites of overgrazing are having a negative impact on sage grouse populations and their habitats.	3017-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1074	1074-5	Protection measures remain a bit weak for oil and gas development in priority sage grouse habitats, particularly the 0.6-mile NSO buffer to be applied as a Condition of Approval. The one wellpad per square mile and 3% overall disturbance percentage are the appropriate thresholds for sage grouse habitat management, but they need to be applied on a per-square-mile basis and not using a DDCT calculation, which allows for inflation of disturbance density inside the project area.	3023-3
1074	1074-4	We recommend the adoption of the following measures which are proposed for adoption in the Preferred Alternative of other BLM plan revisions or sage grouse amendments (note: comment lists 31 measures, see letter #1074):	3035_8
1074	1074-3	We are concerned that the cumulative impacts section of the draft was incomplete and did not include information from the USGS baseline study. Our review the USGS study finds extensive and overlapping direct and indirect impacts on nearly every acre of priority sage grouse habitat. It is important to analyze these overlapping threats and develop solutions, such as the creation of protected areas that will alleviate these threats and provide an adequate mechanism to conserve the species.	3008
1074	1074-2	In the Douglas Core Area, the State of Wyoming has proposed to subdivide Core Area boundaries into subunits (most of which do not get full Core Area protections) and grant exceptions for development density criteria, timing limitations, and other Core Area protections contained in EO 2011-5 or IM 2012-019 to facilitate oil drilling and production by Chesapeake and other companies. There is no sound scientific basis for these exceptions; proposed compensatory funds cannot reliably purchase the increase of sage grouse populations elsewhere in the Core Area (or indeed anywhere), and the loss of sage grouse populations in this Core Area is not readily remediated. The Bighorn Basin RMP should cure these problems for BLM-managed lands and projects on BLM-managed minerals by establishing Priority and General Habitat boundaries as inviolate and permanent designations (at least throughout the life of the Plan) and by precluding exceptions or waivers of sage grouse measures within these respective habitats. BLM must ensure that all Core Area/Priority Habitat/ACEC protections are nondiscretionary standards, so the agency can rely on them as conservation measures that are adequate and reliable in the context of Endangered Species decisionmaking by the U.S. Fish and Wildlife Service.	3023-3

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1074	1074-1	We strongly urge the BLM that Priority Habitats should be withdrawn from future oil and gas leasing, allowing existing leases to lapse as they expire, as in Alternative E. SDEIS at 2-29. From the standpoint of scientific supportability, the Alternative E measures on development density (3% cap, and per square mile section rather than using a DDCT) are scientifically sound, while other Alternatives are inconsistent with scientific findings. Similarly, the one pad per 640-acre section in Alternative E is the proper limit; the 1 pad per 640 acres averaged across a DDCT area does not comport with any of the scientific analyses, each one of which specified that disturbance density calculations were made on a per-section basis and none of which used a DDCT. The NSO/CSU Condition of Approval of 0.25 to 0.6 miles from a lek in the various alternatives will likely result in major impacts to active leks within the Core Areas themselves, as this proximity results in significant impacts to breeding grouse on the lek and will result in development occurring in the midst of the most prime nesting habitats that surround the affected lek.	3023-3
1075	1075-10	Co-location of transmission lines in existing or designated corridors can be applied in some circumstances, but may not always be feasible due to conflicts with other mandated reliability and redundancy requirements. APLIC recommends that co-location be considered a possible BMP, but not a requirement.	3033-2
1075	1075-9	APLIC encourages the BLM to follow Alternative F, which allows motor vehicle access to existing roads, however the prohibition of new road construction within 1.9 miles of Greater Sage-Grouse Core Habitat Areas may have a negative impact for electric utility customers due to limiting access for outage responses and maintenance activities. Rather, BMPs should be applied on a case-by case basis to minimize potential impacts to sage-grouse and their habitat.	3039-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1075	1075-7	If mitigating for environmental impacts associated with new construction, utilities often seek conservation partnerships that serve a specific conservation need, provide a benefit to the species and/or habitats considered, provide a cost-effective benefit to ratepayers, and are reasonably commensurate with the level of impact. APLIC encourages the BLM to develop incentives for industry that meet these conservation and customer goals. Numerous state sage-grouse plans have either included or are developing incentive programs for industry and private landowners, as these are critical to the overall conservation of sage-grouse and their habitat. Because habitat is the primary factor influencing sage-grouse populations, habitat conservation and enhancement efforts should be a primary focus of minimization and mitigation efforts. APLIC encourages the BLM to consider mitigation banks and offsite mitigation as mechanisms to pool habitat conservation resources and target conservation efforts in highest priority areas. In the development of such mitigation banks, the potential for future power line corridors should be considered. For unknown impacts of power lines, APLIC recommends that the BLM provide opportunities and incentives to conduct additional studies using the research protocols developed by Utah Wildlife in Need in 2012 and endorsed by the Western Association of Fish and Wildlife Agencies (WAFWA). As indicated by WAFWA, such research should be acceptable as a component of a mitigation package for unknown project impacts. In addition, APLIC encourages the BLM to jointly identify potential sage-grouse incentives and partnerships with the electric utility industry.	3027-3

1075	1075-6	<p>Perch discouragers were originally designed to reduce raptor electrocutions by moving birds from an unsafe (electrocution risk) perching location to a safer alternative, either on the same structure or a nearby structure. Recent data has documented poor effectiveness of perch discouragers and greater effectiveness of covers for preventing electrocutions (see Suggested Practices for Avian Protection on Power Lines: The State of the Art in 2006 [APLIC 2006], pages 17-18). Despite their declining use by electric utilities, perch discouragers have been required by resource agencies and installed to dissuade raptors and corvids from perching or nesting on power poles in areas with sage-grouse or other special status species. Perch discourager research has shown limited effectiveness in preventing perching. Discouragers can actually increase the potential for nesting on structures because they provide a firm foundation for nest material. Furthermore, use of discouragers to avoid perching on a structure increases electrocution risk by forcing birds to perch in unsafe areas. Perch discouragers may aid in the accumulation of nest material (APLIC 2006), and could potentially increase raven predation pressure due to nest construction on discouragers in areas where raven predation on sage-grouse nests is a concern. The negative impacts of perch discouragers must be weighed against the limited benefits, if any, they may provide, particularly if they contribute to mortalities of protected birds and facilitate increases in predator nesting opportunities. Hunting techniques and strategies of avian predators of sage-grouse should also be considered, because they differ for different prey species. For example, golden eagle diet is largely mammalian (80-90%, Kochert et al. 2002). Golden eagles prey on sage-grouse opportunistically, and typically hunt sage-grouse by stooping from a high soar (Watson 1997, Kochert et al. 2002). Consequently, power poles may not play an important role in eagle predation of sage-grouse. Golden eagles are vulnerable to electrocution mortality (APLIC 2006) and perch discouragers have been correlated with increased eagle electrocution risk (PacifiCorp, in prep.). Common ravens are known predators of sage-grouse nests, yet ravens are able to overcome perch discouragers, will perch on wires, and may experience higher nesting rates on poles with perch discouragers. Because of these concerns, APLIC requests that the BLM consider other more effective alternatives to sage-grouse conservation, such as habitat conservation or enhancement efforts, that are compatible with conservation measures for other protected species (e.g. electrocution prevention measures for raptors and other migratory birds). APLIC supports BLM's integration of the Suggested Practices for Avian Protection on Power Lines: The State of the Art 2006 (APLIC 2006) manual to reduce avian electrocutions and mortality.</p>	3033-1

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1075	1075-5	Installing new power lines underground or converting existing lines from overhead to underground are often raised as possible permit stipulations or mitigation options. However, underground power lines result in significant cost increases, reduced reliability, greater ground disturbance during construction and repairs, longer outage periods for customers, and may not always be feasible from an engineering and operations perspective. Underground power lines can result in impacts to other federally listed species, pose a threat of negative impacts on cultural resources, and may have a negative impact to waterways. Underground power lines require a continuous excavation, including blasting in rocky terrain, through all habitat types. In sagebrush habitat, this would result in ground disturbance for the entire line route and associated access roads. This is in contrast to overhead lines, which result in a disturbance only at the structure locations, and the power line's associated access. Underground lines would also require excavation for repairs or maintenance, which would result in ground disturbance occurring temporarily over the life of the line, not just during initial construction. Ground disturbance during construction, repairs, and maintenance can result in large, permanent displacement of excavated soil and subsequent issues with re-establishing native vegetation and preventing the overgrowth of invasive species. A University of California study (Bumby et al 2009) found that underground power lines have more environmental impacts than overhead power lines for all categories and most scenarios in southern California. For more detailed discussion of environmental and engineering constraints associated with underground power lines, see Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC 2012), pages 62-63. APLIC supports BLM alternatives that allow overhead power lines to minimize habitat impacts versus installing underground power lines.	3033-2
1075	1075-4	APLIC submits that stipulations for sage-grouse included in the Big Horn Basin RMP revision should not include any mitigation requirement unless it is based on valid science, not anecdotal or casual observation, and is specific to sage-grouse. APLIC encourages the BLM to apply the APLIC/agency sage-grouse BMPs, much like the BLM has for APPs, to serve as the current best practices for sage-grouse issues related to electric utility facilities.	3033-1
1075	1075-3	APLIC requests that the BLM consider these studies, which use current telemetry techniques and specifically investigate sage-grouse responses to power lines, when addressing power lines in its RMP updates.	3033-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1075	1075-2	APLIC has been working with a group of member utilities and state/federal agency representatives including the BLM, to develop BMPs for electric utilities in sage-grouse areas. The APLIC model of collaborative, voluntary efforts -such as the Avian Protection Plan Guidelines, short courses, and guidance documents developed in partnership with the FWS -is serving as a framework for the sagegrouse BMPs. These BMPs are intended to be a living document that is updated and refined as new research becomes available. APLIC is interested in working with federal and state agencies to develop measures that are practical, effective, science-based, and justifiable to customers and public service commissions. APLIC encourages BLM to recognize this continued positive partnership in its RMP revision.	3035-7
1075	1075-1	Likewise, APLIC encourages the BLM to ensure that Greater sage-grouse stipulations included in the Big Horn Basin RMP are consistent with the Wyoming Governor's Executive Order for Sage-grouse.	3035_1
1076	1076-2	2) We have concerns of the suggestion that exploration drilling for bentonite, in either core or non-core areas, be elevated from a notice level to a plan of operations level. Bentonite drilling is fairly low impact, and we feel that the activity can easily be managed within the notice-level structure.	3020
1076	1076-1	1) Of the two new supplement options, we support Alternative F as it more closely mirrors the boundaries set forth by the Governor's Executive Order core areas. Conversely, Alternative E is neither a viable or realistic option for our industry. Should the final alternative become a blend of all six options, we would ask that the size of the core area does not exceed the recommendations of the Executive Order.	3035_1
1079	1079-2	Designation of additional areas of critical environmental concern would, however, have negative socioeconomic impacts. The Committee has received testimony from both local government cooperating agencies and state officials to that effect. We support those entities formal comments to the BLM regarding those effects and ask that the BLM consider those impacts and impacts on the local culture in adopting a resource management plan.	3036-2
1079	1079-1	We ask that the BLM work with Governor Mead and state agencies to ensure the Big Horn RMP is fully consistent with the original Executive Order and those modifications made by Executive Orders 2011-5 and 2013-3, Greater Sage-Grouse Area Protection. The Committee further believes the executive orders encompass all of the lands in Wyoming which require additional land use restrictions to ensure a thriving and sustainable greater sage-grouse population in Wyoming. For these reasons, we urge that the BLM reject both alternative E and F. The designation of additional areas as areas of critical environmental concern, whether based upon BLM's "key habitat" labeling or Wyoming's "core area" strategy simply is not necessary given the State's actions in this area.	3035_1

Bighorn Basin Resource Management Plan Revision Project

Appendix B

Laws, Regulations, Policies, and Guidance

APPENDIX B

LAWS, REGULATIONS, POLICIES, AND GUIDANCE

Appendix B lists the various laws, regulations, policies, and directives applicable to management of Bureau of Land Management-administered lands within the Planning Area, including the following:

- Table B-1: Federal Laws and Statutes;
- Table B-2: Bureau of Land Management Regulations and Policies;
- Table B-3: Applicable Wyoming State Laws and Regulations; and
- Table B-4: Memoranda and Agreements.

Table B-1. Federal Laws and Statutes

Federal Law or Statute	Year
Acquired Lands Act – Act of August 7, 1947; 61 Stat. 913	1947
Act of April 23, 1932; 47 Stat. 136	1932
Act of August 13, 1954 (68 Stat. 708, 30 U.S.C. 521 subpart)	1954
Act of July 23, 1955 (Pub. L. 167; 43 CFR 3710)	1955
Act of June 30, 1950 (16 U.S.C. 508(C) and (e))	1950
Act of October 30, 1978 (92 Stat. 2073-2075)	1978
Act of September 1, 1949, Section 3 (30 U.S.C. 192c)	1949
Act of September 28, 1962 (Pub. L. 87-713, 76 Stat. 652)	1962
American Indian Religious Freedom Act (42 U.S.C. 1996)	1978
Antiquities Act (P.L. 59-209; 34 Stat. 225; 16 U.S.C. 431-433)	1906
Archaeological Resources Protection Act (P.L. 96-95; 93 Stat. 721; 16 U.S.C. 470aa et seq.) as amended (P.L. 100-555; P.L. 100-588)	1979
Archeological and Historic Preservation Act (16 U.S.C. 469-469c-1, P.L. 86-523, 74 Stat. 220, 88 Stat. 174)	1974
Archeological and Paleontological Salvage for Federal Highway Projects (23 U.S.C. 305; 72 Stat. 913 (1958), 74 Stat. 525 (1960))	1960
Bald Eagle Protection Act (16 U.S.C. 668-668d, 54 Stat. 250)	1940
Carey Act of August 18, 1894 as amended (43 U.S.C. 641 et seq.)	1894
Carlson-Foley Act of 1968 (42 U.S.C. 1241-1243)	1968
Classification and Multiple Use Act of September 19, 1964 (78 Stat. 986, 43 U.S.C. 1411–18)	1964
Clean Air Act, as amended	1963
Coastal Zone Management Act (P.L. 92-583, 16 U.S.C. 1451-1456)	1972
Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (42 U.S.C. 9601)	1980
Department of the Interior Secretarial Order 3226, Climate Change and the Department of the Interior	2001
Department of the Interior Secretarial Order 3336, Rangeland Fire Prevention, Management and Restoration	2015
Desert Land Act (19 Stat. 377; 43 U.S.C. 321-323), as amended	1877
Domestic Minerals Program Extension Act	1953
Earl Douglass, 44 L.D. 325, August 6, 1915	1915
Economy Act 1932, as amended, (P.L. 72-211; 47 Stat. 417; 31 U.S.C. 686)	1932
Emergency Planning and Community Right-to-Know Act (42 U.S.C. 11001-11050)	1986
Emergency Wetland Resources Act	1986
Endangered Species Act (16 U.S.C. 1531-1544, 87 Stat. 884), as amended	1973

Table B-1. Federal Laws and Statutes (Continued)

Federal Law or Statute	Year
Energy Independence and Security Act	2007
Energy Policy Act (P.L. 109–58)	2005
Executive Order – Public Water Reserve 107	1926
Executive Order 10355 – Delegating to the Secretary of the Interior the Authority of the President to withdraw or reserve lands of the United States for public purposes	1952
Executive Order 11514 – Protection and Enhancement of Environmental Quality	1970
Executive Order 11593 – Protection and Enhancement of the Cultural Environment	1971
Executive Order 11644 – Use of Off-Road Vehicles on the Public Lands	1972
Executive Order 11738 – Administration of the Clean Air Act and the Federal Water Pollution Control Act	1973
Executive Order 11987 – Exotic Organisms	1977
Executive Order 11988 – Floodplain Management	1977
Executive Order 11989 – Off-road Vehicles on Public Lands	1977
Executive Order 11990 – Protection of Wetlands	1977
Executive Order 11991 – Relating to protection and Enhancement of Environmental Quality	1977
Executive Order 12088 – Federal Compliance with Applicable Pollution Control	1978
Executive Order 12580 – Superfund Implementation and 13016 – Amendment to Executive Orders 12580	1987 and 1996
Executive Order 13007 – Indian Sacred Sites	1996
Executive Order 13084 – Consultation and Coordination with Indian Tribal Governments	1998
Executive Order 13112 – Invasive Species	1999
Executive Order 13148 – Greening of the Government through Leadership in Environmental Management	2000
Executive Order 13175 – Consultation and Coordination with Indian Tribal Governments	2000
Executive Order 13816 – Responsibilities of Federal Agencies to Protect Migratory Birds	2001
Executive Order 13195 – Trails for America in the 21st Century	2001
Executive Order 13212 – Actions to Expedite Energy-Related Projects	2003
Executive Order 13287 – Preserve America	2003
Executive Order 6910 and Executive Order 6964, and amendments	1934
Federal Aid Highway Act (23 U.S.C. 107(d) and 317)	1958
Federal Cave Resources Preservation Act (16 U.S.C. 4301 – 4309)	1988
Federal Coal Leasing Amendments Act (90 Stat. 1083-1092), as amended	1976
Federal Coal Management Program Coal Screening Process (43 Code of Federal Regulations [CFR] 3420.1-4)	1997
Federal Facilities Compliance Act of 1992	1992
Federal Land Policy and Management Act	1976
Federal Lands Recreation Enhancement Act	2004
Federal Noxious Weed Act of 1974 (section 15), as amended (7 U.S.C. 2801 et seq.); the first section and section 15 of that Act (7 U.S.C. 2801 note and 7 U.S.C. 2814)	1974

Table B-4. Memoranda and Agreements

Memoranda and Agreements	Description	Year
Assistance agreement KAA990028-Abandoned Mine Land (AML) Reclamation Agreement	The AML program in Wyoming currently operates pursuant to this assistance agreement between the Wyoming State Office of the BLM and the Wyoming DEQ. It provides for the cooperative effort between the two agencies for a long-term relationship to efficiently and economically plan for, and share responsibilities to ensure, effective abandoned mine land reclamation on public lands in Wyoming.	
Association of Fish and Wildlife Agencies (AFWA), United States Forest Service (USFS), Bureau of Land Management (BLM), United States Fish and Wildlife Service (FWS)	Policies and guidelines for fish and wildlife management in National Forest and BLM Wilderness.	2006
BLM Memorandum of Understanding WO300-2006-07, April 2006	Facilitate interagency coordination and establish policies and procedures to implement Section 225 of the Energy Policy Act of 2005.	2006
BLM Memorandum of Understanding WO-230-2010-04	Between the U.S. Department of the Interior Bureau of Land Management and the U.S. Fish and Wildlife Service to Promote the Conservation of Migratory Birds.	2010
Memorandum of Understanding among federal land managers and U.S. EPA on oil and gas development and NEPA	Memorandum of Understanding Among the U.S. Department of Agriculture, U.S. Department of the Interior, and U.S. Environmental Protection Agency, Regarding Air Quality Analyses and Mitigation for Federal Oil and Gas Decisions Through the National Environmental Policy Act Process.	2011
Clean and Diversified Energy Initiative	Recommends initiatives to facilitate the timely leasing and permitting of geothermal resources.	2005
Cooperative Agreements with Weed and Pest Districts: Bighorn County, Hot Springs County, Park County, Washakie County	Details cooperative efforts for noxious weed control on BLM-administered lands by the county weed and pest districts.	
Cooperative Management Agreement between BLM, Worland District, LU Sheep Company, WGFD, Wyoming State Board of Land Commissioners	Details cooperative efforts for road and motor vehicle management for the benefit of watershed and big game within the upper Grass and Enos creek drainages.	1989
Cooperative Management Agreement between BLM, Worland District, WGFD, Wyoming State Board of Land Commissioners, Double-H Ranch	Details cooperative efforts for road and motor vehicle management for the benefit of watershed and big game within the upper Grass, Enos, Lefthand and Middle creek drainages.	June 1994
Double H Ranch Access Area	BLM, Double H Ranch, WG&F – Public Access.	
Grass Creek Travel Management Area	BLM, Wyoming State Board of Land Commissioners, WGFD, LU Sheep Company, Travel Management in Grass Creek area.	
Interagency Agreement between the USFS and the BLM	Establishes procedures for the administration of oil and gas operations on federal leases within the National Forest System.	2006
Interagency between BLM and Bureau of Reclamation Agreement	The BLM has jurisdiction over NOIs to conduct geophysical exploration which involve Bureau of Reclamation (BOR) lands. The BOR will be contacted for their conditions of approval.	
Medicine Lodge Habitat Management Unit Areas	BLM, WGFD – Public Access.	
Memorandum of Agreement WY-117	Memorandum of Agreement among the BLM and the Wyoming Board of Land Commissioners, the Wyoming SHPO and the Advisory Council on Historic Preservation, addresses cultural resource protection in state exchanges.	

Table B-5. Memoranda and Agreements (Continued)

Memoranda and Agreements	Description	Year
Memorandum of Agreement WY-118	Memorandum of Agreement between the BLM and the Wyoming Board of Land Commissioners, addresses processing state exchanges.	
Memorandum of Agreement WY-119	Memorandum of Agreement between the BLM and the ASCS, addresses management of agricultural trespass.	
Memorandum of Agreement WY-121	Memorandum of Agreement between the BLM and the National Park Service, addresses management of the Oregon National Historic Trails.	
Memorandum of Agreement WY-122	Memorandum of Agreement among the BLM and the USFS, Wyoming Department of Public Lands, Wyoming Game and Fish Commission, Wyoming Recreation Commission, Wyoming Department of Agriculture, and the Wyoming State Planning Coordinator’s Office, addresses access to public land.	
Memorandum of Agreement WY-131	Memorandum of Agreement between the BLM and the Wyoming Game and Fish Department (WGFD), addresses overall coordination on land and resource management.	
Memorandum of Agreement WY-19	Memorandum of Agreement between the BLM and the Wyoming Governor, addresses overall cooperation in public and state land management efforts.	
Memorandum of Agreement WY-20	Memorandum of Agreement between the BLM and the Wyoming Game and Fish Commission, addresses a myriad of land and resource management issues, including classifications, land acquisition and disposal, and access.	
Memorandum of Agreement WY-21	Memorandum of Agreement between the BLM and Region II and Region IV of the USFS, addresses overall coordination on a myriad of land and resource management issues.	
Memorandum of Agreement WY-63	Memorandum of Agreement among the BLM, the USFS, Wyoming Department of Public Lands and the Wyoming Game and Fish Commission, addresses public land access and management of access problems.	
Memorandum of Agreement WY-65	Memorandum of Agreement between the BLM and the Agricultural Stabilization and Conservation Service (ASCS), addresses overall coordination on a myriad of land and resource management issues.	
Memorandum of Agreement WY-7	Memorandum of Agreement between the BLM and the Wyoming Recreation Commission; addresses land classifications and withdrawals to protect public lands generally, and specifically to protect historic trails.	
Memorandum of Agreement WY-77	Memorandum of Agreement among the BLM, the ASCS, USFS, AES, and Wyoming State Conservation Commission, addresses overall coordination on conservation planning projects.	
Memorandum of Agreement WY930-91-06-38	Memorandum of Agreement between the BLM and the Wyoming Board of Land Commissioners, addresses exchange pooling.	
Memorandum of Agreement WY930-91-06-39	Memorandum of Agreement between the BLM and the Wyoming Board of Land Commissioners, addresses exchange of state land in holdings in wilderness areas.	
Memorandum of Agreement, between the Wyoming DEQ and the State of Wyoming Oil and Gas Conservation Commission	Wyoming DEQ delegated permitting of road applications for oilfield wastes when the wastes are to be applied on the lease, unit, or communitized area. Wyoming DEQ still has the jurisdiction for permitting road application of oil field wastes outside of the lease, unit, or communitized area.	1999

Table B-5. Memoranda and Agreements (Continued)

Memoranda and Agreements	Description	Year
Memorandum of Understanding between BLM and State of Wyoming Oil and Gas Conservation Commission	Outlines the handling of NOIs to conduct geophysical exploration and sharing of information and compliance inspections. The State of Wyoming Oil and Gas Conservation Commission has jurisdiction over injection wells and spacing.	
Memorandum of Understanding between the BLM and the Department of Agriculture (60F26045-48)	Predator control protocols were formalized in this Interagency Memorandum of Understanding.	1995
Memorandum of Understanding BLM/APHIS-Wildlife Services (ADC)	Detailing cooperative efforts between the two groups on suppression of grasshoppers and Mormon crickets on BLM lands (Document #03-8100-0870-MU, February 27, 2003), and local National Resource conservation Service (NRCS).	2003
Memorandum of Understanding No. WY 19	Between the United States Department of the Interior (DOI) BLM and the Wyoming Department of Environmental Quality (DEQ) Land Quality Division (LQD) and addresses Management Of Surface Mining and Exploration for Locatable Minerals On Public Lands. It was signed November 11, 2003. This is a Supplemental Memorandum to the General Statewide Memorandum of Understanding (Memorandum of Understanding) dated October, 1975, between the Governor of Wyoming and the United States, by and through the State Director, BLM, United States DOI.	2003
Memorandum of Understanding No. WY-920-1301	Between the United States Department of the Interior (DOI) BLM and the Wyoming Department of Environmental Quality (DEQ) Land Quality Division (LQD) for Management of Surface Mining and Exploration for Mineral Materials (Salable Minerals) on Public Lands, signed on September 11, 2013. This is a Supplemental Memorandum to the General Statewide Memorandum of Understanding (Memorandum of Understanding) dated October, 1975, between the Governor of Wyoming and the United States, by and through the State Director, BLM, United States DOI.	2013
Memorandum of Understanding WY920-02-09-108	Between the BLM, the FHWA, and the Wyoming Department of Transportation that defines each agency's responsibilities in regard to processing federal-aid highway appropriations.	2002
Memorandum of Understanding WY920-08-07-192	Memorandum of Understanding WY920-08-07-192 between BLM, the Federal Highway Administration (FHWA), and the Wyoming Department of Transportation, addresses each agency's responsibilities in regard to processing federal-aid highway appropriations. To implement Sections 107(d) and 317 of the federal Aid Highway Act (23 U.S.C. 107(d) and 317), as amended, the agencies operate under this Memorandum of Understanding (updated in August 2007). All appropriations under the Federal Aid Highway Act are required to be consistent with the referenced Memorandum of Understanding.	2007
National Memorandum of Understanding between the BLM and the Department of Defense	This Memorandum of Understanding outlines procedures for processing Notices of Intent (NOIs) to conduct geophysical operations when Air Force, Army, and Navy lands are involved. The Department of Defense will be the lead agency when their lands are involved in an NOI.	
Nowater Off-highway Vehicle (OHV) Trail System	BLM, Wyoming State Trails Program, Worland chamber of Commerce, Ten Sleep Chamber of Commerce.	

Table B-5. Memoranda and Agreements (Continued)

Memoranda and Agreements	Description	Year
Programmatic Agreement Among BLM, the Advisory Council on Historic Preservation, and the National Conference of State Historic Preservation Offices (SHPOs)	Regarding the Manner in which BLM will meet its Responsibilities Under the National Historic Policy Act (NHPA).	2012
Public Access Area Agreements Between BLM and WGFD	Public access area agreements to numerous BLM parcels on South Fork, Shoshone, North Fork Shoshone, Clarks Fork of the Yellowstone River, and Luce and Hogan Reservoirs.	
Renner, Carter Billy Miles Tensleep Public Access Area	BLM, WGFD – Public Access.	
State Protocol Agreement Between the Wyoming BLM State Director and the Wyoming SHPO	Programmatic agreement among the BLM Advisory Council on historic preservation, and the national conference of state historic preservation officers regarding the manner in which BLM will meet its responsibilities under the National Historic Preservation Act.	2014
Western Association of Fish and Wildlife Agencies (WAFWA)/USFS/BLM/USFWS Memorandum of Understanding (08-31-2000)	Involving the management of sage grouse and their habitat.	2000
Wyoming DEQ	There are currently no agreements between BLM and the State of Wyoming DEQ-LQD regarding exploration for or development of non-energy leasable minerals. Wyoming DEQ-LQD processes applications for these minerals under their “Non-Coal” rules and regulations. It is possible that the same Memorandum of Understanding between BLM and Wyoming DEQ-LQD for locatable minerals would have some valuable application should these two agencies need to work together to process applications related to non-energy leasable minerals.	
Yellowstone River Compact	Between the states of Wyoming, Montana, and North Dakota was agreed upon to create an equitable division and apportionment of such waters; this compact ultimately controls the future and current uses of water resources in the basin.	1950

APPENDIX C

MONITORING AND EVALUATION

1.0 INTRODUCTION

This appendix provides an overview of the Bighorn Basin Monitoring and Evaluation protocol. Conditions may change over the life of the land use plan and these changes may require different management actions to protect resources and minimize resource conflicts. To address the changing conditions and provide management flexibility that incorporates best management practices (BMP), the Bureau of Land Management (BLM) reviews effectiveness of management actions, assesses the current resource conditions and, if needed, alters management actions.

Due to staffing and funding levels, monitoring will be prioritized consistent with the goals and objectives of the Resource Management Plan (RMP) in cooperation with local, state, and other federal agencies. A system should be established to regularly collect, coordinate and distribute monitoring data collected by other federal and state agencies. Changes to monitoring may result from developing technologies or a better understanding of information.

The monitoring framework for greater sage-grouse is provided in Appendix Y.

2.0 DATA COLLECTION

In cooperation with local, state and other federal agencies, the BLM will collect, analyze, and report monitoring data that allows for the determination of cause and effect, conditions, trends and predictive modeling of land use authorizations. Monitoring methods are implemented to collect data that establish current conditions and reveal any change in the indicators. Monitoring techniques consider when, where, and frequency. The data collected through monitoring provide a variety of information applicable to one or more resource uses. To increase effectiveness, efficiency and eliminate duplication, monitoring methods should be designed to address as many uses as possible. The BLM will collaborate with cooperating agencies and permittees to assist in or perform this data collection.

3.0 DATA ANALYSIS

Data will be analyzed to determine the change that has occurred as a result of management actions. Data analysis will be conducted on a predetermined schedule that considers the data collection frequency for detecting change. Data will also be recorded and organized to facilitate analysis to be used in assessing management actions. Analyzed data will be assessed to determine whether the resource conditions are meeting the planned goals; whether a change has occurred, and if so, identify the cause; and what appropriate action should be taken to achieve the desired outcome if the objective is not being met. New technology and management methods will be reviewed to determine their applicability in modifying or replacing current management actions. The BLM will collaborate with cooperating agencies to assist in or perform this data analysis.

4.0 DECISION

When the assessment shows that the goals are still valid but the outcome is not being achieved, the cause of non-achievement will be documented and a change or modification in management actions would be warranted to address the causal factors. The assessment will develop recommendations to be considered by management for continuation, modification, or replacement of current management actions. Because adoption of a new management action may require changes in the monitoring plan, the assessment will also evaluate the effectiveness of the monitoring and data collection methods and recommend continued use, modification, or elimination of those methods.

5.0 ESTABLISHMENT OF MONITORING PROTOCOLS

Establishing monitoring protocols will follow BLM program specific policy and, where appropriate, the general seven step principles outlined in the Regional Framework for Water-Resources Monitoring Related to Energy Exploration and Development. Those steps are:

1. Specify monitoring goals and objectives.
2. Characterize anthropogenic stressors that may affect receptors and parameters of interest.
3. Develop regional questions and conceptual models to describe the process and pathways anthropogenic stressors may affect receptors.
4. Suggest indicators to measure the effects of anthropogenic stressors, and define existing information availability and needs.
5. Estimate the sensitivity of the indicators to detect change, to guide final indicator choice, and monitoring design.
6. Describe a process by which management can identify thresholds of change requiring a management response as indicated by causal factors.
7. Identify clear connections between the overall monitoring program and management decision process.

6.0 RESOURCE MONITORING TABLE

The resource monitoring table (Table C-1) identifies the indicator that will be monitored to detect change in resource conditions, the method or technique of monitoring, the locations for monitoring, the unit of measurement for monitoring, the frequency for monitoring, and the action triggers that indicate the effectiveness of the management action. Footnotes in Table C-1 indicate where monitoring is generally conducted by stakeholders or cooperating agencies.

Table C-1. Resource Monitoring Table

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Air Quality ¹	M-1	Air quality.	Ambient air sampling and air quality modeling.	Established Monitoring Stations.	Parts per million.	Hourly to 24-hour samples in accordance with standards.	Samples exceeding National Ambient Air Quality Standards.
	M-2	Gaseous and particulate critical air pollutants.	Emission inventory.	Established Monitoring Stations.	Pounds per hour and tons per year.	Annually.	Samples exceeding Ambient Air Quality Standards or levels of concern.
Cultural ²	M-3	National Register eligible sites.	Site inspection.	Area wide.	Disturbance.	Annually.	Disturbance as a result of land uses or vandalism, fire, and severe weather events such as flooding and erosion.
Fire	M-4	Fire fuels.	Site inspection.	Wildland-urban interface and industrial interface areas.	Acres.	Annually.	Presence of fire fuels that present a risk to communities and industrial sites.
	M-5	Vegetation condition.	Ecological site condition and trend studies.	Vegetation types where there is a history of fire in the ecosystem.	Representative sample.	Annually.	Vegetation growth trend is moving away from desired conditions for the vegetation type.
	M-6	Resource and property damage.	Fire behavior.	Individual fire.	Fire temperature, flame length, burn rate, and acres burned.	While the fire is burning.	Acres burned and fire intensity that exceed prescription.
Forestry	M-7	Forest Health.	Ecological site condition and trend.	Forested lands.	Representative sample area.	Every 3 to 5 years.	Disease, insect infestation, or encroachment of undesirable plant species threatens forest health.
	M-8	Timber stands.	Timber stand examination.	Commercial forested areas.	Board feet, age class, and damages.	Every 10 to 20 years.	Basal area growth does not meet timber type standards.
Lands and Realty	M-9	Realty authorization compliance.	Site compliance inspection.	Area wide.	Number of site inspections.	Annually.	Non-compliance or non-use.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Livestock Grazing	M-10	Vegetation condition	BLM approved monitoring methods; monitoring plans are included in Allotment Management Plans.	All areas being grazed.	Representative sample of grazed area.	Every 5 to 10 years On a priority basis monitor allotments before livestock turnout.	Conditions are not meeting goals and objectives for vegetation due specifically to livestock grazing management. Inconsistent with Guidelines for Livestock Grazing Management, and Wyoming Rangeland Monitoring Guide, and similar guidance updated over time. Not meeting or moving towards Wyoming Standards for Healthy Rangelands.
	M-11	Forage utilization	Utilization study plot or site visit; monitoring plans are included in Allotment Management Plans.	Priority allotments or as needed.	Representative sample of grazed area.	On a priority basis, monitor during and after the area has been grazed.	Utilization consistently exceeds prescribed levels identified in the utilization Appendix W or the vigor of key plant species is declining.
	M-12	Livestock numbers.	Counts and site visits; monitoring plans are included in Allotment Management Plans.	Varies by allotment.	Number of allotments or operators inspected.	Annually or when livestock are moved on or off the allotment.	Livestock numbers exceeding permitted numbers or in areas unauthorized.
Minerals	M-13	Surface disturbance.	Remote sensing or site inspection.	Mineral development sites.	Acres disturbed.	Bi-annual or more.	Acres disturbed exceeding the range established for the area.
	M-14	Compliance with authorization.	Area inspection.	Area wide.	Compliance.	During operations at least bi-annually.	Non-compliance.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Off-Highway Vehicles	M-15	Off-highway vehicle disturbance; establishment of unauthorized vehicle routes.	Remote sensing or site visit; traffic counter data.	Travel Management Area; site-specific to area of disturbance.	Miles of routes; acres of disturbance.	Prioritize areas and monitor higher priority areas every 1-3 years and lower priority areas every 2-4 years.	Disturbance exceeding the baseline, accelerated soil erosion occurring, and vegetation being removed.
Paleontology	M-16	Significant paleontological resources.	Site inspection.	Site.	Degradation or loss of significant fossil resources.	Annually.	Loss or damage to significant fossil resources as a result of human or natural causes.
Recreation	M-17	General recreation use; realization of desired beneficial outcomes.	Onsite Inspection, visitor use data, surveys; document user conflicts or complaints.	Area wide with emphasis on SRMAs and ERMAs with high visitation; areas not managed as recreation management areas but recognized for recreational use and resources.	Changes to desired recreation setting characteristics; changes in experiences and realized desired beneficial outcomes; changes in types, seasons or levels of use.	Prioritize areas and monitor higher priority areas (SRMAs and ERMAs) every 1-3 years and lower priority areas every 3-5 years.	When visitor surveys or public comments indicate that recreation area management objectives are not met; when desired settings, experiences, and beneficial outcomes are not realized; when change is causing undue or unnecessary degradation of the site or area; when change is causing goal interference and conflicts.
	M-18	Concentrated recreation use.	Inspect developed recreation sites or areas that have facilities.	Recreation site.	Condition of recreation site, facilities, visits and visitor days.	Annually.	When change is causing undue or unnecessary degradation of facilities and use areas; public complaints.
	M-19	Compliance with commercial authorization.	Administrative review, site inspection.	Activity site.	Permit stipulations, resource conditions, and site restoration.	During and after an event; annually for other commercial users.	When non-compliance is determined or degradation of resources is occurring.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Special Designations and Management Areas	M-20	Resource condition.	Site visit or remote sensing.	Special designation and management area.	Amount of degradation or loss of resources; impacts to important and relevant resources.	The BLM will monitor the impacts that Resource Management Plan implementation and other approved projects have on National Trail resources, qualities, values, and associated settings and the primary use or uses, including determining the effectiveness of design features, project stipulations, and mitigation measures on a regular basis as the Resource Management Plan and projects are implemented.	Undue or unnecessary degradation or loss of resources or important and relevant resources as a result of human or natural causes.
Wilderness Study Areas	M-21	Wilderness Characteristics (size, naturalness, outstanding opportunities for primitive and unconfined recreation or solitude, supplemental values).	Site visits; aerial monitoring.	Wilderness Study Areas (141,068 acres).	Miles of linear human intrusions; acres disturbed; impacts to wilderness characteristics identified by onsite visit or public comment.	Annually.	Failure to meet the non-impairment standard or other objectives outlined in Manual 6330.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Travel and Transportation Management	M-22	Roads and trails. ³	Route management categories and maintenance levels; onsite inspection or remote sensing; traffic counter data.	Area wide.	Miles.	Per Facility Asset Management System Condition Assessment Plans.	Conditions represent a hazard to life and property; route conditions do not meet identified road standards.
	M-23	Seasonal closures. ⁶	Aerial and field inspections.	Travel Management Areas with seasonal closures for wildlife.	Acres.	Every 5 years.	Changes in use of seasonal habitat requiring closure.
Vegetation	M-24	Trend.	BLM approved monitoring methods.	Area wide.	Representative sample.	Every 2 to 10 years.	Not meeting or moving towards the goals and objectives for 4000 Biological Resources (BR) Vegetation-Grassland and Shrubland Communities or the Wyoming Standards for Healthy Rangelands.
	M-25	Precipitation. ¹	Weather stations.	Representative sample to detect precipitation patterns.	Inches of precipitation.	Monthly and annually.	N/A.
	M-26	Climate. ¹	Weather stations.	Representative sample to detect patterns.	Degrees.	Monthly and annually.	N/A.
	M-27	Noxious weed and invasive plant trends. ⁴	Remote sensing or site visit.	Priority areas.	Acres of established weeds and potential habitat areas.	Annually.	Spreading or establishment of invasive species in new areas.
	M-28	Special Status Species.	Site inspection.	Special Status Species' habitats.	Population and trend.	Annually.	A declining trend in populations.
	M-29	Wetland/riparian condition.	Proper Functioning Condition.	Priority wetlands/riparian areas.	Stream miles and acres along with rating.	Every 1 to 3 years.	Not achieving Proper Functioning Condition or not exhibiting and upward trend.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Visual Resource Management	M-30	Project conformance with VRM Class Objectives.	Remote sensing or site visit; Visual Resource Contrast Rating from Key Observation Points; Visual simulations.	Class I, II, and sensitive III and IV areas.	Measure the degree of contrasting elements against the surrounding natural elements of the landscape (color, form, line, etc.) before and after implementation of an action.	Visual Contrast Ratings will be prepared for projects in visually sensitive areas; comparison of pre and post implementation data will evaluate the sufficiency of project design features in meeting VRM Class Objectives.	Intrusion that exceeds thresholds for meeting VRM Class Objectives.
Water Quality, Watershed and Soils Management	M-31	Surface water quality. ⁵	Water sampling.	All surface water.	Milligrams per liter and tons per day.	On a priority basis.	Water quality does not meet state standards.
	M-32	Groundwater quality. ⁵	Groundwater sampling.	Established monitoring stations.	Representative sample of water quality.	Annually.	Water quality does not meet state standards and water is migrating from one aquifer to another.
	M-33	Channel geometry.	Riparian cross sections.	Priority streams.	Change in stream channel (width, depth, side channel modification, and bank sloughing).	Every 1 to 3 years.	Conditions are moving away from Proper Functioning Condition.
	M-34	Soil erosion uplands.	Visual observation and surveyed erosion pins.	Area wide where land use activities are occurring.	Soil loss in tons per acre.	Visual examination while land use activity is active and annual site surveys.	When soil loss is accelerated beyond natural levels.
	M-35	Soil erosion on stream banks and floodplains.	Visual observation and surveyed erosion pins.	Area wide where land use activities are occurring.	Area affected in square feet or acres.	Visual examination while land use activity is active and annual site surveys.	Water table is shrinking beyond average precipitation fluctuations.
	M-36	Soil compaction.	Penetrometer or visual inspection.	Area affected by land use activities.	Pounds per square inch.	1 to 2 times annually.	Compaction restricts water infiltration and plant growth.
	M-37	Soil compaction, porosity, permeability, and depth to water.	Monitoring wells (peizometers).	Riparian areas.	Depth to water table.	Every 2 to 3 years.	Accelerated stream bank soil loss.

Table C-1. Resource Monitoring Table (Continued)

Resource	Record Number	Indicator	Method or Technique	Location	Unit of Measure	Frequency	Action Triggers
Wildlife and Fisheries ⁶	M-38	Big game seasonal habitat.	Aerial and field inspections.	Crucial wildlife habitat areas.	Numbers during occupancy periods.	Annually.	A change in numbers beyond the normal fluctuations.
	M-39	Special Status Species occupancy and productivity.	Aerial and field inspections.	Habitat areas and established buffer zones.	Numbers during occupancy periods.	Annually.	A decline in numbers beyond the normal fluctuations.
	M-40	Threatened and endangered species occupancy and productivity.	Aerial and field inspections.	Habitat areas and established buffer zones.	Numbers during occupancy periods.	Annually.	A decline in numbers beyond the normal fluctuations.
	M-41	Macroinvertebrate indicator species.	Collecting macroinvertebrate species.	Perennial streams.	Species and condition of macroinvertebrates.	Every 2 to 10 years.	No presence of macroinvertebrates that represent good quality water in the stream.
	M-42	Neo-tropical bird habitat.	Site visit.	Area wide.	Numbers during occupancy period.	Every 2 to 3 years.	Declining trend in habitat occupancy.
	M-43	Raptors.	Site visit.	Area wide.	Nest occupancy rate.	Every 2 to 5 years.	Declining trend in nest site occupancy.
Waterway corridors eligible for inclusion into the National Wild and Scenic River System	M-44	Waterway-specific identified ORV.	Site visits, monitoring, and project proposals.	Eligible waterway corridors.	Miles of linear human intrusions; acres disturbed, impacts to corridor specific ORVs as observed by onsite visit, public comment, or project proposals.	Annually, or when site specific issue arises.	Impacts to corridor specific identified ORVs.

APPENDIX D

IMPLEMENTATION

1.0 GENERAL

Implementation of the Bighorn Basin Resource Management Plan (RMP) will require continued involvement of cooperating agencies, both in terms of funding and time, and continued public participation. This appendix describes the basic elements of implementing the Bighorn Basin RMP.

2.0 IMPLEMENTATION WORKING GROUP

Each field office will implement its respective RMP. To ensure overall coordination, Bureau of Land Management (BLM) and the cooperating agencies should meet at least yearly to provide support for the implementation prioritization, review recommendations for changes to implementation strategies and review monitoring evaluation results. This group is called the Implementation Working Group. Implementation Working Groups will serve in a recommending capacity as the BLM cannot relinquish its decision-making authority or responsibility. A single Implementation Working Group may serve both field offices, or an Implementation Working Group may be convened for each field office. All Implementation Working Group meetings will be open to the public, and announced on the BLM website.

The Implementation Working Group will ensure implementation is orderly and without duplication or confusion. The Implementation Working Group will look at interdisciplinary and interagency implementation rather than resource-by-resource implementation to make recommendations regarding the best use of funding and personnel from both cooperating agencies and the BLM.

3.0 IMPLEMENTATION TRACKING DATABASE

A database has been developed for both the Cody and Worland Field Offices to track the budget, monitoring, and implementation actions. Once the database has been populated, it will require continual maintenance and updates to accurately track the implementation process. Information will be collected based on quarterly performance evaluation (PE) accomplishment reporting, and complete fiscal year reports will be published with analysis on the BLM website by December 31 of each calendar year.

4.0 MONITORING WORKING GROUP

To ensure that monitoring methods are in place, a Monitoring Working Group will be assembled to develop an overall monitoring plan, utilizing existing monitoring information from the various members of the Implementation Working Group. The team's guidance and direction will be provided through Appendix C, Monitoring and Evaluation. The BLM is responsible to apply monitoring procedures and protocols that are based on BLM policies, field office priorities and available funding. The BLM intends to monitor the **implementation** of the entire RMP as a separate process from monitoring the impacts. The appropriate field manager will make final decisions on the monitoring plans, monitoring priorities, and whether or not monitoring data collected by other agencies meets the specific needs of the BLM.

The BLM Field Manager will assess the monitoring needs and consider additions or changes proposed by the Monitoring Working Group.

Since some monitoring data is being collected and provided by other federal and state agencies to the extent of their specific missions and expertise, a system will be established to regularly collect and coordinate this data. The team will also be responsible for collecting data to determine if the implemented actions are meeting stated goals and objectives or desired outcomes.

5.0 ACTIVITY PLAN WORKING GROUPS

Activity Plan Working Groups (APWG) consisting of local, state, and federal governments will be formed for new projects when circumstances dictate. Cooperating agencies in these APWGs will assist the BLM in developing alternatives and preparing environmental analyses. APWGs will serve in a recommending capacity as the BLM cannot relinquish its decision-making authority or responsibility. As an example, travel management plans would be developed with an APWG.

The objectives of APWGs include the following:

- Minimizing analysis and decision making controversy by being proactive rather than reactive to public land use and resource conflicts.
- Providing effective, cost-efficient, and collaboratively-based solutions to resource conflicts.
- Improving resource conditions by recommending practices appropriate to special situations.
- Streamlining public land authorizations, increasing implementation flexibility, and notifying public land users of required practices.
- All APWG meetings where recommendations are made to the BLM will be open to the public, and will provide for specific and helpful public involvement. This includes providing web-based information to the public prior to any APWG meetings; such that members of the public can provide input to the working session, both early and mid-way through the scheduled meetings.

6.0 PUBLIC INVOLVEMENT

A website where the public can quickly and easily access data concerning implementation should be developed and kept current. Creating this website and maintaining it through the implementation cycle will be a vital part of implementation success. The public is welcome to provide implementation comments to the BLM any time during the cycle, but schedules for implementation planning decisions will be posted so the public can make timely comments. All APWG meetings where recommendations are made to the BLM will be open to the public, and will provide for specific and helpful public involvement. This includes providing web-based information to the public prior to any APWG meetings; such that members of the public can provide input to the working session, both early and mid-way through the scheduled meetings.

Memorandum

To: Field Managers; Bureau of Land Management; Cody and Worland Field Offices; Cody, Wyoming; Worland, Wyoming

From: Field Supervisor, U.S. Fish and Wildlife Service, Wyoming Field Office, Cheyenne, Wyoming /s/ Scott Hicks for Brian T. Kelly

Subject: Scoping Comments for Bighorn Basin Resource Management Plan

Thank you for the opportunity to provide scoping comments on the proposed Bighorn Basin Resource Management Plan (RMP). The Bighorn Basin RMP will be a combined effort of the U.S. Bureau of Land Management's (BLM) Cody and Worland Field Offices and will replace the current Cody and Worland RMPs. The Bighorn Basin RMP will provide future direction for approximately 3.2 million surface acres and 4.2 million acres of Federal mineral estate in north-west Wyoming. The Bighorn Basin RMP will establish goals and objectives for resource management; identify lands that are open or available for certain uses, including any restrictions and lands that are administratively unavailable to certain uses; provide comprehensive management direction for all resources and uses; and make broad scale decisions guiding future site-specific implementation decisions. The area covered by the Bighorn Basin RMP includes 12 Wilderness Study Areas, nine Areas of Critical Environmental Concern, two areas of special designation, and seven special recreation management areas. The planning area for the Bighorn Basin RMP includes part of Hot Springs County, and all of Park, Washakie, and Big Horn Counties, Wyoming.

In response to your request to review the proposed action, we are providing you with comments on (1) threatened and endangered species, (2) migratory birds, and (3) wetlands and riparian areas. The Service provides recommendations for protective measures for threatened and endangered species in accordance with the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Protective measures for migratory birds are provided in accordance with the Migratory Bird Treaty Act (MBTA), 16 U.S.C. 703 and the Bald and Golden Eagle Protection Act (BGEPA), 16 U.S.C. 668. Wetlands are afforded protection under Executive Orders 11990 (wetland protection) and 11988 (floodplain management), as well as section 404 of the Clean Water Act. Other fish and wildlife resources are considered under the Fish and Wildlife Coordination Act and the Fish and Wildlife Act of 1956, as amended, 70 Stat. 1119, 16 U.S.C. 742a-742j.

Section 7 Consultation Letters

1175

Threatened and Endangered Species

The following threatened or endangered species could occur in the project area:

Black-footed ferret: Black-footed ferrets (*Mustela nigripes*) may be affected if prairie dog towns are impacted. Please be aware that black-footed ferret surveys are no longer recommended in black-tailed prairie dog towns (see our February 2, 2004, letter previously provided to your office). However, we encourage the Bureau to protect all prairie dog towns for their value to the prairie ecosystem and the many species that rely on them. We further encourage you to analyze potentially disturbed prairie dog towns for their value to future black-footed ferret reintroduction.

If white-tailed prairie dog towns or complexes greater than 200 acres will be disturbed, surveys for ferrets may be recommended in order to determine if the action will result in an adverse effect to the species. Surveys are recommended even if only a portion of the white-tailed prairie dog town or complex, as identified in our enclosed letter, will be disturbed. According to the *Black-Footed Ferret Survey Guidelines* (USFWS 1989), a prairie dog complex consists of two or more neighboring prairie dog towns less than 7 km (4.3 miles) from each other. If a field check indicates that prairie dog towns may be affected, you should contact this office for guidance on ferret surveys.

Canada lynx: Canada lynx (*Lynx canadensis*) and their primary prey, snowshoe hare (*Lepus americanus*), are strongly associated with boreal forest comprised of conifer species, in particular, spruce and fir types. Within critical habitat, four primary constituent elements necessary for the conservation of lynx have been identified. These include: (1) presence of snowshoe hares and their preferred habitat conditions, including dense understories of young trees or shrubs tall enough to protrude above the snow; (2) winter snow conditions that are generally deep and fluffy for extended periods of time; (3) sites for denning having abundant, coarse, woody debris, such as downed trees and root wads; and (4) matrix habitat (other habitat types that do not support snowshoe hares) that occurs between patches of boreal forest in close juxtaposition such that lynx are likely to travel through such habitat unimpeded.

Canada lynx were listed on March 24, 2000 (65 FR 16052) in the contiguous United States as threatened. Concentrations of lynx observations occur in western Wyoming in the Wyoming and Salt River ranges and continue north through the Tetons and Absaroka ranges in and around Yellowstone National Park. Numerous records have also come from the west slope of the Wind River Range, with fewer observations in the Bighorn and Uinta mountains (Reeve *et al.* 1986). To most benefit lynx, habitats should retain an overstory for concealment and forested connectivity between feeding, security, and denning habitats. We recommend that you adequately assess the potential effects of this proposal to lynx and snowshoe hare in order to ensure the project does not result in loss of valuable lynx habitat.

Proposed revised Canada lynx critical habitat: On February 28, 2008, the Service published a Proposed Rule (73 FR 10860) to revise the designated critical habitat for the contiguous United States distinct population segment of the Canada lynx. Critical habitat receives protection under section 7 of the Act through the prohibition against Federal agencies carrying out, funding, or authorizing activities that result in the destruction or adverse modification of critical habitat. Section 7 of the Act requires consultation on Federal actions that may affect critical habitat. Section 7(a)(4) of the Act requires Federal agencies to confer with us on any action that is likely to result in destruction or adverse modification of proposed critical habitat.

1175

The proposed revised critical habitat occurs in areas that are considered to be occupied by lynx and currently contain the physical and biological features essential to the conservation of lynx. In Wyoming, which is part of Unit 5 – Greater Yellowstone Area, critical habitat for lynx has been proposed for portions Fremont, Lincoln, Park, Sublette, and Teton Counties, including parts of Yellowstone National Park and Bridger-Teton and Shoshone National Forests, and small areas of Bureau of Land Management and private lands.

Maps of the proposed revised critical habitat and more detailed location information are available at <http://mountain-prairie.fws.gov/species/mammals/lynx/>.

Gray wolf: The Service had removed the Northern Rocky Mountain Distinct Population Segment of the gray wolf (*Canis lupus*) from the list of threatened and endangered species under the Act (73 FR 10514). On July 18, 2008, a Federal District Court issued a preliminary injunction that immediately reinstated the Act's protections for wolves in the northern Rocky Mountains. In September 2008, the Service requested the court vacate and remand the final delisting rule back to the Service. The court granted the Service's request on October 13, 2008. The Service recently reopened the public comment period on its proposal to delist the gray wolf in the northern Rocky Mountains and intends to make a new final listing determination. At this time, the Act's provisions currently in effect are the same ones in effect before wolves were delisted on March 28, 2008. All wolves within Wyoming are now considered part of the nonessential, experimental population. Although wolves in Wyoming currently remain listed and protected under the Act, additional flexibility is provided for their management under the provisions of the special regulations promulgated for the nonessential experimental population on January 6, 2005 (70 FR 1286) and January 28, 2008 (73 FR 4720).

Requirements for interagency consultation under section 7 of the Act differ based on the land ownership and/or management responsibility where the animals occur. Except on National Park Service or National Wildlife Refuge lands, wolves in Wyoming are treated as proposed for listing rather than listed. Two provisions of section 7 apply to Federal actions outside National Parks or National Wildlife Refuges: (1) section 7 (a)(1), which states all Federal agencies shall utilize their authorities to carry out programs for the conservation of listed species; and, (2) section 7 (a)(4), which requires Federal agencies to confer with the Service on actions that are likely to jeopardize the continued existence of the species. On National Park Service or National Wildlife Refuge lands wolves in the nonessential experimental population are treated as threatened species for the purposes of section 7. Wolves are dependant on movements of big game populations and may occur in large ungulate migration, wintering, or parturition areas. During project activities wolves may change their use of the project areas based upon changes to big game population numbers and changes in movement of herds. Project planning should consider impacts to big game populations, including wintering grounds and migration corridors.

Ute ladies'-tresses: Ute ladies'-tresses (*Spiranthes diluvialis*) is a perennial, terrestrial orchid, 8 to 20 inches tall, with white or ivory flowers clustered into a spike arrangement at the top of the stem. *S. diluvialis* typically blooms from late July through August; however, depending on location and climatic conditions, it may bloom in early July or still be in flower as late as early October. *S. diluvialis* is endemic to moist soils near wetland meadows, springs, lakes, and perennial streams where it colonizes early successional point bars or sandy edges. The elevation range of known occurrences is 4,200 to 7,000 feet (although no known populations in Wyoming occur above 5,500 feet) in alluvial substrates along riparian edges, gravel bars, old oxbows, and moist to wet meadows. Soils where *S. diluvialis* have been found typically range from fine

Section 7 Consultation Letters

1175

silt/sand, to gravels and cobbles, as well as to highly organic and peaty soil types. *S. diluvialis* is not found in heavy or tight clay soils or in extremely saline or alkaline soils. *S. diluvialis* seems intolerant of shade and small scattered groups are found primarily in areas where vegetation is relatively open. Surveys should be conducted by knowledgeable botanists trained in conducting rare plant surveys. *S. diluvialis* is difficult to survey for primarily due to its unpredictability of emergence of flowering parts and subsequent rapid desiccation of specimens. The Service does not maintain a list of “qualified” surveyors but can refer those wishing to become familiar with the orchid to experts who can provide training or services.

Species of Concern

Greater Sage-grouse: The Service is currently conducting a review to determine if the greater sage-grouse (*Centrocercus urophasianus*) warrants listing. Greater sage-grouse are dependent on sagebrush habitats year-round. Habitat loss and degradation, as well as loss of population connectivity have been identified as important factors contributing to the decline of greater sage-grouse populations rangewide (Braun 1998, Wisdom *et al.* 2002). Therefore, any activities that result in loss or degradation of sagebrush habitats that are important to this species should be closely evaluated for their impacts to sage-grouse. If important breeding habitat (leks, nesting, or brood rearing habitat) is present in the project area, the Service recommends no project-related disturbance March 1 through June 30, annually. Minimization of disturbance during lek activity, nesting, and brood rearing is critical to sage-grouse persistence within these areas. Likewise, if important winter habitats are present (Doherty *et al.* 2008), we recommend no project-related disturbance November 15 through March 14, annually.

We recommend you contact the Wyoming Game and Fish Department to identify important greater sage-grouse habitats within the project area, and appropriate mitigative measures to minimize potential impacts from the proposed project. The Service recommends surveys and mapping of important greater sage-grouse habitats where local information is not available. The results of these surveys should be used in project planning, to minimize potential impacts to this species. No project activities that may exacerbate habitat loss or degradation should be permitted in important habitats. Additionally, unless site-specific information is available, greater sage-grouse habitat should be managed following the guidelines by Connelly *et al.* 2000 (also known as the Western Association of Fish and Wildlife Agencies [WAFWA] guidelines).

In Wyoming, information suggests that greater sage-grouse populations are negatively affected by energy development activities, especially those that degrade important sagebrush habitat, even when mitigative measures are implemented (Braun 1998, Lyon 2000, Naugle *et al.* 2006). Greater sage-grouse populations can repopulate areas developed for resource extraction after habitat reclamation for the species (Braun 1987). However, there is no evidence that populations attain their previous levels and reestablishment of sage-grouse in a reclaimed area may take 20 to 30 years, or longer (Braun 1998). Therefore, this project should be carefully evaluated for long-term and cumulative effects on the greater sage-grouse, since reclamation may not restore populations to pre-activity levels. The Bureau should ensure this activity does not exacerbate greater sage-grouse declines on either a local or range-wide level.

Migratory Birds

In addition to requirements to consult on projects affecting threatened and endangered species, agencies also have obligations to protect migratory bird species, including eagles and other raptors, protected under the MBTA and BGEPA. Of particular focus are the species identified in the Service’s *Birds of Conservation Concern 2002*. In accordance with the Fish and Wildlife

1175

Coordination Act (16 USC 2912 (a)(3)), this report identifies “species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing” under the Act. This report is intended to stimulate coordinated and proactive conservation actions among Federal, State, and private partners and is available at <http://www.fws.gov/migratorybirds/reports/bcc2002.pdf>.

The MBTA, enacted in 1918, prohibits the taking of any migratory birds, their parts, nests, or eggs except as permitted by regulations and does not require intent to be proven. Section 703 of the MBTA states, “Unless and except as permitted by regulations ... it shall be unlawful at any time, by any means or in any manner, to ... take, capture, kill, attempt to take, capture, or kill, or possess ... any migratory bird, any part, nest, or eggs of any such bird...” The BGEPA, prohibits knowingly taking, or taking with wanton disregard for the consequences of an activity, any bald or golden eagles or their body parts, nests, or eggs, which includes collection, molestation, disturbance, or killing.

In order to promote the conservation of migratory bird populations and their habitats, the Service recommends that the Bureau implement those strategies outlined within the Memorandum of Understanding directed by the President of the U.S. under the Executive Order 13186, where possible. Work that could lead to the take of a migratory bird or eagle, their young, eggs, or nests (for example, if you are going to erect new roads, or power lines in the vicinity of a nest), should be coordinated with our office before any actions are taken.

Wetlands

The functions and values of wetlands are well documented and are especially important in the arid west. Substantial degradation diminishes the effectiveness of wetlands to function as food, cover, and breeding sites for wetland dependent species; sediment transport systems; water retention/storage sites; contaminant sinks; and chemical exchange sites. To ensure the Service has sufficient information to assess project impacts on wetlands, assessments should include:

1. An enumeration of the acreage of wetlands, by type, impacted by the proposed action.
2. A discussion of why wetlands cannot be avoided.
3. A description of the functions and values of the wetlands, including sediment transport, water storage, habitat for aquatic and terrestrial organisms, and contaminant sinks, as well as the potential risks of water removal for these functions and values.
4. Measures that will reduce or eliminate adverse impacts to wetlands such as a mitigation plan to offset unavoidable impacts, protective buffers, seasonal and physical restrictions, maintenance of the natural hydrograph, and development and implementation of a monitoring program to track the effectiveness of mitigation measures.
5. Results of wetland monitoring or management activities in, or adjacent to, the proposed project site.
6. The anticipated short and long term effects to wetland and riparian areas during and after project completion.

We recommend addressing each of the above concerns where applicable to the project. We appreciate your efforts to ensure the conservation of Wyoming’s natural resources. If you have questions regarding this letter or resources described above, please contact Alex Schubert of my office at the letterhead address or phone (307) 772-2374, extension 238.

BB RMP

October 10, 2008

Mr. Richard Brannan, Chairman
Arapaho Business Council
PO Box 396
Fort Washakie, WY 82514

Mr. Brannan:

The Cody and Worland Field Offices are beginning a revision of their land use plans. The Cody, Grass Creek, and Washakie Resource Management Plans (RMP) currently serve as our general direction for all resource and land use management decisions for the BLM-administered public lands and resources in our administrative area. The new plan will guide the use, protection, and management of natural and cultural resources on the public lands in Big Horn, Hot Springs, Park and Washakie counties in Wyoming.

In an effort to keep you informed of the status of our planning effort, we are again contacting tribes who have previously expressed cultural concerns relating to the planning area, or whose traditional lands coincide with the planning area. To date, consultation on the RMP revision process with your tribe has included correspondence, telephone contacts, and meetings when requested.

We greatly appreciate the coordination we have accomplished with you in the past and would like to continue our relationship. BLM recently modified its policy on working with tribal governments during land use plan revisions. This new policy affords you the opportunity to provide further input into this process. We previously invited you to become a cooperating agency. Cooperating agency status is available to government entities with jurisdiction by law or special expertise. A cooperating agency provides staff to the BLM planning team to develop analysis for which they have particular expertise. The cooperating agency must develop a Memorandum of Understanding with the federal agency and must fund its own participation. Please note that the tribe's participation as a cooperating agency does not satisfy the BLM's obligation to consult on a government-to-government basis. Therefore, regardless of your tribe's decision to participate or not as a cooperating agency, our government-to-government consultation will continue.

BLM-0062

We expect to begin our formal scoping process for the RMP later this month. We would like to come to a Tribal Business Council Meeting and provide information about the planning area and the scope of our anticipated effort for the RMP. We are requesting your comments regarding any interests or concerns your Tribe might have with our agencies management of the Planning Area. Please assist us in identifying any places of traditional religious or cultural importance to your Tribe within the Planning Area, or needs for access to such places. Also are there any traditional cultural leaders or religious practitioners who should be contacted?

We value your knowledge, concerns, and perspectives relating to the planning area. If you would like further information regarding cooperating agency status, please contact Caleb Hiner, Project Manager, at 307-347-5171. With regard to cultural heritage issues, you may wish to contact Michael T. Bies, Archaeologist, at 307-347-5154 or Kierson Crume at 307-578-5929. Thanks for your continued participation in our RMP revision process.

Sincerely,

Eddie Bateson
District Manager
Wind River/Big Horn Basin District

M. [Signature]	3/6/13

March 29, 2013

CERTIFIED MAIL NUMBER 7009 2250 0000 9893 1818
RETURN RECEIPT REQUESTED
Silas C. Whitman, Chairman
Nez Perce Tribal Executive Committee
P.O. Box 305
Lapwai, ID 83540

Dear Mr. Whitman:

The Cody and Worland Field Offices of the Bureau of Land Management (BLM) wish to update you on the status of the Bighorn Basin Proposed Resource Management Plan (PRMP) revision.

The BLM most recently contacted you in February, 2012, in anticipation of issuance of the Final Environmental Impact Statement (FEIS) for the Bighorn Basin RMP revision.

In response to the National Technical Team's (NTT) focus on Alternative Development and analysis of Sage-Grouse conservation measures, the BLM is entering into a Draft Supplemental Environmental Impact Statement (DSEIS) phase for Proposed Sage-Grouse Priority Habitat, Area of Critical Environmental Concern (ACEC), nominations.

The newly designed ACEC nominations are the Key Area Boundary and the Core Area (V. 3) Boundary. These nominations are based on the Wyoming Governor's Core Area and Executive Order 2011-5, the NTT conservation measures, and citizen proposed alternatives.

In an effort to keep you informed about the DSEIS, we are again contacting tribes who have expressed cultural concerns relating to the planning area, or whose traditional lands

coincide with the planning area. To date, consultation on the RMP revision process with your tribe has included correspondence, telephone contacts, and meetings when requested.

The BLM prepared the PRMP/DSEIS in consultation with cooperating agencies, and Native American groups, taking into account public comments received during this planning effort. The PRMP provides a framework for the future management direction and appropriate use of the Bighorn Basin planning area, located in portions of Big Horn, Hot Springs, Park, and Washakie Counties, Wyoming. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Bighorn Basin.

The BLM will again move to the Final EIS phase of the proposed RMP revision upon completion of the DSEIS comment period.

We value your knowledge, concerns, and perspectives relating to the planning area. If you would like further information on the planning process, please contact Holly Elliott at (307) 347-5193, email- helliott@blm.gov.

With regard to cultural heritage issues, you may wish to contact Kierson Crume, Cody Field Office Archaeologist, at (307) 578-5929 or Marit Bovee, Worland Field Office Archaeologist, at (307) 347-5114. If you or your representatives would like to visit the planning area or meet with BLM managers and specialists please let us know. Thank you for your continued participation in our RMP planning process.

Sincerely,

s/Steve Dondero
Steve Dondero
District Manager

2.0 COOPERATING AGENCY POSITION STATEMENTS

2.1 Washakie County Conservation District

The Washakie County Conservation District shall continue to promote and encourage the motive and means for the optimum production and conservation of resources to enhance economic opportunity and the quality of life. The Washakie County Conservation District shall strive to promote a clean and healthy environment.

2.2 Wyoming Department of Agriculture

The Wyoming Department of Agriculture (WDA) offers the following statements in regard to the Bureau of Land Management (BLM) Bighorn Basin Resource Management Plan revision:

The WDA supports no net loss of Animal Unit Months (AUMs). A net loss of AUMs may negatively impact livestock producers and Wyoming agriculture. We do not support the permanent closure of any area to livestock grazing, including the Alternative B proposal to close crucial winter range for elk and bighorn sheep and key areas for greater sage-grouse, or the proposal to prohibit new domestic sheep grazing on pronghorn crucial winter range. Instead, the WDA believes that the BLM should work with livestock grazing permittees to incorporate specific livestock management plans to address conflicts. The WDA supports the Alternative D proposal to allow livestock grazing in areas closed to grazing (e.g., the Bighorn River tracts) as a tool to maintain or improve resource conditions.

The WDA supports the BLM's decision to conduct all wild horse activities to remain compliant with the Wyoming Consent Decree (August 2003), including striving to maintain Appropriate Management Levels.

The WDA also supports BLM proposals to follow current best management practices and recommendations made by the Wyoming State Brucellosis Coordination Team. This helps reduce the spread of brucellosis and maintain viable livestock operations.

These positions are a reflection of the WDA mission: dedication to the promotion and enhancement of Wyoming's agriculture, natural resources and contribution to Wyoming quality of life.

APPENDIX F

SPECIAL DESIGNATIONS

1.0 INTRODUCTION

This appendix includes a brief description of the Wild and Scenic River (WSR) and Area of Critical Environmental Concern (ACEC) designation and evaluation processes. This appendix also contains information on where to obtain the full reports that provided additional information on these processes.

2.0 WILD AND SCENIC RIVER DESIGNATION PROCESS

The Bureau of Land Management (BLM) initiated a WSR review of all BLM-administered public lands along waterways within the Worland and Cody planning areas. This review was to determine eligibility, assign a tentative classification, and screen for suitability factors, as identified in the Wild and Scenic Rivers Act (WSRA) of 1968, as amended (see Table F-1). No waterway segments were determined eligible during this review in the Grass Creek Resource Area. The review process and decisions can be reviewed in the Grass Creek Resource Management Plan (RMP) (1999). Those segments in the remainder of the Planning Area determined eligible and assessed for suitability are all recommended as suitable for inclusion in the National Wild and Scenic River System under alternatives B and E.

The BLM WSR review includes a three-step process:

1. Determining whether public lands along waterways meet the WSR eligibility criteria to be tentatively classified as wild, scenic, or recreational.
2. Determining whether any of those public lands that meet the eligibility criteria are also assessed for suitability.
3. Determining what rivers and adjacent public lands are determined suitable and recommended for designation and how they will be managed.

The WSR review was conducted separately from the RMP planning process to expedite the review process, resulting in a stand-alone WSR review report. The BLM will use this land use planning process to gather additional data, in the form of public comments and the impact analysis contained in Chapter 4 of this Proposed RMP and Final Environmental Impact Statement (EIS), to support eligibility and suitability findings. This WSR suitability assessment may be modified as a result of public comments. Following the review and response to any public comments on the Draft RMP and Draft EIS that address WSR recommendations presented in this document, the BLM will release the map and Record of Decision that contain the agency's WSR findings.

The Worland and Cody *Wild and Scenic River* reports may be viewed online at:
<http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn/docs/wsr.html>

Sources: BLM 2002; BLM 2003; BLM 2009a; BLM 2009b

¹Waterway Segment Revaluated as part the 2009 Cody Field Office Wild and Scenic River Addendum Report.

²Approximate length based on available geographic information system data; segment lengths have been rounded to the nearest hundredth of a mile.

³To provide for a range of alternatives, all Wild and Scenic River eligible segments are recommended as suitable under alternatives B and E, and none of the Wild and Scenic River eligible segments are recommended as suitable under Alternative C.

⁴Detailed explanations of how suitable waterways met each of the suitability factors appears in the Worland and Cody Field Office Wild and Scenic River Reports, available on the project website.

⁵The 2003 Wild and Scenic Rivers Review Report found Oasis Spring Creek eligible, tentatively classified as Wild, and suitable for inclusion. However, the 2009 Wild and Scenic Rivers Review Addendum Report found Oasis Spring Creek not eligible because the waterway is identified as ephemeral, which also means that Oasis Spring Creek does not have a tentative classification, and is not suitable. The BLM decided to keep Oasis Spring Creek in the RMP for analysis and alternatives.

BLM Bureau of Land Management
WSR Wild and Scenic River

In following the WSR process, the BLM used the Bighorn Basin Resource RMP Revision as the vehicle to identify the suitability of each of the eligible waterway corridors. Each element of the revision process, including but not limited to scoping, RMP tours, workshops, cooperators meetings, and public comments, was used to for determining suitability. As identified earlier as the third process, the BLM determined that none of the eligible waterway corridors are suitable for inclusion into the National Wild and Scenic Rivers System. Refer to Table F-2 for suitability determination for each of the waterway corridors.

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
Cody Field Office		
Clarks Fork of the Yellowstone (Segment 1)	No	<p>Factor 1: Scenic and recreation quality are outstanding. However, the amount of private land interspersed with BLM may make it difficult to maintain ORV's.</p> <p>Factor 2: BLM-administered mineral/surface estate interspersed with private land. Not suitable due to the preponderance of private land, dominating this portion of the waterway.</p> <p>Factors 2, 4, 5, 7, 9: Difficult to administer, due to the preponderance of private land interspersed with smaller segments of river on public land.</p> <p>Factors 3, 7, 8, 9, 11: Local interest would include those Valid Existing Rights to allow for irrigation water out of the Clarks Fork of the Yellowstone River. Those rights would be honored.</p> <p>Factors 3, 9: Irrigation uses off the Clarks Fork.</p> <p>Factors 3, 13: In 1993, during the first inventory, there was interest by the state to develop these waters into a dam/reservoir. Recent conversations with the governor's office reflected a change in that interest.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Clarks Fork of the Yellowstone River, Segment 1 as suitable for inclusion into the NWSRS.</p>
Clarks Fork of the Yellowstone (Segment 2)	No	<p>Factor 1: Includes outstanding scenic and recreation values.</p> <p>Factor 2: The majority of land along this waterway is privately owned. The BLM does not control actions on private property, so this preponderance of private ownership would make the maintenance of the identified ORVs difficult.</p> <p>Factor 3: State of Wyoming expressed interest in developing this waterway through the construction of a dam and reservoir. However, recent communication with the Governor's Office indicates that the state may no longer be considering this option; Valid existing water rights would be allowed to continue for the remainder of the permit term, and could potentially be renewed after the term ends. However, new irrigation rights-of-way would only be granted if they were designed to limit effects on the identified ORVs that make this waterway eligible.</p> <p>Factors 3, 8, 9, 10, 11, 13: Local interest in the potential designation of the Clarks Fork of the Yellowstone River includes concerns related to the withdrawal of irrigation water from the river.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Clarks Fork of the Yellowstone River, Segment 2 as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
Clarks Fork of the Yellowstone (Segment 2)	No	<p>Factor 1: Outstanding area. Scenery, water sports, fisheries, geology, history, and recreation.</p> <p>Factor 2: BLM administers both surface and mineral estate.</p> <p>Factors 3, 7, 8, 11: Some water rights may include using this area for irrigation (pumping water out of the river). These are Valid Existing Rights and should not be affected.</p> <p>Factors 3, 8, 11, 13: Powersite Reservation 26 and Powersite Classification 201 currently apply to this portion of the Clarks Fork of the Yellowstone River. The suitable determination for Segment 3 is based on a revocation of this power site withdrawal. The decision to revoke this withdrawal would be made by the Federal Energy Regulatory Commission;</p> <p>Several ditches take water out with head-gates, one head-gate pumps water out of the river. Public Water reserve in segments.</p> <p>Factors 3, 13: In 1993, during the first inventory, there was interest by the state to develop these waters into a dam/reservoir. Recent conversations with the governor’s office reflected a change in that interest.</p> <p>Factor 6: With the abutment of this segment of the river with the designated WSR on USFS, the BLM will be consistent with surrounding management and retention of those values that make this area suitable.</p> <p>Factors 8, 11: The RMP revision’s preferred alternative manage this area under a CSU (historic trails) and NSO (Recreation), which will aid in protecting the identified ORVs within the waterway corridor. These underlying prescriptions negate the need to recommend this waterway corridor for inclusion into the National Wild and Scenic Rivers System.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Clarks Fork of the Yellowstone, Segment 3 as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Cottonwood Creek	No	<p>Factor 1: Class A scenic area. Dramatic rise of canyon walls, good trail management for horseback rides and non-motorized vehicles.</p> <p>Factors 2, 4: BLM administers both surface and mineral estate and the water rights.</p> <p>Factor 3: Historically, this canyon water was diverted for irrigation 50-80 years ago, ending at Pete's Cabin.</p> <p>Factors 8, 11: The river corridor is within the Little Mountain ACEC and the Craig Thomas Special Management Area, which management prescriptions (such as administratively unavailable for oil and gas leasing, ROW avoidance, renewable exclusion area) in the BLM’s preferred alternatives will benefit the identified ORVs within Cottonwood Creek.</p> <p>Factor 10: Public interest in this canyon has been supportive of this area receiving some special management. Cooperators, and local, state, and other affected federal agencies did not see the need to designate Cow Creek as suitable for inclusion into the NWSRS.</p>
Cow Creek (Segment 1)	No	<p>Factors 1, 12: This area is similar to other canyons in Little Mountain area - but it ties to Porcupine Creek which was already recommended as eligible and suitable in the 1993 inventory. This area will continue to be remote and inaccessible - very difficult to get to unless hiking.</p> <p>Factors 2, 4: BLM administers both estates (surface/mineral).</p> <p>Factors 2, 4, 11: BLM is currently managing the area and it is staying in character.</p> <p>Factors 8, 11: The river corridor is within the Little Mountain ACEC and the Craig Thomas Special Management Area, which management prescriptions (such as administratively unavailable for oil and gas leasing, ROW avoidance, renewable exclusion area) in the</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
		<p>BLM’s preferred alternatives will benefit the identified ORVs within Cow Creek.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Cow Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Cow Creek – Segment 2	No	<p>Factor 1: Historic Area, Geological features.</p> <p>Factor 2: BLM-administered surface and minerals.</p> <p>Factor 3: Continued grazing and recreation opportunities.</p> <p>Factors 8, 11: The river corridor is within the Little Mountain ACEC and the Craig Thomas Special Management Area, which management prescriptions (such as administratively unavailable for oil and gas leasing, ROW avoidance, renewable exclusion area) in the BLM’s preferred alternatives will benefit the identified ORVs within Cow Creek (Segment 2).</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Cow Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Deer Creek, Porcupine Creek, and Trout Creek River Corridors	No	<p>Factors 1, 12: As determined during the ORV analysis for Porcupine Creek and its eligible tributaries, the scenic and recreational value of this river is very unique, particularly when compared to other rivers of this type in the region. The addition of the Porcupine Creek and its tributaries into the WSR system would provide a creditable addition. The scenic qualities are extremely unique when viewed from a regional perspective, since few canyons in the region have walls as high or as vertical, and remain in such an undisturbed pristine condition.</p> <p>Factor 2: With the exception of two small tracts of private land on Porcupine Creek encompassing a total of 0.5 miles, the remainder of Porcupine Creek and its eligible tributaries are public land administered by the BLM. This includes 9.7 miles on Porcupine Creek, 1.3 miles on Deer Creek, 2.4 miles on Oasis Spring Creek and 0.9 miles on Trout Creek, for a total of 14.3 miles. This abundance of public lands presents minimal land ownership conflict and would ensure effective manageability if the river is designated as a WSR.</p> <p>Factors 2, 6: As previously indicated, the majority of the analyzed portion of Porcupine Creek and its tributaries is public land. Acquisition of the existing 0.5 miles of private property is not deemed necessary to effectively manage the area as a WSR. Because of this large degree of public land, and no need to acquire the property to administer the river, estimates have not been prepared indicating the cost of federal acquisition of the involved private property.</p> <p>Factors 3, 5, 7: The United States Department of Interior, Bureau of Mines, indicates the areas adjacent to Porcupine Creek and its associated tributaries have occurrences of numerous mineral resources, and further indicate depending on the configuration of any associated withdrawal, may impact mineral development.</p> <p>The United States Department of Interior, Bureau of Indian Affairs, indicates they want to ensure continued involvement of the Bureau of Indian Affairs and the Crow Tribe during any analysis of this section of river for Wild and Scenic values.</p> <p>Correspondence has also been received from the Wyoming Water Development Commission opposing the designation of this river as a WSR, since it would mean more federal control of water resources.</p> <p>Factors 3, 7, 11: No known conflicts have been identified on the section of river under analysis in this document. Potential conflicts may exist upstream on lands administered by the USFS, or downstream on Crow Tribal Lands. The Bureau of Indian Affairs, representing the Crow Tribe, has indicated concern with potential conflict with Crow Tribal Lands in Montana as a result of this analysis. There are no known potential</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
		<p>conflicts which would result from inclusion of Porcupine Creek and its associated tributaries in the WSR system. There are also no known projects or proposals which would be foreclosed or diminished if the area were not protected under the WSR system. Of course, the designation would provide congressional protection to the area.</p> <p>Factors 3, 8, 11: The river corridors are within the Little Mountain ACEC and the Craig Thomas Special Management Area, which management prescriptions (such as administratively unavailable for oil and gas leasing, ROW avoidance, renewable exclusion area) in the BLM’s preferred alternatives will benefit the identified ORVs within these river corridors.</p> <p>Factors 3, 8, 12, 13: There are no known historical or existing rights which would be adversely affected by designation of Porcupine Creek or its associated tributaries. There is existing livestock trailing and a primitive access road occurring in the scenic section of the river, and it is not anticipated that the designation would adversely impact either of these ongoing uses. Infringement of other potential future land uses in the corridor; i.e., grazing privileges, mining claims, and rights-of-way, may occur to some degree. Wild and scenic characteristics now present in the river corridor would be protected from alteration resulting from future land uses and development.</p> <p>Factors 3, 9, 13: The WGFD has voiced concerns about maintaining the ability to do riparian habitat management adjacent to the river, but has not indicated opposition or support for designation.</p> <p>Factors 4, 7, 9: Porcupine Creek and its associated tributaries, if designated a WSR could be effectively managed by the BLM. If ongoing studies would determine portions of the creek administered by the USFS, are also suitable, the entire river could be effectively managed by either agency or jointly by both.</p> <p>Factor 5: There is no known interest, by any entity, in sharing the cost of administering the river as a WSR.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Porcupine Creek, Deer Creek, Trout Creek, or any waterway corridor as suitable for inclusion into the NWSRS, or to manage any river corridors to maintain or enhance the identified ORVs. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Meeteetse Creek	No	<p>Factor 1: Scenic, geologic, wildlife, historic values in waterway corridor. Currently, there is no legal vehicular access. However, Carter Mountain and the Meeteetse Creek drainage are accessible via hiking from USFS.</p> <p>Factor 2: BLM-administered surface; private mineral estate.</p> <p>Factors 2, 4, 7, 11: The mineral estate along Meeteetse Creek is privately owned, and this ownership pattern is the primary reason a suitability determination was not supported for this waterway. While the BLM could impose certain conditions of approval for minerals development in this area, the preservation of the identified ORVs would be difficult if such development occurred.</p> <p>Factors 2, 7, 8: Segments 1 & 2 are divided by a parcel of Wyoming State Land.</p> <p>Factors 3, 7, 8, 11: Continued use for grazing, recreation, and wildlife. In the Carter Mountain ACEC. Hunt Oil could develop their mineral interest, but the BLM would have administrative control on surface conditions of approval.</p> <p>Factor 8: Agency can manage these resources with other than WSR designation.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Meeteetse Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
North Fork Shoshone River		<p>Factor 1: Scenic, recreation and geology. Yellowstone National Park corridor leading to the East Gate of the park.</p> <p>Factors 1, 2, 7, 8, 9, 10: In the areas where the river crosses BLM-administered surface, the agency manages both the surface and the mineral estate. Public lands along this waterway provide important river access points and habitat for animals such as grizzly bears. However, the majority of land along this waterway is privately owned. The BLM does not control actions on private property, so this preponderance of private ownership would make the maintenance of the identified ORVs difficult.</p> <p>Factor 2: The BLM administers both surface and mineral estate. However, with the preponderance of private land interspersed along the river corridor, ORV's may be hard to maintain in the present state.</p> <p>Factor 3: No reasonably foreseeable potential uses known beyond current multiple uses.</p> <p>Factors 5, 6, 8, 9: Management of WSR in this area would be onerous due to the amount of private land and traffic.</p> <p>Factor 10: Heavy recreation area along the highway to Yellowstone National Park.</p> <p>Cooperators, and local, state, and other affected federal agencies did not see the need to designate North Fork Shoshone River as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Oasis Spring Creek	No	<p>Factor 1: The 2003 WSR eligibility analysis originally found Oasis Spring Creek as eligible. The 2009 Cody Field Office Addendum found that Oasis Spring Creek is not eligible because it is ephemeral, not intermittent.</p> <p>Factors 8, 11: The river corridor is within the Little Mountain ACEC, which management prescriptions (such as administratively unavailable for oil and gas leasing, ROW avoidance, renewable exclusion area). These underlying management prescriptions will benefit the identified ORVs within the river corridor.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate the upstream portions of White Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Pat O'Hara Creek		<p>Factor 2: BLM-administered (surface/mineral) with private interspersed.</p> <p>Factor 3: Active grazing leases.</p> <p>Factors 8, 11: The BLM is successfully managing the identified ORVs using existing cultural resource laws. The protection these laws afford the cultural and historic sites associated with this waterway is sufficient, making inclusion in the NWSRS unnecessary.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Pat O'Hara Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
South Fork Shoshone River		<p>Factor 1: Very beautiful scenery and heavily used by recreationists and homeowners in the area.</p> <p>Factor 2: In the areas where the river crosses BLM-administered surface, the agency manages both the surface and the mineral estate. However, the majority of land along this waterway is privately owned. The BLM does not control actions on private property, so this preponderance of private ownership would make the maintenance of the identified ORVs difficult.</p> <p>Factor 3: Continued urban interface with BLM land interspersed with private. A large number of private residences and vacation homes have been built on private land along this waterway in recent years. Designation as part of the NWSRS would not stop the</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
		<p>expansion of the wildland urban interface in this area, which would further complicate maintenance of the identified ORVs.</p> <p>Factors 5, 6, 8, 9: The agency would have a difficult time preserving the ORV's for this area, due to the preponderance of private land and continued growth of the area.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate South Fork Shoshone River as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Worland Field Office		
Canyon Creek	No	<p>Factor 2: Potential management conflicts with interspersed and adjacent private lands that may compromise suitability of waterway.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Canyon Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Deep Creek	No	<p>Factor 2: Majority of surface ownership up stream is private; Irrigation diversions and interests upstream of segment; Designated as WSR may prevent upstream water rights.</p> <p>Factors 3, 7, 8, 9, 13: Irrigation diversions and interests upstream of segment.</p> <p>Designated as WSR may prevent upstream water rights; WGFD interested in maintaining cutthroat species. Have done treatments in the past. In addition, WGFD has in-stream flow protection area within corridor. This allows WGFD to protect stream for minimum base flow requirements.</p> <p>Factors 8, 11: Entire waterway corridor within existing CSUs to manage for Big Game Migration Corridors, Raptors, and Rock Art Sites.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Deep Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Dry Medicine Lodge Creek	No	<p>Factor 1: Downstream portion of Dry Medicine Lodge is intermittent, and perennial the upper half.</p> <p>Factors 3, 13: WGFD interested in maintaining cutthroat species, which at this location is one of few exceptional areas along the West Slope of the Bighorn of which support cutthroat trout.</p> <p>Factors 8, 11: Entire waterway corridor under CSU stipulations, majority from Canyons RMZ, Rock Art Sites, cutthroat trout, the remainder from big game migration corridors, Blue and Red Ribbon streams, raptor buffers, and sage-grouse. Approximately 9 miles (majority) within Spanish Point ACEC with an unavailable stipulation; 8.1 miles within the lands with wilderness characteristics.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Dry Medicine Lodge Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Kirby Creek	No	<p>Factor 2: Land-locked by private lands and inaccessible to the public; unlikelihood of obtaining public access to the public lands via private property.</p> <p>Factors 2, 3, 11: Potential management conflicts with interspersed and adjacent private lands that may compromise suitability of waterway.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Kirby Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
Medicine Lodge Creek	No	<p>Factors 3, 8, 11: Entire waterway corridor is within the Medicine Lodge WSA, and most of the waterway corridor is within the Spanish Point ACEC. Cave and Karst resources will benefit from WSR designation. ACEC and WSA are currently adequately managing resources.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Medicine Lodge Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Powder River (Middle Fork)	No	<p>Factor 1: The identified area is too small to adequately manage as a WSR.</p> <p>Factors 1, 8, 11: The waterway corridor is too small to adequately manage as a WSR. The Buffalo Field Office manages the waterway downstream and proposes in the RMP revision to continue to retain the free-flowing characteristics and ORVs if Congress denies the Middle Fork Powder River WSR nomination. Entire waterway corridor within CSU stipulation for Class 1 and 2 streams; NSO stipulations within a segment of the corridor for recreation sites.</p> <p>Factor 2: Huge amount of private lands upstream of identified waterway corridor; Drainages in private lands upstream of corridor are scoured.</p> <p>Factors 3, 7, 9, 11, 13: BLM-administered lands immediately to the west of waterway is managed as a stock driveway; WGFD have implemented fish treatments, and wish to maintain fish management to sustain cutthroat species.</p> <p>Factor 3: Vegetation treatments such as mastication treatments will be precluded.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate the Middle Fork of the Powder River as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Paint Rock Creek Unit	No	<p>Factors 2, 7, 11: The Bighorn USFS allows for motorized use within the valley bottom upstream of the identified waterway segment.</p> <p>Private lands within waterway segment.</p> <p>Factors 3, 7, 9, 11, 13: Historic livestock uses, and current livestock operations are observed in the Paint Rock Unit. Middle Fork Paint Rock is used to trail cattle, as well as motorized vehicles are used to support ranching activities. WGFD currently managing for cutthroat trout.</p> <p>Factors 3, 11, 13: South Fork Paint Rock contains pure strain of cutthroat trout which WGFD manages for. WSR designation may preclude appropriate management to maintain or enhance this resource.</p> <p>Factors 8, 11, 13: Management of identified ORVs will conflict with WSR criteria (cutthroat trout); CSU stipulations in place within the Middle Fork Paint Rock, Laddie Creek, and South Paint Rock from Class I and 2 streams and Canyons RMZ; Upper watershed in South Paint Rock under CSU from cutthroat trout stipulations; Major portion of Paint Rock under CSU stipulation from rocks art sites.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate the Paint Rock Creek Unit as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
Paint Rock Creek Unit (upstream portion of Laddie Creek)	No	<p>Factor 2: Land-locked by private lands and inaccessible to the public; unlikelihood of obtaining public access to the public lands via private property.</p> <p>Factors 8, 11: the potential management conflicts with interspersed and adjacent private lands that may compromise suitability of waterway.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see</p>

Table F-2. Suitability Determinations for Waterways Determined Eligible for Wild and Scenic River Designation in the Planning Area (Continued)

Name	Suitable	Suitability Factors (refer to BLM Manual 6400)
		the need to designate this unit as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.
Trapper Creek	No	<p>Factor 1: Great X (significant cave resource) is located upstream of Trapper Creek segment, and exits within the WSA.</p> <p>Factors 1, 3, 12, 13: In-stream flow in Trapper Creek.</p> <p>Factor 2: Large amount of private surface ownership up stream.</p> <p>Factors 8, 11: Entire waterway segment is within the Trapper Creek WSA. This waterway segment will be suitable if Congress decides to release the WSA to multiple use.</p> <p>Upper reaches of corridor under an unavailable stipulation from Spanish Point ACEC.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate Trapper Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p> <p>Factor 11: Currently managed under WSA objectives. WSR designation will create redundant management designations.</p>
White Creek	No	<p>Factors 2, 3, 7, 11, 13: Majority of surface ownership up stream is private.</p> <p>Diversion located at mouth of the Canyon; Two-track located within proximity to the upstream boundary used for livestock use and other operations. Designation of WSR will preclude use on the two-track; Proposed vegetation treatment project within proximity to the corridor located on top of the rims.</p> <p>Factor 3: Livestock use surrounding waterway, but managing livestock use within the waterway corridor will not be an issue.</p> <p>Factor 8, 11: NSO found in tiny portion in lower reaches from riparian areas, CSU on entire corridor from Canyon RMZ, as well as raptors, big game corridors, and wetland/riparian buffers.</p> <p>Factor10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate White Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>
White Creek (upstream portions)	No	<p>Factor 2: Land-locked by private lands and inaccessible to the public; unlikelihood of obtaining public access to the public lands via private property.</p> <p>Factors 3, 8, 11: Potential management conflicts with interspersed and adjacent private lands that may compromise suitability of waterway.</p> <p>Factor 10: Cooperators, and local, state, and other affected federal agencies did not see the need to designate the upstream portions of White Creek as suitable for inclusion into the NWSRS. In addition, there were no comments during the Land Use Plan that supported the WSR designation.</p>

3.0 ACEC NOMINATION PROCESS

Part of the planning process for the Bighorn Basin RMP Revision Project included a review of BLM-administered lands to determine whether they met the criteria for designation as ACECs. The ACEC designation is an administrative designation used by the BLM that is accomplished through the land use planning process. It is unique to the BLM in that no other agency uses this form of designation. The Federal Land Policy and Management Act (FLPMA), states that the BLM will give priority to the designation and protection of ACECs in the development and revision of land use plans.

ACECs are composed of only BLM-administered lands, and private lands and lands administered by other agencies are not included in the boundaries of ACECs. Unlike other special designations, such as wilderness study areas (WSAs), the designation of an area as an ACEC does not by itself automatically prohibit or restrict other uses in the area (with the exception that a mining plan of operation is required for any proposed mining activity within a designated ACEC). However, to be considered for designation, special management beyond the standard provisions established by the RMP must be required to protect the BLM-administered public lands that meet the important and relevant criteria (described below).

Several steps are required to identify and evaluate ACECs. These steps include (1) the nomination of areas by the public during scoping or by BLM resource specialists, (2) evaluation of the nominated areas to determine if they meet the importance and relevance criteria described below, and (3) consideration of the potential ACECs as management scenarios analyzed in the RMP and EIS. As part of this evaluation, the BLM also considers whether the existing ACEC designations should be modified or terminated. The Draft RMP and Draft EIS contained recommendations proposing potential ACECs for designation. Following the closure of the comment period on the Draft RMP and Draft EIS, the BLM published a Notice of Intent (NOI) to begin preparation of EISs and Supplemental EISs to Incorporate Greater Sage-grouse Conservation Measures into Land Use Plans and Land Management Plans (76 FR 77008, December 9, 2011) in accordance with the BLM National Greater Sage-grouse Planning Strategy Charter released in August 2011 (BLM 2011). Nominations for greater sage-grouse-related ACECs were submitted by members of the public in response to the NOI. The Supplement to the Draft RMP and Draft EIS contains recommendations proposing Greater Sage-Grouse Key Habitat Area and Priority Habitat Management Area ACECs for designation and public comment.

Public comments on the Draft RMP and Draft EIS as well as the Supplement to that document were reviewed and adjustments were made as necessary before the release of this Proposed RMP and Final EIS. Designation of ACECs will be incorporated into the Record of Decision (ROD) approving the RMP.

Regulations at 43 Code of Federal Regulations (CFR) part § 1610.7-2 state that during the resource management planning process, inventory data should be analyzed to determine whether there are areas within the Planning Area containing resources, values, systems or processes or hazards eligible for further consideration for designation as ACECs. In order to be eligible for designation as an ACEC, an area must meet at least one of both the relevance and importance criteria described below.

3.1 Relevance

An area meets the relevance criteria if it contains one or more of the following:

1. A significant historic, cultural, or scenic value (including but not limited to rare or sensitive archeological resources and religious or cultural resources important to Native Americans).

2. A fish and wildlife resource (including but not limited to habitat for threatened, endangered, or sensitive species, or habitat essential for maintaining species diversity).
3. A natural process or system (including but not limited to threatened, endangered, or sensitive plant species; rare, endemic, or relic plants or plant communities which are terrestrial, aquatic, or riparian; or rare geological features).
4. Natural hazards (including but not limited to areas of avalanche, dangerous flooding, landslides, unstable soils, seismic activity, or dangerous cliffs). A hazard caused by human action may meet the relevance criteria if it is determined through the RMP process that it has become part of a natural process.

3.2 Importance

The values, resources, system, processes, and/or hazards that allowed the area to meet the relevance criteria must have qualities that are in need of protection or special attention in order for the area to meet the importance criteria. The area meets the importance criteria if its relevance qualities can be characterized by one or more of the following:

- A. Has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource.
- B. Has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change.
- C. Has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of FLPMA.
- D. Has qualities that warrant highlighting in order to satisfy public or management concerns about safety and public welfare.
- E. Poses a substantial threat to human life and safety or to property.

Based on comments received during scoping and internal recommendations from BLM specialists, nine existing ACECs were nominated for continued designation and five expansion areas associated with these existing ACECs were proposed, as were 14 new ACEC nominations. These 28 nominated areas were evaluated using the relevance and importance criteria described above. Twenty-two of the nominations met both the relevance and importance criteria and were analyzed in the Draft RMP and Draft EIS. Additionally, two ACECs were analyzed in the Supplement to the Draft RMP and Draft EIS.

Table F-3 lists the 28 nominations that were considered. This table lists the acreage of the proposed areas, the values of concern that warranted the nominations, the relevance and importance criteria that each area meets (numbers and letters correspond to the lists above), and whether the area was recommended for analysis in the Draft RMP and Draft EIS or the Supplement to the Draft RMP and Draft EIS.

Additional information relevant to ACECs in the Planning Area, including the original completed ACEC Evaluation Forms and detailed maps of the existing or proposed ACECs, can be viewed in the *Areas of Critical Environmental Concern Evaluation Report*, which is available online at: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn/docs.html>.

Table F-3. Summary Results of the ACEC Evaluation Process

Area	Acres	Value(s) of Concern	Relevance Criteria ¹	Importance Criteria ¹	Recommended	Comments
<i>Existing ACECs (no expansion proposed)</i>						
Big Cedar Ridge	264	Paleontological	1	A, B	Yes	The area contains abundant paleontological resources, in particular, fossilized plants. Sites with such in situ preservation of entire plant communities are extremely rare, both regionally and nationally.
Red Gulch Dinosaur Tracksite	1,798	Paleontological	1, 3	A, B	Yes	The area contains the largest tracksite in Wyoming, and one of only a few worldwide from the Middle Jurassic Period.
Sheep Mountain Anticline	11,520	Geologic; Caves; Cultural; Scenic	1, 3	A, B	Yes	This area is composed of a classic Laramide anticline featured in textbooks nationwide and studied by geology classes from all over the world. The area also contains several caves, some of international significance, which provide recreational, educational, and research opportunities.
Spanish Point Karst	6,298	Caves; Recreational; Sinking Stream Segments; Water Quality	1, 3	A, B	Yes	The cave/karst system in the area is an important recharge area for the Madison aquifer. The area also contains recreational qualities due to good public access, scenic values, and varied potential recreation activities (primarily hiking, rock climbing, and caving).
<i>Existing ACECs with Proposed Expansions</i>						
Brown/Howe (existing)	5,501	Paleontological	1, 3	A, B	Yes	This area contains paleontological values in the form of dinosaur fossils (primarily of Jurassic age), most notably from the suborder Theropoda and Sauropoda.
Brown/Howe (proposed expansion)	15,233	Paleontological	1, 3	A, B	Yes	The values of the expansion area are similar to the existing, but also includes vertebrate fossils and scientifically important paleobotanical, palynological (pollen), mammalian fossil, and dinosaur eggshell site resources.
Carter Mountain (existing)	10,867	Vegetation; Wildlife	1, 2, 3	B	Yes	This area contains alpine tundra and rare plants, and also includes for big game habitat (crucial winter range).
Carter Mountain (proposed expansion)	5,707	Cultural; Recreational; Special Status Species; Vegetation; Watershed; Wildlife; Soils	1, 2, 3, 4	A, B, C	Yes	The values of the expansion area are similar to the existing, but also include habitat for wildlife transition, and summer ranges. The area also includes special status species, and fragile and unstable soils and intense weather conditions that can cause hazards to visitors.

Table F-3. Summary Results of the ACEC Evaluation Process (Continued)

Area	Acres	Value(s) of Concern	Relevance Criteria ¹	Importance Criteria ¹	Recommended	Comments
Five Springs Falls (existing)	163	Recreational; Scenic; Special Status Species	1, 3	A, B	Yes	Five Springs Falls area provides unique habitat for four plant species that are known to occur only in Wyoming and one other state. This unique habitat is composed of vertical cliff walls that are kept moist by spray from the waterfall. The Five Springs Falls Campground and waterfalls in the area are of recreational and scenic value.
Five Springs Falls (proposed expansion)	1,646	Geologic; Scenic; Public Safety	1, 3, 4	A, B	Yes	Geologic strata situated in the proposed ACEC expansion have been severely uplifted, folded, and faulted, resulting in an area of exceptional scenic and geologic interest and value; the steep topography is unstable, and downslope movements of soil and rock presents a public safety risk.
Little Mountain (existing)	21,476	Caves; Cultural; Paleontological; Scenic	1, 3	A, B, E	Yes	The karst topography has resulted in the capture and preservation of animal fossils, and the area contains sites from Prehistoric occupation. The mine shafts and tailings from uranium mining are a safety hazard.
Little Mountain expansion area (proposed expansion)	50,575	Wildlife; Special Status Species; Recreational; Vegetation; Scenic	1, 2, 3	A, B, C	Yes	This area contains big game seasonal and migration corridors, and known or potentially occurring BLM Sensitive Species and rare plant species habitat; these habitats are under threat from invasive species, human development, and livestock-wildlife disease transfer. The area includes numerous cultural sites (e.g., rock shelters, vision quest sites) and is an important area for hunting, fishing, wildlife viewing, and scenic geologic features.
Upper Owl Creek Area (existing)	13,758	Cultural; Fish; Recreational; Scenic; Soils; Special Status Species; Vegetation; Wildlife	1, 2, 3	A, B	Yes	The ACEC contains wildlife resources and special status species (including migratory birds, wolves, grizzly bears, moose, and wolverines), cultural resources, and primitive recreational opportunities (e.g., hiking, camping, fishing, and horseback riding). Vegetation communities include endemic plant species growing in “moonscapes” where rocky, sparsely-vegetated soils support low-growing, cushion plant communities, as well as forested areas that include old-growth tree stands.
Upper Owl Creek Area (proposed expansion)	18,975	Cultural; Fish; Recreational; Scenic; Soils; Special Status Species; Vegetation; Wildlife	1, 2, 3	A, B	Yes	The values of the expansion area are similar to the existing.

Table F-3. Summary Results of the ACEC Evaluation Process (Continued)

Area	Acres	Value(s) of Concern	Relevance Criteria ¹	Importance Criteria ¹	Recommended	Comments
<i>Proposed ACECs</i>						
Black-tailed Prairie Dog Complex	182	Wildlife; Special Status Species	2, 3	-	No	The area met the relevance criteria for fish and wildlife resources (black-tailed prairie dog, a species that has been petitioned for listing under the ESA) and natural process (potential habitat for black-footed ferret, an Endangered species). It did not meet the importance criteria because special management attention is not required to protect the black-tailed prairie dog complex; standard and routine management prescriptions afforded to special status wildlife species are sufficient.
Chapman Bench	23,326	Special Status Species; Vegetation; Wildlife	2, 3	A, B, C	Yes	The area contains sagebrush habitat used by sensitive bird species and other wildlife.
Clarks Fork Basin/Polecat Bench West Paleontological Area	23,895	Paleontological; Scenic	1, 3	A, B	Yes	The area contains a stratigraphic contact zone and the paleontological and geochemical values associated with these rock layers that are exposed in only a few areas worldwide.
Clarks Fork Canyon	12,249	Geologic; Open Space; Recreational; Special Status Species; Wildlife	2, 3	A, B	Yes	The area contains geologic, crucial winter range for big game, one of only two ranges for mountain goats in the state and one of the largest bighorn sheep ranges in the country, special status species habitat (including plant, sagebrush obligate wildlife, and Yellowstone cutthroat trout), open space, and recreational resources and uses including along the Clarks Fork of the Yellowstone River.
Fifteen Mile and Manderson White-tailed Prairie Dog Complex	7,917	Wildlife; Special Status Species	2	-	No	The area met the relevance criteria for fish and wildlife resources (BLM Sensitive white-tailed prairie dog). It did not meet the importance criteria special management attention is not required to protect the white-tailed prairie dog complex; standard and routine management prescriptions afforded to special status wildlife species are sufficient.
Foster Gulch Paleontological Area	27,302	Paleontological; Scenic	1, 3	A, B	Yes	The area contains a stratigraphic contact zone and the paleontological and geochemical values associated with these rock layers that are exposed in only a few areas worldwide.

Table F-3. Summary Results of the ACEC Evaluation Process (Continued)

Area	Acres	Value(s) of Concern	Relevance Criteria ¹	Importance Criteria ¹	Recommended	Comments
Greater Sage-Grouse Priority Habitat Management Areas	1,116,698	Special Status Species; Vegetation	2, 3	A, B, C	Yes	The area contains sagebrush habitat used by sensitive bird species and other wildlife, including the greater sage-grouse, a candidate species for listing under provisions of the ESA. These habitats are under threat from surface disturbance associated with mineral (including gravel pits) and ROW development, renewable energy developments, heavy recreational and motorized vehicle use, and invasive and nonnative species infestations. These activities threaten important greater sage-grouse habitats, including breeding, later brood-rearing, and winter concentration areas.
Greater Sage-Grouse Key Habitat Area	1,232,583	Special Status Species; Vegetation	2, 3	A, B, C	Yes	Same as above.
McCullough Peaks South Paleontological Area	6,994	Paleontological; Scenic	1, 3	A, B	Yes	The area contains a stratigraphic contact zone and the paleontological and geochemical values associated with these rock layers that are exposed in only a few areas worldwide.
McCullough Peaks/ YU Bench	298,402	Scenic; Historic; Cultural; Wildlife; Recreational; Geologic	1, 2, 3, 4	-	No	The area met the relevance criteria for significant historic, cultural, or scenic value; fish and wildlife resources; natural process or system (for sage-grouse and wild horse habitat and geology); and natural hazards. It did not meet the importance criteria as management concerns are similar to other locations and can be addressed through other means (e.g., Herd Management Areas).
Rainbow Canyon	1,433	Paleontological; Geologic; Scenic	1, 3	A, B	Yes	The area contains scenic and geologic resources, as well as paleontological resources that include dinosaurian and paleobotanical fossils.
Rattlesnake Mountain	19,137	Special Status Species; Vegetation; Wildlife	2, 3	A, B, C	Yes	The area contains wildlife habitat (big game seasonal habitat and migration corridors), vegetation communities associated with the volcanic and limestone soils, and special status wildlife and plant species habitat.
Sheep Mountain	25,153	Vegetation; Wildlife; Special Status Species	1, 2, 3	A, B, C	Yes	The area contains wildlife habitat (big game seasonal habitat and migration corridors) and vegetation communities associated with the volcanic and limestone soils.

Table F-3. Summary Results of the ACEC Evaluation Process (Continued)

Area	Acres	Value(s) of Concern	Relevance Criteria ¹	Importance Criteria ¹	Recommended	Comments
Shoshone River Parcels	424	Wildlife	1, 2, 3, 4	-	No	The area contains riparian and river related values. Met the relevance criteria for significant historic, cultural, or scenic value; fish and wildlife resources; natural process or system; and natural hazards. It did not meet the importance criteria as management and other concerns are similar to other riparian areas in the Planning Area.

APPENDIX G

LEASE STIPULATIONS, INCLUDING EXCEPTION, MODIFICATION, AND WAIVER CRITERIA

1.0 INTRODUCTION

This appendix lists the stipulations applicable under the Bureau of Land Management's (BLM's) Proposed Resource Management Plan (RMP) (Alternative D) on oil and gas leasing referenced in Chapter 2 of this Proposed RMP and Final Environmental Impact Statement (EIS).

The RMP determines which areas of the Planning Area are open to fluid mineral leasing, including the constraints or conditions open areas are subject to, and which areas are closed to fluid mineral leasing. Alternative D proposes to close the following areas to mineral leasing: Wilderness Study Areas, recommended Wild and Scenic Rivers, and certain Special Recreation Management Areas (Burnt Hollow, Dry Creek Petrified Tree, Middle Fork Powder River, Mosier Gulch, and Hole-in-the-Wall).

In areas open to leasing, the BLM may impose lease stipulations. A lease stipulation is a condition of lease issuance that provides a level of protection for other resource values or land uses by restricting lease operations during certain times or locations, or to avoid unacceptable impacts, to an extent greater than standard lease terms or regulations. These resource values and land uses generally include air, wildlife, soil, water, recreation, visual, and cultural resources. A stipulation is an enforceable term of the lease contract, which supersedes any inconsistent provisions of the standard lease form, and is attached to and made a part of the lease. Lease stipulations further implement the BLM's regulatory authority to protect resources or resource values. Lease stipulations are developed through the land use planning process. "The authorized officer may require stipulations as conditions of lease issuance. Stipulations shall become part of the lease and shall supersede inconsistent provisions of the standard lease form. Any party submitting a bid... shall be deemed to have agreed to stipulations applicable to the specific parcel..." (43 CFR 3101.1-3).

Exceptions, waivers, and modifications provide an effective means of applying "Adaptive Management" techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The criteria for approval of exceptions, waivers, and modifications should be supported by National Environmental Policy Act (NEPA) analysis, either through the land use planning process or site-specific environmental review.

This appendix identifies fluid mineral lease stipulations and addresses the procedure for providing exceptions, modifications, and waivers of lease stipulations. Procedures for changing Conditions of Approval (COAs) placed on surface disturbance and disruptive activity authorizations to protect resource values are the same. The BLM cannot apply a NSO restriction after lease issuance. The BLM can apply TLS and CSU restrictions, as COAs on an Application for Permit to Drill (APD) consistent with lease rights. The criteria for exceptions to COAs on APDs is the same as that for leasing in Table G-1. Additionally, COAs on APDs do not apply to other portions of the lease such as maintenance and operation of existing facilities.

The RMP serves as the vehicle for explaining the conditions under which waivers, exceptions, or modifications of lease stipulations may be granted.

Definitions

The three types of surface stipulations the BLM applies are: (1) no surface occupancy (NSO), (2) timing limitation stipulation (TLS), and (3) controlled surface use (CSU).

- **NSO:** Use or occupancy of the land surface for fluid mineral exploration or development is prohibited in order to protect identified resource values. The minerals under NSO lands may potentially be developed by directionally or horizontally drilling from nearby lands that do not have the NSO limitation.
- **TLS:** Prohibits surface use during a specified time period to protect identified resource values. (Seasonal restriction).
- **CSU:** Use and occupancy is allowed (unless restricted by another stipulation), but identified resource values require special operational constraints that may modify lease rights.

Surface use rights are described in more detail at 43 CFR 3101.1-2.

2.0 EXCEPTIONS, MODIFICATIONS, AND WAIVERS

An applicant may request an exception, modification, or waiver of a stipulation or restriction included in a lease or applied as a COA.

- **Exception:** A one-time exemption to a lease stipulation or COA determined on a case-by-case basis.
- **Modification:** A change to the provisions of a lease stipulation, either temporarily or for the term of the lease.
- **Waiver:** A permanent exemption to a lease stipulation.

2.1 Processing Exceptions, Modifications, and Waivers

An exception, waiver, or modification must be based on one of two criteria. According to 43 CFR 3101.1-4, “A stipulation included in an oil and gas lease shall be subject to modification or waiver only if the authorized officer determines that the factors leading to its inclusion in the lease have changed sufficiently to make the protection provided by the stipulation no longer justified or if the proposed operations would not cause unacceptable impacts.” Waiver, exceptions, or modifications must be supported by appropriate environmental analysis and documentation.

The person requesting the exception, modification, or waiver is responsible to submit a written request including information that might assist the authorized official in making a decision. The authorized officer will review the information submitted in support of the request along with other pertinent information. Requests must be submitted to the BLM field office in which the lease is located. Modification and waiver requests will be forwarded to the BLM-Wyoming Deputy State Director for Minerals and Lands along with the Field Office’s recommendation. Requests shall be subject to at least a 30-day public review if the authorized officer determines that a stipulation involves an issue of major concern to the public (43 CFR 3101.1-4).

The request is considered a unique action and is analyzed and documented individually for RMP and NEPA compliance. Processing may include coordination or consultation with the Wyoming Game and Fish Department (WGFD), U.S. Fish and Wildlife Service (USFWS), State Historic Preservation Office, or other agencies. For example, requests will not be granted for stipulations designed to protect

Threatened and Endangered species, unless the BLM consults with the USFWS and reinitiates consultation, if necessary. Consultation with other agencies requires additional time and resources to process.

The request must include the lease number and effective date, the stipulation(s) the request is for, the change in circumstances that lead the lessee or operator to believe the request is appropriate, and the name and/or number of any applicable authorization(s) (i.e., application for permit to drill, sundry, right-of-way). A map is strongly recommended. The following information must be addressed, when applicable, in the written request:

1. **WHY** the public land user wants the request. For example with a timing limitation exception request, include the reason(s) why an action could not be completed within the original stipulation period, any evidence of why the action would not adversely affect the resource or species being protected, or any other information (additional mitigation measures or alternatives) that would help the BLM (and WGFD or USFWS) in reviewing the request.
2. **WHO** is filing the request. This must include the company name, the name of the contact person, and the address, telephone number, e-mail address (if available), and fax number of the contact person.
3. **WHAT** is being requested. For example with a timing limitation request, include a detailed description of the activity including types of equipment or vehicles required and the number of trips expected.
4. **WHERE** the activity would take place. This must include the legal description of the activity and a map clearly depicting these areas. Proponent prepared Geographic Information System layers meeting BLM requirements can expedite the processing.
5. **WHEN** the activity would occur and it's duration. This must include the start date, end date, and time of day/night when activities would occur.

Requests must be made in writing and hard copy delivered to the Field Manager at the physical address of the office. When time is of the essence, the process may be initiated by fax or electronic delivery of a scanned copy but the original must be received by the Field Office within three working days. No exception, waiver, or modification will be issued until the hard copy request is received.

An exception request must be initiated near the time of the proposed activity. As a general rule, the request should be made within two weeks of conducting the proposed activity. The unpredictability of weather, animal movement and condition, and so on precludes analysis of requests related to wildlife far in advance of the time periods in question. The BLM uses a set of criteria when considering an exception request. Professional judgment plays a key part in the BLM's decisions on whether to grant exceptions. There is no clear-cut formula.

The following example describes some of the factors considered by the BLM when determining whether a request for a big game winter range timing limitation exception should be granted.

Factors Considered

1. Resource Concern
 - Animal presence or absence
 - Additional or new resource concerns
 - Potential for increased wildlife accidents or poaching

2. Animal Conditions

- Physical condition of individual animals (e.g., fat reserves)
- Local animal population condition (animal density)
- Potential for additive mortality
- Likelihood of introduction or increased incidence of disease
- Likelihood of decreased recruitment/natality

3. Climate/Weather

- Snow conditions (depth, crusting, longevity)
- Current and historic local precipitation patterns
- Current and historical seasonal weather patterns
- Recent and current wind-chill factors (indication of animals energy use)
- Duration of condition
- Short- and long-range forecasts

4. Habitat Condition and Availability

- Water and forage condition (availability, quality, and quantity)
- Competition (interspecific, intraspecific)
- Animal use of available forage
- Suitable and ample forage immediately available and accessible

5. Spatial Considerations

- Migration/travel corridors
- Winter range, foraging, calving or breeding
- Topography (plains vs. mountains)
- Topographic/geographic limitations (barriers)
- Presence of thermal cover (e.g., protection from wind)
- Proportion of range impacted
- Juxtaposition and density of other activities/disturbances in the vicinity
- Cumulative impacts

6. Timing

- When proposed activity would occur in the stipulation period
- Kind and duration of potentially disruptive activity
- Likelihood of animals habituating to the proposed activity

A determination will be fully documented in the case file with an appropriate level of environmental review after asking not one, but a series of questions, such as:

- Would the BLM remain in compliance with laws and regulations?
- Is the proposal in conformance with the objectives of the RMP?
- What would be the level of harm to the protected resource, both locally and regionally?

- What would be the economic or public safety concerns if an active operation near completion was shut in to comply with a seasonal closure? (For example: economic, multi-stage fracturing not completed; safety, casing and cementing of fresh water zones not completed.)
- Are the impacts temporary, rather than long term?
- Is the resource being protected rare, or is it relatively common? Is it a special status species?
- Based on existing knowledge of a species and its use of an area, would impacts be confined to single or a small number of individuals, or would there be impacts on local or regional populations?
- Would impacts be allowed under existing law and policy?
- Is offsite mitigation an appropriate option? (For example, where individual or cumulative impacts cannot be effectively mitigated on site?)
- Can the impacts be reduced to an acceptable level through intensive use of environmental Best Management Practices?

The following table lists RMP leasing stipulations and possible exceptions, modifications, and waivers to those stipulations under Alternative D. Table G-1 describes each stipulation, provides the Management Action record number, and the criteria for considering exceptions, modifications, and waivers.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area

Management Action	2038
Protected Resource	Absaroka Front MLP analysis area: Wildlife habitat outside elk crucial winter range
Text of Management Action	<p>Zone 1 -- outside elk crucial winter range are subject to CSU. Oil and gas-related surface disturbances are restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 32 acres. A minimum lease size of 640 noncontiguous acres of federal mineral estate would be applied outside elk crucial winter range. Smaller parcels may be leased only when 640 acres of federal mineral estate are not available and leasing is necessary to remain in compliance with laws, regulations and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements.</p> <ul style="list-style-type: none"> • Allow additional disturbance pending acceptable final reclamation. • Co-locate new disturbance where technically feasible. • Utilize unitization to minimize surface disturbance in elk crucial winter range.
Stipulation Type	CSU
RMP Acres Affected	24,500 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within Zone 1 outside elk crucial winter range of the Absaroka Front MLP analysis area ((1) Surface occupancy or use will be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 32 acres; (2) as mapped on the Cody Field Office GIS database; (3) protecting wildlife habitat in Zone 1 of the Absaroka Front MLP analysis area.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of elk. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if an environmental record of review finds that a portion of the area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the elk. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within elk habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	2039
Protected Resource	Absaroka Front MLP analysis area: Wildlife habitat inside elk crucial winter range
Text of Management Action	<p>Zones 1 and 3 -- Within elk crucial winter range, oil and gas-related surface disturbances would be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. A minimum lease size of 1,280 noncontiguous acres of federal mineral estate would be required. Total surface disturbance per lease will not exceed 64 acres. Smaller parcels may be leased only when 1,280 acres of federal mineral estate is not available and leasing is necessary to remain in compliance with laws, regulations and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements.</p> <ul style="list-style-type: none"> • Allow additional disturbance pending acceptable final reclamation. • Co-locate new disturbance where technically feasible. • Utilize unitization to minimize surface disturbance in crucial winter range.
Stipulation Type	CSU
RMP Acres Affected	49,950 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within Zones 1 and 3 inside elk crucial winter range of the Absaroka Front MLP analysis area (1) Surface occupancy or use will be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 64 acres; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting wildlife habitat in elk crucial winter range within Zones 1 and 3 of the Absaroka Front MLP analysis area.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of elk. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if an environmental record of review finds that a portion of the area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the elk. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within elk habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p>
Management Action	2040
Protected Resource	Absaroka Front MLP analysis area: Wildlife habitat adjoining USFS and State Lands
Text of Management Action	<p>Zone 2 -- Require a Master Development Plan to minimize impacts to big game crucial winter range or transitional habitat.</p> <p>Co-locate new disturbance where technically feasible.</p> <p>Utilize unitization to minimize surface disturbance in big game winter range.</p>
Stipulation Type	Lease Notice
RMP Acres Affected	4,763 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within Zone 2 of the Absaroka Front MLP analysis area (1) Prior to surface disturbance within Zone 2, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate).
Management Action	2042
Protected Resource	Absaroka Front MLP analysis area: Wildlife habitat
Text of Management Action	Zone 3 -- Apply a CSU to avoid locating new surface disturbance within forest type vegetation in areas identified as habitat for big game crucial winter range.
Stipulation Type	CSU
RMP Acres Affected	26,567 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within Zone 3 of the Absaroka Front MLP analysis area within forest type vegetation in areas identified as habitat for big game crucial winter range (1) Prior to surface disturbance within Zone 3 forest type vegetation, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <p>Design oil and gas development to avoid or reduce unnecessary disturbances to forest type vegetation.</p> <p>(2) as mapped in Worland Field Office GIS database; (3) to protect forest type vegetation in areas identified as habitat for big game crucial winter range within Zone 3 of the Absaroka Front MLP analysis area.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of big game. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if an environmental record of review finds that a portion of the area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of big game. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within big game habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.in accordance with the land use plan and/or the regulatory provisions for such changes.</p>
Management Action	2043
Protected Resource	Absaroka Front MLP analysis area: Recreation
Text of Management Action	Zone 3 -- Apply a Timing Limitation Stipulation (TLS) for surface disturbing or disruptive activity from September 1-November 15 to maintain recreational settings for hunting within the Absaroka Mountain Foothills SRMA.
Stipulation Type	TLS
RMP Acres Affected	10,584 acres
Stipulation Description	Avoid surface-disturbing and disruptive activities within Absaroka Mountain Foothills SRMA (1) September 1 to November 15; (2) as mapped on the Worland Field Office GIS database; (3) protecting recreational settings.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resource use, considering health and safety.</p> <p>Modification: This stipulation may be modified if a portion of the lease is determined by the BLM authorized officer to not be located within the Absaroka Mountain Foothills SRMA.</p> <p>Waiver: This stipulation may be waived if the BLM authorized officer determines that the entire lease is no longer managed for recreational settings for hunting or is not located within the Absaroka Mountain Foothills SRMA.</p>
Management Action	2045
Protected Resource	Fifteen Mile MLP analysis area: Recreation, conserve geologic features, LRP soils
Text of Management Action	<p>Within the Fifteen Mile MLP analysis area apply a CSU restriction. Allow no more than 1 surface disturbance per lease, to include 1 well pad and ancillary facilities, to maintain recreational settings, and conserve geologic features, LRP soils, allow no more than 1 surface disturbance per lease Total surface disturbance per lease will not exceed 32 acres. A minimum lease size of 640 noncontiguous acres of federal mineral estate would be applied within the analysis area. Smaller parcels may be leased only when 640 acres of federal mineral estate are not available and leasing is necessary to remain in compliance with laws, regulations and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements.</p> <ul style="list-style-type: none"> • Allow additional disturbance pending acceptable final reclamation. • Co-locate new disturbance where technically feasible. • Utilize unitization to control the pace and density of development.
Stipulation Type	CSU
RMP Acres Affected	180,816 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Fifteen Mile MLP analysis area (1) Surface occupancy or use will be restricted to no more than 1 surface disturbance per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 32 acres; (2) as mapped on the Worland Field Office GIS database; (3) protecting recreational setting, LRP soils, and geologic features within the Fifteen Mile MLP Analysis Area.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for geologic features or LRP soils. The BLM can and does grant exceptions if the BLM determines that granting an exception would not adversely impact the resource being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if an environmental record of review finds that a portion of the area is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the resource. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if it is determined that the site is no longer considered in the land use plan to be within LRP soils or geologic features. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	2046
Protected Resource	Fifteen Mile MLP analysis area: Recreation, conserve geologic features, LRP soils
Text of Management Action	<p>Apply a lease notice to restrict surface disturbance on LRP soils and unique geologic features unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts, which may include, but not be limited to include an Erosion, Revegetation and Restoration Plan.</p> <p>The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • The disturbed area will be stabilized with no evidence of accelerated erosion features. • The disturbed area shall be managed to ensure soil characteristics approximate an appropriate reference site with regard to erosional features to maintain soil productivity and sustainability. • Slope stability is maintained preventing slope failure and erosion. • Sufficient viable topsoil is maintained for ensuring successful final reclamation. At locations where interim reclamation will be completed, this will be accomplished by respreading all salvaged topsoil over the areas of interim reclamation. • The original landform and site productivity will be partially restored during interim reclamation and fully restored as a result of final reclamation.
Stipulation Type	Lease Notice
RMP Acres Affected	180,816 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Fifteen Mile MLP analysis area (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts, which may include, but not be limited to include an Erosion, Revegetation and Restoration Plan.</p> <p>Prior to surface disturbance on limited reclamation potential areas a site-specific construction, stabilization, and reclamation plan (Plan) must be submitted to the BLM by the applicant as a component of the APD (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The Plan must include designs approved and stamped by a licensed engineer. The operator shall not initiate surface-disturbing activities unless the BLM authorized officer has approved the Plan (with conditions, as appropriate).</p>
Management Action	2047
Protected Resource	Fifteen Mile MLP analysis area: Recreation, conserve geologic features, LRP soils
Text of Management Action	Limit off-road vehicular use for Notice of Staking (NOS) level casual use actions within the Fifteen Mile MLP analysis area. Allow off-road motorized (OHV) and mechanized (mountain bike) travel up to 300 feet from established roads in areas with limited travel designations to allow for staking activities, provided that: 1) no resource damage occurs; 2) no new routes are created; and 3) such access is not otherwise prohibited by the BLM authorized officer.
Stipulation Type	Lease Notice
RMP Acres Affected	230,699 acres
Stipulation Description	Limit off-road vehicular use for Notice of Staking (NOS) level casual use actions within the Fifteen Mile MLP analysis area. Allow off-road motorized (OHV) and mechanized (mountain bike) travel up to 300 feet from established roads in areas with limited travel designations to allow for staking activities, provided that: 1) no resource damage occurs; 2) no new routes are created; and 3) such access is not otherwise prohibited by the BLM authorized officer. Casual use within the Fifteen Mile MLP Analysis Area is allowed within 300 feet of established roadways provided that such access is not otherwise prohibited by the BLM authorized officer.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	2049
Protected Resource	Big Horn Front MLP analysis area: Wildlife migration corridors
Text of Management Action	Prohibit surface-disturbing activities within ½ mile of big game migration corridors within the Big Horn Front MLP analysis area.
Stipulation Type	NSO
RMP Acres Affected	18,698 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within ½ mile of big game migration corridors within the Big Horn Front MLP analysis area; (2) as mapped on the Cody/Worland Field Office GIS database.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation or the NSO criteria if an environmental record of review finds that a portion of the NSO area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that that the entire leasehold is greater than ½ mile from big game migration corridors within the Big Horn Front MLP Analysis Area Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p>
Management Action	2050
Protected Resource	Big Horn Front MLP analysis area: Wildlife habitat inside elk crucial winter range
Text of Management Action	<p>Within elk crucial winter range, oil and gas-related surface disturbances would be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. A minimum lease size of 1280 noncontiguous acres of federal mineral estate would be required. Total surface disturbance per lease will not exceed 64 acres. Smaller parcels may be leased only when 1280 acres of federal mineral estate is not available and leasing is necessary to remain in compliance with laws, regulations and policy; for example, to protect the federal mineral estate from drainage or to commit the federal mineral estate to unit or communitization agreements.</p> <ul style="list-style-type: none"> • Allow additional disturbance pending acceptable final reclamation. • Co-locate new disturbance where technically feasible. • Utilize unitization to minimize surface disturbance in crucial winter range.
Stipulation Type	CSU
RMP Acres Affected	81,630 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited inside elk crucial winter range within the Big Horn Front MLP analysis area (1) Surface occupancy or use will be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 64 acres; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting wildlife habitat in elk crucial winter range the Big Horn Front MLP Analysis Area.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of elk. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if an environmental record of review finds that a portion of the area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the elk. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within elk habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.</p>
Management Action	2050
Protected Resource	Big Horn Front MLP analysis area – Elk winter range
Text of Management Action	Avoid surface-disturbing and disruptive activities within elk winter range from November 15 through April 30.
Stipulation Type	TLS
RMP Acres Affected	113,688 acres
Stipulation Description	<p>Avoid surface-disturbing and disruptive activities within elk winter range (1) from Nov 15 to Apr 30; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting elk winter range.</p> <p>Exception: The BLM authorized officer may grant an exception if the operator demonstrates that the crucial winter range areas are not occupied during the period of concern, subject to confirmation by the BLM, in coordination with WGFD.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulations based upon BLM evaluation in coordination with WGFD to determine that the crucial winter range is not present or boundaries of the subject winter range areas have been refined. The BLM authorized officer may modify the area subject to the stipulations based upon BLM evaluation in coordination with WGFD to determine that the crucial winter range is not present or boundaries of the subject winter range areas have been refined.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined that the entire lease area is no longer managed as crucial winter range, in coordination with WGFD.</p>
Management Action	2051
Protected Resource	Big Horn Front MLP analysis area: Recreational settings
Text of Management Action	Limit off-road vehicular use for Notice of Staking (NOS) level casual use actions within the Big Horn Front MLP analysis area. Allow off-road motorized (OHV) and mechanized (mountain bike) travel up to 300 feet from established roads in areas with limited travel designations to allow for staking activities, provided that: 1) no resource damage occurs; 2) no new routes are created; and 3) such access is not otherwise prohibited by the BLM authorized officer.
Stipulation Type	Lease Notice
RMP Acres Affected	285,796 acres
Stipulation Description	Limit off-road vehicular use for Notice of Staking (NOS) level casual use actions within the Big Horn Front MLP analysis area. Allow off-road motorized (OHV) and mechanized (mountain bike) travel up to 300 feet from established roads in areas with limited travel designations to allow for staking activities, provided that: 1) no resource damage occurs; 2) no new routes are created; and 3) such access is not otherwise prohibited by the BLM authorized officer. Casual use within the Big Horn Front MLP Analysis Area is allowed within 300 feet of established roadways provided that such access is not otherwise prohibited by the BLM authorized officer.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	4036
Protected Resource	Water, Riparian/Wetland: Within 500 feet perennial surface water, and riparian/wetland areas
Text of Management Action	Prohibit surface-disturbing activities within 500 feet of surface water and riparian/wetland areas (97,894 acres) except when such activities are necessary and when their impacts can be mitigated.
Stipulation Type	NSO
RMP Acres Affected	120,781 acres
Stipulation Description	<p>No surface occupancy (1) within 500 feet of perennial surface water, riparian/wetland areas, and playas; (2) as mapped on the Cody and Worland Field Office GIS database.</p> <p>Exception: The authorized officer may grant an exception if, based upon an evaluation by the BLM, it is determined that the proposal would not adversely affect perennial surface waters, riparian/wetland areas and/or playas.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation if, based upon an evaluation by the BLM, it is determined that the proposal is not located within 500 feet of perennial surface waters, riparian/wetland areas and/or playas.</p> <p>Waiver: The authorized officer may grant a waiver if it is determined that the entire lease area is not within 500 feet of perennial surface waters, riparian/wetland areas and/or playas. This determination will be based upon an evaluation by the BLM.</p>
Management Action	4055
Protected Resource	Water, Riparian/Wetland, Fish and Wildlife
Text of Management Action	Apply a NSO restriction and prohibit surface-disturbing activities within 500 feet and apply a CSU and avoid surface-disturbing activities within ¼ mile of any waters rated by the WGFD as Blue Ribbon or Red Ribbon (trout streams of national or statewide importance).
Stipulation Type	CSU
RMP Acres Affected	7,033 acres
Stipulation Description	<p>Surface occupancy or use is restricted within ¼ mile of waters rated by the WGFD as Class 1 or 2 fisheries. (1) Prior to surface disturbance within ¼ mile of waters rated by the WGFD as Class 1 or 2 fisheries, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate). The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • Reserve pits should be designed to prevent possible contamination of soil and groundwater. • Drill pad sites should be designed to disperse storm water runoff onto upland sites using proper erosion and sediment control techniques. • Design road crossing of streams to allow fish passage at all flows. • Design crossings such that they do not destabilize the channel or increase water velocity. <p>(2) as mapped by the WGFD or Worland/Cody Field Office GIS database; (3) to protect designated Blue Ribbon and Red Ribbon fisheries habitat and fish populations.</p> <p>Exception: The BLM authorized officer may grant an exception if it is determined that the action is of a scale, sited in a location, or otherwise designed so that the proposed action would not result in a decline in fish abundance or range.</p> <p>Modification: The BLM authorized officer may grant a modification if it is determined that a portion of the lease is no longer located within ¼ mile of WGFD-designated Blue or Red Ribbon fisheries.</p> <p>Waiver: This stipulation may be waived if the BLM authorized officer determines that the entire leasehold is not located within ¼ mile of WGFD-designated Blue or Red Ribbon fisheries.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	4062
Protected Resource	Fish and Wildlife: Bighorn River HMP/RAMP tracts and the BLM-administered tracts in Yellowtail WHMA
Text of Management Action	Prohibit surface-disturbing and disruptive activities in the Bighorn River HMP/RAMP tracts and the BLM-administered tracts in Yellowtail WHMA and apply an NSO restriction as appropriate.
Stipulation Type	NSO
RMP Acres Affected	5,835 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within Bighorn River HMP/RAMP tracts and the BLM-administered tracts in Yellowtail WHMA (2) protecting fish and wildlife resources.</p> <p>Exception: The BLM authorized officer may grant an exception if, in coordination with the WGFD, it is determined that the action as proposed or conditioned would meet the HMP/RAMP and/or WHMA management objectives.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation or surface occupancy criteria if, in coordination with the WGFD, it is determined that a portion of the lease is not located within the Bighorn River HMP/RAMP tracts or BLM-administered tracts in Yellowtail WHMA.</p> <p>Waiver: The BLM authorized officer may grant a waiver if, in coordination with the WGFD, it is determined that the entire lease area is no longer located within the Bighorn River HMP/RAMP tracts or BLM-administered tracts in Yellowtail WHMA.</p>
Management Action	4076
Protected Resource	Fish and Wildlife: Big game crucial winter range habitat outside of Oil and Gas Management Areas
Text of Management Action	Avoid surface-disturbing and disruptive activities within big game crucial winter range (1,638,732 acres) from November 15 through April 30.
Stipulation Type	TLS
RMP Acres Affected	1,638,732 acres
Stipulation Description	<p>No surface use is allowed during the following time periods. This stipulation does not apply to operation and maintenance of production facilities.</p> <p>Timing Limitation Stipulation (TLS) (1) Nov 15 to Apr 30; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting big game on crucial winter range.</p> <p>Exception: The BLM authorized officer may grant an exception if the operator demonstrates that the crucial winter range areas are not occupied during the period of concern, subject to confirmation by the BLM, in coordination with WGFD.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulations based upon BLM evaluation in coordination with WGFD to determine that the crucial winter range is not present or boundaries of the subject winter range areas have been refined.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined that the entire lease area is no longer managed as crucial winter range, in coordination with WGFD.</p>
Management Action	4077
Protected Resource	Fish and Wildlife: Federal mineral estate within the Absaroka Front Management Area
Text of Management Action	On federal mineral estate within the Absaroka Front Management Area, apply a mix of CSU/TLS/NSO stipulations.
Stipulation Type	TLS
RMP Acres Affected	4,857 acres
Stipulation Description	No surface occupancy (1) within overlapping migration corridors and big game crucial winter range in the Absaroka Front Management Area (2) as mapped on the Worland/Cody Field Office GIS

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>database.</p> <p>Exception: The BLM authorized officer may grant an exception if the operator demonstrates that the crucial winter range areas are not occupied during the period of concern, subject to confirmation by the BLM, in coordination with WGFD.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulations based upon BLM evaluation in coordination with WGFD to determine that the crucial winter range is not present or boundaries of the subject winter range areas have been refined, or within the Absaroka Front Management Area.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined that the entire lease area is no longer managed as crucial winter range, in coordination with WGFD, or within the Absaroka Front Management Area.</p>
Management Action	4077
Protected Resource	Fish and Wildlife: Federal mineral estate within the Absaroka Front Management Area
Text of Management Action	On federal mineral estate within the Absaroka Front Management Area, apply a mix of CSU/TLS/NSO stipulations.
Stipulation Type	CSU
RMP Acres Affected	111,410 acres
Stipulation Description	<p>Surface occupancy or use is restricted within the Absaroka Front Management Area. (1) Prior to surface disturbance within big game crucial habitat, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate). The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • Design oil and gas development to avoid or reduce unnecessary disturbances, wildlife conflicts, and habitat impacts. • Plan the pattern and rate of development to avoid the most important habitats and generally reduce the extent and severity of impacts. • Cluster drill pads, roads and facilities in specific, “low-impact” areas, if geologically feasible. • Consider “liquid gathering systems” (LGS) to eliminate surface storage tanks and reduce truck trips for removal of liquids. • To the extent practicable, place infrastructure within or near previously disturbed locations. • Minimize infrastructure development and operational activity during life of field by using consolidation (e.g., “unitized”) development techniques. <p>(2) as mapped in Worland/Cody Field Office GIS database; (3) to protect big game crucial habitat.</p> <p>Exception: An exception may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action can be fully mitigated or there are not practical alternatives.</p> <p>Modification: The authorized officer may modify the boundaries of the stipulation area if (1) a portion of the area is not being used as protected range by the identified species, (2) habitat outside of stipulation boundaries is being used and needs to be protected, or (3) the migration patterns have changed causing a difference in the season of use.</p> <p>Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold can be occupied without adversely affecting the resources.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	4077
Protected Resource	Fish and Wildlife: Federal mineral estate within the Absaroka Front Management Area
Text of Management Action	On federal mineral estate within the Absaroka Front Management Area, apply a mix of CSU/TLS/NSO stipulations.
Stipulation Type	NSO
RMP Acres Affected	41,177 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within the Absaroka Front Management Area (2) protecting overlapping migration corridors and big game crucial winter range.</p> <p>Exception: The BLM authorized officer may grant an exception if, in coordination with the WGFD, it is determined that the action as proposed or conditioned would meet wildlife management objectives.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation or surface occupancy criteria if, in coordination with the WGFD, it is determined that a portion of the lease is not located within migration corridors or overlapping big game crucial winter range.</p> <p>Waiver: The BLM authorized officer may grant a waiver if, in coordination with the WGFD, it is determined that the entire lease area is no longer located within migration corridors or overlapping big game crucial winter range.</p>
Management Action	4113
Protected Resource	Special Status Species
Text of Management Action	Control surface-disturbing activities to avoid or mitigate adverse effects on about 1,300 BLM-administered surface acres of active prairie dog colonies within the Meeteetse complex. This requirement will remain in effect until completion of a site-specific activity plan being prepared to manage ferrets in this area. The restriction will then be reassessed for its continued appropriateness. This restriction applies to such things as mineral leasing, geophysical exploration (except casual use), and construction activities.
Stipulation Type	CSU
RMP Acres Affected	1,300 acres
Stipulation Description	<p>Surface occupancy or use is restricted within the Meeteetse prairie dog complex. (1) Prior to surface disturbance within the Meeteetse prairie dog complex, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate). The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • Verify the presence or absence of prairie dogs within the colony boundary. • New access roads should avoid intersecting a prairie dog colony or bisecting two adjacent colonies. • For multiple –well programs, if geologically and technically feasible, drill from the same pad using directional drilling technologies. • Salvage topsoil from all facilities and re-apply during interim and final reclamation. Native seed mixes will be required to re-establish short grass prairie vegetation during reclamation. <p>(2) as mapped by the WGFD or Worland/Cody Field Office GIS database; (3) to retain habitat characteristics within the Meeteetse prairie dog complex for black-footed ferret reintroduction.</p> <p>Exception: The BLM authorized officer may grant an exception if it is determined that the action is of a scale, sited in a location, or otherwise designed so that the proposed action would not impair the function or utility of the site for reoccupation by black-footed ferret.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation or surface occupancy criteria if, after consultation with the USFWS, it is determined that a portion of the NSO</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>area is nonessential for possible reintroduction of black-footed ferret, or is determined not to be located within the Meeteetse prairie dog complex.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined by the BLM, in consultation with the USFWS, that the entire lease area is nonessential for possible reintroduction of black-footed ferret, or it is determined the entire lease area is not located within the Meeteetse prairie dog complex.</p>
Management Action	4117
Protected Resource	Special Status Species: Within 0.6-mile radius of the perimeter greater sage-grouse leks within PHMAs
Text of Management Action	Surface occupancy and surface-disturbing activities would be prohibited on or within 0.6-mile radius of the perimeter of occupied sage-grouse leks.
Stipulation Type	NSO
RMP Acres Affected	120,019 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within 0.6-mile radius of the perimeter of occupied greater sage-grouse leks inside PHMAs (2) protection of greater sage-grouse leks within PHMAs.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Modification: The authorized officer may modify the area subject to the stipulation or the NSO criteria if an environmental record of review finds that a portion of the NSO area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within a Greater Sage-Grouse designated PHMAs or connectivity area, or Greater Sage-Grouse are no longer a BLM sensitive or special status species and are not listed by the U.S. Fish and Wildlife Service as threatened or endangered under the Endangered Species Act. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p>
Management Action	4117
Protected Resource	Special Status Species: Within ¼-mile radius of the perimeter of greater sage-grouse leks outside of PHMAs
Text of Management Action	Apply a NSO stipulation to prohibit or restrict surface-disturbing activities or surface occupancy within ¼-mile radius of the perimeter of occupied sage-grouse leks.
Stipulation Type	NSO
RMP Acres Affected	4,077 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within ¼-mile radius of the perimeter of occupied greater sage-grouse leks outside PHMA (2) protection of greater sage-grouse leks outside PHMAs.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of</p>

	<p>the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of Greater Sage-Grouse. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Modification: The authorized officer may modify the area subject to the stipulation or the NSO criteria if an environmental record of review finds that a portion of the NSO area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within a Greater Sage-Grouse designated PHMAs or connectivity area, or Greater Sage-Grouse are no longer a BLM sensitive or special status species and are not listed by the U.S. Fish and Wildlife Service as threatened or endangered under the Endangered Species Act. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p>
Management Action	4118
Protected Resource	Special Status Species: Within 0.6-mile radius of the perimeter greater sage-grouse leks within PHMAs
Text of Management Action	Restrict disruptive activity within 0.6-mile radius of the perimeter of occupied sage-grouse leks from March 15 to June 30.
Stipulation Type	TLS
RMP Acres Affected	All PHMAs – 1,446,042 acres
Stipulation Description	<p>Avoid disruptive activities within PHMAs (1) March 1 to June 30 within 0.6-mile radius of the perimeter of occupied sage-grouse leks; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting greater sage-grouse leks within PHMAs from disruptive activities.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not affect reproductive displays, nest attendance, egg or chick survival, or early brood-rearing success. Actions designed to enhance the long-term utility or availability of suitable Greater Sage-Grouse habitat may be exempted from this timing limitation. The BLM can and does grant exceptions to seasonal restrictions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Modification: The authorized officer may modify the size and shape of the TLS area or the TLS criteria if an environmental record of review indicates the actual habitat suitability for seasonal Greater Sage-Grouse activities is greater or less than the stipulated area, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the described lands are no longer considered in the land use plan to be within a Greater Sage-Grouse designated PHMAs, or are incapable of serving the long-</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	term requirements of Greater Sage-Grouse nesting habitat and that these ranges no longer warrant consideration as components of Greater Sage-Grouse nesting habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)
Management Action	4118
Protected Resource	Special Status Species: Greater sage-grouse nesting and early brood-rearing habitats inside PHMAs
Text of Management Action	Apply a TLS to prohibit or restrict surface-disturbing and/or disruptive activities in sage-grouse nesting and early brood-rearing habitat within PHMAs from March 15 to June 30.
Stipulation Type	TLS
RMP Acres Affected	All PHMAs – 1,446,042 acres
Stipulation Description	<p>Prohibit or restrict surface-disturbing and/or disruptive activities (1) March 1 to June 30; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting sage-grouse nesting and early brood-rearing habitat within PHMAs.</p> <p>Exception: An exception may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the habitat is not being used during the TLS period of concern for any given year. Additionally this restriction will not apply to maintenance and operation of existing facilities.</p> <p>Sage-grouse specific exception criteria for application of greater or lesser restrictions to short or long-term activities. Exception evaluation factors may include, but are not limited to, condition of the habitat, presence of sage-grouse or their sign, presence of other activities in the area, importance for migration or connectivity, duration and timing of proposed activity, local topography, severity and forecast of weather, beneficial aspects of the project for sage-grouse, including possible reclamation activities, and cover and forage availability.</p> <p>Modification: The authorized officer may modify the boundaries in the stipulation area if it is determined that the actual habitat suitability for nesting/early brood-rearing is greater or less than the identified boundary. Timeframes may be modified based on studies documenting local periods of actual use.</p> <p>Waiver: This stipulation may be waived, if after consultation with the WGFD, it is determined that the described lands are incapable of serving the long-term requirements of sage-grouse nesting habitat and these ranges no longer warrant consideration as components of sage-grouse nesting habitat.</p>
Management Action	4118
Protected Resource	Special Status Species: Within ¼ mile of greater sage-grouse leks outside of PHMAs
Text of Management Action	Apply a TLS to restrict disruptive activity within ¼ mile of occupied sage-grouse leks from March 15 to June 30.
Stipulation Type	TLS
RMP Acres Affected	59,456 acres
Stipulation Description	<p>Prohibit or restrict disruptive activities outside PHMAs (1) within ¼ mile of greater sage-grouse leks outside of PHMAs from March 1 to June 30; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting sage-grouse nesting and early brood-rearing habitat outside PHMAs.</p> <p>Exception: An exception may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the habitat is not being used during the TLS period of concern for any given year. Additionally this restriction will not apply to maintenance and operation of existing facilities. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Sage-grouse specific exception criteria for application of greater or lesser restrictions to short or long-term activities. Exception evaluation factors may include, but are not limited to, condition of</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>the habitat, presence of sage-grouse or their sign, presence of other activities in the area, importance for migration or connectivity, duration and timing of proposed activity, local topography, severity and forecast of weather, beneficial aspects of the project for sage-grouse, including possible reclamation activities, and cover and forage availability.</p> <p>Modification: The authorized officer may modify the boundaries in the stipulation area if it is determined that the actual habitat suitability for nesting/early brood-rearing is greater or less than the identified boundary. Timeframes may be modified based on studies documenting local periods of actual use. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived, if after consultation with the Wyoming Game and Fish Department, it is determined that the described lands are incapable of serving the long-term requirements of sage-grouse nesting habitat and these ranges no longer warrant consideration as components of sage-grouse nesting habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p>
Management Action	4118
Protected Resource	Special Status Species: Greater sage-grouse nesting and early brood-rearing habitat outside PHMAs
Text of Management Action	Apply a TLS to prohibit or restrict surface-disturbing and/or disruptive activities in sage-grouse nesting and early brood-rearing habitat within 2 miles of the lek or lek perimeter of any occupied lek from March 15 to June 30.
Stipulation Type	TLS
RMP Acres Affected	303,329 acres
Stipulation Description	<p>Prohibit or restrict surface-disturbing and/or disruptive activities in sage-grouse nesting and early brood-rearing habitat within 2 miles of the lek or lek perimeter of any occupied lek (1) from March 1 to June 30; (2) as mapped on the Worland/Cody Field Office GIS database; (3) Greater sage-grouse nesting and early brood-rearing habitat outside PHMAs.</p> <p>Exception: An exception may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the habitat is not being used during the TLS period of concern for any given year. Additionally this restriction will not apply to maintenance and operation of existing facilities. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Sage-grouse specific exception criteria for application of greater or lesser restrictions to short or long-term activities. Exception evaluation factors may include, but are not limited to, condition of the habitat, presence of sage-grouse or their sign, presence of other activities in the area, importance for migration or connectivity, duration and timing of proposed activity, local topography, severity and forecast of weather, beneficial aspects of the project for sage-grouse, including possible reclamation activities, and cover and forage availability.</p> <p>Modification: The authorized officer may modify the boundaries in the stipulation area if it is determined that the actual habitat suitability for nesting/early brood-rearing is greater or less than the identified boundary. Timeframes may be modified based on studies documenting local periods of actual use. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived, if after consultation with the Wyoming Game and Fish Department, it is determined that the described lands are incapable of serving the long-term requirements of sage-grouse nesting habitat and these ranges no longer warrant consideration as components of sage-grouse nesting habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	4119
Protected Resource	Special Status Species: Mapped greater sage-grouse winter habitats/concentration areas
Text of Management Action	Apply a TLS to prohibit or restrict surface-disturbing and disruptive activities in mapped sage-grouse winter habitats/concentration areas from December 1 to March 14.
Stipulation Type	TLS
RMP Acres Affected	167,774 acres
Stipulation Description	<p>Prohibit or restrict surface-disturbing and/or disruptive activities within sage-grouse winter concentration areas (1) from December 1 to March 14; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting Mapped greater sage-grouse winter habitats/concentration areas.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, will not impair the function and suitability of the winter concentration area, or it is determined that the winter concentration area is not occupied by concentrated populations of Greater Sage- Grouse during the period of concern. Actions designed to enhance the long-term utility or availability of suitable Greater Sage-Grouse habitat may be exempted from this timing limitation. The BLM can and does grant exceptions to seasonal restrictions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Modification: The authorized officer may modify the size and shape of the TLS area or the TLS criteria if an environmental record of review indicates the actual habitat suitability for seasonal Greater Sage-Grouse activities is greater or less than the stipulated area, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p> <p>Waiver: This stipulation may be waived over the entire lease if, in coordination with the State wildlife agency, it is determined that the described lands are incapable of serving the long-term requirements of Greater Sage-Grouse winter habitat and that these ranges no longer warrant consideration as components of Greater Sage-Grouse winter habitat. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see BLM Manuals 1624 and 3101.)</p>
Management Action	4120
Protected Resource	Special Status Species: Density Disturbance within PHMAs
Text of Management Action	In greater sage-grouse PHMAs, limit the density of disturbances to an average of one oil and gas or mining facility per 640 acres. The one location and cumulative value of existing disturbances would not exceed 5 percent of habitat. Utilize the most current greater sage-grouse density disturbance process or other state and/or federal agreed upon process for compliance evaluations. Inside PHMA, all suitable habitat disturbed (any program area) will not exceed 5 percent within the Disturbance Density Calculation Tool (DDCT) area using the DDCT process.
Stipulation Type	CSU
RMP Acres Affected	All PHMAs – 1,446,042 acres
Stipulation Description	Surface occupancy or use will be restricted to (1) no more than an average of one disturbance facility per 640 acres using the DDCT, and the cumulative value of all applicable surface disturbances, existing or future, must not exceed 5 percent of the DDCT area, as described in the DDCT; (2) as calculated using the DDCT; (3) To protect Greater Sage-Grouse designated PHMAs

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>from habitat fragmentation and loss.</p> <p>This lease does not guarantee the lessee the right to occupy the surface of the lease for the purpose of producing oil and natural gas within Greater Sage-Grouse designated PHMAs. The surface occupancy restriction criteria identified in this stipulation may preclude surface occupancy and may be beyond the ability of the lessee to meet due to existing surface disturbance on Federal, State, or private lands within designated PHMAs or surface disturbance created by other land users. The BLM may require the lessee or operator to enter into a unit agreement or drilling easement to facilitate the equitable development of this and surrounding leases.</p> <p>Exception: The authorized officer may grant an exception if an environmental record of review determines that, the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life history, or behavioral needs of Greater Sage-Grouse. An exception to the stated limits may be granted when offsite mitigation is determined to provide an overall beneficial effect to Greater Sage-Grouse habitat and populations. The BLM can and does grant exceptions if the BLM, in coordination with the WGFD, determines that granting an exception would not adversely impact the population being protected. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see Bureau of Land Management Manuals 1624 and 3101.)</p> <p>Modification: The authorized officer may modify the area subject to the stipulation or surface occupancy criteria if an environmental record of review finds that a portion of the CSU area is nonessential, or it is identified through scientific research or monitoring that the existing criteria are inadequate or overly protective for maintaining the function or utility of the site for the seasonal habitat, life-history, or behavioral needs of the Greater Sage-Grouse, including (but not limited to) reproductive display, daytime loafing/staging activities, and nesting. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see Bureau of Land Management Manuals 1624 and 3101.)</p> <p>Waiver: The authorized officer may grant a waiver if it is determined by the BLM, in coordination with the State wildlife agency, it is determined that the site is no longer considered in the land use plan to be within a Greater Sage-Grouse designated PHMAs or Greater Sage-Grouse are no longer a BLM sensitive or special status species and are not listed by the U.S. Fish and Wildlife Service as threatened or endangered under the Endangered Species Act. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. (For guidance on the use of this stipulation, see Bureau of Land Management Manuals 1624 and 3101.)</p>
Management Action	4123
Protected Resource	Special Status Species: Nesting Raptors
Text of Management Action	<p>To protect nesting raptors, apply a TLS on 126,241 acres to prohibit surface-disturbing and disruptive activities within:</p> <ul style="list-style-type: none"> • ¼ mile of active raptor nests and ½ mile of active golden eagle, bald eagle, northern goshawk, merlin, and prairie and peregrine falcon nests during specific species nesting period or until young birds have fledged. See Appendix K for species nesting periods. • 1 mile of active ferruginous hawk nests from March 1 to July 31 or until young birds have fledged.
Stipulation Type	TLS
RMP Acres Affected	113,826 acres
Stipulation Description	<p>No surface use is allowed within ¼ mile of active raptor nests and ½ mile of active golden eagle, bald eagle, northern goshawk, merlin, and prairie and peregrine falcon nests and 1 mile of active ferruginous hawk nests during specific species nesting period or until young birds have fledged. This stipulation does not apply to operation and maintenance of production facilities.</p> <p>Timing Limitation Stipulation (1) during the following time periods:</p> <ul style="list-style-type: none"> • American Kestrel April 1 – August 15

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<ul style="list-style-type: none"> • Bald Eagle January 1 – August 15 • Boreal Owl February 1 – July 31 • Burrowing Owl April 1 – September 15 • Common Barn Owl February 1 – September 15 • Cooper's Hawk March 15 – August 31 • Eastern Screech-owl March 1 – August 15 • Ferruginous Hawk March 15 – July 31 • Golden Eagle January 15 – July 31 • Great Gray Owl March 15 – August 31 • Great Horned Owl December 1 – September 31 • Long-eared Owl February 1 – August 15 • Merlin April 1 – August 15 • Northern Goshawk April 1 – August 15 • Northern Harrier April 1 – August 15 • Northern Pygmy-Owl April 1 – August 1 • Northern Saw-whet Owl March 1 – August 31 • Osprey April 1 – August 31 • Peregrine Falcon March 1 – August 15 • Prairie Falcon March 1 – August 15 • Red-tailed Hawk February 1 – August 15 • Sharp-shinned Hawk March 15 – August 31 • Short-eared Owl March 15 – August 1 • Swainson's Hawk April 1 – August 31 • Western Screech-owl March 1 – August 15 • All other raptors February 1 – July 31 <p>(2) as mapped on the Worland/Cody Field Office GIS database or as determined by field evaluation; (3) protecting active raptor nests.</p> <p>Exception: The BLM authorized officer may grant an exception if it is determined that the raptor nest(s) are not active or the proposed action is of a scale, sited in a location, or otherwise designed so that the proposed action would not disturb (be likely to cause: physical injury; a decrease in productivity by substantially interfering with normal breeding, feeding, or sheltering behavior; or nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior) nesting raptors of conservation concern. The determination may include consultation with the WGFD or USFWS.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulations based upon a BLM evaluation in coordination with WGFD and/or USFWS, as necessary. The stipulation may be modified based on negative or positive monitoring results; or if it is determined that the action will not impair the function or the suitability of the habitat, or cause nest abandonment.</p> <p>Waiver: The stipulation may be waived if the BLM authorized officer determines that the entire lease area does not include seasonal buffer zones for nests of raptor species of conservation concern. This determination shall be based upon field studies of the area by a qualified representative and subject to confirmation from BLM, in coordination with the WGFD and/or USFWS, as necessary.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	4123
Protected Resource	Special Status Species: ¼ mile from raptor nest sites
Text of Management Action	To protect the actual nest site, apply a year-round CSU stipulation within ¼ mile of all raptor nests (47,651 acres).
Stipulation Type	CSU
RMP Acres Affected	57,897 acres
Stipulation Description	<p>Surface occupancy or use within ¼ mile of raptor nest sites will be restricted. (1) Prior to surface disturbance within ¼ mile of raptor nests a mitigation plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator may not initiate surface disturbing activities unless the BLM authorized officer has approved the plan or approved it with conditions. The plan must demonstrate to the BLM authorized officer’s satisfaction that nesting raptors of conservation concern would not be agitated or bothered to a degree that causes or is likely to cause:</p> <ul style="list-style-type: none"> • physical injury; • a decrease in productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior; or • nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior, or preclude nest reoccupation; <p>(2) as mapped on the Worland/Cody Field Office GIS database or determined by BLM field evaluation; (3) protecting raptor nest sites.</p> <p>Exception: The BLM authorized officer may grant an exception if a staff review determines that the proposed action is of a scale, sited in a location, or otherwise designed so that the proposed action would not result in a failure to meet the performance standards above. The determination may include coordination with the WGFD and/or USFWS.</p> <p>Modification: A modification may be granted if the BLM authorized officer determines that portions of the leasehold can be occupied without adversely affecting the nest site or suitable nesting habitat, based on topography, species, season of use, and other pertinent factors. The determination may include coordination with the WGFD and/or USFWS.</p> <p>Waiver: The stipulation may be waived if the BLM authorized officer determines that the entire lease area is not within ¼ mile of a raptor nest or suitable nesting habitat. This determination shall be based upon a field evaluation of the area by a qualified representative and subject to confirmation from the BLM. Confirmation may include coordination with the WGFD and/or USFWS.</p>
Management Action	4124 and 7087
Protected Resource	Special Status Species: Chapman Bench Management Area
Text of Management Action	<p>Manage a portion of the Chapman Bench area as the Chapman Bench Management Area (3,425 acres of BLM-administered surface ownership):</p> <ul style="list-style-type: none"> • manage for the retention and success of the mountain plover, long-billed curlew, and other sensitive species habitat • apply a NSO restriction
Stipulation Type	NSO
RMP Acres Affected	3,425 acres
Stipulation Description	<p>No surface occupancy or use is allowed (1) within the Chapman Bench Management Area as mapped on the Cody Field Office GIS database; (2) protecting mountain plover, long-billed curlew, and other sensitive species habitat.</p> <p>Exception: The BLM authorized officer may grant an exception if it is determined that the action, as proposed or conditioned, would not impair the function or utility of sensitive species habitats, in</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>coordination with the WGFD.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation or surface occupancy criteria if after coordination with the WGFD is the BLM determines that the NSO area is not located in habitat for sensitive species.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined by the BLM, in coordination with the WGFD, that the lease area is not located within the Chapman Bench Management Area.</p>
Management Action	4127
Protected Resource	Special Status Species: Sage Creek Prairie Dog Town
Text of Management Action	Implement conservation measures outlined in the Biological Evaluation for black-tailed prairie dogs in the Sage Creek Prairie Dog Town. Apply an NSO restriction on the Sage Creek Prairie Dog Town.
Stipulation Type	NSO
RMP Acres Affected	182 acres
Stipulation Description	<p>No surface occupancy is permitted within the Sage Creek Prairie Dog Town (1) as mapped on the Cody Field Office GIS database; (2) protection of prairie dog habitat.</p> <p>Exception: The BLM authorized officer may grant an exception if it is determined that the action, as proposed or conditioned, would not impair the function or utility of sensitive species habitats, in coordination with the WGFD.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation or surface occupancy criteria if after coordination with the WGFD is the BLM determines that the NSO area is not located in habitat for sensitive species.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined by the BLM, in coordination with the WGFD, that the lease area is not located within complexes are suitable for black-footed ferret reintroduction.</p>
Management Action	4133
Protected Resource	Surface Water: Riparian habitat supporting special status fish species
Text of Management Action	Prohibit surface-disturbing activities within 500 feet and avoid surface-disturbing activities within ¼ mile of perennial surface water and riparian/wetland areas except when their impacts can be mitigated to an acceptable level.
Stipulation Type	CSU
RMP Acres Affected	277,744 acres
Stipulation Description	<p>Surface occupancy or use within ¼ mile of perennial surface water, and riparian/wetland areas will be restricted where determined to support special status fish species. (1) Prior to surface disturbance within ¼ mile of waters of the state, perennial surface water, and riparian/wetland areas where determined to support special status fish species, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate). The plan must demonstrate to the BLM authorized officer’s satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • Prevent contamination of soil and groundwater. • Upland sites are protected from storm water runoff using proper erosion and sediment control techniques. • Stabilization of channel crossings. <p>(2) as mapped on the Worland/Cody Field Office GIS database; (3) to protect waters of the state, perennial surface water, and riparian/wetland areas.</p> <p>Exception: An exception may be granted by the authorized officer if the operator submits a plan that demonstrates that impacts from the proposed action can be fully mitigated or there are not</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>practical alternatives.</p> <p>Modification: Consider modifications if (1) there are no practical alternatives, (2) impacts can be fully mitigated, and (3) the action is designed to enhance the protected resource(s).</p> <p>Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold can be occupied without adversely affecting riparian resources.</p>
Management Action	4153
Protected Resource	Wild Horses: McCullough Peaks and Fifteenmile HMAs foaling season
Text of Management Action	Avoid and discourage organized special recreation permits using domestic horses in the McCullough Peaks and Fifteenmile HMAs.
Stipulation Type	TLS
RMP Acres Affected	180,371 acres
Stipulation Description	<p>No surface use is allowed (1) Feb 1 to July 31; (2) within the McCullough Peaks and Fifteenmile HMAs as mapped on the Worland/Cody Field Office GIS database; (3) protecting McCullough Peaks and Fifteenmile HMAs foaling season.</p> <p>Exception: The BLM authorized officer may grant an exception the BLM determines the area is not likely to be occupied during the period of concern and the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulations based upon BLM determination that suitable foaling range is not present or boundaries of the HMA have changed.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined that the entire lease area is no longer within the HMA, or is not located within suitable foaling range.</p>
Management Action	5014
Protected Resource	Cultural Resources: Legend Rock Petroglyph Site
Text of Management Action	Apply a NSO restriction on the Legend Rock Petroglyph Site.
Stipulation Type	NSO
RMP Acres Affected	783 acres
Stipulation Description	<p>No surface occupancy or use is permitted allowed on within the designated Legend Rock Petroglyph Site.</p> <p>No Surface Occupancy (NSO) (1) within the designated Legend Rock Petroglyph site as mapped on the Worland Field Office GIS database; (2) for the protection of cultural resources.</p> <p>Exception: The BLM authorized officer may grant an exception if, after consultation with Indian tribes and SHPO, it is determined that the proposed action will result in a no adverse effect determination to the sacred, spiritual, and/or traditional nature of the property(s).</p> <p>Modification: This stipulation may be modified by the BLM authorized officer if, in consultation with Indian tribes and SHPO, the site is no longer considered eligible for NRHP or if, in consultation with Indian tribes and SHPO, it is determined that the identified property’s sacred, spiritual, and/or traditional values have been downgraded and/or the tribes have reduced the previous avoidance distance around the site.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined, in consultation with Indian tribes and SHPO, that the identified site is no longer considered sacred, spiritual, and/or traditional.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	5021
Protected Resource	Cultural Resources: Foreground of important cultural sites (defined in Glossary) up to 3 miles or the visual horizon
Text of Management Action	Avoid surface-disturbing activities and protect the foreground of important cultural sites (defined in Glossary) up to 3 miles or the visual horizon whichever is closer (the SCZ) where setting is an important aspect of the integrity for the site. Use BMPs (Appendix L) to avoid or mitigate adverse effects.
Stipulation Type	CSU
RMP Acres Affected	25,733 acres
Stipulation Description	<p>(1) Surface occupancy or use will be restricted to no more than 1 location per lease, to include 1 well pad and ancillary facilities. Total surface disturbance per lease will not exceed 32 acres; (2) as mapped on the Cody Field Office GIS database; (3) protecting wildlife habitat in Zone 1 of the Absaroka Front MLP analysis area.</p> <p>Exception: The BLM authorized officer may grant an exception if, after consultation with Indian tribes and/or SHPO, it is determined that the proposed action will result in a no adverse effect determination to the sacred, spiritual, and/or traditional nature of the property(s).</p> <p>Modification: This stipulation may be modified by the BLM authorized officer if, in consultation with Indian tribes and SHPO, the site is no longer considered eligible for NRHP or if, in consultation with Indian tribes and/or SHPO, it is determined that the identified property's sacred, spiritual, and/or traditional values have been downgraded and/or the tribes have reduced the previous avoidance distance around the site.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined, in consultation with Indian tribes and/or SHPO, that the identified site is no longer considered sacred, spiritual, and/or traditional.</p>
Management Action	5049
Protected Resource	VRM: Class II
Text of Management Action	Allow surface-disturbing activities in areas managed as VRM Class II only if the level of change to the landscape from the activities are low, and will not attract the attention of the casual observer, or the project can be mitigated to meet these objectives.
Stipulation Type	CSU
RMP Acres Affected	1,163,380 acres
Stipulation Description	<p>Controlled Surface Use (CSU) --Surface occupancy or use will be restricted within Class I and/or Class II Visual Resource Management VRM) areas. (1) Prior to surface disturbance within Visual Resource Management Class I and/or II areas, a site-specific plan must be submitted to the BLM by the applicant as a component of the Application for Permit to Drill (BLM Form 3160-3) or Sundry Notice (BLM Form 3160-5) – Surface Use Plan of Operations. The operator shall not initiate surface disturbing activities unless the BLM authorized officer has approved the plan (with conditions, as appropriate). The plan must demonstrate to the BLM authorized officer's satisfaction how the operator will meet the following performance standards:</p> <ul style="list-style-type: none"> • A visual contrast rating must demonstrate that VRM Class I and/or II objectives will be met. • Where required by the BLM authorized officer, a visual simulation must be prepared and must demonstrate that VRM Class I and/or II objectives will be met through practices such as siting of permanent facilities. • Where present and feasible, existing surface disturbances shall be utilized; new surface disturbances shall be minimized to the extent practicable. • All permanent above-ground facilities (such as production tanks or other production facilities) not having specific coloration requirements for safety must be painted or designed using a BLM-approved color.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>(2) as mapped in the Worland/Cody Field Office GIS database; (3) protecting Class II Visual Resource Management Areas.</p> <p>Exception: The BLM authorized officer may grant an exception if it is demonstrated through a BLM-approved visual simulation and contrast rating worksheet that the project or identified mitigation will meet or exceed VRM Class I or II objectives. This restriction does not apply to temporary structures such as drilling rigs.</p> <p>Modification: The BLM authorized officer may modify the area subject to the stipulation if it is demonstrated that VRM Class I or II objectives have been modified through appropriate RMP planning procedures, or if a portion of the lease is not located within a VRM Class II area.</p> <p>Waiver: The BLM authorized officer may grant a waiver if it is determined that the entire leasehold is no longer managed for VRM Class I or II objectives based on planning, or if the entire leasehold is not located within a Class I or II area.</p>
Management Action	6067
Protected Resource	Recreational Resources: Campgrounds, trailheads, day use areas, and similar recreation sites
Text of Management Action	<p>Apply a NSO restriction at the time of lease offering on the following:</p> <ul style="list-style-type: none"> • Fishing and hunting access areas (8,034 acres) • Five Springs Falls Campground (approximately 372 acres) • The Cody Archery Range (374 acres) • Lovell Rod and Gun Club shooting range (139 acres) • Areas within ¼ mile of campgrounds, trailheads, day use areas, and similar recreational sites
Stipulation Type	NSO
RMP Acres Affected	<p>Fishing and hunting access areas (8,034 acres)</p> <p>Five Springs Falls Campground (approximately 372 acres)</p> <p>The Cody Archery Range (374 acres)</p> <p>R&PP lease the Lovell Rod and Gun Club shooting range (139 acres)</p>
Stipulation Description	<p>No surface occupancy or use is permitted (1) on developed recreation sites (2) for the protection of designated campgrounds, trailheads, day use areas, and similar recreation sites.</p> <p>Exception: An exception to this stipulation may be granted by the BLM authorized officer if the BLM determines that the function and utility of the recreational resources are not adversely affected.</p> <p>Modification: The BLM authorized officer may modify the stipulation if the boundaries of recreational sites are changed or a portion of the lease area is determined not to be located within a designated recreational site.</p> <p>Waiver: This BLM authorized officer may waive this stipulation if it is determined that the entire leasehold no longer contains developed recreation areas.</p>
Management Action	6077
Protected Resource	Scenic and Recreational Resources: Absaroka Mountain Foothills SRMA
Text of Management Action	Apply a CSU stipulation on the Absaroka Mountain Foothills SRMA and Absaroka ERMA.
Stipulation Type	CSU
RMP Acres Affected	71,705 acres
Stipulation Description	<p>Surface occupancy or use will be restricted within the Absaroka Mountain Foothills SRMA and Absaroka ERMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	Resources and ensuring the recreational opportunities and setting of the SRMA. Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.
Management Action	6087
Protected Resource	Scenic and Recreational Resources: Areas within the Bighorn River SRMA and Bighorn River ERMA
Text of Management Action	Apply an NSO restriction on lands within the Bighorn River SRMA and the Bighorn River ERMA.
Stipulation Type	NSO
RMP Acres Affected	3,976 acres
Stipulation Description	No surface occupancy is permitted (1) on lands within the Bighorn River SRMA and the Bighorn River ERMA (2) protecting the Bighorn River SRMA and the Bighorn River ERMA. Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes. Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights. Any changes to this stipulation will be made in accordance with the land use plan and/or the regulatory provisions for such changes.
Management Action	6109
Protected Resource	Scenic and Recreational Resources: Tatman Mountain RMZ
Text of Management Action	Apply a CSU stipulation on the Tatman Mountain RMZ.
Stipulation Type	CSU
RMP Acres Affected	49,393 acres
Stipulation Description	Surface occupancy or use will be restricted or prohibited within the Tatman Mountain RMZ (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA. (2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA. Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	6127
Protected Resource	Scenic and Recreational Resources: Canyons RMZ
Text of Management Action	Apply a CSU stipulation on the Canyons RMZ.
Stipulation Type	CSU
RMP Acres Affected	3,679 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Canyons RMZ (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6148
Protected Resource	Scenic and Recreational Resources: Brokenback/Logging Road RMZ
Text of Management Action	Apply a CSU stipulation on the Brokenback/Logging Road RMZ.
Stipulation Type	CSU
RMP Acres Affected	49,328 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Brokenback/Logging Road RMZ (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6159
Protected Resource	Scenic and Recreational Resources: Middle Fork of the Powder River SRMA
Text of Management Action	<p>Apply a CSU stipulation on the Middle Fork of the Powder River SRMA.</p> <p>Review mineral leases on a case-by-case basis and apply mitigation through activity level planning in the Southern Bighorns ERMA.</p>
Stipulation Type	CSU
RMP Acres Affected	13,368 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Middle Fork of the Powder River SRMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6170
Protected Resource	Scenic and Recreational Resources: Canyon Creek SRMA
Text of Management Action	Apply a CSU stipulation on the Canyon Creek SRMA.
Stipulation Type	CSU
RMP Acres Affected	3,679 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Canyon Creek SRMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6189
Protected Resource	Scenic and Recreational Resources: Within ¼ mile of campgrounds, trailheads, day use areas, river access sites, and similar recreational sites in The Rivers SRMA
Text of Management Action	Apply an NSO restriction on areas within ¼ mile of campgrounds, trailheads, day use areas, river access sites, and similar recreational sites within The Rivers SRMA.
Stipulation Type	NSO
RMP Acres Affected	197 acres
Stipulation Description	<p>No surface occupancy is permitted (1) Within ¼ mile of campgrounds, trailheads, day use areas, river access sites, and similar recreational sites in The Rivers SRMA (2) for protection of developed recreation sites.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	6200
Protected Resource	Scenic and Recreational Resources: McCullough Peaks SRMA
Text of Management Action	Apply a NSO restriction on 41,653 acres within the McCullough Peaks SRMA.
Stipulation Type	NSO
RMP Acres Affected	65,552 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within the McCullough Peaks SRMA (2) for the protection of Scenic and Recreational Resources.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6208
Protected Resource	Recreational Resources: Basin Gardens Play Area RMZ
Text of Management Action	Apply a CSU stipulation on the Basin Gardens Play Area SRMA.
Stipulation Type	CSU
RMP Acres Affected	4,426 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Basin Gardens Play Area RMZ (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	6227
Protected Resource	Recreational Resources: Horse Pasture SRMA.
Text of Management Action	Apply a CSU stipulation on the Horse Pasture SRMA.
Stipulation Type	CSU
RMP Acres Affected	144 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Horse Pasture SRMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Worland Field Office GIS database; (3) protecting Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6237
Protected Resource	Scenic and Recreational Resources: Beck Lake SRMA
Text of Management Action	Apply a CSU stipulation on the Beck Lake SRMA.
Stipulation Type	CSU
RMP Acres Affected	6,475 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Beck Lake SRMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p> <p>(2) as mapped on the Cody Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA.</p> <p>Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	6245
Protected Resource	Scenic and Recreational Resources: Newton Lake Ridge SRMA
Text of Management Action	The Newton Lake Ridge SRMA is open to oil and gas leasing with a CSU restriction.
Stipulation Type	CSU
RMP Acres Affected	1,949 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Newton Lake Ridge SRMA (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate to the authorized officer’s satisfaction that the proposed action is consistent with the prescribed management for the SRMA.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	(2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting Scenic and Recreational Resources and ensuring the recreational opportunities and setting of the SRMA. Exception: Consider exceptions if exploration and development would not impair identified scenic and primitive or semi primitive recreational resources. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.
Management Action	7007
Protected Resource	Special Designations (Paleontological Resources): Fossil concentration area in the Big Cedar Ridge ACEC
Text of Management Action	Apply an NSO restriction on the 264-acre fossil concentration area in the Big Cedar Ridge ACEC.
Stipulation Type	NSO
RMP Acres Affected	264 acres
Stipulation Description	No surface occupancy is permitted (1) on the 264-acre fossil concentration area in the Big Cedar Ridge ACEC (2) protection of paleontological resources. Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold no longer contains designated ACECs.
Management Action	7021
Protected Resource	Special Designations (Paleontological Resources): Sundance Formation of the Red Gulch Dinosaur Tracksite ACEC
Text of Management Action	Apply an NSO restriction for mineral leasing, exploration, and development on BLM-administered lands in the Sundance Formation of the Red Gulch Dinosaur Tracksite ACEC.
Stipulation Type	NSO
RMP Acres Affected	1,798 acres
Stipulation Description	No surface occupancy is permitted (1) within Sundance Formation of the Red Gulch Dinosaur Tracksite ACEC (2) protection of paleontological resources. Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated. Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed. Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold no longer contains designated ACECs.
Management Action	7029
Protected Resource	Special Designations (Geologic Resources): Center of the Sheep Mountain Anticline ACEC
Text of Management Action	Apply an NSO restriction on the center of the Sheep Mountain Anticline.
Stipulation Type	NSO
RMP Acres Affected	9,034 acres
Stipulation Description	No surface occupancy is permitted (1) within the center of the Sheep Mountain Anticline ACEC (2) protection of geologic resources.

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	<p>Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold no longer contains designated ACECs.</p>
Management Action	7029
Protected Resource	Special Designations (Geologic Resources): Northern and southern portions of the Sheep Mountain Anticline ACEC
Text of Management Action	Apply a CSU on the northern portion and the southern portion of the Sheep Mountain Anticline ACEC.
Stipulation Type	CSU
RMP Acres Affected	2,227 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the Northern and southern portion of the Sheep Mountain Anticline ACEC (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting Special Designations (Geologic Resources).</p> <p>Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold no longer contains designated ACECs.</p>
Management Action	7154
Protected Resource	Special Designations (Geologic; Paleontological): Paleocene, Eocene Thermal Maximum ACEC
Text of Management Action	Apply an NSO restriction on the PETM ACEC. Grant exceptions on a case-by-case basis.
Stipulation Type	NSO
RMP Acres Affected	14,908 acres
Stipulation Description	<p>No surface occupancy is permitted (1) within the PETM ACEC (2) protection of geologic and paleontological resources.</p> <p>Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: This stipulation may be waived, if the authorized officer determines that the entire leasehold no longer contains designated ACECs.</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

Management Action	7296
Protected Resource	Special Designations (Cultural Resources): Within the viewshed from the Heart Mountain Relocation Camp National Historic Landmark toward Heart Mountain
Text of Management Action	Apply a CSU stipulation and BMPs (Appendix L) to avoid or mitigate adverse effects within the viewshed from the Heart Mountain Relocation Camp National Historic Landmark toward Heart Mountain.
Stipulation Type	CSU
RMP Acres Affected	7,365 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within the viewshed of the Heart Mountain Relocation Camp National Historic Landmark (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts; (2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting the viewshed from the Heart Mountain Relocation Camp National Historic Landmark toward Heart Mountain.</p> <p>Exception: An exception to this restriction or stipulation may be granted by the authorized officer, if the operator submits a plan demonstrating that impacts from the proposed action are acceptable or can be adequately mitigated.</p> <p>Modification: The stipulated area may be modified by the authorized officer if the boundaries are changed.</p> <p>Waiver: A waiver may be granted if the restriction violates the leaseholder/operator lease rights.</p>
Management Action	7299
Protected Resource	Special Designations (Scenic and Cultural Resources): Up to 3 miles from the Nez Perce (Neeme-poo) NHT
Text of Management Action	Protect the foreground of National Historic Trails (defined in Glossary) up to 3 miles or the visual horizon whichever is closer (the SCZ) where setting is an important aspect of the integrity for the trail. Use BMPs (Appendix L) to avoid or mitigate adverse effects.
Stipulation Type	CSU
RMP Acres Affected	25,733 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited within 3 miles from the Nez Perce (Neeme-poo) NHT or the visual horizon whichever is closer (the SCZ) where setting is an important aspect of the integrity for the trail (1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate proposed infrastructure is either not visible or will result in a weak contrast rating.</p> <p>(2) as mapped on the Cody Field Office GIS database; (3) protecting Special Designations (Scenic and Cultural Resources) the Nez Perce (Neeme-poo) NHT</p> <p>Exception: The authorized officer may consider a lease stipulation exception within the National Trails Management Corridor if 1) an action is at least 3 miles from a National Trail, a significant National Trail historical or recreational site, or Trail-related recreational activities; or, 2) all components and effects of the action are in compliance with the RMP-designated VRM standard in consultation with appropriate federal agency. The proposal must be capable of attaining a no adverse-affect determination in consultation with SHPO.</p> <p>Modification: The authorized officer may modify the area subject to the stipulation or surface occupancy criteria if it is determined by the BLM, after consultation with the appropriate federal and/or agency that a portion of the NSO area does not contribute, as determined by Section 106, to the trails’ nature and purpose or their setting or if the proposed action can be developed in a way that meets the management objectives for the NHTs. This determination shall be based upon field evaluation of the area by a qualified archaeologist/historian and subject to confirmation by the BLM.</p> <p>Waiver: The authorized officer may grant a waiver if it is determined, in consultation with the</p>

Table G-1. Oil and Gas Lease Stipulations – Bighorn Basin Planning Area (Continued)

	appropriate federal and/or state agency, that the area is no longer considered to contribute to the trails' nature and purpose or setting or if the proposed action can be developed in a way that meets the management objectives for the NHTs. This determination shall be based upon field evaluation of the area by a qualified archaeologist/historian and subject to confirmation by the BLM.
Management Action	7303
Protected Resource	Special Designations (Scenic and Cultural Resources): Up to 2 miles from Other Trails
Text of Management Action	Protect the foreground of Historic Trails (defined in glossary) up to 2 miles or the visual horizon whichever is closer (the SCZ) where setting is an important aspect of the integrity for the trail, and use BMPs (Appendix L) to avoid or mitigate adverse effects.
Stipulation Type	CSU
RMP Acres Affected	414,586 acres
Stipulation Description	<p>Surface occupancy or use will be restricted or prohibited up to 2 miles where setting is an important aspect of the integrity for the trail.</p> <p>(1) unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts;</p> <p>The Plan must demonstrate proposed infrastructure is either not visible or will result in a weak contrast rating.</p> <p>(2) as mapped on the Worland/Cody Field Office GIS database; (3) protecting other historic trails.</p> <p>Exception: The authorized officer may grant an exception if surveys determine that other historic trail remnants are not present or it is determined that the section of trail is sufficiently compromised that the action will not result in an adverse effect to the trail.</p> <p>Modification: If surveys determine that a portion of the lease area does not contain contributing trail segments, then the stipulation may be modified. This determination shall be based upon field evaluation of the area by a qualified archaeologist/historian and subject to confirmation by the BLM.</p> <p>Waiver: The authorized officer may grant a waiver if surveys determine that the entire lease area does not contain contributing trail segments, then the stipulation may be waived. This determination shall be based upon field evaluation of the area by a qualified archaeologist/historian and subject to confirmation by the BLM.</p>

APPENDIX H

WYOMING BUREAU OF LAND MANAGEMENT MITIGATION GUIDELINES FOR SURFACE-DISTURBING AND DISRUPTIVE ACTIVITIES

1.0 INTRODUCTION

Wyoming Mitigation Guidelines are a compilation of practices employed by Bureau of Land Management (BLM) to mitigate impacts from surface disturbance. They apply to activities such as, but not limited to, road or pipeline construction, range improvements, and permitted recreation activities. The guidelines are designed to protect resources such as soils and vegetation, wildlife habitat, and cultural or historic properties. The guidelines are presented as an appendix of this Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) for easy reference as they apply to many resources and derive from many laws. All BLM RMPs have included these guidelines as appendices. The guidelines are not land use decisions; rather they are examples of mitigation measures that could be applied, as appropriate, based on site-specific National Environmental Policy Act (NEPA) analysis for individual proposals. Comment on the use and application of specific mitigation measures can be made during the NEPA process for individual proposals. Because mitigation measures change or are modified, based on new information, the guidelines are updated periodically for all field offices in Wyoming.

These guidelines are primarily for the purpose of attaining statewide consistency in how requirements are determined for avoiding and mitigating environmental impacts and resource and land use conflicts. Consistency in this sense does not mean that identical requirements would be applied for all similar types of land use activities that may cause similar types of impacts. Nor does it mean that the requirements or guidelines for a single land use activity would be identical in all areas.

The EIS for the RMP does not decide or dictate the exact wording or inclusion of these guidelines. Rather, the guidelines are used in the RMP EIS process as a tool to help develop the RMP alternatives and to provide a baseline for comparative impact analysis in arriving at RMP decisions. These guidelines will be used in the same manner in analyzing activity plans and other site-specific proposals. These guidelines and their wording are matters of policy. As such, specific wording is subject to change primarily through administrative review, not through the RMP EIS process. Any further changes that may be made in the continuing refinement of these guidelines and any development of program-specific standard stipulations will be handled in another forum, including appropriate public involvement and input.

2.0 PURPOSE

The purpose of the “Wyoming BLM Mitigation Guidelines” is to inform a potential lessee, permittee, or operator of the requirements that must be met when using BLM-administered public lands. These guidelines have been written in a format that will allow for the addition of specific or specialized mitigation following the submission of a detailed plan of development or other project proposal, and an environmental analysis.

Those resource activities or programs currently without a standardized set of permit or operation stipulations can use the mitigation guidelines as stipulations or as conditions of approval, or as a baseline for developing specific stipulations for a given activity or program.

Because use of the mitigation guidelines was integrated into the RMP EIS process and will be integrated into the site-specific environmental analysis process, the application of stipulations or mitigation requirements derived through the guidelines will facilitate consistency with planning decisions at plan implementation.

3.0 MITIGATION GUIDELINES

3.1 Surface Disturbance Mitigation Guideline

Surface disturbance will be controlled or prohibited in the following areas or conditions. For Federal oil and gas lease operations, under 43 CFR 3101.1-2 and the terms of the lease (BLM Form 3100-11), the authorized officer may require reasonable measures to minimize adverse impacts to other resource values, land uses, and users not addressed in lease stipulations at the time operations are proposed. Such reasonable measures may include, but are not limited to, modification of siting or design of facilities, timing of operations, and specification of interim and final reclamation measures. At a minimum, measures shall be deemed consistent with lease rights granted provided they do not: require relocation of proposed operations by more than 200 meters; require that operations be sited off the leasehold; or prohibit new surface disturbing operations for a period in excess of 60 days in any lease year.

- Slopes in excess of 25 percent.
- Within important scenic areas (Class I and II Visual Resource Management Areas).
- Within 500 feet of surface water and/or riparian areas.
- Construction with frozen material or during periods when the soil material is saturated or when watershed damage is likely to occur.
- Within 500 feet of Interstate highways and 200 feet of other existing rights-of-way (i.e., U.S. and State highways, roads, railroads, pipelines, power lines).
- Within ¼-mile of occupied dwellings.

Guidance

The intent of the surface disturbance mitigation guideline is to inform interested parties (potential lessees, permittees, or operators) that when one or more of the above conditions exist, surface-disturbing activities will be prohibited unless or until a permittee or the designated representative and the surface management agency arrive at an acceptable plan for mitigation of anticipated impacts. This negotiation will occur prior to development.

Specific criteria (e.g., 500 feet from water) have been established based upon the best information available. However, geographical areas and time periods must be delineated at the field level.

3.2 Wildlife Mitigation Guideline

- A. To protect important big game winter habitat, activities or surface use will not be allowed from November 15 to April 30 within certain areas encompassed by the authorization.

Application of this limitation to operation and maintenance of a developed project must be based on environmental analysis of the operational or production aspects.

Exception, waiver, or modification of this limitation in any year may be approved in writing, including documented supporting analysis, by the authorized officer.

- B. To protect important raptor and/or sage and sharp-tailed grouse nesting habitat, activities or surface use will not be allowed from February 1 to July 31 within certain areas encompassed by the authorization. The same criteria apply to defined raptor and game bird winter concentration areas from November 15 to April 30.

Application of this limitation to operation and maintenance of a developed project must be based on environmental analysis of the operational or production aspects.

Exception, waiver, or modification of this limitation in any year may be approved in writing, including documented supporting analysis, by the authorized officer.

- C. No activities or surface use will be allowed on that portion of the authorization area identified within (legal description) for the purpose of protecting (e.g., sage/sharp-tailed grouse breeding grounds, and/or other species/activities) habitat.

Exception, waiver, or modification of this limitation in any year may be approved in writing, including documented supporting analysis, by the authorized officer.

- D. Portions of the authorized use area legally described as (legal description), are known or suspected to be essential habitat for (name) which is a threatened or endangered species. Prior to conducting any onsite activities, the lessee/permittee will be required to conduct inventories or studies in accordance with BLM and United States Fish and Wildlife Service guidelines to verify the presence or absence of this species. In the event that (name) occurrence is identified, the lessee/permittee will be required to modify operational plans to include the protection requirements of this species and its habitat (e.g., seasonal use restrictions, occupancy limitations, facility design modifications).

Guidance

The Wildlife Mitigation Guideline is intended to provide two basic types of protection: seasonal restriction and prohibition of activities or surface use (2c). Item 2d is specific to situations involving threatened or endangered species. Legal descriptions will ultimately be required and should be measurable and legally definable. There are no minimum subdivision requirements at this time. The area delineated can and should be defined as necessary, based upon current biological data, prior to the time of processing an application and issuing the use authorization. The legal description must eventually become a part of the condition for approval of the permit, plan of development, and/or other use authorization.

The seasonal restriction section identifies three example groups of species and delineates three similar timeframe restrictions. The big game species including elk, moose, deer, pronghorn, and bighorn sheep, all require protection of crucial winter range between November 15 and April 30. Elk and bighorn sheep also require protection from disturbance from May 1 to June 30, when they typically occupy distinct

calving and lambing areas. Raptors include eagles, accipiters, falcons (peregrine, prairie, and merlin), buteos (ferruginous and Swainson’s hawks), osprey, and burrowing owls. The raptors and sage and sharp-tailed grouse require nesting protection between February 1 and July 31. The same birds often require protection from disturbance from November 15 through April 30 while they occupy winter concentration areas.

Item 2c, the prohibition of activity or surface use, is intended for protection of specific wildlife habitat areas or values within the use area that cannot be protected by using seasonal restrictions. These areas or values must be factors that limit life-cycle activities (e.g., sage-grouse strutting grounds, known threatened and endangered species habitat).

Exception, waiver, or modification of requirements developed from this guideline must be based upon environmental analysis of proposals (e.g., activity plans, plans of development, plans of operation, applications for permit to drill) and, if necessary, must allow for other mitigation to be applied on a site-specific basis.

3.3 Cultural Resource Mitigation Guideline

When a proposed land use has potential for affecting the characteristics which qualify a cultural property for the National Register of Historic Places (NRHP), mitigation will be considered. In accordance with Section 106 of the National Historic Preservation Act, procedures specified in 36 Code of Federal Regulation (CFR) 800 will be used in consultation with the Wyoming State Historic Preservation Officer and the Advisory Council on Historic Preservation in arriving at determinations regarding the need and type of mitigation to be required.

Guidance

The preferred strategy for treating potential adverse effects on cultural properties is “avoidance.” If avoidance involves project relocation, the new project area may also require cultural resources survey. If avoidance is imprudent or unfeasible, appropriate mitigation may include excavation (data recovery), stabilization, monitoring, protection barriers and signs, or other physical and administrative measures.

Reports documenting results of cultural resources survey, evaluation, and the establishment of mitigation alternatives (if necessary) shall be written according to standards contained in BLM Manuals, the cultural resource permit stipulations, and in other policy issued by the BLM. These reports must provide sufficient information for Section 106 consultation. Reports shall be reviewed for adequacy by the appropriate BLM cultural resource specialist. If cultural properties on, or eligible for, the NRHP are located within these areas of potential impact and cannot be avoided, the authorized officer shall begin the Section 106 consultation process in accordance with the procedures contained in 36 CFR 800.

Mitigation measures shall be implemented according to the mitigation plan approved by the BLM authorized officer. Such plans are usually prepared by the land use applicant according to BLM specifications. Mitigation plans will be reviewed as part of Section 106 consultation for NRHP eligible or listed properties. The extent and nature of recommended mitigation shall be commensurate with the significance of the cultural resource involved and the anticipated extent of damage. Reasonable costs for mitigation will be borne by the land use applicant. Mitigation must be cost effective and realistic. It must consider project requirements and limitations, input from concerned parties, and be BLM approved or BLM formulated.

Mitigation of paleontological and natural history sites will be treated on a case-by-case basis. Factors such as site significance, economics, safety, and project urgency must be taken into account when making a decision to mitigate. Authority to protect (through mitigation) such values is provided for in FLPMA, Section 102(a)(8). When avoidance is not possible, appropriate mitigation may include excavation (data recovery), stabilization, monitoring, protection barriers and signs, or other physical and administrative protection measures.

3.4 Special Resource Mitigation Guideline

To protect (resource value), activities or surface use will not be allowed (i.e., within a specific distance of the resource value or between date to date) in (legal description).

Application of this limitation to operation and maintenance of a developed project must be based on environmental analysis of the operational or production aspects.

Exception, waiver, or modification of this limitation in any year may be approved in writing, including documented supporting analysis, by the authorized officer.

Example Resource Categories (Select or identify category and specific resource value):

- a. Recreation areas
- b. Special natural history or paleontological features
- c. Special management areas
- d. Sections of major rivers
- e. Prior existing rights-of-way
- f. Occupied dwellings
- g. Other (specify)

Guidance

The *Special Resource Mitigation Guideline* is intended for use only in site-specific situations where one of the first three general mitigation guidelines will not adequately address the concern. The resource value, location, and specific restrictions must be clearly identified. A detailed plan addressing specific mitigation and special restrictions will be required prior to disturbance or development and will become a condition for approval of the permit, plan of development, or other use authorization.

Exception, waiver, or modification of requirements developed from this guideline must be based upon environmental analysis of proposals (e.g., activity plans, plans of development, plans of operation, applications for permit to drill) and, if necessary, must allow for other mitigation to be applied on a site-specific basis.

3.5 No Surface Occupancy Guideline

No Surface Occupancy (NSO) will be allowed on the following described lands (legal description) because of (resource value).

Example Resource Categories (Select or identify category and specific resource value):

- a. Recreation areas (e.g., campgrounds, historic trails, national monuments)
- b. Major reservoirs/dams
- c. Special management area (e.g., known threatened or endangered species habitat, areas suitable for consideration for wild and scenic rivers designation)
- d. Other (specify)

Guidance

The *No Surface Occupancy Mitigation Guideline* is intended for use only when other mitigation is determined insufficient to adequately protect the public interest and is the only alternative to “no development” or “no leasing.” The legal description and resource value of concern must be identified and be tied to an NSO land use planning decision.

Waiver of, or exception(s) to, the NSO requirement will be subject to the same test used to initially justify its imposition. If, upon evaluation of a site-specific proposal, it is found that less restrictive mitigation would adequately protect the public interest or value of concern, then a waiver or exception to the NSO requirement is possible. The record must show that because conditions or uses have changed, less restrictive requirements will protect the public interest. An environmental analysis must be conducted and documented (e.g., environmental assessment, environmental impact statement, etc., as necessary) in order to provide the basis for a waiver or exception to an NSO planning decision. Modification of the NSO requirement will pertain only to refinement or correction of the location(s) to which it applied. If the waiver, exception, or modification is found to be consistent with the intent of the planning decision, it may be granted. If found inconsistent with the intent of the planning decision, a plan amendment would be required before the waiver, exception, or modification could be granted.

When considering the “no development” or “no leasing” option, a rigorous test must be met and fully documented in the record. This test must be based upon stringent standards described in the land use planning document. Since rejection of all development rights is more severe than the most restrictive mitigation requirement, the record must show that consideration was given to development subject to reasonable mitigation, including “no surface occupancy.” The record must also show that other mitigation was determined to be insufficient to adequately protect the public interest. A “no development” or “no leasing” decision should not be made solely because it appears that conventional methods of development would be unfeasible, especially where an NSO restriction may be acceptable to a potential permittee. In such cases, the potential permittee should have the opportunity to decide whether or not to go ahead with the proposal (or accept the use authorization), recognizing that an NSO restriction is involved.

3.6 Regional Mitigation Guideline

For information on Regional Mitigation, please refer to Section 2.3.6 of this RMP.

APPENDIX I

STANDARD OIL AND GAS STIPULATIONS

1.0 MULTIPLE MINERAL DEVELOPMENT STIPULATION

1.1 Standard Lease Stipulation No. 1: Cultural Resources

This lease may be found to contain historic properties and/or resources protected under the National Historic Preservation Act (NHPA), American Indian Religious Freedom Act, Native American Graves Protection and Repatriation Act, Executive Order 13007, or other statutes and executive orders. The BLM will not approve any ground-disturbing activities that may affect any such properties or resources until it completes its obligations (e.g., State Historic Preservation Officer and tribal consultation) under applicable requirements of the NHPA and other authorities. The BLM may require modification to exploration or development proposals to protect such properties, or disapprove any activity that is likely to result in adverse effects that cannot be successfully avoided, minimized, or mitigated.

1.2 Standard Lease Stipulation No. 2: Endangered Species Act Section 7 Consultation

The lease area may now or hereafter contain plants, animals, or their habitats determined to be threatened, endangered, or other special status species. The BLM may recommend modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved activity that will contribute to a need to list such a species or their habitat. The BLM may require modifications to or disapprove proposed activity that is likely to result in jeopardy to the continued existence of a proposed or listed threatened or endangered species or result in the destruction or adverse modification of a designated or proposed critical habitat. The BLM will not approve any ground-disturbing activity that may affect any such species or critical habitat until it completes its obligations under applicable requirements of the Endangered Species Act as amended, 16 United States Code (U.S.C.) § 1531 et seq., including completion of any required procedure for conference or consultation.

1.3 Standard Lease Stipulation No. 3: Multiple Mineral Development

Operations will not be approved that, in the opinion of the authorized officer, would unreasonably interfere with the orderly development and/or production from a valid existing mineral lease issued prior to this one for the same lands.

1.4 Lease Notice 1

Under Regulation 43 Code of Federal Regulations (CFR) 3101.1 2 and terms of the lease (BLM Form 3100 11), the authorized officer may require reasonable measures to minimize adverse impacts to other resource values, land uses, and users not addressed in lease stipulations at the time operations are proposed. Such reasonable measures may include, but are not limited to, modification of siting or design of facilities, timing of operations, and specification of interim and final reclamation measures, which may require relocating proposed operations up to 200 meters, but not off the leasehold, and prohibiting surface-disturbing activities for up to 60 days.

The lands within this lease may include areas not specifically addressed by lease stipulations that may contain special values, may be needed for special purposes, or may require special attention to prevent damage to surface and/or other resources. Possible special areas are identified below. Any surface use or occupancy within such special areas will be strictly controlled or, if absolutely necessary, prohibited. Appropriate modifications to imposed restrictions will be made for the maintenance and operation of producing wells.

1. Slopes in excess of 25 percent.
2. Within 500 feet of surface water and/or riparian areas.
3. Construction with frozen material or during periods when the soil material is saturated or when watershed damage is likely to occur.
4. Within 500 feet of Interstate highways and 200 feet of other existing rights-of-way (i.e., United States and State highways, roads, railroads, pipelines, power lines).
5. Within ¼ mile of occupied dwellings.
6. Material sites.

Guidance

The intent of this notice is to inform interested parties (potential lessees, permittees, operators) that when one or more of the above conditions exist, surface-disturbing activities will be prohibited unless or until the permittee or the designated representative and the surface management agency arrive at an acceptable plan for mitigation of anticipated impacts. This negotiation will occur prior to development and become a condition for approval when authorizing the action. Specific threshold criteria (e.g., 500 feet from water) have been established based upon the best information available. However, geographical areas and time periods of concern must be delineated at the field level (i.e., “surface water and/or riparian areas” may include both intermittent and ephemeral water sources or may be limited to perennial surface water). The referenced oil and gas leases on these lands are hereby made subject to the stipulation that the exploration or drilling activities will not interfere materially with the use of the area as a materials site/free use permit. At the time operations on the above lands are commenced, notification will be made to the appropriate agency. The name of the appropriate agency may be obtained from the proper BLM Field Office.

1.5 Lease Notice 2

Background

The BLM, by including National Historic Trails (NHTs) within its National Landscape Conservation System, has recognized these trails as national treasures. The BLM's responsibility is to review the strategy for management, protection, and preservation of these trails. The NHTs in Wyoming, which include the Oregon, California, Mormon Pioneer, and Pony Express Trails, as well as the Nez Perce Trail, were designated by Congress through the National Trails System Act (Public Law (Pub. L.) 90-543; 16 U.S.C. 1241-1251) as amended through Pub. L. 106-509 dated November 13, 2000.

Protection of the NHTs is normally considered under the National Historic Preservation Act (Pub. L. 89-665; 16 U.S.C. 470 et seq.) as amended through 1992 and the National Trails System Act. Additionally, Executive Order 13195, "Trails for America in the 21st Century," signed January 18, 2001, states in Section 1: "Federal agencies will...protect, connect, promote, and assist trails of all types throughout the United States (U.S.). This will be accomplished by...(b) Protecting the trail corridors associated with national scenic trails and the high priority potential sites and segments of national historic trails to the degrees necessary to ensure that the values for which each trail was established remain intact." Therefore, the BLM will be considering all impacts and intrusions to the NHTs, their associated historic landscapes, and all associated features, such as trail traces, grave sites, historic encampments, inscriptions, natural features frequently commented on by emigrants in journals, letters and diaries, or any other feature contributing to the historic significance of the trails. Additional NHTs will likely be designated amending the National Trails System Act. When these amendments occur, this notice will apply to those newly designated NHTs as well.

Strategy

The BLM will proceed in this objective by conducting a viewshed analysis on either side of the designated centerline of the NHTs in Wyoming for the purpose of identifying and evaluating potential impacts to the trails, their associated historic landscapes, and their associated historic features. Subject to the viewshed analysis and archeological inventory, reasonable mitigation measures may be applied. These may include, but are not limited to, modification of siting or design of facilities to camouflage or otherwise hide the proposed operations within the viewshed. Additionally, specification of interim and final reclamation measures may require relocating the proposed operations within the leasehold. Surface-disturbing activities will be analyzed in accordance with the National Environmental Policy Act (NEPA) of 1969 (Pub. L. 91-190; 42 U.S.C. 4321-4347) as amended through Pub. L. 94-52, July 3, 1975 and Pub. L. 94-83, August 9, 1975, and the National Historic Preservation Act, *supra*, to determine if any design, siting, timing, or reclamation requirements are necessary). This strategy is necessary until the BLM determines that, based on the results of the completed viewshed analysis and archeological inventory, the existing land use plans (Resource Management Plans [RMP]) have to be amended.

The use of this lease notice is a predecisional action, necessary until final decisions regarding surface-disturbing restrictions are made. Final decisions regarding surface-disturbing restrictions will take place with full public disclosure and public involvement over the next several years if BLM determines that it is necessary to amend existing land use plans.

Guidance

The intent of this notice is to inform interested parties (potential lessees, permittees, operators) that when any oil and gas lease contains remnants of NHTs, or is located within the viewshed of a NHTs' designated centerline, surface-disturbing activities will require the lessee, permittee, operator or their designated representative, and the surface management agency to arrive at an acceptable plan for mitigation of anticipated impacts. This negotiation will occur prior to development and become a condition for approval when authorizing the action.

1.6 Lease Notice 3

Greater Sage-Grouse Habitat: The lease may in part, or in total, contain important greater sage-grouse habitats as identified by the BLM, either currently or prospectively. The operator may be required to implement specific measures to reduce impacts of oil and gas operations on the greater sage-grouse populations and habitat quality. Such measures shall be developed during the Application for Permit to Drill (APD) on-site and environmental review process and will be consistent with the lease rights granted.

1.7 Attachment to Each Lease

Notice to Lessee

Provisions of the Mineral Leasing Act (MLA) of 1920, as amended by the Federal Coal Leasing Amendments Act of 1976, affect an entity's qualifications to obtain an oil and gas lease. Section 2(a)(2)(A) of the MLA, 30 U.S.C. 201 (a)(2)(A), requires that any entity that holds and has held a federal coal lease for 10 years beginning on or after August 4, 1976, and who is not producing coal in commercial quantities from each such lease, cannot qualify for the issuance of any other lease granted under the MLA. Compliance by coal lessees with Section 2(a)(2)(A) is explained in 43 CFR 3472.

In accordance with the terms of this oil and gas lease, with respect to compliance by the initial lessee with qualifications concerning federal coal lease holdings, all assignees and transferees are hereby notified that this oil and gas lease is subject to cancellation if: (1) the initial lessee as assignor or as transferor has falsely certified compliance with Section 2(a)(2)(A), or (2) because of a denial or disapproval by a State Office of a pending coal action, i.e., arms-length assignment, relinquishment, or logical mining unit, the initial lessee as assignor or as transferor is no longer in compliance with Section 2(a)(2)(A). The assignee, sublessee or transferee does not qualify as a bona fide purchaser and, thus, has no rights to bona fide purchaser protection in the event of cancellation of this lease due to noncompliance with Section 2(a)(2)(A). Information regarding assignor, sublessor or transferor compliance with Section 2(a)(2)(A) is contained in the lease case file as well as in other BLM records available through the State Office issuing this lease.

APPENDIX J

AIR RESOURCES MANAGEMENT PLAN

1.0 INTRODUCTION

1.1 Background

1.1.1 Preparation of the Analysis of the Management Situation in 2008 disclosed monitoring data within and adjacent to the Planning Area is limited. Concern arose over the need to establish background concentrations and to have monitoring in place prior to increased development.

1.1.2 The need for establishing background concentrations was not based on concern over existing air quality, but rather to provide adequate monitoring to characterize changes over time. Table J-1 is an overview of the applicable primary WAAQS and NAAQS and baseline representative maximum pollutant concentrations measured in and at sites near the Planning Area. These representative concentrations can be compared with the applicable WAAQS and NAAQS to indicate the status of recent air quality conditions within the Planning Area relative to the standards.

The examination of these data indicates that the current air quality for criteria pollutants in the Planning Area is considered good overall. Based upon measurements taken at the North Absaroka IMPROVE site (Figure J-1) and the Cloud Peak IMPROVE site (Figure J-2), visibility in the Planning Area is considered excellent.

1.1.3 To address the monitoring data limitation at the land use planning level, the BLM and cooperating agencies developed Management Action 1002 to establish a monitoring network to provide additional data for describing background concentrations.

1.1.4 The BLM established a monitoring site approximately 25 miles north of Worland in Big Horn County, known as the Basin site. The purpose of this station is to provide a general indicator of existing air quality and long term trends in air quality but is not intended for NAAQS compliance.

1.1.5 The emissions projected in the emissions calculations in Appendix U of the Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) have potential to negatively impact visibility and air quality in Bridger, Fitzpatrick, North Absaroka, and Washakie Wilderness Areas and Yellowstone National Park depending upon the temporal and spatial distribution of development. This emission inventory was compiled for the Planning Area to determine the relative magnitude of total air pollutant emissions to compare emissions and associated impacts between the alternatives. The estimated levels of emissions for each alternative are summarized in Table J-2. Projected emissions are similar to those of the base year, 2008, as shown in Table J-2 and Table J-3. The emission inventory also revealed that emissions would primarily result from mineral development and production.

Table J-1. Applicable National and State Primary Air Quality Standards for Criteria Pollutants and Baseline Representative Concentrations for the Planning Area

Pollutant	Averaging Time	NAAQS			WAAQS			Representative Concentrations		
		(ppm)	(ppb)	($\mu\text{g}/\text{m}^3$)	(ppm)	(ppb)	($\mu\text{g}/\text{m}^3$)	(ppm)	(ppb)	($\mu\text{g}/\text{m}^3$)
Carbon Monoxide	1 hour ¹	35	35,000	40,000	35	35,000	40,000	1.7	1,730	1,979
	8 hour ¹	9	9,000	10,000	9	9,000	10,000	0.8	814	931
Nitrogen Dioxide	1 hour ²	0.10	100	189	0.10	100	189	0.014	14	26.4
	Annual ³ (Arithmetic Mean)	0.053	53	100	0.053	53	100	0.00168	1.68	2.9
Ozone	8 hour ⁴	0.075	75	147	0.075	75	147	0.062	62	121
PM ₁₀	24 hour ⁵	N/A	N/A	150	N/A	N/A	150	N/A	N/A	78
	Annual ⁶	N/A	N/A	N/A	N/A	N/A	50	N/A	N/A	11
PM _{2.5}	24 hour ⁷	N/A	N/A	35	N/A	N/A	35	N/A	N/A	5.0
	Annual ⁸	N/A	N/A	12	N/A	N/A	15	N/A	N/A	1.8
Sulfur Dioxide ¹⁰	1 hour ⁹	0.075	75	197	0.075	75	197	0.033	33	86

¹Not to be exceeded more than once per year. Data collected at Yellowstone National Park during 2005.

²To attain this standard, the 3-year average of the 98th percentile of 1-hour concentrations at each monitor within an area must not exceed 100 ppb. Thunder Basin data, 2009.

³Thunder Basin annual average for 2009.

⁴To attain this standard, the 3-year average of the fourth-highest daily maximum 8-hour average ozone concentrations measured at each monitor within an area over each year must not exceed 75 ppb. Measured fourth highest concentration for 2009 for the Thunder Basin site.

⁵Not to be exceeded more than once per year on average over 3 years. Maximum 24-hour average for 2009 at Cody SLAMS site.

⁶Annual average for 2009 for Cody SLAMS site.

⁷To attain this standard, the 3-year average of the 98th percentile of 24-hour concentrations at each population-oriented monitor in an area must not exceed 35 $\mu\text{g}/\text{m}^3$. Maximum 24-hour average for 2009 for the North Absaroka IMPROVE site.

⁸To attain this standard, the 3-year average of the weighted annual mean PM_{2.5} concentrations from single or multiple community-oriented monitors must not exceed 12.0 $\mu\text{g}/\text{m}^3$. Annual average for 2009 for the North Absaroka site.

⁹To attain this standard, the 3-year average of the 98th percentile of 1-hour concentrations at each monitor within an area must not exceed 75 ppb.

¹⁰The SO₂ value is from the Wyoming DEQ Casper monitor, located in Natrona County and is the 3-year average of the 98th percentile of 1-hour concentrations measured for 2011, 2012, and 2013. Although not located in the Bighorn Basin, this is the closest monitor with available recent data.

$\mu\text{g}/\text{m}^3$ micrograms per cubic meter

1.1.6 In June 2011, Memorandum of Understanding among the U.S. Department of Agriculture, U.S. Department of Interior and U.S. Environmental Protection Agency Regarding Air Quality Analyses and Mitigation for Federal Oil and Gas Decisions Through the National Environmental Policy Act Process (MOU) was signed. This MOU outlines how to protect air quality and air quality related values, such as visibility and Class I areas, while allowing for oil and gas development on federally managed lands.

1.1.7 The Environmental Protection Agency’s (EPA) comments on the Draft Resource Management Plan (RMP) and Draft Environmental Impact Statement (EIS), included “the EPA believes that the ‘level of concern’ that would warrant modeling under Management Action 1005 (contained in the Draft RMP) has already been reached.” This concern is based on the level of emissions from existing activity disclosed in the Draft EIS and the proximity of proposed leasing areas to five Federal Class I areas, including Bridger, Fitzpatrick, North Absaroka, and Washakie Wilderness Areas and Yellowstone National Park.

Emissions from future activities have potential to negatively impact visibility and air quality in the Class I areas depending upon the temporal and spatial distribution of development.

1.2 Purpose

- 1.2.1 The purpose of this Air Resources Management Plan (ARMP) is to further clarify Physical Resources – Air Quality goals, objectives, and management actions set forth in Table 2-9 of the Final EIS. This ARMP describes air resources management; authorization of activities that have the potential to adversely impact air resources within the Planning Area; acknowledges areas where data is incomplete or difficult to obtain; sets a plan to obtain additional information; and outlines specific informational requirements and mitigation measures that may apply to projects that have the potential to generate air emissions and adversely affect air resources in the Planning Area.
- 1.2.2 This ARMP may be modified as necessary to comply with law, regulation, and policy and to address new information and changing circumstances. Amendment of the RMP is necessary to change the goals, objectives or management actions set forth in Table 2-9 while change to implementation, including this ARMP, may be made without Amending the RMP.

1.3 Characterization of Air Resources in the Environmental Impact Statement

1.3.1 Emissions Inventory for Land Use Planning

- 1.3.1.1 An air emissions inventory was compiled for the Planning Area to determine the relative magnitude of total air pollutant emissions and to compare emissions between alternatives. This emissions inventory is summarized in Appendix U. Emissions were calculated using assumptions about the likelihood of potential future activities occurring under each alternative which are found in Appendix T. As a result, the compiled air emissions inventory represents a comparison of emissions of air pollutants based on best available but speculative information for future development projections.
- 1.3.1.2 The emissions inventory is valuable for contrasting the impact of land use allocations on air resources among alternatives and useful for identifying those activities that are likely to be major contributors of emissions.
- 1.3.1.3 The air emissions inventory supports two major conclusions: 1) there is not a substantial difference in total air emissions among alternatives (Table 4-2), and 2) oil and gas development activities and mining are major contributors to air emissions.

1.3.2 Class I Areas

- 1.3.2.1 Class I areas in or near the Planning Area are Yellowstone National Park, North Absaroka Wilderness Area, Washakie Wilderness Area, Fitzpatrick Wilderness Area, and Bridger Wilderness Area. Visibility estimates for the North Absaroka site (Western boundary of the Planning Area) and the Cloud Peak site (eastern boundary of the planning area) are shown in Figures 3-12 and 3-13 of the Final EIS, respectively. The data from these two monitoring locations indicate excellent visibility.

2.0 AIR RESOURCES MANAGEMENT PLAN

2.1 Resource Inventory and Characterization

2.1.1 A characterization of air quality conditions in Class I areas in the vicinity of the planning area will be conducted to measure progress towards meeting the Air Quality goals and objectives (Table 2-9). BLM will conduct this characterization in partnership with federal and state agencies with responsibility for managing air quality in Class I areas, including DEQ, EPA, Forest Service and NPS, as soon as possible subject to funding and staffing levels.

2.1.1.1 This Class I area characterization will consist of two separate parts. Part I will be compilation of existing air quality data on the Class I area as provided and analyzed by partnering agencies. Part II will consist of a regional modeling analysis to characterize air quality in the Class I areas listed in Section 1.1.5. This modeling would be conducted either 1) as part of a specific development project air impact analysis being conducted by BLM for a NEPA analysis or 2) as part of an interagency regional modeling analysis that includes the Planning Area. With this modeling, the BLM could effectively predict direct Big Horn Basin emissions impacts to nearby Class I areas. Information from other modeling efforts and monitoring data will also be used to inform the Class I characterization. Details of this modeling are presented in Section 2.4 *Modeling*.

2.1.1.2 Until such time as both parts of the Class I characterization are completed Applications for Permit to Drill (APDs), field development proposals, and mining plans of operation, will include an emissions inventory. The emissions inventory will quantify emissions of regulated air pollutants from all sources related to the proposed project, emissions impacting Class I areas, including fugitive emissions and greenhouse gas emissions, estimated for each year for the life of the project. Additional information on permitting and emission inventories is provided in Section 2.2 *Permitting* and Section 2.5 *Mitigation*.

2.1.1.3 Based upon the findings of the Class I characterization, and as provided for by law and consistent with lease rights and obligations, BLM will ensure implementation of reasonable mitigation, control measures and design features through appropriate mechanisms, which may include lease stipulations and conditions of approval, notices to lessees, and permit terms and conditions (see Section 2.2 *Permitting* and 2.5 *Mitigation*)

2.2 Permitting

2.2.1 The BLM has the authority and responsibility under the Federal Land Policy and Management Act to manage public lands in a manner that will protect the quality of air and atmospheric values. Therefore, BLM may manage the pace, place, density, and intensity of leasing and development to meet air quality goals.

2.2.2 The BLM will, prior to authorization, consider the magnitude of potential air emissions from the project or activity, existing air quality conditions, proximity to Class I areas, and issues identified during project scoping to identify pollutants of concern and to determine the appropriate level of air analysis to be conducted for the project.

2.2.3 The BLM will require an emissions inventory, as set forth in the MOU. The MOU states “As early as possible in its planning process, the Lead Agency will identify the reasonably

- foreseeable number of oil or gas wells that can be expressed as a range, expected to be located within the planning area. Existing reasonably foreseeable development scenarios can be used to identify the number of wells.” The BLM may require an emissions inventory for mineral development projects (such as mining operations and individual applications for permit to drill) and may require project specific air quality modeling (see Management Action 1006) depending on project characteristics, proximity to a federally mandated Class I area, sensitive Class II area, or population center, location within a non-attainment or maintenance area, meteorological or geographic conditions, existing air quality conditions, magnitude of existing development in the area, or issues identified during project scoping. The emissions inventory will quantify emissions of regulated air pollutants from all sources related to the proposed project, emissions impacting Class I areas, including fugitive emissions and greenhouse gas emissions, estimated for each year for the life of the project. BLM will use this estimated emissions inventory to identify pollutants of concern and to determine the appropriate level of air analysis to be conducted for the proposed project. This information will inform monitoring (see Section 2.3 *Monitoring*), modeling (see Section 2.4 *Modeling*) and mitigation (see Section 2.5 *Mitigation*).
- 2.2.4 The BLM has the responsibility to implement the decisions of the RMP in a manner that protects air quality. BLM also must recognize valid and existing leasing rights. The BLM can require specific actions and measures necessary to protect air quality in response to adverse impacts at the project permitting stage (Management Action 1003).
- 2.2.4.1 BLM will consider applying mitigation to emissions sources not otherwise regulated by WDEQ for mineral development projects where an air quality impact analysis determines there are or will likely be future impacts above acceptable levels, including impacts to Class I areas. Mitigation may include reduction in the pace or scale of development.
- 2.2.5 Until such time as both phases of the Class I area characterization are completed, the BLM will require the following in addition to those items listed above:
- 2.2.5.1 The proponent of a project will be required to minimize air pollutant emissions by complying with all applicable state and federal regulations (including application of best available control technology) and may be required to apply mitigation such as best management practices, and other control technologies or strategies identified by the BLM or WDEQ in accordance with delegated regulatory authority.
- 2.2.5.2 The proponent of a mineral development project that has the potential to emit any regulated air pollutant will be required to provide a detailed description of operator committed measures to reduce project related air pollutant emissions including greenhouse gases and fugitive dust. Project proponents for oil and gas development projects should refer to Table J-4 as a reference for potential mitigation technologies and strategies. The list is not intended to preclude the use of other effective air pollution control technologies that may be proposed. Details of the mitigation measure would be submitted by the applicant and enforced as a condition of the BLM-issued authorization.

- 2.2.5.3 The BLM may require the proponent of other projects to comply with 2.2.5.1 and 2.2.5.2 depending on project characteristics, proximity to a federally mandated Class I area, sensitive Class II area, or population centers, location within a non-attainment or maintenance area, meteorological or geographic conditions, existing air quality conditions, magnitude of existing development in the area, or issues identified during project scoping.

2.3 Monitoring

- 2.3.1 As part of a comprehensive air management plan for the Planning Area, BLM will work cooperatively with federal and state agencies with responsibility for managing air resources to determine, characterize, and track air resource conditions. (Management Action 1004)
- 2.3.2 The BLM may require project proponents to conduct air monitoring. The requirement for monitoring will be based on the absence of existing monitoring; existing air quality conditions; magnitude of potential air emissions from the project or activity; magnitude of existing emission sources in the area; proximity to a federally mandated Class I area, sensitive Class II area, or population center; location within a non-attainment or maintenance area; meteorological or geographic conditions; project duration; or issues identified during project scoping. The project proponent will be responsible for siting, installing, operating, and maintaining any required air monitoring.
- 2.3.4 The BLM will support and participate in regional monitoring efforts to meet Management Action 1002 which reads as follows:
- “Define a criteria pollutant and air quality related values monitoring strategy and cooperatively establish a monitoring network by creating a method for siting air quality monitors in order to provide additional data for describing background concentrations.”

2.4 Modeling

- 2.4.1 Air dispersion and photochemical grid models are useful tools for predicting project specific impacts to air quality, predicting the potential effectiveness of control measures and strategies, and for predicting trends in regional concentrations of some air pollutants.
- 2.4.2 BLM may require project proponents to conduct air quality modeling based on the absence of sufficient data to ensure compliance with laws regulations or to determine the effectiveness of mitigation options. The requirement for modeling will follow the MOU and will be based on existing air quality conditions; magnitude of potential air emissions from the project or activity; magnitude of existing emission sources in the area; proximity to a federally mandated Class I area, sensitive Class II area, an area expected to exceed a NAAQS or PSD increment or population center; location within a non-attainment or maintenance area; meteorological or geographic conditions; project duration; or issues identified during project scoping (Management Action 1006).

- 2.4.3 BLM will support and participate in regional modeling efforts through multi-state and/or multi-agency organizations such as Western Governors’ Association – Western Regional Air Partnership (WRAP), the Federal Leadership Forum (FLF), and WDEQ’s Ozone Technical Forum (OTF). If results from an interagency, regional modeling study are used to evaluate impacts within the Big Horn Basin, BLM will ensure that direct emissions from BLM’s management actions within the region are included in the study. This model would predict direct Big Horn Basin emissions impacts to nearby Class I areas and would satisfy the Air Resources Management Plan Class I Characterization part II as set forth in Section 2.1.1.1, above.

2.5 Mitigation

- 2.5.1 Many of the activities that BLM authorizes, permits, or allows generate air pollutant emissions that have the potential to adversely impact air quality. The primary mechanism to reduce air quality impacts is to reduce emissions (mitigation).
- 2.5.2 BLM will require additional air emission control measures and strategies within its regulatory authority and in consultation with federal and state agencies with responsibility for managing air resources if proposed or committed measures are insufficient to achieve air quality goals (Goal PR: 1 and Goal PR: 2) and objectives (PR:1.1, PR:1.2, PR:2.1, PR2.2) and Management Action 1003.
- 2.5.3 The proponent of a project will be required to minimize air pollutant emissions by complying with all applicable state and federal regulations (including application of best available control technology) and may be required to apply mitigation including but not limited to best management practices, and other control technologies or strategies identified by the BLM or WDEQ in accordance with delegated regulatory authority (Management Action 1003).
- 2.5.4 The proponent of a project will demonstrate regard for air resources and will demonstrate consideration of measures to reduce emissions to achieve Management Action 1003. A project proponent will be required to identify operator-committed measures in its proposal. Example, mitigation strategies for oil and gas development activities are presented in Table J-4.
- 2.5.5 Development and implementation of appropriate protection measures is most effective at the project approval stage, because the proposed action has been defined in terms of temporal and spatial characteristics as well as development processes and procedures. This better defined information allows more precise identification of impacts to air quality which results in more specific impact analysis, and identification of effective mitigation. As part of the project approval process, the BLM will identify project-specific measures in response to identified impacts to air resources.

2.6 Contingency Plans

- 2.6.1 The BLM may require project proponents to submit a contingency plan that provides a strategy for reduction in emissions should observed effects or modeled impacts show state or federal standards or applicable thresholds for air quality related values may be exceeded. Specific operations and pollutants to be addressed in the contingency plan will be determined by BLM on a case-by-case basis taking into account existing air quality and pollutants emitted by the project. This is to ensure conformance with air quality goals and objectives.
- 2.6.2 If observed effects or modeled impacts show state or federal regulatory standards or applicable thresholds for air quality related values may be exceeded, BLM may require mitigation measures to comply with such standards. Mitigation may include management of the pace, place, density and intensity of development or require smaller emission projects to demonstrate compliance with standards or applicable thresholds through quantitative air quality analysis. This is to ensure conformance with the air quality goals and objectives in Table 2-9.

Table J-4. Sample Emission Reduction Strategies for Oil and Gas Development

Emission Reduction Measure	Potential Environmental Benefits	Potential Environmental Liabilities	Feasibility
Control Strategies for Drilling and Compression			
Directional Drilling.	Reduces construction related emissions (dust and vehicle and construction equipment emissions). Decreases surface disturbance and vegetation impacts (dust and CO ₂ and nitrogen flux). Reduces habitat fragmentation.	Could result in higher air impacts in one area with longer sustained drilling times.	Depends on geological strata.
Improved engine technology (Tier 2 or better) for diesel drill rig engines.	Reduced NO _x , PM, CO, and VOC emissions.		Dependent on availability of technology from engine manufacturers.
Selective Catalytic Reduction (SCR) for drill rig engines and/or compressors.	NO _x emissions reduction, potential decreased formation of visibility impairing compounds and ozone. NO _x control efficiency of 95% achieved on drill rig engines. NO _x emission rate of 0.1 g/hp-hr achieved for compressors.	Potential NH ₃ emissions and formation of visibility impairing ammonium sulfate. Regeneration/disposal of catalyst can produce hazardous waste.	Not applicable to 2-stroke engines.

Table J-4. Sample Emission Reduction Strategies for Oil and Gas Development (Continued)

Emission Reduction Measure	Potential Environmental Benefits	Potential Environmental Liabilities	Feasibility
Non-selective catalytic reduction (NSCR) for drill rig engines and/or compressors.	NO _x emissions reduction, potential decreased formation of visibility impairing compounds, and ozone. NO _x control efficiency of 80-90% achieved for drill rig engines. NO _x emission rate of 0.7 g/hp-hr achieved for compressor engines greater than 100 hp.	Regeneration/disposal of catalysts can produce hazardous waste.	Not applicable to lean burn or 2-stroke engines.
Natural Gas fired drill rig engines.	NO _x emissions reduction, potential decreased formation of visibility impairing compounds, and ozone.		Requires onsite processing of field gas.
Electrification of compressors.	Decreased emissions at the source. Transfers emissions to more efficiently controlled source (EGU).	Displaces emissions to electric generating unit (EGU).	Depends on availability of power and transmission lines.
Improved engine technology (Tier 2 or better) for all mobile and non-road diesel engines.	Reduced NO _x , PM, CO, and VOC emissions.		Dependent on availability of technology from engine manufacturers.
Green (a.k.a. closed loop or flareless) completions.	Reduction in VOC and CH ₄ emissions. Reduces or eliminate flaring and venting and associated emissions. Reduces or eliminates open pits and associated evaporative emissions. Increased recovery of gas to pipeline rather than atmosphere.	Temporary increase in truck traffic and associated emissions.	Need adequate pressure and flow. Need onsite infrastructure (tanks/dehydrator). Availability of sales line. Green completion permits required by WY BACT in some areas.
Green workovers	Same as above.	Same as above.	Same as above.
Minimize/eliminate venting and/or use closed loop process where possible during "blow downs".	Same as above.		Best Management Practices required by WY BACT.
Reclaim/remediate existing open pits, no new open pits.	Reduces VOC and GHG emissions. Reduces potential for soil and water contamination. Reduces odors.	May increase truck traffic and associated emissions.	Requires tank and/or pipeline infrastructure.
Electrification of wellhead compression/pumping.	Reduces local emissions of fossil fuel combustion and transfers to more easily controlled source.	Displaces emissions to electric generating unit (EGU).	Depends on availability of power and transmission lines.
Wind (or other renewable) generated power for compressors.	Low or no emissions.	May require construction of infrastructure. Visual impacts. Potential wildlife impacts.	Depends on availability of power and transmission lines.

Table J-4. Sample Emission Reduction Strategies for Oil and Gas Development (Continued)

Emission Reduction Measure	Potential Environmental Benefits	Potential Environmental Liabilities	Feasibility
Control Strategies Utilizing Centralized Systems			
Centralization (or consolidation) of gas processing facilities (separation, dehydration, sweetening, etc.).	Reduces vehicle miles traveled (truck traffic) and associated emissions. Reduced VOC and GHG emissions from individual dehy/separator units.	Temporary increase in construction associated emissions. Higher potential for pipe leaks/groundwater impacts.	Requires pipeline infrastructure.
Liquids Gathering systems (for condensate and produced water).	Reduces vehicle miles traveled and associated emissions. Reduced VOC and GHG emissions from tanks, truck loading/unloading, and multiple production facilities.	Temporary increase in construction associated emissions. Higher potential for pipe leaks/groundwater impacts.	Requires pipeline infrastructure.
Water and/or fracturing liquids delivery system.	Reduced long term truck traffic and associated emissions.	Temporary increase in construction associated emissions. Higher potential for pipe leaks/groundwater impacts.	Requires pipeline infrastructure. Not feasible for some terrain.
Control Strategies for Tanks, Separators, and Dehydrators			
Eliminate use of open top tanks.	Reduced VOC and GHG emissions.		Required by WY BACT for produced water tanks in some areas.
Capture and control of flashing emissions from all storage tanks and separation vessels with vapor recovery and/or thermal combustion units.	Reduces VOC and GHG emissions.	Pressure build up on older tanks can lead to uncontrolled rupture.	98% VOC control if ≥ 10 TPY required statewide by WY BACT.
Capture and control of produced water tank emissions.	Reduces VOC and GHG emissions.		98% VOC control and no open top tanks required by WY DEQ in some areas.
Capture and control of dehydration equipment emissions with condensers, vapor recovery, and/or thermal combustion.	Reduces VOC, HAP, and GHG emissions.		Still vent condensers required and 98% VOC control if ≥ 8 TPY required statewide and in CDA by WY BACT. All dehy emissions controlled at 98% in JPAD (no 8 TPY threshold).
Control Strategies for Misc. Fugitive VOC Emissions			
Install and maintain low VOC emitting seals, valves, hatches on production equipment.	Reduces VOC and GHG emissions.		
Initiate an equipment leak detection and repair program (including use of FLIR cameras, grab samples, organic vapor detection devices, visual inspection, etc.).	Reduction in VOC and GHG emissions.		

Table J-4. Sample Emission Reduction Strategies for Oil and Gas Development (Continued)

Emission Reduction Measure	Potential Environmental Benefits	Potential Environmental Liabilities	Feasibility
Install or convert gas operated pneumatic devices to electric, solar, or instrument (or compressed) air driven devices/controllers.	Reduces VOC and GHG emissions.	Electric or compressed air driven operations can displace or increase combustion emissions.	
Use "low" or "no bleed" gas operated pneumatic devices/controllers.	Reduces VOC and GHG emissions.		or closed loop required statewide by WY BACT.
Use closed loop system or thermal combustion for gas operated pneumatic pump emissions.	Reduces VOC and GHG emissions.		Required statewide by WY BACT (98% VOC control or closed loop).
Install or convert gas operated pneumatic pumps to electric, solar, or instrument (or compressed) air driven pumps.	Reduces VOC and GHG emissions.	Electric or compressed air driven operations can displace or increase combustion emissions.	Required statewide by WY BACT if no thermal combustion used.
Install vapor recovery on truck loading/unloading operations at tanks.	Reduces emissions of VOC and GHG emissions.	Pressure build up on older tanks can lead to uncontrolled rupture.	WY BACT analysis required if VOC ≥ 8 TPY or HAP ≥ 5 TPY.
Control Strategies for Fugitive Dust and Vehicle Emissions			
Unpaved surface treatments including watering, chemical suppressants, and gravel.	20% - 80% control of fugitive dust (particulates) from vehicle traffic.	Potential impacts to water and vegetation from runoff of suppressants.	
Use remote telemetry and automation of wellhead equipment.	Reduces vehicle traffic and associated emissions.		
Speed limit control and enforcement on unpaved roads.	Reduction of fugitive dust emissions.		
Reduce commuter vehicle trips through car pools, commuter vans or buses, innovative work schedules, or work camps.	Reduced combustion emissions, reduced fugitive dust emissions, reduced ozone formation, reduced impacts to visibility.		
Miscellaneous Control Strategies			
Use of ultra-low sulfur diesel in engines, compressors, construction equipment, etc.	Reduces emissions of particulates and sulfates.		Fuel not readily available in some areas.
Reduce unnecessary vehicle idling.	Reduced combustion emissions, reduced ozone formation, reduced impacts to visibility, reduced fuel consumption.		
Reduced pace of (phased) development.	Peak emissions of all pollutants reduced.	Emissions generated at a lower rate but for a longer period. LOP, duration of impacts is longer.	May not be economically viable or feasible if multiple mineral interests.

APPENDIX K

BIOLOGICAL RESOURCES

This appendix contains information on biological resources intended to augment the discussions in Volume 1 of the Bighorn Basin Resource Management Plan (RMP) revision and Environmental Impact Statement (EIS). Included in this appendix is information on Special Status Species (raptor nesting periods [Table K-1]), Wildlife (Wyoming Game and Fish Department [WGFD] Herd Unit maps [Figures K-1 through K-7]), and a species list (Table K-2) showing the scientific names for the species discussed in the document.

1.0 RAPTOR NESTING PERIOD

Many raptors are sensitive to disturbance during the breeding and nesting season. Such disturbance may result in take. The United States Fish and Wildlife Service recommend spatial and seasonal buffer zones to avoid or minimize disturbance and the risk of take. The spatial buffers vary by alternative; however, the seasonal restrictions remain constant among the alternatives, as outlined in the table below. These seasonal restrictions may be modified on a site-specific or project-specific basis based on field observations and local conditions.

Table K-1. Seasonal Restrictions

Common Name	Period of Seasonal Restriction
American Kestrel	April 1 – August 15
Bald Eagle	January 1 – August 15
Boreal Owl	February 1 – July 31
Burrowing Owl	April 1 – September 15
Common Barn Owl	February 1 – September 15
Cooper's Hawk	March 15 – August 31
Eastern Screech-owl	March 1 – August 15
Ferruginous Hawk	March 15 – July 31
Golden Eagle	January 15 – July 31
Great Gray Owl	March 15 – August 31
Great Horned Owl	December 1 – September 30
Long-eared Owl	February 1 – August 15
Merlin	April 1 – August 15
Northern Goshawk	April 1 – August 15
Northern Harrier	April 1 – August 15
Northern Pygmy-Owl	April 1 – August 1
Northern Saw-whet Owl	March 1 – August 31
Osprey	April 1 – August 31
Peregrine Falcon	March 1 – August 15
Prairie Falcon	March 1 – August 15
Red-tailed Hawk	February 1 – August 15
Sharp-shinned Hawk	March 15 – August 31
Short-eared Owl	March 15 – August 1
Swainson's Hawk	April 1 – August 31
Western Screech-owl	March 1 – August 15

2.0 HERD UNITS

Big game species in the Planning Area include pronghorn (antelope), deer (mule deer and white-tailed deer), elk, moose, bighorn sheep, and mountain goat. Boundaries of the herd unit areas are established to encompass all the seasonal ranges and habitats or special life-function areas (e.g., calving and lambing areas) utilized by a more or less discreet population or herd. Because there will always be some interchange of animals between adjacent populations, and portions of populations change important use patterns over time, these boundaries are well defined, but not permanent. They do, however, represent the best available data and identify population units consistent with the most recent biological and climatic conditions. Chapter 3, *Wildlife* provides information about the relative size and amount of BLM-administered lands in Planning Area big game herd units. Figures K-1 through K-7 show the WGFD herd units. Specific information about population trends is available through the WGFD via the agency’s Job Completion Reports.

3.0 SPECIES LIST

Table K-2. Common and Scientific Names of Plant and Wildlife Species Identified in the Environmental Impact Statement

Common Name	Scientific Name
Plants	
Absaroka beardtongue	<i>Penstemon absarokensis</i>
Absinth wormwood	<i>Artemisia absinthium</i>
Alder	<i>Alnus spp.</i>
Alfalfa	<i>Medicago sativa</i>
Alkali bulrush	<i>Scirpus maritimus</i>
Alkali cordgrass	<i>Spartina gracilis</i>
Alkali grass	<i>Puccinellia spp.</i>
Alkali sacaton	<i>Sporobolus airoides</i>
Alpine poppy	<i>Papaver pygmaeum</i>
Annual yellow sweet clover	<i>Melilotus indicus</i>
Antelope bitterbrush	<i>Purshia tridentata</i>
Aspen	<i>Populus tremuloides</i>
Aster	<i>Aster alpinus</i>
Baltic rush	<i>Juncus balticus</i>
Basin big sagebrush	<i>Artemisia tridentata ssp. tridentata</i>
Basin wildrye	<i>Leymus cinereus</i>
Beardtongue penstemon	<i>Penstemon spp.</i>
Beyrich threeawn	<i>Aristida beyrichiana</i>
Big bluegrass	<i>Poa secunda</i>
Big horn fleabane	<i>Erigeron allocotus</i>
Big sagebrush	<i>Artemisia tridentata</i>
Bigseed dodder	<i>Cuscuta indecora var. neuropetala</i>
Big-tooth maple	<i>Acer grandidentatum</i>
Birch	<i>Betula spp.</i>
Biscuitroot	<i>Lomatium spp.</i>
Bitterbrush	<i>Purshia spp.</i>
Black elderberry	<i>Sambucus nigra</i>
Black greasewood	<i>Sarcobatus vermiculatus</i>
Black henbane	<i>Hyoscyamus niger</i>
Black sagebrush	<i>Artemisia nova</i>
Blowout penstemon	<i>Penstemon haydenii</i>
Blue elderberry	<i>Sambucus nigra ssp. cerulea</i>
Blue grama	<i>Bouteloua gracilis</i>
Blue spruce	<i>Picea pungens</i>
Bluebell	<i>Mertensia spp.</i>
Bluebunch wheatgrass	<i>Pseudoroegneria spicata</i>
Bottlebrush squirreltail	<i>Elymus elymoides</i>
Box elder	<i>Acer negundo</i>

Table K-2. Common and Scientific Names of Plant and Wildlife Species Identified in the Environmental Impact Statement (Continued)

Common Name	Scientific Name
Broadleaved twayblade	<i>Listera convallarioides</i>
Buckwheat	<i>Polygonaceae spp.</i>
Buffalo grass	<i>Buchloe dactyloides</i>
Buffalobur	<i>Solanum rostratum</i>
Bulrush	<i>Scirpus spp.</i>
Canada thistle	<i>Cirsium arvense</i>
Cary's beardtongue	<i>Penstemon caryi</i>
Cattail	<i>Typha spp.</i>
Chamisso cottongrass	<i>Eriophorum chamissonis</i>
Cheatgrass	<i>Bromus tectorum</i>
Chokecherry	<i>Prunus virginiana</i>
Cocklebur	<i>Xanthium spp.</i>
Coil beaked lousewort	<i>Pedicularis contorta var. ctenophora</i>
Colombia needlegrass	<i>Achnatherum nelsonii ssp. nelsonii</i>
Columbine	<i>Aquilegia spp.</i>
Common burdock	<i>Arctium minus (Hill) Bernh.</i>
Common crupina	<i>Crupina vulgaris</i>
Common mullein	<i>Verbascum thapsus</i>
Common St. Johnswort	<i>Hypericum perforatum</i>
Common tansy	<i>Tanacetum vulgare</i>
Common threesquare	<i>Schoenoplectus pungens</i>
Composite dropseed	<i>Sporobolus compositus</i>
Corn	<i>Zea mays</i>
Cottonwood	<i>Populus spp.</i>
Curl-leaf mountain mahogany	<i>Cercocarpus ledifolius</i>
Curly dock	<i>Rumex crispus</i>
Currant	<i>Ribes spp.</i>
Cusick's alkali grass	<i>Puccinellia cusickii</i>
Dalmatian toadflax	<i>Linaria genistifolia ssp. dalmatica</i>
Diffuse knapweed	<i>Centaurea diffusa</i>
Distaff thistle	<i>Carthamus baeticus</i>
Douglas' knotweed	<i>Polygonum douglasii</i>
Douglas-fir	<i>Pseudotsuga menziesii</i>
Dubois milkvetch	<i>Astragalus gilviflorus var. purpureus</i>
Dwarf raspberry	<i>Rubus arcticus ssp. acaulis</i>
Dwarf woolly-heads	<i>Psilocarphus brevissimus</i>
Dyer's woad	<i>Isatis tinctoria</i>
Eastern cottonwood	<i>Populus deltoides</i>
Englemann spruce	<i>Picea engelmannii</i>
English Bluebell	<i>Hyacinthoides spp.</i>
Evert's water parsnip	<i>Cymopterus evertii</i>
False agoseris	<i>Agoseris glauca var. laciniata</i>
Field bindweed	<i>Convolvulus arvensis</i>

Table K-2. Common and Scientific Names of Plant and Wildlife Species Identified in the Environmental Impact Statement (Continued)

Common Name	Scientific Name
Field pussytoes	<i>Antennaria neglecta</i>
Four-winged saltbush	<i>Atriplex canescens</i>
Fragile rockbrake	<i>Cryptogramma stelleri</i>
Gardner’s saltbush	<i>Atriplex garnderi</i>
Globemallow	<i>Sphaeralcea spp.</i>
Goats rue	<i>Galega officinalis</i>
Gorse	<i>Ulex spp.</i>
Greasewood	<i>Sarcobatus vermiculatus</i>
Green ash	<i>Fraxinus pennsylvanica</i>
Green needlegrass	<i>Nasella viridula</i>
Green spleenwort	<i>Asplenium trichomanes-ramosum</i>
Hairy prince’s-plume	<i>Stanleya tomentosa var. tomentosa</i>
Hairy tranquil goldenweed	<i>Pyrocoma clementis var. villosa</i>
Hairy whitetop	<i>Cardaria pubescens</i>
Halogeton	<i>Halogeton glomeratus</i>
Hapeman’s coolwort	<i>Sullivantia hapemanii var. hapemanii</i>
Hawthorne	<i>Crataegus spp.</i>
Herbaceous seepweed	<i>Suaeda maritima</i>
Hoary cress	<i>Cardaria draba</i>
Houndstongue	<i>Cynoglossum offinale</i>
Hulled rush	<i>Juncus triglumis</i>
Hyattville milkvetch	<i>Astragalus jejunus var. articulatus</i>
Iberian starthistle	<i>Centaurea iberica</i>
Ice grass	<i>Phippsia algida</i>
Idaho fescue	<i>Festuca idahoensis</i>
Indian paintbrush	<i>Castilleja spp.</i>
Indian ricegrass	<i>Achnatherum hynenoides</i>
Inland saltgrass	<i>Distichlis spicata</i>
Italian thistle	<i>Carduus pycnocephalus</i>
Japanese brome	<i>Bromus japonicus</i>
Juniper	<i>Juniperus spp.</i>
Kentucky bluegrass	<i>Poa pratensis</i>
King spike fescue	<i>Leucopoa kingii</i>
Knotweed	<i>Polygonum spp.</i>
Kotzebuei’s grass-of-parnassus	<i>Parnassia kotzebuei</i>
Lance-leaved moonwort	<i>Botrychium lanceolatum var. lanceolatum</i>
Large bur-reed	<i>Sparganium eurycarpum</i>
Large yellow lady-slipper	<i>Cypripedium parviflorum</i>
Large-leaved pondweed	<i>Potamogeton amplifolius</i>
Larkspur	<i>Delphinium spp.</i>
Leafy spurge	<i>Euphorbia esula</i>
Leafy thistle	<i>Cirsium foliosum</i>
Limber pine	<i>Pinus flexilis</i>

Table K-2. Common and Scientific Names of Plant and Wildlife Species Identified in the Environmental Impact Statement (Continued)

Common Name	Scientific Name
Locoweed	<i>Oxytropis spp.</i>
Lodgepole pine	<i>Pinus contorta</i>
Longleaf arnica	<i>Arnica lonchophylla</i>
Lupine	<i>Lupinus spp.</i>
Meadow parsnip	<i>Thaspium spp.</i>
Medusahead	<i>Taeniatherum caput-medusae</i>
Milkvetch	<i>Astragalus spp.</i>
Mingan moonwort	<i>Botrychium minganense</i>
Mistletoe	<i>Arceuthobium spp.</i>
Moschatel	<i>Adoxa moschatellina</i>
Mountain big sagebrush	<i>Artemisia tridentata var. vaseyana</i>
Mountain deathcamus	<i>Zigadenus elegans</i>
Mountain lady-slipper	<i>Cypripedium montanum</i>
Mountain mahogany	<i>Cercocarpus montanus</i>
Musk thistle	<i>Carduus nutans</i>
Mutton bluegrass	<i>Poa fendleriana</i>
Nebraska sedge	<i>Carex nebrascensis</i>
Needle-and-thread	<i>Hesperostipa comata</i>
Nuttall's saltbush	<i>Atriplex nuttallii</i>
Orange hawkweed	<i>Hieracium aurantiacum</i>
Ox-eye daisy	<i>Leucanthemum vulgare or Chrysanthemum leucanthemum</i>
Perennial pepperweed (giant whitetop)	<i>Lepidium latifolium</i>
Perennial sowthistle	<i>Sonchus arvensis</i>
Persistent sepal yellowcress	<i>Rorippa calycina</i>
Phlox	<i>Phlox spp.</i>
Plains pricklypear	<i>Opuntia polyacantha</i>
Plains rough fescue	<i>Festuca hallii</i>
Plumeless thistle	<i>Carduus acanthoides</i>
Poison hemlock	<i>Conium maculatum</i>
Ponderosa pine	<i>Pinus ponderosa</i>
Porter's sagebrush	<i>Artemisia porteri</i>
Prairie cordgrass	<i>Spartina Pectinata</i>
Prairie junegrass	<i>Koeleria macrantha</i>
Pricklypear cactus	<i>Opuntia spp.</i>
Puncturevine	<i>Tribulus terrestris</i>
Purple loosestrife	<i>Lythrum salicaria</i>
Purple starthistle	<i>Centaurea calcitrapa</i>
Puzzling moonwort	<i>Botrychium paradoxum</i>
Quackgrass	<i>Elymus repens</i>
Quaking aspen	<i>Populus tremuloides</i>
Rabbitbrush	<i>Chrysothamnus spp.</i>
Ragwort	<i>Packera spp.</i>
Rattlesnake fern	<i>Botrychium virginianum</i>

Table K-2. Common and Scientific Names of Plant and Wildlife Species Identified in the Environmental Impact Statement (Continued)

Common Name	Scientific Name
Red cottongrass	<i>Eriophorum ressuloum</i>
Redstem storks bill	<i>Erodium cicutarium</i>
Rocky Mountain juniper	<i>Juniperus scopulorum</i>
Rocky Mountain maple	<i>Acer glabrum</i>
Rocky Mountain twinpod	<i>Physaria saximontana var. dentata</i>
Rough cocklebur	<i>Xanthium strumarium</i>
Rubber rabbitbrush	<i>Ericameria nauseosa ssp. nauseosa var. nauseosa</i>
Rush skeletonweed	<i>Chondrilla juncea</i>
Rushes	<i>Juncaceae</i>
Russian knapweed	<i>Acroptilon repens</i>
Russian olive	<i>Elaeagnus angustifolia</i>
Saltbush	<i>Atriplex spp.</i>
Saltcedar	<i>Tamarix spp.</i>
Saltgrass	<i>Distichlis spicata</i>
Sand dropseed	<i>Sporbolus cryptandrus</i>
Sandberg's bluegrass	<i>Poa secunda</i>
Sandwort	<i>Arenaria spp.</i>
Sartwell's sedge	<i>Carex sartwellii var. sartwellii</i>
Scarlet globemallow	<i>Sphaeralcea coccinea</i>
Scotch thistle	<i>Onopordum acanthium</i>
Sea blight	<i>Suaeda maritime</i>
Sedges	<i>Cyperaceae</i>
Serviceberry	<i>Amerlanchier alnifolia</i>
Shadscale	<i>Atriplex confertifolia</i>
Shadscale saltbush	<i>Atriplex confertifolia</i>
Sheathed musineon	<i>Musineon vaginatum</i>
Sheep fescue	<i>Festuca ovina</i>
Shortleaved sedge	<i>Carex misandra</i>
Shoshonea	<i>Shoshonea pulvinata</i>
Showy milkweed	<i>Asclepias speciosa</i>
Shrubby cinquefoil	<i>Dasiphora fruticosa</i>
Silver sagebrush	<i>Artemisia canescens</i>
Single-head pussytoes	<i>Antennaria monocephala</i>
Skeletonleaf bur ragweed	<i>Ambrosia tomentosa</i>
Skunkbush sumac	<i>Rhus trilobata</i>
Slender bulrush	<i>Schoenoplectus heterochaetus</i>
Slim-pod Venus' looking glass	<i>Triodanis leptocarpa</i>
Snowberry	<i>Symphoricarpos spp.</i>
Spikerush	<i>Eleocharis spp.</i>
Spiny hopsage	<i>Grayia spinosa</i>
Spiny phlox	<i>Phlox hoodsii</i>
Spotted knapweed	<i>Centaurea stoebe ssp. micranthos</i>
Subalpine fir	<i>Abies lasiocarpa</i>

APPENDIX L

REQUIRED DESIGN FEATURES AND BEST MANAGEMENT PRACTICES

Required Design Features (RDFs) are required for certain activities in greater sage-grouse habitat. RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations (e.g., a larger or smaller protective area). All variations in RDFs would require that at least one of the following be demonstrated in the National Environmental Policy Act (NEPA) analysis associated with the project/activity:

- A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable;
- An alternative RDF is determined to provide equal or better protection for greater sage-grouse or its habitat; or
- A specific RDF will provide no additional protection to greater sage-grouse or its habitat.

Adverse environmental impacts associated with development can be avoided, reduced, or mitigated through the project's design and implementation. In order to provide regulatory certainty that the measures will be incorporated, they must be required of every project. The National Technical Team (NTT) report identified management actions and practices that would reduce adverse impacts to greater sage-grouse if mandated to development throughout Core Area (Priority Habitat Management Areas). Some of these practices are incorporated in Alternative D as being universally appropriate. The ones that could be analyzed on a planning area-wide basis have been made a part of the management actions and in this appendix as RDFs.

Other environmental protection measures could not be analyzed in a resource area-wide Environmental Impact Statement (EIS) because their appropriateness depends upon site-specific issues such as proximity to the boundary of Priority Habitat Management Areas or non-crucial habitat or engineering or physical limitations such as an oil and gas producing zone being too close to the surface to be recoverable through directional drilling. These best management practices (BMPs) are required to be considered in a site-specific project's design to reduce, prevent, or avoid adverse environmental or social impacts. These practices are analyzed to help ensure that development is conducted in an environmentally responsible manner. Some BMPs are as simple as choosing a paint color that helps oil and natural gas equipment blend with the natural surroundings, making development less visible. Other BMPs may reduce the amount of vegetation lost to development, improve the speed of re-growth of desirable vegetation, or may reduce the amount of wildlife disturbance in important habitats. Public land users are encouraged to review these practices, incorporate them where appropriate, or develop better methods for achieving the same goal. However, the Bureau of Land Management (BLM) may also require their incorporation into the design features of the project as a Condition of Approval (COA). A design feature should only be considered as a potential beneficial impact under the NEPA when it is part of a BLM authorization as a COA. If the practice is only voluntary or suggested, the BLM lacks the authority to require its implementation, so the project should be analyzed as if the practice will not

occur. The BLM authorization will make clear whether the BMP is mandatory (attached as a COA) or merely encouraged.

NEPA analysis that concludes that BMPs should not be attached as mandatory COAs needs to clearly explain why with relation to site-specific factors. The purpose of this section is not to select certain practices or designs and require that only those be used. It is not possible to evaluate all the known practices and make determinations as to which are best, particularly without a specific project in a specific location. BMPs should be matched and adapted to meet the site-specific requirements of the management action, project and local environment. No one management practice is best suited to every site or situation, or will remain the most optimal practice over time. BMPs must be adaptive and monitored regularly to evaluate effectiveness. As discussed more fully in the Special Status Species-Wildlife section, protections for the greater sage-grouse are an important focal point in the preparation of the Resource Management Plan (RMP). Accordingly, a special section of BMPs identifies management that should be considered in greater sage-grouse priority habitat. It is expected that these BMPs will change over time as monitoring and further study develop improved greater sage-grouse protections.

1.0 REQUIRED DESIGN FEATURES

The following design approaches are required for all projects unless the proponent establishes that due to site limitations or engineering considerations, the design approaches are infeasible. Economic considerations such as increased costs do not render a design infeasible. The following measures would be applied as RDFs for all solid minerals. They would also apply to locatable minerals subject to valid existing rights and consistent with applicable law.

1.1 Greater Sage-Grouse Protection Required Design Features for All Projects

The following measures, and others as they are identified, will be required for all BLM-authorized development. As appropriate, they may be required as part of the design of the project or as a mandatory COA. The following required design features are found in the Sage-Grouse National Technical Team report (Sage-grouse NTT 2011) titled “A Report on National Greater Sage-Grouse Conservation Measures”.

General

1. Evaluate and take advantage of opportunities to remove or modify existing power lines within priority sage-grouse habitat areas. When possible, require perch deterrents on existing or new overhead facilities. Encourage installation of perch deterrents on existing facilities.
2. Where existing leases or rights-of-way (ROWs) have had some level of development (road, fence, well, etc.) and are no longer in use, reclaim the site by removing these features and restoring the habitat.
3. Locate man camps outside priority sage-grouse habitats.
4. Work cooperatively with permittees, leasees, and other landowners to develop grazing management strategies that integrate both public and private lands into single management units.

5. Coordinate BMPs and vegetative objectives with the Natural Resources Conservation Service (NRCS) for consistent application across jurisdictions where the BLM and NRCS have the greatest opportunities to benefit greater sage-grouse, particularly as it applies to the NRCS's National Sage-Grouse Initiative:
(<http://www.nrcs.usda.gov/wps/portal/nrcs/detailfull/national/programs/farmland/initiatives/andcid=steldevb1027671>).
6. When conducting NEPA analysis for water developments or other rangeland improvements address the direct and indirect effects to sage-grouse populations and habitat.
7. Evaluate the role of existing seedings that are currently composed of primarily introduced perennial grasses in and adjacent to priority sage-grouse habitats to determine if they should be restored to sagebrush or habitat of higher quality for sage-grouse. If these seedings are part of an Allotment Management Plan/Conservation Plan or if they provide value in conserving or enhancing the rest of the priority habitats, then no restoration would be necessary. Assess the compatibility of these seedings for sage-grouse habitat or as a component of a grazing system during land health assessments. For example, some introduced grass seedings are an integral part of a livestock management plan and reduce grazing pressure in important sagebrush habitats, or serve as a strategic fuels management area.
8. Where the federal government owns the surface, and the mineral estate is in non-federal ownership, apply appropriate BMPs to surface development.

Roads

1. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.
2. Locate roads to avoid important areas and habitats.
3. Coordinate road construction and use among Federal fluid mineral lessees and ROW or Surface Use Agreement (SUA) holders.
4. Construct road crossings of ephemeral, intermittent, and perennial streams to minimize impacts to the riparian habitat, such as by crossing at right angles to ephemeral drainages and stream crossings.
5. Establish slow speed limits on BLM and Forest Service system-administered roads or design roads for slower vehicle speeds to reduce sage-grouse mortality.
6. Establish trip restrictions or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).
7. Do not issue ROWs or SUAs to counties on energy development roads, unless for a temporary use consistent with all other terms and conditions including this document.
8. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)
9. Apply dust abatement on roads, well pads, and other surface disturbances.
10. Close and rehabilitate duplicate roads by restoring original landform and establishing a desirable plant community.
11. Do not issue ROWs to counties on newly constructed energy development roads, unless for a temporary use consistent with all other terms and conditions included in this document.

Operations

1. Site and/or minimize linear ROWs or SUAs to reduce disturbance and fragmentation of sagebrush habitats.
2. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.
3. Bury power lines to the extent technically feasible.
4. Collocate powerlines, flowlines, and small pipelines under or immediately adjacent to existing roads/transportation corridors.
5. Cover all fluid-containing pits and open tanks with netting (maximum 1.5-inch mesh size) regardless of size to reduce sage-grouse mortality.
6. Equip tanks and other above ground facilities with structures or devices that discourage nesting and perching of raptors and corvids.
7. Control the spread and effects of invasive non-native plant species, including treating weeds prior to surface disturbance and washing vehicles and equipment at designated wash stations when constructing in areas with weed infestations.
8. Require sage-grouse-safe fences.
9. Clean up refuse.
10. Locate mining camps outside of priority sage-grouse habitats.
11. Fit transmission towers with anti-perch devices.
12. Construct sage-grouse-safe fences around sumps.
13. Cluster disturbances, operations (hydraulic fracture stimulation, liquids gathering, etc.), and facilities.
14. Use directional and horizontal drilling to the extent feasible as a means to reduce surface disturbance in relation to the number of wells.
15. Place infrastructure in already disturbed locations where the habitat has not been fully restored.
16. Apply a phased development approach with concurrent reclamation.
17. Place liquid gathering facilities outside priority areas. To reduce truck traffic and perching and nesting sites for ravens and raptors do not place tanks at well locations within priority habitat areas.
18. Pipelines must be under or immediately adjacent to the road.
19. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use.
20. Restrict the construction of tall facilities, distribution powerlines, and fences to the minimum number and amount needed.
21. Design or site permanent structures to minimize impacts to sage-grouse, with emphasis on locating and operating facilities that create movement (e.g., pump jacks) or attract frequent human use and vehicular traffic (e.g., fluid storage tanks) in a manner that will minimize disturbance of sage-grouse or interference with habitat use.

22. Use only closed-loop systems for drilling operations, with no reserve pits.
23. Consider using oak (or other material) mats for drilling activities where topography permits to reduce vegetation disturbance and for temporary roads between closely-spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.

West Nile

1. Restrict impoundment construction to reduce or eliminate threats from West Nile Virus (WNV).
2. Increase the size of freshwater ponds to accommodate a greater volume of water than is discharged. This will result in un-vegetated and muddy shorelines that breeding *Cx. tarsalis* avoid. This modification may reduce *Cx. tarsalis* habitat but could create larval habitat for *Culicoides sonorensis*, a vector of blue tongue disease, and should be used sparingly. Steep shorelines should be used in combination with this technique whenever possible.
3. Build steep shorelines to reduce shallow water (greater than 60 centimeters [cm]) and aquatic vegetation around the perimeter of impoundments. Construction of steep shorelines also will create more permanent ponds that are a deterrent to colonizing mosquito species like *Cx. tarsalis* which prefer newly flooded sites with high primary productivity.
4. Maintain water levels below that of rooted vegetation for a muddy shoreline that is unfavorable habitat for mosquito larvae. Rooted vegetation includes both aquatic and upland vegetative types. Avoid flooding terrestrial vegetation in flat terrain or low lying areas. Aquatic habitats with a vegetated inflow and outflow separated by open water produce 5 to 10 fold fewer *Culex* mosquitoes than completely vegetated wetlands. Wetlands with open water also had significantly fewer stage III and IV instars which may be attributed to increased predator abundances in open water habitats.
5. Construct dams or impoundments that restrict down slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage, or lining constructed ponds in areas where seepage is anticipated.
6. Line channels where discharge water flows into ponds with crushed rock, or use a horizontal pipe to discharge inflow directly into existing open water, thus precluding shallow surface inflow and accumulation of sediment that promotes aquatic vegetation.
7. Line the overflow spillway with crushed rock, and construct the spillway with steep sides to preclude the accumulation of shallow water and vegetation.
8. Fence pond sites to restrict access by livestock and other wild ungulates that trample and disturb shorelines, enrich sediments with manure and create hoof print pockets of water that are attractive to breeding mosquitoes.
9. Manage artificial water impoundments for the prevention and/or spread of WNV where the virus poses a threat to sage-grouse. This may include but is not limited to: (a) the use of larvicides and adulticides to treat waterbodies; (b) overbuilding ponds to create non-vegetated, muddy shorelines; (c) building steep shorelines to reduce shallow water and emergent aquatic vegetation; (d) maintaining the water level below rooted vegetation; (e) avoiding flooding terrestrial vegetation in flat terrain or low lying areas; (f) constructing dams or impoundments that restrict seepage or overflow; (g) lining the channel where discharge water flows into the pond with crushed rock, or use a horizontal pipe to discharge inflow directly into existing open water; (h) lining the overflow spillway with crushed rock and construct the spillway with steep

Appendix L – Required Design Features and Best Management Practices

sides to preclude the accumulation of shallow water and vegetation; and (j) restricting access of ponds to livestock and wildlife.

10. Field Offices should consider alternate means to manage produced waters that could present additional vectors for WNV. Such remedies may include re-injection under an approved Underground Injection Control permit, transfer to single/centralized facility, etc.
11. Policy Statement 7 regarding WNV does not apply to naturally occurring waters.
12. Design impoundments for wildlife and/or livestock use to reduce the potential to produce vectors for WNV where the virus may pose a threat to sage-grouse.
13. Manage water impoundments to prevent the spread of WNV where analysis shows the virus poses a threat to sage-grouse and may result in negative impacts to other species of concern.
14. Remove or re-inject produced water to reduce habitat for mosquitoes that vector WNV. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:
 - Overbuild size of ponds for muddy and non-vegetated shorelines.
 - Build steep shorelines to decrease vegetation and increase wave actions.
 - Avoid flooding terrestrial vegetation in flat terrain or low lying areas.
 - Construct dams or impoundments that restrict down slope seepage or overflow.
 - Line the channel where discharge water flows into the pond with crushed rock.
 - Construct spillway with steep sides and line it with crushed rock.
15. Treat waters with larvicides to reduce mosquito production where water occurs on the surface.
16. Restrict pit and impoundment construction to reduce or eliminate threats from WNV.

Noise

1. Limit noise to less than 10 decibels above ambient measures (20 to 24 decibels) at sunrise at the perimeter of a lek during active lek season.
2. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.
3. Locate new compressor stations outside priority habitats and design them to reduce noise that may be directed towards priority habitat.
4. Require sage-grouse safe fences.

Reclamation

1. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.
2. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling, and revegetating cut-and-fill slopes.
3. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.

4. Implement irrigation during interim or final reclamation for sites where establishment of seedlings has been shown or is expected to be difficult due to dry conditions. Utilize mulching techniques to expedite reclamation.
5. Use mulching, soil amendments, and/or erosion blankets to expedite reclamation and to protect soils.
6. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.
7. Minimize surface-disturbing or disrupting activities (including operations and maintenance) where needed to reduce the impacts of human activities on important seasonal sage-grouse habitats. Apply these measures during project level planning.
8. When conducting NEPA analysis for wild horse and burro management activities, water developments or other rangeland improvements for wild horses in priority sage-grouse habitat, address (and apply conservation measures as appropriate) the direct and indirect effects to sage-grouse populations and habitat.
9. During activity level planning, where appropriate, designate routes with current administrative/agency purpose or need to administrative access only.
10. Identify and work with partners to increase native seed availability and work with plant material centers to develop new plant materials, especially the forbs needed to restore sage-grouse habitat.
11. Consider potential changes in climate when proposing seedings using native plants. Consider seed collections from the warmer component within a species' current range for selection of native seed.
12. Use Ecological Site Descriptions (ESDs) or other protocols could be used (e.g., TEUI or LSI) to identify the understory species and sagebrush subspecies needed to restore desirable habitat conditions.

Vegetation Treatments/Fire and Fuels Management

1. During vegetation management project design, consider the utility of using livestock to strategically reduce fine fuels, and implement grazing management that will accomplish this objective. Consult with ecologists to minimize impacts to native perennial grasses.
2. Provide to personnel planning vegetation treatments information on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
3. Use vegetation treatment prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable plant species and reduce risk of hydrophobicity).
4. Ensure proposed sagebrush treatments are planned with interdisciplinary input from BLM/Forest Service and /or state wildlife agency biologist and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.
5. Ensure that treatments are configured in a manner (e.g., strips) that promotes use by sage-grouse.
6. Where appropriate, incorporate roads and natural fuels breaks into fuels break design.
7. Power-wash all vehicles and equipment involved in vegetation treatment activities prior to entering the area to minimize the introduction of undesirable and/or invasive plant species.

Appendix L – Required Design Features and Best Management Practices

8. Design vegetation treatments in areas of high wildfire frequency to facilitate firefighter and public safety, reduce the risk of extreme fire behavior; and to reduce the risk and rate of fire spread to sage-grouse habitats.
9. Restore prior perennial grass/shrub plant communities infested with non-native invasive species to a species composition characterized by perennial grasses, forbs, and shrubs as outlined in ESDs.
10. Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.
11. Reduce the risk of vehicle or human-caused wildfires and the spread of invasive species into sage-grouse habitats could be minimized by planting perennial vegetation (e.g., green-strips) paralleling road ROWs (this BMP could be applied to BLM linear ROW authorizations).
12. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, and strictly managed grazed strips) to aid in controlling wildfire should wildfire occur near sage-grouse key habitats or important restoration areas (such as where investments in restoration have already been made).
13. Design vegetation treatments in sage-grouse habitats to strategically reduce wildfire threats in the greatest area. This may involve spatially arranging new vegetation treatments with past treatments, vegetation with fire-resistant serial stages, natural barriers, and roads in order to constrain fire spread and growth. This may require vegetation treatments to be implemented in a more linear versus block design.
14. Design post Emergency Stabilization and Rehabilitation (ES&R) and Burned Area Emergency Response management to ensure long term persistence of seeded or pre-burn native plants. This may require temporary or long-term changes in livestock grazing, wild horse and burro, and travel management, etc., to achieve and maintain the desired condition of ES&R and Burned Area Emergency Response projects to benefit sage-grouse. Include sage-grouse habitat parameters as defined by Connelly et al., Hagen et al., or if available, State Sage-Grouse Conservation plans and appropriate local information in habitat restoration objectives. Make maintaining these objectives within priority sage-grouse habitat areas a high restoration priority.
15. Make re-establishment of sagebrush and desirable understory plant cover (relative to ecological site potential) a high priority for restoration efforts. Write specific vegetation objectives to reestablish sage-brush cover and desirable understory cover.
16. Where applicable, design fuels treatment objective to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.
17. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
18. Use fire prescriptions that minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).
19. Ensure proposed sagebrush treatments are planned with interdisciplinary input from BLM, Forest Service and/or state wildlife agency biologist and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.

20. Where appropriate, ensure that treatments are configured in a manner (e.g., strips) that promotes use by sage-grouse.
21. Where applicable, incorporate roads and natural fuel breaks into fuel break design.
22. Power-wash all firefighting vehicles, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATVs) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.
23. Design vegetation treatment in areas of high frequency to facilitate firefighting safety, reduce the risk of extreme fire behavior; and to reduce the risk and rate of fire spread to sage-grouse key habitats and restoration habitats.
24. Give priority for implementing specific sage-grouse habitat restoration projects in areas infested with undesirable annual grasses first to sites which are adjacent to or surrounded by sage-grouse key habitats. Areas infested with undesirable annual grasses are second priority for restoration when the sites not adjacent to key habitat, but within two miles of key habitat. The third priority for areas infested with undesirable annual grasses habitat restoration projects are sites beyond two miles of key habitat. The intent is to focus restoration outward from existing, intact habitat.
25. As funding and logistics permit, restore areas infested with undesirable annual grasses to a species composition characterized by perennial grasses, forbs, and shrubs.
26. Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.
27. Remove standing and encroaching trees within at least 100 meters of occupied sage-grouse leks and other habitats (e.g., nesting, wintering, and brood rearing) to reduce the availability of perch sites for avian predators, as appropriate, and resources permit.
28. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.
29. Develop state-specific sage-grouse reference information and resource materials containing maps, a list of resource advisors, contact information, local guidance, and other relevant information.
30. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.
31. Assign a sage-grouse resource advisor to all extended attack fires in or near priority sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals.
32. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.
33. During periods of multiple fires, ensure line officers are involved in setting priorities.
34. Locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, and heli-bases) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.

Appendix L – Required Design Features and Best Management Practices

35. Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.
36. Minimize burnout operations in key sage-grouse habitats by constructing direct firelines whenever safe and practical to do so.
37. Utilize retardant and mechanized equipment to minimize burned acreage during initial attack.
38. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.

Fire Operations Best Management Practices for Sage-Grouse Conservation

1. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.
2. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.
3. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals.
4. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.
5. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.
6. During periods of multiple fires, ensure line officers are involved in setting priorities.
7. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.
8. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and ATVs prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.
9. Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.
10. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.
11. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.
12. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.
13. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.

Fuels Management Best Management Practices for Sage-Grouse Conservation

1. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.
2. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
3. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).
4. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.
5. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.
6. Where applicable, incorporate roads and natural fuel breaks into fuel break design.
7. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.
8. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display current fuels treatment opportunities for suppression resources.
9. Give priority for implementing specific sage-grouse habitat restoration projects in areas infested with undesirable annual grasses, first to sites which are adjacent to or surrounded by preliminary priority habitat (PPH) or that reestablish continuity between priority habitats. Areas infested with undesirable annual grasses are a second priority for restoration when the sites are not adjacent to PPH, but within two miles of PPH. The third priority for areas infested with undesirable annual grasses habitat restoration projects are sites beyond two miles of PPH. The intent is to focus restoration outward from existing, intact habitat.
10. As funding and logistics permit, restore areas infested with undesirable annual grasses to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.
11. Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.
12. Remove standing and encroaching trees within at least 100 meters of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.
13. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.

Oil and Gas Development

1. Require unitization when deemed necessary for proper development and operation of an area or to facilitate more orderly (e.g., phased and/or clustered) development as a means of minimizing adverse impacts to resources, including greater sage-grouse, so long as the unitization plan adequately protects the rights of all parties including the United States, according to the Federal Lease Form, 3100-11, Sections 4 and 6.

2.0 BEST MANAGEMENT PRACTICES

The best management practices (BMPs) shown in this appendix are not intended to encompass all potentially applicable BMPs. Instead, Appendix L was developed to address specific issues brought forward during scoping, alternative development, and comments from the public and cooperating agencies.

2.1 Best Management Practices for Important Cultural Resource and Trail Settings

The BLM should use standard measures to reduce the visual impact of proposed actions within trail settings, where setting is a contributing element of eligibility to the National Register of Historic Places and the setting has integrity. Standard measures should be used as stipulations or conditions of approval attached to authorizations. Standard measures, or BMPs, for reducing the visibility of proposed actions include, but are not limited to:

- Apply a controlled surface use (CSU) stipulation to surface-disturbing activities or surface occupancy.
- Visual Contrast Ratings and, as appropriate, require visual simulations.
- Consolidate project facilities among oil and gas developers; maximize use of existing locations.
- Develop coordinated road and pipeline systems.
- Reduce the amount of surface development by consolidating facilities.
- Use low profile facilities.
- Locate projects to maximize the use of topography and vegetation to screen development.
- Design projects to blend with topographic forms and existing vegetation patterns.
- Use environmental coloration or camouflage techniques to reduce the visual impact of facilities that cannot be completely hidden.
- Use broken linear patterns for road developments to screen roads as much as possible. This can include feathering or blending of the edges of linear rights-of-way to soften the dominant line form.
- For livestock control, use electric fencing with low-visibility fiberglass posts and environmental colors.
- Design linear facilities and seismic lines to run parallel to key observation points rather than perpendicular.
- Position facilities to present less of a visual impact (e.g., a facility with several tanks lined up so that one obscures the visibility of the others).

2.2 Decontamination Procedure for Aquatic Invasive Species

To prevent the spread of aquatic invasive species, the Wyoming Game and Fish Department recommends following the guidelines outlined in the *Aquatic Invasive Species in Wyoming* brochure (link below). Specific BMPs to aquatic invasive species spread prevention include, but are not limited to:

- Decontamination should first occur before arrival at a project site, so aquatic invasive species are not transferred from the last visited area. Decontamination should occur again before leaving a project site, so aquatic invasive species are not transferred to the next site.
 - Decontamination may consist of either:
 1. Drain all water from equipment and compartments, clean equipment of all mud, plants, debris, or animals, and dry equipment for five days in summer (June, July, and August); 18 days in spring (March, April, and May) and fall (September, October, and November); or three days in winter (December, January, and February) when temperatures are at or below freezing,
- or-
2. Use a high pressure (2,500 pounds per square inch [psi]) hot water (140°F) pressure washer to thoroughly wash equipment and flush all compartments that may hold water.

<http://gf.state.wy.us/fish/AIS/index.asp>

2.3 Wyoming Forestry Best Management Practices

The Wyoming Forestry Best Management Practices: Forestry BMPs Water Quality Protection Guidelines (link below) describes BMPs for the management of forest lands. These BMPs are a set of voluntary preferred methods of forestland management designed to protect water quality and forest soils, and are intended for use on non-industrial private, forest industry, state-owned and federal forests.

<http://slf-web.state.wy.us/forestry/bmp2.aspx>

2.4 Reseeding Best Management Practices

The following recommendations may be required depending on the project size and location.

1. Proposed actions where native brush species located on lands proposed to be disturbed are unique and desirable for interim and final reclamation purposes, and the seed supply for these desirable brush species is not commercially available, will be collected from the area and stored using the procedures of the Seeds of Success program. Seedlings or plugs of common dominant species will be propagated, preferably locally, in preparation for use in portions of area to be reclaimed to expedite vegetation recovery.
2. Areas of sustainable plant communities and populations (where they do not conflict with other allowable resource uses) will be identified as sources for native plant material and will be managed under consideration of the need to consistently produce seed stocks of non-commercially available materials for use in reclamation and restoration work (e.g., to support reclamation of abandoned mine lands or well pads or to supplement commercially available seeds in high fire years).

2.5 Engineering Best Management Practices

Road maintenance, construction, and any other related travel and transportation management will be mandated by BLM Manual 9113. BLM Manual 9113 provides for BMPs to be used in evaluating, maintaining, and constructing BLM travel and transportation routes. As stated in Manual 9113, “Bureau roads must be designed to an appropriate standard no higher than necessary to accommodate their intended functions adequately (timber hauling administrative access, public travel); and design, construction, and maintenance activities must be consistent with national policies for safety, aesthetics, protection and preservation of cultural, historic, and scenic values, and accessibility for the physically handicapped. The following is a list of BMPs that are recommended but not binding for road maintenance practices:

1. Design roads to minimize total disturbance, to conform with topography, and to minimize disruption of natural drainage patterns.
2. Base road design criteria and standards on road management objectives such as traffic requirements of the proposed activity and the overall TP, economic analysis, safety requirements, resource objectives, and minimizing damage to the environment.
3. Locate roads on stable terrain such as ridge tops, natural benches, and flatter transitional slopes near ridges, and valley bottoms, and moderate side slopes and away from slumps, slide prone areas, concave slopes, clay beds, and where rock layers dip parallel to the slope. Locate roads on well-drained soil types; avoid wet areas when possible.
4. Construct cut and fill slopes to be approximately 3 horizontal (h):1 vertical (v) or flatter where feasible. Locate roads to minimize heights of cutbanks. Avoid high, steeply sloping cutbanks in highly fractured bedrock.
5. Avoid headwalls, midslope locations on steep, unstable slopes, fragile soils, seeps, old landslides, side slopes in excess of 70 percent, and areas where the geologic bedding planes or weathering surfaces are inclined with the slope. Implement extra mitigation measures when these areas cannot be avoided.
6. Construct roads for surface drainage by using outslopes, crowns, grade changes, drain dips, waterbars and in-sloping to ditches as appropriate.
7. Sloping the road base to the outside edge for surface drainage is normally recommended for local spurs or minor collector roads where low-volume traffic and lower traffic speeds are anticipated. This is also recommended in situations where long intervals between maintenance will occur and where minimum excavation is wanted. Out-sloping is not recommended on steep slopes. Sloping the road base to the inside edge is an acceptable practice on roads with steep side slopes and where the underlying soil formation is very rocky and not subject to appreciable erosion or failure.
8. Crown and ditching is recommended for arterial and collector roads where traffic volume, speed, intensity and user comfort are considerations. Recommended gradients range from 0 to 15 percent where crown and ditching may be applied, as long as adequate drainage away from the road surface and ditch lines is maintained.
9. Minimize excavation, when constructing roads, through the use of balanced earthwork, narrowing road widths, and end hauling where side slopes are between 50 and 70 percent.

10. If possible, construct roads when soils are dry and not frozen. When soils or road surfaces become saturated to a depth of 3 inches, BLM-authorized activities should be limited or ceased unless otherwise approved by the authorized officer.
11. Consider improving inadequately surfaced roads that are to be left open to public traffic during wet weather with gravel or pavement to minimize sediment production and maximize safety.
12. Retain vegetation on cut slopes unless it poses a safety hazard or restricts maintenance activities. Roadside brushing of vegetation should be done in a way that prevents disturbance to root systems and visual intrusions (i.e., avoid using excavators for brushing).
13. Retain adequate vegetation between roads and streams to filter runoff caused by roads.
14. Avoid riparian/wetland areas where feasible; locate in riparian/wetland areas only if the roads do not interfere with the attainment of resource objectives.
15. Minimize the number of unimproved stream crossings. When a culvert or bridge is not feasible, locate drive-through (low water crossings) on stable rock portions of the drainage channel. Harden crossings with the addition of rock and gravel if necessary. Use angular rock if available.
16. Locate roads and limit activities of mechanized equipment within stream channels to minimize their influence on riparian areas. When crossing a stream is necessary, design the approach and crossing perpendicular to the channel, where practicable. Locate the crossing where the channel is well defined, unobstructed, and straight.
17. Avoid placing fill material in floodplain unless the material is large enough to remain in place during flood events.
18. Use drainage dips instead of culverts on level 2 roads where gradients will not present a safety issue. Locate drainage dips in such a way so that water will not accumulate or where outside berms prevent drainage from the roadway. Locate and design drainage dips immediately upgrade of stream crossings and provide buffer areas and catchment basins to prevent sediment from entering the stream.
19. Construct catchment basins, brush windrows, and culverts in a way to minimize sediment transport from road surfaces to stream channels. Install culverts in natural drainage channels in a way to conform with the natural streambed gradients with outlets that discharge onto rocky or hardened protected areas.
20. Design and locate water crossing structures in natural drainage channels to accommodate adequate fish passage, provide for minimum impacts to water quality, and to be capable of handling a 100-year event for runoff and floodwaters.
21. Use culverts that pass, at a minimum, a 25-year storm event or have a minimum diameter of 24 inches for permanent stream crossings and a minimum diameter of 18 inches for road cross drains.
22. Replace undersized culverts and repair or replace damaged culverts and downspouts. Provide energy dissipaters at culvert outlets or drainage dips.
23. Locate culverts or drainage dips in such a manner as to avoid discharge onto unstable terrain such as headwalls or slumps. Provide adequate spacing to avoid accumulation of water in ditches or road surfaces. Culverts should be placed on solid ground to avoid road failures.

24. Proper sized aggregate and riprap should be used during culvert construction. Place riprap at culvert entrance to streamline waterflow and reduce erosion.
25. Establish adapted vegetation on all cuts and fill immediately following road construction and maintenance.
26. Remove berms from the downslope side of roads, consistent with safety considerations.
27. Leave abandoned roads in a condition that provides adequate drainage without further maintenance. Close abandoned roads to traffic. Physically obstruct the road with gates, large berms, trenches, logs, stumps, or rock boulders as necessary to accomplish permanent closure.
28. Abandon and rehabilitate roads that are no longer needed. Leave these roads in a condition that provides adequate drainage. Remove culverts.
29. When plowing snow for winter use of roads, provide breaks in snow berms to allow for road drainage. Avoid plowing snow into streams. Plow snow only on existing roads.
30. Maintenance should be performed to conserve existing surface material, retain the original crowned or out-sloped self-draining cross section, prevent or remove rutting berms (except those designed for slope protection) and other irregularities that retard normal surface runoff. Avoid wasting loose ditch or surface material over the shoulder where it can cause stream sedimentation or weaken slump-prone areas. Avoid undercutting back slopes.
31. Do not disturb the toe of cut slopes while pulling ditches or grading roads. Avoid sidecasting road material into streams.
32. Grade roads only as necessary. Maintain drain dips, waterbars, road crown, in-sloping and outsloping, as appropriate, during road maintenance.
33. Maintain roads in special areas according to special area guidance. Generally, retain roads within existing disturbed areas and sidecast material away from the special area.
34. When landslides occur, save all soil and material usable for reclamation or stockpile for future reclamation needs. Avoid sidecasting of slide material where it can damage, overload, and saturate embankments, or flow into down-slope drainage courses. Reestablish vegetation as needed in areas where vegetation has been destroyed due to sidecasting.
35. Strip and stockpile topsoil ahead of construction of new roads, if feasible. Reapply soil to cut and fill slopes prior to revegetation.

2.6 Best Management Practices for Livestock Grazing

The purpose of this section is not to attempt to select certain practices and require that only those be used. It is not possible to evaluate all the known practices and make determinations as to which are best. What is best must be determined as a result of a site-specific investigation of the proposed management action. No one management practice is best suited to every site or situation. BMPs must be adaptive and monitored regularly to evaluate effectiveness.

The following sources contain information regarding grazing BMPs. Over time, other sources of information will become available and will be considered in proposed management actions.

The National Range and Pasture Handbook

<http://www.glti.nrcs.usda.gov/technical/publications/nrph.html>

Best Management Practices for Grazing

<http://deq.state.wy.us/wqd/watershed/Downloads/NPS%20Program/92602.pdf>

The following BMPs for livestock grazing management within greater sage-grouse Priority Habitat Management Areas have been identified from Cagney et al. (2010):

Sage-Grouse Habitat Season

- Mating Leaks: Avoid any new sources of disturbance such as range improvements on lek sites.
- Nesting/Early Brood-Rearing: Maintain the Sagebrush/Bunchgrass Plant Community wherever currently present. Manage for high vigor in all plant communities. Avoid repeatedly using cool-season bunchgrasses in the critical growing season and limit utilization to moderate levels to assure that the previous year's standing crop is available for hiding cover.
- Late Brood-Rearing: Avoid repeatedly grazing riparian areas in seasons when temperatures are high.
- Winter: Avoid levels of browsing on sagebrush that would limit sage-grouse access to their food supply and cover. Additionally, avoid heavy use of herbaceous standing crop as this will adversely affect hiding cover the following spring.

Vegetation Community

- Bunchgrass: Consider changes in management that would increase utilization or change the timing of grazing on these sites.
- Sagebrush/Bunchgrass:
 - Retain sufficient residual cover to provide Sage-Grouse hiding cover the following year.
 - Employ planned grazing; periodic small-scale disturbance such as occasional thinning or specialized small ruminant grazing of dense (30+ percent canopy cover) sagebrush will help maintain this desired state.
- Sagebrush/Rhizomatous Grass/Bluegrass:
 - Establish grazing strategies tailored to plant growth requirements of cool-season grasses.
 - Retain sufficient residual cover to provide Sage-Grouse hiding cover the following year.
 - Avoid confining animals on inadequate pasture or supplemental feeding to compensate for a lack of natural forage.
- Sagebrush/Bare Ground: Restrict grazing in conjunction with restoration efforts until the site is ready to sustain grazing.

2.7 Best Management Practices for Visual Resources

The following BMPs would be considered to reduce impacts to all visual resource management classes within the Planning Area:

- Burying of distribution power lines and flow lines in or adjacent to access roads;
- Repeating elements of form, line, color, and texture to blend facilities and access roads with the surrounding landscape;
- Painting all above-ground structures, production equipment, tanks, transformers, and insulators not subject to safety requirements to blend with the natural color of the landscape, using paint that is a non-reflective “standard environmental color” approved by the BLM visual resource management (VRM) specialist:
 - All new equipment brought onto the sites should be painted the same color(s);
 - Semi-gloss paints will stain and fade less than flat paints;
 - Typically, the background is a vegetated background, and seldom a solid background;
 - The selected color should be one or two shades darker than the background; and
 - Consider the predominant season of public use; however, never paint an object to match snow.
- Performing final reclamation recontouring of all disturbed areas, including access roads, to the original contour or a contour that blends with the surrounding topography;
- Avoiding facility placement on steep slopes, ridge tops, and hilltops;
- Screening facilities from view;
- Following contours of the land to reduce unnecessary disturbance;
- Recontouring and revegetating disturbed areas to blend with the surrounding landscape;
- Reclaiming unnecessary access roads as soon as possible to the original contour;
- Using gravel of a similar color to adjacent dominant soil and vegetation colors for road surfacing;
- Use dust abatement to reduce fugitive dust, as well as minimize the light colors of the routes;
- Avoiding locating pads in areas visible from primary roads;
- Using subsurface or low-profile facilities to prevent protrusion above horizon line when viewed from any primary road;
- Co-locating wells when possible;
- Locating facilities far enough from the cut and fill slopes to facilitate recontouring for interim reclamation;
- Locating wells away from prominent features, such as rock outcrops;
- Completing an annual transportation plan for entire area before beginning construction, and making a layout that will minimize disturbance and visual impact;
- Designing and constructing all new roads to a safe and appropriate standard “no higher than necessary” to accommodate their intended use;
- Locating roads far enough off the back of ridgelines so they aren’t visible from state, county, or BLM roads;
- Using remote monitoring to reduce traffic and road requirements;
- Removing unused equipment, trash, and junk immediately.

2.8 Best Management Practices for Water Resources

BMPs would be appropriate for consideration to mitigate potential water quality impacts when proposed oil and gas activities are within 500 feet of riparian areas and surface waters of the state, Source Water Protection Areas identified in Wellhead or Source Water Protection Plans approved by the local governing body, and “High” and “Moderately High” sensitivity aquifers (identified throughout the use of the Wyoming Groundwater Vulnerability Assessment Handbook (as updated over time). BMPs to mitigate impacts to water resources include, but are not limited to, the following:

- Those management approaches for oil and gas activities required by Source Water and Wellhead Protection Plans approved by the local governing body; or
- Use closed loop drilling systems;
- Do not use evaporation ponds in proximity to shallow aquifers;
- Do not use unlined ponds or pits overlying sensitive aquifers;
- Line surface impoundment ponds (evaporation ponds or drilling pits) with synthetic liners and subsequently decommission by removing all contaminants and liner and reclaiming the area;
- Identify water supply wells and implement appropriate protection measures for the affected aquifer(s), as necessary to prevent the introduction of contaminants into the well;
- Require a monitoring plan which includes collection of baseline and periodic water quality data from potentially affected water supply wells, identification of parameters to monitor, reporting results to BLM and well owners, reporting to Wyoming Department of Environmental Quality-Air Quality Division;
- Review the geology of shallow aquifers to determine well construction requirements, which may include cementing to surface and drilling with a fresh water mud system;
- Requirement surface casing and cement to a specific formation or depth to protect aquifers at depth that need protection:
 - Set surface casing below the lowermost underground sources of drinking water and set into a confining (e.g., shale) layer;
 - Set an intermediate string of casing and cement in the event of deep aquifers;
 - Require submittal of a well logging plan and document submittal of plan to ensure proper well construction to protect groundwater. If a lost circulation event occurs during the installation of surface casing, a cement bond log will be required to be run on the surface casing to determine if the cement is adequate and protective.
 - Review the geology of shallow aquifers in proximity to groundwater development activities to determine potential impacts to flow patterns supporting water elements such as fen, wetlands, springs, and seeps, and ponds.

2.9 Best Management Practices for Greater Sage-Grouse Protection

Knowledge of BMPs for greater sage-grouse protections is an evolving field. As research is done on impacts of various kinds of activities, or the absence thereof, on greater sage-grouse, additional protections will be identified. While some of these will be generic enough to be applied planning area-wide, others will require site-specific analysis to determine if they are appropriate for inclusion as a

mandatory COA. This BMP section of this appendix will be supplemented as technology and understanding of greater sage-grouse advance.

APPENDIX M

LAND DISPOSAL AND ACQUISITION

1.0 LAND TENURE DESCRIPTIONS

The Bighorn Basin Resource Management Plan (RMP) revision project identifies land retention and disposal as defined in Table M-1 below.

Table M-1. Land Tenure Descriptions

Land Tenure	Description
Retention	Not available for disposal, except by R&PP or only by exchange if land with better resource values could be obtained.
Disposal	Available for disposal. Could include community expansion or to adjust property boundaries or to meet agriculture needs. <i>Example: Sale of land having an existing gas processing plant. A FLPMA sale to a local government or private party. Airport Grant to a local government. Patent of R&PP lease¹. Public lands without resource conflicts within 2 miles of communities.</i>
Other (Disposal for the Westside Irrigation Project)	Pursuant to an act of Congress, convey all right, title, and interest (excluding mineral interest) to the Westside Irrigation District after completion of an environmental analysis under NEPA. Lands within the boundary which are not conveyed under the final decision for this transfer (patent) would be retained in federal ownership and would not be available for other disposal actions. (Public Law 106-485 [November 9, 2000; 114 Stat. 2199])

¹The Planning Area is open to applications for conveyances to qualified applicants under the Recreation and Public Purpose Act or Federal Public Airport Act.

FLPMA Federal Land Policy and Management Act
 NEPA National Environmental Policy Act
 R&PP Recreation and Public Purposes

2.0 LANDS AVAILABLE FOR DISPOSAL

In Table M-2 below, the Bighorn Basin RMP revision project specifically identifies areas available for consideration for disposal by employing the “isolated, difficult or expensive to manage, or needed-for community expansion” disposal criteria in the FLPMA. The areas below were identified during the RMP revision process as complying with FLPMA disposal criteria. Inclusion in this table does not constitute a decision that the land will be disposed. Before taking any disposal action, consideration will be given to each individual tract and will include public involvement. As stated elsewhere in the RMP, the preferred method of disposal or acquisition of lands is through exchanges. Proposals for disposal of lands not identified in this table will be considered if they are consistent with the objectives of the approved RMP and may require a land use plan amendment.

¹Some legal descriptions encompass more land than is intended for possible disposal, resulting in smaller map polygons than the area listed in the legal description.

Note: The public parcel in T. 55N., R. 98W., sec. 16 and 17 is no longer in federal ownership; it was conveyed by the BLM to the Powell Recreation District in February 2014 while the Proposed RMP and Final EIS was being prepared. As the RMP is finalized, the associated acreages will be updated accordingly.

3.0 CRITERIA FOR RETENTION, ACQUISITION, OR DISPOSAL

The FLPMA provides for retention of the public lands in federal ownership and management by the BLM for multiple uses. The FLPMA and other federal laws, executive orders, and policies suggest criteria to use when categorizing public lands for retention or disposal, and for identifying acquisition priorities. Disposal by sale, exchange, airport grant, or Recreation and Public Purpose (R&PP) patent remains an option if such an action would serve an important objective and have a public benefit.

Site-specific environmental review and documentation in conformance with NEPA, including completion of categorical exclusions and plan conformance determinations where appropriate, will be accomplished for each proposed land program action. Interdisciplinary impact analysis will be tiered within the framework of this and other applicable environmental documents. Many of the foregoing provisions of this appendix are based upon current policy. Future shifts in policy and national priorities may result in modifications of these provisions and changes in addressing priority lands actions. Land tenure adjustments must serve the public interest.

The following is suggested criteria to consider in land tenure adjustment proposals, but it is not considered all-inclusive. These criteria are meant to guide and streamline consideration of land tenure adjustment proposals.

3.1 Criteria for Retention or Acquisition

Acquisition of lands will be considered, if in compliance with the RMP, to facilitate various resource management objectives and to acquire lands with high resource values including, but not limited to:

- Important, crucial, or critical habitat for fish, wildlife, and plants;
- Riparian areas, wetlands, and designated floodplains;
- Parcels that provide access to larger blocks of public land;
- Lands with special designation or management emphasis;
- Important cultural resources;
- Recreation opportunities and benefits;
- Mineral development potential;
- VRM Class I and Class II areas;
- The preferred method for acquisition will be through exchange;
- Acquisitions, including easements, can be completed through exchange, Land and Water Conservation Funds (LWCF) purchases, or donations; and
- Acquisitions of private lands will be pursued only with willing landowners. The following geographic areas are identified as priority areas for acquisition:
 - Rattlesnake Mountain;
 - Carter Mountain;
 - Cedar Mountain (Cody);
 - Little Mountain;
 - Sheep Mountain (west of Buffalo Bill Reservoir);
 - McCullough Peaks (includes Wild Horse Management area);
 - Clarks Fork River; and
 - Bighorn River.

3.1.1 Criteria for Disposal

Current policy prescribes general priorities for land disposal actions that include:

- BLM and other federal jurisdictional transfers;
- Transfers to state and local agencies (e.g., R&PP patents, airport patents);
- State exchanges;
- Private exchanges;
- Sales;
- Desert land entries;
- Parcels difficult or costly to administer;
- Parcels of special importance to local communities; and
- Parcels more suitable for management by another federal or state agency.

Transfer to other public agencies will also be considered if improved management efficiency would result. Prior to any disposal, a site-specific analysis must determine that the lands considered contain

no significant wildlife, recreation, or other resource values the loss of which could not be mitigated; have no overriding public values; and represent no substantial public investments. Exchange will be the preferred method for disposals.

3.1.1.1 Exchanges

Land exchanges that serve the national interest and are beneficial to BLM programs or that support the programs of other agencies (reference Sections 102, 205, and 206 of FLPMA) will be promoted.

- Transfer of leasable minerals out of federal ownership should be avoided except when non-federal leasable minerals are to be received in return. It is preferable to trade both surface and subsurface (mineral) estates.
- Exchanges should involve lands similar in character and/or value. Lands acquired by the BLM in an exchange will generally be retained under federal ownership or control, unless there is a compelling reason for doing so.
- Exchanges should not be made solely for the purpose of blocking up federal land ownership.

Sales

Public land sale proposals are the result of a BLM initiative or in response to expressed public interest or need. Lands to be considered for disposal, at a minimum, must meet the following criteria as outlined in Section 203 of the FLPMA:

- They are difficult and uneconomical to manage and are not suitable for management by another federal department or agency;
- Disposal would serve important public objectives, including but not limited to, community expansion or economic development, that could not be achieved prudently or feasibly on land other than public lands and that outweigh other public objectives or values; or
- The tract was acquired for a specific purpose, and the tract is no longer required for that purpose or any other federal purpose.

Generally, exchanges are the preferred method of disposal but sales will be used when: it is required by national policy; or it is required to achieve disposal objectives on a timely basis, and where disposal through exchange would cause unacceptable delays, or disposal through exchange is not feasible. The preferred method of selling public land will be by competitive bidding at public auction to qualifying purchasers. However, modified competitive bidding procedures and direct sales may be used in certain situations.

Sales and Exchanges Involving Wetlands

BLM policy is to retain wetlands in federal ownership unless federal, state, public, and private institutions and parties have demonstrated the ability to maintain, restore, and protect wetlands and riparian habitats on a continuous basis (BLM Manual 6740). Sales and exchanges may be authorized when:

- The tract of public wetlands is either so small or remote that it is uneconomical to manage; or
- The tract of public wetlands is not suitable for management by another federal agency.

3.1.2 Recreation and Public Purposes Lease/Patent

The objective of the R&PP Act is to meet the needs of state and local governmental agencies and other qualified organizations for public lands required for recreational and public purposes. Use of the R&PP Act protects public values in the land through its reversionary provisions and helps qualified entities obtain the more liberal pricing authorized under the R&PP Act.

Public lands shall be conveyed or leased only for an established or definitely proposed project for which there is a reasonable timetable of development and satisfactory development and management plans. No more land than is reasonably necessary for the proposed use shall be conveyed.

3.1.3 Airport Grants

Grants of public land for airports and airways are available to public agencies through the Federal Aviation Administration (FAA) under the Airport and Airway Improvement Act (reference 43 Code of Federal Regulations [CFR] §2640). Use of this act protects public values in the land through its reversionary provisions and helps qualified entities obtain land at no cost (except for administrative processing charges) as authorized under this act.

3.1.4 Desert Land Entries

The purpose of the Desert Land Law is to permit the reclamation by irrigation of arid public land through individual effort and private capital (reference 43 Code of Federal Regulations [CFR] §2520).

Lands that will not produce any reasonably remunerative agricultural crop by the usual means or methods of cultivation, without artificial irrigation, may be considered for a desert land entry. The lands must be surveyed, unreserved, unappropriated, non-mineral, non-timber, and incapable of producing an agricultural crop without irrigation. The lands must be suitable for agricultural purposes and more valuable for that purpose than for any other. Tracts need not be contiguous, but shall be sufficiently close to each other to be managed satisfactorily as an economic unit.

The proposed crop may include any agricultural product to which the land under consideration is generally adapted and which would return a fair reward for the expense of producing it.

All Desert Land Entry applications will be coordinated with the Wyoming State Water Engineer and the Natural Resources Conservation Service.

4.0 ACCESS AND EASEMENTS

Access/improved access or easements have been identified in the following areas:

Cody Field Office

- Rattlesnake Mountain
- Hogan/Luce/Bald Ridge area
- Carter Mountain
- Cedar Mountain (Cody)
- Hudson Falls (Shell)
- Little Mountain/Dugans Bench

Appendix M – Land Disposal and Acquisition

- Sheep Mountain (west of Buffalo Bill Reservoir)
- Coon Creek (Byron)
- McCullough Peaks
- Seven Mountain Subdivision (Cooper lane near Cody)
- Dry Bear/Bear Creek (north of Greybull)
- Clarks Fork River
- Heart Mountain
- Sheep Mountain/Bighorn Lake/River access

Worland Field Office

- Shell/Webber Canyon
- Hyattville logging road area
- Tatman/Fenton Pass
- Hamilton Dome
- Upper Owl Creek
- Bighorn River
- Neiber Road (off of South Flat)
- Road 1406 in Sand draw (east of Cedar Mountain WSA)
- South Rim Shell Canyon to South Rim Trapper Canyon (south to Alkali Road)
- Upper White Creek Drainage
- West of Hamilton Dome between Cottonwood and Owl Creek
- South Fork Owl Creek
- Rock Creek
- South Fork North Fork Owl Creek
- Dutch Nick Flats Road (across Dave Slover property, T. 47N., R. 97W. sec. 23)

Access for Recreation:

- Upper Grass Creek Area
- Enos Creek
- Upper Cottonwood Creek
- Upper South Fork of Owl Creeks of the Absaroka Mountain Foothills

Foot/horseback Access:

- Shoshone National Forest

Limited motorized vehicle access on roads in the Red Canyon Creek Area (Thermopolis Community Pit).

Access to public lands on the Bighorn and Greybull Rivers:

- Basin Ridge, Dry Bear Creek, Heron West, Kane East, Kane West, Lovell Draw, Manderson Bridge, Perkins Bottom-East, Rairden Bridge, Red Bluff View, Red Rim Meadows-South, Sheep Mountain West, South Flat Bridge, Stucco South

Access in the **15-Mile Badlands area**. Includes the following – but not limited to:

- Burlington Pass Road, Fenton Pass Road, Badger Gulch Road, 15-Mile Road, Dorsey Creek Road, Murphy Draw Road, Elk Creek Road

Access in the **Trapper Creek RMZ** (includes Shell Canyon to Red Gulch Road, to the Bighorn NF):

- Horse Mountain, Trapper Creek, White Creek

Access into the **Paint Rock RMZ** (Alkali Road, Bighorn NF, Luman Creek Road area to Wyoming Route 31):

- Laddie Creek and Paint Rock Creek

Access to the **Brokenback RMZ** (Luman Creek Area, Bighorn NF, Highway 16, Hyattville-Ten Sleep Road):

- Laddie Creek, Military Creek, Luman Creek, Dorn Draw Road, additional access into North and South Brokenbacks, yearlong public access on North and South Brokenback

South Bighorns RMZ (Rome Hill Road, Hazelton Road, Upper Nowood, South WFO boundary):

- Access into upper Nowood area, Otter Creek, Deep Creek, Little Canyon Creek, Public land tracts along the Nowood River, Cherry Creek Road/Split Rock Road to Hazelton Road, Lysite Mountain, Land parcels within Spring Creek, Spring Creek Road to Rome Hill Road

Access into **Canyon Creek RMZ** (Highway 16 to Rome Hill Road, Smilo Road to BLM Road 1417).

APPENDIX N

WYOMING STANDARDS FOR HEALTHY RANGELANDS

1.0 INTRODUCTION

According to the Department of the Interior's final rule for grazing administration, effective August 21, 1995, the Wyoming Bureau of Land Management (BLM) State Director is responsible for the development of standards for healthy rangelands and guidelines for livestock grazing management on 18 million acres of Wyoming's public rangelands. The development and application of these standards and guidelines are to achieve the four fundamentals of rangeland health outlined in the grazing regulations (43 CFR [Code of Federal Regulations] 4180.1). Those four fundamentals are: (1) watersheds are functioning properly; (2) water, nutrients, and energy are cycling properly; (3) water quality meets State standards; and (4) habitat for special status species is protected.

Standards address the health, productivity, and sustainability of the BLM-administered public rangelands and represent the minimum acceptable conditions for the public rangelands. The standards apply to all resource uses on public lands. Their application will be determined as use-specific guidelines are developed. Standards are synonymous with goals and are observed on a landscape scale. They describe healthy rangelands rather than important rangeland by-products. The achievement of a standard is determined by observing, measuring, and monitoring appropriate indicators. An indicator is a component of a system whose characteristics (e.g., presence, absence, quantity, and distribution) can be observed, measured, or monitored based on sound scientific principles.

Guidelines provide for, and guide the development and implementation of, reasonable, responsible, and cost-effective management practices at the grazing allotment and watershed level. The guidelines in this document apply specifically to livestock grazing management practices on the BLM-administered public lands. These management practices will either maintain existing desirable conditions or move rangelands toward statewide standards within reasonable timeframes. Appropriate guidelines will ensure that the resultant management practices reflect the potential for the watershed, consider other uses and natural influences, and balance resource goals with social, cultural/historic, and economic opportunities to sustain viable local communities. Guidelines, like standards, apply statewide.

Implementation of the Wyoming standards and guidelines will generally be done in the following manner. Grazing allotments or groups of allotments in a watershed will be reviewed based on the BLM's current allotment categorization and prioritization process. Allotments with existing management plans and high-priority allotments will be reviewed first. Lower priority allotments will be reviewed as time allows or when it becomes necessary for BLM to review the permit/lease for other reasons such as permit/lease transfers, permittee/lessee requests for change in use, etc. The permittees and interested publics will be notified when allotments are scheduled for review and encouraged to participate in the review. The review will first determine if an allotment meets each of the six standards. If it does, no further action will be necessary. If any of the standards aren't being met, then rationale explaining the contributing factors will be prepared. If livestock grazing practices are found to be among the contributing factors, corrective actions consistent with the guidelines will be developed and implemented before the next grazing season in accordance with 43 CFR 4180. If a lack of data prohibits the reviewers from determining if a standard is being met, then a strategy will be developed to acquire the data in a timely manner.

Appendix N – Wyoming Standards for Healthy Rangelands

On a continuing basis, the Standards for Healthy Rangelands will direct on-the-ground management on the public lands. They will serve to focus the development and implementation of activity plans or grazing permits/leases to maintain or achieve healthy rangelands.

Quantifiable resource objectives and specific management practices to maintain or achieve the standards will be developed at the local BLM District and Field Office levels and will consider all reasonable and practical options available to achieve desired results on a watershed or grazing allotment scale. The objectives shall be reflected in site-specific activity/implementation plans and/or in livestock grazing permits/leases for the public lands. These objectives and practices may be developed formally or informally through mechanisms available and suited to local needs (such as Coordinated Resource Management [CRM] efforts).

The development and implementation of standards and guidelines will enable on-the-ground management of the public rangelands to maintain a clear and responsible focus on both the health of the land and its dependent natural and human communities. This development and implementation will ensure that any mechanisms currently being employed or that may be developed in the future will maintain a consistent focus on these essential concerns. This development and implementation will also enable immediate attention to be brought to bear on existing resource concerns.

These standards and guidelines are compatible with BLM's three-tiered land use planning process. The first tier includes the laws, regulations, and policies governing BLM's administration and management of the public lands and their uses. The previously mentioned fundamentals of rangeland health specified in 43 CFR 4180.1, the requirement for BLM to develop these state (or regional) standards and guidelines, and the standards and guidelines themselves, are part of this first tier. Also part of this first tier are the specific requirements of various federal laws and the objectives of 43 CFR 4100.2 that require BLM to consider the social and economic well-being of the local communities in its management process.

These standards and guidelines will provide for statewide consistency and guidance in the preparation, amendment, and maintenance of BLM land use plans, which represent the second tier of the planning process. The BLM land use plans provide general allocation decisions concerning the kinds of resource and land uses that can occur on the BLM-administered public lands, where they can occur, and the types of conditional requirements under which they can occur. In general, the standards will be the basis for development of planning area-specific management objectives concerning rangeland health and productivity, and the guidelines will direct development of livestock grazing management actions to help accomplish those objectives.

The third tier of the BLM planning process, activity or implementation planning, is directed by the applicable land use plan and, therefore, by the standards and guidelines. The standards and guidelines, as BLM statewide policy, will also directly guide development of the site-specific objectives and the methods and practices used to implement the land use plan decisions. Activity or implementation plans contain objectives which describe the site-specific conditions desired. Grazing permits/leases for the public lands contain terms and conditions which describe specific actions required to attain or maintain the desired conditions. Through monitoring and evaluation, the BLM, grazing permittees, and other interested parties determine if progress is being made to achieve activity plan objectives.

Wyoming rangelands support a variety of uses which are of significant economic importance to the State and its communities. These uses include oil and gas production, mining, recreation and tourism, fishing, hunting, wildlife viewing, and livestock grazing. Rangelands also provide amenities which contribute to the quality of life in Wyoming such as open spaces, solitude, and opportunities for personal renewal. Wyoming's rangelands should be managed with consideration of the State's historical, cultural, and social development and in a manner which contributes to a diverse, balanced, competitive, and resilient

economy in order to provide opportunity for economic development. Healthy rangelands can best sustain these uses.

To varying degrees, BLM management of the public lands and resources plays a role in the social and economic well-being of Wyoming communities. The National Environmental Policy Act (part of the above-mentioned first planning tier) and various other laws and regulations mandate the BLM to analyze the socioeconomic impacts of actions occurring on public rangelands. These analyses occur during the environmental analysis process of land use planning (second planning tier), where resource allocations are made, and during the environmental analysis process of activity or implementation planning (third planning tier). In many situations, factors that affect the social and economic well-being of local communities extend far beyond the scope of BLM management or individual public land users' responsibilities. In addition, since standards relate primarily to physical and biological features of the landscape, it is very difficult to provide measurable socioeconomic indicators that relate to the health of rangelands. It is important that standards be realistic and within the control of the land manager and users to achieve.

2.0 STANDARDS FOR HEALTHY PUBLIC RANGELANDS

2.1 Standard #1

Within the potential of the ecological site (soil type, landform, climate, and geology), soils are stable and allow for water infiltration to provide for optimal plant growth and minimal surface runoff.

THIS MEANS THAT:

The hydrologic cycle will be supported by providing for water capture, storage, and sustained release. Adequate energy flow and nutrient cycling through the system will be achieved as optimal plant growth occurs. Plant communities are highly varied within Wyoming.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Water infiltration rates
- Soil compaction
- Erosion (rills, gullies, pedestals, capping)
- Soil micro-organisms
- Vegetative cover (gully bottoms and slopes)
- Bare ground and litter

The above indicators are applied as appropriate to the potential of the ecological site.

2.2 Standard #2

Riparian and wetland vegetation has structural, age, and species diversity characteristic of the stage of channel succession and is resilient and capable of recovering from natural and human disturbance in order to provide forage and cover, capture sediment, dissipate energy, and provide for groundwater recharge.

THIS MEANS THAT:

Wyoming has highly varied riparian and wetland systems on public lands. These systems vary from large rivers to small streams and from springs to large wet meadows. These systems are in various stages of natural cycles and may also reflect other disturbance that is either localized or widespread throughout the watershed. Riparian vegetation captures sediments and associated materials, thus enhancing the nutrient cycle by capturing and utilizing nutrients that would otherwise move through a system unused.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Erosion and deposition rate
- Channel morphology and floodplain function
- Channel succession and erosion cycle
- Vegetative cover
- Plant composition and diversity (species, age class, structure, successional stages, desired plant community, etc.)
- Bank stability
- Woody debris and instream cover
- Bare ground and litter

The above indicators are applied as appropriate to the potential of the ecological site.

2.3 Standard #3

Upland vegetation on each ecological site consists of plant communities appropriate to the site which are resilient, diverse, and able to recover from natural and human disturbance.

THIS MEANS THAT:

In order to maintain desirable conditions and/or recover from disturbance within acceptable timeframes, plant communities must have the components present to support the nutrient cycle and adequate energy flow. Plants depend on nutrients in the soil and energy derived from sunlight. Nutrients stored in the soil are used over and over by plants, animals, and microorganisms. The amount of nutrients available and the speed with which they cycle among plants, animals, and the soil are fundamental components of rangeland health. The amount, timing, and distribution of energy captured through photosynthesis are fundamental to the function of rangeland ecosystems.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Vegetative cover
- Plant composition and diversity (species, age class, structure, successional stages, desired plant community, etc.)
- Bare ground and litter
- Erosion (rills, gullies, pedestals, capping)
- Water infiltration rates

The above indicators are applied as appropriate to the potential of the ecological site.

2.4 Standard #4

Rangelands are capable of sustaining viable populations and a diversity of native plant and animal species appropriate to the habitat. Habitats that support or could support threatened species, endangered species, species of special concern, or sensitive species will be maintained or enhanced.

THIS MEANS THAT:

The management of Wyoming rangelands will achieve or maintain adequate habitat conditions that support diverse plant and animal species. These may include listed threatened or endangered species (U.S. Fish and Wildlife-designated), species of special concern (BLM-designated), and other sensitive species (State of Wyoming-designated). The intent of this standard is to allow the listed species to recover and be delisted, and to avoid or prevent additional species becoming listed.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Noxious weeds
- Species diversity
- Age class distribution
- All indicators associated with the upland and riparian standards
- Population trends
- Habitat fragmentation

The above indicators are applied as appropriate to the potential of the ecological site.

2.5 Standard #5

Water quality meets State standards.

THIS MEANS THAT:

The State of Wyoming is authorized to administer the Clean Water Act. BLM management actions or use authorizations will comply with all Federal and State water quality laws, rules and regulations to address water quality issues that originate on public lands. Provisions for the establishment of water quality standards are included in the Clean Water Act, as amended, and the Wyoming Environmental Quality Act, as amended. Regulations are found in Part 40 of the Code of Federal Regulations and in *Wyoming's Water Quality Rules and Regulations*. The latter regulations contain Quality Standards for Wyoming Surface Waters. Natural processes and human actions influence the chemical, physical, and biological characteristics of water. Water quality varies from place to place with the seasons, the climate, and the kind substrate through which water moves. Therefore, the assessment of water quality takes these factors into account.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Chemical characteristics (e.g., pH, conductivity, dissolved oxygen)
- Physical characteristics (e.g., sediment, temperature, color)
- Biological characteristics (e.g., macro- and micro-invertebrates, fecal coliform, and plant and animal species)

2.6 Standard #6

Air quality meets State standards.

THIS MEANS THAT:

The State of Wyoming is authorized to administer the Clean Air Act. BLM management actions or use authorizations will comply with all Federal and State air quality laws, rules, regulations and standards. Provisions for the establishment of air quality standards are included in the Clean Air Act, as amended, and the Wyoming Environmental Quality Act, as amended. Regulations are found in Part 40 of the Code of Federal Regulations and in *Wyoming Air Quality Standards and Regulations*.

INDICATORS MAY INCLUDE BUT ARE NOT LIMITED TO:

- Particulate matter
- Sulfur dioxide
- Photochemical oxidants (ozone)
- Volatile organic compounds (hydrocarbons)
- Nitrogen oxides
- Carbon monoxide
- Odors
- Visibility

3.0 BLM WYOMING GUIDELINES FOR LIVESTOCK GRAZING MANAGEMENT

1. Timing, duration, and levels of authorized grazing will ensure that adequate amounts of vegetative ground cover, including standing plant material and litter, remain after authorized use to support infiltration, maintain soil moisture storage, stabilize soils, allow the release of sufficient water to maintain system function, and to maintain subsurface soil conditions that support permeability rates and other processes appropriate to the site.
2. Grazing management practices will restore, maintain, or improve riparian plant communities. Grazing management strategies consider hydrology, physical attributes, and potential for the watershed and the ecological site. Grazing management will maintain adequate residual plant cover to provide for plant recovery, residual forage, sediment capture, energy dissipation, and groundwater recharge.
3. Range improvement practices (instream structures, fences, water troughs, etc.) in and adjacent to riparian areas will ensure that stream channel morphology (e.g., gradient, width/depth ratio, channel roughness and sinuosity) and functions appropriate to climate and landform are maintained or enhanced. The development of springs, seeps, or other projects affecting water and associated resources shall be designed to protect the ecological and hydrological functions, wildlife habitat, and significant cultural, historical, and archaeological values associated with the water source. Range improvements will be located away from riparian areas if they conflict with achieving or maintaining riparian function.
4. Grazing practices that consider the biotic communities as more than just a forage base will be designed in order to ensure that the appropriate kinds and amounts of soil organisms, plants, and

animals to support the hydrologic cycle, nutrient cycle, and energy flow are maintained or enhanced.

5. Continuous season-long or other grazing management practices that hinder the completion of plants' life-sustaining reproductive and/or nutrient cycling processes will be modified to ensure adequate periods of rest at the appropriate times. The rest periods will provide for seedling establishment or other necessary processes at levels sufficient to move the ecological site condition toward the resource objective and subsequent achievement of the standard.
6. Grazing management practices and range improvements will adequately protect vegetative cover and physical conditions and maintain, restore, or enhance water quality to meet resource objectives. The effects of new range improvements (water developments, fences, etc.) on the health and function of rangelands will be carefully considered prior to their implementation.
7. Grazing management practices will incorporate the kinds and amounts of use that will restore, maintain, or enhance habitats to assist in the recovery of Federal threatened and endangered species or the conservation of federally-listed species of concern and other State-designated special status species. Grazing management practices will maintain existing habitat or facilitate vegetation change toward desired habitats. Grazing management will consider threatened and endangered species and their habitats.
8. Grazing management practices and range improvements will be designed to maintain or promote the physical and biological conditions necessary to sustain native animal populations and plant communities. This will involve emphasizing native plant species in the support of ecological function and incorporating the use of non-native species only in those situations in which native plant species are not available in sufficient quantities or are incapable of maintaining or achieving properly functioning conditions and biological health.
9. Grazing management practices on uplands will maintain desired plant communities or facilitate change toward desired plant communities.

3.1 Definitions

Activity Plans: Allotment Management Plans (AMPs), Habitat Management Plans (HMPs), Watershed Management Plans (WMPs), and other plans developed at the local level to address specific concerns and accomplish specific objectives.

Coordinated Resource Management (CRM): A group of people working together to develop common resource goals and resolve natural resource concerns. CRM is a people process that strives for win-win situations through consensus-based decision making.

Desired Plant Community: A plant community which produces the kind, proportion, and amount of vegetation necessary for meeting or exceeding the land use plan/activity plan objectives established for an ecological site(s). The desired plant community must be consistent with the site's capability to produce the desired vegetation through management, land treatment, or a combination of the two.

Ecological Site: An area of land with specific physical characteristics that differs from other areas both in its ability to produce distinctive kinds and amounts of vegetation and in its response to management.

Erosion: (v.) Detachment and movement of soil or rock fragments by water, wind, ice, or gravity. (n.) The land surface worn away by running water, wind, ice, or other geological agents, including such processes as gravitational creep.

Grazing Management Practices: Grazing management practices include such things as grazing systems (rest-rotation, deferred rotation, etc.), timing and duration of grazing, herding, salting, etc. They do not include physical range improvements.

Guidelines (For Grazing Management): Guidelines provide for, and guide the development and implementation of, reasonable, responsible, and cost-effective management actions at the allotment and watershed level which move rangelands toward statewide standards or maintain existing desirable conditions. Appropriate guidelines will ensure that the resultant management actions reflect the potential for the watershed, consider other uses and natural influences, and balance resource goals with social, cultural/historic, and economic opportunities to sustain viable local communities. Guidelines, and therefore, the management actions they engender, are based on sound science, past and present management experience, and public input.

Indicator: An indicator is a component of a system whose characteristics (e.g., presence, absence, quantity, and distribution) can be observed, measured, or monitored based on sound scientific principles. An indicator can be evaluated at a site- or species-specific level. Monitoring of an indicator must be able to show change within timeframes acceptable to management and be capable of showing how the health of the ecosystem is changing in response to specific management actions. Selection of the appropriate indicators to be observed, measured, or monitored in a particular allotment is a critical aspect of early communication among the interests involved on-the-ground. The most useful indicators are those for which change or trend can be easily quantified and for which agreement as to the significance of the indicator is broad based.

Litter: The uppermost layer of organic debris on the soil surface, essentially the freshly fallen or slightly decomposed vegetal material.

Management Actions: Management actions are the specific actions prescribed by the BLM to achieve resource objectives, land use allocations, or other program or multiple use goals. Management actions include both grazing management practices and range improvements.

Objective: An objective is a site-specific statement of a desired rangeland condition. It may contain either or both qualitative elements and quantitative elements. Objectives frequently speak to change. They are the focus of monitoring and evaluation activities at the local level. Monitoring of the indicators would show negative changes or positive changes. Objectives should focus on indicators of greatest interest for the area in question.

Rangeland: Land on which the native vegetation (climax or natural potential) is predominantly grasses, grass-like plants, forbs, or shrubs. This includes lands revegetated naturally or artificially when routine management of that vegetation is accomplished mainly through manipulation of grazing. Rangelands include natural grasslands, savannas, shrublands, most deserts, tundra, alpine communities, coastal marshes, and wet meadows.

Rangeland Health: The degree to which the integrity of the soil and ecological processes of rangeland ecosystems are sustained.

Riparian: An area of land directly influenced by permanent water. It has visible vegetation or physical characteristics reflective of permanent water influence. Lakeshores and streambanks are typical riparian areas. Excluded are such sites as ephemeral streams or washes that do not have vegetation dependent on free water in the soil.

Standards: Standards are synonymous with goals and are observed on a landscape scale. Standards apply to rangeland health and not to the important by-products of healthy rangelands. Standards relate to the current capability or realistic potential of a specific site to produce these by-products, not to the

presence or absence of the products themselves. It is the sustainability of the processes, or rangeland health, which produces these by-products.

Terms and Conditions: Terms and conditions are very specific land use requirements that are made a part of the land use authorization in order to assure maintenance or attainment of the standard. Terms and conditions may incorporate or reference the appropriate portions of activity plans (e.g., Allotment Management Plans). In other words, where an activity plan exists that contains objectives focused on meeting the standards; compliance with the plan may be the only term and condition necessary in that allotment.

Upland: Those portions of the landscape which do not receive additional moisture for plant growth from run-off, streamflow, etc. Typically these are hills, ridgetops, valley slopes, and rolling plains.

RECREATION MANAGEMENT

1.0 RECREATION MANAGEMENT AREA PRESCRIPTIONS

This appendix displays the details of the management action prescriptions for each of the alternatives (B, C, D, E, and F). Alternative A prescriptions are described in Chapter 2 of the Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS). Recreation management in the Bighorn Basin Planning Area is separated into two types of recreation management units; Special Recreation Management Areas (SRMA), and Extensive Recreation Management Areas (ERMA). These units are delineated and managed accordingly to the desired recreational setting character conditions, activities, experiences, and beneficial outcomes. Data collected to arrive at allocating these areas as separate recreation management areas were from intensive public outreach including formal Bureau of Land Management (BLM) public scoping meetings, on the ground visitor surveys, field monitoring and observations, and work with stakeholders such as tourism entities and industries, Special Recreation Permit (SRP) permittees, and others who rely heavily on BLM-administered public lands.

SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness, especially as compared to other areas used for recreation. SRMAs are managed to protect and enhance a targeted set of activities, experiences, benefits, and desired recreation setting characteristics. SRMAs may be divided into recreation management zones (RMZ) to further delineate specific recreation opportunities. Recreation Management is prescribed and implemented at the RMZ level. For example; the Badlands SRMA is further divided into three RMZs; one managed for recreational touring activities and associated experiences and benefits; one managed to enhance back-country types of activities and associated experiences and benefits; and one managed for primitive activities, experiences, and benefits. Not all SRMAs within the Planning Area are divided into RMZs because of the commonality of desired settings, activities, experiences, and beneficial outcomes. Canyon Creek SRMA and Middle Fork of the Powder River SRMA are such examples. Within an SRMA, recreation and visitor services management is recognized as the predominant land use planning focus, where specific recreation opportunities and recreation setting characteristics are managed and protected on a long-term basis.

ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or recreation and visitor services program investments. Management objectives under an ERMA are to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. Management of ERMA areas is commensurate with the management of other resources and resource uses. While generally unnecessary, ERMAs may be subdivided into recreation management zones (RMZ) to ensure recreation and visitor services are managed commensurate with the management of other resources and resource uses.

Public lands that are not designated a Recreation Management Area (SRMA or ERMA) are managed to meet basic recreation and visitor services and resource stewardship needs. Recreation is not emphasized, however recreation activities may occur except on those lands closed to public use. The recreation and visitor services are managed to allow recreation uses that are not in conflict with the primary uses of these lands. Management actions and allowable use decisions will still be necessary to address visitor health and safety, use user conflicts, the type(s), activities and locations where special

recreation permits would be issued or not issued, and mitigation of recreation impacts on cultural and natural resources.

Recreational activities are popular within the Planning Area for both residents and non-residents. Popular recreational activities include but are not limited to camping, hunting, fishing, hiking, rock hounding, spelunking, floating and rafting, cross country skiing, wildlife viewing, driving for pleasure, all-terrain vehicle (ATV)/four-wheel drive touring, motocross and endurance sports, mountain biking, target shooting, and sightseeing. A spike in recreational use on BLM-administered public lands is observed during the summer months, and especially during the big game hunting season, which attracts most of the recreational users, not just within the region, but visitors from outside of Wyoming.

Recreational uses inherently contain conflicting uses which compromises health and safety, user conflicts, goal interference, un-realization of desired experiences and beneficial outcomes, and ultimately natural resource damage. Allocating, or dividing the Planning Area into sub-recreational units, based off of desired settings, activities, experiences, and beneficial outcomes will aid in appropriate recreational marketing, niche-matching, diminish user conflicts, and ultimately an appreciation of the recreational resources which fosters resource protection.

Recreation and visitor services scoping meetings were conducted throughout the Planning Area, resulting in a stand-alone Recreation and Travel Management review report. The BLM will use this land use planning process to gather additional data to support managing areas as either an SRMA or an ERMA, and to further identify the desired recreation settings character conditions, activities, experiences, and beneficial outcomes. Recreation management designation or prescriptions may be modified if deemed necessary as a result of public comments.

The *Bighorn Basin Resource Management Plan Revision Project Summary of the Recreation and Travel Management Workshops* reports may be viewed under the Documents Library at:
<http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn/docs.html>.

The following recreational matrix further details the allocation of recreation management based on desired settings, activities, experiences, and beneficial outcomes. Because the criteria currently being used as guidance for allocating recreational management into SRMAs and ERMAs did not exist at the time of the last Land Use Plans, the following recreational matrix does not include recreation sub-units for Alternative A.

However, there are seven areas currently designated as SRMAs within the Planning Area. The Cody Field Office manages the Worland Caves, Historic Trails, and The Rivers SRMAs and part of the Bighorn River and West Slope SRMAs. The Worland Field Office manages the Absaroka Mountain Foothills and Badlands SRMAs and part of the Bighorn River and West Slope SRMAs. The Cody Resource Area Land Use Plan (November, 1990), the Grass Creek Resource Area Land Use Plan (September, 1998), and the Washakie Resource Area Land Use Plan (September, 1988) designated these areas to be managed as SRMAs because of the unique recreational niches, recreational setting characters, opportunities and activities, and popularity.

ALTERNATIVES B AND E

<p>Absaroka Mountain Foothills SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>This SRMA is necessary to accommodate semi-primitive to middle country recreational experiences in a recreational resource rich environment. The Absaroka Mountain Foothills area is a very popular destination for both local residents and out-or-region visitors. The area is abundant in a wide variety of wildlife including grizzly bears, major access into the Shoshone National Forest and the Washakie Wilderness, and dramatic scenery.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Absaroka Mountain Foothills as a destination SRMA for non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing so that they realize a “moderate” level of the targeted experience and benefit outcomes in these Back Country and Middle Country settings.</p> <p><u>Activities:</u> Wildlife viewing, nature viewing, hiking, hunting.</p> <p><u>Experiences:</u> Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Learning more about things here.</p> <p><u>Benefits:</u> Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Improved mental well-being and physical fitness and health maintenance. Heightened sense of satisfaction with our area as a place to live. Positive contributions to local-regional economic stability. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p> <p><u>Physical</u></p> <p><u>Remoteness:</u> Back Country. Implement/maintain road closures to maintain back country settings.</p> <p><u>Naturalness:</u> Back Country. Manage for back country and middle country settings where natural setting</p> <p><u>Social</u></p> <p><u>Contacts and Group size:</u> Back Country.</p>

Appendix O – Recreation

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small. May have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Allow for primitive motorized routes and non-motorized trails to exist. Facilities and structures are rare and often accessible via unimproved routes. Horse and hiking trailheads will be constructed at major key access points.

Operational

Mechanized Use:

Middle/Front Country.

Main access roads are crowned and ditched gravel roads accessed by 2-wheel and 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use. Roads within the LU Sheep Company area are closed, but available for public access during hunting season. Trails for non-motorized use will be constructed so as to access public lands.

Management Controls and Visitor Services:

Middle Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails, and seasonal closures within the LU Sheep Company area.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the LU Ranch cooperative agreement.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Develop trailheads for foot and horse travel. Potential locations will include the Blue Creek Trail, and sites along the North and South forks of the Owl Creek and Rock Creek areas. Additional sites may be identified throughout the life of the plan.

Administrative

Visual Resource Management:

Class I within Owl Creek WSA, Class II for the remainder of SRMA.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) limited to designated roads and trails.

Close Owl Creek WSA to motorized and mechanized use.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within Absaroka Mountain Foothills SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO stipulation will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Maintain cooperative agreement with Wyoming State Land Board, Wyoming State Game and Fish, and LU Sheep Company.

Partners:

Surrounding private land owners, Shoshone National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

Pack goats are prohibited.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Tour de Badlands RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is contained within the Badlands SRMA, which is popular for motorized touring to explore the scenic desert basin. Natural recreational resources within the SRMA contain wildlife, open spaces, wild horses, and an erratic landscape which offers outstanding scenic quality.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Tour de Badlands RMZ for motorized recreationists to engage in motorized sightseeing touring, hunting, wildlife viewing, and nature viewing so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Middle Country and Front Country settings.</p> <p>Activities: Driving for pleasure, hunting, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Enjoy having easy access to natural landscapes. Enjoy having access to close-to-home outdoor amenities. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.</p> <p>Benefits: Improved mental well-being. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Positive contributions to local-regional economic stability. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Middle Country/Front Country. On or near 4-wheeled drive and improved roads. Maintain main access roads through the area for 2-wheel and 4-wheel drive access into the Badlands area.</p> <p>Naturalness: Middle Country. Natural setting may have moderately dominant alterations but would not draw the attention of the observers on trails and primitive roads within the area.</p>

Facilities and Structures:

Front Country.

Primitive and improved routes/trails may exist. Facilities and structures are scattered.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Front Country.

2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use. On site controls and services present but subtle.

Management Controls and Visitor Services:

Middle Country.

On site controls and services present but subtle. Signs present at key access points. Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, wildlife, and wild horses resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the wild horse program, and surrounding WSAs.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Maintain a strong sign program so as to keep the access routes within the RMZ well marked.

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop one or more scenic interpretive sites and driving loops for motorized and mechanized travel in the Tour de Badlands area within the Badlands SRMA to highlight the area's scenic values. These could involve the Fifteenmile Creek and Dorsey Creek roads and The Murphy Draw Road with overlooks at the Painted Canyon of Elk Creek and at Bobcat Draw.

Identify routes to close and reclaim, construct new routes, and identify routes to remain open.

Develop trailheads for ATV unloading stations.

Interpretive signs at trailheads and parking areas.

Additional sites may be identified throughout the life of the plan.

Signs present at key access points, but limited within the RMZ.

Administrative**Visual Resource Management:**

Class II.

Comprehensive Trails and Travel Management:

Limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Tour de Badlands RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Private landowners, Wyoming Department of Transportation, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, IMBA, community ATV organizations, and other clubs/organizations.

Other Administration:

Limit the use of signing or other administrative controls.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Wild Badlands RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is within the Badlands SRMA. This RMZ is rich in natural recreational resources such as erratic and dramatic landscapes, management to maintain the primitive to semi-primitive setting characteristics, wilderness characteristics, three WSAs, wildlife, and wild horses which caters to primitive and semi-primitive recreational experiences.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Wild Badlands RMZ exclusively for non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country settings.</p> <p>Activities: Hiking, hunting, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Enjoy having easy access to natural landscapes.</p> <p>Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Closer relationship with the natural world. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p>Physical</p> <p>Remoteness: Back Country. Maintain road closures to maintain back country settings.</p> <p>Naturalness: Back Country. Manage the natural setting so that they may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Primitive and Back Country. Trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare and</p>

developed only in occasions where necessary to protect the back country settings.

Social

Contacts and Group Size:

Back Country.

Manage for a season average of fewer than 6 encounters/day on and off travel routes.

Operational

Mechanized Use:

Primitive.

Non-motorized and non-mechanized (foot and horseback) travel only.

Management Controls and Visitor Services:

Back Country.

On site controls and services present at key access points, but subtle.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Minimum amount of BLM facilitating outputs necessary to achieve planning objectives.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop educational signs at trailheads and parking areas on user ethics, geology, and wilderness.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with WSAs, access points, information regarding the wilderness program, and outdoor ethics messages such as Leave No Trace!

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Identify routes to close and reclaim. Modify identified routes into non-motorized and non-mechanized trails.

Develop primitive trailheads at key access points.

Install kiosks and signs at trailheads and parking areas.

Signs present at key access points, but very limited within the RMZ.

Administrative

Visual Resource Management:

Class I.

Comprehensive Trails and Travel Management:

Closed to motorized and non-mechanized travel.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Minerals, Oil and Gas Leasing, and Other Surface-Disturbing Activities:

Mineral uses, Oil and Gas and Geothermal leasing, exploration, and development will be guided by the Interim

Management Policy for Lands under Wilderness Review (IMP).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Including, but not limited to: Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Sierra Club, Wyoming Wilderness Association.

Other Administration:

Limit the use of signing or other administrative controls.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Tatman Mountain RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is within the Badlands SRMA. Much like the Wild Badlands RMZ, this RMZ is rich in natural recreational resources such as erratic and dramatic landscapes, dominant mountainous environment, and current management to maintain the primitive to semi-primitive setting characteristics, wildlife, and wild horses which caters to primitive and semi-primitive recreational experiences. The RMZ is located to the west of Sheep Mountain WSA and provides for exceptional wildlife resource opportunities, access, motorized and primitive forms of touring, and high scenic quality.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Tatman Mountain RMZ for non-motorized recreationists to engage in muscle-powered activities such as hiking, hunting, mountain biking, and horseback riding so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Back country to Middle country settings.</p> <p>Activities: Hiking, hunting, mountain biking, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Enjoy having easy access to natural landscapes.</p> <p>Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Closer relationship with the natural world. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Middle Country. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p> <p>Naturalness: Back Country. Manage the natural setting so that they may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p>

Facilities and Structures:

Back Country.

Trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare and developed only in occasions where necessary to protect the back country settings.

Social

Contacts and Group Size:

Back Country.

Manage for a season average of fewer than 6 encounters/day on and off travel routes. In issuing SRPs, allow for a group size less than 5 participants.

Operational

Mechanized Use:

Back/Middle Country.

Middle country for the access routes acting as main portals into the RMZ. Manage for back country settings (non-motorized travel) outside of those corridors.

Management Controls and Visitor Services:

Back/Middle Country.

On site controls and services present at key access points, but subtle.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Minimum amount of BLM facilitating outputs necessary to achieve planning objectives.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop educational signs at trailheads and parking areas on user ethics, geology, wild horses, and wilderness characteristics.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated routes and trails, key access points, private lands, and outdoor ethics messages such as Tread Lightly and Leave No Trace!

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Identify routes to maintain as open to motorized use. Reclaim routes identified as closed. Maintain open routes so as to sustain motorized use. Modify identified closed routes into non-motorized and mechanized trails for muscle-powered recreational activities.

Develop primitive trailheads at key access points.

Install kiosks and signs at trailheads and parking areas.

Signs present at key access points, but very limited within the RMZ.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Minerals, Oil and Gas Leasing, and Other Surface-Disturbing Activities:

Pursue withdrawal from all forms of appropriation under all laws pertaining to mineral leasing, location, and sale and closed to leasing within the Tatman Mountain RMZ.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Including, but not limited to: Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Sierra Club, Wyoming Wilderness Association.

Other Administration:

Limit the use of signing or other administrative controls.

<p>West Slope SRMA – Cody Field Office</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The west slope of the Bighorn mountains attracts visitors from the surrounding communities and from outside the region due to the spectacular scenery, abundant wildlife, and exposed geologic formations. Nearby attractions which also draw visitors to the area include the Bighorn Canyon National Recreation Area, and the Medicine Wheel on the Bighorn National Forest. Also, some visitors traveling to or from Yellowstone National Park spend time in the area. The SRMA includes the Little Mountain, Five Springs, and Brown/Howe Dinosaur Areas of Critical Environmental Concern (ACECs), several creeks found eligible for possible inclusion into the Wild and Scenic River system, and significant cave and karst resources. The Five Springs Falls Campground and the Cottonwood Creek Trailhead are BLM-managed sites within the SRMA. The west slope of the Bighorns provides important wildlife habitat and access into the Bighorn National Forest. These resources provide for excellent semi-primitive non-motorized recreation to motorized (touring) recreation.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hunting, hiking, horseback riding, wildlife viewing, sightseeing, fishing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back, Middle, and Front Country settings.</p> <p>Activities: Hunting, wildlife viewing, hiking, photography, sightseeing, driving for pleasure.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Developing skills and abilities. Enjoy going exploring on my/our own. Enjoying the closeness of family.</p> <p>Benefits: Improved mental well-being and physical fitness and health maintenance. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Heightened sense of satisfaction with our area as a place to live. Positive contributions to local-regional economic stability. Maintenance of community’s distinctive recreation/tourism market niche or character. Increased desirability as a place to live or retire.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Middle Country. Maintain Middle Country settings on much of the SRMA where lands are on or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p>

Back Country.

Maintain back country settings where lands are more than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight.

Naturalness:

Back Country and Middle Country where natural setting may have subtle to moderately dominant modifications that would be noticed but not draw the attention of the casual observer wandering through the area and primitive motorized routes and non-motorized trails may exist.

Facilities and Structures:

Facilities and structures are rare and often accessible via unimproved routes.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

Maintain Middle Country settings where 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use are acceptable.

Management Controls and Visitor Services:

Middle Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, and camp sites.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads, campgrounds, and parking areas.

Do not develop a recreation site at Rainbow Canyon.

Administrative

Visual Resource Management:

Class I within wild segments of several creeks eligible for possible inclusion into the Wild and Scenic River System, Class II

for the remainder of the SRMA.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Prohibit surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>West Slope SRMA – Worland Field Office</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>Paint Rock RMZ</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>This RMZ is contained within the West Slope of the Bighorns SRMA. The Paint Rock RMZ attracts visitors from the surrounding communities to outside the region. The Medicine Lodge State Park attracts many visitors who enjoy exploring the slope of the Bighorns. Such resources include the Medicine Lodge WSA, Paint Rock Canyon, the Hyattville Logging Road, the Red Gulch/Alkali Road Backcountry Byway, prominent wildlife habitat management areas, abundant wildlife and fishing, and access into the Bighorn National Forest. These resources provide for excellent semi-primitive non-motorized recreation to motorized (touring) recreation.</p>
<p>Objective Statement: Manage the Paint Rock RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, wildlife viewing, hunting, fishing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country and Middle Country settings.</p> <p>Activities: Wildlife viewing, fishing, nature viewing, hiking, photography, sightseeing, hunting.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Developing skills and abilities. Enjoy going exploring on my/our own. Enjoying the closeness of family.</p> <p>Benefits: Improved mental well-being and physical fitness and health maintenance. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Heightened sense of satisfaction with our area as a place to live. Positive contributions to local-regional economic stability. Maintenance of community’s distinctive recreation/tourism market niche or character. Increased desirability as a place to live or retire.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Middle/Back Country. On land surrounding the Red Gulch/Alkali Road Back Country Byway, Cold Springs Road, and the Black Butte road, maintain middle country settings on or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight. Maintain back country settings within the WSA.</p> <p>Naturalness: Middle/Back Country. Natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area and primitive motorized routes and non-motorized trails may exist. Maintain primitive</p>

naturalness settings for the WSA where lands are essentially an unmodified natural environment. Evidence of humans is unnoticed by an observer wandering through the area.

Facilities and Structures:

Primitive and Back Country.

Facilities and structures are rare and often accessible via unimproved routes. Maintain primitive settings in the WSA where trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Middle/Back Country.

Maintain Middle country settings along the Cold Springs Road, Black Butte Road, and the Red Gulch/Alkali Road Back Country Byway where 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use are acceptable.

Management Controls and Visitor Services:

Middle/Back Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails outside WSA. Within the Medicine Lodge WSA, motorized and mechanized use is prohibited.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Red Gulch/Alkali Road Back Country Byway, Medicine Lodge Wildlife Habitat Area, and the Medicine Lodge WSA.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Develop new and maintain trailheads for foot and horse travel. Potential locations will include the Wapiti Ridge Trail, Lone Tree Trail and trailhead, Black Butte, and along the Red Gulch/Alkali Road Back Country Byway. Additional sites may be identified throughout the life of the plan.

Upgrade access route to the Lone Tree trailhead and upgrade the Lone Tree Trail.

Develop hiking trails in the Wet and Dry Medicine Lodge Canyons.

Maintain the off-highway vehicle (OHV) route between the Medicine Lodge State Park and Cold Springs Road.

Designate motorized touring loops connecting with the Bighorn National Forest, the Trapper Creek RMZ, and the Brokenback/Logging Road RMZ, which may include new construction.

Develop campgrounds if needed.

Administrative

Visual Resource Management:

Class I within the Medicine Lodge WSA, Class II for the remainder of SRMA.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Close Medicine Lodge WSA to motorized and mechanized use.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Paint Rock RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Maintain cooperative agreement with Wyoming State Land Board, and Wyoming State Game and Fish.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

West Slope SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Trapper Creek RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ contains natural recreational resources which support recreational activities including hunting, sightseeing, and fishing. This areas contains the Trapper Creek WSA, two waterway segments identified as eligible and suitable for inclusion into the Wild and Scenic River System, Spanish Point ACEC, significant cave and karst resources, the Red Gulch/Alkali Road Backcountry Byway, the Red Gulch Dinosaur Tracksite and the Red Gulch Dinosaur Tracksite ACEC, and highly rated scenic quality. This area attracts visitors from within and outside the region to enjoy the resources in these semi-primitive setting to a middle country settings.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
Objective Statement: Manage the Trapper Creek RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, hunting, wildlife viewing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country, Middle Country, and Front Country settings.
Activities: Hunting, wildlife viewing, nature viewing, hiking, sightseeing, photography.
Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Enjoying the closeness of family.
Benefits: Improved mental well-being. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<u>Physical</u> Remoteness: Front/Back Country. On land surrounding the Red Gulch/Alkali Road Back Country Byway, maintain front country settings on or near improved county roads, but at least 0.5 mile from any highway. Maintain back country settings within the Trapper Creek and Alkali

Creek WSAs where lands are more than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight.

Naturalness:

Back Country/Primitive.

Manage for a Back Country setting where natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.

Maintain primitive naturalness settings for the WSAs where lands are essentially an unmodified natural environment. Evidence of humans is unnoticed by an observer wandering through the area.

Facilities and Structures:

Front Country/Primitive.

For lands within the Back Country Byway, maintain the front country settings where primitive and improved routes/trails may exist. Facilities and structures are scattered.

Maintain primitive settings in the WSAs where trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare.

Social

Contacts and Group Size:

Middle Country/Back Country/Primitive.

For lands along the Byway, maintain middle country settings where usually 7-14 encounters/day off travel routes and campsites, and 15-29 encounters/day on travel routes. Usually group size is small to moderate.

Manage for back country settings for remainder of SRMA not including WSAs. Manage for 3-6 encounters/day off travel routes, and 7-15 encounters/day on travel routes. Usually group size is small.

Manage for primitive settings for WSAs. Usually fewer than 3 encounters/day at campsites and fewer than 6 encounters/day on travel routes. Usually group size is small in relation to surrounding areas.

Operational

Mechanized Use:

Front Country/Primitive.

Maintain front country settings along the Red Gulch/Alkali Road Back Country Byway where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized are appropriate.

Manage for primitive settings for the WSAs where there is no mechanized or motorized travel whatsoever.

Management Controls and Visitor Services:

Middle/Back Country.

Manage for middle country settings where on site controls and services are present but subtle.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails outside WSAs. Within the Trapper and Alkali Creek WSAs, motorized and mechanized use is prohibited.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Red Gulch/Alkali Road Back Country Byway, Trapper Creek and Alkali Creek WSAs, the Madison Recharge zone, and caving ethics.

Maintain the Red Gulch Dinosaur Tracksite.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Develop new and maintain trailheads for foot and horse travel. Potential locations will include the Webber Canyon area, White Creek, and Black Mountain areas. Additional sites may be identified throughout the life of the plan.

Construct trailheads to accommodate mountain bike users.

Construct pull-offs along the Red Gulch/Alkali Road.

Back Country Byway.

Designate motorized touring loops within the Trapper Creek RMZ, as well as connecting with the Paint Rock RMZ, and the Bighorn National Forest, which may include new construction.

Administrative

Visual Resource Management:

Class I within the Trapper Creek and Alkali Creek WSAs, and the White Creek and Trapper Creek WSRs. Class II for the remainder of SRMA.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Close WSAs and Spanish Point Karst ACEC to motorized and mechanized use.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Consider the acquisition of legal and/or physical access for hunting, fishing, and camping.

Consider acquiring areas such as Horse Mountain, Trapper Creek, and White Creek.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Trapper Creek RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –
SRP required.

Agreements:

Maintain cooperative agreements with the Big Horn National Forest.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, IMBA, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>West Slope SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>Brokenback/Logging Road RMZ</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>This area exhibits exceptional scenic quality, wildlife resources, and exposed geologic formations. The Hyattville Logging Road is within this area and is proposed to be a backcountry byway for Alternative B. The Logging Road is a popular access point into the Bighorn Mountains. Two other routes, the North and South Brokenback Roads act as very popular access points into the RMZ, as well as the Bighorn National Forest, especially during the big game hunting seasons. Access into this area is in part due to a coordinated agreement between the Wyoming Game and Fish and surrounding private land holders, as well as a foot/horse trail developed by the BLM so as to access more of this area. This area is a very popular hunting area for both local and visiting hunters.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Brokenback/Logging Road RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, hunting, wildlife viewing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country and Middle Country settings.</p> <p><u>Activities:</u> Hunting, hiking, wildlife viewing, nature viewing, driving for pleasure.</p> <p><u>Experiences:</u> Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoying the closeness of family.</p> <p><u>Benefits:</u> Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Stronger ties with my family and friends. Greater awareness that the Bighorn Basin is special. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Middle Country Settings. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight. Front Country settings along the Hyattville Logging Road. On or near improved country roads, but at least 0.5 mile from any highway.</p> <p>Naturalness: Back Country Settings. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Front Country settings for lands along the South and North Brokenback Roads, and along the Hyattville Logging Road. Primitive and improved routes/trails may exist. Facilities and structures are back country settings where they are rare and isolated. Remainder of RMZ is Middle Country. Primitive motorized and non-motorized trails may exist.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country. Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.</p> <p><u>Operational</u></p> <p>Mechanized Use: Middle Country. 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Back Country. On site controls and services present but subtle. Minimum amount necessary to achieve planning objectives. Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<p style="text-align: center;"><u>Information and Education</u></p> <p>Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources. Provide stewardship information to help preserve the special landscape character. Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Hyattville/Logging Road Back Country Byway, Carter Access area, and Wyoming Game and Fish Wildlife Habitat Management Areas. Make available for special outdoor educational programs such as CORE and Take it Outside!</p> <p style="text-align: center;"><u>Monitoring</u></p> <p>Vehicle counters with routine surveys and observation. Visitor reports of crowding. Informal visitor surveys and formal focus groups as funding allow. If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.</p>

Management

Develop facilities to enhance recreation and visitor services for the following areas:

- Trailheads for North and South Brokenback areas, Laddie Creek, and the Hyatteville Logging Road.
- Pull-outs along the Hyatteville Logging Road.
- Improve Salt Lick trail and trailhead.
- Construct additional trailheads and trails.

Designate motorized touring loops within the Brokenback/Logging road RMZ as well as connecting with the Paint Rock RMZ and the Bighorn National Forest, which may include new construction.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Continue to implement current South Broken Back Travel Management Plan.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Consider the acquisition of legal and/or physical access for hunting, fishing, and camping for areas including but not limited to North and South Brokenback roads, Luman Creek Road, Military Creek Road, Dorn Draw Road.

Lengthen public access duration for the North and South Brokenback roads to yearlong access.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Brokenback/Logging Road RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue additional access agreement in the South Brokenback, and North Brokenback areas.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

West Slope SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
South Bighorns RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
The southern Bighorns are popular for visitors to explore, hike, and especially hunt. Outfitters and tour guides enjoy guiding clients here due to the impressive and exceptional scenic qualities, abundant wildlife, and alternative access points onto 33-Mile Road (Hazelton Road) which exhibits exceptional viewing opportunities of the surrounding mountain landscape, the Cloud Peak Wilderness, the Bighorn Basin, and the Powder River Basin to the east; as well as access into the Hole-in-the-Wall region, the Middle Fork of the Powder River, Casper, and the Bighorn National Forest. The South Bighorns contain a rich history including cattle and sheep operations, mining, and infamous outlaws including Billy the Kid. Currently, impressive coordinated travel management efforts between the BLM, Wyoming State Game and Fish, Wyoming State Land Board, and the Orchard Ranch are improving access into the area as well as improving resource management. BLM manages a campground along the Middle Fork of the Powder River which is a destination area for visitors from within and outside the region. The Middle Fork of the Powder River is managed as a blue ribbon trout fishery, as well as identified as eligible and draft suitable for inclusion into the Wild and Scenic River System. The Buffalo Field Office had also identified the Middle Fork of the Powder River within their jurisdiction as eligible for inclusion into the Wild and Scenic River System. The impressive Deep Creek is another waterway segment identified as eligible and draft suitable for inclusion into the Wild and Scenic Rivers System, as well as a sought-after fishery for exceptional fishing and sightseeing opportunities. This area has received significant managerial support from both the Worland and Buffalo Field Offices in improving access into the area to support a variety of recreational activities such as hunting and fishing.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
Objective Statement: Manage the South Bighorns RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, hunting, wildlife viewing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country and Middle Country settings.
Activities: Hunting, fishing, hiking, wildlife viewing, nature viewing, driving for pleasure.
Experiences: Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoying the closeness of family.
Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Stronger ties with my family and friends. Greater awareness that the Bighorn Basin is special. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding.

<p>Increased desirability as a place to live or retire.</p> <p>Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Middle Country Settings. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight. Front Country settings along Rome Hill Road, Dry Farm Road, and Hazelton Road. On or near improved country roads, but at least 0.5 mile from any highway.</p> <p>Naturalness: Back Country Settings. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area. Middle Country Settings for lands within the Middle Fork of the Powder River Campground. Natural setting may have moderately dominant alterations but would not draw the attention of the observers on trail and primitive roads within the area.</p> <p>Facilities and Structures: Middle Country. Primitive motorized and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes. Manage the Middle Fork of the Powder River Campground as Front Country.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small. Rural settings along Upper Nowood Road. People seem to be everywhere, but human contact remains intermittent.</p> <p><u>Operational</u></p> <p>Mechanized Use: Front/Middle Country. Front Country along Cherry Creek Road, Dry Farm Road, Spring Creek Road, Rome Hill Road, and Hazelton Road. 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use. Middle Country for remainder of RMZ. 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Back Country. On site controls and services are present but subtle. Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.</p>

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Hazelton Road Back Country Byway, and the Upper Nowood Travel Management Plan.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop facilities necessary to maximize recreational opportunities at the Middle Fork camping area, the Cherry Creek stock driveway crossing of Deep Creek, Otter Creek.

Develop trailheads for Middle Fork Campground, Mahogany Butte, Deep Creek, Upper Nowood areas, and in other areas on a case-by-case basis.

Administrative

Visual Resource Management:

Class II. Class I within the Deep Creek WSR.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Continue to implement current Upper Nowood Travel Management Plan.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Consider the acquisition of legal and/or physical access for hunting, fishing, boating, and camping. Areas to be considered for acquisition include Otter Creek, Deep Creek, Little Canyon Creek, public land tracts along the Nowood River area, Cherry Creek Road to Hazelton Road, Lysite Mountain, land parcels within Spring Creek, and Spring Creek Road to Rome Hill Road.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the South Bighorns RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO stipulation will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of

damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Maintain cooperative agreement with Double-H Ranch, Wyoming State Land Board, and Wyoming Game and Fish.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Orchard Ranch, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>Canyon Creek SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>Canyon Creek area is located within the southern Bighorns just south of Highway 16, which is a very popular highway over the Bighorn Mountains as well as a popular route to Yellowstone National Park. Canyon Creek exhibits exceptionally high scenic qualities from the exposed dolomite and Ten Sleep formation observed through the impressive canyon complemented by the perennial Canyon Creek which supports a blue-ribbon fishery and a healthy riparian zone through the canyon. A subdivision (Canyon Creek Village) is growing south of the area in which residents enjoy exploring, hiking, hunting, and fishing Canyon Creek. Canyon Valley Resort is located within the area which provides recreational opportunities such as guiding services for visitors, big game outfitting, and golfing opportunities. The scenic qualities as well as the wildlife resources establish the foundation for the tourism market in this area. Smilo Road provides access into BLM-administered public lands east of Canyon Creek as well as the Bighorn National Forest.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the Canyon Creek SRMA for non-motorized recreationists to engage in hiking, hunting, fishing, nature viewing, and wildlife viewing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country settings.</p> <p>Activities: Fishing, hunting, hiking, nature viewing, wildlife viewing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Develop skills and abilities. Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Enjoying getting some needed physical exercise.</p> <p>Benefits: Improved mental well-being. Improved physical fitness and health maintenance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p> <p><u>Physical</u> Remoteness: Back Country. More than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight. Smilo Road, the access route to</p>

the Canyon Creek fishing access parking area, and few other two-tracks are observed along the edges of the area.

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Trails may exist but do not exceed standard to carry expected use. Facilities and structures are rare and isolated.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.

Operational

Mechanized Use:

Back Country.

Mountain bikes perhaps other mechanize use but all is non-motorized. Smilo Road will remain open to motorized access into area.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, non-native invasive weed species found within the area, geology, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails, and camp sites.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop looping hiking trails in Canyon Creek, and off of Smilo Road.

Develop trailheads at Canyon Creek and Smilo Road.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Acquire legal and physical access to maximize recreational opportunities.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Canyon Creek SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue a cooperative agreement with the Canyon Creek Estates.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Canyon Creek Estates, Back Country Horsemen, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>Red Canyon Creek SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>Red Canyon Creek is located along the slopes of the Owl Creek Mountains outside the community of Thermopolis. This area exhibits high scenic qualities, wildlife resources, and opportunities for primitive-type recreation. A subdivision is growing on the north side of the area, which the adjacent BLM-administered public lands provides for easy-to-access public lands for the local residents. The community of Thermopolis has been marketing its natural recreational resources (most especially its thermal resources located within the very popular Hot Springs State Park), as well as prioritizing primitive-type recreational opportunities such as hiking, and horseback riding within the State Park.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the Red Canyon Creek SRMA for motorized and non-motorized recreationists to engage in hunting, hiking, wildlife viewing, and nature viewing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Middle Country settings.</p> <p>Activities: Hiking, wildlife viewing, hunting, nature viewing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Develop skills and abilities. Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Enjoying getting some needed physical exercise.</p> <p>Benefits: Improved mental well-being. Improved physical fitness and health maintenance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Back Country. Most of the SRMA is more than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight. Access routes (two-tracks and improved route) exist along the fringe of the SRMA, as well as within parcels of private lands within the area.</p>

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.

Operational

Mechanized Use:

Back Country.

Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized. The fringes will be managed for 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use so as to maintain current land uses.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, geology, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails, and camp sites.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop hiking trail to Red Canyon Creek.

Develop trailheads at northern access point.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Red Canyon Creek SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Community of Thermopolis, Hot Springs State Park, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>The Rivers SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The Rivers destination SRMA is made up of BLM-managed public lands on the North and South Forks of the Shoshone River, the main stem of the Shoshone River, and the Clarks Fork of the Yellowstone River. These rivers are very popular for fishing, floating, sightseeing, and hunting and are used by local residents as well as visitors from throughout the nation and from foreign countries. Many visitors traveling to or from Yellowstone National Park spend time in Cody. Several companies offer commercial fishing or floating trips on these rivers. BLM and the Wyoming Game and Fish Department (WGFD) have an agreement which recognizes the high recreational value of various tracts of land along these rivers and provides for cooperative efforts to develop access and manage the sites. Many sites have been developed over the years. Several of the river access sites also serve as trailheads for hiking and horseback access to the Shoshone National Forest. In addition, there are access sites which have been developed by other parties. The North Fork of the Shoshone River and portions of the Shoshone River are considered blue-ribbon trout fisheries.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p> <p><u>Objective Statement:</u></p> <p>Manage The Rivers SRMA for motorized and non-motorized recreation opportunities such as fishing, floating, photography, hunting, hiking, and nature viewing so that recreationists report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, and middle country settings.</p> <p><u>Activities:</u></p> <p>Fishing, floating, sightseeing, hunting, photography, and nature viewing.</p> <p><u>Experiences:</u></p> <p>Enjoy going exploring on my/our own. Enjoy the closeness of family. Experiencing a greater sense of independence. Testing endurance. Enjoy risk taking adventure.</p> <p><u>Benefits:</u></p> <p>Improved mental well-being. Closer relationship with the natural world. Enhanced sense of personal freedom. Improved physical fitness and health maintenance. Improved skills for outdoor enjoyment. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Increased local job opportunities. Increased local tourism revenue. Improved local economic stability.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Rural Country. On or near primary highways, but still within a rural area. Front Country. On or near improved county roads, but at least 0.5 mile from any highway. Middle Country. On or near 4-wheel drive roads, but at least ½ mile from all improved roads, though they may be in sight.</p> <p>Naturalness: Rural, Front, and Middle Country. Natural setting is culturally modified to the point that it is dominant to the sensitive travel route observer in some locations. In other locations, natural setting may have moderately dominant alterations but would not draw the attention of the observers on trails and primitive roads within the area.</p> <p>Facilities and Structures: Rural and Front Country. Primitive and improved routes/trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Front Country setting. Usually up to 29 encounters/day off travel routes and 30 or more encounters/day en-route. Group size varies from small to large. Visitor encounters can be high during peak use periods at the major boat ramps.</p> <p><u>Operational</u></p> <p>Mechanized Use: Front Country. Manage the majority of the river tracts for a Front Country setting where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Front Country. On site controls and services are present but harmonize with the natural environment. Personnel periodic.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<u>Information and Education</u>
<p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs. Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management.</p> <p>Provide stewardship information to help preserve the special landscape character.</p> <p>Provide for a map with designated roads, boat ramps, hazards, and BLM-administered public land tracts.</p> <p>Make available for special outdoor educational programs such as CORE and Take it Outside!</p> <p>Work closely with the gateway communities of Cody, Powell, Thermopolis, Worland, Basin, Lovell, and Greybull, and other partners in the region in marketing and outreach.</p>

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other river segments, institute fee areas, or limit river use.

Management

Continue to provide for experiences and associated facilities with an emphasis on maintaining rural to front country recreation settings.

Continue to provide opportunities that contribute to meeting recreation demand while protecting resources.

In cooperation with WGFD and other partners, provide and maintain visitor facilities, services, signing, and programs.

Administrative**Visual Resource Management:**

Class II.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails for the North and South Forks of the Shoshone River and the Clarks Fork of the Yellowstone River and is limited to existing roads and trails for the Shoshone River area.

Lands and Realty:

Manage lands within one mile of the Shoshone, Greybull, and Clarks Fork of the Yellowstone Rivers as avoidance areas for construction of above ground power lines. Alternative energy avoidance area for realty actions.

Retain recreational access to the North and South Forks of the Shoshone, the Shoshone, and the Clarks Fork of the Yellowstone Rivers.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply NSO to some lands within the Rivers SRMA (WGFD/BLM access areas on the Clarks Fork of the Yellowstone and the North and South Forks of the Shoshone River).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Communities of Cody, Powell, Lovell, Wyoming Game and Fish, Trout Unlimited, Shoshone Back Country Horsemen, Shoshone National Forest, Park County Recreation Board, and other interested groups.

Other Administration:

On site controls and services are present but harmonize with the natural environment.

<p>McCullough Peaks SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The McCullough Peaks SRMA lies east of Cody and north of U.S. Highway 14/16/20. This scenic, popular area is used by residents of Cody, Powell, Park and Big Horn Counties for uses such as viewing wild horses, sightseeing, hunting, horseback riding, mountain biking, hiking, photography, driving for pleasure (including ATVs and motorcycles), and wildlife viewing. Colorful badlands provide excellent photographic opportunities. Tourists traveling to or from Yellowstone National Park also use the area. Several commercial permittees provide wild horse viewing tours or interpretive tours in the area. The McCullough Peaks WSA lies within the SRMA as does the McCullough Peaks Wild Horse Herd Management Area (HMA).</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u></p> <p>Manage the McCullough Peaks SRMA for motorized and non-motorized recreation opportunities such as wildlife and wild horse viewing, nature viewing, horseback riding, hunting, and hiking so that recreationists report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, middle and back country settings.</p> <p><u>Activities:</u></p> <p>Viewing wild horses and wildlife, sightseeing, hunting, mountain biking, hiking, photography, driving for pleasure, horseback riding.</p> <p><u>Experiences:</u></p> <p>Enjoy going exploring on my/our own.</p> <p>Learn.</p> <p>Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.</p> <p>Enjoy the closeness of family.</p> <p>Learning more about things here.</p> <p>Enjoy having easy access to natural landscapes.</p> <p><u>Benefits:</u></p> <p>Enhanced awareness and understanding of nature.</p> <p>Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance.</p> <p>Increased appreciation of area’s cultural history.</p> <p>Improved mental well-being.</p> <p>Heightened sense of satisfaction with our area as a place to live.</p> <p>Greater community involvement in recreation and other land use decisions.</p> <p>Increased desirability as a place to live or retire.</p> <p>Maintenance of community’s distinctive recreation/tourism market niche or character.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Rural, Front, Middle, and Back Country. The eastern and southern boundaries lie along major highways. There are several BLM roads and numerous two-tracks and ATV trails in the SRMA area.</p> <p>Naturalness: Front and Middle Country. Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within the area but not draw the attention of observers on trails and primitive routes. Back Country. Natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Rural and Front Country. Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters. Middle Country. Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Usually up to 6 encounters/day off travel routes and up to 15 encounters/day on travel routes. Usually group size is small. Middle Country settings. Usually up to 14 encounters/day off travel routes, and up to 29 encounters/day en route. Usually group size is small. Most of the time, social settings will reflect back country definition.</p> <p><u>Operational</u></p> <p>Mechanized Use: Front and Middle Country. Manage the SRMA for 2-wheel drive and 4-wheel drive vehicles, ATVs, dirt bikes and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Middle Country. On site controls and services are present but subtle. Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<u>Information and Education</u>
<p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.</p> <p>Provide stewardship information to help preserve the special landscape character.</p> <p>Provide for a map with designated roads, trailheads, trails.</p> <p>Make available for special outdoor educational programs such as CORE and Take it Outside!</p>

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine road and trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points and to identify such items as travel routes, the WSA boundary, and the herd area boundary.

Interpretive signs at trailheads and parking areas, where appropriate.

Provide opportunities for the public to view wild horses in the McCullough Peaks HMA.

Administrative

Visual Resource Management:

Class I in the McCullough Peaks WSA and Class II elsewhere in the SRMA.

Comprehensive Trails and Travel Management:

Motorized vehicle use is limited to designated roads and trails in the entire SRMA.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

No leasing within the McCullough Peaks WSA and NSO elsewhere in the SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Prohibit organized SRPs using domestic horses in the McCullough Peaks HMA.

Partners:

City of Cody; Park County Recreation Board; private landowners; local mountain biking, hiking, equestrian, and motorized groups, FOAL, Wyoming State Trails Program, and other interested groups.

Basin Gardens SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Basin Gardens Play Area RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This area is located between the Communities of Greybull and Basin, Wyoming. This area is currently being used for off-road hill climbs used by both ATVs and motorcycles, dominantly motorcycles. Visitors are from within the communities, as well as from outside the area, particularly Billings, Montana. The area is composed of bentonite and mostly devoid of vegetation. The Basin Gardens area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. The communities from RMP Scoping opportunities had identified this area as highly desired for motorized recreational opportunities.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
Objective Statement: Manage the Basin Gardens Play Area RMZ for motorized recreationists to engage in ATV, motorbike, and other motorized hill climbing activities so that visitors report realizing a “moderate” level of recreation experience and benefit outcomes in these Front Country settings.
Activities: Driving for pleasure, motorcycle hill climbing.
Experiences: Developing skills and abilities. Enjoying risk-taking adventure. Being around people I know and enjoy.
Benefits: Improved physical fitness and health maintenance. Improved outdoor recreation skills. Enhanced sense of personal freedom. More well-rounded childhood development. Heightened sense of satisfaction with our area as a place to live. Increased desirability as a place to live or retire. Improved local economic stability. Increased local tourism revenue. Maintenance of community’s distinctive recreation/tourism market niche or character.
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
Physical
Remoteness: Front Country. The RMZ is surrounded by county roads, and displays tracks from heavy off-road use.

Naturalness:

Front Country.

The area’s natural setting from the intense off-road use may have modifications which range from being easily noticed to strongly dominant to observers within the area. These alterations would remain unnoticed or visually subordinate from sensitive travel routes (Highway 16, 20) and use areas.

Facilities and Structures:

Front Country.

Primitive and improved routes/trails may exist. Facilities and structures are scattered.

Social

Contacts and Group Size:

Middle Country settings.

Usually 7-14 encounters/day off travel routes (e.g., staging areas), and 15-29 encounters/day en route. Usually group size is small to moderate.

Operational

Mechanized Use:

Middle Country.

4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Front Country.

On site controls and services are present but harmonize with the natural environment.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, and user safety.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated routes, trailheads, docking stations, designated areas tailored for different degrees of riding experience (novice areas to experienced areas).

Make information available to the surrounding communities.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop areas for novice riders to highly experienced riders.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Class III.

Comprehensive Trails and Travel Management:

Motorized use open to off-road/cross-country use.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Basin Gardens Play RMZ.

Prohibit mineral material sales and/or free use permits in the Basin Gardens Play Area.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Greybull, Basin, Manderson, and Worland, Wyoming State Trails Program, surrounding private land owners, NOHVCC, Sagehoppers, and other interested groups and OHV clubs.

Other Administration:

No glass containers and pallets (burning, etc.) allowed.

Noise constraints are enforceable via 43 CFR 8343.1.

Basin Gardens SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Basin Gardens RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
The Basin Gardens RMZ area was identified through public scoping as a desirable area to enjoy motorized and non-motorized opportunities on BLM-administered public lands that are located close to the communities. Non-motorized opportunities, most especially mountain biking was identified as a highly popular activity. The area is located outside of Greybull, Wyoming. The hills west of the area are very popular for motorized hill climbing activities, as well as some identified mountain biking activities. Management focus for this RMZ will be for non-motorized recreation that would potentially be displaced by the motorized activities that dominate the adjoining RMZ.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p><u>Objective Statement:</u> Manage the Basin Gardens RMZ for motorized and non-motorized recreationists to engage in hiking, hunting, nature viewing, and wildlife viewing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these back to middle country settings.</p> <p><u>Activities:</u> Hiking, hunting, nature viewing, wildlife viewing, mountain biking.</p> <p><u>Experiences:</u> Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Developing skills and abilities.</p> <p><u>Benefits:</u> Improved physical fitness and health maintenance. Improved capacity for outdoor physical activity. Greater community involvement in recreation and other land use decisions. Heightened sense of satisfaction with our area as a place to live. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p><u>Remoteness:</u> Middle Country. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p> <p><u>Naturalness:</u> Back Country. Natural settings may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p><u>Facilities and Structures:</u> Back Country.</p>

Trails may exist but do not exceed standard to carry expected use. Facilities and structures are rare and isolated.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Back Country.

On site controls and services present but subtle. Minimum amount necessary to achieve planning objectives.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, user safety, and designated travel routes.

Provide stewardship information to help preserve the special landscape character.

Make information available to the surrounding communities.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop mountain biking trailheads and mountain biking routes.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Class III.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated routes and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Basin Gardens RMZ.

Prohibit mineral material sales and/or free use permits in the Basin Gardens RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Greybull, Basin, Manderson, and Worland, Wyoming State Trails Program, surrounding private land owners, IMBA, Backcountry Horsemen, and other interested groups.

<p>Horse Pasture SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The Horse Pasture SRMA is 144 acres of BLM-administered public land nestled along the foothills of Rattlesnake Ridge and surrounded by agriculture uses. This area was once used as an oil and gas staging area, complete with residential buildings. Currently, in coordination with Devon Energy Corporation, the BLM is in the process of reclaiming the area to pre-development landscape. The area is used by the community of Worland for uses such as walking, hunting (bird and big game), and nature viewing.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p>Objective Statement: Manage the Horse Pasture SRMA for non-motorized recreationists to engage in photography, hunting, nature viewing, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these middle country settings.</p> <p>Activities: Hiking, wildlife viewing, nature viewing, photography, hunting (bird and big game), dog interaction (walking, training, hunting, etc.).</p> <p>Experiences: Enjoy going exploring on my/our own. Learn. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoy the closeness of family. Learning more about things here. Enjoy having easy access to natural landscapes.</p> <p>Benefits: Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Front Country. The south boundary is along an improved road used for agricultural purpose. Some primitive routes exist within the area from past management. Within the SRMA, the desired remoteness setting will be middle country, the edge will, by default, be front country.</p>

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small. Most of the time, social settings will reflect primitive definition.

Operational

Mechanized Use:

Back Country.

Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized. The fringes will be managed for 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use so as to maintain current land uses.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop interpretive/historic nature trail within the Horse Pasture.

Develop trailhead at western edge of SRMA.

Signs present at key access points, but limited within the SRMA, with exception to nature trail.

Interpretive signs at trailhead, and along trail.

Administrative**Visual Resource Management:**

Class II.

Comprehensive Trails and Travel Management:

The area is closed to motorized use.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Horse Pasture SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO stipulation will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Community of Worland, Wyoming State Trails Program, Wyoming Game and Fish, Devon Energy, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>Bighorn River SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The Bighorn River has been a very popular area known for river recreation such as boating/floating, fishing, hunting, and motor boating. The southern river segments (from Wedding of the Waters to Skelton Bridge) are managed as a blue-ribbon fishery with many Wyoming Game and Fish managed put-in and take-outs. The river contains BLM-administered islands, as well as other scattered tracts of land that provide for river access. Recently, the BLM acquired the Eggert tract which has enhanced user access to the river, as well as extended float trips from boaters putting-in upstream of the tract. From Greybull north to Bighorn Lake, there are three public access locations: Railroad, Greybull Bridge, and ML Dike Ramp. The Bighorn River tracts are currently managed under the Bighorn River Habitat Management Plan and Recreation Area Management Plan (2/23/1989). The HMP/RAMP prescribes management for other resources such as wildlife, vegetation, fisheries, and invasive and noxious weed management.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Bighorn River SRMA for river recreation use for visitors to engage in sightseeing, hunting, photography, fishing, and floating so that they report realizing a “moderate” level of recreation experience and benefit outcomes in back to middle country settings.</p> <p><u>Activities:</u> Sightseeing, hunting, photography, fishing, and floating.</p> <p><u>Experiences:</u> Enjoy going exploring on my/our own. Enjoy the closeness of family. Experiencing a greater sense of independence. Testing endurance. Enjoy risk taking adventure.</p> <p><u>Benefits:</u> Improved mental well-being. Closer relationship with the natural world. Enhanced sense of personal freedom. Improved physical fitness and health maintenance. Improved skills for outdoor enjoyment. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Increased local job opportunities. Increased local tourism revenue. Improved local economic stability.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Front Country. The tracts provide for main access points to the Bighorn River, which are on or near improved county roads, but at least 0.5 mile from any highway.</p> <p>Naturalness: Back Country. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area. Some tracts along the Bighorn River (Durkee Boat Ramp) are Front Country due to adjacent land uses.</p> <p>Facilities and Structures: Front Country. Primitive and improved routes/trails may exist. Facilities and structures are scattered.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Most of the Bighorn River Tracts are usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on travel routes. Usually group size is small. Most of the time, social settings will reflect primitive definition. Visitor encounters can be high during peak use periods at the boat ramp. Encounters diminish the further downstream (north).</p> <p><u>Operational</u></p> <p>Mechanized Use: Front Country. Manage the majority of the river tracts for a Front Country setting where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Back Country. On site controls and services are present but subtle. Personnel periodic. Minimum amount necessary to achieve planning objectives.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<p style="text-align: center;"><u>Information and Education</u></p> <p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs. Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management. Provide stewardship information to help preserve the special landscape character. Provide for a map with designated roads, boat ramps, hazards, and BLM-administered public land tracts. Make available for special outdoor educational programs such as CORE and Take it Outside! Work closely with the gateway communities of Thermopolis, Worland, Basin, Lovell, and Greybull, and other partners in the region in marketing and outreach.</p> <p style="text-align: center;"><u>Monitoring</u></p> <p>Vehicle counters with routine surveys and observation. Visitor reports of crowding. Informal visitor surveys and formal focus groups as funding allow.</p>

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other river segments, institute fee areas, or limit river use.

Management

Continue to provide for a day use experience and associated facilities with an emphasis on maintaining a middle country recreation setting.

Continue to provide opportunities that contribute to meeting recreation demand while protecting resources.

Provide and maintain visitor facilities, services, signing, and programs.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy exclusion area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Bighorn River SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

An NSO stipulation will be applied.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Communities of Thermopolis, Worland, Basin, Lovell, and Greybull, Wyoming Game and Fish, National Park Service, Friends of Bighorn Lake, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>Beck Lake Area SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The Beck Lake Area SRMA contains about 6,483 acres of BLM-administered public land south of Beck Lake. The area is used by residents of Cody and Park County for uses such as mountain biking, hiking, hunting, driving for pleasure, and wildlife viewing. The City of Cody is seeking a Recreation and Public Purpose (R&PP) lease for land in the northern portion of the SRMA. That land would complement the recreation facilities the City manages at Beck Lake Park. Management of the R&PP area would be governed by agreement(s) and operating plan(s) associated with its R&PP status.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement:</p> <p>Manage the Beck Lake Area community SRMA for non-motorized recreationists to engage in mountain biking, hiking, photography, wildlife viewing, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these rural and front country settings.</p> <p>Activities:</p> <p>Mountain biking, hiking, wildlife viewing, nature viewing, photography, hunting, dog interaction (walking, training, hunting, etc.).</p> <p>Experiences:</p> <p>Enjoy going exploring on my/our own. Learn. Enjoy the closeness of family. Learning more about things here.</p> <p>Benefits:</p> <p>Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p> <p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness:</p> <p>Rural and Front Country.</p> <p>A major highway lies along the eastern boundary of the SRMA. Numerous primitive and developed roads lie within the area.</p>

Naturalness:

Rural to Front Country.

Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within the area.

Facilities and Structures:

Rural and Front Country.

Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.

Social

Contacts and Group Size:

Middle Country settings.

Usually up to 14 encounters/day off travel routes, and up to 29 encounters/day en route. Usually group size is small.

Operational

Mechanized Use:

Back Country.

Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized.

Management Controls and Visitor Services:

Middle Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with access, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailhead.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

The area is closed to motorized use.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

NSO.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property.

The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

City of Cody, Park County Recreation Board, private landowners, local mountain biking and hiking groups, Wyoming State Trails Program, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

<p>Newton Lake Ridge SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The Newton Lake Ridge SRMA contains about 1,997 acres of BLM-administered public land north of Newton Lakes. The area is used by residents of Cody and Park County for uses such as mountain biking, hiking, hunting, and wildlife viewing.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the Newton Lake Ridge SRMA for non-motorized recreationists to engage in mountain biking, hiking, photography, hunting, wildlife viewing, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, and middle country settings.</p>

<p>Benefits: Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p>
<p>Remoteness: Rural, Front, and Middle Country. The northeastern boundary is along a major highway. Several short, primitive routes occur within the SRMA.</p>
<p>Naturalness: Front and Middle Country. Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within</p>

the area but not draw the attention of observers on trails and primitive routes.

Facilities and Structures:

Rural and Front Country.

Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small. Most of the time, social settings will reflect primitive definition.

Operational

Mechanized Use:

Back Country.

Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized.

Management Controls and Visitor Services:

Middle Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailhead.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

The area is closed to motorized use.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

NSO.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

City of Cody, Park County Recreation Board, private landowners, local mountain biking and hiking groups, Wyoming State Trails Program, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls.

Worland Caves ERMA

ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.

This ERMA is within the entire Bighorn Basin Planning Area and will guide recreation management for the known and for newly discovered cave and karst systems for both the Worland and the Cody Field Offices. A cave is defined as any naturally occurring void, cavity, recess, or system of interconnected passages occurring beneath the surface of the Earth or within a cliff or ledge large enough to permit an individual to enter, whether or not the entrance is naturally formed or man. In the planning area, solution caves are, by far the most common type of cave. They are found in limestone and dolomite strata and are formed by the dissolving of rock along and adjacent to joints (fractures), faults, and bedding planes in the rock. Caves were often used by Native Americans as temporary living quarters, storage areas, shelter, and game traps. Cave resources are fragile due to their association with other resources such as groundwater hydrologic systems and biological communities. They may also be considered non-renewable resources due to paleontological and archaeological deposits, speleothems (formations inside caves), and biological resources.

The known cave and karst resources throughout the planning area are very popular for recreational activities. Spirit Mountain, in the Cody Field Office, is an example of observed high recreation use. Caves provide for very unique opportunities and experiences and nearly every caving experience results in desired beneficial outcomes for the visitor. Managing the cave resources as a separate ERMA will enable to focus more recreation management to be more proactive in adequately managing the cave resources, as well as providing for desired cave and karst activities, experiences, and beneficial outcomes.

ERMA OBJECTIVE(S) DECISION

ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.

Objective Statement:

Guidelines to be considered in addressing resource demands include, but are not limited to: a regulation of surface disturbance in regard to future renewable energy developments, the avoidance of future ROW actions through any cave areas deemed to be significant, attempts to acquire resources through exchange, implementing fire suppression restrictions and geophysical exploration restrictions to comply with OHV restrictions, and management under Visual Resource Management (VRM) Class II, III, and IV guidelines as identified for each cave unit. Cave resources could be monitored for degradation. Managers may evaluate the desirability and practicality of various monitoring strategies including, but are not limited to, photo monitoring, water quality monitoring, and a periodic census of indicator species. Management policies and guidelines should be established for cave resources specific to the planning area identifying how to manage the land around the resources including policies related to travel management, gates or barricades, erosion, appropriate recreation use, and resource protection.

MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS

Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.

Physical

Remoteness:

Maintain primitive and pristine environment in the cave and karst systems.

Naturalness:

Manage the natural setting so that they may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Facilities and structures are extremely rare and developed only in occasions where necessary to protect the cave and karst environment.

Social

Contacts and Group Size:

Manage for a season average of fewer than 6 encounters/day on and off travel routes.

Operational

Mechanized Use:

Manage for both non-motorized and motorized travel above ground over cave and karst passages.

Within cave and karst passages, foot traffic only.

Management Controls and Visitor Services:

On site controls and services present at key access points, but subtle.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during spike caving use, usually during the summer.

Minimum amount of BLM facilitating outputs necessary to achieve planning objectives.

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop educational signs at trailheads and parking areas on user ethics, geology, and wilderness.

Provide stewardship information to help preserve the special landscape character.

Make available for special outdoor educational programs such as Boy Scouts, CORE, and Take it Outside!

Monitoring

Vehicle counters with surveys and observation.

Visitor registers and cave register to observe crowding issues.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered.

Management

Cave and Karst management will be guided from the Worland Caves Management Plan.

Develop primitive trailheads at key access points.

Install kiosks and signs at trailheads and parking areas.

Signs present at key access points, but very limited within the ERMA.

Administrative

Visual Resource Management:

Manage consistent with underlying resource VRM prescriptions.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails in areas over important caves or cave passages.

Lands and Realty:

Manage Lands and Realty actions consistent with underlying management prescriptions.

Minerals, Oil and Gas Leasing, and Other Surface-Disturbing Activities:

Cave and karst areas are closed to mineral material disposals, withdrawn from locatable entry, and closed to mineral leasing. These same restrictions apply to important caves or cave passages and karst resources as they are identified.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –
Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –
SRP required.

Partners:

Including, but not limited to: Wyoming State Land Board, Wyoming Game and Fish, Back Country Horsemen, Sierra Club, Wyoming Wilderness Association, NOLS, NSS, and local grotto clubs.

Other Administration:

Limit the use of signing or other administrative controls.

ALTERNATIVE C

<p>Rattlesnake Ridge SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>This area is located approximately 4 miles east of Worland, Wyoming. This area is currently being used for off-road hill climbs used by both ATVs and motorcycles, dominantly motorcycles; as well as oil and gas extraction activities, ROW projects including radio signal towers, and grazing. Most of the visitors are from within the Worland area, as well as from other areas outside of the Worland area, most especially from Thermopolis, Wyoming. The area is heavily used by motorized use enthusiasts, and is mostly devoid of vegetation. The Rattlesnake Ridge area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. In addition, the surrounding communities had identified this area as highly desirable for motorized recreational opportunities during the RMP Scoping meetings.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Rattlesnake Ridge SRMA with a community recreation strategy for motorized recreationists to engage in ATV, motorbike, and other motorized hill climbing activities so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these front to rural settings.</p> <p><u>Activities:</u> Driving for pleasure, motorcycle hill climbing.</p> <p><u>Experiences:</u> Developing skills and abilities. Enjoying risk-taking adventure. Being around people I know and enjoy.</p> <p><u>Benefits:</u> Improved physical fitness and health maintenance. Improved outdoor recreation skills. Enhanced sense of personal freedom. More well-rounded childhood development. Heightened sense of satisfaction with our area as a place to live. Increased desirability as a place to live or retire. Improved local economic stability. Increased local tourism revenue. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Rural Country. The RMZ is surrounded by county roads, and displays tracks from heavy off-road use. The area is on or near primary highways, but still within a rural area.</p> <p>Naturalness: Rural Country. The area’s natural setting from the intense off-road use as well as the industrial activities is culturally modified to the point that it is dominant to the sensitive travel route observer, Pedestrians or other slow moving observers are constantly within view of culturally changed landscape.</p> <p>Facilities and Structures: Rural Country. Paved, improved, and/or primitive roads/highways dominate the landscape. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Middle Country settings. Usually 7-14 encounters/day off travel routes (e.g., staging areas), and 15-29 encounters/day en route. Usually group size is small to moderate.</p> <p><u>Operational</u></p> <p>Mechanized Use: Middle Country. 4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Rural Country. On site controls and services are obvious and numerous. Largely harmonize with the man-made environment (dominantly from the oil and gas extraction activities and the ROW projects).</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<p style="text-align: center;"><u>Information and Education</u></p> <p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, and user safety. Provide stewardship information to help preserve the special landscape character. Provide for a map with designated routes, trailheads, docking stations, designated areas tailored for different degrees of riding experience (novice areas to experienced areas). Make information available to the surrounding communities. Make available for special outdoor educational programs such as CORE and Take it Outside!</p> <p style="text-align: center;"><u>Monitoring</u></p> <p>Vehicle counters with routine surveys and observation. Visitor reports of crowding. Informal visitor surveys and formal focus groups as funding allow. If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.</p>

Management

Develop areas for novice riders to highly experienced riders.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Administrative**Visual Resource Management:**

Class IV.

Comprehensive Trails and Travel Management:

Motorized use open to off-road/cross-country use.

Lands and Realty:

Open to all ROW (including alternative energy realty actions).

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Open to oil and gas, to mineral entry and, other mineral leasing subject to standard protection measures.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration (including casual use), salable minerals exploration and development, and construction activities (including those related to development of recreation facilities or wildlife).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Worland, Thermopolis, Manderson, Basin, and Greybull; Wyoming State Trails Program, surrounding land users and industry, NOHVCC, Sagehoppers, and other interested groups and OHV clubs.

Other Administration:

No glass containers and pallets (burning, etc.) allowed.

Noise constraints are enforceable via 43 CFR 8343.1.

<p>Basin Gardens Play Area ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>This area is located between the Communities of Greybull and Basin, Wyoming. This area is currently being used for off-road hill climbs used by both ATVs and motorcycles, dominantly motorcycles. Visitors are from within the communities, as well as from outside the area, particularly Billings, Montana. The area is composed of bentonite and mostly devoid of vegetation. The Basin Gardens area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. The communities from RMP Scoping opportunities had identified this area as highly desired for motorized recreational opportunities.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p>Objective Statement: Manage the Basin Gardens Play Area as a separate ERMA for motorized recreationists to engage in ATV, motorbike, and other motorized hill climbing activities so as to address public health and safety, use and user conflicts, and resource protection in these Front Country settings.</p>
<p>MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS</p>
<p>Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.</p>
<p><u>Physical</u> Remoteness: Front Country. The RMZ is surrounded by county roads, and displays tracks from heavy off-road use. Naturalness: Front Country. The area’s natural setting from the intense off-road use may have modifications which range from being easily noticed to strongly dominant to observers within the area. These alterations would remain unnoticed or visually subordinate from sensitive travel routes (Highway 16, 20) and use areas. Facilities and Structures: Front Country. Primitive and improved routes/trails may exist. Facilities and structures are scattered.</p>
<p><u>Social</u> Contacts and Group Size: Middle Country settings. Usually 7-14 encounters/day off travel routes (e.g., staging areas), and 15-29 encounters/day en route. Usually group size is small to moderate.</p>
<p><u>Operational</u> Mechanized Use: Middle Country. 4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.</p>
<p>Management Controls and Visitor Services: Front Country. On site controls and services are present but harmonize with the natural environment.</p>

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, and user safety.

Provide for a map with designated routes, trailheads, docking stations, designated areas tailored for different degrees of riding experience (novice areas to experienced areas).

Make information available to the surrounding communities.

Make available for special educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other OHV areas/ trails.

Management

Develop areas for novice riders to highly experienced riders.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the ERMA.

User ethics and informational signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Manage visual resource objectives consistent with adjacent resource program prescriptions. Manage surface-disturbing activities so as to minimize visual contrasts.

Comprehensive Trails and Travel Management:

Motorized use open to off-road/cross-country use.

Lands and Realty:

Open the Basin Gardens Play area to new ROWs.

Minerals:

Pursue withdraw from appropriation under the mining laws for lands within the Basin Gardens Play Area ERMA.

Prohibit mineral material sales and/or free use permits in the Basin Gardens Play Area.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration (including casual use), salable minerals exploration and development, and construction activities (including those related to development of recreation facilities or wildlife).

Open the Basin Gardens Play area to oil and gas and other mineral leasing subject to standard protection measures.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Greybull, Basin, Manderson, and Worland, Wyoming State Trails Program, surrounding private land owners, NOHVCC, Sagehoppers, and other interested groups and OHV clubs.

Other Administration:

No glass containers and pallets (burning, etc.) allowed.

Noise constraints are enforceable via 43 CFR 8343.1.

<p>Basin Gardens ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>The Basin Gardens RMZ area was identified through public scoping as a desirable area to enjoy motorized and non-motorized opportunities on BLM-administered public lands that are located close to the communities. Non-motorized opportunities, most especially mountain biking was identified as a highly popular activity. The area is located outside of Greybull, Wyoming. The hills west of the area is very popular for motorized hill climbing activities, as well as some identified mountain biking activities. Management focus for this RMZ will be for non-motorized recreation that would potentially be displaced by the motorized activities that dominate the adjoining RMZ.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p><u>Objective Statement:</u> Manage the Basin Gardens RMZ for motorized and non-motorized recreationists to engage in hiking, hunting, nature viewing, and wildlife viewing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these back to middle country settings.</p>
<p>MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS</p>
<p>Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.</p>
<p><u>Physical</u></p> <p><u>Remoteness:</u> Middle Country. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p> <p><u>Naturalness:</u> Back Country. Natural settings may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p><u>Facilities and Structures:</u> Back Country. Trails may exist but do not exceed standard to carry expected use. Facilities and structures are rare and isolated.</p> <p><u>Social</u></p> <p><u>Contacts and Group Size:</u> Back Country. Usually 3-6 encounters/day off travel routes and 7-15 encounters/day on travel routes. Usually group size is small.</p> <p><u>Operational</u></p> <p><u>Mechanized Use:</u> Middle Country. 4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.</p> <p><u>Management Controls and Visitor Services:</u> Back Country. On site controls and services present but subtle. Minimum amount necessary to achieve planning objectives.</p>

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, and user safety.

Provide stewardship information to help preserve the special landscape character.

Make information available to the surrounding communities.

Make available for special educational programs such as CORE and Take it Outside!

Monitoring

Monitor visitor use, visitor safety, and resource conditions through; BLM staff, volunteers and recreation-tourism partnerships (e.g., towns, outfitters, recreation organizations, etc.).

Vehicle counters with routine surveys, on-site patrols, and observation.

Management

Develop mountain biking trailheads and mountain biking routes.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the ERMA.

Interpretive signs at trailheads and parking areas.

Administrative

Visual Resource Management:

Manage visual resource objectives consistent with adjacent resource program prescriptions. Manage surface-disturbing activities so as to minimize the degree of visual contrast.

Comprehensive Trails and Travel Management:

Motorized use is limited to existing roads and trails.

Lands and Realty:

Open the Basin Gardens area to new ROWs.

Open the Basin Gardens area to alternative energy realty actions (i.e., wind, solar, etc.).

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Basin Gardens area.

Authorize mineral material sales and/or free use permits in the Basin Gardens area.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration (including casual use), salable minerals exploration and development, and construction activities (including those related to development of recreation facilities or wildlife).

Open the Basin Gardens Creek area to oil and gas and other mineral leasing subject to standard protection measures.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Greybull, Basin, Manderson, and Worland, Wyoming State Trails Program, surrounding private land owners, IMBA, Backcountry Horsemen, and other interested groups.

ALTERNATIVES D AND F

<p>Absaroka Mountain Foothills SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>This SRMA is necessary to accommodate back to middle country recreational experiences in a recreational resource rich environment. The Absaroka Mountain Foothills area is a very popular destination for both local residents and out-of-region visitors due to the openness, and naturalness of the area. The area is abundant in a wide variety of wildlife including grizzly bears, major access into the Shoshone National Forest and the Washakie Wilderness, and dramatic scenery.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the Absaroka Mountain Foothills as an undeveloped SRMA for non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing so that they realize a “moderate” level of the targeted experience and benefit outcomes listed below in these Back Country and Middle Country settings.</p> <p>Activities: Wildlife viewing, nature viewing, hiking, hunting, horseback riding.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Learning more about things here.</p> <p>Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Improved mental well-being and physical fitness and health maintenance. Heightened sense of satisfaction with our area as a place to live. Positive contributions to local-regional economic stability. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p> <p><u>Physical</u> Remoteness: Back Country. Implement/maintain road closures to maintain back country settings.</p> <p>Naturalness: Back Country. Manage for back country and middle country settings where natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p>

Facilities and Structures:

Back Country.

Allow for primitive motorized routes and non-motorized trails to exist. Facilities and structures are rare and often accessible via unimproved routes. Horse and hiking trailheads will be constructed at major key access points.

Social

Contacts and Group size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Back to Middle Country.

Main access roads are crowned and ditched gravel roads accessed by 2-wheel and 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use. Roads within the LU Sheep Company area are closed, but available for public access during hunting season. Trails for non-motorized use will be constructed so as to access public lands.

Management Controls and Visitor Services:

Middle Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails, and seasonal closures within the LU Sheep Company area.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the LU Ranch cooperative agreement.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

Visitor surveys will be available in register boxes at trailheads.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Develop trailheads for foot and horse travel. Potential locations will include the Blue Creek Trail, and sites along the South fork of the Owl Creek. Additional sites may be identified throughout the life of the plan.

Administrative

Visual Resource Management:

Class II.

Appendix O – Recreation

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Absaroka Mountain Foothills SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

For lands within the Absaroka Front Management Area, oil and gas leasing is subject to those management actions.

Outside of the Absaroka Front Management Area, allow surface-disturbing activities in the Absaroka Mountain Foothills SRMA such as geophysical exploration, salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat) on a case-by-case basis.

A CSU will be stipulated within the SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Maintain cooperative agreement with Wyoming State Land Board, Wyoming State Game and Fish, and LU Sheep Company.

Seek other agreements and partnerships as appropriate.

Partners:

Surrounding private land owners, Shoshone National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Rocky Mountain Elk Foundation, LU Sheep Company, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Pack goats are prohibited.

<p>Absaroka ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>This separate ERMA is necessary to accommodate back to middle country recreational experiences in a recreational resource rich environment. The Absaroka Mountain Foothills area is a very popular destination for both local residents and out-of-region visitors due to the openness, and naturalness of the area. The area is abundant in a wide variety of wildlife including grizzly bears, major access into the Shoshone National Forest and the Washakie Wilderness, and dramatic scenery. However, despite the natural recreational resources, access is very challenging due to the scattered parcels of BLM-administered public land which invites user conflicts.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p>Objective Statement:</p> <p>Manage the Absaroka Foothills as an ERMA for non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing these Back Country and Middle Country settings. Recreation management will focus on addressing resource protection, minimizing use and user conflicts, and public health and safety.</p>
<p>MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS</p>
<p>Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.</p>
<p><u>Physical</u></p> <p>Remoteness: Middle Country. Implement a Travel Management Plan so as to maintain the back to middle country settings. Maintain Back Country settings within the South Owl Creek Canyon.</p> <p>Naturalness: Back Country. Manage for back country settings where natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Middle Country. Allow for primitive motorized routes and non-motorized trails to exist. Facilities and structures are rare and often accessible via unimproved routes. Horse and hiking trailheads will be constructed at major key access points. Maintain primitive setting within the South Owl Creek canyons where trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare.</p> <p><u>Social</u></p> <p>Contacts and Group size: Back Country. Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.</p> <p><u>Operational</u></p> <p>Mechanized Use: Back to Middle Country. Main access roads are crowned and ditched gravel roads accessed by 2-wheel and 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use. Trails for non-motorized use will be constructed so as to access public lands.</p>

Management Controls and Visitor Services:

Middle Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails.

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, easements, trailheads, and surface ownership.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Monitor visitor use, visitor safety, and resource conditions through; BLM staff, volunteers and recreation-tourism partnerships (e.g., towns, outfitters, recreation organizations, etc.).

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the ERMA.

Interpretive signs at trailheads and parking areas.

Develop recreational facilities so as to address resource protection, use and user conflicts, and public health and safety.

Administrative

Visual Resource Management:

Manage VRM consistent with other resource objectives.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Absaroka ERMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

For lands within the Absaroka Front Management Area, oil and gas leasing is subject to those management actions.

Outside of the Absaroka Front Management Area, allow surface-disturbing activities in the Absaroka ERMA such as geophysical exploration, salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat) on a case-by-case basis.

A CSU will be stipulated within the ERMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding private land owners, Shoshone National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups and stakeholders.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Pack goats are prohibited.

<p>Bighorn River SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The Bighorn River is a popular area known for river recreation such as boating/floating, fishing, hunting, and motor boating. The river contains scattered tracts of BLM-administered lands that provide for river access. From Greybull north to Bighorn Lake, there are three public access locations: Railroad, Greybull Bridge, and ML Dike Ramp. There may be opportunities in the future to provide additional access. The Bighorn River tracts are currently managed under the Bighorn River Habitat Management Plan and Recreation Area Management Plan (2/23/1989). The HMP/RAMP prescribes management for other resources such as wildlife, vegetation, fisheries, and invasive and noxious weed management.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Bighorn River SRMA for river recreation use for visitors to engage in sightseeing, hunting, photography, fishing, and floating so that they report realizing a “moderate” level of recreation experience and benefit outcomes in back, middle, and front country settings.</p> <p><u>Activities:</u> Sightseeing, hunting, photography, fishing, and floating.</p> <p><u>Experiences:</u> Enjoy going exploring on my/our own. Enjoy the closeness of family. Experiencing a greater sense of independence. Testing endurance. Enjoy risk taking adventure.</p> <p><u>Benefits:</u> Improved mental well-being. Closer relationship with the natural world. Enhanced sense of personal freedom. Improved physical fitness and health maintenance. Improved skills for outdoor enjoyment. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Increased local job opportunities. Increased local tourism revenue. Improved local economic stability.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Front Country. The tracts provide for main access points to the Bighorn River, which are on or near improved county roads, but at least 0.5 mile from any highway.</p> <p>Naturalness: Back Country. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area. Some tracts along the Bighorn River are Front or Middle Country due to adjacent land uses.</p> <p>Facilities and Structures: Front Country. Primitive and improved routes/trails may exist. Facilities and structures are scattered.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Most of the Bighorn River Tracts are usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on travel routes. Usually group size is small. Most of the time, social settings will reflect primitive definition. Visitor encounters can be high during peak use periods at the boat ramps. Encounters diminish the further downstream (north).</p> <p><u>Operational</u></p> <p>Mechanized Use: Front Country. Manage the majority of the river tracts for a Front Country setting where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Back Country. On site controls and services are present but subtle. Personnel periodic. Minimum amount necessary to achieve planning objectives.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<u>Information and Education</u>
<p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs. Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management.</p> <p>Provide stewardship information to help preserve the special landscape character.</p> <p>Provide for a map with designated roads, boat ramps, hazards, and BLM-administered public land tracts.</p> <p>Make available for special outdoor educational programs such as CORE and Take it Outside!</p> <p>Work closely with the gateway communities of Thermopolis, Worland, Basin, Lovell, and Greybull, and other partners in the region in marketing and outreach.</p>
<u>Monitoring</u>
<p>Vehicle counters with routine surveys and observation.</p> <p>Visitor reports of crowding.</p> <p>Informal visitor surveys and formal focus groups as funding allow.</p> <p>If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other</p>

river segments, institute fee areas, or limit river use.

Management

Continue to provide for a day use experience and associated facilities with an emphasis on maintaining a middle country recreation setting.

Continue to provide opportunities that contribute to meeting recreation demand while protecting resources.

Provide and maintain visitor facilities, services, signing, and programs.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Bighorn River SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat) on a case-by-case basis.

An NSO stipulation will be applied to the SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Communities of Thermopolis, Worland, Basin, Lovell, and Greybull, Wyoming Game and Fish, National Park Service, Friends of Bighorn Lake, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Bighorn River ERMA

ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.

The Bighorn River has been a very popular area known for river recreation such as boating/floating, diverse fishery, hunting, and even motor boating. The southern river segments (from Wedding of the Waters to Skelton Bridge) are managed as a blue-ribbon fishery with many Wyoming Game and Fish managed put-in and take-outs. The river contains BLM-administered islands, as well as other scattered tracts of land that provide for river access. Recently, the BLM acquired the Eggert tract which has enhanced user access to the river, as well as extend float trips from boaters putting-in upstream of the tract. The Bighorn River tracts are currently managed under the Bighorn River Habitat Management Plan and Recreation Area Management Plan (2/23/1989). The HMP/RAMP prescribes management from other resources such as wildlife, vegetation, fisheries, and invasive and noxious weed management. Most river access is via the Wyoming Game and Fish access points. Readily accessible BLM-administered public lands are located outside of the “blue-ribbon” section of the Bighorn River, and the tracts are scattered. Primary objectives for these tracts are to enhance wildlife habitat.

ERMA OBJECTIVE(S) DECISION

ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.

Objective Statement:

Manage access to the Bighorn River ERMA for river recreation use for visitors to engage in sightseeing, hunting, photography, fishing, and floating. Manage recreation use for enhanced recreational opportunities, as well as to manage for resource protection, and to minimize use and user conflicts, and public health and safety consistent with the HMP/RAMP.

MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS

Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.

Physical

Remoteness:

Front Country.

The tracts provide for main access points to the Bighorn River, which are on or near improved county roads, but at least 0.5 mile from any highway.

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area. Some tracts along the Bighorn River (Durkee Boat Ramp) are Front Country due to adjacent land uses.

Facilities and Structures:

Front Country.

Primitive and improved routes/trails may exist. Facilities and structures are scattered.

Social

Contacts and Group Size:

Back Country settings.

Most of the Bighorn River Tracts are usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on travel routes. Usually group size is small. Most of the time, social settings will reflect primitive definition.

Visitor encounters can be high during peak use periods at the boat ramps located in the southern sections of the Bighorn River (Wedding of the Waters to Skelton Bridge). Encounters diminish the further downstream (north).

Operational**Mechanized Use:**

Front Country.

Manage the majority of the river tracts for a Front Country setting where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Minimum amount necessary to achieve planning objectives.

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs. Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, boat ramps, hazards, and BLM-administered public land tracts.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Work closely with the gateway communities of Thermopolis, Worland, Basin, and Greybull, and other partners in the region in marketing and outreach.

Monitoring

Vehicle counters at access points with routine surveys and observation.

Solicit partnerships and cooperative agreements to: Monitor recreation setting condition through on-site patrols. Informal visitor surveys and formal focus groups as funding allow.

Visitor reports of crowding. If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other river segments, institute fee areas, or limit river use.

Management

Continue to provide for a day use experience and associated facilities with an emphasis on maintaining a middle country recreation setting.

Continue to provide opportunities that contribute to meeting recreation demand while protecting resources.

Provide and maintain visitor facilities, services, signing, and programs.

Administrative**Visual Resource Management:**

Manage visual resources consistent with adjacent resource prescriptions.

Comprehensive Trails and Travel Management:

Manage trails and travel management consistent with adjacent resource prescriptions.

Lands and Realty:

Lands within the Bighorn River ERMA are ROW avoidance areas. ROWs are collocated whenever possible.

The Bighorn River ERMA is an alternative energy avoidance area for realty actions (i.e., wind, solar, etc.).

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Bighorn River ERMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Apply an NSO restriction on lands within the Bighorn River ERMA.

Avoid surface-disturbing activities within the Bighorn River ERMA such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of

recreation facilities or wildlife habitat) on a case-by-case basis.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Communities of Thermopolis, Worland, Basin, and Greybull, Wyoming Game and Fish, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Tour de Badlands RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is contained within the Badlands SRMA, which is popular for motorized touring to explore the scenic desert basin. Natural recreational resources within the SRMA contain wildlife, open spaces, wild horses, and an erratic landscape which offers outstanding scenic quality.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Tour de Badlands RMZ for motorized recreationists to engage in motorized sightseeing touring, hunting, wildlife viewing, and nature viewing so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Middle Country and Front Country settings.</p> <p>Activities: Driving for pleasure, hunting, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Enjoy having easy access to natural landscapes. Enjoy having access to close-to-home outdoor amenities. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.</p> <p>Benefits: Improved mental well-being. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Positive contributions to local-regional economic stability. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Middle/Front Country. On or near 4-wheeled drive and improved roads. Maintain main access roads through the area for 2-wheel and 4-wheel drive access into the Badlands area.</p> <p>Naturalness: Middle Country. Natural setting may have moderately dominant alterations but would not draw the attention of the observers on trails and primitive roads within the area.</p>

Facilities and Structures:

Front Country.

Primitive and improved routes/trails may exist. Facilities and structures are scattered.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Front Country.

2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use. On site controls and services present but subtle.

Management Controls and Visitor Services:

Middle Country.

On site controls and services present but subtle. Signs present at key access points. Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, wildlife, and wild horses resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the wild horse program, and surrounding WSAs.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Maintain a strong sign program so as to keep the access routes within the RMZ well marked.

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop one or more scenic interpretive sites and driving loops for motorized and mechanized travel in the Tour de Badlands area within the Badlands SRMA to highlight the area's scenic values. These could involve the Fifteenmile Creek and Dorsey Creek roads and The Murphy Draw Road with overlooks at the Painted Canyon of Elk Creek and at Bobcat Draw.

Identify routes to close and reclaim, construct new routes, and identify routes to remain open.

Develop trailheads for ATV unloading stations.

Interpretive signs at trailheads and parking areas.

Additional sites may be identified throughout the life of the plan.

Signs present at key access points, but limited within the RMZ.

Administrative**Visual Resource Management:**

Manage VRM consistent with other resource management objectives.

Comprehensive Trails and Travel Management:

Limited to designated roads and trails.

Lands and Realty:

ROW exclusion area.

Alternative energy avoidance area for realty actions.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Tour de Badlands area.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Review mineral leases on a case-by-case basis and apply mitigation through activity level planning.

Allow surface-disturbing activities in the Tour de Badlands RMZ such as geophysical exploration (except casual use), saleable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat) on a case-by-case basis.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Private landowners, Wyoming Department of Transportation, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, IMBA, community ATV organizations, and other clubs/organizations.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Wild Badlands RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is within the Badlands SRMA. This RMZ is rich in natural recreational resources such as erratic and dramatic landscapes, management to maintain the primitive to semi-primitive setting characteristics, wilderness characteristics, three WSAs, wildlife, and wild horses which caters to primitive and semi-primitive recreational experiences.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Wild Badlands RMZ exclusively for non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country settings.</p> <p>Activities: Hiking, hunting, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Enjoy having easy access to natural landscapes.</p> <p>Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Closer relationship with the natural world. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p>Physical</p> <p>Remoteness: Back Country. Maintain road closures to maintain back country settings.</p> <p>Naturalness: Back Country. Manage the natural setting so that they may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Primitive. Trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare and</p>

developed only in occasions where necessary to protect the back country settings.

Social

Contacts and Group Size:

Back Country.

Manage for a season average of fewer than 6 encounters/day on and off travel routes.

Operational

Mechanized Use:

Primitive.

Non-motorized and non-mechanized (foot and horseback) travel only.

Management Controls and Visitor Services:

Back Country.

On site controls and services present at key access points, but subtle.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Minimum amount of BLM facilitating outputs necessary to achieve planning objectives.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop educational signs at trailheads and parking areas on user ethics, geology, and wilderness.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with WSAs, access points, information regarding the wilderness program, and outdoor ethics messages such as Leave No Trace!

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with surveys and observation along perimeter of WSAs.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Identify routes to close and reclaim. Modify identified routes into non-motorized and non-mechanized trails.

Develop primitive trailheads at key access points.

Install kiosks and signs at trailheads and parking areas.

Signs present at key access points, but very limited within the RMZ.

Administrative

Visual Resource Management:

Class I.

Comprehensive Trails and Travel Management:

Closed to motorized and non-mechanized travel.

Lands and Realty:

ROW avoidance area.

Alternative energy exclusion area for realty actions.

Minerals, Oil and Gas Leasing, and Other Surface-Disturbing Activities:

Mineral uses, Oil and Gas and Geothermal leasing, exploration, and development will be guided by the Interim

Management Policy for Lands under Wilderness Review (IMP).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Including, but not limited to: Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Sierra Club, Wyoming Wilderness Association.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Badlands SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Tatman Mountain RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This RMZ is within the Badlands SRMA. Much like the Wild Badlands RMZ, this RMZ is rich in natural recreational resources such as erratic and dramatic landscapes, dominant mountainous environment, and current management to maintain the primitive to semi-primitive setting characteristics, wildlife, and wild horses which caters to primitive and semi-primitive recreational experiences. The RMZ is located to the west of Sheep Mountain WSA and provides for exceptional wildlife resource opportunities, access, motorized and primitive forms of touring, and high scenic quality.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p>Objective Statement: Manage the Tatman Mountain RMZ for non-motorized recreationists to engage in muscle-powered activities such as hiking, hunting, mountain biking, and horseback riding so that affected community residents report realizing a “moderate” level of recreation experience and benefit outcomes in these Back country to Middle country settings.</p> <p>Activities: Hiking, hunting, mountain biking, wildlife viewing, nature viewing, sightseeing.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Feeling good about solitude, being isolated, and independent. Enjoy having easy access to natural landscapes.</p> <p>Benefits: Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Closer relationship with the natural world. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Middle Country. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p> <p>Naturalness: Back Country. Manage the natural setting so that they may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p>

Facilities and Structures:

Back Country.

Trails may exist but do not exceed standard to carry expected use.

Facilities and structures are extremely rare and developed only in occasions where necessary to protect the back country settings.

Social

Contacts and Group Size:

Back Country.

Manage for a season average of fewer than 6 encounters/day on and off travel routes. In issuing SRPs, allow for a group size less than 5 participants.

Operational

Mechanized Use:

Middle/Back Country.

Middle country for the access routes acting as main portals into the RMZ. Manage for back country settings (non-motorized travel) outside of those corridors.

Management Controls and Visitor Services:

Middle Country.

On site controls and services present at key access points, but subtle.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM monitoring presence during hunting season.

Minimum amount of BLM facilitating outputs necessary to achieve planning objectives.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop educational signs at trailheads and parking areas on user ethics, geology, wild horses, and wilderness characteristics.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated routes and trails, key access points, private lands, and outdoor ethics messages such as Tread Lightly and Leave No Trace!

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Identify routes to maintain as open to motorized use. Reclaim routes identified as closed. Maintain open routes so as to sustain motorized use. Modify identified closed routes into non-motorized and mechanized trails for muscle-powered recreational activities.

Develop primitive trailheads at key access points.

Install kiosks and signs at trailheads and parking areas.

Signs present at key access points, but very limited within the RMZ.

Administrative**Visual Resource Management:**

Manage VRM consistent with other resource management objectives.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Acquire legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Tatman Mountain RMZ.

Minerals, Oil and Gas Leasing, and Other Surface-Disturbing Activities:

A CSU is stipulated within this zone.

Allow surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat) on a case-by-case basis.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Including, but not limited to: Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Back Country Horsemen, Sierra Club, Wyoming Wilderness Association.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

West Slope of the Bighorns SRMA – Worland Field Office

SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.

Canyons RMZ

SUPPORTING INFORMATION

Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.

This RMZ is contained within the West Slope of the Bighorns SRMA. The Canyon RMZ attracts visitors from both the surrounding communities to outside the region. The Medicine Lodge State Park attracts many visitors who enjoy exploring the slope of the Bighorns. Such resources include the Medicine Lodge and Dry Medicine Lodge canyons, Paint Rock Canyon, Trapper Creek and White Creek canyons, Spanish Point ACEC, Red Gulch Dinosaur Tracksite and the Red Gulch Dinosaur Tracksite ACEC, the Hyattville Logging Road, the Red Gulch/Alkali Road Backcountry Byway, prominent wildlife habitat management areas, abundant wildlife and fishing, significant cave and karst resources, highly rated scenic quality and access into the Bighorn National Forest. These resources provide for excellent primitive non-motorized recreation to motorized (touring) recreation.

SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS

SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.

Objective Statement:

Manage the Canyons RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, wildlife viewing, hunting, fishing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes listed below in these Back Country and Middle Country settings.

Activities:

Hunting, wildlife viewing, fishing, nature viewing, hiking, photography, sightseeing, spelunking.

Experiences:

Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.

Developing skills and abilities.

Enjoy going exploring on my/our own.

Enjoy having easy access to natural landscapes.

Enjoying the closeness of family.

Benefits:

Improved mental well-being and physical fitness and health maintenance.

Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance.

Increased appreciation of area’s cultural history.

Heightened sense of satisfaction with our area as a place to live.

Greater family bonding.

Positive contributions to local-regional economic stability.

Maintenance of community’s distinctive recreation/tourism market niche or character.

Increased desirability as a place to live or retire.

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS

Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.

Physical

Remoteness:

Back to Middle Country.

On land surrounding the Red Gulch/Alkali Road Back Country Byway, Cold Springs Road, Hyattville Logging Road, and the Black Butte road, maintain middle country settings on or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight. Maintain back country settings within the WSAs and canyons.

Naturalness:

Middle/Back Country.

Natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area and primitive motorized routes and non-motorized trails may exist. Maintain primitive naturalness settings for the WSAs and canyons where lands are essentially an unmodified natural environment. Evidence of humans is unnoticed by an observer wandering through the area.

Facilities and Structures:

Primitive/Back Country.

Facilities and structures are rare and often accessible via unimproved routes. Maintain primitive settings in the WSAs where trails may exist but do not exceed standard to carry expected use. Facilities and structures are extremely rare.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes for the majority of the zone. Usually group size is small. Areas such as Dry Medicine Lodge Canyon, Cold Springs Road, Hyattville Logging Road, and Paint Rock Canyon is middle country where 7-14 encounters/day off travel routes, and 15-29 encounters/day en route. Usually group size is small to moderate.

Operational

Mechanized Use:

Middle/Back Country.

Maintain Middle country settings along the Cold Springs Road, Black Butte Road, Hyattville Logging Road, and the Red Gulch/Alkali Road Back Country Byway where 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use are acceptable. Maintain Back Country settings within the Spanish Point ACEC where mountain bikes perhaps other mechanized use is allowed, but all travel is non-motorized.

Management Controls and Visitor Services:

Middle/Front Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails outside the Spanish Point ACEC. Motorized use within the ACEC is strictly prohibited.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Utilize adaptive management techniques to provide identified recreation opportunities (activities, experiences, and benefits) and reach desired future setting conditions.

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Red Gulch/Alkali Road Back Country Byway, Medicine Lodge Wildlife Habitat Area; Trapper Creek, Medicine Lodge, and Alkali Creek WSAs,

the Madison Recharge zone, and caving ethics.

Maintain the Red Gulch Dinosaur Tracksite.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Solicit partnerships and cooperative agreements to: Monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies), Monitor recreation setting condition through on-site patrols throughout the year.

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailheads and parking areas.

Develop new and maintain trailheads for foot and horse travel. Potential locations will include the Webber Canyon area, White Creek, Black Mountain area, Wapiti Ridge Trail, Lone Tree Trail and trailhead, Black Butte, and along the Red Gulch/Alkali Road Back Country Byway. Additional sites may be identified throughout the life of the plan.

Upgrade access route to the Lone Tree trailhead and upgrade the Lone Tree Trail.

Develop hiking trails in the Wet and Dry Medicine Lodge Canyons.

Construct Trailheads to accommodate mountain bike users.

Construct Pull-offs along the Red Gulch/Alkali Road.

Back Country Byway.

Maintain the OHV route between the Medicine Lodge State Park and Cold Springs Road.

Designate motorized touring loops connecting with the Bighorn National Forest, the Canyons RMZ, and the Brokenback/Logging Road RMZ, which may include new construction.

Develop campgrounds if needed.

Work with local spelunking community and adjacent land management agencies to maintain cave and karst areas.

Administrative

Visual Resource Management:

Class I within the Medicine Lodge, Trapper Creek, and Alkali Creek WSAs. Class II and III for the remainder of RMZ.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails. Off road use within the WSAs is strictly prohibited.

Over-snow travel off of designated routes and ways is strictly prohibited.

All motorized travel is prohibited within the Spanish Point ACEC.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Consider the acquisition of legal and/or physical access for hunting, fishing, and camping. Consider acquiring areas such as Horse Mountain, Trapper Creek, and White Creek.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Canyons RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply CSU restriction for this zone.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Maintain cooperative agreement with Wyoming State Land Board, and Wyoming State Game and Fish.

Seek other agreements and partnerships as appropriate.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Medicine Lodge State Park, IMBA, surrounding private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

West Slope of the Bighorns SRMA
SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.
Brokenback/Logging Road RMZ
SUPPORTING INFORMATION
Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.
This area exhibits exceptional scenic quality, wildlife resources, and exposed geologic formations. The Hyattville Logging Road is within this area and is proposed to be a backcountry byway for Alternative B. The Logging Road is a popular access point into the Bighorn Mountains. Two other routes, the North and South Brokenback Roads act as very popular access points into the RMZ, as well as the Bighorn National Forest, during the big game hunting seasons. Access into this area is in part due to a coordinated agreement between the Wyoming Game and Fish and surrounding private land holders, as well as a foot/horse trail developed by the BLM so as to access more of this area. This area is a very popular hunting area for both local and visiting hunters.
SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS
SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.
<p><u>Objective Statement:</u> Manage the Brokenback/Logging Road RMZ as a zone within the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hiking, hunting, wildlife viewing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country and Middle Country settings.</p> <p><u>Activities:</u> Hunting, hiking, wildlife viewing, nature viewing, driving for pleasure.</p> <p><u>Experiences:</u> Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoying the closeness of family.</p> <p><u>Benefits:</u> Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Stronger ties with my family and friends. Greater awareness that the Bighorn Basin is special. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p><u>Remoteness:</u> Middle Country Settings.</p>

On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.

Front Country settings along the Hyattville Logging Road.

On or near improved country roads, but at least 0.5 mile from any highway.

Naturalness:

Back Country Settings.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Front/Middle Country.

Front Country settings for lands along the South and North Brokenback Roads, and along the Hyattville Logging Road.

Primitive and improved routes/trails may exist. Facilities and structures are back country settings where they are rare and isolated.

Remainder of RMZ is Middle Country.

Primitive motorized and non-motorized trails may exist.

Social

Contacts and Group Size:

Back Country.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Back Country.

On site controls and services present but subtle. Minimum amount necessary to achieve planning objectives.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Hyattville/Logging Road Back Country Byway, Carter Access area, and Wyoming Game and Fish Wildlife Habitat Management Areas.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop facilities to enhance recreation and visitor services for the following areas:

- Trailheads for North and South Brokenback areas, Laddie Creek, and the Hyatteville Logging Road.
- Pull-outs along the Hyatteville Logging Road.
- Improve Salt Lick trail and trailhead.
- Construct additional trailheads and trails on a case-by-case basis or as the needs arise.

Designate motorized touring loops within the Brokenback/Logging road RMZ as well as connecting with the Canyons RMZ and the Bighorn National Forest, which may include new construction.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Continue to implement current South Broken Back Travel Management Plan.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Consider the acquisition of legal and/or physical access for hunting, fishing, and camping for areas including but not limited to North and South Brokenback roads, Luman Creek Road, Military Creek Road, Dorn Draw Road.

Lengthen public access duration for the North and South Brokenback roads to yearlong access under terms of the related Travel Management Plan.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Brokenback/Logging Road RMZ.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply a CSU for this zone.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue additional access agreement in the South Brokenback, and North Brokenback areas.

Maintain current easement agreement with local land owners in this zone.

Seek other agreements and partnerships as appropriate.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>West Slope SRMA – Cody Field Office</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The west slope of the Bighorn mountains attracts visitors from the surrounding communities and from outside the region due to the spectacular scenery, abundant wildlife, and exposed geologic formations. Nearby attractions which also draw visitors to the area include the Bighorn Canyon National Recreation Area, and the Medicine Wheel on the Bighorn National Forest. Also, some visitors traveling to or from Yellowstone National Park spend time in the area. The SRMA includes the Little Mountain, Five Springs, and Brown/Howe Dinosaur ACECs, several creeks found eligible for possible inclusion into the Wild and Scenic River system, and significant cave and karst resources. The Five Springs Falls Campground and the Cottonwood Creek Trailhead are BLM-managed sites within the SRMA. The west slope of the Bighorns provides important wildlife habitat and access into the Bighorn National Forest. These resources provide for excellent semi-primitive non-motorized recreation to motorized (touring) recreation.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the West Slope of the Bighorns SRMA for motorized and non-motorized recreationists to engage in hunting, hiking, horseback riding, wildlife viewing, sightseeing, fishing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back, Middle, and Front Country settings.</p> <p>Activities: Hunting, wildlife viewing, hiking, photography, sightseeing, driving for pleasure.</p> <p>Experiences: Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Developing skills and abilities. Enjoy going exploring on my/our own. Enjoying the closeness of family.</p> <p>Benefits: Improved mental well-being and physical fitness and health maintenance. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Heightened sense of satisfaction with our area as a place to live. Positive contributions to local-regional economic stability. Maintenance of community’s distinctive recreation/tourism market niche or character. Increased desirability as a place to live or retire.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p> <p><u>Physical</u> Remoteness: Middle Country. Maintain Middle Country settings on much of the SRMA where lands are on or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.</p>

Back Country.

Maintain back country settings where lands are more than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight.

Naturalness:

Back/Middle Country.

Natural setting may have subtle to moderately dominant modifications that would be noticed but not draw the attention of the casual observer wandering through the area and primitive motorized routes and non-motorized trails may exist.

Facilities and Structures:

Middle Country.

Facilities and structures are rare and often accessible via unimproved routes.

Social

Contacts and Group Size:

Back Country.

Usually 3-6 encounters/day off travel routes and campsites, and 7-15 encounters/day on travel routes. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

Maintain Middle Country settings where 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use are acceptable.

Management Controls and Visitor Services:

Middle Country.

Signs present at key access points.

Patrolled periodically by law enforcement officer, and other BLM employees. Spike in BLM presence during hunting season.

Some use restrictions, limit motorized travel to designated roads and trails.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, geology, and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, and camp sites.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Signs present to identify roads and provide directions.

Interpretive signs at trailheads, campgrounds, and parking areas.

Develop a recreation site at Rainbow Canyon.

Additional recreational developments may be done throughout the life of the plan, if warranted.

Administrative

Visual Resource Management:

Class II and III for the SRMA.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

Open to ROWs.

Open to renewable energy development.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration (including casual use), salable minerals exploration and development, and construction activities (including those related to development of recreation facilities or wildlife habitat).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, National Park Service, Wyoming Game and Fish, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>South Bighorns ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>The southern Bighorns are popular for visitors to explore, hike, and especially hunt. Outfitters and tour guides enjoy guiding clients here due to the impressive and exceptional scenic qualities, abundant wildlife, and alternative access points onto 33-Mile Road (Hazelton Road) which exhibits exceptional viewing opportunities of the surrounding mountain landscape, the Cloud Peak Wilderness, the Bighorn Basin, and the Powder River Basin to the east; as well as access into the Hole-in-the-Wall region, the Middle Fork of the Powder River, Casper, and the Bighorn National Forest. The South Bighorns contain a rich history including cattle and sheep operations, mining, and infamous outlaws including Billy the Kid. Currently, an impressive coordinated travel management effort improving access into the area as well as improving resource management exists between the BLM, Wyoming State Game and Fish, Wyoming State Land Board, and the Orchard Ranch. A coordinated resource effort once existed between the BLM, Wyoming State Land Board, and the Wyoming Game and Fish Department, which accomplished recreation, wildlife, and weed management goals. The impressive Deep Creek is a waterway segment identified as eligible and draft suitable for inclusion into the Wild and Scenic Rivers System, as well as a sought-after fishery for exceptional fishing and sightseeing opportunities. Due to the amount of and the spatial location of private lands within the Southern Bighorns, the most appropriate recreation management strategy of the area would be under a separate ERMA.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p>Objective Statement:</p> <p>Manage the South Bighorns as an ERMA for motorized and non-motorized recreationists to engage in hiking, wildlife viewing, nature viewing, hunting, fishing, and driving for pleasure in these Back Country and Middle Country settings.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p><u>Physical</u></p> <p>Remoteness: Middle Country Settings. On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight. Front Country settings along Rome Hill Road, Dry Farm Road, and Hazelton Road. On or near improved country roads, but at least 0.5 mile from any highway.</p> <p>Naturalness: Back Country Settings. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Middle Country. Primitive motorized and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small. Rural settings along Upper Nowood Road where people seem to be everywhere, but human contact remains intermittent.</p>

Operational

Mechanized Use:

Front/Middle Country.

Front Country along Cherry Creek Road, Dry Farm Road, Spring Creek Road, Rome Hill Road, and Hazelton Road.

2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.

Middle Country for remainder of ERMA.

4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Some onsite visitor orientation (kiosk and trail markers) will be developed, which may include interpretive signs at trailheads and parking areas on history, user ethics, wildlife resources, etc.

Provide stewardship information to help preserve the special landscape character. Work with partners to provide additional interpretation of the historic events and buildings, ranches, and other remnants.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Hazelton Road Back Country Byway, and the Upper Nowood Travel Management Plan.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys, on-site patrols, and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Develop facilities necessary to maximize recreational opportunities at areas such as, but not limited to the Cherry Creek stock driveway crossing of Deep Creek, Otter Creek, and Split Rock.

Develop trailheads for Mahogany Butte, Deep Creek, Upper Nowood areas, and in other areas on a case-by-case basis so as to sustain recreational opportunities, as well as to address use and user conflicts, public health and safety, and to address resource protection.

Administrative

Visual Resource Management:

Manage VRM consistent with other resource management objectives.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Continue to implement Upper Nowood Travel Management Plan.

Lands and Realty:

ROW avoidance area.

Open to alternative energy development. Co-locate renewable energy ROW authorizations whenever possible.

Consider the acquisition of legal and/or physical access for hunting, fishing, boating, and camping. Areas to be considered for acquisition include Otter Creek, Deep Creek, Little Canyon Creek, public land tracts along the Nowood River area, Cherry Creek Road to Hazelton Road, Lysite Mountain, land parcels within Spring Creek, and Spring Creek Road to Rome

Hill Road.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the South Bighorns ERMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities.

Review mineral leases on a case-by-case basis and apply mitigation through activity level planning.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue/revitalize cooperative agreement with Double-H Ranch, Wyoming State Land Board, and Wyoming Game and Fish.

Maintain cooperative agreement with Orchard Ranch, Wyoming State Land Board, and Wyoming Game and Fish.

Seek other agreements and partnerships as appropriate.

Partners:

Including, but not limited to the Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Orchard Ranch, Double-H Ranch, Back Country Horsemen, Rocky Mountain Elk Foundation, Ten Sleep, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Middle Fork of the Powder River SRMA

SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.

SUPPORTING INFORMATION

Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.

BLM manages a campground along the Middle Fork of the Powder River which is a destination area for visitors from within and outside the region. The Middle Fork of the Powder River is managed as a blue ribbon trout fishery, as well as identified as eligible and draft suitable for inclusion into the Wild and Scenic River System. The Buffalo Field Office had also identified the Middle Fork of the Powder River within their jurisdiction as eligible for inclusion into the Wild and Scenic River System. This area has received significant managerial support from both the Worland and Buffalo Field Offices in coordination with the Wyoming State Game and Fish in improving access into the area to support a variety of recreational activities, dominantly hunting and fishing.

SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS

SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.

Objective Statement:

Manage the Middle Fork of the Powder River as an SRMA with a destination strategy for motorized and non-motorized recreationists to engage in fishing, hunting, hiking, wildlife viewing, nature viewing, and driving for pleasure so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country and Middle Country settings.

Activities:

Fishing, hunting, hiking, camping, photography, nature viewing, general dispersed recreation, Driving for pleasure, snowmobiling, snowshoeing.

Experiences:

- Enjoy going exploring on my/our own.
- Enjoy having easy access to natural landscapes.
- Savoring the total sensory – sight, sound, and smell – experience of a natural landscape.
- Enjoying the closeness of family.
- Feeling good about solitude, being isolated, and independent.

Benefits:

- Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance.
- Stronger ties with my family and friends.
- Greater awareness that the Bighorn Basin is special.
- Greater spiritual growth.
- Heightened sense of satisfaction with our area as a place to live.
- Lifestyle improvement or maintenance.
- Greater family bonding.
- More well-rounded childhood development.
- Increased desirability as a place to live or retire.

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS

Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.

Physical

Remoteness:

Middle Country Settings.

On or near 4-wheel drive roads, but at least 0.5 mile from all improved roads, though they may be in sight.

Front Country settings along Hazelton Road and the Middle Fork of the Powder River Campground.

Naturalness:

Back Country Settings.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Middle Country Settings for lands within the Middle Fork of the Powder River Campground.

Natural setting may have moderately dominant alterations but would not draw the attention of the observers on trail and primitive roads within the area.

Facilities and Structures:

Middle Country.

Primitive motorized and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.

Manage the Middle Fork of the Powder River Campground as Front Country.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.

Middle country settings along Hazelton Road and Middle Fork of the Powder River Campground. Usually 7-14 encounters/day off travel routes (e.g., staging areas and campgrounds), and 15-29 encounters/day en route. Usually group size is small to moderate.

Operational

Mechanized Use:

Front Country along Hazelton Road.

2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.

Middle Country for remainder of SRMA.

4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Some onsite visitor orientation (kiosk and trail markers) will be developed. This may include orientation methods such as interpretive signs at trailheads and Middle Fork of the Powder River Campground on history, user ethics, and fish and wildlife resources.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads and trails, trailheads, camp sites, and information regarding the Hazelton Road

Back Country Byway.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys, on-site patrols, and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails or other campgrounds, reevaluating fee structure, etc.

Management

Maintain and improve the Middle Fork of the Powder River campground and associated so as to maximize identified beneficial outcomes.

Develop additional trailheads, campgrounds, or other recreational facilities on a case-by-case basis so as to meet identified beneficial outcomes, recreational setting character conditions, and resource maintenance.

Develop trailhead at the Middle Fork Campground, and in other areas on a case-by-case basis.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Consider the acquisition of legal and/or physical access for recreation related opportunities. Areas to be considered for acquisition include public land tracts along the Cherry Creek Road to Hazelton Road, and along Hazelton Road.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Middle Fork Powder River SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Apply a CSU stipulation for the Middle Fork Powder River SRMA.

Avoid surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue MOUs with surrounding land owners, Wyoming State Land Board, Wyoming Game and Fish, and the Buffalo and

Casper BLM Field Offices.

Seek other agreements and partnerships as appropriate.

Partners:

Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, Buffalo and Casper BLM Field Offices, private land owners, Back Country Horsemen, Rocky Mountain Elk Foundation, and other sports groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>Canyon Creek SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>Canyon Creek area is located within the southern Bighorns just south of Highway 16, which is a very popular highway over the Bighorn Mountains as well as a popular route to Yellowstone National Park. Canyon Creek exhibits exceptionally high scenic qualities from the exposed dolomite and Ten Sleep formation observed through the impressive canyon complemented by the perennial Canyon Creek which supports a blue-ribbon fishery and a healthy riparian zone through the canyon. A subdivision (Canyon Creek Village) is growing south of the area in which residents enjoy exploring, hiking, hunting, and fishing Canyon Creek. Canyon Valley Resort is located within the area which provides recreational opportunities such as guiding services for visitors, big game outfitting, and golfing opportunities. The scenic qualities as well as the wildlife resources establish the foundation for the tourism market in this area. Smilo Road (BLM Road 1416) provides access into BLM-administered public lands east of Canyon Creek as well as the Bighorn National Forest.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the Canyon Creek SRMA for non-motorized recreationists to engage in hiking, hunting, fishing, nature viewing, and wildlife viewing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these Back Country settings.</p> <p><u>Activities:</u> Fishing, hunting, hiking, nature viewing, wildlife viewing.</p> <p><u>Experiences:</u> Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Develop skills and abilities. Enjoy going exploring on my/our own. Enjoy having easy access to natural landscapes. Enjoying getting some needed physical exercise.</p> <p><u>Benefits:</u> Improved mental well-being. Improved physical fitness and health maintenance. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Greater family bonding. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p>
<p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p> <p><u>Physical</u></p> <p><u>Remoteness:</u> Back Country. More than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight. Smilo Road, the access route to</p>

the Canyon Creek fishing access parking area, and few other two-tracks are observed along the edges of the area.

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Trails may exist but do not exceed standard to carry expected use. Facilities and structures are rare and isolated.

Social

Contacts and Group Size:

Back Country settings.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.

Operational

Mechanized Use:

Back Country.

Mountain bikes perhaps other mechanize use but all is non-motorized. Smilo Road will remain open to motorized access into area.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on history, user ethics, non-native invasive weed species found within the area, geology, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails, and camp sites.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Solicit partnerships and cooperative agreements to: Monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies), Monitor recreation setting condition through on-site patrols.

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

Management

Utilize adaptive management techniques to provide identified recreation opportunities (activities, experiences, and benefits) and reach desired future setting conditions.

Develop looping hiking trails in Canyon Creek, and off of Smilo Road.

Develop trailheads at Canyon Creek and Smilo Road.

Some onsite visitor orientation (kiosk and trail markers) will be developed.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Acquire legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Canyon Creek SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply a CSU stipulation.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Agreements:

Pursue a cooperative agreement with the Canyon Creek Estates.

Seek other agreements and partnerships as appropriate.

Partners:

Big Horn National Forest, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Canyon Creek Estates, community of Ten Sleep, Back Country Horsemen, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>Red Canyon Creek ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>Red Canyon Creek is located along the slopes of the Owl Creek Mountains outside the community of Thermopolis. This area exhibits high scenic qualities, wildlife resources, and opportunities for primitive-type recreation. A subdivision is growing on the north side of the area, which the adjacent BLM-administered public lands provides for easy-to-access public lands for the local residents. The community of Thermopolis has been marketing its natural recreational resources (most especially its thermal resources located within the very popular Hot Springs State Park), as well as prioritizing primitive-type recreational opportunities such as hiking, and horseback riding within the State Park. Other uses exist within and around the area such as livestock grazing, and mineral development. Legal public access into the area is questionable, and there are private surface land parcels within the area.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p>Objective Statement:</p> <p>Manage the Red Canyon Creek ERMA to maintain a back country setting, to address public health and safety, use and user conflicts, and resource protection. In addition, recreation management within the ERMA will manage for motorized and non-motorized recreationists to engage in hiking, hunting, wildlife viewing, and nature viewing.</p>
<p>MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS</p>
<p>Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.</p>
<p><u>Physical</u></p> <p>Remoteness: Back Country. Most of the SRMA is more than 0.5 mile from any road, but not as distant as 3 miles, and no road is in sight. Access routes (two-tracks and improved route) exist along the fringe of the SRMA, as well as within parcels of private lands within the area.</p> <p>Naturalness: Back Country. Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Back Country. Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country. Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small.</p> <p><u>Operational</u></p> <p>Mechanized Use: Back Country. Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized. The fringes will be managed for 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use so as to maintain current land uses.</p>

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop visitor orientation signs at trailheads and parking areas on user ethics, designated motorized routes, trails, non-native invasive weed species found within the area, geology, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and on-site patrols.

Monitor for resource degradation, user conflicts, health and safety, and prescribed settings.

Management

Develop hiking trail to Red Canyon Creek.

Develop trailheads at northern access point.

Signs present at key access points, but limited within the ERMA.

Interpretive signs and visitor orientation materials at trailheads and parking areas.

Engage local community, businesses, and other partners in the development and distribution of a brochure and/or area guide book.

Administrative

Visual Resource Management:

Manage VRM consistent with other resource management objectives.

Comprehensive Trails and Travel Management:

All motorized use (including over-snow travel) is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Red Canyon Creek ERMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

On a case-by-case basis, allow surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Review mineral leases on a case-by-case basis, open Red Canyon Creek area to appropriations under the mining laws, and authorize mineral material sales and/or free use permits; apply mitigation through activity level planning.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Community of Thermopolis, Hot Springs State Park, Wyoming State Land Board, Wyoming State Trails Program, Wyoming Game and Fish, private land owners, Back Country Horsemen, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

The Rivers SRMA

SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.

SUPPORTING INFORMATION

Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.

The Rivers destination SRMA is made up of BLM-managed public lands on the North and South Forks of the Shoshone River, the main stem of the Shoshone River, and the Clarks Fork of the Yellowstone River. These rivers are very popular for fishing, floating, sightseeing, and hunting and are used by local residents as well as visitors from throughout the nation and from foreign countries. Many visitors traveling to or from Yellowstone National Park spend time in Cody. Several companies offer commercial fishing or floating trips on these rivers. BLM and the WGFD have an agreement which recognizes the high recreational value of various tracts of land along these rivers and provides for cooperative efforts to develop access and manage the sites. Many sites have been developed over the years. Several of the river access sites also serve as trailheads for hiking and horseback access to the Shoshone National Forest. In addition, there are access sites which have been developed by other parties. The North Fork of the Shoshone River and portions of the Shoshone River are considered blue-ribbon trout fisheries.

SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS

SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.

Objective Statement:

Manage the Rivers SRMA for motorized and non-motorized recreation opportunities such as fishing, floating, photography, hunting, hiking, and nature viewing so that recreationists report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, and middle country settings.

Activities:

Fishing, floating, sightseeing, hunting, photography, and nature viewing.

Experiences:

- Enjoy going exploring on my/our own.
- Enjoy the closeness of family.
- Experiencing a greater sense of independence.
- Testing endurance.
- Enjoy risk taking adventure.

Benefits:

- Improved mental well-being.
- Closer relationship with the natural world.
- Enhanced sense of personal freedom.
- Improved physical fitness and health maintenance.
- Improved skills for outdoor enjoyment.
- Heightened sense of satisfaction with our area as a place to live.
- Greater community involvement in recreation and other land use decisions.
- Greater family bonding.
- Increased desirability as a place to live or retire.
- Increased local job opportunities.
- Increased local tourism revenue.
- Improved local economic stability.

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Rural Country. On or near primary highways, but still within a rural area. Front Country. On or near improved county roads, but at least 0.5 mile from any highway. Middle Country. On or near 4-wheel drive roads, but at least ½ mile from all improved roads, though they may be in sight.</p> <p>Naturalness: Rural, Front, and Middle Country. Natural setting is culturally modified to the point that it is dominant to the sensitive travel route observer in some locations. In other locations, natural setting may have moderately dominant alterations but would not draw the attention of the observers on trails and primitive roads within the area.</p> <p>Facilities and Structures: Rural and Front Country. Primitive and improved routes/trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Front Country setting. Usually up to 29 encounters/day off travel routes and 30 or more encounters/day en route. Group size varies from small to large. Visitor encounters can be high during peak use periods at the major boat ramps.</p> <p><u>Operational</u></p> <p>Mechanized Use: Front Country. Manage the majority of the river tracts for a Front Country setting where 2-wheel drive vehicles predominant, but also 4-wheel drive vehicles and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Front Country. On site controls and services are present but harmonize with the natural environment. Personnel periodic.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<u>Information and Education</u>
<p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs. Use information and interpretation to lessen visitor conflicts, resource impacts, and to increase visitor awareness of wildlife habitat and wetland management.</p> <p>Provide stewardship information to help preserve the special landscape character.</p> <p>Provide for a map with designated roads, boat ramps, hazards, and BLM-administered public land tracts.</p> <p>Make available for special outdoor educational programs such as CORE and Take it Outside!</p> <p>Work closely with the gateway communities of Cody, Powell, Thermopolis, Worland, Basin, Lovell, and Greybull, and other partners in the region in marketing and outreach.</p>

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other river segments, institute fee areas, or limit river use.

Management

Continue to provide for experiences and associated facilities with an emphasis on maintaining rural to front country recreation settings.

Continue to provide opportunities that contribute to meeting recreation demand while protecting resources.

In cooperation with WGFD and other partners, provide and maintain visitor facilities, services, signing, and programs.

Administrative

Visual Resource Management:

Class II and Class III.

Comprehensive Trails and Travel Management:

Motorized use is limited to designated roads and trails for the North and South Forks of the Shoshone River and the Clarks Fork of the Yellowstone River and is limited to existing roads and trails for the Shoshone River area.

Lands and Realty:

Manage lands within one mile of the Shoshone and Clarks Fork of the Yellowstone Rivers as avoidance areas for construction of above ground power lines except in designated utility corridors.

Alternative energy avoidance area for realty actions.

Retain recreational access to the North and South Forks of the Shoshone, the Shoshone, and the Clarks Fork of the Yellowstone Rivers plus increase emphasis on float access and facilities where appropriate.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat) within campgrounds, trailheads, day use areas, river access sites, and similar recreational sites and trails within The Rivers SRMA.

Apply an NSO restriction on areas within ¼ mile of campgrounds, trailheads, day use areas, river access sites, and similar recreational sites within The Rivers SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Communities of Cody, Powell, Lovell, Wyoming Game and Fish, Trout Unlimited, Shoshone Back Country Horsemen, Shoshone National Forest, Park County Recreation Board, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

On site controls and services are present but harmonize with the natural environment.

<p>McCullough Peaks SRMA</p>
<p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p>
<p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>The McCullough Peaks SRMA lies east of Cody and north of U.S. Highway 14/16/20. This scenic, popular area is used by residents of Cody, Powell, Park and Big Horn Counties for uses such as viewing wild horses, sightseeing, hunting, horseback riding, mountain biking, hiking, photography, driving for pleasure (including ATVs and motorcycles), and wildlife viewing. Colorful badlands provide excellent photographic opportunities. Tourists traveling to or from Yellowstone National Park also use the area. Several commercial permittees provide wild horse viewing tours or interpretive tours in the area. The McCullough Peaks WSA lies within the SRMA as does the McCullough Peaks Wild Horse Herd Management Area (HMA).</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p>
<p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p><u>Objective Statement:</u> Manage the McCullough Peaks SRMA for motorized and non-motorized recreation opportunities such as wildlife and wild horse viewing, nature viewing, horseback riding, hunting, and hiking so that recreationists report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, middle and back country settings.</p>
<p><u>Activities:</u> Viewing wild horses and wildlife, sightseeing, hunting, mountain biking, hiking, photography, driving for pleasure, horseback riding.</p>
<p><u>Experiences:</u> Enjoy going exploring on my/our own. Learn. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoy the closeness of family. Learning more about things here. Enjoy having easy access to natural landscapes.</p>
<p><u>Benefits:</u> Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>

RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS
Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.
<p><u>Physical</u></p> <p>Remoteness: Rural, Front, Middle, and Back Country. The eastern and southern boundaries lie along major highways. There are several BLM roads and numerous two-tracks and ATV trails in the SRMA area.</p> <p>Naturalness: Front and Middle Country. Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within the area but not draw the attention of observers on trails and primitive routes. Back Country. Natural setting may have subtle modifications that would be noticed but not draw the attention of the casual observer wandering through the area.</p> <p>Facilities and Structures: Rural and Front Country. Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters. Middle Country. Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.</p> <p><u>Social</u></p> <p>Contacts and Group Size: Back Country settings. Usually up to 6 encounters/day off travel routes and up to 15 encounters/day on travel routes. Usually group size is small. Middle Country settings. Usually up to 14 encounters/day off travel routes, and up to 29 encounters/day en route. Usually group size is small. Most of the time, social settings will reflect back country definition.</p> <p><u>Operational</u></p> <p>Mechanized Use: Front and Middle Country. Manage the SRMA for 2-wheel drive and 4-wheel drive vehicles, ATVs, dirt bikes and non-motorized mechanized use.</p> <p>Management Controls and Visitor Services: Middle Country. On site controls and services are present but subtle. Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.</p>
IMPLEMENTING DECISIONS
Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.
<u>Information and Education</u>
<p>Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.</p> <p>Provide stewardship information to help preserve the special landscape character.</p> <p>Provide for a map with designated roads, trailheads, trails.</p> <p>Make available for special outdoor educational programs such as CORE and Take it Outside!</p>

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine road and trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points and to identify such items as travel routes, the WSA boundary, and the herd area boundary.

Interpretive signs at trailheads and parking areas, where appropriate.

Provide opportunities for the public to view wild horses in the McCullough Peaks HMA.

Administrative

Visual Resource Management:

Class I in the McCullough Peaks WSA and Class II elsewhere in the SRMA.

Comprehensive Trails and Travel Management:

Motorized vehicle use is limited to designated roads and trails in the entire SRMA.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Closed to surface-disturbing activities such as geophysical exploration (except casual use), salable minerals exploration and development, and construction activities (except those related to development of recreation facilities or wildlife habitat).

No leasing within the McCullough Peaks WSA and NSO elsewhere in the SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Prohibit organized SRPs using domestic horses in the McCullough Peaks HMA.

Partners:

City of Cody; Park County Recreation Board; private landowners; local mountain biking, hiking, equestrian, and motorized groups, FOAL, Wyoming State Trails Program, and other interested groups.

<p>Basin Gardens Play Area SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p>
<p>This area is located between the Communities of Greybull and Basin, Wyoming. This area is currently being used for off-road hill climbs used by both ATVs and motorcycles, dominantly motorcycles. Visitors are from within the communities, as well as from outside the area, particularly Billings, Montana. The area is composed of bentonite and mostly devoid of vegetation. The Basin Gardens area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. The communities from RMP Scoping opportunities had identified this area as highly desired for motorized recreational opportunities.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement: Manage the Basin Gardens Play Area SRMA for motorized recreationists to engage in ATV, motorbike, and other motorized hill climbing activities so that visitors report realizing a “moderate” level of recreation experience and benefit outcomes in these Front Country settings.</p> <p>Activities: Driving for pleasure, motorcycle hill climbing.</p> <p>Experiences: Developing skills and abilities. Enjoying risk-taking adventure. Being around people I know and enjoy.</p> <p>Benefits: Improved physical fitness and health maintenance. Improved outdoor recreation skills. Enhanced sense of personal freedom. More well-rounded childhood development. Heightened sense of satisfaction with our area as a place to live. Increased desirability as a place to live or retire. Improved local economic stability. Increased local tourism revenue. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p> <p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness: Front Country. The RMZ is surrounded by county roads, and displays tracks from heavy off-road use.</p> <p>Naturalness: Front Country.</p>

The area’s natural setting from the intense off-road use may have modifications which range from being easily noticed to strongly dominant to observers within the area. These alterations would remain unnoticed or visually subordinate from sensitive travel routes (Highway 16, 20) and use areas.

Facilities and Structures:

Front Country.

Primitive and improved routes/trails may exist. Facilities and structures are scattered.

Social

Contacts and Group Size:

Middle Country settings.

Usually 7-14 encounters/day off travel routes (e.g., staging areas), and 15-29 encounters/day en route. Usually group size is small to moderate.

Operational

Mechanized Use:

Middle Country.

4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Front Country.

On site controls and services are present but harmonize with the natural environment.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Ensure targeted experiences and benefits is included and explained in all visitor information.

Engage local sporting good businesses and other partners in the development and distribution of a brochure and/or area guide book.

Some onsite visitor orientation (kiosk and trail markers) will be developed. Orientation materials will include a map with designated routes/areas, trailheads, docking stations, and designated areas tailored for different degrees of riding experience (novice areas to experienced areas).

Make available for special educational programs such as CORE and Take it Outside!

Monitoring

Solicit partnerships and cooperative agreements to: Monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies).

Monitor recreation setting condition through on-site patrols.

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails or areas or limiting carrying capacity at trailheads.

Management

Utilize adaptive management techniques to provide identified recreation opportunities (activities, experiences, and benefits) and reach desired future setting conditions.

Develop areas for novice riders to highly experienced riders.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Administrative

Visual Resource Management:

Manage visual resource objectives according to adjacent resource program prescriptions.

Comprehensive Trails and Travel Management:

Motorized use open to off-road/cross-country use.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Basin Gardens Play Area SRMA.

Avoid mineral material disposals in the Basin Gardens Play Area SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply a CSU restriction for the Basin Gardens Play Area SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Greybull, Basin, Manderson, and Worland, Wyoming State Trails Program, surrounding private land owners, NOHVCC, Sagehoppers, and other interested groups and OHV clubs.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

No glass containers and pallets (burning, etc.) allowed.

Noise constraints are enforceable via 43 CFR 8343.1.

<p>Rattlesnake Ridge ERMA</p>
<p>ERMAs are administrative units that require specific management consideration in order to address recreation use, demand, or Recreation and Visitor Services (R&VS) program investments. ERMAs are managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. ERMA management is commensurate and considered in context with the management of other resources and resource uses.</p>
<p>This area is located approximately 4 miles east of Worland, Wyoming. This area is currently being used for off-road hill climbs used by both ATVs and motorcycles, dominantly motorcycles; as well as oil and gas extraction activities, ROW projects including radio signal towers, and grazing. Most of the visitors are from within the Worland area, as well as from other areas outside of the Worland area, most especially from Thermopolis, Wyoming. The area is heavily used by motorized use enthusiasts, and is mostly devoid of vegetation. The Rattlesnake Ridge area provides for exceptional motorized hill climbing opportunities ranging from novice riders to very challenging climbs for the experienced riders. In addition, the surrounding communities had identified this area as highly desirable for motorized recreational opportunities during the RMP Scoping meetings. The other uses within the area expose visitors to potential health risks from elements such as hydrogen sulfide (H₂S), and active oil and gas extraction activities. Conflicts between users have been an issue and interim management between the oil and gas companies and recreationists has been established in this area, but without significant BLM management guidance.</p>
<p>ERMA OBJECTIVE(S) DECISION</p>
<p>ERMA objectives must define the recreation activities and the associated qualities and conditions which become the focus for R&VS management.</p>
<p>Objective Statement: Manage the Rattlesnake Ridge ERMA for motorized recreationists to safely engage in ATV, motorbike, and other motorized hill climbing activities with a priority in addressing use and user conflicts, public health and safety, resource protection, and to maintain these front country to rural settings.</p>
<p>MANAGEMENT ACTIONS & ALLOWABLE USE DECISIONS</p>
<p>Identify management action and allowable use decisions for R&VS and other programs necessary to: facilitate visitor participation in the identified outdoor recreation activities; maintain particular recreation setting characteristics; address visitor health and safety, resource protection, and use and user conflicts; and, address the type(s), activities, and locations where special recreation permits would or would not be issued.</p>
<p><u>Physical</u> Remoteness: Rural Country. The RMZ is surrounded by county roads, and displays tracks from heavy off-road use. The area is on or near primary highways, but still within a rural area. Naturalness: Rural Country. The area’s natural setting from the intense off-road use as well as the industrial activities is culturally modified to the point that it is dominant to the sensitive travel route observer, Pedestrians or other slow moving observers are constantly within view of culturally changed landscape. Facilities and Structures: Rural Country. Paved, improved, and/or primitive roads/highways dominate the landscape. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.</p>
<p><u>Social</u> Contacts and Group Size: Middle Country settings. Usually 7-14 encounters/day off travel routes (e.g., staging areas), and 15-29 encounters/day en route. Usually group size is small to moderate.</p>
<p><u>Operational</u> Mechanized Use: Middle Country.</p>

4-wheel drive vehicles, ATVs, dirt bikes, in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Rural Country.

On site controls and services are obvious and numerous. Largely harmonize with the man-made environment (dominantly from the oil and gas extraction activities and the ROW projects).

IMPLEMENTATION DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop visitor orientation signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, other important land uses within the area, and user safety.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated routes, trailheads, docking stations, designated areas tailored for different degrees of riding experience (novice areas to experienced areas).

Make available for special educational programs such as CORE and Take it Outside!

Monitoring

Solicit partnerships and cooperative agreements to: Monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies).

Monitor recreation setting condition through on-site patrols.

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails or areas or limiting carrying capacity at trailheads.

Management

Develop areas for novice riders to highly experienced riders with coordinated effort through other entities such as local OHV groups, and onsite oil and gas companies.

Develop trailheads containing loading dock stations, kiosks, comfort stations, and adequate parking.

Signs present at key access points, but limited within the ERMA.

Visitor orientation materials (kiosks and signs) at trailheads and parking areas.

Administrative

Visual Resource Management:

Manage visual resources according to other adjacent resource program prescriptions.

Comprehensive Trails and Travel Management:

Motorized use limited to existing roads and trails.

Lands and Realty:

Open to all ROW (including alternative energy realty actions).

Pursue legal and physical access to maximize recreational opportunities.

Minerals:

Open to oil and gas, to mineral entry and, other mineral leasing subject to standard protection measures.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration (including casual use), salable minerals exploration and development, and construction activities.

(including those related to development of recreation facilities or wildlife)

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Surrounding communities including but not limited to Worland, Thermopolis, Manderson, Basin, and Greybull; Wyoming State Trails Program, surrounding land users and industries, NOHVCC, Sagehoppers, and other interested groups and OHV clubs.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

Glass containers and pallets are prohibited.

<p>Horse Pasture SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The Horse Pasture SRMA is 144 acres of BLM-administered public land nestled along the foothills of Rattlesnake Ridge and surrounded by agriculture uses. This area was once used as an oil and gas staging area, complete with residential buildings. Currently, in coordination with Devon Energy Corporation, the BLM is in the process of reclaiming the area to pre-development landscape. The area is used by the community of Worland for uses such as walking, hunting (bird and big game), and nature viewing.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement:</p> <p>Manage the Horse Pasture SRMA for non-motorized recreationists to engage in photography, hunting, nature viewing, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these back to middle country settings.</p> <p>Activities:</p> <p>Hiking, wildlife viewing, nature viewing, photography, hunting (bird and big game), dog interaction (walking, training, hunting, etc.).</p> <p>Experiences:</p> <p>Enjoy going exploring on my/our own. Learn. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoy the closeness of family. Learning more about things here. Enjoy having easy access to natural landscapes.</p> <p>Benefits:</p> <p>Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p> <p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness:</p> <p>Front Country.</p> <p>The south boundary is along an improved road used for agricultural purpose. Some primitive routes exist within the area</p>

from past management. Within the SRMA, the desired remoteness setting will be middle country, the edge will, by default, be front country.

Naturalness:

Back Country.

Natural setting may have subtle modifications but not draw the attention of the casual observer wandering through the area.

Facilities and Structures:

Back Country.

Primitive motorized routes and non-motorized trails may exist. Facilities and structures are rare and often accessible via unimproved routes.

Social

Contacts and Group Size:

Back Country.

Usually up to 6 encounters/day off travel routes, and up to 15 encounters/day on trails. Usually group size is small. Most of the time, social settings will reflect primitive definition.

Operational

Mechanized Use:

Back Country.

Manage the SRMA for mountain bikes perhaps other mechanized use but all is non-motorized. The fringes will be managed for 4-wheel drive vehicles, ATVs, dirt bikes, or snowmobiles in addition to non-motorized mechanized use so as to maintain current land uses.

Management Controls and Visitor Services:

Back Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs and visitor orientation materials at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Solicit partnerships and cooperative agreements to: Monitor outcome attainment and preferences through customer assessments (focus group interviews or visitor studies), Monitor recreation setting condition through on-site patrols.

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

Management

Utilize adaptive management techniques to provide identified recreation opportunities (activities, experiences, and benefits) and reach desired future setting conditions.

If need arrives, develop interpretive/historic nature trail within the Horse Pasture.

Develop trailhead at western edge of SRMA. Facilities will include, but not limited to visitor orientation materials, adequate parking, comfort station, and other necessary facilities identified throughout the life of the plan.

Signs present at key access points, but limited within the SRMA, with exception to nature trail.

Interpretive signs at trailhead, and along trail.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

Motorized use within the SRMA is limited to designated roads and trails.

Lands and Realty:

ROW avoidance area.

Alternative energy avoidance area for realty actions.

Minerals:

Do not pursue withdraw from appropriation under the mining laws for lands within the Horse Pasture SRMA.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Avoid surface-disturbing activities such as geophysical exploration, salable minerals exploration and developments, and construction activities (except those related to development of recreation facilities or wildlife habitat).

Apply a CSU stipulation for the Horse Pasture SRMA.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

Community of Worland, Wyoming State Trails Program, Wyoming Game and Fish, Devon Energy Corporation, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>Beck Lake Area SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The Beck Lake Area SRMA contains about 6,473 acres of BLM-administered public land south of Beck Lake. The area is used by residents of Cody and Park County for uses such as mountain biking, hiking, hunting, driving for pleasure, and wildlife viewing. The City of Cody is seeking an R&PP lease for land in the northern portion of the SRMA. That land would complement the recreation facilities the City manages at Beck Lake Park. Management of the R&PP area would be governed by agreement(s) and operating plan(s) associated with its R&PP status.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement:</p> <p>Manage the Beck Lake Area community SRMA for non-motorized and motorized recreationists to engage in mountain biking, hiking, photography, wildlife viewing, driving for pleasure, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these rural and front country settings.</p> <p>Activities:</p> <p>Mountain biking, hiking, wildlife viewing, nature viewing, photography, hunting, driving for pleasure, dog interaction (walking, training, hunting, etc.).</p> <p>Experiences:</p> <p>Enjoy going exploring on my/our own. Learn. Enjoy the closeness of family. Learning more about things here.</p> <p>Benefits:</p> <p>Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p> <p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness:</p> <p>Rural and Front Country.</p> <p>A major highway lies along the eastern boundary of the SRMA. Numerous primitive and developed roads lie within the area.</p>

Naturalness:

Rural to Front Country.

Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within the area.

Facilities and Structures:

Rural and Front Country.

Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.

Social

Contacts and Group Size:

Middle Country settings.

Usually up to 14 encounters/day off travel routes, and up to 29 encounters/day en route. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

Manage the SRMA for non-motorized mechanized use as well as 4-wheel drive vehicles, ATVs and dirt bikes.

Management Controls and Visitor Services:

Middle Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated routes, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailhead.

Administrative

Visual Resource Management:

Manage VRM consistent with other resource objectives.

Comprehensive Trails and Travel Management:

Motorized vehicle use is limited to designated roads and trails.

Lands and Realty:

Open to ROWs.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration, salable minerals exploration and development, and construction activities on a case-by-case basis.

Open to oil and gas leasing with a CSU restriction.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property.

The following guidelines will be used in determining SRP status:

1-15 participants –

No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

City of Cody, Park County Recreation Board, private landowners, local mountain biking and hiking groups, local motorized groups, Wyoming State Trails Program, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

<p>Newton Lake Ridge SRMA</p> <p>SRMAs are administrative units where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, and/or distinctiveness; especially compared to other areas used for recreation. For each SRMA: establish objective decisions, describe recreation setting characteristics, identify management actions and allowable use decisions and, if necessary, identify implementation decisions.</p>
<p>SUPPORTING INFORMATION</p> <p>Briefly describe the rationale for designating the SRMA including the unique value, importance or distinctiveness of the area. This documents the rationale for consideration of the SRMA in the planning process and, if selected, designation of the SRMA in the record of decision.</p> <p>The Newton Lake Ridge SRMA contains about 1,949 acres of BLM-administered public land north of Newton Lakes. The area is used by residents of Cody and Park County for uses such as mountain biking, hiking, hunting, and wildlife viewing.</p>
<p>SRMA/RECREATION MANAGEMENT ZONE (RMZ) OBJECTIVE(S) DECISIONS</p> <p>SRMAs may be subdivided into RMZs with discrete objectives. SRMA/RMZ objectives must define the specific recreation opportunities (i.e., activities, experiences and benefits derived from those experiences) which become the focus of Recreation and Visitor Services (R&VS) management.</p>
<p>Objective Statement:</p> <p>Manage the Newton Lake Ridge SRMA for non-motorized and motorized recreationists to engage in mountain biking, hiking, photography, hunting, wildlife viewing, and sightseeing so that they report realizing a “moderate” level of recreation experience and benefit outcomes in these rural, front, and middle country settings.</p> <p>Activities:</p> <p>Mountain biking, hiking, wildlife viewing, nature viewing, photography, hunting.</p> <p>Experiences:</p> <p>Enjoy going exploring on my/our own. Learn. Savoring the total sensory – sight, sound, and smell – experience of a natural landscape. Enjoy the closeness of family. Learning more about things here. Enjoy having easy access to natural landscapes.</p> <p>Benefits:</p> <p>Enhanced awareness and understanding of nature. Greater sensitivity to/awareness of outdoor aesthetics, nature’s art and its elegance. Increased appreciation of area’s cultural history. Improved mental well-being. Heightened sense of satisfaction with our area as a place to live. Greater community involvement in recreation and other land use decisions. Increased desirability as a place to live or retire. Maintenance of community’s distinctive recreation/tourism market niche or character.</p>
<p>RECREATION SETTING CHARACTERISTIC (RSC) DESCRIPTIONS</p> <p>Describe the physical, social and operational recreation setting qualities to be maintained or enhanced.</p>
<p><u>Physical</u></p> <p>Remoteness:</p> <p>Rural, Front, and Middle Country. The northeastern boundary is along a major highway. Several short, primitive routes occur within the SRMA.</p> <p>Naturalness:</p> <p>Front and Middle Country. Natural setting may have modifications which range from being easily noticed to strongly dominant to observers within</p>

the area but not draw the attention of observers on trails and primitive routes.

Facilities and Structures:

Rural and Front Country.

Primitive and improved motorized routes and non-motorized trails may exist. Facilities and structures are readily apparent and may range from scattered to small dominant clusters.

Social

Contacts and Group Size:

Middle Country settings.

Usually up to 14 encounters/day off travel routes, and up to 29 encounters/day on trails. Usually group size is small.

Operational

Mechanized Use:

Middle Country.

Manage the SRMA for 4-wheel drive vehicles, ATVs, and dirt bikes in addition to non-motorized mechanized use.

Management Controls and Visitor Services:

Middle Country.

On site controls and services are present but subtle.

Personnel periodic. Rules clearly posted with some restrictions. Periodic enforcement, with an increase in BLM presence during big game hunting season.

IMPLEMENTING DECISIONS

Implementation decisions are actions to achieve or implement land use plan decisions. Implementation decisions include: management, administration, information and education and monitoring.

Information and Education

Develop interpretive signs at trailheads and parking areas on user ethics, non-native invasive weed species found within the area, history, hunting, and other current resource programs.

Provide stewardship information to help preserve the special landscape character.

Provide for a map with designated roads, trailheads, trails.

Make available for special outdoor educational programs such as CORE and Take it Outside!

Monitoring

Vehicle counters with routine surveys and observation.

Visitor reports of crowding.

Informal visitor surveys and formal focus groups as funding allow.

If trends show that use is over acceptable limits, additional action may be considered, such as encouraging use on other trails.

Management

Work with partners and other interested publics to determine trail maintenance and construction needs, signing needs, and access points.

Work with volunteers to develop and maintain limited facilities, as needed, in the area.

Signs present at key access points, but limited within the SRMA.

Interpretive signs at trailhead.

Administrative

Visual Resource Management:

Class II.

Comprehensive Trails and Travel Management:

Motorized vehicle use is limited to designated roads and trails.

Lands and Realty:

Open to ROWs.

Alternative energy avoidance area for realty actions.

Oil and Gas Leasing and Other Surface-Disturbing Activities:

Allow surface-disturbing activities such as geophysical exploration, salable minerals exploration and development, and construction activities on a case-by-case basis.

Open to oil and gas leasing with a CSU restriction.

Special Recreation Permits:

SRPs will be issued as a discretionary action. Issue SRPs for a wide variety of uses, that are consistent with resource/program objectives, and within budgetary/workload constraints.

Cost recovery procedures for issuing SRPs would be applied where appropriate.

If circumstances warrant, limitations on available SRPs may be developed and implemented.

If circumstances warrant, limitations on SRP group numbers may be developed and implemented.

To assist in the determination of whether an organized group activity or event would require an SRP, factors such as the following may be considered: resource concerns, user conflicts, need for monitoring, health and safety concerns, risk of damage to federal facilities or property. No SRP required, unless otherwise determined that an SRP will be needed.

16-30 participants –

Letter of Agreement, unless otherwise determined that an SRP will be needed.

Over 30 participants –

SRP required.

Partners:

City of Cody, Park County Recreation Board, private landowners, local mountain biking and hiking groups, Wyoming State Trails Program, and other interested groups.

Other Administration:

Limit the use of signing or other administrative controls unless and until monitoring supports an increase in education, signing, or enforcement to meet public recreation objectives for the area.

2.0 RECREATION MANAGEMENT MATRICES

The matrices that follow show recreation management areas across the Planning Area, as well as the management of key types of resource uses (e.g., ROWs and travel management) in these areas. To allow comparability across the alternatives, management is shown for the same areas under each alternative, regardless of whether that area is a distinct recreation management area (i.e., SRMA, RMZ, or separate ERMA) or is only managed as part of a larger ERMA.

This page intentionally left blank.

APPENDIX P

LIVESTOCK GRAZING ALLOTMENTS

This appendix consists of three tables that provide detailed information on grazing allotments in the Planning Area. Table P-1 summarizes basic characteristics of each grazing allotment, including current size, management, and use. Table P-2 summarizes the results of the most recent assessment of the *Wyoming Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management* for each grazing allotment. Table P-3 lists grazing allotments that are wholly or partially within Greater Sage-Grouse Priority Habitat Management Areas, and identifies the current management category for each. Grazing allotments in Table P-3 may be subject to additional restrictions under one or more of the alternatives, as described in Chapter 2, *Detailed Analysis of Alternatives*.

Table P-1. Current Livestock Grazing Allotment Information

Allotment Number	Allotment Name	Management Category	Total Federal Acres	Type Management	Number of Pastures	Active Use (AUMs) ¹	Type of Livestock
00001	Manderson Group	I	9,039	Non-growing Season Use	1	779	Cattle
00002	Weber Lower	I	32,156	Spring/Fall Deferment	6	2,762	Cattle
00003	Cold Springs	I	4,510	Rest Rotation		696	Cattle/Horses
00004	Gapen Hyatt	I	10,032	Non-growing Season Use and Restricted Growing Season Use	1	751	Cattle

¹Codes in Progress and Standard columns are as follows: Y = Yes, meets standard, N = No, does not meet standard, U = Unknown.

²Codes in Progress and Standard columns are as follows: Y = Yes, meets standard, N = No, does not meet standard, U = Unknown.

³Standards 5 and 6 are dependent upon determinations made by the Wyoming Department of Environmental Quality (DEQ). Standard 5 is Unknown if allotment specific data is not available. Wyoming DEQ is researching whether any “impaired” waters have data showing impairment on BLM lands.

⁴Some acres within the allotment met standards, while others did not.

Note: Data in table derived from Bureau of Land Management Cody and Worland Field Offices internal databases accessed from 2010 to 2013.

APPENDIX Q

ECONOMIC IMPACT ANALYSIS METHODOLOGY

1.0 INTRODUCTION

This appendix describes the methods and data that underlie the economic impact modeling analysis. Input-output models such as the Impact Analysis for Planning (IMPLAN) model, an economic impact analysis model, provide a quantitative representation of the production relationships between individual economic sectors. Thus, the economic modeling analysis uses information about physical production quantities and the prices and costs for goods and services. The inputs required to run the IMPLAN model are described in the following narrative and tables. The resulting estimates from the IMPLAN model, by alternative, can be found in the *Economic Conditions* section in Chapter 4. The first section of this appendix describes general aspects of the IMPLAN model and how it was used to estimate economic impacts. The remaining sections provide additional detailed data used in the analysis for oil and gas, livestock grazing, and recreation.

2.0 THE IMPLAN MODEL

IMPLAN is a regional economic model that provides a mathematical accounting of the flow of money, goods, and services through a region's economy. The model provides estimates of how a specific economic activity translates into jobs and income for the region. It includes the ripple effect (also called the "multiplier effect") of changes in economic sectors that may not be directly impacted by management actions, but are linked to industries that are directly impacted. In IMPLAN, these ripple effects are termed indirect impacts (for changes in industries that sell inputs to the industries that are directly impacted) and induced impacts (for changes in household spending as household income increases or decreases due to the changes in production).

This analysis used IMPLAN 2007; prior to running the model, cost and price data were converted to a consistent dollar year (2011) using regional and sector-specific adjustment factors from the IMPLAN model. The values in this appendix are expressed in year 2011 dollars so that the earnings and employment estimates can be easily compared to the latest (i.e., 2011) earnings and employment data available from the Bureau of Economic Analysis.

The IMPLAN model has 440 economic sectors, of which 188 are represented in the four Planning Area counties. This analysis involved direct changes in economic activity for 33 IMPLAN economic sectors, as well as changes in all other related sectors due to the ripple effect. The IMPLAN production coefficients were modified to reflect the interaction of producing sectors in the Planning Area. As a result, the calibrated model does a better job of generating multipliers and the subsequent impacts that reflect the interaction between and among the sectors in the Planning Area compared to a model using unadjusted national coefficients. For instance, worker productivity in oil and gas production is higher in Wyoming than the national average. Key variables used in the IMPLAN model were filled in using data specific to Wyoming, including employment estimates, labor earnings, and total industry output.

3.0 OIL AND GAS

The economic impacts analysis for oil and gas reflects drilling, completion, and production activities. The number of wells drilled and completed is based on the updated Reasonable Foreseeable Development (RFD) scenario (BLM 2009a; BLM 2014a) and the constraints applied under each alternative. Total well numbers for each alternative are presented in Table Q-1. Table Q-2 presents the projected quantity of oil and gas produced on federal surface, and Table Q-3 presents the projected quantity of oil and gas produced from federal, state, and private (fee) surface.

Table Q-1. Oil and Gas Well Numbers

Item	Conventional Infill	Exploratory Deep	Coalbed Natural Gas	Total
Federal Surface				
Alternative A – Wells Drilled	989	112	83	1,184
Alternative A – Wells Completed	854	32	75	961

BCF billion cubic feet
MMBO million barrels of oil

The costs of drilling and completing wells and producing oil and gas, also are relevant for the economic impact analysis. Table Q-4 provides a summary of the costs of drilling, completion, and production for each well type (conventional infill, exploratory deep, and coalbed natural gas [CBNG]) used for the economic analysis.

Table Q-4. Assumptions for Analysis of Economic Impacts for Oil and Gas Well Drilling and Completion According to Well Type

Assumption	Well Type		
	Conventional Infill	Exploratory Deep	Coalbed Natural Gas
Drilling Impacts			
Drilling Cost (\$/well)	\$960,017	\$9,372,267	\$48,641
Local Drilling Costs ¹	85%	58%	83%
Local Direct Impact (\$/well)	\$812,044	\$5,476,054	\$40,594
Local Total Impact (\$/well) ²	\$1,079,243	\$6,991,360	\$53,927
Multiplier (total impact/direct impact)	1.33	1.28	1.33
Completion Impacts			
Completion Cost (\$/well)	\$1,376,005	\$4,338,189	\$51,323
Local Completion Costs ¹	55%	37%	55%
Local Direct Impact (\$/well)	\$762,734	\$1,614,992	\$28,449
Local Total Impact (\$/well) ²	\$1,011,420	\$2,054,612	\$39,957
Multiplier (total impact/direct impact)	1.33	1.27	1.40

Source: BLM 2009b; adjusted to year 2011 dollars using chain-type price indices from IMPLAN (Taylor 2010) and the Consumer Price Index (BLS 2014). Data are based on Authorizations For Expenditure provided by exploration and development companies, and include the assumption that approximately 40 percent of infill and deep wells will be directional or horizontal and the remainder will be vertical.

¹The local cost shares were based on the percent of total drilling or completion costs that would be spent on goods and services purchased from the local economy.

²Total impacts estimated using Impact Analysis for Planning (IMPLAN) include direct, indirect, and induced impacts.

% percent
\$ U.S. dollars

Appendix Q – Economic Impact Analysis Methodology

Table Q-5 provides the assumptions used to determine the economic impact associated with the production of oil and gas. For the analysis, the Bureau of Land Management (BLM) estimated a production cost (for gas) of \$1.55 per thousand cubic feet (mcf), based on data from the Energy Information Administration (Taylor 2010) and updated to year 2011 dollars using the Consumer Price Index (BLS 2014).

Table Q-5. Assumptions for Analysis of Economic Impacts on Output for Oil and Gas Production

Economic Impact	Oil Production (per million barrels)	Gas Production (per billion cubic feet)
Direct Economic Impact ¹	\$84,006,000 ²	\$4,345,000 ³
Indirect Economic Impact ⁴	\$4,833,957	\$250,024
Induced Economic Impact ⁵	\$2,166,767	\$112,071
Total Economic Impact	\$91,006,724	\$4,707,095
Multiplier (total impact/direct impact)	1.08	1.08

Note: All dollar values are in year 2011 dollars.

¹Direct economic impact is the market value of output.

²Based on an oil price of \$84.006 per barrel, which is the forecast price for oil from 2015-2018 projected by the Wyoming Consensus Revenue Estimating Group (CREG 2013), adjusted from \$87.00 (in 2013 dollars) to 2011 dollars.

³Based on a gas price of \$4.345 per thousand cubic feet; this is the price forecast for gas from 2016 (\$4.50 per mcf) projected by the Wyoming Consensus Revenue Estimating Group (CREG 2013), adjusted from 2013 to 2011 dollars. The 2016 forecast price was used because it is representative of the forecast range (\$3.85-\$4.95 per mcf) over 2014-2018.

⁴Indirect impacts from Impact Analysis for Planning (IMPLAN) reflect increased demand in sectors that directly or indirectly provide supplies to the oil and gas industry.

⁵Induced impacts from IMPLAN reflect increased demand in the consumer and government sectors.

The forecasted number of wells and production used for estimating employment impacts is the same as for estimating impacts on labor earnings and output. Table Q-6 shows the direct and total employment impacts attributable to drilling and completion.

Table Q-6. Assumptions for Employment Impact Analysis for Oil and Gas Well Drilling and Completion According to Well Type

Employment Impact	Well Type		
	Conventional Infill	Exploratory Deep	Coalbed Natural Gas
Drilling Impacts			
Direct Employment (jobs/well)	3.4	20.7	0.2
Total Employment Impact (jobs/well)	5.8	34.5	0.3
Multiplier (Total Impact/Direct Impact)	1.69	1.67	1.70
Average Earnings per Job (2011 dollars)	\$64,779	\$63,453	\$54,795
Completion Impacts			
Direct Employment (jobs/well)	4.1	7.1	0.2
Total Employment Impact (jobs/well)	6.5	11.2	0.3
Multiplier (Total Impact/Direct Impact)	1.59	1.58	1.58
Average Earnings per Job (2011 dollars)	\$59,699	\$60,374	\$58,360

Note: Direct and total employment impact and average earnings per job are calculated using Impact Analysis for Planning (IMPLAN).

Table Q-7 shows the direct and total employment impacts associated with production.

Table Q-7. Assumptions for Employment Impact Analysis for Oil and Gas Production

Employment Impact (annual number of jobs)	Oil Production (per million barrels)	Gas Production (per billion cubic feet)
Direct Employment	26.9	1.7
Indirect Employment	30.6	1.9
Induced Employment	18.7	1.2
Total Employment	76.2	4.8
Multiplier (Total Impact/Direct Impact)	2.83	2.83
Average Earnings per Job (2011 dollars)	\$60,779	\$74,439

Note: Direct, indirect, and induced employment impact and average earnings per job are calculated using Impact Analysis for Planning (IMPLAN).

The analysis of potential changes in tax revenues is based on tax rates of 12.5 percent of taxable value for federal mineral royalties, 6 percent of taxable value for state severance taxes (Wyoming Department of Revenue 2001), and 6.8 percent of taxable value for local ad valorem production taxes (based on average tax rates for the counties of Big Horn [7.2%], Hot Springs [6.3%], Park [7.0%], and Washakie [6.9%]) (Wyoming Department of Revenue 2014). Taxable value refers to value of sales minus allowable deductions, including certain costs of production and transportation. For purposes of estimating tax revenues, taxable value was estimated based on the average taxable value per unit sold from the counties in the Planning Area for production year 2010 using data from the Wyoming Department of Revenue (Wyoming Department of Revenue 2011). Taxable value was estimated as \$63.01 per barrel for oil, and \$3.40 per mcf for natural gas (2011 dollars).

4.0 LIVESTOCK GRAZING

Economic impacts due to changes in livestock grazing are a function of the amount of forage available and the economic value of the forage. For livestock grazing, long-term surface-disturbing actions from actions listed in Appendix T may affect available animal unit months (AUMs). BLM actions to withdraw certain lands for livestock grazing would also reduce the available forage on federal lands. In addition, land disposal actions may have economic impacts; however, those impacts were not analyzed quantitatively because it is difficult to predict the net change in AUMs. Subsequent landowners may continue to graze the land, leaving overall livestock production and output in the region unaffected.

The economic analysis of livestock grazing impacts is based on a long-term average (from 1988 to 2012) of authorized use as a proportion of active use. Based on data from the BLM's Rangeland Administration System (RAS), authorized use ranged from 43 percent to 79 percent of active use between 1988 and 2012, with an average value of 64 percent (BLM 2010a; BLM 2014b). Whereas permitted AUMs include active and suspended non-use AUMs, active use AUMs exclude suspended non-use AUMs. Authorized use represents AUMs billed for and paid for each year for a permit/lease. These AUMs are not the same as actual use AUMs (and may or may not be reasonably close to actual use AUMs), but are closer to what takes place on the ground each year, or the "actual use", than the active use AUMs. Authorized use information is obtained from the RAS, while actual use represents the AUMs physically used on the ground. Actual use may be less than or equal to authorized use, but authorized use provides an upper bound for actual use. The BLM adjusts authorized use on an annual basis to account for the forage value

Appendix Q – Economic Impact Analysis Methodology

of the land in a given year, based on climatic conditions (e.g., drought), as well as taking into account the needs of the land and the ranch operators.

Whereas reductions in land available for livestock grazing (via long-term surface disturbance or grazing withdrawal) are based on active use AUMs, financial conditions on a given ranch operation are determined by actual use (i.e., the actual forage value of the land that is used for livestock) and authorized use (e.g., bank loans that are based on the available forage value of federal leases held by the ranch operator). Thus, authorized use is a more appropriate baseline than active use from which to measure reductions in available AUMs due to surface disturbance or restriction on grazing land. If reductions were measured from a baseline of active use, with no adjustment for actual use, economic impacts would be overstated (BLM 2010a).

Based on the historical analysis from 1988 to 2012 noted above, the economic analysis of livestock grazing impacts uses a baseline of 195,369 AUMs, which represents 64 percent of the active use of 305,264 AUMs. Reductions in AUMs due to long-term surface disturbance and grazing restrictions are also adjusted for the ratio of authorized to active use.

Table Q-8 provides a summary of initial AUMs and total AUMs lost by 2027 due to surface-disturbing activities. Based on current allocations of AUMs to cattle and sheep, 85 percent of the AUM reduction is allocated to cattle and the remainder is allocated to sheep, for the purpose of estimating changes in output and employment. (There are also some AUMs allocated to horse and buffalo grazing, but these comprise one percent and less than one percent, respectively.) Surface disturbance acres were converted to AUMs using a conversion factor of 10.5 acres per AUM (BLM 2009c).

Table Q-8. Estimated Animal Unit Month Losses

Item	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Active Use AUMs						
Initial AUMs (active use)	305,264	305,264	305,264	305,264	305,264	305,264
AUMs lost from surface-disturbing activities (total, long-term disturbance)	1,490	1,037	3,951	1,743	1,029	1,682
AUMs closed to grazing by BLM management actions	169	162,572	169	169	162,572	169
Total AUMs lost from surface-disturbing activities and withdrawn	1,659	163,609	4,120	1,912	163,601	1,851
AUMs lost from surface-disturbing activities and withdrawn (estimated annual)	83	8,180	206	96	8,180	93
Net AUMs in 2027 (active use)	303,605	141,655	301,144	303,352	141,663	303,413

Table Q-8. Estimated Animal Unit Month Losses (Continued)

Item	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
AUMs Authorized (64 percent of active use AUMs)						
Initial AUMs (authorized)	195,369	195,369	195,369	195,369	195,369	195,369
AUMs lost from surface-disturbing activities (total, long-term disturbance)	954	664	2,529	1,116	659	1,076
AUMs closed to grazing by BLM management actions	108	104,046	108	108	104,046	108
Total AUMs lost from surface-disturbing activities and withdrawn	1,062	104,710	2,637	1,224	104,705	1,185
AUMs lost from surface-disturbing activities and withdrawn (estimated annual)	53	5,235	132	61	5,235	59
Net AUMs in 2027 (authorized)	194,307	90,659	192,732	194,145	90,664	194,184

AUM Animal Unit Month
BLM Bureau of Land Management

Due to price fluctuations, average per-AUM values for cattle and sheep are based on a ten-year average value of production estimates from the Wyoming Agricultural Statistics Service, adjusted to year 2011 dollars (Taylor 2009; Taylor 2010; BLS 2014). The value for cattle is \$48.38 per AUM and the value for sheep is \$46.84 per AUM (in 2011 dollars). Including indirect and induced impacts, the value of one AUM for cattle is \$99.95 and for sheep \$109.67 (in 2011 dollars). Table Q-9 shows the economic impact assumptions for cattle and sheep. The direct economic impact is the estimated change in livestock output per AUM; IMPLAN generates the indirect and induced impacts.

Table Q-9. Assumptions for Analysis of Impacts on Output for Livestock Grazing

Economic Impact	Cattle	Sheep
Direct Economic Impact (\$/AUM)	\$48.38	\$46.84
Indirect Economic Impact (\$/AUM) ¹	\$39.55	\$47.06
Induced Economic Impact (\$/AUM) ²	\$12.02	\$15.78
Total Economic Impact (\$/AUM)	\$99.95	\$109.67
Multiplier (Total Impact/Direct Impact)	2.07	2.34

Note: All dollar values are in year 2011 dollars.

Note: Detail may not add to total due to rounding.

¹Indirect impacts reflect increased demand in sectors that directly or indirectly provide supplies to the livestock industry.

²Induced impacts reflect increased demand in the consumer and government sectors.

AUM Animal Unit Month

Table Q-10 provides a summary of the employment impacts assumed according to unit changes in livestock AUMs.

Table Q-10. Assumptions for Analysis of Employment Impacts for Livestock Grazing

Employment Impact	Cattle	Sheep
Direct Employment (Jobs/1,000 AUMs)	0.466	0.980
Indirect Employment (Jobs/1,000 AUMs)	0.233	0.542
Induced Employment (Jobs/1,000 AUMs)	0.121	0.165
Total Employment (Jobs/1,000 AUMs)	0.820	1.687
Multiplier (Total Impact/Direct Impact)	1.76	1.72
Average Earnings per Job (year 2011 dollars)	\$36,126	\$19,940

Note: Direct, indirect, and induced employment impacts and average earnings per job are calculated using Impact Analysis for Planning (IMPLAN).

AUM Animal Unit Month

5.0 RECREATION

The analysis of economic impacts considers only recreation expenditures of nonresidents of the Planning Area. This is based on the assumption that expenditures of residents would occur in the region regardless of the BLM’s actions that impact recreational opportunities; however, changes in nonresident recreation patterns would alter the amount of money entering the local region.

Economic impacts from recreation are a function of recreation visitor days (RVDs) and expenditures per day. Future RVDs were estimated based on current RVDs, recent growth rates, and projected trends. Estimates of future RVDs were based on the professional judgment of BLM staff, as well as a United States Forest Service (USFS) study that provides forecasts of recreation activity for the Rocky Mountain region (Bowker et al. 1999) and contacts with neighboring BLM field offices. Table Q-11 provides a summary of estimated annual growth rates, and Figure Q-1 provides a graphical view.

Table Q-11. Estimated Growth Rates for Nonresident Recreation Visitor Days

Year	OHV		Hunting		Fishing	
	<i>RVDs this year</i>	<i>Growth over previous year</i>	<i>RVDs this year</i>	<i>Growth over previous year</i>	<i>RVDs this year</i>	<i>Growth over previous year</i>
2004	11,177	-	17,707	-	33,725	-
2005	12,440	11.3%	19,579	10.57%	29,904	-11.33%

RVD Recreation visitor day

Figure Q-1. Recent Trends and Projected Future Change: Nonresident Recreation Visitor Days

Source: BLM 2009d

OHV Off-highway Vehicle

The estimates for average expenditure per visitor day, in year 2011 dollars, are \$92.55 for fishing (Wyoming Game and Fish Department [WGFD] 2008; USFWS 2008); \$140.73 for hunting (Responsive Management 2004); and \$56.33 for off-highway vehicle (OHV) use (Foulke et al. 2006). Table Q-12 shows the direct, indirect, and induced output per RVD for each recreation activity, in year 2011 dollars.

Table Q-12. Assumptions for Analysis of Impacts on Output for Recreation Activities

Economic Impact	OHV (per RVD)	Hunting (per RVD)	Fishing (per RVD)
Direct Economic Impact ¹	\$56.33	\$140.73	\$92.55
Indirect Economic Impact ²	\$8.30	\$38.27	\$12.28
Induced Economic Impact ³	\$5.94	\$22.85	\$10.74
Total Economic Impact	\$70.57	\$201.85	\$115.57
Multiplier (total impact/direct impact)	1.25	1.43	1.25

Note: Detail may not add to total due to rounding.

¹Direct economic impact is the average expenditure per visitor day.

²Indirect impacts from Impact Analysis for Planning (IMPLAN) reflect increased demand in sectors that directly or indirectly provide support for the recreation industry.

³Induced impacts from IMPLAN reflect increased demand in the consumer and government sectors.

OHV Off-highway vehicle
RVD Recreation visitor day

Table Q-13 provides a summary of employment impacts assumed according to unit changes in RVDs.

Table Q-13. Assumptions for Employment Impact Analysis for Recreation Activities

Employment Impact (annual number of jobs)	OHV (per 1,000 RVDs)	Hunting (per 1,000 RVDs)	Fishing (per 1,000 RVDs)
Direct Employment	0.69	2.45	1.24
Indirect Employment	0.07	0.33	0.10
Induced Employment	0.06	0.23	0.11
Total Employment	0.83	3.01	1.46
Multiplier (Total Impact/Direct Impact)	1.20	1.23	1.17
Average Earnings per Job (2011 dollars)	\$18,640	\$19,741	\$19,253

Note: Direct, indirect, and induced employment impact and average earnings per job are calculated using Impact Analysis for Planning (IMPLAN).

Note: Detail may not add to total due to rounding.

APPENDIX R

COMPREHENSIVE TRAVEL AND TRANSPORTATION MANAGEMENT

1.0 QUESTIONS AND ANSWERS

1. *What are some of the basic premises of Comprehensive Travel and Transportation Management?*

Public access shall be provided to public lands, but managed to protect the public resources as well. This appendix focuses on motorized travel. Routes that are open to motorized vehicle use are also open to non-motorized travel and, in general, cross-country travel using non-motorized modes. Pedestrian, equestrian, and mountain bike riding, or other non-motorized travel modes are generally not constrained, except that any proposal for construction of new trails would be subject to public review under the National Environmental Policy Act (NEPA). Emergency response (including firefighting), permitted use of motorized vehicles, and certain Bureau of Land Management (BLM) administrative uses are exceptions to specific Travel Management Plans (TMPs).

2. *How will travel management designations be implemented?*

Many Comprehensive Travel and Transportation Management (CTTM) decisions in this Resource Management Plan (RMP) revision remain unchanged. Several defined areas, specified in Chapter 2, will continue management under existing TMPs. Examples of existing TMP decisions include 1) defined areas under seasonal closures and 2) Wilderness Study Areas (WSAs) either closed to motorized vehicle use, or restricted to the routes identified during the WSA inventory process. Additionally, in many existing TMPs, routes have been designated as open or closed to motorized vehicle use and, in some cases, have been obliterated and reclaimed.

Areas not under these defined TMP decisions will be divided into additional geographic TMP areas. Each area will have its own plan with its own decisions describing routes open or closed to motorized vehicle use. Cooperating agencies, affected private landowners, and the general public will be involved in each travel planning effort prior to TMP decisions.

In depth travel management policy is found in [BLM Manual 1626 – Travel and Transportation](#), available online at:

http://www.blm.gov/pgdata/etc/medialib/blm/wo/Information_Resources_Management/policy/blm_manual.Par.38105.File.dat/1626.pdf

3. *How will the public know if an area is open or closed? How will the BLM ensure the public is notified?*

TMPs will include a public process to ensure involvement in route inventory efforts and discussion of goals and objectives of each TMP (public access, resource protection, private land considerations, etc.); these efforts will be announced in local newspapers and the Wyoming BLM website (www.blm.gov/wy/st/en.html). Following route management decisions for each TMP, maps will be available on the website or at the Cody and Worland Field Offices. In addition, newly affected areas will be signed at entry points, or portals, and information will be provided for distribution at community

venues (e.g., cooperating local stores serving remote areas). Public information and education of the public will precede enforcement. For example, as an area is undergoing TMP development, notices to the community using the area will be posted onsite to announce planning schedules and opportunities for involvement. Once decisions are made, onsite posting of decisions and maps will occur prior to enforcement actions.

4. What will be the schedule for TMP implementation?

Existing TMPs are expected to continue, unless a need for change is identified and assessed using a public process.

New CTTM guidance and policy now requires the BLM to designate all roads, primitive routes, and trails as either open or closed. The BLM will implement TMPs in areas high in priority to address resource concerns which can be found in Maps 69-74. The management designation of “existing” is an interim designation until a TMP designates the route as open for motorized use, or closed to motorized use. Limiting use to “designated” is an indication of high TMP priority. TMP efforts will be scheduled based on priorities established during RMP implementation planning (Appendix D). Priorities for implementation will be informed by cooperating agencies, affected private landowners and the general public, as well as by the level of resource management concerns identified by the BLM. It is expected that the identified future TMPs for areas Limited to Designated roads and trails will take at least five years to properly plan and implement, if each plan takes one year to complete, and if each Field Office initiates one new TMP each year.

The BLM will go through an inventory process to verify the existence of routes that are documented to exist at the date of the RMP Record of Decision (ROD). These inventory processes will also undergo public review to assure a complete understanding of motorized vehicle use in these TMPs. The BLM will conduct a route-by-route analysis using the minimization (designation) criteria (43 CFR 8342.1) to designate or close individual routes in the TMP.

Some areas may be closed immediately with the RMP. Depending on the selected RMP in the ROD, this implementation decision may close certain WSAs, Areas of Critical Environmental Concern (ACECs), or other areas completely to motorized vehicles.

Some areas will continue as Open Areas or become Open Areas depending on the selected RMP in the Record of Decision; and dependent upon completion of each Open Area TMP including required implementation procedures. Management of Open Areas is important for public safety and TMPs specific to each Open Area will be prioritized for completion in the RMP Implementation Planning process. Partners are particularly sought for Open Area TMP efforts.

5. What will the local TMP implementation process look like?

Public Involvement Details

The annual RMP Implementation Plans for each of the field offices will determine the initiation of planning efforts for any specific TMP. The schedule for the TMP will be announced in local newspapers and on the Wyoming BLM website (www.blm.gov/wy/st/en.html), and cooperating agencies and affected private landowners will be notified.

Minimum expected public involvement opportunities for each new TMP will include: posting notices of scoping and planning schedules (onsite, website, and newspaper); providing at least one public meeting during the scoping period; providing for public information and participation in the route inventory

review process, which will take place over at least one entire field season (spring, summer and fall); providing for at least one public meeting following completion of the NEPA document; and, prior to decision making, providing public notice of TMP decisions on the Wyoming BLM website, local newspapers, and onsite.

Revision of existing TMPs will involve the original stakeholders and will also include opportunities for public involvement, including NEPA review, but may not be as extensive as those provided for new TMPs as stated above, depending on the issues to be resolved with the TMP revision. (For example, an entire new route inventory would not be expected.)

Route Inventory Details

Approximately 80 percent to 90 percent of the travel network is expected to be already captured on the BLM's inventoried route network, and the BLM is acquiring additional route inventory information on an ongoing basis. This current inventory is available for review at BLM field offices. When the BLM conducts an inventory review for a new TMP, the public, cooperating agencies, and other stakeholders will be invited to review the known route inventory and to provide specific information on inventoried routes (maps will be provided) or additional routes yet to be inventoried. (The public is invited to provide global positioning system [GPS] data or other information to document other known routes.) During the route inventory review, the BLM will:

- Review and verify information provided by the public, cooperating agencies, and affected landowners.
- Continue to collect additional route data using aerial photos and verify data collected from aerial photos using GPS.
- Assess and define route condition (route by route analysis) and assign interim route category and expected maintenance level.
- Produce new maps.

Decision Criteria

Route designations provide for public access, protection of resources, public safety, and the minimization of user conflicts in accordance with the following criteria per 43 CFR 8342.1:

- Provide adequate public access using a variety of travel modes and appropriate routes.
- Minimize detriment to soil, watershed, vegetation, air, and other resources.
- Preserve wilderness characteristics for WSAs and areas defined specifically for such management in the RMP ROD.
- Minimize harassment of wildlife and disruption of wildlife habitats, giving priority to the protection of endangered or threatened species and their habitats.
- Minimize conflicts between motorized vehicle use and other recreational uses and ensure compatibility of uses with existing conditions in populated areas, taking into account noise and other effects.

6. How will permitted or authorized users be affected by the TMP?

Generally, permit holders will not be impacted by the TMP as permits may allow for use of areas or routes otherwise closed to public motorized travel. Exploration for locatable minerals may be impacted in areas closed to motorized use, where a plan of operations is required (43 Code of Federal Regulations [CFR] § 3809.11(5)).

7. How may permit holders provide information about necessary routes and uses?

Following requests by permit holders, specific permits may authorize motorized travel on routes or in areas not available to the general public (grazing use authorizations, seismic survey permits, approved rights-of-way (ROW), Applications for Permit to Drill or Sundry Notices, timber sale permits, fuel wood permits, etc.) All affected permit holders and users of public lands are encouraged to participate in the travel and transportation inventory efforts to assure full understanding of motorized vehicle use designations in any TMP.

8. Can permit holders restrict public or administrative access?

No, permit holders may not obstruct public use on any route of travel that is open to the general public without authorization by a BLM authorized officer. The BLM requires administrative access across private property and permitted allotments to manage and protect public lands (43 CFR 4130.3-2(h)).

9. When is motorized travel allowed off TMP routes?

Necessary tasks that support commercial or industrial uses of public lands are allowed by permit in the following cases:

- Maintenance of fences and range improvements, salt placement for livestock consumption, and tending to sick cattle.
- Surveying or staking work associated with filing a Notice of Intent (NOI) to conduct geophysical exploration activities, field reconnaissance, and survey work in advance of a ROW action such as a pipeline.
- Mineral activities defined as casual use (except in Closed areas).
- Other permits or authorizations which expressly allow for motorized vehicle travel off TMP routes.

Recreational or general public activities may be allowed off TMP routes (i.e., off-road or cross-country) for specific purposes, which are defined as those activities which generally require the use of a motorized vehicle, and that do not create resource damage. Examples of necessary tasks allowing off-route motorized (OHV) and mechanized (mountain bike) travel in the Bighorn Basin RMP include:

- Parking alongside a route to remove the vehicle from the traffic lane—depending on the RMP ROD, travel may be allowed up to 30 feet from the route edge in areas Limited to Designated roads and trails, and not allowed in Closed areas or in any WSAs.
- Travel for big game carcass retrieval—depending on the RMP ROD travel is allowed up to 300 feet from the route edge only in areas Limited to Designated routes, and not allowed in Closed areas or in any WSAs.
- Travel for dispersed campsite access—depending on the RMP ROD travel is allowed up to 300 feet from the route edge only in areas Limited to Designated roads and trails, and not allowed in Closed areas or in any WSAs.

Any motorized travel outside of these parameters or that causes resource damage is a violation of the RMP decisions and is subject to enforcement action including citation and fine.

10. How will BLM administrative actions be affected by the TMPs? In what cases may the BLM travel off road?

BLM administrative functions may require motorized travel off TMP routes for a variety of administrative purposes where a motor vehicle is required to accomplish the mission, some of which are listed below:

- wild horse management
- fish and wildlife monitoring
- noxious weed control
- fence repair
- restoration and enhancement
- fire suppression and fuels management
- law enforcement activities

The BLM may sign certain routes for administrative use only. As appropriate and necessary, the BLM may reclaim administrative routes and preclude further (non-emergency) use.

11. How will private landowners be affected by TMPs?

ROWs for access will not be affected by the TMPs although certain routes may be closed to public access and use. All affected ROW holders and private landowners are encouraged to participate in the route inventory efforts to assure full understanding of motorized uses in any TMP to minimize user conflicts.

12. If needed, how will local TMPs be changed?

Revision of existing TMPs will involve the original stakeholders and will also include opportunities for public involvement, including NEPA review, but may not be as extensive as those provided for new TMPs as stated above, depending on the issues to be resolved with the TMP revision. (For example, an entire new route inventory would not be expected.)

Issues requiring TMP revisions may include:

- cooperative travel management opportunities with landowners or other agencies
- construction of new access routes associated with permitted activities
- resource monitoring requiring opening or closing routes
- BLM-administered land tenure adjustments
- protecting public health and safety
- preventing unacceptable resource damage
- new issues that may require a change in the TMP
- re-designating routes as open if the cultural, biological, or physical resource has successfully recovered to where the OHV designation can be less restrictive and public demand for additional routes can be demonstrated

13. Does BLM always need to use an entire TMP to address routes?

No, the BLM may close specific roads to protect health and safety and prevent resource damage, or engage in temporary route closures consistent with IM 2010-028. As per 43 CFR 8341.2 (a), if the authorized officer determines that off-road vehicles are causing or will cause considerable adverse effects upon resources or other authorized uses, the BLM shall immediately close areas affected to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. Compliance with NEPA in the context of temporary closures may include:

- Categorical Exclusions
- Environmental Assessments
- Environmental Impact Statements
- A Determination of NEPA Adequacy (can be used to document that the contemplated action has been adequately covered in an existing NEPA document)

14. What if the BLM needs to change travel designations?

There are three OHV use designations in a TMP: Open, Closed, and Limited. Changing designations requires an RMP amendment. Under past guidance, existing roads and trails was a travel management designation under the limited category. New CTTM policy/guidance now defines existing as an interim management designation until a TMP designates it as open or closed for motorized travel. An RMP amendment is not required to designate routes (i.e., perform TMP) within areas identified in the RMP as managed on an interim basis as existing roads and trails.

15. Why would the BLM change travel designations?

- a new regulation or policy
- use trends, such as OHV recreational activities, requiring a responsive CTTM action to maintain desired settings, experiences, and beneficial outcomes (refer to Recreation Appendix O)
- to maintain desired physical, biological, or heritage resources

16. How will the BLM notify the public of revised travel designations?

- BLM website and local newspapers, at a minimum
- NEPA document scoping and comment periods will be announced

17. How will the BLM manage routes under a specific TMP?

Management of specific routes will be defined in each TMP. Routes may: remain open and receive a specific level of maintenance; be repaired or upgraded; be seasonally closed; be closed to motorized travel; be obliterated and reclaimed; be reconstructed or re-routed; or made available for ROW or landowner access or for administrative use only. New routes may be constructed. Signage will be defined in each TMP.

In specific TMPs, or in Recreation Area Management Plans, trails may be constructed for specific uses (e.g., hiking, mountain biking, and/or equestrian use).

18. How will the BLM close and reclaim additional roads and construct replacement roads?

Once a road inventory is complete, the BLM may close or construct roads through a TMP. Criteria for closing a road include (refer to 43 CFR 8342.1-Minimization Criteria):

- adverse impacts or threats to landowners or stakeholders
- threats to public safety
- adverse impacts to resources, including soil, water, or wildlife
- desired level of access
- redundant (parallel) routes

Criteria for constructing a road include:

- new authorized uses of public lands
- changes to land tenure
- resource protection
- rerouting a road for safety or resource protection
- approval through authorization, such as ROWs

19. Under what criteria would the BLM acquire access across private or state lands?

The BLM may acquire easements across non-federal lands as needed to meet resource objectives. Exclusive easements, which include public access, may be acquired under the following circumstances:

- Access to public lands is desirable.
- Substantial investment is planned on acquired property.
- Existing cooperative road agreements lack adequate rights for other parties.
- Where applicable in the case of the logging road permits issued or assigned after May 4, 1956, the BLM may obtain perpetual easements under the terms of 43 CFR 2812.6-2(a)(II) for construction of roads with appropriated funds.
- Access restriction and exclusion.

Non-exclusive easements generally provide adequate administrative access for BLM management activities. They usually do not provide access for the general public.

20. Under what criteria will the BLM maintain roads? What are the maintenance levels?

Criteria to maintain routes will be site specific and dependent upon route-by-route analysis, the areas' resource objectives, use, and resource concerns. Primitive routes within WSAs are not maintained other than by the passage of vehicles, with certain exceptions. Exceptions are limited to the minimum mechanical maintenance necessary to provide access (1) as follows:

- For emergencies such as suppression activities associated with wildfire or search and rescue;
- To grandfathered grazing uses and facilities as defined by the Interim Management Plan (IMP) for Lands under Wilderness Review, and under specific authorizations;
- To sites where reclamation or stabilization is needed to protect or improve the lands' wilderness values; and
- to private inholdings.

Appendix R – Comprehensive Travel and Transportation Management

In these exceptions, maintenance will occur using the “minimum tool concept” described in BLM Manual 6330, Management of Wilderness Study Areas. NEPA analysis is required to analyze maintenance alternatives except in the case of emergencies.

There are five maintenance levels assigned to a travel route ranging from low maintenance priority to high priority.

Level 1: Maintenance is limited to protecting adjacent land and resource values, which means that Level 1 roads are not maintained for motorized traffic. These roads are no longer needed and are closed to traffic. The objective is to remove these roads from the transportation system. Where appropriate, drainage and runoff patterns will be maintained to protect adjacent land. Closure and traffic restrictive devices will be maintained.

Level 2: Typically known as a ‘two-track road’, these routes are passable by high clearance vehicles and maintained dependent on funding levels. Seasonal closures or other restrictions may be imposed. When possible, drainage structures are inspected and maintained within a 3-year period. Grading as necessary to correct drainage problems. Slides may be left in place if they do not obstruct drainage.

Level 3: Natural or aggregate surface with a defined cross section, drainage structures such as rolling dips, culverts or ditches, and may normally be negotiated by passenger cars driven cautiously. User comfort and convenience are not a priority. When possible, drainage structures are inspected and maintained annually. Grading provides reasonable riding comfort at prudent speeds. Brushing to improve sight distance. Slides obstructing drainage receive high priority. Other slides are removed on a scheduled basis.

Level 4: Single or double lane with aggregate surface. Access for passenger cars driven at prudent speeds. When possible, roadway is maintained annually. Major repairs as needed.

Level 5: Highest traffic volume of the transportation system. Single or double lane with aggregate surface. Access for passenger cars traveling at prudent speeds. When possible, roads are maintained annually with preventive maintenance program. Level 5 roads are repaired as needed.

21. Under what criteria will maintenance levels change?

The BLM may adjust maintenance levels based upon use, available funding, and as needs arrive. Maintenance levels may be adjusted during a TMP if it is decided that a particular route would be more appropriately assigned a different maintenance level.

22. What are the Best Management Practices BLM intends to use?

Appendix L lists route management best management practices, and these are included in the Engineering Best Management Practices discussion.

23. What is the BLM’s monitoring plan for the TMP?

On a priority basis BLM will monitor motorized vehicle use for:

- user pioneered roads or trails
- impacts on wildlife
- impacts on other recreation or resource uses

- user conflicts and complaints
- resource damage
- private land conflicts
- trends in violations and incidents

Monitoring methods include traffic counters, intercept surveys, aerial flights, remote sensing observation techniques, investigation of complaints from the public, and field observations.

24. How will the BLM assure that the TMPs are being implemented correctly?

The BLM seeks to inform the public of travel management planning, to educate public land users about TMP and route decisions, and use the lowest level of enforcement to achieve desired outcomes. Enforcement may include citations and fines if motorized use occurs outside of the specific constraints of TMPs or off-road in areas that are defined in the RMP as Closed or Limited. Regulations and maps/brochures will be made available at multiple locations, including the BLM website, BLM offices, local venues and onsite, as appropriate. Informative materials include:

OHV Signs

Standardized signs (i.e., type of substrate, layout, and design) will identify OHV designations in the field; however, the level of signing will be defined in specific TMPs. OHV signage includes:

- **Portal signs:** Portal signs provide travel designations for an area, such as, “Motorized vehicle use on public land in this area is limited to designated roads and trails.” Portal signs will be posted accordingly:
 - For areas Limited to Designated roads and trails, portal signs will provide additional information. For example: “Motorized vehicle use on public land in this area is limited to roads and trails identified with a white arrow.”
 - For areas managed as Open, portal signs will specify the boundaries, user ethics, and public safety messages.
 - For areas managed as Closed to motorized use, signs that state the reason for the closure will be posted.
- **Route signs:** All designated routes (routes that are open to motorized vehicle travel) will be identified with signs, including an open symbol, such as a white arrow. White arrows should be placed at entrances and intersections of all designated roads. All individual closed routes would not typically have signs.

Maps and Brochures

Maps and brochures can provide detailed information to the public about OHV designations. They are an excellent source of land ownership status and travel information. While maps and brochures cannot be the only source of information, they are an excellent aid.

Brochures can portray OHV designations for specific areas. They are easy to produce, inexpensive, and can be updated quickly and made available in printed or online versions. Brochures can assist enforcement activities to monitor and enforce designated roads and trails.

Education

The Tread Lightly and Operation Respect programs will be included in OHV implementation planning. The BLM will initiate programs in the Planning Area for the public that emphasize responsible motorized

vehicle use and respect for the land, resources, and private property rights. Tread Lightly! Inc. is a source of excellent educational materials that promote responsible OHV use.

The Wyoming BLM has used the Operation Respect program for over 20 years. This program is a public outreach initiative that promotes respect for both public and private land, provides information on access to public lands, encourages users to obtain permission from private landowners, and specifies where to get information. Additional programs such as the BLM's Environmental Education Program, the Game and Fish Department's Hunter Stewardship Program, the Hunter Safety Education Program, and the Annual Hunting and Fishing Heritage Exposition, will be utilized when possible for the BLM's OHV program public outreach. Outfitters and guides associations can also assist the BLM with educating the public about OHV ethics. These and other avenues that promote responsible OHV use should be strengthened.

The BLM will incorporate information about regulations, penalties, consequences for irresponsible behavior, and potential impacts to resources from inappropriate use into the outreach program. Methods of public outreach include information postings on the BLM's website, brochures, fact sheets, news releases, and radio talk shows.

Enforcement

All federal and state motor vehicle laws are subject to enforcement. Publication of TMP decisions in the *Federal Register* or made available through any completed NEPA process is sufficient for legal enforcement. Enforcement may include citations and fines if motorized use occurs outside of the specific constraints of TMPs, or off route in areas that are defined in the RMP as Closed or Limited. There are narrow exceptions for necessary tasks (see above). The BLM may enter into cooperative law enforcement agreements with state and local agencies such as the Wyoming Game and Fish Department or county law enforcement agencies.

25. How will the BLM address sage-grouse habitat management in TMPs?

Route by route analysis (referred also as minimization or designation criteria as stated in 43 CFR 8342.1) in sage-grouse Priority Habitat Management Areas will recognize sage-grouse habitat as a predominant management objective, as well as the priority resource to manage for. The route by route analysis will determine future travel management plans within sage-grouse Priority Habitat Management Areas, which would be designed to minimize impacts to sage-grouse habitat.

Travel management planning will include:

- Evaluate the need for closures of routes not desired for public purposes, including seasonal closures, and designate routes with current administrative/agency purpose or need to administrative access only;
- Routes designated as closed will be restored when necessary using appropriate seed mixtures for sage-grouse ecological conditions;
- Limit route construction to realignments of existing designated routes if that realignment has a minimal impact on sage-grouse habitat, eliminates the need to construct a new road, or is necessary for motorist safety;
- Use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then new road construction would be designed to mitigate impacts to sage-grouse habitat consistent with the National Greater Sage-Grouse Conservation Measures/Planning Strategy (IM 2012-044);

- Upgrading of routes that would change route category (road, primitive road, or trail) or capacity would be allowed if it would have minimal impact on sage-grouse habitat, if it is necessary for motorist safety, or eliminates the need to construct a new road;
- For new road proposals, consider an alternative that would locate new primary and secondary roads greater than 1.9 mi from the perimeter of occupied sage-grouse leks inside priority habitat areas. Additionally, for new proposals, consider and evaluate an alternative that would locate new tertiary roads greater than 0.6 mile from the perimeter of occupied leks; and
- Construct new roads to a minimum design standard needed for proposed activity.

Travel management will also evaluate the need for closures, including seasonal closures.

26. How will BLM consider cultural resources under TMPs?

BLM will comply with the requirements of Section 106 of the NHPA when designating OHV areas and a travel management network as part of future TMPs. Specific projects undertaken to improve, or rehabilitate, routes or areas are also undertakings subject to Section 106 of the NHPA. Compliance with Section 106 would be in accordance with the Wyoming State Protocol agreement between BLM and the Wyoming SHPO and BLM guidance relating to cultural resource considerations for OHV designations and travel management (BLM IM 2012-067 (Feb. 15, 2012)). BLM would consider as part of this process existing cultural resource information and potential impacts to historic properties. BLM would identify the geographic area or areas within which the character or use of any historic properties may be directly or indirectly affected by the designations, i.e., the Area of Potential Effect (APE). APEs should include areas that might suffer indirect effects from OHV use, such as access routes leading to at-risk sites vulnerable to vandalism and looting (e.g., historic or prehistoric structures, rock shelters, or rock art) or increased erosion to sites.

BLM also may close routes or roads or OHV designations to protect cultural resources. Evaluation of routes or areas to be designated as closed to protect cultural resources may be based on existing inventory information and may be implemented through appropriate level of National Environmental Policy Act analysis, including issuance of a temporary closure. There may be cases where continued use of an OHV management area or route prior to designation may not be authorized before Class III inventory and Section 106 compliance is completed.

Cultural resources inventory requirements, priorities, and strategies will vary depending on the quality of existing information, the extent of potential change to the location by OHV use, the expected density and nature of historic properties (see BLM Manual 8110), and the potential direct, indirect, and cumulative effects of proposed designations. Where there is a reasonable expectation that a proposed designation will shift, concentrate, or expand travel into areas where historic properties are likely to be adversely affected, a Class II or Class III inventory focused on areas where adverse effects are likely to occur is recommended prior to designation.

2.0 KNOWN ROAD AND TRAIL NETWORK

The Figure R-1 displays the travel management designations for the known road and trail network in the Planning Area. The known road and trail network in the Planning Area can be obtained from the local BLM office or downloaded from <http://www.blm.gov/wy/st/en.html>. Any future decisions to limit travel to designated roads would be based on updated, site specific inventories that would include public participation.

³Areas limited to existing roads and trails on an interim basis until completion of travel management planning.
⁴Areas with no separate travel management designation are areas with no specific travel management designation under the alternative. Travel Management in these areas is managed consistent with other resource objectives. If no other travel management applies, motorized vehicle use is limited to existing roads and trails.
⁵Areas open to over-snow vehicle travel under alternatives A and C are considered on a case-by-case basis.
⁶Areas open to over-snow vehicle travel under Alternative B must have a minimum average of 12 inches of snow or be recognized as a groomed motorized trail. If these conditions do not exist then the over-land travel decisions regulate travel in the area.
⁷Areas closed to over-snow vehicle travel under Alternative C are considered on a case-by-case basis.

APPENDIX S

LANDS WITH WILDERNESS CHARACTERISTICS

When evaluating lands with wilderness characteristics, the Bureau of Land Management (BLM) utilizes BLM Manual 6310 - Conducting Wilderness Characteristics Inventory of BLM Lands and BLM Manual 6320 - Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process. The BLM is also currently referencing Instruction Memorandum (IM) No. 2013-106, Additional Guidance Regarding Public and Cooperating Agency Involvement in and Access to Wilderness Characteristics Inventory Information and the Land Use Planning Process. The BLM Cody and Worland Field Offices updated the Lands with Wilderness Characteristics Inventory in 2011 to respond to additional information. The current forms for evaluating Lands with Wilderness Characteristics are provided on the following pages.

Based on identified resource conflicts and the need to prioritize other resource uses, *the BLM has not proposed to manage inventoried lands with wilderness characteristics specifically for naturalness, outstanding opportunities for solitude, and primitive and unconfined recreation under the Proposed Resource Management Plan (RMP)*. The rationale for these proposals by inventoried unit is available in Table S-1.

1.0 EVALUATION OF CURRENT CONDITIONS

- 1) Document and review any existing BLM wilderness characteristics inventory findings on file regarding the presence or absence of individual wilderness characteristics, using Form 1, below.
- 2) Consider relevant information regarding current conditions available in the office. Identify and describe any changes to the existing inventory information. Use interdisciplinary team knowledge, aerial photographs, field observations, maps, etc., and document the findings on Form 2, below. Document current conditions regarding wilderness characteristics, as opposed to potential future conditions.
- 3) Conduct field reviews as necessary to verify information and to ascertain current conditions. Reach conclusions on current conditions including boundaries, size of areas and presence or absence of wilderness characteristics. Fully explain the basis for each conclusion on Form 2, including any critical differences between BLM and citizen information.
- 4) Document the findings regarding current conditions for each inventoried area. Describe how the present conditions are similar to, or have changed from, the conditions documented in the original wilderness characteristics inventory. Document the findings on Form 2 for each inventory area. Cite to or attach data considered, including photographs, maps, GIS layers, field trip notes, project files, etc.

2.0 FORM 1

DOCUMENTATION OF BLM WILDERNESS CHARACTERISTICS INVENTORY FINDINGS FROM PREVIOUS INVENTORY ON RECORD

1. Is there existing BLM wilderness characteristics inventory information on all or part of this area?

No _____ (Go to Form 2) **Yes** _____ (If yes, and if more than one area is within the area, list the unique identifiers for those areas.):

a) Inventory Source: _____

b) Inventory Area Unique Identifier(s): _____

c) Map Name(s)/Number(s): _____

d) BLM District(s)/Field Office(s): _____

2. BLM Inventory Findings on Record:

Existing inventory information regarding wilderness characteristics (if more than one BLM inventory area is associated with the area, list each area and answer each question individually for each inventory area):

a) Inventory Source: _____

Area Unique Identifier	Sufficient Size? Yes/No (acres)	Naturalness? Yes/No	Outstanding Solitude? Yes/No	Outstanding Primitive & Unconfined Recreation? Yes/No	Supplemental Values? Yes/No

3.0 FORM 2

CURRENT CONDITIONS: PRESENCE OR ABSENCE OF WILDERNESS CHARACTERISTICS

Area Unique Identifier _____ Acreage _____
(If the inventory area consists of subunits, list the acreage of each and evaluate each separately).

In completing steps (1)-(5), use additional space as necessary.

(1) Is the area of sufficient size? (If the area meets one of the exceptions to the size criterion, check "Yes" and describe the exception in the space provided below),

Yes _____ No _____

Note: If "No" is checked the area does not have wilderness characteristics; check "N/A" for the remaining questions below.

Description (describe the boundaries of the area--wilderness inventory roads, property lines, etc.):

(2) Does the area appear to be natural?

Yes _____ No _____ N/A _____

Note: If "No" is checked the area does not have wilderness characteristics; check "N/A" for the remaining questions below.

Description (include land ownership, location, topography, vegetation, and summary of major human uses/activities):

(3) Does the area (or the remainder of the area if a portion has been excluded due to unnaturalness and the remainder is of sufficient size) have outstanding opportunities for solitude?

Yes _____ No _____ N/A _____

Description (describe the area's outstanding opportunities for solitude):

Appendix S – Lands with Wilderness Characteristics

(4) Does the area (or the remainder of the area if a portion has been excluded due to unnaturalness and the remainder is of sufficient size) have outstanding opportunities for primitive and unconfined recreation?

Yes _____ No _____ N/A _____

Note: If “No” is checked for both 3 and 4 the area does not have wilderness characteristics; check “N/A” for question 5.

Description (describe the area’s outstanding opportunities for primitive and unconfined recreation):

(5) Does the area have supplemental values (ecological, geological, or other features of scientific, educational, scenic or historical value)?

Yes _____ No _____ N/A _____

Description:

SUMMARY OF ANALYSIS*

Area Unique Identifier: _____

Summary

Results of analysis:

(Note: Explain the inventory findings for the entirety of the inventory unit. When wilderness characteristics have been identified in an area that is smaller than the size of the total inventory unit, explain why certain portions of the inventory unit are not included within the lands with wilderness characteristics (e.g., the inventory found that certain parts lacked naturalness).

1. Does the area meet any of the size requirements? ___ Yes ___ No

2. Does the area appear to be natural? ___ Yes ___ No ___ N/A

3. Does the area offer outstanding opportunities for solitude or a primitive and unconfined type of recreation? ___ Yes ___ No ___ N/A

4. Does the area have supplemental values? ___ Yes ___ No ___ N/A

Check one:

The area, or a portion of the area, has wilderness characteristics and is identified as lands with wilderness characteristics.

The area does not have wilderness characteristics.

**This form documents information that constitutes an inventory finding on wilderness characteristics. It does not represent a formal land use allocation or a final agency decision subject to administrative remedies under either 43 CFR parts 4 or 1610.5-3.*

4.0 ROUTE ANALYSIS¹

(Factors to consider when determining whether a route is a road² for wilderness characteristics inventory purposes.)

Wilderness Characteristics Inventory Area Unique Identifier: _____

Route or Route Segment³ Name and/or Identifier: _____

(Include Transportation Plan Identifier, if known, and include route number supplied by citizen information, when available.)

I. LOCATION

Refer to attached map _____ and BLM corporate data (GIS). List photo point references (where applicable) or reference attached photo log.

Describe: _____

II. ROUTE CONTEXT

A. Current Purpose⁴ (if any) of Route: (Examples: Rangeland/Livestock Improvements [stock tank, developed spring, reservoir, fence, corral], Inholdings [ranch, farmhouse], Mine Site, Concentrated Use Site [camp site], Recreation, Utilities [transmission line, telephone, pipeline], Administrative [project maintenance, communication site, vegetation treatment]).

¹ This form documents information that constitutes an inventory finding on wilderness characteristics. It does not represent a formal land use allocation or a final agency decision subject to administrative remedies under either 43 CFR parts 4 or 1610.5-3.

² Road: An access route which has been improved and maintained by mechanical means to insure relatively regular and continuous use. A way maintained solely by the passage of vehicles does not constitute a road.

- a. Improved and maintained – Actions taken physically by people to keep the road open to vehicle traffic. “Improved” does not necessarily mean formal construction. “Maintained” does not necessarily mean annual maintenance.
- b. Mechanical means – Use of hand or power machinery or tools.
- c. Relatively regular and continuous use – Vehicular use that has occurred and will continue to occur on a relatively regular basis. Examples are: access roads for equipment to maintain a stock water tank or other established water sources, access roads to maintained recreation sites or facilities, or access roads to mining claims.

³ If a portion of a route is found to meet the wilderness inventory road criteria (see Part III) and the remainder does not meet these criteria (e.g., a cherrystem road with a primitive route continuing beyond a certain point), identify each segment and explain the rationale for the separate findings under pertinent criteria.

⁴ The purpose of a route is not a deciding factor in determining whether a route is a road for wilderness characteristics inventory purposes. The purpose of a route does provide context for factors on which such a determination may be based, particularly the question of whether maintenance of the route ensures relatively regular and continuous use. The purpose also helps to determine whether maintenance that may so far have been unnecessary to ensure such use would be approved by BLM when the need arises.

Describe: _____

B. Right-of-Way (ROW):

1. Is there a ROW associated with this route?

Yes ___ No ___ Unknown ___

2. If yes, what is the stated purpose of the ROW? _____

3. Is the ROW still being used for this purpose?

Yes ___ No ___ Unknown or N/A ___

Explain: _____

III. WILDERNESS INVENTORY ROAD CRITERIA

A. Evidence of construction or improvement using mechanical means:

Yes ___ (if either A.1 or A.2 is checked "yes" below) No ___ (if both A.1 and A.2 are checked "no" below)

1. Construction: (Is there evidence that the route or route segment was originally constructed using mechanical means?)

Yes ___ No ___

Examples: Paved ___ Bladed ___ Graveled ___ Roadside Berms ___ Cut/Fill ___ Other ___

Describe: _____

2. Improvements: (Is there evidence of improvements using mechanical means to facilitate access?)

Yes ___ No ___ If "yes": by Hand Tools ___ by Machine ___

Examples: Culverts ___ Hardened Stream Crossings ___ Bridges ___ Drainage ___ Barriers ___ Other ___

Describe: _____

Appendix S – Lands with Wilderness Characteristics

B. Maintenance: (Is there evidence of maintenance that would ensure relatively regular and continuous use?):

Yes ___ (if either B.1 or B.2 is checked “yes” below) No ___ (if both B.1 and B.2 are checked “no” below)

1. Is there Evidence or Documentation of Maintenance using hand tools or machinery?

Yes ___ No ___ If “yes”: by Hand Tools ___ by Machine ___

Explain: _____

2. If the route or route segment is in good⁵ condition, but there is no evidence of maintenance, would mechanical maintenance with hand tools or machines be approved by BLM to meet the purpose(s) of the route in the event this route became impassable?

Yes ___ No ___

Explain: _____

C. Relatively regular and continuous use: (Does the route or route segment ensure relatively regular and continuous use?)

Yes ___ No ___

Describe evidence (e.g., direct, vehicles or vehicle tracks observed, or indirect, evidence of use associated with purpose of the route such as maintenance of facility that route accesses) and other rationale for whether use has occurred and will continue to occur on a relatively regular basis (i.e., regular and continuous use relative to the purpose(s) of the route).⁶

⁵ Good condition would be a condition that ensures regular and continuous use relative to the purposes of the route. Consider whether the route can be clearly followed in the field over its entire course and whether all or any portion of the route contains any impediments to travel.

⁶ Include estimate of travel rates for the stated purposes, e.g., trips/day or week or month or season or year or even multiple years in some facility maintenance cases.

IV. CONCLUSION

Does the route or route segment⁷ meet the definition of a wilderness inventory road (i.e., are items III.A and III.B and III.C all checked yes)?

Yes ____ = Wilderness Inventory Road

No ____ = Not a road for wilderness inventory purposes

Explanation⁸: _____

Evaluator(s): _____ Date: _____

⁷ If part of the route meets the wilderness inventory road definition and the remainder does not, describe the segment meeting the definition and any remaining portion not meeting the definition and why.

⁸ Describe and explain rationale for any discrepancies with citizen proposals.

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit

Unit Containing Wilderness Characteristics	Rationale
Worland Field Office	
008 DH	Do not manage for wilderness characteristics in this area due to the current land uses present in the area. Active sand and gravel pit north of area, which may be predicted to head south into the area. There currently are mining claims present, and the potential for future coal bed methane extraction exists in the area.
0016 DH	Do not manage for wilderness characteristics in this area due to the current land uses present in the area. Bentonite potential exists surrounding and within proximity to the area. In addition, approximately 50% of the area is leased for oil and gas.
0048 PR	There is a development potential for Coal Bed Methane; The area is 20% leased, 77% coal. Oil and gas leases are very important for sustaining historic and current land uses, as well as the potential for future CBNG development. The current land uses will conflict with managing for wilderness characteristics.
1536 PR	Do not manage for wilderness characteristics within the area due to potential commercial timber; cultural and wildlife management will indirectly benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.
Owl Creek Subunit 5 (formerly 661 TS)	<p>Presence of Gypsum, uranium and timber in the area. 97% of the area is unavailable to oil and gas leasing. Potential for gypsum and uranium to be mined is low due to terrain and access to the area.</p> <p>The area does contain high quality timber but is not accessible or feasible to logging. However, there is no history of commercial timber in the area because of the access and the difficult terrain would require a cable yarding system. The timber is of high quality but it is not economically available unless the timber market substantially increases. Logging in this area is not foreseeable.</p> <p>However, because the area is 97% unavailable to leasing, is managed under the Owl Creek ACEC, within the Absaroka Front Management Area, has low development potential, and from public comments, the area will not be managed specifically for wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics. Current and proposed management prescriptions from other resources management prescriptions will benefit wilderness characteristics.</p>
Owl Creek Subunits 1-4 (Formerly Owl Creek CP)	<p>41 % of the area has been identified as Commercial Forest Land, and 31% contains Uranium. Low potential for timber development because of the difficult access in the area as well as the terrain. It is estimated that only 50% of the timber in the area would be accessible because of the terrain. Cost of timber, access, and difficulty of using logging equipment in the area limits the potential of commercial timber. Uranium is a locatable mineral, not leasable. Potential for mining in the area is low due to the terrain and access.</p> <p>Because the area is 97% unavailable to leasing, is managed under the Owl Creek ACEC, within the Absaroka Front Management Area, has low development potential, and from public comments, the area will not be managed specifically for wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics. Current and proposed management prescriptions from other resources management prescriptions will benefit wilderness characteristics.</p>

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
1535 PR	<p>It is recommended not to manage for wilderness characteristics within the area. 16% of the area contains Gypsum, as well as 0.6% sand and gravel, 1.2 % limestone. Potential gypsum claims exist because Gypsum (and sand and gravel) are limited but are available.</p> <p>However, the area is identified as big game and sage grouse habitat. Oil and gas restraints encompass the entire area with TLS and CSU stipulations to address wildlife resources. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.</p>
568 TS	<p>7% of the area has been identified as Commercial Forest Land, 46% contains Limestone, and 8% Phosphate. The area has terrain which limits the development potential. Timber and limestone development are low and not foreseeable for the area.</p> <p>The only stand of Ponderosa Pine in the Grass Creek Resources Area (T. Stephens), Owl Creek ACEC, Absaroka Front Management Area (Draft EIS), 81% unavailable to leasing, .02% NSO, 14% CSU.</p> <p>Because of the very low potential for development, the area is managed as the Owl Creek ACEC, and 81% is unavailable. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics. Current and proposed management prescriptions from other resources management prescriptions will benefit wilderness characteristics.</p>
069 JW	<p>33% of the area contains Gypsum, and 2% Uranium, 4% Limestone. A gravel pit is located approx. 1 mile to the northwest.</p> <p>The terrain of the area makes the development unlikely. There are many places located in the area that have a much better potential for mineral development.</p> <p>96% of the area is under a CSU. CSU and TLS stipulations cover the entire area, which will adequately and indirectly maintain wilderness characteristics. Specific management for wilderness characteristics are not necessary.</p>
130 JW	<p>No extractive resources identified as available, the terrain will make any resource difficult to access. CSU (50%) and TLS stipulations cover the entire area, which will adequately and indirectly maintain wilderness characteristics. Specific management for wilderness characteristics are not necessary.</p>
Medicine Lodge CP Subunit A and B (Formerly Medicine Lodge North CP)	<p>Some potential exists for commercial timber, but remains low due to the ACEC and the emphasis on maintaining wildlife habitat. The difficult terrain and the Spanish Point Karst ACEC limit the availability of the resources.</p> <p>Most of the area overlaps with the Spanish Point Karst ACEC. In addition, groundwater recharge withdrawal, seasonal closure for wildlife, and archaeological resources requires management prescriptions which benefits wilderness characteristics. Due to existing ACEC management prescriptions, and overlapping TLS wildlife stipulations and CSU stipulations to maintain recreational resources, management to sustain or enhance wilderness characteristics within the area is not necessary. Wilderness characteristics will be adequately managed for within the area. In addition, upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.</p>

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
Paintrock CP	Paint Rock area is listed on the National Register of Historic Places. The area is one of the few areas that exposes the Hyattville member of Ten Sleep Sandstone making the area geologically unique. Overlapping CSU (to address recreational, cultural, and hydrological resources) and TLS stipulations (wildlife resources) cover the entire area, which will adequately and indirectly maintain wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics. Specific management for wilderness characteristics are not necessary.
Sheep Mountain CP	The area is adjacent to Sheep Mountain WSA. The northern portion of the area is within the 15-Mile MLP, and TLS stipulations to address wildlife resources underlay the area. These management prescriptions will benefit and aid in sustaining wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, some of the area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
669 AK	Upon development of the preferred alternative for the Bighorn Basin RMP revision, nearly the entire area is within the 15-Mile MLP, which stipulations are present to protect and manage for recreational resources, specific CSU stipulations to address recreation management, as well as overlapping TLS stipulations to address wildlife resources. These management prescriptions will benefit wilderness characteristics.
639 AK	Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics. In addition, CSU stipulations specific for recreation management, as well as overlapping TLS stipulations to address wildlife resources will further benefit wilderness characteristics. These management prescriptions will indirectly benefit wilderness characteristics.
31 PR	100% of the area is within a CSU. Because of the high potential for commercial harvest of timber, it is recommended not to manage for wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.
508 AK	69.11% leased for oil and gas; 12% of area contains sand and gravel, and active leases existing in the area. It is recommended to not manage for wilderness characteristics because of the existing leases for oil and gas. Upon development of the preferred alternative for the Bighorn Basin RMP revision, nearly the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
508 Tristate Gooseberry N Platte	45.89% of the area is leased for oil and gas, and the potential for mineral development exists judging by the amount of leases in the area. Recommended that managing the area for wilderness characteristics will conflict with current land uses. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
509 AK Dorsey Ck	The area has a high potential of oil and gas development (81% of area is under a lease) Recommended that managing the area for wilderness characteristics will conflict with current land uses. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
516 DH	69% of the area has been identified as Commercial Forest Land, 74% contains uranium; potential for timber harvest is high; the potential for uranium development is low. It is recommended not to manage to sustain the wilderness characteristics in the area due to the commercial harvest of timber. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics.
577 AK	92.68% of the area is currently under a lease for oil and gas; with the high potential for oil and gas extraction. It is recommended not to manage to sustain the wilderness characteristics in the area due to the active leases and high potential for extraction.
622 AK	Potential for oil and gas extraction is present (41.84% under a lease for oil and gas), as well as coal resources in the area. It is recommended not to manage to sustain the wilderness characteristics in the area due to the active leases and high potential for extraction, and the presence of other resources.
651 AK	There is the high potential for oil and gas extraction (61.63% leased for oil and gas), which managing the area to sustain wilderness characteristics would conflict with current land uses. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
665 CW	The development potential exists in the area (12.4% leased for oil and gas). There are existing stipulations (6 % NSO, 50% CSU) which aids wilderness characteristics, but, it is recommended that managing for wilderness characteristics in the area will conflict with current land uses, and conflict with the potential of future mineral extraction.
668 AK	Do not manage for wilderness characteristics in the area because the majority of area (98%) is under lease. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the majority of the area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
676 AK, PR	The area currently has stipulations which will assist in managing for wilderness characteristics (9% NSO, 40% CSU). It is recommended not to manage for wilderness characteristics due to the potential for oil and gas extraction (32% of the area is leased). Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
Alkali Creek NW CP	The area is 100% CSU, high potential for archaeological resources, which specific resource management will benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.
Bobcat Draw South II CP	Do Not manage the area for wilderness characteristics as it conflicts with oil and gas lease and potential for oil shale development. In addition, 66% of the area is within a CSU stipulation, which will benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the majority area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
Bobcat Draw West CP	It is not recommended to manage for wilderness characteristics in the area due to the current land uses (72% leased for oil and gas). Some characteristics will benefit from CSU stipulations within the area. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
Honeycombs 164 CP	99% of the area is identified as containing Coal, with very low potential for development; the area is could have potential for exploration of coal bed methane. It is not recommended to manage for wilderness characteristics within the areas due to the potential for resource development.
Honeycombs NW 107 CP	70% of the area is identified as containing Coal, very low potential for development; the area could have potential for exploration of coal bed methane. It is not recommended to manage for wilderness characteristics within the areas due to the potential for resource development.
Honeycombs S CP	98% of the area is identified as containing Coal, which the potential to extract coal bed methane exists, as well as the oil and gas leases within the area. It is not recommended to manage for wilderness characteristics within the areas due to the potential for resource development.
Red Butte North CP	Do not manage for wilderness characteristics in the area because the majority of area (83%) is under lease. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the majority of the area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
Bobcat Draw South CP	It is not recommended to manage for wilderness characteristics due to the potential for oil shale development, and existing oil and gas leases. 90% of the area is under CSU stipulations to manage for paleontological and archaeological resources, which will benefit wilderness characteristics.
652 Upper, Lower AK	It is not recommended to manage for wilderness characteristics due to existing oil and gas leases. In addition, 53% of the area is under CSU stipulations, as well as other resources (wild horse HMA, sensitive watershed, paleo resources) which those resources management prescriptions will benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
626 AK	The land status within the area will conflict with effective management prescriptions to maintain wilderness characteristics. NSO and CSU stipulations (14% and 33% respectively) within the area will benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the majority of the area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
509 AK	Do not manage for wilderness characteristics due to the sand and gravel pits and the conflicts with land status within the area. In addition, Wild Horse management prescriptions may indirectly benefit some of the wilderness characteristics within the area (i.e., management actions that will maintain or enhance conformance with the Wyoming Standards for Healthy Rangelands, and not actively promoting the 15-Mile HMA and maintaining remote natural characteristics). Upon development of the preferred alternative for the Bighorn Basin RMP revision, the majority of the area will be within the 15-Mile Master Leasing Plan, which provides for stipulations that will sustain soil and visual resources which will directly benefit wilderness characteristics.
005 PR	The surrounding private lands may be developed for residential, or 2 nd homes, therefore easements are more likely to be sought after and further developed; this is similar to what is being observed along the Hyattville Logging Road. Managing for wilderness characteristics may increase landowner conflicts and possible future easements. There are also commercial timber resources which may be recovered. In addition, NSO and CSU stipulations (2% and 80% of the area respectively) will benefit wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
Cody Field Office	
Carter Mountain	The area has an irregular land pattern and contains many inholdings. Secondary vehicle routes provide access to the nearest inholdings. Management actions for the Carter Mountain ACEC and the Absaroka Front SMA help protect naturalness. There are no current oil and gas leases in the area. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics.
Painted Hills	Much of the area lies within the Sheep Mountain Anticline ACEC. Many of the management actions for the ACEC help protect naturalness.
Trout Creek	The area lies within the Craig Thomas Little Mountain SMA and the management actions for that area help protect naturalness. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire area will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.
Sheep Mountain	Management actions for the proposed Sheep Mountain ACEC and the Absaroka front SMA subsequently continue to maintain the integrity of naturalness. There are no current oil and gas leases in the area. A large parcel of private land owned by The Nature Conservancy is being held for possible acquisition by BLM. Nearly all of this land lies on top of the mountain. There is a small parcel on the southwest side of the area that is also part of the proposal. Private and state lands nearly surround the area, and in addition, the boundary is highly irregular, which may prove difficult or inefficient to manage solely for wilderness characteristics. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics.
Rattlesnake Mountain	Area is highly developed. Rattlesnake Road, a dominant feature in the landscape, is the main access route into BLM and many of the spur routes within Rattlesnake Mountain are used primarily for logging and wood cutting activities. Managing for wilderness characteristics in this area will compromise these activities. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Absaroka Front Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation related resources, and visual resources which will directly benefit wilderness characteristics.
Cedar Ridge	Do not manage for wilderness characteristics in the area due to current oil and gas activity where approximately 68% of the area is under lease. Managing to sustain wilderness characteristics will conflict with current land uses.
Little Dry Creek	Do not manage for wilderness characteristics in the area because the majority of area (74%) is under lease, and new wells with associated development are currently proposed. Managing to sustain wilderness characteristics will conflict with current land uses.
North YU Bench	Do not manage for wilderness characteristics in the area because the majority of area (approximately 61%) is under lease. Managing to sustain wilderness characteristics will conflict with current land uses.
Crystal Creek	There is mineral potential (bentonite) present within the area, and mining claims are heading towards the interior of the area. Managing for wilderness characteristics will conflict with current and future land uses. Upon development of the preferred alternative for the Bighorn Basin RMP revision, the entire will be within the Bighorn Master Leasing Plan, which provides for stipulations that will sustain wildlife, recreation, and visual resources which will directly benefit wilderness characteristics.

Table S-1. Rationale for Not Managing Lands with Wilderness Characteristics for Naturalness, Outstanding Opportunities for Solitude, and Primitive and Unconfined Recreation, by Field Office and Unit (Continued)

Unit Containing Wilderness Characteristics	Rationale
Rough Gulch	64% of the area is covered by oil and gas leases. One of the proposed PETM ACEC units lies within a portion of the area. Some of the management actions for the ACEC help protect naturalness. The area is highly valued for its scenery and recreational opportunities (motorized and non-motorized). The area will be designated as part of the McCullough Peaks Special Recreation Management Area, management actions for the SRMA would help protect naturalness (NSO).
Whistle Creek	Portions of the area, approximately 33% of the area, contain oil and gas leases. The area has high potential for oil and gas and moderate to high development potential. The area is highly valued for its scenery and recreational opportunities (motorized and non-motorized). The area will be designated as part of the McCullough Peaks Special Recreation Management Area, management actions for the SRMA would help protect naturalness (NSO).
Coon Creek	83% of the area is covered by oil and gas leases. A portion of the area lies within one of the proposed PETM ACEC parcels, which management actions will benefit wilderness characteristics.
Bald Ridge	Management actions for the ACEC, and Absaroka Front SMA help protect naturalness. The entire area is within the Absaroka Front Management Area, MLP, and nearly the entire area within the Clarks Fork ACEC. These protective management layers will benefit the wilderness characteristics.

APPENDIX T

SURFACE DISTURBANCE AND REASONABLE FORESEEABLE ACTIONS

1.0 SUMMARY OF REASONABLE FORESEEABLE ACTIONS

This appendix includes information on surface disturbance and reasonable foreseeable actions within the Planning Area. Table T-1 provides projected acres of surface disturbance by resource. Table T-2 provides foreseeable development project assumptions by resource; the projected surface disturbances in Table T-1 are based on the project assumptions in Table T-2. The purpose of the Resource Management Plan (RMP) is to make land use allocations. The level of detail for impact analysis is to make informed land use allocations. This appendix on surface disturbance and reasonable foreseeable actions is a tool that was used to compare the impacts of land use allocations across the alternatives. Therefore, the estimated total number of individual activities and associated surface disturbance may be exceeded so long as the additional activities or location of the development would not change the land use allocations determined through the Record of Decision. These actions are subject to subsequent permitting and environmental analysis.

Table T-1. Summary of Projected Acres of Surface Disturbance by Resource

Type of Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Mineral Resources – Leasable Oil and Gas (includes CBNG)

Table T-1. Summary of Projected Acres of Surface Disturbance by Resource (Continued)

Type of Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Cumulative Disturbance						
Total Acres Short-Term Disturbance from BLM Actions	136,252.5	73,940.0	245,642.0	140,174.5	71,829.3	137,065.4
Total Acres Reclaimed from BLM Actions	120,606.5	63,047.3	204,157.0	121,868.5	62,008.3	119,383.9
Total Acres Long-Term Disturbance from BLM Actions	15,646.0	10,892.7	41,485.0	18,306.0	10,802.0	17,663.4
Total Acres Short-Term Disturbance from Non-BLM Actions	24,129.0	26,183.0	24,154.0	24,135.0	26,183.0	24,129.0
Total Acres Reclaimed from Non-BLM Actions	14,493.5	16,573.5	14,493.5	14,497.5	16,573.5	14,493.5
Total Acres Long-Term Disturbance from Non-BLM Actions	9,635.5	9,609.5	9,660.5	9,637.5	9,609.5	9,635.5
Cumulative Long-Term Acres of Disturbance	25,282	20,502	51,146	27,944	20,412	27,299

¹Based on the Reasonable Foreseeable Development for Geothermal (BLM 2009a), development is unlikely and would only occur on previously disturbed areas.

²Acres disturbed by mechanical fuels treatment and prescribed fire will naturally be reclaimed within 5 years.

³Includes range enhancements and other wildlife habitat restoration actions.

⁴Assumes 10 percent of the BLM actions acreages.

⁵Surface disturbance activities resulting from invasive species projects will be naturally reclaimed within 5 years. Therefore long-term disturbance from BLM actions will be zero.

⁶Based upon 58 percent BLM-administered surface; 42 percent private and state trust lands.

⁷Actions would likely be mostly oil and gas related, including CO₂ and energy pipelines.

⁸Approximately 50 percent of roads would be oil and gas related (based on the Reasonable Foreseeable Development Scenario for Oil and Gas [BLM 2009b; BLM 2013]), with the rest coming from local demand.

⁹20 sites at 0.5 acre each.

¹⁰Actions would likely be mostly oil and gas related.

AML Abandoned Mine Land
 BLM Bureau of Land Management
 CBNG Coalbed natural gas
 CO₂ Carbon dioxide
 ROW Rights-of-Way

Appendix T – Surface Disturbance and Reasonable Foreseeable Actions

Table T-2. Reasonable Foreseeable Development Assumptions

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Mineral Resources – Locatable						
Exploration (Number of Active Claims/Acres)	3,167/188,200	-	-	-	-	-
Acres Under Notice (common to all)	155/year	155/year	155/year	155/year	75/year (This number is decreased as ACEC designation in greater sage-grouse Key Habitat Areas precludes Notice submission – all 3809 exploration activities are submitted as Plans).	75/year (This number is decreased as ACEC designation in sage-grouse PHMAs precludes Notice submission – all exploration activities are submitted as Plans).
Acres Closed to Locatable Mineral Entry (surface/mineral estate)	65,090/174,354	271,370/325,102	23,916/47,846	48,728/72,031	1,148,232/ 1,375,585 (Estimate of all land that would be withdrawn from mineral entry. Takes into account acres already withdrawn in Alternative B and adds remaining fed surface/mineral acres included in all Key Habitat Areas).	48,728/72,031 (No locatable mineral withdrawals would be pursued in PHMAs so Alternative F = Alternative D).

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Acres Available for Locatable Mineral Entry (surface/mineral estate)	3,124,724/ 4,033,195	2,918,444/ 3,882,447	3,165,898/ 4,159,703	3,141,086/ 4,135,518	1,976,492/ 2,657,610 (Alternative A – Alternative E closed) (federal surface and mineral estate acres).	3,141,086/ 4,135,518 (No locatable mineral withdrawals would be pursued in PHMAs so Alternative F = Alternative D).
Projected Additional Acres Closed to Locatable Mineral Entry (mineral estate)	21,000	45,000	21,200	21,000	876,862	21,000 (No mineral withdrawal within ACEC is being pursued under Alternative F).

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Assumptions	<p>All BLM-administered mineral estate except in areas specifically withdrawn or closed to mineral entry would remain open for mining claim location, and exploration and development of locatable minerals.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>	<p>Large acreages in ACECs and other special management areas are proposed for withdrawal from mineral entry under the Mining Laws. However, this would not significantly limit opportunities to explore for and develop locatable minerals, as many areas in the Planning Area where locatable minerals occur would remain open to locatable mineral entry.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>	<p>Same as assumption under Alternative A, except less acreage would be proposed for withdrawal from mineral entry under the Mining Laws.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>	<p>Same as assumption under Alternative A, except less acreage would be proposed for withdrawal from mineral entry under the Mining Laws.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>	<p>Locatable mineral exploration would be conducted under a plan of operation and not a notice under Alt E with a Greater Sage-Grouse Key Habitat Areas ACEC designated in the Planning Area; Acres remain the same as Alternative B.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>	<p>Locatable mineral exploration would be conducted under a plan of operation and not a notice under Alt F with a Greater Sage-Grouse PHMAs ACEC designated in the Planning Area; Acres remain the same as Alternative D.</p> <p>Any surface management operations proposed on claims that pre-date a withdrawal would require a validity examination.</p>

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Development (Number of Sites/Acres)	23/31,500	-	-	-	23/31,500	23/31,500
Projected New Acres of Surface Disturbance	1000/year	1000/year	1000/year	1000/year	500/year	1000/year
Assumptions	Assumes 700 acres/year new mining disturbance in the CYFO for bentonite and gypsum and 300 acres/year new mining disturbance in the WFO for bentonite. New closures or withdrawals would not take place in areas where there are active bentonite, gypsum, or uranium mining claims. Assumes no new surface disturbance for uranium development.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Assumes 400 acres/year new mining disturbance in the CYFO for bentonite and gypsum and 100 acres/year new mining disturbance in the WFO for bentonite. New closures or withdrawals would not take place in areas where exploration for or development of locatable minerals are taking place. Assumes no new surface disturbance for uranium development.	Assumes 700 acres/year new mining disturbance in the CYFO for bentonite and gypsum and 300 acres/year new mining disturbance in the WFO for bentonite. New closures or withdrawals would not take place in areas where exploration for or development of locatable minerals are taking place. Assumes no new surface disturbance for uranium development.

Total Productive Wells	4,863	4,248	4,933	4,801	4,245	4,801

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Assumptions	All new wells would result in 3 acres of surface disturbance, which would be reduced to 1.5 acres of long-term disturbance through reclamation. A 1.5-acre areas of disturbance is assumed for all existing wells.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A
Assumptions	-	Reductions in non-federal wells from the baseline scenario under this alternative reflect potential impacts on the economic viability of drilling wells in areas where non-federal land is surrounded by BLM-administered lands closed to mineral leasing.	-	Same as Alternative B	Same as Alternative B	-

Appendix T – Surface Disturbance and Reasonable Foreseeable Actions

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Mineral Resources – Salable						
Mineral Material Disposals (Number of Sites/Acres)	77/3,760	-	-	-	46/800	77/3,760
Acres Closed to Mineral Material Disposals	231,854	2,541,750	348,215	184,193	2,811,915 (Estimate of all public land that would be closed to mineral material disposals. Takes into account acres already closed in Alternative B and adds remaining fed surface/mineral acres included in all Key ACEC areas).	184,913 (No additional public land would be closed to mineral material disposals in PHMAs so Alternative F = Alternative D).
Acres Open to Mineral Material Disposals	3,975,695	1,665,799	3,859,334	4,023,356	1,163,780 (Alternative A – Alternative E closed).	4,023,356 (Alternative F = Alternative D) See above.
Projected New Acres of Surface Disturbance	2,000	800	2,000	1,800	800	1,800
Assumptions	Assumes a total of 2,000 new acres of surface disturbance due to mineral materials disposal over next 20 years = 100 acres/year on public lands in the Planning Area.	Assumes a 60 percent reduction in the amount of public land available for mineral material disposals = 800 new acres of public land surface disturbance over 20 years = 40 acres/year new mineral materials-related disturbance on public lands in the Planning Area.	Assumes a total of 2,000 new acres of surface disturbance due to mineral materials disposal over next 20 years = 100 acres/year on public lands in the Planning Area.	Assumes a total of 2,000 new acres of surface disturbance due to mineral materials disposal over next 20 years = 100 acres/year on public lands in the Planning Area.	Assumes a 60% reduction in the amount of public land available for mineral material disposals = 800 new acres public land disturbance over 20 years = 40 ac/year new mineral materials-related disturbance on public lands in the Planning Area.	Assumes a total of 2,000 new acres of surface disturbance due to mineral materials disposal over next 20 years = 100 acres/year on public lands in the Planning Area.

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Mineral Resources – Geothermal						
Development (Number of Sites/Acres)	0/0	0/0	0/0	0/0	0/0 (as per Geothermal RFD)	0/0 (as per Geothermal RFD)
Fire and Fuels Management						
Prescribed Fire (acres)	2,000/year	1,000/year	4,000/year	2,000/year	900/year	2000/year
Assumptions			Assumes 2,000 acres for wildlife and 2,000 acres for other purposes.		Alternative E further restricts RX @ or below 12" precipitation zone.	No further restrictions from Alternative D.
Mechanical Fuels Management (acres)	1,500/year	250/year	3,000/year	1,500/year	250/year	1,500/year
Forest, Woodlands, and Forest Products						
Forest Products Sales (acres)	1,500/year	1,000/year	2,000/year	1,500/year	1,000/year	1,500/year
Invasive Species and Pest Management						
Assumptions	For all disturbed areas, assumes 10 percent requires treatment. Ten percent is based on 2 years' experience in treatment of previously disturbed areas for various resources. For federal oil and gas well disturbances, assumes 10 percent requires treatment on short-term disturbance and 10 percent requires treatment on long-term disturbance.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A

Appendix T – Surface Disturbance and Reasonable Foreseeable Actions

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
BLM Road Maintenance	No new disturbance	No new disturbance	No new disturbance	No new disturbance	No new disturbance	No new disturbance
Assumptions	Maintenance actions would be within existing disturbances.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A
Not associated with any surface disturbance (acres)	2,500	1,250	5,000	2,500	1,250	2,500
Assumptions	Based on average treated acres per year regardless if infestation resulting from surface disturbance activities or not.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A
Fish and Wildlife Resources						
Habitat Restoration and Enhancement: Sagebrush (acres)	2,000	1,000	2,000	2,000	900/year	2000/year
Assumptions	Same areas as accounted for in prescribed fire disturbance above.	Same areas as accounted for in prescribed fire disturbance above.	This makes up half of the prescribed fire disturbance above.	Same areas as accounted for in prescribed fire disturbance above.	Alternative E further restricts RX @ or below 12" precipitation zone.	No further restrictions from Alternative D.
Habitat Restoration and Enhancement: Aspen (acres)	50	100	0	50	100	50
Assumptions	Included as part of mechanical fuels management treatment noted above.	Included as part of mechanical fuels management treatment noted above.		Included as part of mechanical fuels management treatment noted above.	No further restrictions from Alternative B.	No further restrictions from Alternative D.

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Watershed Restoration and Enhancement (acres)	2,050	1,100	2,000	2,050	1,100	2,050
Stream Restoration, Structure Removal, and Other Fisheries Enhancements (number of sites/acres)	0	91	0	0	91	0
Assumptions		Over the life of the plan: 80 acres lentic restoration; 10 miles lotic restoration; assumes disturbance on 8 feet on either side of the stream = 10 acres per site.			No further restrictions from Alternative B.	No further restrictions from Alternative D.
Culvert Replacements (number of sites/acres)	0	3/1	0	0	3/1	0
Watershed Enhancement Projects						
Seeding and Restoration Projects (acres)	1,331	2,662	616	1,331	2,662	1,331
Assumptions	Based on watershed restoration projects to date.	Assumes greater emphasis on watershed restoration.	Assumes less emphasis on watershed restoration.	Based on watershed restoration projects to date.	Assumes greater emphasis on watershed restoration.	Assumes less emphasis on watershed restoration.
Abandoned Facilities and AML Restoration						
Abandoned Facility Restoration (acres)	10	10	10	10	10	10
AML Restoration (acres)	100	200	100	100	200	100

Appendix T – Surface Disturbance and Reasonable Foreseeable Actions

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Paleontological						
Fossil Collection (acres)	200	250	200	200	250	200
Assumptions	Currently, less than 10 acres/year are disturbed during paleontological excavations in the Planning Area. Assumes this rate would continue.	Alternative B promotes fossil collection and therefore will result in additional acreages.	Currently, less than 10 acres/year are disturbed during paleontological excavations in the Planning Area. Assumes this rate would continue.	Currently, less than 10 acres/year are disturbed during paleontological excavations in the Planning Area. Assumes this rate would continue.	Alternative E continues to promote fossil collection and therefore will result in additional acreages.	Less than 10 acres/year are disturbed during paleontological excavations in the Planning Area. Alternative F assumes this rate would continue.
Renewable Energy						
Wind Energy Development (number of sites/acres)	1/200	1/200	1/200	1/200	1/200	1/200
Rights-of-Way (ROW)						
Communication Site Development (number of sites/acres)	20/10	20/10	20/10	20/10	20/10	20/10
Powerline Development (number of sites/acres)	196/338	132/229	208/359	196/338	132/229	165/312
Pipeline Development (number of sites/acres)	122/2,949	90/2,196	128/3,101	122/2,949	90/2,196	122/1,178
Road Development (number of sites/acres)	220/1,966	137/1,229	519/4,638	220/1,966	137/1,229	220/1,966
Comprehensive Trails and Travel Management						
Road Maintenance	No new disturbance	No new disturbance	No new disturbance	No new disturbance	No new disturbance	No new disturbance
Assumptions	Assumes maintenance actions would be within existing disturbances.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A

Table T-2. Reasonable Foreseeable Development Assumptions (Continued)

Type of Development/Disturbance	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
BLM Road and Trail Creation (acres)	1,233	2,776	12,907	5,820	1,221	5,820
Methods/Assumptions	There has been an average of 61 acres/year of new road/trail creation over the past 20 years.	Assumes 138 acres/year of new road/trail construction over the life of the plan.	Assumes 645 acres/year of new road/trail construction over the life of the plan.	Assumes 291 acres/year of new road/trail construction over the life of the plan.	41% more roads and trails than Alternative B in WFO, and 15% more roads and trails in CYFO are subject to closure and reclamation.	Same as Alternative D
Recreation						
Campsites (number of sites/acres)	7/14	27/54	4/8	20/40	26/12	19/38
Interpretive Sites (number of sites/acres)	15/78	30/111	7/70	29/107	28/107	27/105
Other Facilities (number of sites/acres)	29/257.5	44/2,088	16/11,232.5	45/5,750	22/2061.3	26/5672
Livestock Grazing						
Reservoir/Pit Development (number of sites/acres)	73/40	36/20	146/80	73/40	36/20	69/38
Well Development (number of sites/acres)	23/5	12/2.5	46/10	23/5	12/2.5	22/4.7

APPENDIX U

TECHNICAL SUPPORT DOCUMENT FOR AIR QUALITY

1.0 INTRODUCTION

This technical support document describes the air quality impact analysis for the Proposed Bighorn Basin Resource Management Plan (RMP) revision, Final Environmental Impact Statement (EIS). This appendix is divided into the following five sections:

- 2.0 Regulatory Framework
- 3.0 Thresholds of Significance
- 4.0 Air Quality Impact Analysis
- 5.0 Emission Calculations
- 6.0 References

Copies of this technical support document and accompanying data files are available upon request from the Bureau of Land Management (BLM) Cody or Worland Field Offices.

2.0 REGULATORY FRAMEWORK

The basic framework for controlling air pollutants in the United States is mandated by the 1970 Clean Air Act (CAA) and its amendments, Environmental Protection Agency (EPA) regulations, including the 1999 Regional Haze Regulations, and state and local air quality regulations. The CAA addresses criteria air pollutants, state and national ambient air quality standards for criteria air pollutants, and the Prevention of Significant Deterioration (PSD) program. The Regional Haze Regulations address visibility impairment. EPA regulations address ambient air quality standards for criteria pollutants, emission control technology, air quality monitoring, and State Implementation Plan (SIP) development (which may include air quality modeling), and air quality related value (AQRV) analyses related to regional haze.

2.1 Ambient Air Quality Constituents

Air pollutants addressed in this study include criteria pollutants, hazardous air pollutants (HAP), sulfur and nitrogen compounds, which could cause visibility impairment (regional haze) or atmospheric deposition impacts, and greenhouse gases.

2.1.1 Criteria Pollutants

Criteria pollutants are those for which national standards of concentration have been established. Ambient air concentrations of these constituents greater than the standards represent a risk to human health. Criteria pollutants include carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), ozone (O₃), particulate matter (PM₁₀, PM_{2.5}), and lead, each of which is listed below.

Carbon Monoxide. CO is an odorless, colorless gas formed during any combustion process, such as operation of engines, fireplaces, and furnaces. High concentrations of CO affect the oxygen-carrying capacity of the blood and can lead to unconsciousness and asphyxiation. Wildfires are natural sources of CO.

Nitrogen Dioxide. NO₂ is a red-brown gas formed during the operation of internal combustion engines or other burning processes. Such processes emit a mixture of nitrogen gases, collectively called nitrogen oxides (NO_x). NO_x can contribute to brown cloud conditions and can convert to ammonium nitrate particles and nitric acid, which can cause visibility impairment and acid rain. Bacterial action in soil can be a natural source of nitrogen compounds.

Sulfur Dioxide. SO₂ forms during combustion from trace levels of sulfur in coal or diesel fuel. It can convert to ammonium sulfate and sulfuric acid, which can cause visibility impairment and acid rain. Volcanoes are natural sources of SO₂. Anthropogenic sources include refineries and power plants.

Ozone. O₃ is a gas that generally is not emitted directly into the atmosphere, but is formed from the chemical reactions of NO_x and volatile organic compound (VOC) emissions. As stated above, internal combustion engines are the main source of NO_x, while sources of VOCs include, but are not limited to, leaks from oil and gas development operations (“fugitive” emissions), paint, varnish, and various types of vegetation. The faint acrid smell common after thunderstorms is caused by ozone formation caused by lightning. Ozone is a strong oxidizing chemical that can burn lungs and eyes, as well as damage plants.

Particulate Matter. Particulate matter (e.g., soil particles, hair, pollen) are essentially small particles suspended in the air that settle to the ground slowly and may be re-suspended if disturbed. Separate allowable concentration levels for particulate matter are based on the relative size of the particle:

- PM₁₀ particles, particles with diameters of less than 10 micrometers, are small enough to be inhaled and can cause adverse health impacts.
- PM_{2.5} particles, particles with diameters of less than 2.5 micrometers, are so small that they can be drawn deeply into the lungs and cause serious health problems. Particles of this size also are the main cause of visibility impairment.

Lead. Before the widespread use of unleaded fuel in automobiles, lead particles were emitted from automobile tailpipes. Lead is not considered in this RMP and EIS because no proposed projects are expected to emit lead. The lead standard also will not be addressed in this appendix because lead is not a current concern; it will, however, be considered in future projects. Lead is also generally not considered in site specific environmental analysis for similar reasons.

2.1.2 Hazardous Air Pollutants

Although HAPs, including N-hexane, ethylbenzene, toluene, xylene, formaldehyde, and benzene, do not have ambient air quality standards, the EPA has issued reference concentrations for evaluating the inhalation risk for cancerous and noncancerous health impacts, known as reference concentrations for chronic inhalation.

The EIS associated with the Bighorn Basin RMP is a National Environmental Policy Act (NEPA) document and not a regulatory document. However, there are regulatory issues that should be taken into account in preparing this EIS and ensuing project-specific EISs. Actual regulation of HAPs is achieved through compliance with the applicable maximum achievable control technology (MACT) standards and not through ambient air quality standards. Regulatory agencies implement control through Section 112

programs, specifically Section 112(g) case-by-case MACT determinations based on 40 CFR Part 63, Subpart B, and Section 112(d) MACT emission standards.

Any source that emits or has the potential to emit 10 tons per year or more of any HAP or 25 tons per year or more of any combination of HAPs is considered a major source and will require a Title V, Part 70, operating permit review and permit. This may include either a case-by-case 112(g) MACT determination, if the source is new or has had major modifications and no applicable MACT emission standard has been promulgated, or compliance with an applicable MACT emission standard. Specific regulations that may apply in the Planning Area include 40 CFR Part 63 Subpart HH, National Emission Standards for Hazardous Air Pollutants From Oil and Natural Gas Production Facilities; 40 CFR Part 63 Subpart HHH, National Emission Standards for Hazardous Air Pollutants From Natural Gas Transmission and Storage Facilities; and 40 CFR Part 63 Subpart ZZZ, National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines. This last regulation, new in 2004, affects source categories using reciprocating engines for gas compression. HAP emissions are associated with industrial activities, such as oil and gas operations, refineries, paint shops, dry cleaning facilities, and woodworking shops. Because this analysis is qualitative, no specific analyses of either short- or long-term HAP impacts are made.

2.1.3 Atmospheric Deposition Constituents

Sulfur and nitrogen compounds that can be deposited in terrestrial and aquatic ecosystems include nitric acid, nitrate, ammonium, and sulfate. Nitric acid and nitrate are not emitted directly into the air, but form in the atmosphere from industrial and automotive emissions of NO_x. Sulfate is formed in the atmosphere from industrial emission of SO₂. Deposition of nitric acid, nitrate, and sulfate can adversely affect plant growth, soil chemistry, lichens, aquatic environments, and petroglyphs. Ammonium is primarily associated with feedlots and agricultural fertilization. Ammonium deposits can affect terrestrial and aquatic vegetation. Although deposition may be beneficial as a fertilizer, it can adversely affect the timing of plant growth and dormancy. Although this analysis will be qualitative, future specific projects will require quantitative analyses using the criteria listed below.

Greenhouse Gases

Greenhouse gases (GHGs) are pollutants that are effective in preventing heat from escaping the earth's atmosphere and have been attributed to altering components of the earth's climate. These include carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O). Other identified GHGs, including hydroflourocarbons, perflourocarbons, and sulfur hexafluoride were not included in the analysis because proposed activities are not sources of these pollutants and emissions are expected to be insignificant or zero.

3.0 THRESHOLDS OF SIGNIFICANCE

Criteria Pollutants

National Ambient Air Quality Standards (NAAQS) and Wyoming Ambient Air Quality Standards (WAAQS) are health-based standards that identify maximum limits for criteria air pollutant concentrations at all locations to which the public has access. The NAAQS and WAAQS are legally enforceable standards. Concentrations that are above the NAAQS and WAAQS represent a risk to human health and by law, require public safeguards be implemented. State standards must be at least as protective of human health as federal standards, and may be more restrictive than the federal standards as allowed by the CAA. The EPA has developed standards for each pollutant for a specific averaging time. Short averaging times (1, 8, and 24 hours) address short-term exposure, while the annual standards address long-term exposure.

Chapter 3 of the Proposed RMP and Final EIS presented the national primary air quality standards and the Wyoming primary air quality standards. Analyses of proposed alternatives for project-specific EISs compare cumulative concentrations of air pollutants to the NAAQS and WAAQS. The BLM requires that all authorized activities comply with applicable local, state, tribal, and federal air quality laws, regulations, and standards.

3.1.1 Prevention of Significant Deterioration

The goal of the PSD program is to ensure that air quality in areas with clean air does not significantly deteriorate, while a margin for future industrial growth is maintained. Major stationary sources are governed by the PSD program, which is unlikely to apply to BLM sources in the Planning Area with the exception of gas compressor stations. Under the PSD program, each area in the United States is classified by the air quality in that region according to the following system:

- **PSD Class I Areas.** Areas with pristine air quality, such as wilderness areas, national parks, and some Native American reservations, are accorded the strictest protection. Only very small incremental increases in pollutant concentrations are allowed in order to maintain the very clean air quality in these areas.
- **PSD Class II Areas.** Essentially, all areas that are not designated as Class I are designated as Class II. Moderate incremental increases in pollutant concentrations are allowed, although the concentrations are not allowed to reach the concentrations set by Wyoming and federal standards (WAAQS and NAAQS).
- **PSD Class III Areas.** No areas have been designated yet as Class III. A larger incremental increase in pollutant concentrations would be allowed, up to the applicable WAAQS and NAAQS.

The incremental increases allowed for specific pollutants in Class I and Class II areas can be found in the Wyoming Air Quality Standards and Regulations (Wyoming DEQ 2004). Comparisons of potential PM₁₀, NO₂, and SO₂ concentrations with PSD increments are intended to evaluate a threshold of concern only and do not represent a regulatory PSD increment consumption analysis. Regulatory PSD increment consumption analyses are solely the responsibility of the State of Wyoming, which has been granted primacy (with EPA oversight) under the CAA. In project-specific EISs, the BLM does not expect that a PSD analysis will be performed; rather, the PSD standards are used as a reference only to give the public a better understanding of the level of potential impact.

Hazardous Air Pollutants

Section 112 of the CAA lists more than 180 chemicals as HAPs. In addition, Sections 112 (d) and 112(g) require regulatory agencies to establish MACT Standards for sources that emit HAPs. Any source that emits or has the potential to emit 10 tons per year or more of any HAP or 25 tons per year or more of any combination of HAPs is considered a major source and will require a Title V, Part 70, operating permit review and permit. In addition to MACT standards, EPA has listed (on its Air Toxics Database) Reference Exposure Levels (RELs) for many of the HAPs. RELs are defined as concentrations at or below which no adverse health effects are expected.

3.2 Regional Haze

Visibility impairment in the form of regional haze obscures the clarity, color, texture, and form of what we see. Haze-causing pollutants (mostly fine particles) are directly emitted into the atmosphere or are formed when gases emitted into the air form particles as they are carried downwind. Emissions from human-caused and natural sources can be carried great distances, contributing to regional haze. The current method for assessing impacts on visibility is described in the Federal Land Managers' Air Quality Related Values Work Group (FLAG) Phase I Report—Revised 2010 and is hereafter referred to as the FLAG 2010 method (FLAG 2010). This method compares incremental changes in light extinction relative to estimated natural background to a 5-percent change in light extinction threshold and a 10-percent change in light extinction threshold. Using the 98th percentile values, a 5-percent change in light extinction (approximately equal to 0.5 deciview [dv]) is the threshold recommended in FLAG 2010 and is considered to contribute to regional haze visibility impairment. A 10-percent change in light extinction (approximately equal to 1.0 dv) is considered to cause visibility impairment when compared to background conditions.

The Wyoming Department of Environmental Quality (DEQ)—Air Quality Division (AQD) originally submitted its Regional Haze SIP in accordance with 40 CFR, Part 51.309, in December 2003. This SIP emphasized reductions in SO₂ emissions with a goal of improving visibility on the Colorado Plateau. Since its submission, EPA revised 40 CFR, Parts 51.308 and 309 based on legal actions, and a revised 309 SIP was submitted by Wyoming DEQ in November 2008. A draft supplemental revision to the 309 SIP was prepared in August 2009.

The EPA developed regional haze regulations in response to the CAA amendments of 1977 and 1990. These regulations are intended to maintain visibility on the least-impaired days and to improve visibility on the most-impaired days in mandatory federal Class I areas across the United States, so that visibility in these areas is returned to natural conditions by the year 2064. These regulations require states to submit a regional haze SIP and progress reports to demonstrate reasonable progress toward the 2064 goal.

Atmospheric Deposition

As described in the Federal Land Managers' AQRV Work Group (FLAG) Phase I Report – Revised 2010 (FLAG 2010), the National Park Service, the United States Forest Service (USFS), and the United States Fish and Wildlife Service (USFWS) have established thresholds to evaluate nitrogen and sulfur deposition within Class I areas. These deposition analysis thresholds (DATs) are defined as 0.005 kilogram per hectare per year (kg/ha/yr) in the western United States for both nitrogen and sulfur. These thresholds are typically used to analyze impacts of individual projects. Cumulative impacts are typically compared to the level of concern, which is defined by the National Park Service and USFWS as 3 kg/ha/yr for

nitrogen and 5 kg/ha/yr for sulfur in Rocky Mountain regions. Deposition rates that are below the level of concern are believed to cause no adverse impacts.

Lake Chemistry

The USFWS considers lake chemistry changes to be potentially significant if the screening methodology predicts decreases in acid neutralizing capacity (ANC) of more than defined limits of acceptable change (LAC). A lake's LAC depends on its background ANC value. The LAC is defined as a 10 percent change for lakes with ANC background values greater than 25 microequivalents per liter (eq/l) and is defined as a change of 1 eq/l for lakes with ANC background values less than 25 eq/l. If the ANC of a lake is predicted to decrease by more than the applicable LAC then potential changes to lake chemistry may cause adverse effects and a more detailed analysis of lake chemistry impacts would be required.

3.3 Applicability to the Planning Area

Air pollution impacts are limited by local, state, tribal, and federal air quality regulations, standards, and implementation plans established under the CAA and administered by the Wyoming DEQ AQD with oversight from the EPA. Air quality regulations require that proposed new, or modified existing, air pollutant emission stationary sources (including oil and gas compression facilities) undergo a permitting review before their construction can begin. Therefore, the Wyoming DEQ AQD has the primary authority and responsibility to review permit applications and to require emission permits, fees, and control devices before construction or start of operation. Fugitive dust and exhaust from construction activities, along with air pollutants emitted during operation (for example, well operations, booster and pipeline compressor engines associated with natural gas wells), are potential causes of air quality impacts. These issues are more likely to generate public concern where natural gas development activities occur near residential areas or near sensitive Class I and Class II areas.

The USFS, the National Park Service, and the USFWS, located throughout Wyoming, also have expressed concerns about potential atmospheric deposition (acid rain) and visibility impacts within downwind PSD Class I and PSD Class II sensitive areas under their administrations.

Table U-1 provides a summary of recent air quality conditions for NO₂, ozone, PM₁₀, and PM_{2.5}, taken from measurements for the period 2010-2012 from available monitors located within or nearby the planning area. These include maximum 24 hour and annual averages for PM_{2.5}, maximum 1 hour averages for NO₂, maximum annual averages for PM₁₀, and the 4th highest 8-hour average ozone concentration for each year, from which the ozone design value is derived. Except for a relatively high measured 24-hour average concentration of PM_{2.5} at the Lander site for 2010, located outside the Planning Area, most concentrations measured during this period are well within the applicable standards. Given the Planning Area's current attainment status, future development projects that have the potential to emit more than 250 tons per year of any criteria pollutant (or certain listed sources that have the potential to emit more than 100 tons per year) would be required to undergo a site-specific regulatory PSD increment consumption analysis under the federal New Source Review permitting regulations.

Development projects that require PSD permits also may be required by the applicable air quality regulatory agencies to incorporate additional emission control measures (including a best available control technology [BACT] analysis and determination) to ensure protection of air quality resources and to demonstrate that the combined impacts of all PSD sources will not exceed the allowable incremental air quality impacts for NO₂, PM₁₀, and SO₂. Minor sources having emissions below the cutoff rates

mentioned above do not require PSD permits; nevertheless, their emissions consume increment. A regulatory PSD increment consumption analysis may be conducted, either as part of a New Source Review or independently. The determination of PSD increment consumption is a responsibility of the applicable air quality regulatory agencies, with EPA oversight. In addition, an analysis of cumulative impacts due to all existing sources and the permit applicant’s sources is required during a New Source Review to demonstrate that applicable ambient air quality standards will be met during the operational lifetime of the permit applicant’s operations.

Sources subject to the PSD permit review procedure also are required to demonstrate potential impacts on AQRV. These include visibility impacts, degradation of mountain lakes due to atmospheric deposition (acid rain), and impacts on sensitive flora and fauna in Class I areas. The CAA also provides specific visibility protection procedures for the mandatory federal Class I areas designated by the United States Congress on August 7, 1977, which included wilderness areas greater than 5,000 acres in size, as well as national parks and national memorial parks greater than 6,000 acres in size as of that date.

Table U-1. Recently Observed NO₂, O₃, PM₁₀, and PM_{2.5} Concentrations Within and in the Vicinity of the Planning Area and Applicable Air Quality Standards

Pollutant/Monitoring Site (ID)	Average Time/Measurement	2010	2010	2012	NAAQS
Nitrogen Dioxide (NO₂) (ppb)					
Thunder Basin Grassland	1 hour (max)	15	16	25	100
Ozone (O₃) (ppb)					
Basin	8 hours (4th high)	55	56	57	75
Thunder Basin	8 hours (4th high)	63	61	71	75
PM₁₀ (µg/m³)					
Cody	24 hours (max)	25	46	45	150
Sheridan – Highland Park	24 hours (max)	36	48	25	150
Sheridan – Police Station	24 hours (max)	70	96	75	150
PM_{2.5} (µg/m³)					
Lander	Annual	9.3	7.8	7.8	15
Sheridan – Highland Park	Annual	8.8	5.5	4.3	15
Sheridan – Police Station	Annual	8.7	7.6	8.3	15
Lander	24 hours (98th %)	32.0	30.0	25.0	35
Sheridan – Highland Park	24 hours (98th %)	14.0	15.0	10.0	35
Sheridan – Police Station	24 hours (98th %)	27.0	23.0	19.0	35

- % percent
- NAAQS National Ambient Air Quality Standards
- NO₂ nitrogen dioxide
- O₃ ozone
- PM_{2.5} particulate matter less than 2.5 microns in diameter
- PM₁₀ particulate matter less than 10 microns in diameter
- ppb parts per billion
- ppm parts per million
- µg/m³ micrograms per cubic meter

4.0 AIR QUALITY IMPACT ANALYSIS

As described in Chapter 4, a qualitative emission comparison approach was used for this assessment. A qualitative method was selected because of a lack of specific project information on location, types, and magnitude of potential projects. Emissions calculations (see 5.0 *Emission Calculations*) were based on the best available engineering data and assumptions, emission inventory procedures, and professional and scientific judgment. For any future projects, significance criteria for potential air quality impacts will include local, state, tribal, and federally enforced legal requirements to ensure that air pollutant concentrations remain within specific allowable levels.

It is important to note that before actual development could occur, the applicable air quality regulatory agencies (including the state, tribe, or the EPA) would need to review specific air pollutant emissions preconstruction permit applications that examine potential project-specific air quality impacts. As part of these permit reviews (depending on source size), the air quality regulatory agencies could require additional quantitative air quality impact analyses or mitigation measures. Thus, before development occurred, additional site-specific air quality analyses may need to be performed to ensure protection of air quality. Federal land managers may require a demonstration that potential impacts from proposed projects would not adversely affect AQRV (including visibility) in sensitive Class I and Class II areas.

5.0 EMISSION CALCULATIONS

For this analysis, emissions of PM₁₀, PM_{2.5}, NO_x, SO₂, CO, VOC, and HAPs were estimated for a 20-year period, beginning with 2008 as the base year, 2018 as the mid-point interim year, and 2027 as the end of this period. Emissions were estimated for the six alternatives: Alternative A (Current Management), Alternative B (Least Resource Use), Alternative C (More Resource Use), Alternative D (Preferred Alternative), Alternative E (Sage-Grouse Key Habitat Areas ACEC), and Alternative F (Sage-Grouse Priority Habitat Management Areas ACEC). Emissions were estimated for the base year 2008 corresponding to Alternative A while emissions for all alternatives were estimated for 2018 and 2027. A set of spreadsheets, originally developed for use in preparing emissions for the Casper RMP revision (BLM 2007), were updated and adapted for use in estimating emissions for the Planning Area for these years. The spreadsheets were updated with the latest emission factors for motor vehicles, off-road engine types, and other activities corresponding to the base year (2008), and the out years, 2018 and 2027. Emission factors used to estimate emissions for various categories were obtained from (1) the EPA NONROAD2008a Emissions Model (EPA 2008), (2) Wyoming DEQ AQD BACT levels for natural gas-fired internal combustion engines (Wyoming DEQ 2011), and (3) the MOBILE6.2.03 emission factor model for on-road vehicles (EPA 2003). Information regarding equipment types, numbers, activity, etc., for the various emission categories/activities was provided by specialists in the BLM Cody (CYFO) and Worland (WFO) Field Offices.

When reviewing the emission inventory, it is important to understand that assumptions were made regarding development. For example, there is uncertainty regarding ultimate development of energy resources (e.g., number of wells, equipment used, specific locations of wells, etc.). In general, the assumptions that were made would tend to result in a conservatively high estimate of emissions. For instance, given the number of sources included in this analysis, the likelihood that all emission sources would actually operate at their reasonable, foreseeable maximum emission rates over an entire year (or even 24 hours) is small. A summary of total emissions for each pollutant species from all BLM activities is presented in Chapter 4, *Air Quality* section. Detailed emission totals for each category/planning year are presented at the end of this section.

The analysis includes emissions estimates for the following activities: (1) oil development, (2) natural gas development, (3) salable minerals development, (4) locatable minerals development, (5) renewable energy development, (6) livestock management activities, (7) vegetation management, (8) vegetation management of invasive species, (9) fire management (including prescribed fire), (10) forest and woodlands activities, (11) rights-of-way (ROW) and corridors, (12) off-highway vehicle (OHV) use, and (13) resource road maintenance. Because of the difficulty in accurately estimating emission factors for fugitive VOC emissions from oil and gas development operations, and emissions from any prescribed fire activities conducted on BLM land within the Planning Area, these types of emissions have not been estimated in this analysis. Also, activities related to cultural resources, paleontology, recreation, and wildlife and fish would produce inconsequential amounts of air emissions and are not included in the emission summaries.

5.1.1 Assumptions Used in Developing Emissions for the Bighorn Basin RMP

The following assumptions were used in the emission calculations:

- All emission sources operated at their reasonably foreseeable maximum emission rates (as identified in the other resource sections of this document) simultaneously throughout the area.
- All conventional oil and gas wells existing currently and projected in the reasonably foreseeable development (RFD) scenario, were assumed to be fully operational and to remain operating, except for normal projected well closures throughout the area. Well numbers were provided by the CYFO and the WFO.
- Activity data associated with management actions other than those related to conventional natural gas and oil wells were averaged over the entire analysis period to produce annual average emissions. Oil and gas activity follows RFD projections both in time and duration.
- Induced or secondary growth related to increases in vehicle miles traveled is not included in the emissions inventory. Only activities directly related to BLM actions are considered.
- Stationary sources associated with oil and gas development would operate at emission levels based on currently observed BACT levels, and compressor stations for natural gas would be equipped with nonselective catalytic reduction (NSCR) catalyst. Also, it is assumed that conventional natural gas well fields would use gas gathering systems and process gas through centralized dehydration units.
- Activity data associated with management actions other than those related to conventional natural gas wells were averaged over the entire analysis period to produce annual average emissions, except for renewable energy development, where the single development activity was assumed to occur in one year (2018).
- EPA off-road emission standards were used to estimate emissions for non-road sources in project years 2008, 2018, and 2027. This approach simulates the replacement of existing sources by new lower-emitting equipment with future EPA off-road engine emission standards.
- Use of water application as a best management practice (BMP) would reduce fugitive dust emissions from ground-disturbing activities during construction and reclamation activities and maintenance of roads at project sites by 50 percent from uncontrolled levels.
- BMPs for surface-disturbing activities are applied under all alternatives. Appendix H lists standard mitigation guidelines that are used in the Planning Area to mitigate adverse impacts caused by surface-disturbing activities. These BMPs provide protection to soil resources and minimize adverse impacts to soil stability, compaction, and productivity.

Detailed descriptions for emissions estimation for each activity follow. Individual tables of air emissions for all BLM activities were calculated in spreadsheets for each activity.

5.1.2 Oil and Natural Gas Wells Emissions Estimation

Criteria pollutant emissions from oil and conventional natural gas wells development were calculated based on data provided by the CYFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions from conventional natural gas wells include the following:

- Fugitive dust and combustive emissions from well pad construction activities
- Fugitive dust and combustive emissions from road traffic
- Combustive emissions from natural gas-fired compressors
- Fugitive dust and combustive emissions from separators, dehydrators, and water-tank heater operations
- Fugitive dust and combustive emissions from compressor station visits
- Fugitive dust and combustive emissions from well workover operations
- Fugitive dust and combustive emissions from well and pipeline visits for inspection and repair
- VOC emissions from tank condensate and truck loadout (for natural gas wells only)
- Fugitive dust and combustive emissions from road-maintenance activities
- Fugitive dust and combustive emissions from road and well reclamation activities

Estimated emissions from oil wells include the following:

- Fugitive dust and combustive emissions from well pad construction activities
- Fugitive dust and combustive emissions from road traffic
- Fugitive dust and combustive emissions from well workover operations
- Fugitive dust and combustive emissions from well and pipeline visits for inspection and repair
- Fugitive dust and combustive emissions from road maintenance activities

5.1.3 Salable and Locatable Minerals Emissions Estimation

Criteria pollutant emissions from salable and locatable minerals operations were calculated based on data provided by the CYFO and used best available information, BACT, AP-42, and emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust emissions from sand and gravel or mineral processing
- Emissions from truck traffic on unpaved roads at the sand and gravel or mineral processing plant
- Emissions from batch-drop operations
- Fugitive dust and combustive emissions from development and reclamation activities

5.1.4 Renewable Energy Development Emissions Estimation

Criteria pollutant emissions from renewable energy activities were calculated based on data provided by the CYFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from wind-energy development
- Fugitive dust emissions from commuting vehicles on unpaved roads
- Combustive emissions from commuting vehicles on unpaved and paved roads

5.1.5 Livestock Management Emissions Estimation

Criteria pollutant emissions from livestock management projects were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from construction of springs, reservoirs and pits, wells, pipelines, fences, and reservoir maintenance
- Fugitive dust emissions from commuting vehicles on unpaved roads
- Combustive emissions from commuting vehicles on unpaved and paved roads

5.1.6 Vegetation Emissions Estimation

Criteria pollutant emissions from vegetation operations including management of invasive species were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from vegetative mechanical treatments (excluding hand work)
- Fugitive dust emissions from commuting vehicles on unpaved roads
- Combustive emissions from commuting vehicles on unpaved and paved roads

5.1.7 Fire Management Emissions Estimation

Criteria pollutant emissions from fire management activities were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from mechanical treatments (hand work) and prescribed fire
- Fugitive dust emissions from commuting vehicles on unpaved roads
- Combustive emissions from commuting vehicles on unpaved and paved roads

5.1.8 Forest and Woodlands Emissions Estimation

Criteria pollutant emissions from forest and woodlands activities were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from silviculture treatments, forest products, weed treatments, and insect control
- Fugitive dust emissions from commuting vehicles on unpaved roads
- Combustive emissions from commuting vehicles on unpaved and paved roads

5.1.9 Rights-of-Way Corridor Emissions Estimation

Criteria pollutant emissions from ROW corridor operations were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include the following:

- Fugitive dust and combustive emissions from construction of roads, telephone and fiber optics, powerlines, pipelines (mineral/water), communication sites, and other facilities
- Fugitive dust and combustive emissions for commuting vehicle road traffic

5.1.10 Off-Highway Vehicles Emissions Estimation

Criteria pollutant emissions from OHVs were calculated using the EPA's NONROAD2008a emissions model for Park, Hot Springs, Big Horn, and Washakie Counties for 2008, 2018, and 2027. OHVs for this category include all-terrain vehicles (ATVs), off-road motorcycles (dirt bikes), and snowmobiles. It was assumed in this analysis that activity (and resulting emissions) for this category would be the same for all alternatives for 2018 and 2027. As a check of the estimates from the NONROAD2008 model, Table U-2 provides estimates for "nonroad recreational equipment" for 2002 for these counties obtained from the Western Regional Air Partnership (WRAP) web site (WRAP 2009). It is assumed that ATVs, off-road motorcycles, and snowmobiles make up the majority of the recreational equipment category. The estimates prepared by WRAP are comparable to those provided by the NONROAD2008 model for 2005 for these counties.

Table U-2. 2002 Annual Nonroad Emission Estimates for Recreational Equipment for the Planning Area Prepared by WRAP

County	Emissions					
	VOC (tpy)	NO _x (tpy)	CO (tpy)	PM ₁₀ (tpy)	PM _{2.5} (tpy)	SO ₂ (tpy)
Big Horn County	231.97	3.36	837.81	5.35	4.93	0.49
Hot Springs County	504.68	3.80	1,281.48	11.62	10.69	0.93
Park County	192.09	7.47	754.66	5.86	5.43	0.77
Washakie County	284.28	2.35	730.65	6.59	6.07	0.54
Total	1,213.03	16.98	3,604.60	29.43	27.12	2.72

Source: WRAP 2009

Note: Totals may not add up due to rounding

CO	carbon monoxide	SO ₂	sulfur dioxide
NO _x	nitrogen oxide	tpy	tons per year
PM _{2.5}	particulate matter less than 2.5 microns in diameter	VOC	volatile organic compound
PM ₁₀	particulate matter less than 10 microns in diameter	WRAP	Western Regional Air Partnership

5.1.11 Road Maintenance Emissions Estimation

Criteria pollutant emissions from road maintenance activities (excluding well road maintenance) were calculated based on data provided by the WFO and used best available information, BACT, AP-42, and the emission studies from other BLM documents. Estimated emissions include fugitive dust and combustive emissions resulting from the use of a grader. It was assumed that the majority of road maintenance activities would occur in the summer and only once in the winter.

5.1.12 Summary of Emissions for All BLM Activities

Tables U-3 through U-189 summarize the projected total annual emissions by resource for 2008, 2018, and 2027. Air quality impacts would primarily result from minerals development and production and oil and natural gas development activities; emissions associated with these actions would outweigh those produced from other proposed activities. Alternative E would result in the lowest levels of emissions in 2018 and 2027 for all pollutants, while Alternative C would result in the highest levels of emissions for these two years, and except for volatile organic compound (VOC) emissions, higher emissions than in the 2008 base year. Alternative C would have the greatest potential to contribute to exceedances of the NAAQS or WAAQS of any alternative. Alternatives D and F would result in comparable impacts to the base line year (i.e., 2008), except that VOC emissions are expected to decrease slightly in 2018 and further by 2027; projected emissions are, therefore, unlikely to contribute to an exceedance of a NAAQS or WAAQS. As noted above in Section 2, Alternative E is essentially the same as Alternative B, except that it designates BLM-administered lands within greater sage-grouse Key Habitat Areas as Areas of Critical Environmental Concern (ACECs), which would limit resource development and other activities in these areas, and result in the least amount of emissions of all the alternatives. Alternative F is the nearly the same as Alternative D, except it designates certain areas as Greater Sage-Grouse Priority Habitat Management Areas, which would also limit resource development and other activities, but not as much as those identified in Alternative E.

**Table U-3. Summary of Output - Alternative A
Total Annual Emissions from Oil Wells - Year 2008**

Activity	Annual Emissions (Tons)

WATER EROSION PREDICTION PROJECT (WEPP) TECHNICAL SUPPORT DOCUMENT

1.0 WEPP ANALYSIS

This appendix describes the process and results of the quantitative analysis conducted by the Bureau of Land Management (BLM) using the Water Erosion Prediction Project (WEPP) model for the Bighorn Basin Resource Management Plan (RMP) revision. The WEPP model was used to predict how management under each alternative would impact erosion in the Planning Area. WEPP simulates the conditions that impact erosion, such as the amount of vegetation canopy and soil water content. Specifically, the BLM used the WEPP model to calculate runoff amounts and erosion rates which were based on a series of parameters designed to estimate conditions in the Planning Area and model the impacts of management actions. The results of the analysis are described in the *Soil* and *Water* sections of Chapter 4 of the Proposed RMP and Final Environmental Impact Statement.

The WEPP model used by the BLM is a web-based interface designed by the United States Forest Service. The WEPP model can be accessed at: <http://forest.moscowfs.lwsu.edu/fswepp/>. Erosion rates are inherently difficult to predict, and the rates of erosion predicted by WEPP are within +/-50 percent. Despite this lack of precision, these rates are appropriate for comparing and analyzing impacts of the alternatives on the soil resource. Erosion rates were calculated for different resource programs using surface disturbance acreage figures as projected in Appendix T.

Two modules available in the WEPP interface were used by the BLM to estimate erosion rates: WEPP Road and Disturbed WEPP. The WEPP Road module was used to predict erosion rates for new roads built in the Planning Area over the life of the plan. Disturbed WEPP was used to estimate runoff amounts and all other erosion rates as a result of surface-disturbing activity in the Planning Area. WEPP allows users to predict erosion rates for numerous forest and rangeland erosion conditions. In order to estimate these conditions, the BLM used certain assumptions and input parameters for the analysis.

Climate parameters used by the WEPP model were developed using Worland, Wyoming precipitation data at 5,000 feet of elevation in order to represent the entire Planning Area. Both the Disturbed WEPP and WEPP Road modules are limited to four soil textures (clay loam, silt loam, sandy loam, and loam); a loam soil texture was used for all erosion predictions.

All WEPP erosion analyses were conducted using a 50-year simulation to represent the return interval.

The following parameters were used to simulate conditions in the Planning Area:

- Slopes used in Disturbed WEPP: Upper slope 0 to 25 percent; lower slope 5 to 25 percent
- Slope lengths used in Disturbed WEPP: 300 feet (standard length used for environmental analysis in the Planning Area)
- Gradients used in WEPP Road: Road gradient 4 percent; fill gradient 30 percent; buffer gradient 15 percent
- Lengths used in WEPP Road: Road length 200 feet; fill length 15 feet; buffer length 130 feet
- Width used in WEPP Road: Road width 12 feet
- Rock cover used in Disturbed WEPP and WEPP Road: 5 percent

Appendix V – Water Erosion Prediction Project (WEPP)

In addition to simulating conditions in the Planning Area the BLM needed to model the conditions for short-term and long-term surface disturbances. Disturbed WEPP has eight vegetative treatment options available: 20-year-old forest, 5-year-old forest, shrub-dominated rangeland, tall-grass prairie, short-grass prairie, low-severity fire, high-severity fire, and skid trail. By adjusting cover parameters, these vegetative treatment options can be applied to a wide variety of vegetative communities and land uses. In order to simulate short-term and long-term disturbances, the following vegetation treatment and cover parameters were used:

- Short-term disturbance: high-severity fire with zero percent cover
- Long-term disturbance: short-grass prairie with 40 percent cover

The WEPP model, using these input parameters, calculated an initial average erosion rate of 4.165 tons per acre per year for short-term disturbances and a rate of 1.602 tons per acre per year for post-reclamation disturbances in the long term. Runoff amounts were calculated using the same parameters. The WEPP model estimated that areas impacted by short-term surface disturbance would experience 0.34 inches of runoff per year, and in the long term, average runoff would drop to 0.19 inches per year. The WEPP model estimated that with no disturbance there would be only trace amounts of annual runoff.

The WEPP Road module simulates road conditions using options for road design, road surface, and traffic level. Road design has four options including insloped, bare ditch; insloped, vegetated or rocked ditch; outsloped, rutted; and outsloped, unrutted. WEPP Road module options for road surface include native, graveled, or paved, and traffic level can be represented by a high, low, or no traffic option. For this analysis, the insloped, bare ditch road design, native road surface, and high traffic level were used. Using these parameters, the BLM calculated the erosion rate associated with road development to be 292.4 pounds per year per 200 foot long, 12 foot wide stretch of road.

Using these average erosion rates and the surface disturbance acreage figures as projected in Appendix T, the BLM calculated the erosion figures displayed in Table V-1.

¹Acres disturbed by mechanical fuels treatment and prescribed fire will naturally be reclaimed within 5 years. Therefore long-term erosion will be zero.

²Includes range enhancements and other wildlife habitat restoration actions.

³Surface disturbance activities resulting from invasive species projects will be naturally reclaimed within 5 years. Therefore long-term erosion will be zero.

⁴Actions would likely be mostly oil and gas related, including carbon dioxide and energy pipeline.

⁵Calculated using WEPP Road module and parameters.

⁶Approximately 50 percent of roads would be oil and gas related, with the rest coming from local demand.

⁷Actions would likely be mostly oil and gas related.

APPENDIX W

UTILIZATION LEVELS IN THE PLANNING AREA

1.0 INTRODUCTION

Utilization is the percentage of forage that has been consumed or destroyed during a specific period. By comparing measured utilization with appropriate use levels for key forage plants, and by comparing utilization with actual use, climate, and trend data, short- and long-term stocking level adjustments can be made. Utilization monitoring provides an index to the amount of the current year's standing crop that remains on the range following grazing. This standing crop helps maintain soil productivity, livestock diet quality, wildlife habitat, and forage plant vigor.

Use pattern mapping will be collected on scheduled allotments to provide an estimate of forage utilization on a pasture or allotment basis. On priority allotments, more detailed utilization data may be collected on key forage plants along permanent transects on existing or new, cooperatively established key areas.

Utilization will be measured on the standing vegetation in a pasture or allotment using Bureau of Land Management (BLM) approved methods. When practical, the times for measuring utilization will be agreed upon by the BLM and livestock grazing permittees, or otherwise will be consistent with federal regulations and BLM policy.

The utilization levels provided in Table W-1 are generally considered to be appropriate for the precipitation levels, vegetative communities, and grazing seasons encountered in the Planning Area. These utilization levels will be considered during the allotment monitoring, assessment, and evaluation process, as well as during activity plan development and the National Environmental Policy Act (NEPA) and permit/lease renewal process, and will be linked to climatic conditions and site-specific vegetative community information.

Although utilization levels may vary from year to year, utilization levels which consistently exceed the levels displayed in Table W-1 would not be expected to meet watershed and vegetation management objectives. Some exceptions may occur. Specialized grazing management may require utilization levels different than those cited.

Although the growing season varies by precipitation zone and from year to year, the growth curves described in the Natural Resources Conservation Service (NRCS) Ecological Site Technical Guides would be used as a guide to growing seasons.

The utilization levels in the Planning Area (Table W-1) were developed from 30 years of experience and success by the BLM in the Wind River/Bighorn Basin District. The prescribed and/or desired grazing management that provides plant recovery time and associated utilization levels is supported by the references provided following the table.

Table W-1. Utilization Levels in the Planning Area

On an allotment-by-allotment basis, the following utilization levels ¹ for key species and key areas would be established ² as appropriate in allotments not meeting or not making acceptable progress toward meeting rangeland health standards due to current livestock grazing use or not meeting allotment objectives under current prescribed grazing management. ³		On an allotment-by-allotment basis, the following utilization levels ¹ for key species and key areas would be established ² as appropriate in allotments meeting or making acceptable progress toward meeting rangeland health standards under current livestock grazing use and/or meeting allotment objectives under current prescribed grazing management. ³	
Key grass species on key upland sites receiving 14 or less inches annual precipitation	35% or less utilization of current standing crop during growing season ⁴ 50% or less utilization of current year’s growth during dormant season ⁵	Key grass species on key upland sites receiving 14 or less inches annual precipitation	50% or less utilization of current standing crop during growing season ⁴ 60% or less utilization of current year’s growth during dormant season ⁵
Key grass species on key upland sites receiving greater than 14 inches annual precipitation	45% or less utilization of current standing crop during growing season ⁴ 60% or less utilization of current year’s growth during dormant season ⁵	Key grass species on key upland sites receiving greater than 14 inches annual precipitation	55% or less utilization of current standing crop during growing season ⁴ 65% or less utilization of current year’s growth during dormant season ⁵
Key grass species on all riparian sites	Less than 50% utilization of current year’s growth	Key grass species on all riparian sites	Less than 50% utilization of current year’s growth
Key shrub/woody species on all sites	Less than 35% utilization of current year’s growth	Key shrub/woody species on all sites	Less than 40% utilization of current year’s growth

¹In areas where extensive wildlife use occurs (crucial winter ranges for elk, bighorn sheep, pronghorn, and winter sage-grouse concentration areas or sage-grouse nesting habitat and brood rearing habitat), utilization levels may need to be adjusted downward to ensure that total utilization of the current year’s growth following the use period of large ungulates (livestock and /or wildlife) does not exceed the prescribed level for dormant season use. During the collection/evaluation of utilization data if desired levels are consistently exceeded and the causal factor(s) are identified (livestock/wildlife/wild horses etc.), management actions/mitigation to alleviate the overuse would be employed and directed towards those responsible for the overuse. Please refer to Section 3.6.7 of the document for more information about wildlife and livestock grazing.

²Although levels may vary widely from year to year, utilization levels which consistently exceed these would not be expected to meet watershed and vegetation management objectives and would necessitate an adjustment in management.

³“Prescribed grazing” is defined as the controlled harvest of vegetation with grazing or browsing animals designed to meet rangeland health standards and allotment specific resource objectives. Prescribed grazing management is outlined in management agreements, allotment management plans, the terms and conditions of a permit or lease, etc. Grazing systems (rest rotation, deferred rotation, short duration, conservatively stocked season-long, etc.), range improvement projects, utilization standards, etc., are tools which could be used on an allotment specific basis to achieve resource objectives.

⁴Growing season in the 5-9 inch precipitation zone is generally considered to be April-June. Growing season in the 10-14 inch precipitation zone is generally considered to be May-July 15. Growing season in the 15-19 inch precipitation zone is generally considered to be May 15-August 1.

⁵Dormant season is defined as the period outside of growing season.

VISUAL RESOURCE INVENTORY

1.0 OVERVIEW

The visual resource inventory process provides Bureau of Land Management (BLM) managers with a means for determining visual values. The inventory consists of a scenic quality evaluation, sensitivity level analysis, and a delineation of distance zones. Based on these three factors, BLM-administered lands are placed into one of four visual resource inventory classes. These inventory classes represent the relative value of the visual resources. Classes I and II being the most valued, Class III representing a moderate value, and Class IV being of least value. The inventory classes provide the basis for considering visual values in the resource management planning (RMP) process. Visual Resource Management classes are established through the RMP process for all BLM-administered lands. During the RMP process, the class boundaries are adjusted as necessary to reflect the resource allocation decisions made in RMPs.

2.0 DELINEATING SCENIC QUALITY RATING UNITS

The Planning Area is subdivided into scenic quality rating units (SQRUs) for rating purposes. Rating areas are delineated on a basis of: like physiographic characteristics; similar visual patterns, texture, color, variety, etc.; and areas which have similar impacts from man-made modifications. The size of SQRU's may vary from several thousand acres to 100 or less acres, depending on the homogeneity of the landscape features and the detail desired in the inventory. Refer to Map X-1 to see the SQRUs delineated for the Bighorn Basin.

3.0 SCENIC QUALITY EVALUATION

Scenic quality is a measure of the visual appeal of a tract of land. In the visual resource inventory process, public lands are given an A, B, or C rating based on the apparent scenic quality which is determined using seven key factors: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural. During the rating process, each of these factors are ranked on a comparative basis with similar features within the physiographic province. The "Ecoregions of the United States" by R.G. Bailey is used in making these refinements (Bailey 1994). An important premise of the evaluation is that all public lands have scenic value, but areas with the most variety and most harmonious composition have the greatest scenic value. Another important concept is that the evaluation of scenic quality is done in relationship to the natural landscape. This does not mean that man-made features within a landscape necessarily detract from the scenic value. Man-made features that complement the natural landscape may enhance the scenic value. Evaluations should avoid any bias against man-made modification to natural landscape. Each SQRU is evaluated by an interdisciplinary team by observing the area from several important viewpoints. Scores should reflect the evaluator's overall impression of the area. Refer to Map X-2 for an illustration of the scenic quality evaluation for the Bighorn Basin.

4.0 SENSITIVITY LEVEL ANALYSIS

Sensitivity levels are a measure of public concern for scenic quality. Public lands are assigned high, medium, or low sensitivity levels by analyzing the various indicators of public concern. In evaluating sensitivity levels, the following six key factors are considered:

1. **Type of Users.** Visual sensitivity will vary with the type of users. Recreational sightseers may be highly sensitive to any changes in visual quality, whereas workers who pass through the area on a regular basis may not be as sensitive to change.
2. **Amount of Use.** Areas seen and used by large numbers of people are potentially more sensitive. Protection of visual values usually becomes more important as the number of viewers increase.
3. **Public Interest.** The visual quality of an area may be of concern to local, state, or national groups. Indicators of this concern are usually expressed in public meetings, letters, newspaper or magazine articles, newsletters, land-use plans, etc. Public controversy created in response to proposed activities that would change the landscape character should also be considered.
4. **Adjacent Land Uses.** The interrelationship with land uses in adjacent lands can affect the visual sensitivity of an area. For example, an area within the view shed of a residential area may be very sensitive, whereas an area surrounded by commercially developed lands may not be visually sensitive.
5. **Special Areas.** Management objectives for special areas such as Natural Areas, Wilderness Areas or Wilderness Study Areas, Wild and Scenic Rivers, Scenic Areas, Scenic Roads or Trails, and Areas of Critical Environmental Concern, frequently require special consideration for the protection of the visual values. This does not necessarily mean that these areas are scenic, but rather that one of the management objectives may be to preserve the natural landscape setting. The management objectives for these areas may be used as a basis for assigning sensitivity levels.
6. **Other Factors.** Consider any other information such as research or studies that includes indicators of visual sensitivity.

Map X-3 illustrates the sensitivity levels evaluated for the Bighorn Basin.

5.0 DISTANCE ZONES

Landscapes are subdivided into three distance zones based on relative visibility from travel routes or observation points. The three zones are: foreground-middleground, background, and seldom seen. The foreground-middleground zone includes areas seen from highways, rivers, or other viewing locations which are less than 3 to 5 miles away. Seen areas beyond the foreground-middleground zone but usually less than 15 miles away are in the background zone. Areas not seen as foreground-middleground or background (i.e., hidden from view) are in the seldom-seen zone. For the Bighorn Basin, linear transportation routes transect through nearly the entire planning area, which eliminates the background and seldom seen areas. As a result, the entire Bighorn Basin Planning Area is evaluated and delineated as foreground/middle ground zone. Refer to Map X-4 for an illustration of the Planning Area's distance zones.

6.0 VISUAL RESOURCE INVENTORY CLASSES

After evaluating and rating scenic quality, sensitivity levels, and delineating distance zones, visual resource inventory classes are assigned to each SQRU. Class I is assigned to those areas where a management decision has been made previously to maintain a natural landscape. This includes areas such as national wilderness areas, the wild section of national wild and scenic rivers, and other congressionally and administratively designated areas where decisions have been made to preserve a natural landscape. Classes II, III, and IV are assigned based on a combination of scenic quality, sensitivity level, and distance zones. This is accomplished by combining the three overlays for scenic quality, sensitivity levels, and distance zones and using the guidelines shown in Table X-1 to assign the proper class. The end product is a visual resource inventory class overlay as shown in Map X-5. Inventory classes are informational in nature and provide the basis for considering visual values in the RMP process.

Table X-1. Visual Resource Inventory Matrix

		Visual Sensitivity Levels						
		High			Medium			Low
Special Areas		I	I	I	I	I	I	I
Scenic Quality	A	II	II	II	II	II	II	II
	B	II	III	III*	III	IV	IV	IV
				IV*				
	C	III	IV	IV	IV	IV	IV	IV
		f/m	b	s/s	f/m	b	s/s	s/s
		Distance Zones						

Source: BLM 1986

Distance zones: f/m = foreground-midground, b = background, s/s = seldom seen areas

*If adjacent area is Class III or lower, assign Class III, if higher, assign Class IV

APPENDIX Y

GREATER SAGE-GROUSE IMPLEMENTATION STRATEGY

1.0 INTRODUCTION

The Bighorn Basin Resource Management Plan (RMP) and Final EIS provides specific goals, objectives, management actions, and required design features for the conservation of greater sage-grouse in Wyoming. These are the commitments made to meet the federal agencies' national policy and direction for the conservation of greater sage-grouse in light of the 2010 U.S. Fish and Wildlife Service (USFWS) listing decision as warranted but precluded from listing under the Endangered Species Act. Through the National Planning Strategy, BLM and U.S. Forest Service (USFS) in coordination with USFWS have identified conservation measures to be included in the respective agencies' land use plans as the principal regulatory mechanisms to assure adequate conservation of the greater sage-grouse and its habitat on public lands.

The measures identified in this RMP have been developed in coordination with not just the USFWS, but also the State of Wyoming, including the Wyoming Game and Fish Department (WGFD), and local cooperating agencies including conservation districts and counties.

Wyoming has established Core Population Areas to help delineate landscape planning units by distinguishing areas of high biological value. These areas are based on the locations of breeding areas and are intended to help balance greater sage-grouse habitat requirements with demand for energy development (Doherty et al. 2011). The Proposed RMP is consistent with the Core Area Strategy, but contains additional restrictions to protect other resources, which results in added protections to greater sage-grouse habitat and achieving conservation objectives identified in the Conservation Objectives Team (COT) Report on BLM-managed public lands. The COT Report indicates that the Core Area Strategy is a substantial regulatory mechanism that contributes to the conservation of greater sage-grouse and balances the priorities of retaining a healthy greater sage-grouse population on the landscape and energy development.

This appendix will introduce the framework for implementation of greater sage-grouse conservation measures within the Cody and Worland Field Offices. Implementation is a combination of permitting activities under the auspices of management direction provided in the Land Use Plan (LUP), undertaking specific activities in pursuit of the goals and objectives identified in the plan and monitoring of sage brush habitat and populations.

The implementation framework outlined here is focused specifically towards greater sage-grouse and is reflective of how the national strategy will be assimilated into the existing statewide implementation efforts currently in place in Wyoming. This framework has been developed mindful of the varying scales at which implementation will be evaluated: at the local level to define successful conservation measures, at the state level to assess success of the statewide strategy, and across the species' range.

In 2013, the Director of U.S. Fish and Wildlife Service tasked staff with the development of range-wide conservation objectives for the sage-grouse to define the degree to which threats need to be reduced or ameliorated to conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future. Recognizing that state wildlife agencies have management expertise and management authority for sage-grouse, the FWS created a COT of state and USFWS representatives to accomplish this task.

Appendix Y – Greater Sage-Grouse Implementation Strategy

The COT conservation framework consisted of (1) identifying greater sage-grouse population and habitat status and threats, (2) defining a broad conservation goal, (3) identifying priority areas for conservation, and (4) developing specific conservation objectives and measures. The COT used three parameters—population and habitat representation, redundancy, and resilience (Shaffer and Stein 2010, Redford et al. 2011)—as guiding concepts in developing the conservation goal, priority areas for conservation, conservation objectives, and measures.

The COT report identified priority areas for greater sage-grouse population habitats as Priority Areas for Conservation or (PACs). PACs are recognized as key areas across the landscape that are necessary to maintain redundant, representative, and resilient populations” of the species. The COT Report describes maintaining the integrity of PACs as “the essential foundation for greater sage-grouse conservation.” PACs cover nearly 73 million acres across the west; within the Bighorn Basin Planning Area, more than 1.1 million acres of BLM-administered surface are considered priority habitat (Table Y-1). Thirty-five percent of the priority habitat in the Planning Area is BLM-administered surface and twenty-six percent is BLM-administered minerals. Based upon 2007 lek counts, and the population data contained in the COT Report, the Bighorn Basin Planning Area contains an estimated two percent of the range-wide population of greater sage-grouse. Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) within the Planning Area are depicted in Figure Y-1.

Table Y-1. Greater Sage-Grouse Habitat within the Bighorn Basin Planning Area

<i>Populations / Subpopulations: Wyoming Basin and Powder River Basin Populations WAFWA Management Zone I and II</i>		
Surface Estate	Priority Habitat Acres (%)	General Habitat Acres (%)
Private	505,850 (28)	1,327,877 (36)
State	151,591 (8)	244,045 (7)
BLM	1,115,076 (62)	2,034,027 (55)
Other	13,652 (1)	86,707 (2)
Total	1,786,169	3,692,656
Fluid Mineral Estate	Priority Habitat Acres (%)	General Habitat Acres (%)
Non-federal	360,032 (20)	1,099,993 (30)
BLM	1,426,137 (80)	2,592,663 (70)
Total	1,786,169	3,692,656

Figure Y-1. Priority Habitat Management Areas and General Habitat Management Areas within the Planning Area Bighorn Basin Planning Area

The conservation objectives identified in the COT Report, targeted at maintaining redundant, representative, and resilient greater sage-grouse habitats and populations, is the basis by which the greater sage-grouse elements of the Bighorn Basin Proposed RMP were developed. Due to the variability in ecological conditions and the nature of the threats across the range of the greater sage-grouse, developing detailed, prescriptive species or habitat actions was not attainable at the range-wide scale. Specific strategies and actions necessary to achieve the conservation objectives have been developed by BLM and USFS in cooperation with state and local governments to ensure implementation of activities to meet the objectives identified in the COT report.

2.0 COT OBJECTIVE 1: STOP POPULATION DECLINES AND HABITAT LOSS

“There is an urgent need to ‘stop the bleeding’ of continued population declines and habitat losses by acting immediately to eliminate or reduce the impacts contributing to population declines and range erosion. There are no populations within the range of sage-grouse that are immune to the threat of habitat loss and fragmentation.” (COT Report 2013)

The COT Report identified a series of threats to greater sage-grouse habitat and the extent of those threats at the population scale. The management actions identified in the RMP were specifically designed to reduce the threats, as they were identified. The Wyoming 9-Plan RMP encompasses lands within WAFWA Management Zones 1 and 2. To ensure that the threats are adequately addressed by the RMP, a strategy for reviewing activities and projects on public lands to determine the extent of their impact on greater sage-grouse habitat has also been developed. The following outlines the process by which all activities on public lands will be reviewed.

The BLM will ensure that any activities or projects in greater sage-grouse habitats would: 1) only occur in compliance with Bighorn Basin RMP greater sage-grouse goals and objectives for priority management areas; and 2) maintain neutral or positive greater sage-grouse population trends and habitat by avoiding, minimizing, and offsetting unavoidable impacts to assure a conservation gain at the scale of this land use plan and within greater sage-grouse population areas, state boundaries, and WAFWA Management Zones through the application of mitigation for implementation-level decisions. The mitigation process will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g., avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy, while also following Secretary of the Interior Order 3330 and consulting BLM, USFWS and other current and appropriate mitigation guidance. If it is determined that residual impacts to greater sage-grouse from implementation-level actions would remain after applying avoidance and minimization measures to the extent possible, then compensatory mitigation projects will be used to offset residual impacts, or the project may be deferred or denied if necessary to achieve the goals and objectives for priority and general management areas in the Bighorn Basin RMP.

To ensure that impacts from activities proposed in greater sage-grouse PHMAs are appropriately approved and mitigated as necessary, the BLM will apply mitigation measures and conservation actions and potentially modify the location, design, construction, and/or operation of proposed land uses or activities to comply with statutory requirements for environmental protection. The mitigation measures and conservation actions (Appendix L) for proposed projects or activities in these areas will be identified as part of the National Environmental Policy Act (NEPA) environmental review process, through interdisciplinary analysis involving resource specialists, project proponents, government entities, landowners or other Surface Management Agencies. Those measures selected for implementation will be identified in the Record of Decision (ROD) or Decision Record (DR) for those authorizations and will inform a potential lessee, permittee, or operator of the requirements that must be met when using BLM-administered public lands and minerals to mitigate, per the mitigation hierarchy referenced above, impacts from the activity or project such that greater sage-grouse goals and objectives are met. Because these actions create a clear obligation for the BLM to ensure any proposed mitigation action adopted in the environmental review process is performed, there is assurance that mitigation will lead to a reduction of environmental impacts in the implementation stage and include binding mechanisms for enforcement (CEQ Memorandum for Heads of Federal Departments and Agencies 2011).

To achieve the goals and objectives for PHMAs in the Bighorn Basin Planning Area, the BLM will assess all proposed land uses or activities such as road, pipeline, communication tower, or powerline construction,

fluid and solid mineral development, range improvements, and recreational activities proposed for location in PHMAs in a step-wise manner. The following steps identify a screening process for review of proposed activities or projects in these areas (Table Y-2). This process will provide a consistent approach and ensure that authorization of these projects, if granted, will appropriately mitigate impacts and be consistent with the RMP goals and objectives for greater sage-grouse. The following steps provide for a sequential screening of proposals.

Table Y-2. Implementation of RMP Decisions to Address COT Threats

COT Threat	Threat Extent	Program Area	RMP Decision	Implementation Process	Tracking Mechanism
Sagebrush Elimination	Present but Localized (MZ1) Present but Localized (Wyoming Basin Population)	Vegetation Management Wildland Fire Management

Grazing Range Management Structures	Present and Widespread (MZ1) Present and Widespread (Wyoming Basin Population)	Range Management Wild Horse and Burro Management Special Status Species Vegetation Management			
Free-Roaming Equids	Not Present (MZ1) Present but Localized (Wyoming Basin Population)	Wild Horse and Burro Management			
Conifer Encroachment	Present but Localized (MZ1) Present but Localized (Wyoming Basin Population)	Wildland Fire Management Vegetation Management			
Agriculture and Urbanization	Present but Localized (MZ1) Present but Localized (Wyoming Basin Population)	Lands and Realty			

Table Y-2. Implementation of RMP Decisions to Address COT Threats (Continued)

COT Threat	Threat Extent	Program Area	RMP Decision	Implementation Process	Tracking Mechanism
Mining	Present and Widespread (MZ1) Present but Localized (Wyoming Basin Population)	Lands and Realty Locatable Minerals Salable Minerals Non-energy Leasable Minerals Management			
Recreation	Present and Widespread (MZ1) Present and Widespread (Wyoming Basin Population)	Recreation Trails and Travel Management			
Infrastructure	Present and Widespread (MZ1) Present and Widespread (Wyoming Basin Population)	Lands and Realty Trails and Travel Management			

Step 1 – Determine Proposal Adequacy

This screening process is initiated upon formal submittal of a proposal for authorization for use of BLM/USFS lands. The actual documentation of the proposal would include at a minimum a description of the location, scale of the project and timing of the disturbance. The acceptance of the proposal(s) for review would be consistent with existing protocol and procedures for each type of use. Evaluating consistency with (at a minimum) state greater sage-grouse regulations.

Step 2 – Evaluate Proposal Consistency with LUP

Step 2.1 – The proposal will be reviewed to determine whether it would be allowed as prescribed in the Land Use Plan. For example, some activities or types of development are prohibited in greater sage-grouse habitat, such as wind developments in Priority Habitat. Evaluation of projects will also include an assessment of the current state of the Adaptive Management hard and soft triggers. If the proposal is for an activity that is specifically prohibited, the applicant should be informed that the application is being rejected since it would not be allowed, regardless of the design of the project.

Step 2.2 – The proposal will be reviewed to determine whether it conforms with the Density and Disturbance Limitations. If the proposed activity occurs within a PHMA, evaluate whether the disturbance from the activity exceeds the limit on the amount of disturbance allowed within the activity or project area (Density/Disturbance Calculation Tool [DDCT] process). If current disturbance within the activity area or the anticipated disturbance from the proposed activity exceeds this threshold, the project would be deferred until such time as the amount of disturbance within the area has been reduced below the threshold, redesigned so as to not result in any additional surface disturbance (collocation) or redesigned to move it outside of PHMA. Should the project be a result of a valid existing right, BLM will work to minimize the disturbance and determine any residual impacts that may require appropriate mitigation.

The maximum density of disruptive activities and surface disturbance allowed will be analyzed via the DDCT, and will be conducted by the Federal Land Management Agency on federal land and the project proponent on non-federal (private, state) land per the RMP 9 revision.

State Agency Permit is needed, without a need for a federal permit:

The first point of contact for addressing greater sage-grouse issues for any state permit application should be the WGFD. Project proponents (proponents) need to have a thorough description of their project and identify the potential effects on greater sage-grouse prior to submitting an application to the permitting agency. Project proponents should contact WGFD at least 45-60 days prior to submitting their application. More complex projects will require more time. It is understood that WGFD has a role of consultation, recommendation, and facilitation, and has no authority to either approve or deny the project. The purpose of the initial consultation with the WGFD is to become familiar with the project proposal and ensure the project proponent understands the DDCT and recommended stipulations.

Federal Agency Permit is needed, with or without a State permit:

When a project requires federal action prior to approval, the proponent should contact the federal agency responsible for reviewing the action. The federal agency and the proponent will determine the best process for completing the DDCT and receiving recommendations from WGFD. Project proponents (proponents) need to have a thorough description of their project and identify the potential effects on greater sage-grouse prior to submitting an application to the permitting agency.

Maximum Density and Disturbance Process

Density and Disturbance Calculation: The DDCT is a spatially based tool that calculates both the average density of disruptive activities and total surface disturbance within the area affected by the project, or DDCT assessment area. The DDCT assessment area is created based on buffers around proposed projects (first buffer) in protected greater sage-grouse PHMAs, and subsequent buffers around any occupied, PHMA leks within the first buffer. A 4-mile buffer is used to identify 75% of the greater sage-grouse use around a lek. All activities will be evaluated within the context of maximum allowable disturbance (disturbance percentages, location and number of disturbances) of suitable greater sage-grouse habitat (see Appendix 1 for definition of suitable greater sage-grouse habitat and disturbance of suitable greater sage-grouse habitat) within the DDCT assessment area. This tool allows for better siting of projects rather than averaging the density/disturbance calculation per section.

All lands within PHMA boundaries are considered suitable habitat unless documented. Mapped unsuitable habitat is treated neither as suitable habitat, nor disturbance, which results in the area being removed from the DDCT assessment area altogether.

1. Density/Disturbance Calculation Tool: Determine all occupied leks within PHMAs that may be affected by the project by placing a 4 mile boundary around the project boundary (as defined by the proposed area of disturbance related to the project). All occupied leks located within the 4 mile boundary and within PHMAs will be considered in this assessment (Figure Y-2).

Figure Y-2. Proposed Project Boundary

A 4-mile boundary will then be placed around the perimeter of each of these lek(s) (Figure Y-2).

The PHMAs within the combined 4-mile buffer around both the leks and the project boundary creates the DDCT assessment area for each individual project (Figure Y-3).

Figure Y-3. DDCT Assessment Area

Disturbance will be analyzed for the DDCT assessment area as a whole and for each individual lek within the DDCT assessment area (Figures Y-4 through Y-7).

Figure Y-4. DDCT Assessment Area – Existing Disturbance

Figure Y-5. DDCT Assessment Area – Existing Disturbance (cont.)

Figure Y-6. DDCT Assessment Area – Existing Disturbance with Buffer

Figure Y-7. DDCT Assessment Area – Existing Disturbance with Buffer (cont.)

Density of disruptive features will be analyzed for the DDCT assessment area as a whole and for each individual lek within the DDCT assessment area (Figures Y-8 through Y-10).

Figure Y-8. DDCT Assessment Area – Existing Disruptive Features

Figure Y-9. DDCT Assessment Area – Existing Disruptive Features Buffer

Figure Y-10. DDCT Assessment Area – Existing Disruptive Features Buffer (cont.)

If there are no leks identified for this assessment within the 4-mile boundary around the project boundary, the DDCT assessment area will be that portion of the 4-mile project boundary within the PHMAs.

2. Density and Disturbance analysis: The total number of discrete disruptive activity features, as well as the total disturbance acres within the DDCT assessment area will be determined through an evaluation of:
 - a. Existing disturbance (greater sage-grouse habitat that is disturbed due to existing anthropogenic activity and wildfire);
 - b. Approved permits (that have approval for on the ground activity) not yet implemented; and
 - c. Validating digitized disturbance through on the ground evaluation.

The complete analysis package (DDCT results, mapbook, and Worksheet), and recommendations developed by consultation and review outlined herein will be forwarded to the appropriate permitting agency(s). WGFD recommendations will be included, as will other recommendations from project proponents and other appropriate agencies. Project proponent shall have access to all information used in developing recommendations. Where possible and when requested by the project proponent, State agencies shall provide the project proponent with potential development alternatives other than those contained in the project proposal.

If the permit for which a proponent has applied expires, another DDCT analysis is required before issuing a new permit. An additional DDCT is not required for Permit extensions or renewals when no changes are being authorized. Any project will need to comply with the current Executive Order.

Step 2.3 – The BLM/USFS’s goal for any new activity or development proposal within PHMAs is to provide consistent implementation of project proposals which meet the BLM’s LUP goals and the population management objectives of the State. Activities would be consistent with the strategy where it can be sufficiently demonstrated that no declines to PHMA populations would be expected as a result of the proposed action. Published research suggests that impacts to greater sage-grouse leks associated primarily with infrastructure and energy development are discernible at a distance of at least 4 miles and that many leks within this radius have been extirpated as a direct result of development (Walker et al. 2007, Walker 2008). Research also suggests that an evaluation of habitats and greater sage-grouse populations that attend leks within an 11-mile radius from the project boundary in the context of “large” projects may be appropriate in order to consider all seasonal habitats that may be affected for birds that use the habitats associated with the proposal during some portion of the life-cycle of seasonally migratory greater sage-grouse (Connelly et al. 2000).

To determine the manner in which greater sage-grouse may be impacted by proposed undertakings, the following will be reviewed in the site specific NEPA analysis to quantify the effects:

- Greater Sage-Grouse Habitat delineation maps.
- Current science recommendations.
- The ‘Base Line Environment Report’ (USGS) which identifies areas of direct and indirect effect for various anthropogenic activities.
- Consultation with agency or State Wildlife Agency biologist.
- Other methods needed to provide an accurate assessment of impacts.

If the proposal will not have a direct or indirect impact on either the habitat or population, document the findings in the NEPA and proceed with the appropriate process for review, decision and implementation of the project.

Step 3 – Apply Avoidance and Minimization Measures to Comply with Sage-Grouse Goals and Objectives

If the project can be relocated so as to not have an impact on greater sage-grouse and still achieve objectives of the proposal and the disturbance limitations, relocate the proposed activity and proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record). This Step does not consider redesign of the project to reduce or eliminate direct and indirect impacts, but rather authorization of the project in a physical location that will not impact greater sage-grouse. If the preliminary review of the proposal concludes that there may be adverse impacts to greater sage-grouse habitat or populations in Step 2 and the project cannot be effectively relocated to avoid these impacts, proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record) with the inclusion of appropriate mitigation requirements to further reduce or eliminate impacts to greater sage-grouse habitat and populations and achieve compliance with greater sage-grouse objectives. Mitigation measures could include design modifications of the proposal, site disturbance restoration, post-project reclamation, etc. (see Appendix L). Compensatory or offsite mitigation may be required (Step 4) in situations where residual impacts remain after application of all avoidance and minimization measures.

Step 4 – Apply Compensatory Mitigation or Reject/Defer Proposal

If screening of the proposal has determined that direct and indirect impacts cannot be eliminated through avoidance or minimization, evaluate the proposal to determine if compensatory mitigation can be used to offset the remaining adverse impacts and achieve greater sage-grouse goals and objectives. If the impacts cannot be effectively mitigated, reject or defer the proposal. The criteria for determining this situation could include but are not limited to:

- The current trend within the Priority Habitat is down and additional impacts, whether mitigated or not, could lead to further decline of the species or habitat.
- The proposed mitigation is inadequate in scope or duration, has proven to be ineffective or is unproven in terms of science based approach.
- The project would impact habitat that has been determined to be a limiting factor for species sustainability.
- Other site specific information and analysis that determined the project would lead to a downward change of the current species population or habitat and not comply with greater sage-grouse goals and objectives.

If, following application of available impact avoidance and minimization measures, the project can be mitigated to fully offset impacts and assure conservation gain to the species and comply with greater sage-grouse goals and objectives, proceed with the appropriate process for review, decision and implementation (NEPA and Decision Record).

Mitigation

General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and assure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by

avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g., avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e., residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see Glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- **Avoidance**
 - Include avoidance areas (e.g., right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g., Resource Management Plans, Forest Plans, State Plans); and,
 - Include any potential, additional avoidance actions (e.g., additional avoidance best management practices) with regard to greater sage-grouse conservation.
- **Minimization**
 - Include minimization actions (e.g., required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
 - Include any potential, additional minimization actions (e.g., additional minimization best management practices) with regard to greater sage-grouse conservation.

- **Compensation**
 - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
 - Residual Impact and Compensatory Mitigation Project Valuation Guidance
 - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.
 - This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
 - For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g., uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
 - The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for greater sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
 - Options for implementing compensatory mitigation should be identified, such as:
 - Utilizing certified mitigation/conservation bank or credit exchanges.
 - Contributing to an existing mitigation/conservation fund.
- **Compensatory Mitigation Siting**
 - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
 - Sites should be durable (see glossary).
 - Sites identified by existing plans and strategies (e.g., fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
 - Project types should be identified that help reduce threats to greater sage-grouse (e.g., protection, conservation, and restoration projects).
 - Each project type should have a goal and measurable objectives.
 - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
 - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
 - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
 - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- **Compensatory Mitigation Reporting**
 - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
 - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- **Compensatory Mitigation Program Implementation Guidelines**
 - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g., Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

3.0 COT OBJECTIVE 2: IMPLEMENT TARGETED HABITAT MANAGEMENT AND RESTORATION

“Some sage-grouse populations warrant more than the amelioration of the impacts from stressors to maintain sage-grouse on the landscape. In these instances, and particularly with impacts resulting from wildfire, it may be critical to not only remove or reduce anthropogenic threats to these populations but additionally to improve population health through active habitat management (e.g., habitat restoration). This is particularly important for those populations that are essential to maintaining range-wide redundancy and representation.” (COT Report, 2013)

In many areas of Wyoming, amelioration of threats isn't enough. Activities must be taken to enhance the habitat for continued success of greater sage-grouse. This objective identifies the areas where RMPs will put forth the commitments for habitat restoration and enhancement.

The Wyoming Game and Fish Department established local greater sage-grouse working groups over 10 years ago. Each of these local working groups developed conservation plans which have served to guide conservation of greater sage-grouse habitat at a local level. The management objectives for this federal

land use plan were developed in coordination with the State of Wyoming, recognizing the ongoing work which has been done over the last 10 years in Wyoming as a result of the conservation efforts identified by each of the local working groups.

Upon completion of the planning process, with issuance of an Approved Plan and Record of Decision, subsequent implementation decisions will be put into effect by developing implementation (activity-level or project-specific) plans. These implementation decisions will be based upon the objectives identified in the Approved Plan and Record of Decisions, and will be coordinated with local working groups.

4.0 COT OBJECTIVE 3: DEVELOP AND IMPLEMENT STATE AND FEDERAL CONSERVATION STRATEGIES AND ASSOCIATED INCENTIVE-BASED CONSERVATION ACTIONS AND REGULATORY MECHANISMS

“To conserve sage-grouse and habitat redundancy, representation, and resilience, state and federal agencies, along with interested stakeholders within range of the sage-grouse should work together to develop a plan, including any necessary regulatory or legal tools (or use an existing plan, if appropriate) that includes clear mechanisms for addressing the threats to sage-grouse within PACs. Where consistent with state conservation plans, sage grouse habitats outside of PACs should also be addressed. We recognize that threats can be ameliorated through a variety of tools within the purview of states and federal agencies, including incentive-based conservation actions or regulatory mechanisms. Federal land management agencies should work with states in developing adequate regulatory mechanisms. Federal land management agencies should also contribute to the incentive-based conservation and habitat restoration and rehabilitation efforts. In the development of conservation plans, entities (states, federal land management agencies, etc.) should coordinate with FWS. This will ensure that the plans address the threats contributing to the 2010 warranted but precluded determination, and that conservation strategies will meaningfully contribute to future listing analyses.” (COT Report, 2013)

4.1 Implementation Working Groups

National Level

In December 2011, Wyoming Governor Matt Mead and Secretary of the Interior Ken Salazar co-hosted a meeting to address coordinated conservation of the greater sage-grouse across its range. Ten states within the range of the greater sage-grouse were represented, as were the U.S. Forest Service (FS), the Natural Resources Conservation Service (NRCS), and the Department of the Interior (DOI) — including representatives from the DOI’s Bureau of Land Management (BLM) and U.S. Fish and Wildlife Service (FWS). The primary outcome of the meeting was the creation of a Sage-Grouse Task Force (Task Force) chaired by Governors Mead (WY) and Hickenlooper (CO) and the Director of the BLM. The Task Force was directed to develop recommendations on how to best advance a coordinated, multi-state, range-wide effort to conserve the greater sage-grouse, including the identification of conservation objectives to ensure the long-term viability of the species.

Regional Level

Regional Level Teams (Sage Grouse Implementation Group)

State Level

The Sage Grouse Implementation Team (SGIT) has been established through Wyoming Legislature (Wyoming Statute 9-19-101(a)) to review data and make recommendations to the Governor of Wyoming regarding actions and funding to enhance and restore greater sage-grouse habitats in Wyoming. Additionally, the SGIT is responsible for making recommendations to the Governor regarding regulatory actions necessary to maintain greater sage-grouse populations and greater sage-grouse habitats.

Adaptive Management Working Group has been established in consultation with the SGIT to provide appropriate guidance for agencies with the ability to affect greater sage-grouse populations and/or habitat through their permitting authority. The AMWG includes BLM, FS, FWS, and State of Wyoming.

Local Level

In 2000, a Local Working Group was established by the Wyoming Game and Fish Department to develop and facilitate implementation of local conservation plans for the benefit of greater sage-grouse, their habitats, and whenever feasible, other species that use sagebrush habitats. This group prepared the Wyoming Greater Sage-grouse Conservation Plan (Wyoming Sage-Grouse Working Group 2003) to provide coordinated management and direction across the state. In 2004, local greater sage-grouse working groups were formed to develop and implement local conservation plans. Eight local working groups around Wyoming have completed conservation plans, many of which prioritize addressing past, present, and reasonably foreseeable threats at the state and local levels, and prescribe management actions for private landowners to improve greater sage-grouse conservation at the local scale, consistent with Wyoming's Core Population Area Strategy.

4.2 Implementation Tracking

Because the State of Wyoming continues to retain management of the species, and through implementation of the Executive Order, BLM Wyoming will continue to coordinate tracking of populations, disturbance and conservation actions.

- DDCT GIS for tracking disturbance
- Population Counts
- Lek counts
- Conservation Actions

In addition to the tracking databases being maintained by the State of Wyoming, a national- Greater Sage-grouse Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of greater sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the ROD or approved plan. The BLM and the USFS will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

4.3 Public Involvement

A website where the public can quickly and easily access data concerning implementation will be developed and kept current on the Wyoming BLM database. Creating this website and maintaining it through the implementation cycle will be a vital part of implementation success. The public is welcome to provide implementation comments to the BLM any time during the cycle, but schedules for implementation planning decisions will be posted so the public can make timely comments. All Activity Plan Working Group meetings where recommendations are made to the BLM will be open to the public, and will provide for specific and helpful public involvement. This includes providing web-based information to the public prior to any Activity Plan Working Group meetings; such that members of the public can provide input to the working session, both early and mid-way through the scheduled meetings.

The state sponsored LWG and SGIT meetings are advertised and open to the public.

5.0 COT OBJECTIVE 4: PROACTIVE CONSERVATION ACTIONS

“Proactive, incentive based, voluntary conservation actions (e.g., Candidate Conservation Agreements with Assurances, Natural Resources Conservation Service programs) should be developed and/or implemented by interested stakeholders and closely coordinated across the range of the species to ensure they are complimentary and address sage-grouse conservation needs and threats. These efforts need to receive full funding, including funding for necessary personnel.” (COT Report, 2013)

In addition to the conservation activities identified through implementation of the Resource Management Plan in coordination with the Local Working Group Conservation Plans, BLM and USFS will continue to partner with other agencies and stakeholders to identify conservation actions to benefit greater sage-grouse habitat. Actions which may occur could include Candidate Conservation Agreements with accompanying Candidate Conservation Agreements with Assurances and designation of conservation easements.

Candidate Conservation Agreements are entered into when a potential threat to habitat is identified. BLM enters into CCAs with USFWS to identify potential threats and plan for conservation measures to address potential threats. The purpose of CCAs and the accompanying CCAAs for private lands is to prevent listing of any sensitive species under ESA.

BLM Wyoming has already entered into a Statewide CCA for range management on BLM lands in Wyoming. This CCA promotes proper livestock grazing and management through implementation of voluntary conservation measures and management practices that are consistent with greater sage-grouse population management and habitat conservation objectives on BLM lands.

Conservation Easements are identified private lands with greater sage-grouse habitat where the private landowners enter into voluntary agreements with the government to give up developmental rights which may adversely affect habitat. The most common way these areas may be used in Wyoming is for mitigation banks. Allowing development within some areas of historic greater sage-grouse habitat or marginal habitat will require appropriate mitigation. In some cases the most appropriate mitigation may be for project proponents to buy credits at a conservation easement, thus creating a mitigation bank. Overall, the benefit is to the greater sage-grouse, as it reduces the overall potential for fragmented habitat by ensuring there are areas with no development potential which could adversely affect the viability of the species.

Sweetwater River Conservancy Habitat Conservation Bank

The Sweetwater River Conservancy Habitat Conservation Bank is the first conservation bank established for greater sage-grouse. Located in central Wyoming, the bank manages habitat for greater sage-grouse allowing energy development and other activities to proceed on other lands within Wyoming. A conservation bank is a site or suite of sites established under an agreement with the USFWS, intended to protect, and improve habitat for species. Credits may be purchased which result in perpetual conservation easements and conservation projects on the land to offset impacts occurring elsewhere. The Sweetwater River Conservancy Habitat Conservation Bank launched with 55,000 deeded acres of greater sage-grouse habitat, and could expand up to 700,000 acres on other lands owned by the Sweetwater River Conservancy contingent upon demand (USFWS 2015).

Wyoming Landscape Conservation Initiative

The Wyoming Landscape Conservation Initiative is a long-term science based effort to assess and enhance aquatic and terrestrial habitats at a landscape scale in southwest Wyoming, while facilitating responsible development through local collaboration and partnership. Collaborative efforts address multiple concerns at a scale that considers all activities on the landscape, and can leverage resources that might not be available for single agency projects. Greater sage-grouse initiatives from the Wyoming Landscape Conservation Initiative have included habitat enhancement efforts (e.g., invasive weed treatment, prescribed grazing strategies), and greater sage-grouse research studies (Wyoming Landscape Conservation Initiative 2013).

Powder River Basin Restoration Program

The Powder River Basin Restoration Program is a collaborative partnership to restore and enhance greater sage-grouse habitat on a landscape level in the Powder River Basin. The basin encompasses 13,493,840 acres in northeast Wyoming and southeast Montana. Surface ownership is composed of approximately 70 percent private lands, 14 percent BLM-administered lands (including 8 percent in Wyoming and 6 percent in Montana), 8 percent Forest Service lands, and 8 percent States of Wyoming and Montana lands. Subsurface mineral ownership is 50 to 60 percent federal (BLM 2014).

The Powder River Basin Restoration Program is focusing on areas affected by the federal oil and gas development that has occurred over the past decade in the Powder River Basin in northeastern Wyoming. Its objectives are restoring or enhancing disturbed previously suitable habitat to suitable habitat for sagebrush obligate species, primarily greater sage-grouse. This includes multiple sites affected by coal bed natural gas abandonment reclamation efforts, wildfires, and noxious and invasive plants. Priority will be given to those areas recognized as priority habitats (e.g., PHMAs).

Habitat objectives are meeting the needs for nesting, brood-rearing, and late brood-rearing. The program would contribute to efforts focused on the management and control of mosquitoes carrying West Nile virus and would include funding, labor, treatment locations, and other needs as determined.

Additionally, efforts would be coordinated to reduce fuels in and near greater sage-grouse habitat, to enhance sagebrush stands, support restoration efforts, and reduce the risk of high-severity wildfire. Pine stands and juniper woodlands would be managed for structural diversity and to reduce fuels, especially near PHMA, human developments, and recreation areas.

Natural Resource Conservation Service Sage Grouse Initiative

The US Department of Agriculture, Natural Resources Conservation Service’s Sage-Grouse Initiative (SGI) is working with private landowners in 11 western states to improve habitat for greater sage-grouse (Manier et al. 2013). With 13.5 million acres of greater sage-grouse habitat in private ownership within MZ II/VII (Manier et al. 2013, p. 118), a unique opportunity exists for the Natural Resources Conservation Service to benefit greater sage-grouse and to ensure the persistence of large and intact rangelands by implementing the SGI.

Participation in the SGI program is voluntary, but willing participants enter into binding contracts or easements to ensure that conservation practices that enhance greater sage-grouse habitat, such as fence marking, protecting riparian areas, and maintaining vegetation in nesting areas, are implemented. Participating landowners are bound by a contract (usually 3 to 5 years) to implement, in consultation with Natural Resources Conservation Service staff, conservation practices if they wish to receive the financial incentives offered by the SGI. These financial incentives generally take the form of payments to offset costs of implementing conservation practices and easements or rental payments for long-term conservation.

While potentially effective at conserving greater sage-grouse populations and habitat on private lands, incentive-based conservation programs that fund the SGI generally require reauthorization from Congress under subsequent farm bills, meaning future funding is not guaranteed.

6.0 COT OBJECTIVE 5: DEVELOPMENT OF MONITORING PLANS

“A robust range-wide monitoring program must be developed and implemented for sage-grouse conservation plans, which recognizes and incorporates individual state approaches. A monitoring program is necessary to track the success of conservation plans and proactive conservation activities. Without this information, the actual benefit of conservation activities cannot be measured and there is no capacity to adapt if current management actions are determined to be ineffective.” (COT Report, 2013)

6.1 Greater Sage-Grouse Monitoring Framework

Introduction

The purpose of this U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) Greater Sage-grouse Monitoring Framework (hereafter, monitoring framework) is to describe the methods to monitor habitats and evaluate the implementation and effectiveness of the BLM planning strategy (BLM IM 2012-044) and the USFS Land Use Plans to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved. Therefore, BLM and USFS will use the methods described herein to collect monitoring data to evaluate implementation and effectiveness of the greater sage-grouse (hereafter, greater sage-grouse) planning strategy and the conservation measures contained in land use plans. The type of monitoring data to be collected at the land use plan scale will be described in the monitoring plan which will be developed after the signing of the ROD. For a summary of the frequency of reporting see Attachment A. Adaptive management will be informed by data collected at any and all scales.

To ensure the BLM and USFS have the ability to make consistent assessments about greater sage-grouse habitats across the range of the species, this framework lays out the methodology for monitoring the implementation and evaluating the effectiveness of BLM/USFS actions to conserve the species and its habitat through monitoring that informs effectiveness at multiple scales. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. Implementation monitoring results will provide information to allow the BLM and USFS to evaluate the extent that decisions from the BLM RMP and USFS land management plans (LMP) to conserve greater sage-grouse and its habitat have been implemented. Population monitoring information will be collected by state fish and wildlife agencies and will be incorporated into effectiveness monitoring as it is made available.

This multi-scale monitoring approach is necessary as greater sage-grouse are a landscape species and conservation is scale-dependent whereby conservation actions are implemented within seasonal habitats to benefit populations. The four orders of habitat selection (Johnson 1980) used in this monitoring framework are described by Connelly et al. (2003) and Stiver et al. (2014) as first order (broad scale), second order (mid-scale), third order (fine scale), and fourth order (site scale) to apply them to greater sage-grouse habitat selection. The various scales may show differences because of the methods used. The broad and mid-scale may provide a generalize direction, however the suitability baseline (pre-euro) is not considered an accurate baseline. The current baseline will provide better information on trends provided the data used in the analysis is sound. Based upon the management actions related to the BLM and Wyoming SGE0, the broad and mid-scale may greatly underestimate the impacts of the threats outlined in the COT report. Habitat selection and habitat use by greater sage-grouse occurs at multiple scales and is driven by multiple environmental and behavioral factors. Managing and monitoring greater sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat utilization by individual birds within a given season. Therefore, the tendency to look at a single indicator of habitat suitability or only one scale limits the ability for managers to identify the threats to greater sage-grouse and to respond at the appropriate scale. For descriptions of these habitat suitability indicators for each scale, see the Sage-grouse Habitat Assessment Framework (HAF; Stiver et al. in press).

Monitoring methods and indicators in this monitoring framework are derived from the current peer-reviewed science. Range wide best-available datasets for broad and mid-scale monitoring will be acquired. If these existing datasets are not readily available or are inadequate, but are necessary to effectively inform the three measurable quantitative indicators (sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions), the BLM will strive to develop datasets or obtain information to fill these data gaps. Datasets that are not readily available to inform the fine and site scale indicators will be developed. These data will be used to generate monitoring reports at the appropriate and applicable geographic scales, boundaries and analysis units: across the range of greater sage-grouse as defined by Schroeder et al. (2004), and clipped by WAFWA Management Zone (MZ) (Stiver et al. 2006) boundaries and other areas as appropriate for size (e.g., populations based on Connelly et al. 2004; Figure Y-11). This broad and mid-scale monitoring data and analysis will provide context for RMP/LMP areas; states; greater sage-grouse Priority Habitat, General Habitat and other greater sage-grouse designated management areas; and Priority Areas for Conservation (PACs) as defined in the Greater Sage-grouse Conservation Objectives: Final Report (COT, U.S. Fish and Wildlife Service 2013). Throughout the remainder of the document, all of these areas will be referred to as “sage-grouse areas”.

- Populations: Connelly et al., 2004
- Subpopulations: Connelly et al., 2004
- PACs: USFWS COT Report, 2013

This monitoring framework is divided into two sections. The broad- and mid-scale methods, described in Section 4.2, provide a consistent approach across the range of the species to monitor implementation decisions and actions, mid-scale habitat attributes (e.g., sagebrush availability and habitat degradation), and population changes to determine the effectiveness of the planning strategy and management decisions. (See Table Y-3, Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, greater sage-grouse habitat, and greater sage-grouse populations at the broad and

Appendix Y – Greater Sage-Grouse Implementation Strategy

mid-scales.) For greater sage-grouse habitat at the fine and site scales, described in Section 4.3, this monitoring framework describes a consistent approach (e.g., indicators and methods) for monitoring greater sage-grouse seasonal habitats. Funding, support, and dedicated personnel for broad- and mid-scale monitoring will be renewed annually through the normal budget process. For an overview of BLM and USFS multiscale monitoring commitments, see Attachment A.

Table Y-3. Indicators for Monitoring Implementation of the Strategy, Decisions, Greater Sage-Grouse Habitat, and Greater Sage- Grouse Populations at the Broad and Mid-scales

	Implementation	Habitat		Population (State Wildlife Agencies)
<i>Geographic Scales</i>		<i>Availability</i>	<i>Degradation</i>	<i>Demographics</i>
Broad Scale: From the range of greater sage-grouse to WAFWA Management Zones	BLM/USFS Planning Strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining and infrastructure facilities	WAFWA Management Zone population trend
Mid-scale: From WAFWA Management Zone to populations	An analysis of RMP/LRMP decisions across the designated scale	Mid-scale habitat indicators (HAF 2014; Table 2, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining and infrastructure facilities (Table 2)*	Individual population trend
Fine Scale: Pacs	A summary of DDCT actions related to BLM mineral and surface resources in conjunction with other ownerships	Areas that have greater than 5% sagebrush cover and non-habitat (unsuitable) that is less than 0.6miles from the suitable habitat.	Distribution and amount of anthropogenic disturbances and wildfire occurrences impacting specific PACs	PAC Trends
Site Scale: DDCT level	A summary of DDCT actions related to BLM mineral and surface resources	The available occupied habitat using the DDCT process	Distribution and amount of anthropogenic disturbances and wildfire occurrences impacting specific PACs	Individual lek Trends
Broad Scale: From the range of greater sage-grouse to WAFWA Management Zones	BLM/USFS Planning Strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining and infrastructure facilities	WAFWA Management Zone population trend
Mid-scale: From WAFWA Management Zone to populations; PACs	RMP/LRMP decisions	Mid-scale habitat indicators (HAF 2014; Table 2, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining and infrastructure facilities (Table 2)*	Individual population trend

*HAF 2014; Table 2

Broad and Mid-Scales

First-order habitat selection, the broad scale, describes the physical or geographical range of a species. The first-order habitat of the greater sage-grouse is defined by populations of greater sage-grouse associated with sagebrush landscapes, based on Schroeder et al. 2004, and Connelly et al. 2004, and on population or habitat surveys since 2004. An intermediate scale between the broad and mid-scales was delineated by WAFWA from floristic provinces within which similar environmental factors influence vegetation communities. This scale is referred to as the WAFWA Sage-Grouse Management Zones (MZs). Although no indicators are specific to this scale, these MZs are biologically meaningful as reporting units.

Second-order habitat selection, the mid-scale, includes greater sage-grouse populations and PACs. The second order includes at least 40 discrete populations and subpopulations (Connelly et al. 2004). Populations range in area from 150 to 60,000 mi² and are nested within MZs. PACs range from 20 to 20,400 mi² and are nested within population areas.

Other mid-scale landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. in press) will also be assessed. The methods used to calculate these metrics will be derived from existing literature (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011).

Midscale indicators using the HAF can grossly underestimate the occupation of anthropogenic activities because of the use of 30m pixels (page Table II – X). The HAF removes ‘non’habitat from the suitability availability. There are no parameters that are provided to protect adjacent suitable habitat from development on these nonhabitat parcels, thus making the adjacent nonhabitat a potential threat by indirect impacts.

The Wyoming BLM and USFS Offices will be actively participating in a fine and site scale monitoring that will more accurately reflect the impacts associated with direct and indirect effects of anthropogenic and wildfire impacts.

6.2 Implementation (Decision) Monitoring

Implementation monitoring is the process of tracking and documenting the implementation (or the progress toward implementation) of RMP/LMP decisions. The BLM and the USFS will monitor implementation of project-level and/or site-specific actions and authorizations, with their associated conditions of approval/stipulations for greater sage-grouse, spatially (as appropriate) within Priority Habitat, General Habitat, and other greater sage-grouse designated management areas, at a minimum, for the Bighorn Basin Planning Area. These actions and authorizations, as well as progress toward completing and implementing activity-level plans, will be monitored consistently across all planning units and will be reported to BLM and USFS headquarters annually, as well as reported to the State of Wyoming with numerical and spatial data twice a year, and a HQ summary report every 5 years, for the Bighorn Basin Planning Area. A national-level Greater Sage-grouse Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of greater sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the Record of Decision or approved plan. The BLM will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

6.3 Habitat (Vegetation) Monitoring

The USFWS, in its 2010 listing decision for the sage-grouse, identified 18 threats contributing to the destruction, modification, or curtailment of greater sage-grouse habitat or range (75 FR 13910 2010). The BLM will, therefore, monitor the relative extent of these threats that remove sagebrush, both spatially and temporally, on all lands within an analysis area, and will report on amount, pattern, and condition at the appropriate and applicable geographic scales and boundaries. These 18 threats have been aggregated into three broad- and mid-scale measures to account for whether the threat predominantly removes sagebrush or degrades habitat. (See Table 4, Relationship between the 18 Threats and the 3 Habitat Disturbance Measures for Monitoring.) The three measures are:

1. Sagebrush Availability (percent of sagebrush per suitable unit area)
2. Habitat Degradation (percent of human activity per unit area)
3. Energy and Mining Density (facilities and locations per suitable unit area)

These three habitat disturbance measures will evaluate disturbance on all lands within priority habitat, regardless of land ownership. The direct area of influence will be assessed with the goal of accounting for actual removal of sagebrush on which greater sage-grouse depend (Connelly et al. 2000) and for habitat degradation as a surrogate for human activity. Measure 1 (sagebrush availability) examines where disturbances have removed plant communities that support sagebrush (or have broadly removed sagebrush from the landscape). Measure 1, therefore, monitors the change in sagebrush availability—or, specifically, where and how much of the sagebrush community is available on lands that can support sagebrush within the range of greater sage-grouse. The sagebrush community is defined as the ecological systems that have the capability of supporting sagebrush vegetation and seasonal greater sage-grouse habitats within the range of greater sage-grouse (see Section B.1., Sagebrush Availability). Measure 2 (see Section B.2., Habitat Degradation Monitoring) and Measure 3 (see Section B.3., Energy and Mining Density) focus on where habitat degradation is occurring within suitable sagebrush soils by using the footprint/area of direct disturbance and the number of facilities at the mid-scale to identify the relative amount of degradation per geographic area of interest and in areas that have the capability of supporting sagebrush and seasonal greater sage-grouse use. Measure 2 (habitat degradation) not only quantifies footprint/area of direct disturbance but also establishes a surrogate for those threats most likely to have ongoing activity. Because energy development and mining activities are typically the most intensive activities in sagebrush habitat, Measure 3 (the density of active energy development, production, and mining sites) will help identify areas of particular concern for such factors as noise, dust, traffic, etc., that degrade greater sage-grouse habitat.

Table Y-4. Relationship between the 18 Threats and the 3 Habitat Disturbance Measures for Monitoring

FWS Listing Decision Threat	Sagebrush Availability	Habitat Degradation	Density of Energy and Mining
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X		
Invasive Species	X		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X	

Note: Data availability may preclude specific analysis of individual layers. See the detailed methodology for more information.

The methods to monitor disturbance found herein differ slightly from methods used in the Sage-Grouse Baseline Environmental Report (BER; Manier et al. 2013) that provided a baseline of datasets of disturbance across jurisdictions. One difference is that, for some threats, the data in the BER were for federal lands only. In addition, threats were assessed individually in that report, using different assumptions from those in this monitoring framework about how to quantify the location and magnitude of threats. The methodology herein builds on the BER methodology and identifies datasets and procedures to utilize the best available data across the range of the greater sage-grouse and to formulate a consistent approach to quantify impact of the threats through time. This methodology also describes an approach to combine the threats and calculate the three measures.

6.3.1 Sagebrush Availability (Measure 1)

Greater sage-grouse populations have been found to be more resilient where a percentage of the landscape is maintained in sagebrush (Knick and Connelly 2011), which will be determined by sagebrush availability. Measure 1 has been divided into two sub measures to describe sagebrush availability on the landscape:

- Measure 1a: the current amount of sagebrush on the geographic area of interest, and
- Measure 1b: the amount of sagebrush on the geographic area of interest compared with the amount of sagebrush the landscape of interest could ecologically support.

Measure 1a (the current amount of sagebrush on the landscape) will be calculated using this formula: [the existing updated sagebrush layer] divided by [the geographic area of interest]. The appropriate geographic areas of interest for sagebrush availability include the species' range, WAFWA MZs, populations, and PACs. In some cases these greater sage-grouse areas will need to be aggregated to provide an estimate of sagebrush availability with an acceptable level of accuracy.

Measure 1b (the amount of sagebrush for context within the geographic area of interest) will be calculated using this formula: [existing sagebrush divided by [pre-EuroAmerican settlement geographic extent of lands that could have supported sagebrush]]. This measure will provide information to set the context for a given geographic area of interest during evaluations of monitoring data. The information could also be used to inform management options for restoration or mitigation and to inform effectiveness monitoring.

The sagebrush base layer for Measure 1 will be based on geospatial vegetation data adjusted for the threats listed in Table Y-4. The following subsections of this monitoring framework describe the methodology for determining both the current availability of sagebrush on the landscape and the context of the amount of sagebrush on the landscape at the broad and mid-scales.

6.3.1.1 Establishing the Sagebrush Base Layer

The current geographic extent of sagebrush vegetation within the rangewide distribution of greater sage-grouse populations will be ascertained using the most recent version of the Existing Vegetation Type (EVT) layer in LANDFIRE (2013). LANDFIRE EVT was selected to serve as the sagebrush base layer for five reasons: 1) it is the only nationally consistent vegetation layer that has been updated multiple times since 2001; 2) the ecological systems classification within LANDFIRE EVT includes multiple sagebrush type classes that, when aggregated, provide a more accurate (compared with individual classes) and seamless sagebrush base layer across jurisdictional boundaries; 3) LANDFIRE performed a rigorous accuracy assessment from which to derive the rangewide uncertainty of the sagebrush base layer; 4) LANDFIRE is consistently used in several recent analyses of sagebrush habitats (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011); and 5) LANDFIRE EVT can be compared against the geographic extent of lands that are believed to have had the capability of supporting sagebrush vegetation pre-EuroAmerican settlement [LANDFIRE Biophysical Setting (BpS)]. This fifth reason provides a reference point for understanding how much sagebrush currently remains in a defined geographic area of interest compared with how much sagebrush existed historically (Measure 1b). Therefore, the BLM and the USFS have determined that LANDFIRE provides the best available data at broad and mid-scales to serve as a sagebrush base layer for monitoring changes in the geographic extent of sagebrush. The BLM and the USFS, in addition to aggregating the sagebrush types into the sagebrush base layer, will aggregate the accuracy assessment reports from LANDFIRE to document the cumulative accuracy for the sagebrush base layer. The BLM—through its Assessment, Inventory, and Monitoring

(AIM) program and, specifically, the BLM’s landscape monitoring framework (Taylor et al. 2014)—will provide field data to the LANDFIRE program to support continuous quality improvements of the LANDFIRE EVT layer. The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of the existing percent of sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will also be used to determine the trend in other landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. in press). In the future, changes in sagebrush availability, generated annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section D., Effectiveness Monitoring).

Within the BLM, field office-wide existing vegetation classification mapping and inventories are available that provide a much finer level of data than what is provided through LANDFIRE. Where available, these finer-scale products will be useful for additional and complementary mid-scale indicators and local-scale analyses (see Section 4.3, Fine and Site Scales). The fact that these products are not available everywhere limits their utility for monitoring at the broad and mid-scale, where consistency of data products is necessary across broader geographies.

The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of existing percent sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will be used to determine the trend in other landscape indicators, e.g., patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. in press). In the future, changes in sagebrush availability, generated bi-annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section D).

Data Sources for Establishing and Monitoring Sagebrush Availability

In much the same manner as how the LANDFIRE data was selected as the data source, described above, the criteria for selecting the datasets (Table Y-5) for establishing and monitoring the change in sagebrush availability, Measure 1, were threefold:

- Nationally consistent dataset available across the range
- Known level of confidence or accuracy in the dataset
- Continual maintenance of dataset and known update interval

Table Y-5. Datasets for Establishing and Monitoring Changes in Sagebrush Availability

Dataset	Source	Update Interval	Most Recent Version Year	Use
BioPhysical Setting (BpS) v1.1	LANDFIRE	Static	2008	Denominator for sagebrush availability (1.b.)
Existing Vegetation Type (EVT) v1.2	LANDFIRE	Static	2010	Numerator for sagebrush availability
Cropland Data Layer (CDL)	National Agricultural Statistics Service (NASS)	Annual	2012	Agricultural Updates; removes existing sagebrush from numerator of sagebrush availability
National Land Cover Dataset (NLCD) Percent Imperviousness	Multi-Resolution Land Characteristics Consortium (MRLC)	5 Year	2011 available in March 2014	Urban Area Updates; removes existing sagebrush from numerator of sagebrush availability
Fire Perimeters	GeoMac	Annual	2013	< 1,000 acres Fire updates; removes existing sagebrush from numerator of sagebrush availability
Burn Severity	Monitoring Trends in Burn Severity (MTBS)	Annual	2012 available in April 2014	> 1,000 acres Fire Updates; removes existing sagebrush from numerator of sagebrush availability except for unburned sagebrush islands

LANDFIRE Existing Vegetation Type (EVT) Version 1.2

LANDFIRE EVT represents existing vegetation types on the landscape derived from remote sensing data. Initial mapping was conducted using imagery collected in approximately 2001. Since the initial mapping there have been two update efforts: version 1.1 represents changes before 2008, and version 1.2 reflects changes on the landscape before 2010. Version 1.2 will be used as the starting point to develop the sagebrush base layer.

Ecological systems from the LANDFIRE EVT to be used in the sagebrush base layer were determined by greater sage-grouse subject matter experts through the identification of the ecological systems that have the capability of supporting sagebrush vegetation and could provide suitable seasonal habitat for the greater sage-grouse (Table Y-6). Two additional vegetation types that are not ecological systems were added to the EVT and are *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance. These alliances have species composition directly related to the Rocky Mountain Lower Montane - Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system, both of which are ecological systems in LANDFIRE BpS. In LANDFIRE EVT however, in some map zones, the Rocky Mountain Lower Montane - Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system were named *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance respectively.

Table Y-6. Ecological Systems in BpS and EVT Capable of Supporting Sagebrush Vegetation and Could Provide Suitable Seasonal Habitat for Greater Sage-Grouse

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability to Produce
Colorado Plateau Mixed Low Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia bigelovii</i> <i>Artemisia nova</i> <i>Artemisia frigida</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Columbia Plateau Scabland Shrubland	<i>Artemisia rigida</i>
Great Basin Xeric Mixed Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longicaulis</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Shrubland	<i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Mixed Salt Desert Scrub	<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia spinescens</i>
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>rupicola</i>
Columbia Plateau Low Sagebrush Steppe	<i>Artemisia arbuscula</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i>
Inter-Mountain Basins Big Sagebrush Steppe	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>tripartita</i> <i>Artemisia frigida</i>
Inter-Mountain Basins Montane Sagebrush Steppe	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia nova</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>spiciformis</i>
Northwestern Great Plains Mixed grass Prairie	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia frigida</i>
Northwestern Great Plains Shrubland	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Western Great Plains Sand Prairie	<i>Artemisia cana</i> ssp. <i>cana</i>
Western Great Plains Floodplain Systems	<i>Artemisia cana</i> ssp. <i>cana</i>
Columbia Plateau Steppe and Grassland	<i>Artemisia</i> spp.

Table Y-6. Ecological Systems in BpS and EVT Capable of Supporting Sagebrush Vegetation and Could Provide Suitable Seasonal Habitat for Greater Sage-Grouse (Continued)

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability to Produce
Inter-Mountain Basins Semi-Desert Shrub-Steppe	<i>Artemisia tridentata</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Rocky Mountain Lower Montane-Foothill Shrubland	<i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia frigida</i>
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	<i>Artemisia tridentata</i>
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland and Shrubland	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i>
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
<i>Quercus gambelii</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i>

Accuracy and Appropriate Use of LANDFIRE Datasets

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in Table Y-6 will be merged into one value that represents the sagebrush base layer. With all ecological systems aggregated, the combined accuracy of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately.

LANDFIRE performed the original accuracy assessment of their EVT product on a map zone basis. There are 20 LANDFIRE map zones that cover the historic range of greater sage-grouse as defined by Schroeder (2004). Attachment C lists the user and producer accuracies for the aggregated ecological systems that make up the sagebrush base layer and also defines user and producer accuracies. The aggregated sagebrush base layer for monitoring had producer accuracies ranging from 56.7% to 100% and user accuracies ranging from 57.1% to 85.7%.

LANDFIRE EVT data are not designed to be used at a local level. In reports of the percent sagebrush statistic for the various reporting units (Measure 1a), the uncertainty of the percent sagebrush will increase as the size of the reporting unit gets smaller. LANDFIRE data should never be used at the 30m pixel level (900m2 resolution of raster data) for any reporting. The smallest geographic extent for using the data to determine percent sagebrush is at the PAC level; for the smallest PACs, the initial percent sagebrush estimate will have greater uncertainties compared with the much larger PACs.

Agricultural Adjustments for the Sagebrush Base Layer

The dataset for the geographic extent of agricultural lands will come from the National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) (<http://www.nass.usda.gov/research/Cropland/Release/index.htm>). CDL data are generated annually, with estimated producer accuracies for “large area row crops ranging from the mid 80% to mid-90%,” depending on the state (http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3_18.0). Specific information on accuracy may be found on the NASS metadata website (<http://www.nass.usda.gov/research/Cropland/metadata/meta.htm>). CDL provided the only dataset that matches the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in this monitoring framework and represents the best available agricultural lands mapping product.

The CDL data contain both agricultural classes and nonagricultural classes. For this effort, and in the baseline environmental report (Manier et al. 2013), nonagricultural classes were removed from the original dataset. The excluded classes are:

- Barren (65 & 131), Deciduous Forest (141), Developed/High Intensity (124), Developed/Low Intensity (122), Developed/Med Intensity (123), Developed/Open Space (121), Evergreen Forest (142), Grassland Herbaceous (171), Herbaceous Wetlands (195), Mixed Forest (143), Open Water (83 & 111), Other Hay/Non Alfalfa (37), Pasture/Hay (181), Pasture/Grass (62), Perennial Ice/Snow (112), Shrubland (64 & 152), Woody Wetlands (190).

The rule set for adjusting the sagebrush base layer for agricultural lands (and for updating the base layer for agricultural lands in the future) is that once an area is classified as agriculture in any year of the CDL, those pixels will remain out of the sagebrush base layer even if a new version of the CDL classifies that pixel as one of the nonagricultural classes listed above. The assumption is that even though individual pixels may be classified as a nonagricultural class in any given year, the pixel has not necessarily been restored to a natural sagebrush community that would be included in Table Y-6. A further assumption is that once an area has moved into agricultural use, it is unlikely that the area would be restored to sagebrush. Should that occur, however, the method and criteria for adding pixels back into the sagebrush base layer would follow those found in the sagebrush restoration monitoring section of this monitoring framework.

Urban Adjustments for the Sagebrush Base Layer

The National Land Cover Dataset (NLCD) Percent Imperviousness was selected as the best available dataset to be used for urban updates. These data are generated on a five-year cycle and specifically designed to support monitoring efforts. Other datasets were evaluated and lacked the spatial specificity that was captured in the NLCD product. Any new impervious pixel will be removed from the sagebrush base layer during the update process. Although the impervious surface layer includes a number of impervious pixels outside of urban areas, there are two reasons why this is acceptable for this process. First, an evaluation of national urban area datasets did not reveal a layer that could be confidently used in conjunction with the NLCD product to screen impervious pixels outside of urban zones because unincorporated urban areas were not being included thus leaving large chunks of urban pixels unaccounted for in this rule set. Secondly, experimentation with setting a threshold on the percent imperviousness layer that would isolate rural features proved to be unsuccessful. No combination of values could be identified that would result in the consistent ability to limit impervious pixels outside urban areas. Therefore, to ensure consistency in the monitoring estimates, it was determined to include all impervious pixels.

Fire Adjustments for the Sagebrush Base Layer

Two datasets were selected for performing fire adjustments and updates: GeoMac fire perimeters and Monitoring Trends in Burn Severity (MTBS). An existing data standard in the BLM requires that all fires of more than 10 acres are to be reported to GeoMac; therefore, there will be many small fires of less than 10 acres that will not be accounted for in the adjustment and monitoring attributable to fire. Using fire perimeters from GeoMac, all sagebrush pixels falling within the perimeter of fires less than 1,000 acres will be used to adjust and monitor the sagebrush base layer.

For fires greater than 1,000 acres, MTBS was selected as a means to account for unburned sagebrush islands during the update process of the sagebrush base layer. The MTBS program (<http://www.mtbs.gov>) is an ongoing, multiyear project to map fire severity and fire perimeters consistently across the United States. One of the burn severity classes within MTBS is an unburned to low-severity class. This burn severity class will be used to represent unburned islands of sagebrush within the fire perimeter for the sagebrush base layer. Areas within the other severity classes within the fire perimeter will be removed from the base sagebrush layer during the update process. Not all wildfires, however, have the same impacts on the recovery of sagebrush habitat, depending largely on soil moisture and temperature regimes. For example, cooler, moister sagebrush habitat has a higher potential for recovery or, if needed, restoration than does the warmer, dryer sagebrush habitat. These cooler, moister areas will likely be detected as sagebrush in future updates to LANDFIRE.

Conifer Encroachment Adjustment for the Sagebrush Base Layer

Conifer encroachment into sagebrush vegetation reduces the spatial extent of greater sage-grouse habitat (Davies et al. 2011, Baruch-Mordo et al. 2013). Conifer species that show propensity for encroaching into sagebrush vegetation resulting in greater sage-grouse habitat loss include various juniper species, such as Utah juniper (*Juniperus osteosperma*), western juniper (*Juniperus occidentalis*), Rocky Mountain juniper (*Juniperus scopulorum*), pinyon species, including singleleaf pinyon (*Pinus monophylla*) and pinyon pine (*Pinus edulis*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Douglas-fir (*Pseudotsuga menziesii*) (Gruell et al. 1986, Grove et al. 2005, Davies et al. 2011).

A rule set for conifer encroachment was developed to be used for determination of the existing sagebrush base layer. To capture the geographic extent of sagebrush that is likely to experience conifer encroachment, ecological systems within LANDFIRE EVT version 1.2 (NatureServe 2011) were identified if they have the capability of supporting the conifer species (listed above) and have the capability of supporting sagebrush vegetation. Those ecological systems (Table Y-7) were deemed to be the plant communities with conifers most likely to encroach into sagebrush vegetation. Sagebrush vegetation was defined as including sagebrush species (Attachment B) that provide habitat for the greater sage-grouse and are included in the Sage-Grouse Habitat Assessment Framework. An adjacency analysis was conducted to identify all sagebrush pixels that were directly adjacent to these conifer ecological systems and these immediately adjacent sagebrush pixels were removed from the sagebrush base layer.

Table Y-7. Ecological Systems with Conifers Most Likely to Encroach into Sagebrush Vegetation

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability to Produce
Colorado Plateau Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus osteosperma</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia bigelovii</i> <i>Artemisia pygmaea</i>
Columbia Plateau Western Juniper Woodland and Savanna	<i>Juniperus occidentalis</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia rigida</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
East Cascades Oak-Ponderosa Pine Forest and Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Artemisia tridentata</i> <i>Artemisia nova</i>
Great Basin Pinyon-Juniper Woodland	<i>Pinus monophylla</i> <i>Juniperus osteosperma</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Northern Rocky Mountain Ponderosa Pine Woodland and Savanna	<i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Rocky Mountain Foothill Limber Pine-Juniper Woodland	<i>Juniperus osteosperma</i> <i>Juniperus scopulorum</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i>
Rocky Mountain Poor-Site Lodgepole Pine Forest	<i>Pinus contorta</i> <i>Pseudotsuga menziesii</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i>
Southern Rocky Mountain Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus monosperma</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>

Table Y-7. Ecological Systems with Conifers Most Likely to Encroach into Sagebrush Vegetation (Continued)

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability to Produce
Southern Rocky Mountain Ponderosa Pine Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Pinus edulis</i> <i>Pinus contorta</i> <i>Juniperus</i> spp. <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>Vaseyana</i>

Invasive Annual Grasses Adjustments for the Sagebrush Base Layer

There are no invasive species datasets from 2010 to the present (beyond the LANDFIRE data) that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in the determination of the sagebrush base layer. For a description of how invasive species land cover will be incorporated in the sagebrush base layer in the future, see Section B.1.b., Monitoring Sagebrush Availability.

Sagebrush Restoration Adjustments for the Sagebrush Base Layer

There are no datasets from 2010 to the present that could provide additions to the sagebrush base layer from restoration treatments that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated); therefore, no adjustments were made to the sagebrush base layer calculated from the LANDFIRE EVT (version 1.2) attributable to restoration activities since 2010. Successful restoration treatments before 2010 are assumed to have been captured in the LANDFIRE refresh.

6.3.1.2 Monitoring Sagebrush Availability

Updating the Sagebrush Availability Sagebrush Base Layer

Sagebrush availability will be updated annually by incorporating changes to the sagebrush base layer attributable to agriculture, urbanization, and wildfire. The monitoring schedule for the existing sagebrush base layer updates is as follows:

- **2010 Existing Sagebrush Base Layer** = [Sagebrush EVT] minus [2006 Imperviousness Layer] minus [2009 and 2010 CDL] minus [2009/10 GeoMac Fires < 1,000 acres] minus [2009/10 MTBS Fires excluding unburned sagebrush islands] minus [Conifer Encroachment Layer]
- **2012 Existing Sagebrush Update** = [Base 2010 Existing Sagebrush Layer] minus [2011 Imperviousness Layer] minus [2011 and 2012 CDL] minus [2011/12 GeoMac Fires < 1,000 acres] minus [2011/12 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter]

- **2013 and beyond Existing Sagebrush Updates** = [Previous Existing Sagebrush Update Layer] minus [Imperviousness Layer (if new data are available)] minus [Next 2 years of CDL] minus [Next 2 years of GeoMac Fires < 1,000 acres] minus [Next 2 years MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter] plus [restoration/monitoring data provided by the field]

Sagebrush Restoration Updates

Restoration after fire, after agricultural conversion, after seedings of introduced grasses, or after treatments of pinyon pine and/or juniper, are examples of updates to the sagebrush base layer that can add sagebrush vegetation back in. When restoration has been determined to be successful through range wide, consistent, interagency fine and site-scale monitoring, the polygonal data will be used to add sagebrush pixels back into the broad and mid-scale sagebrush base layer.

Measure 1b – Context for the change in the amount of sagebrush in a landscape of interest

Measure 1b describes the amount of sagebrush on the landscape of interest compared with the amount of sagebrush the landscape of interest could ecologically support. Areas with the potential to support sagebrush were derived from the BpS data layer that describes sagebrush pre Euro-American settlement (biophysical setting (BpS) v1.2 of LANDFIRE). This measure (1b) will provide information during evaluations of monitoring data to set the context for a given geographic area of interest. The information could also be used to inform management options for restoration, mitigation and inform effectiveness monitoring.

The identification and spatial locations of natural plant communities (vegetation) that are believed to have existed on the landscape (BpS) were constructed based on an approximation of the historical (pre Euro-American settlement) disturbance regime and how the historical disturbance regime operated on the current biophysical environment. BpS is composed of map units which are based on NatureServe's (2011) terrestrial ecological systems classification.

The ecological systems within BpS used for this monitoring framework are those ecological systems that have the capability of supporting sagebrush vegetation and could provide seasonal habitat for the greater sage-grouse. These ecological systems are listed in Table Y-6 with the exception of the *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and the *Quercus gambelii* Shrubland Alliance. Ecological systems selected included sagebrush species or subspecies that are included in the Sage-Grouse Habitat Assessment Framework and are found in Attachment B.

Attributable to the lack of any reference data, the BpS layer does not have an associated accuracy assessment. Visual inspection, however, of the BpS data reveals inconsistencies in the labeling of pixels among LANDFIRE map zones. The reason for these inconsistencies between map zones are the decision rules used to map a given ecological system will vary between map zones based on different physical, biological, disturbance and atmospheric regimes of the region. This can result in artificial edges in the map that are an artifact of the mapping process. However, metrics will be calculated at broad spatial scales using BpS potential vegetation type, not small groupings or individual pixels, therefore, the magnitude of these observable errors in the BpS layer is minor compared with the size of the reporting units. Therefore, since BpS will be used to identify broad landscape patterns of dominant vegetation, these inconsistencies will only have a minor impact on the percent sagebrush availability calculation.

LANDFIRE BpS data are not designed to be used at a local level. In reporting the percent sagebrush statistic for the various reporting units, the uncertainty of the percent sagebrush will increase as the size

of the reporting unit gets smaller. LANDFIRE data should never be used at the pixel level (30m²) for any reporting. The smallest geographic extent use of the data for this purpose is at the PAC level and for the smallest PACs the initial percent sagebrush remaining estimate will have greater uncertainties compared with the much larger PACs.

Tracking

BLM and USFS will analyze and monitor sagebrush availability (Measure 1) on a bi-annual basis and it will be used to inform effectiveness monitoring and initiate adaptive management actions as necessary. The 2010 estimate of sagebrush availability will serve as the base year and an updated estimate for 2012 will be reported in 2014 after all datasets become available. The 2012 estimate will capture changes attributable to fire, agriculture, and urban development. Subsequent updates will always include new fire and agricultural data and new urban data when available. Restoration data that meets criteria of adding sagebrush areas back into the sagebrush base layer will begin to be factored in as data allows. Attributable to data availability, there will be a two year lag (approximately) between when the estimate is generated and when the data used for the estimate becomes available (e.g., the 2014 sagebrush availability will be included in the 2016 estimate).

Future Plans

Geospatial data used to generate the sagebrush base layer will be available through BLM's EGIS Web Portal and Geospatial Gateway or through the authoritative data source. Legacy datasets will be preserved, so that trends may be calculated. Additionally, accuracy assessment data for all source datasets will be provided on the portal either spatially, where applicable, or through the metadata. Accuracy assessment information was deemed vital to share to help users understand the limitation of the sagebrush estimates and will be summarized spatially by map zone and included in the Portal.

LANDFIRE plans to begin a remapping effort in 2015. This remapping has the potential to greatly improve overall quality of the data products primarily through the use of higher quality remote sensing datasets. Additionally, BLM and the Multi-Resolution Land Characteristics Consortium (MRLC) are working to improve the accuracy of vegetation map products for broad and mid-scale analyses through the Grass/Shrub mapping effort in partnership with the MRLC. The Grass/Shrub mapping effort applies the Wyoming multi-scale sagebrush habitat methodology (Homer et al. 2009) to spatially depict fractional percent cover estimates for five components range and west-wide. These five components are percent cover of sagebrush vegetation, percent bare ground, percent herbaceous vegetation (grass and forbs combined), annual vegetation, and percent shrubs. One of the benefits of the design of these fractional cover maps is that they facilitate monitoring "with-in" class variation (e.g., examination of declining trend in sagebrush cover for individual pixels). This "with-in" class variation can serve as one indicator of sagebrush quality that cannot be derived from LANDFIRE's EVT information. The Grass/Shrub effort is not a substitute for fine scale monitoring, but will leverage fine scale data to support the validation of the mapping products. An evaluation will be conducted to determine if either dataset is of great enough quality to warrant replacing the existing sagebrush layers. The earliest possible date for this evaluation will not occur until 2018 or 2019 depending on data availability.

6.3.2 Habitat Degradation Monitoring (Measure 2)

The measure of habitat degradation will be calculated by combining the footprints of threats identified in Table Y-4. The footprint is defined as the direct area of influence of “active” energy and infrastructure; it is used as a surrogate for human activity. Although these analyses will try to summarize results at the aforementioned meaningful geographic areas of interest, some may be too small to report the metrics appropriately and may be combined (smaller populations, PACs within a population, etc.). Data sources for each threat are found in Table Y-8, Geospatial data sources for habitat degradation. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and to calculate trends in habitat degradation to inform adaptive management. A 5-year summary report will be provided to the USFWS.

Habitat Degradation Datasets and Assumptions

Energy (oil and gas wells and development facilities): This dataset will compile information from three oil and gas databases: the proprietary IHS Enerdeq database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS Custom Data (hereafter, Platts) database of power plants. Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be removed if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed). Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

Additional Measure: Reclaimed Energy-related Degradation. This dataset will include those wells that have been plugged and abandoned. This measure thereby attempts to measure energy-related degradation that has been reclaimed but not necessarily fully restored to greater sage-grouse habitat. This measure will establish a baseline by using wells that have been plugged and abandoned within the last 10 years from the IHS and AFMSS datasets. Time lags for lek attendance in response to infrastructure have been documented to be delayed 2–10 years from energy development activities (Harju et al. 2010). Reclamation actions may require 2 or more years from the Final Abandonment Notice. Sagebrush seedling establishment may take 6 or more years from the point of seeding, depending on such variables as annual precipitation, annual temperature, and soil type and depth (Pyke 2011). This 10-year period is conservative and assumes some level of habitat improvement 10 years after plugging. Research by Hemstrom et al. (2002), however, proposes an even longer period—more than 100 years—for recovery of sagebrush habitats, even with active restoration approaches. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014). This additional layer/measure could be used at the broad and mid-scale to identify areas where sagebrush habitat and/or potential sagebrush habitat is likely still degraded. This layer/measure could also be used where further investigation at the fine or site scale would be warranted to: 1) quantify the level of reclamation already conducted, and 2) evaluate the amount of restoration still required for sagebrush habitat recovery. At a particular level (e.g., population, PACs), these areas and the reclamation efforts/success could be used to inform reclamation standards associated with future developments. Once these areas have transitioned from reclamation standards to meeting restoration standards, they can be added back into the sagebrush availability layer using the same methodology as described for adding restoration treatment areas lost to wildfire and agriculture conversion (see

Monitoring Sagebrush Restoration in Section B.1.b., Monitoring Sagebrush Availability). This dataset will be updated annually from the IHS dataset.

Energy (coal mines): Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring. Additionally, coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

Energy (wind energy facilities): This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be included. Direct area of influence of these point features will be measured by converting to a polygon dataset as a direct area of influence of 3 acres (1.2ha) centered on each tower point. See the BLM’s “Wind Energy Development Programmatic Environmental Impact Statement” (BLM 2005). Additionally, Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with a 3-acre (1.2ha) direct area of influence.

Energy (solar energy facilities): This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), “Land-Use Requirements for Solar Power Plants in the United States” (Ong et al. 2013).

Energy (geothermal energy facilities): This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

Mining (active developments; locatable, leasable, salable): This dataset will include active locatable mining locations as compiled with the proprietary InfoMine database. Aerial imagery will then be used to digitize manually the active mining surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Currently, there are no known compressive databases available for leasable or salable mining sites beyond coal mines. Other data sources will be evaluated

and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

Infrastructure (roads): This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture most paved and “crowned and ditched” roads while not including “two-track” and 4-wheel-drive routes. These minor roads, while not included in the broad- and mid-scale monitoring, may support a volume of traffic that can have deleterious effects on greater sage-grouse leks. It may be appropriate to consider the frequency and type of use of roads in a NEPA analysis for a proposed project. This fine- and site-scale analysis will require more site-specific data than is identified in this monitoring framework. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011). The most current dataset will be used for each monitoring update. Note: This is a related but different dataset than what was used in BER (Manier et al. 2013). Individual BLM/USFS planning units may use different road layers for fine- and site-scale monitoring.

Infrastructure (railroads): This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct area of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

Infrastructure (power lines): This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as “buried” will be removed from the disturbance calculation. Only “In Service” lines will be used; “Proposed” lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

Infrastructure (communication towers): This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed. It will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

Infrastructure (other vertical structures): This point dataset will be compiled from the FAA’s Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be removed. Duplicate points from the FCC communication towers point file will be removed. Remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

Other Developed Rights-of-Way: Currently, no additional data sources for other rights-of-way have been identified; roads, power lines, railroads, pipelines, and other known linear features are represented in the categories described above. The newly purchased IHS data do contain pipeline information; however, this database does not currently distinguish between above-ground and underground pipelines. If additional features representing human activities are identified, they will be added to monitoring reports using similar assumptions to those used with the threats described above.

6.3.2.1 Habitat Degradation Threat Combination and Calculation

The threats targeted for measuring human activity (Table Y-4) will be converted to direct area of influence polygons as described for each threat above. These threat polygon layers will be combined and features dissolved to create one overall polygon layer representing footprints of active human activity in the range of greater sage-grouse. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation. This measure has been divided into three sub measures to describe habitat degradation on the landscape. Percentages will be calculated as follows:

- **Measure 2a.** Footprint by geographic area of interest: Divide area of the active/direct footprint by the total area of the geographic area of interest (% disturbance in geographic area of interest).
- **Measure 2b.** Active/direct footprint by historical sagebrush potential: Divide area of the active footprint that coincides with areas with historical sagebrush potential (BpS calculation from habitat availability) within a given geographic area of interest by the total area with sagebrush potential within the geographic area of interest (% disturbance on potential historical sagebrush in geographic area of interest).
- **Measure 2c.** Active/direct footprint by current sagebrush: Divide area of the active footprint that coincides with areas of existing sagebrush (EVT calculation from habitat availability) within a given geographic area of interest by the total area that is current sagebrush within the geographic area of interest (% disturbance on current sagebrush in geographic area of interest).

Table Y-8. Geospatial Data Sources for Habitat Degradation (Measure 2)

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM - WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM - WO-300
Energy (coal)	Mines	BLM; USFS; Office of Surface Mining Reclamation and Envofrement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/ Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Energy (wind)	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM - WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM - WO-300
Energy (solar)	Fields/Power Plants	Platts (power plants)	7.3ac - (3.0 ha)/MW	NREL
Energy (geothermal)	Wells	IHS	3.0ac (1.2ha)	BLM - WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Mining	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
Infrastructure (roads)	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7 ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0 ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2 ft (73.2m)	USGS
Infrastructure (railroads)	ActiveLines	Federal Railroad Administration	30.8ft (9.4m)	USGS
Infrastructure (powerlines)	1-199 kV Lines	Platts (transmission lines)	100 ft (30.5 m)	BLM - WO-300
	200-399 kV Lines	Platts (transmission lines)	150 ft (45.7m)	BLM - WO-300
	400-699 kV Lines	Platts (transmission lines)	200 ft (61.0m)	BLM - WO-300
	700+ kV Lines	Platts (transmission lines)	250 ft (76.2m)	BLM - WO-300
Infrastructure (communication)	Towers	Federal Communications Commission	2.5 ac (1.0 ha)	BLM - WO-300

6.3.3 Energy and Mining Density (Measure 3)

The measure of density of energy and mining will be calculated by combining the locations of energy and mining threats identified in Table Y-4. This measure will provide an estimate of the intensity of human activity or the intensity of habitat degradation. The number of energy facilities and mining locations will be summed and divided by the area of meaningful geographic areas of interest to calculate density of these activities. Data sources for each threat are found in Table Y-8. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and 5-year (or longer) trends in habitat degradation.

Energy and Mining Density Datasets and Assumptions

- **Energy (oil and gas wells and development facilities)** (See Section B.2., Habitat Degradation Monitoring.)
- **Energy (coal mines)** (See Section B.2., Habitat Degradation Monitoring.)
- **Energy (wind energy facilities)** (See Section B.2., Habitat Degradation Monitoring.)
- **Energy (solar energy facilities)** (See Section B.2., Habitat Degradation Monitoring.)
- **Energy (geothermal energy facilities)** (See Section B.2., Habitat Degradation Monitoring.)
- **Mining (active developments; locatable, leasable, salable)** (See Section B.2., Habitat Degradation Monitoring.)

Energy and Mining Density Threat Combination and Calculation

Datasets for energy and mining will be collected in two primary forms: point locations (e.g., wells) and polygon areas (e.g., surface coal mining). The following rule set will be used to calculate density for meaningful geographic areas of interest including standard grids and per polygon:

1. Point locations will be preserved; no additional points will be removed beyond the methodology described above. Energy facilities in close proximity (an oil well close to a wind tower) will be retained.
2. Polygons will not be merged, or features further dissolved. Thus, overlapping facilities will be retained, such that each individual threat will be a separate polygon data input for the density calculation.
3. The analysis unit (polygon or 640-acre section in a grid) will be the basis for counting the number of mining or energy facilities per unit area. Within the analysis unit, all point features will be summed, and any individual polygons will be counted as one (e.g., a coal mine will be counted as one facility within population). Where polygon features overlap multiple units (polygons or pixels), the facility will be counted as one in each unit where the polygon occurs (e.g., a polygon crossing multiple 640-acre sections would be counted as one in each 640-acre section for a density per 640-acre-section calculation).
4. In methodologies with different-sized units (e.g., MZs, populations, etc.) raw facility counts will be converted to densities by dividing the raw facility counts by the total area of the unit. Typically this will be measured as facilities per 640 acres.
5. For uniform grids, raw facility counts will be reported. Typically this number will also be converted to facilities per 640 acres.
6. Reporting may include summaries beyond the simple ones above. Zonal statistics may be used to smooth smaller grids to help display and convey information about areas within meaningful geographic areas of interest that have high levels of energy and/or mining activity.
7. Additional statistics for each defined unit may also include adjusting the area to include only the area with the historical potential for sagebrush (BpS) or areas currently sagebrush (EVT).

Individual datasets and threat combination datasets for habitat degradation will be available through the BLM's EGIS web portal and geospatial gateway. Legacy datasets will be preserved so that trends may be calculated.

6.4 Population (Demographics) Monitoring

State wildlife management agencies are responsible for monitoring greater sage-grouse populations within their respective states. WAFWA will coordinate this collection of annual population data by state agencies. These data will be made available to the BLM according to the terms of the forthcoming Greater Sage-Grouse Population Monitoring Memorandum of Understanding (MOU) (2014) between WAFWA and the BLM. The MOU outlines a process, timeline, and responsibilities for regular data sharing of greater sage-grouse population and/or habitat information for the purposes of implementing greater sage-grouse LUPs/amendments and subsequent effectiveness monitoring. Population areas were refined from the “*Greater Sage-grouse (Centrocercus urophasianus) Conservation Objectives: Final Report*” (COT 2013) by individual state wildlife agencies to create a consistent naming nomenclature for future data analyses. These population data will be used for analysis at the applicable scale to supplement habitat effectiveness monitoring of management actions and to inform the adaptive management responses.

6.5 Effectiveness Monitoring

Effectiveness monitoring will provide the data needed to evaluate BLM and USFS actions toward reaching the objective of the national planning strategy (BLM IM 2012-044) – to conserve greater sage-grouse populations and their habitat– and the objectives for the land use planning area. Effectiveness monitoring methods described here will encompass multiple larger scales, from areas as large as the WAFWA MZ to the scale of the Bighorn Basin LUP. Effectiveness data used for these larger-scale evaluations will include all lands in the area of interest, regardless of surface ownership/management, and will help inform where finer-scale evaluations are needed, such as population areas smaller than an LUP or PACs within an LUP (described in Section 4.2, Fine and Site Scales). Data will also include the trend of disturbance within these areas of interest to inform the need to initiate adaptive management responses as described in the Bighorn Basin land use plan.

The BLM and the USFS will coordinate with the State of Wyoming in evaluating the compliance of all actions within greater sage-grouse PHMAs. Evaluation of current disturbance, disruptions and conservation actions within a greater sage-grouse PHMA will be conducted to determine if all entities are in compliance with their specific standards and whether or not it indeed has not caused declines of greater sage-grouse populations. This approach also helps focus scarce resources to areas experiencing habitat loss, degradation, or population declines, without excluding the possibility of concurrent, finer-scale evaluations as needed where habitat or population anomalies have been identified through some other means.

To determine the effectiveness of the greater sage-grouse national planning strategy, the BLM and the USFS will evaluate the answers to the following questions and prepare a broad- and mid-scale effectiveness report:

1. Sagebrush Availability and Condition:
 - a. What is the amount of sagebrush availability and the change in the amount and condition of sagebrush?
 - b. What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?
 - c. What is the trend and condition of the indicators describing sagebrush characteristics important to greater sage-grouse?

2. Habitat Degradation and Intensity of Activities:
 - a. What is the amount of habitat degradation and the change in that amount?
 - b. What is the intensity of activities and the change in the intensity?
 - c. What is the amount of reclaimed energy-related degradation and the change in the amount?
 - d. What is the population estimation of greater sage-grouse and the change in the population estimation?
3. How are the BLM and the USFS contributing to changes in the amount of sagebrush?
4. How are the BLM and the USFS contributing to disturbance?

The compilation of broad- and mid-scale data (and population trends as available) into an effectiveness monitoring report will occur on a 5-year reporting schedule (see Attachment A), which may be accelerated to respond to critical emerging issues (in consultation with the USFWS and state wildlife agencies). In addition, effectiveness monitoring results will be used to identify emerging issues and research needs and inform the BLM and the USFS adaptive management strategy (see the adaptive management section of this Environmental Impact Statement).

To determine the effectiveness of the greater sage-grouse objectives of the land use plan, the BLM and the USFS will evaluate the answers to the following questions and prepare a plan effectiveness report:

1. Is this plan meeting the greater sage-grouse habitat objectives?
2. Are greater sage-grouse areas within the LUP meeting, or making progress toward meeting, land health standards, including the Special Status Species/wildlife habitat standard?
3. Is the plan meeting the disturbance objective(s) within greater sage-grouse areas?
4. Are the greater sage-grouse populations within this plan boundary and within the greater sage-grouse areas increasing, stable, or declining?

The effectiveness monitoring report for this LUP will occur on a 5-year reporting schedule (see Attachment A) or more often if habitat or population anomalies indicate the need for an evaluation to facilitate adaptive management or respond to critical emerging issues. Data will be made available through the BLM's EGIS web portal and the geospatial gateway.

Methods

At the broad and mid-scales (PACs and above) the BLM and the USFS will summarize the vegetation, disturbance, and (when available) population data. Although the analysis will try to summarize results for PACs within each greater sage-grouse population, some populations may be too small to report the metrics appropriately and may need to be combined to provide an estimate with an acceptable level of accuracy. Otherwise, they will be flagged for more intensive monitoring by the appropriate landowner or agency. The BLM and the USFS will then analyze monitoring data to detect the trend in the amount of sagebrush; the condition of the vegetation in the greater sage-grouse areas (MacKinnon et al. 2011); the trend in the amount of disturbance; the change in disturbed areas owing to successful restoration; and the amount of new disturbance the BLM and/or the USFS has permitted. These data could be supplemented with population data (when available) to inform an understanding of the correlation between habitat and PACs within a population. This overall effectiveness evaluation must consider the lag effect response of populations to habitat changes (Garton et al. 2011).

Calculating Question 1, National Planning Strategy Effectiveness: The amount of sagebrush available in the large area of interest will use the information from Measure 1a (I.B.1., Sagebrush Availability) and calculate the change from the 2012 baseline to the end date of the reporting period. To calculate the change in the amount of sagebrush on the landscape to compare with the historical areas with potential to support sagebrush, the information from Measure 1b (I.B.1., Sagebrush Availability) will be used. To calculate the trend in the condition of sagebrush at the mid-scale, three sources of data will be used: the BLM's Grass/Shrub mapping effort (Future Plans in Section B.1., Sagebrush Availability); the results from the calculation of the landscape indicators, such as patch size (described below); and the BLM's Landscape Monitoring Framework (LMF) and greater sage-grouse intensification effort (also described below). The LMF and greater sage-grouse intensification effort data are collected in a statistical sampling framework that allows calculation of indicator values at multiple scales.

Beyond the importance of sagebrush availability to greater sage-grouse, the mix of sagebrush patches on the landscape at the broad and mid-scale provides the life requisite of space for greater sage-grouse dispersal needs (see the HAF). The configuration of sagebrush habitat patches and the land cover or land use between the habitat patches at the broad and mid-scales also defines suitability. There are three significant habitat indicators that influence habitat use, dispersal, and movement across populations: the size and number of habitat patches, the connectivity of habitat patches (linkage areas), and habitat fragmentation (scope of unsuitable and non-habitats between habitat patches). The most appropriate commercial software to measure patch dynamics, connectivity, and fragmentation at the broad and mid-scales will be used, along with the same data layers derived for sagebrush availability.

The BLM initiated the LMF in 2011 in cooperation with the Natural Resources Conservation Service (NRCS). The objective of the LMF effort is to provide unbiased estimates of vegetation and soil condition and trend using a statistically balanced sample design across BLM lands. Recognizing that greater sage-grouse populations are more resilient where the sagebrush plant community has certain characteristics unique to a particular life stage of greater sage-grouse (Knick and Connelly 2011, Stiver et al. in press), a group of greater sage-grouse habitat and sagebrush plant community subject matter experts identified those vegetation indicators collected at LMF sampling points that inform greater sage-grouse habitat needs. The experts represented the Agricultural Research Service, BLM, NRCS, USFWS, WAFWA, state wildlife agencies, and academia. The common indicators identified include: species composition, foliar cover, height of the tallest sagebrush and herbaceous plant, intercanopy gap, percent of invasive species, sagebrush shape, and bare ground. To increase the precision of estimates of sagebrush conditions within the range of greater sage-grouse, additional plot locations in occupied greater sage-grouse habitat (Sage-Grouse Intensification) were added in 2013. The common indicators are also collected on sampling locations in the NRCS National Resources Inventory Rangeland Resource Assessment (<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/nra/nri/?&cid=stelprdb1041620>).

The greater sage-grouse intensification baseline data will be collected over a 5-year period, and an annual greater sage-grouse intensification report will be prepared describing the status of the indicators. Beginning in year 6, the annual status report will be accompanied with a trend report, which will be available on an annual basis thereafter, contingent on continuation of the current monitoring budget. This information, in combination with the Grass/Shrub mapping information, the mid-scale habitat suitability indicator measures, and the sagebrush availability information will be used to answer Question 1 of the National Planning Strategy Effectiveness Report.

Calculating Question 2, National Planning Strategy Effectiveness: Evaluations of the amount of habitat degradation and the intensity of the activities in the area of interest will use the information from Measure 2 (Section B.2., Habitat Degradation Monitoring) and Measure 3 (Section B.3., Energy and

Mining Density). The field office will collect data on the amount of reclaimed energy-related degradation on plugged and abandoned and oil/gas well sites. The data are expected to demonstrate that the reclaimed sites have yet to meet the habitat restoration objectives for greater sage-grouse habitat. This information, in combination with the amount of habitat degradation, will be used to answer Question 2 of the National Planning Strategy Effectiveness Report.

Calculating Question 3, National Planning Strategy Effectiveness: The change in greater sage-grouse estimated populations will be calculated from data provided by the state wildlife agencies, when available. This population data (Section C., Population [Demographics] Monitoring) will be used to answer Question 3 of the National Planning Strategy Effectiveness Report.

Calculating Question 4, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of sagebrush in the area of interest will use the information from Measure 1a (Section B.1., Sagebrush Availability). This measure is derived from the national datasets that remove sagebrush (Table Y-5). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for this measure in the geographic areas of interest. This information will be used to answer Question 4 of the National Planning Strategy Effectiveness Report.

Calculating Question 5, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of disturbance in the area of interest will use the information from Measure 2a (Section B.2., Monitoring Habitat Degradation) and Measure 3 (Section B.3., Energy and Mining Density). These measures are all derived from the national disturbance datasets that degrade habitat (Table Y-8). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for these two measures in the geographic areas of interest. This information will be used to answer Question 5 of the National Planning Strategy Effectiveness Report.

Answers to the five questions for determining the effectiveness of the national planning strategy will identify areas that appear to be meeting the objectives of the strategy and will facilitate identification of population areas for more detailed analysis. Conceptually, if the broad-scale monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing population for the area of interest, there is evidence that the objectives of the national planning strategy to maintain populations and their habitats have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in greater sage-grouse areas is increasing, and/or populations are declining relative to the baseline, there is evidence that the objectives of the national planning strategy are not being achieved. Such a determination would likely result in a more detailed analysis and could be the basis for implementing more restrictive adaptive management measures.

With respect to the land use plan area, the BLM and the USFS will summarize the vegetation, disturbance, and population data to determine if the LUP is meeting the plan objectives. Effectiveness information used for these evaluations includes BLM/USFS surface management areas and will help inform where finer-scale evaluations are needed, such as seasonal habitats, corridors, or linkage areas. Data will also include the trend of disturbance within the greater sage-grouse areas, which will inform the need to initiate adaptive management responses as described in the Bighorn Basin land use plan.

Calculating Question 1, Land Use Plan Effectiveness: The condition of vegetation and the allotments meeting land health standards (as articulated in “BLM Handbook 4180-1, Rangeland Health Standards”) in greater sage-grouse areas will be used to determine the LUP’s effectiveness in meeting the vegetation

objectives for greater sage-grouse habitat set forth in the plan. The field office/ranger district will be responsible for collecting this data. In order for this data to be consistent and comparable, common indicators, consistent methods, and an unbiased sampling framework will be implemented following the principles in the BLM's AIM strategy (Taylor et al. 2014; Toevs et al. 2011; MacKinnon et al. 2011), in the BLM's Technical Reference "Interpreting Indicators of Rangeland Health" (Pellant et al. 2005), and in the HAF (Stiver et al. in press) or other approved WAFWA MZ-consistent guidance to measure and monitor greater sage-grouse habitats. This information will be used to answer Question 1 of the Land Use Plan Effectiveness Report.

Calculating Question 2, Land Use Plan Effectiveness: Sage-grouse areas within the LUP that are achieving land health stands (or, if trend data are available, that are making progress toward achieving them)—particularly the Special Status Species/wildlife habitat land health standard—will be used to determine the LUP's effectiveness in achieving the habitat objectives set forth in the plan. Field offices will follow directions in "BLM Handbook 4180-1, Rangeland Health Standards," to ascertain if greater sage-grouse areas are achieving or making progress toward achieving land health standards. One of the recommended criteria for evaluating this land health standard is the HAF indicators.

Calculating Question 3, Land Use Plan Effectiveness: The amount of habitat disturbance in greater sage-grouse areas identified in this LUP will be used to determine the LUP's effectiveness in meeting the plan's disturbance objectives. National datasets can be used to calculate the amount of disturbance, but field office data will likely increase the accuracy of this estimate. This information will be used to answer Question 3 of the Land Use Plan Effectiveness Report.

Calculating Question 4, Land Use Plan Effectiveness: The change in estimated greater sage-grouse populations will be calculated from data provided by the state wildlife agencies, when available, and will be used to determine LUP effectiveness. This population data (Section C., Population [Demographics] Monitoring) will be used to answer Question 4 of the Land Use Plan Effectiveness Report.

Results of the effectiveness monitoring process for the LUP will be used to inform the need for finer-scale investigations, initiate adaptive management actions as described in the Bighorn Basin land use plan, initiate causation determination, and/or determine if changes to management decisions are warranted. The measures used at the broad and mid-scales will provide a suite of characteristics for evaluating the effectiveness of the adaptive management strategy.

6.5.1 Fine and Site Scales

Fine-scale (third-order) habitat selected by greater sage-grouse is described as the physical and geographic area within home ranges during breeding, summer, and winter periods. At this level, habitat suitability monitoring should address factors that affect greater sage-grouse use of, and movements between, seasonal use areas. The habitat monitoring at the fine and site scale (fourth order) should focus on indicators to describe seasonal home ranges for greater sage-grouse associated with a lek or lek group within a population or subpopulation area. Fine- and site-scale monitoring will inform LUP effectiveness monitoring (see Section D., Effectiveness Monitoring) and the hard and soft triggers identified in the LUP's adaptive management section.

The BLM and USFS will coordinate with the State of Wyoming to share conservation, disturbance and vegetation analysis data to provide a core by core evaluation to make necessary adjustments in activity, priorities and other actions.

Site-scale habitat selected by greater sage-grouse is described as the more detailed vegetation characteristics of seasonal habitats. Habitat suitability characteristics include canopy cover and height of

sagebrush and the associated understory vegetation. They also include vegetation associated with riparian areas, wet meadows, and other mesic habitats adjacent to sagebrush that may support greater sage-grouse habitat needs during different stages in their annual cycle.

As described in the Conclusion (Section 3.4), details and application of monitoring at the fine and site scales will be described in the implementation-level monitoring plan for the Bighorn Basin land use plan. The need for fine- and site-scale-specific habitat monitoring will vary by area, depending on proposed projects, existing conditions, habitat variability, threats, and land health. Examples of fine- and site-scale monitoring include: habitat vegetation monitoring to assess current habitat conditions; monitoring and evaluation of the success of projects targeting greater sage-grouse habitat enhancement and/or restoration; and habitat disturbance monitoring to provide localized disturbance measures to inform proposed project review and potential mitigation for project impacts. Monitoring plans should incorporate the principles outlined in the BLM's AIM strategy (Toevs et al. 2011) and in "AIM-Monitoring: A Component of the Assessment, Inventory, and Monitoring Strategy" (Taylor et al. 2014). Approved monitoring methods are:

- "BLM Core Terrestrial Indicators and Methods" (MacKinnon et al. 2011);
- The BLM's Technical Reference "Interpreting Indicators of Rangeland Health" (Pellant et al. 2005); and,
- "Sage-Grouse Habitat Assessment Framework: Multiscale Assessment Tool" (Stiver et al. in press).

Other state-specific disturbance tracking models include: the BLM's Wyoming Density and Disturbance Calculation Tool (<http://ddct.wygisc.org/>) and the BLM's White River Data Management System in development with the USGS. Population monitoring data (in cooperation with state wildlife agencies) should be included during evaluation of the effectiveness of actions taken at the fine and site scales.

Fine- and site-scale greater sage-grouse habitat suitability indicators for seasonal habitats are identified in the HAF. The HAF has incorporated the Connelly et al. (2000) greater sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA MZ adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from greater sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers.

When conducting land health assessments, the BLM should follow, at a minimum, "Interpreting Indicators of Rangeland Health" (Pellant et al. 2005) and the "BLM Core Terrestrial Indicators and Methods" (MacKinnon et al. 2011). For assessments being conducted in greater sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to greater sage-grouse habitat (see Section D., Effectiveness Monitoring).

6.5.2 Conclusion

This Greater Sage-Grouse Monitoring Framework was developed for all of the Final Environmental Impact Statements involved in the greater sage-grouse planning effort. As such, it describes the monitoring activities at the broad and mid-scales and provides a guide for the BLM to collaborate with partners/other agencies to develop the Bighorn Basin land use plan-specific monitoring plan.

6.5.3 The BLM Greater Sage-Grouse Disturbance and Monitoring Sub Team Membership

Gordon Toevs (BLM-WO)

Duane Dippon (BLM-WO)

Frank Quamen (BLM-NOC)

David Wood (BLM-NOC)

Vicki Herren (BLM-NOC)

Matt Bobo (BLM-NOC)

Michael “Sherm” Karl (BLM-NOC)

ATTACHMENT A: AN OVERVIEW OF MONITORING COMMITMENTS

	Broad and Mid-scales					Fine & Site Scales
	Implement- ation	Sagebrush Availability	Habitat Degradation	Population	Effectiveness	
How will the data be used?	Tracking and documenting implementation of land use plan decisions and inform adaptive management	Tracking changes in land cover (sagebrush) and inform adaptive management	Tracking changes in disturbance (threats) to sage-grouse habitat and inform adaptive management	Tracking trends in sage-grouse populations (and/or leks; as determined by state wildlife agencies) and inform adaptive management	Characterizing the relationship among disturbance, implementation actions, and sagebrush metrics and inform adaptive management	Measuring seasonal habitat, connectivity at the fine scale, and habitat conditions at the site scale, calculating disturbance and inform adaptive management
Who is collecting the data?	BLM FO and FS Forest	NOC and NIFC	National data sets (NOC), BLM FOs and FS Forests as applicable	State wildlife agencies through WAFWA	Comes from other broad and mid-scale monitoring types, analyzed by the NOC	BLM FO and SO, FS Forests and RO (with partners) including disturbance
How often are the data collected, reported and made available to FWS?	Collected and reported annually; summary every 5 years	Updated and changes reported annually; summary reports every 5 years	Collected and changes reported annually; summary reports every 5 years	State data reported annually per WAFWA MOU; summary reports every 5 years	Collected and reported every 5 years (coincident with LUP evaluations)	Collection and trend analysis ongoing, reported every 5 years or as needed to inform adaptive management
What is the spatial scale?	Summarized by LUP with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by MZ, and LUP with flexibility for reporting by other units (e.g., PAC)	Variable (e.g., projects and seasonal habitats)
What are the potential personnel and budget impacts?	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	At a minimum, current skills and capacity must be maintained; data mgmt cost are TBD	At a minimum, current skills and capacity must be maintained; data mgmt and data layer purchase cost are TBD	No additional personnel or budget impacts for BLM or USFS	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment
Who has primary and secondary responsibilities for reporting?	1) BLM FO & SO; FS Forest & RO 2) BLM & FS Planning	1) NOC 2) WO	1) NOC 2) BLM SO, FS RO & appropriate programs	1) WAFWA & state wildlife agencies 2) BLM SO, FS RO, NOC	1) Broad and mid-scale at the NOC, LUP at BLM SO, USFS RO	1) BLM FO & FS Forests 2) BLM SO & FS RO
What new processes/tools are needed?	National implementation data sets and analysis tools	Updates to national land cover data	Data standards and roll-up methods for these data	Standards in population monitoring (WAFWA)	Reporting methodologies	Data standards data storage; and reporting

ATTACHMENT B: LIST OF ALL SAGEBRUSH SPECIES AND SUBSPECIES INCLUDED IN THE SELECTION CRITERIA FOR BUILDING THE EVT AND BPS LAYERS

- *Artemisia arbuscula* subspecies *longicaulis*
- *Artemisia arbuscula* subspecies *longiloba*
- *Artemisia bigelovii*
- *Artemisia nova*
- *Artemisia papposa*
- *Artemisia pygmaea*
- *Artemisia rigida*
- *Artemisia spinescens*
- *Artemisia tripartita* subspecies *rupicola*
- *Artemisia tripartita* subspecies *tripartita*
- *Tanacetum nuttallii*
- *Artemisia cana* subspecies *bolanderi*
- *Artemisia cana* subspecies *cana*
- *Artemisia cana* subspecies *viscidula*
- *Artemisia tridentata* subspecies *wyomingensis*
- *Artemisia tridentata* subspecies *tridentata*
- *Artemisia tridentata* subspecies *vaseyana*
- *Artemisia tridentata* subspecies *spiciformis*
- *Artemisia tridentata* subspecies *xericensis*
- *Artemisia tridentata* variety *pauciflora*
- *Artemisia frigida*
- *Artemisia pedatifida*

ATTACHMENT C: USER AND PRODUCER ACCURACIES FOR AGGREGATED ECOLOGICAL SYSTEMS WITHIN LANDFIRE MAP ZONES

LANDFIRE Map Zone Name	User Accuracy	Producer Accuracy	% of Map Zone within Historic Schroeder
Wyoming Basin	76.9%	90.9%	98.5%
Snake River Plain	68.8%	85.2%	98.4%
Missouri River Plateau	57.7%	100.0%	91.3%
Grand Coulee Basin of the Columbia Plateau	80.0%	80.0%	89.3%
Wyoming Highlands	75.3%	85.9%	88.1%
Western Great Basin	69.3%	75.4%	72.9%
Blue Mountain Region of the Columbia Plateau	85.7%	88.7%	72.7%
Eastern Great Basin	62.7%	80.0%	62.8%
Northwestern Great Plains	76.5%	92.9%	46.3%
Northern Rocky Mountains	72.5%	89.2%	42.5%
Utah High Plateaus	81.8%	78.3%	41.5%
Colorado Plateau	65.3%	76.2%	28.8%
Middle Rocky Mountains	78.6%	73.3%	26.4%
Cascade Mountain Range	57.1%	88.9%	17.3%
Sierra Nevada Mountain Range	0.0%	0.0%	12.3%
Northwestern Rocky Mountains	66.7%	60.0%	7.3%
Southern Rocky Mountains	58.6%	56.7%	7.0%
Northern Cascades	75.0%	75.0%	2.6%
Mogollon Rim	66.7%	100.0%	1.7%
Death Valley Basin	0.0%	0.0%	1.2%

There are two anomalous map zones with 0% user and producer accuracies, attributable to no available reference data for the ecological systems of interest.

User accuracy is a map-based accuracy that is computed by looking at the reference data for a class and determining the percentage of correct predictions for these samples. For example, if I select any sagebrush pixel on the classified map, what is the probability that I'll be standing in a sagebrush stand when I visit that pixel location in the field? Commission Error equates to including a pixel in a class when it should have been excluded (i.e., commission error = 1 – user's accuracy).

Producer accuracy is a reference-based accuracy that is computed by looking at the predictions produced for a class and determining the percentage of correct predictions. In other words, if I know that a particular area is sagebrush (I've been out on the ground to check), what is the probability that the digital map will correctly identify that pixel as sagebrush? Omission Error equates to excluding a pixel that should have been included in the class (i.e., omission error = 1 – producer's accuracy).

8.0 COT OBJECTIVE 6: PRIORITIZE, FUND, AND IMPLEMENT RESEARCH TO ADDRESS EXISTING UNCERTAINTIES

“Increased funding and support for key research projects that will address uncertainties associated with sage-grouse and sagebrush habitat management is essential. Effective amelioration of threats can only be accomplished if the mechanisms by which those threats are imposed on the redundancy, representation, and resilience of the species and its habitats are understood.” (COT Report, 2013)

In accordance with BLM policy, the Record of Decision and Approved Plan will establish intervals and standards for evaluations as part of the implementation strategy. Priorities will be established based on the identified threats in the Planning Area, the conservation objectives included as part of the Approved Plan, and any potential uncertainties associated with sage-grouse and associated habitat management. A part of this strategy will include development of a budget to accomplish each of the identified tasks and fund potential research topics to address any uncertainties.

As new science pertaining to sage-grouse and habitat is continuously evolving, refined management strategies may be necessary to ensure that BLM and USFS are utilizing the most current science, information, and data regarding sage-grouse. It is for this reason that BLM and USFS have collaborated with the State of Wyoming and USFWS to develop an adaptive management strategy as a part of the planning process.

8.1 Wyoming Greater Sage-Grouse Adaptive Management Plan

The greater sage-grouse adaptive management plan provides regulatory assurance that unintended negative impacts to greater sage-grouse habitat will be addressed before consequences become severe or irreversible. This adaptive management plan:

- utilizes science based soft and hard adaptive management triggers,
- addresses multiple scales of data, and
- utilizes an adaptive management working group.

Adaptive Management Triggers

Adaptive management triggers are essential for identifying when potential management changes are needed in order to continue meeting greater sage-grouse conservation objectives. With respect to sage-grouse, all regulatory entities in Wyoming, including the BLM and FS, use soft and hard triggers. Soft and hard triggers are focused on three metrics: 1) number of active leks, 2) acres of available habitat, and 3) population trends based on annual lek counts.

Soft Triggers:

Soft triggers are indicators that management or specific activities may not be achieving the intended results of conservation action or that unanticipated changes to populations or habitats have occurred that have the potential to place habitats or populations at risk. The soft trigger is any deviation from normal trends in habitat or population in any given year. Metrics include, but are not limited to, annual lek counts, wing counts, aerial surveys, habitat monitoring, and DDCT evaluations. BLM and/or FS field offices, with the assistance of their respective land and resource management plan implementation groups, local WGFD offices, and local sage-grouse working groups will evaluate the metrics with the

Adaptive Management Working Group (AMWG) on an annual basis. The purpose of these strategies is to address localized greater sage-grouse population and habitat changes by providing the framework in which management will change if monitoring identifies negative population and habitat anomalies in order to avoid crossing a hard trigger threshold.

Hard Triggers:

Hard triggers are indicators that management is not achieving desired conservation results. Hard triggers would be considered a catastrophic indicator that the species is not responding to conservation actions, or that a larger-scale impact or set of impacts is having a negative effect.

Within the range of normal population variables, hard triggers shall be determined to take effect when two of the three metrics exceeds 60% of normal variability for the area under management in a single year, or when any of the three metrics exceeds 40% of normal variability for a three year time period within a five-year range of analysis. A minimum of three consecutive years in a five-year period is used to determine trends (i.e., Y1-2-3, Y2-3-4, Y3-4-5).

Adaptive Management Response

Soft Trigger Response:

Soft triggers require immediate monitoring and surveillance to determine causal factors and may require curtailment of activities in the short- or long-term, as allowed by law. The project level adaptive management strategies will identify appropriate responses where the project's activities are identified as the causal factor. The management agency (BLM and/or FS) and the AMWG will implement an appropriate response strategy to address causal factors not attributable to a specific project or to make adjustments at a larger regional or state-wide level.

Hard Trigger Response:

Upon determination that a hard trigger has been tripped, the BLM and/or FS will immediately defer issuance of discretionary authorizations for new actions for a period of 90 days. In addition, within 14 days of a determination that a hard trigger has been tripped, the AMWG will convene to develop an interim response strategy and initiate an assessment to determine the causal factor or factors (hereafter called the causal factor assessment).

Interim Strategy

An interim response strategy will be developed, and implemented to the extent permitted by law, within 90 days of determination that a hard trigger has been tripped. The technical team (see Implementation Groups below) will be consulted to identify the scope and scale of the interim strategy. Based on the recommendation of the AMWG, the BLM and/or FS will implement an interim response strategy through an Instruction Memorandum or other management mechanisms to direct management until the causal factor(s) and appropriate response(s) can be determined. The interim response strategy will consist of appropriate management measures undertaken at the project stage, supported by the best available science, to address the specific metric which has been tripped and may include deferral of some activities as appropriate. Measures that were analyzed in this EIS and the COT, NTT reports, and NPT guidance will be reviewed in addition to current science to identify the most appropriate measures to be implemented as part of the interim response strategy. The BLM and/or FS will comply with all applicable law in implementing such response(s), and, if applicable, will undertake a plan amendment or revision under BLM and/or FS's planning regulations and policies.

The interim strategy will be implemented for the biologically significant unit (BSU), which, in Wyoming, is PHMAs, regardless of whether PHMAs cross multiple planning boundaries. If it has been identified that more than one PHMA has the same hard triggers being tripped, or is trending towards triggers being tripped, the interim strategy will be implemented at the appropriate scale.

Causal Factor Assessment

The causal factor assessment will be completed within 180 days of determination that a hard trigger threshold has been crossed. Once the causal factor assessment is completed by the AMWG, the interim response strategy will be modified to adequately address the causal factors in consultation with the technical team. If a causal factor or factors cannot be identified, the interim response strategy shall stay in place until the cause can be determined and any new planning decision can be implemented.

EIS Level Projects

Each major project (EIS level) will include adaptive management strategies in support of the population management objectives for greater sage-grouse set by the State of Wyoming, and will be consistent with the Wyoming Greater Sage-Grouse Adaptive Management Plan. These adaptive management strategies will be developed in partnership with the AMWG, WGFD, project proponents, partners, and stakeholders, incorporating the best available science.

Implementation Groups

Sage-Grouse Implementation Team

The State of Wyoming's strategy is implemented by the Sage-Grouse Implementation Team (SGIT), established by Executive Order in 2008 and codified in 2014 by the Wyoming Legislature (W.S. § 9-19-101). The SGIT is a Governor appointed body with representation by federal agencies (BLM, USFS, FWS, Natural Resources Conservation Service), state agencies (Wyoming Game and Fish Commission, Department of Agriculture, Department of Environmental Quality, Wildlife and Natural Resource Trust Fund, Oil and Gas Conservation Commission, and Office of State Lands and Investments), the Wyoming Legislature, county governments, energy developers, mining companies, landowners, and non-governmental organizations. The BLM, US Fish and Wildlife Service NRCS and the US Forest Service all have an equal role in the SGIT.

Land and Resource Management Plan – Implementation Teams

Land and Resource Management Plans are implemented through implementation teams. These implementation teams include cooperating agencies who participated in the development of this land use plan representing local, state, and federal agencies. These implementation teams will coordinate with the AMWG and others to evaluate metrics and management responses necessary to meet greater sage-grouse conservation objectives within their Planning Area.

Adaptive Management Working Group and Technical Team

An Adaptive Management Working Group (AMWG) will be established in consultation with the SGIT to provide appropriate guidance for agencies with the ability to affect sage-grouse populations and/or habitat through their permitting authority. The AMWG will include BLM, USFS, USFWS, and State of Wyoming. The purpose of this group will be to initiate a response strategy should it be determined that a hard trigger has been tripped or if soft triggers are showing a trend across a region. A hard trigger may be tripped at any time, thus, upon identification of such event, current available population and habitat data will be reviewed by the AMWG with the assistance of a technical team comprised of agency

biologists, scientists familiar with the Management Zone in question, and other individuals as appropriate (e.g., habitat managers, respective landowners, other appropriate representatives) to confirm that a hard trigger has been tripped. Upon verification of data showing that a hard trigger has been tripped, the AMWG will convene within 14 days.

The AMWG will review monitoring data which has been collected by the appropriate local sage-grouse working groups in conformance with data collection standards. This group will meet annually to review all data collected in the prior year regarding sage grouse populations and habitats. Monitoring data will have been analyzed (by WGFD for population based metrics (leks, wing counts, etc., and by land managers [BLM, FS, State of Wyoming] for habitat based metrics [DDCT, etc.]) Should the monitoring data suggest a trend toward a soft or hard trigger being tripped, they will 1. Identify what metric is indicating that trend (population or habitat); and 2. Identify a technical team to review the data and compile a range of activities which may be causing the trend. Should review of the monitoring data identify that multiple soft triggers have been tripped in one PHMA, or the same triggers have been tripped across multiple PHMAs, the technical team will be tasked with verifying the scope and intensity of the trends.

Once the analysis of the trends has been completed by the technical team and reported back to the AMWG, the AMWG will make recommendations to the appropriate land managing agency regarding an interim adaptive management strategy to be implemented. Implementation will occur via the appropriate regulations and policy applicable for that agency. At that time, the State of Wyoming will conduct a review of the regulatory authority implementing the Sage Grouse Core Area Strategy to determine if a State of Wyoming adaptive management strategy is warranted.

Upon review of the annual data by the AMWG and technical team, the State of Wyoming, as part of the AMWG, will contact neighboring states within the respective Management Zone to inform them of any findings. Should a hard trigger be tripped, the trigger which has been tripped and any recommended adaptive management strategy being implemented will be shared with the appropriate neighboring state(s). Should the need arise for implementation of a multi-state adaptive management strategy; the AMWG will coordinate to develop an effective response.

Small Leks

Small leks will be given special consideration. Due to geographic variations a definition of “small” is not provided, rather determination of “small” will be made by the AMWG based upon recommendations of the scientific community. Generally, “small” is considered 10 or fewer males for a three year time period within a five-year range of analysis. If a trigger is hit based upon such a lek, then the adaptive management working group will evaluate the site-specific circumstances and determine appropriate remedial action.

9.0 GLOSSARY TERMS

Additionality: The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (BLM Manual Section 1794).

Avoidance mitigation: Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g., may also include avoiding the impact by moving the proposed action to a different time or location.)

Compensatory mitigation: Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

Compensatory mitigation projects: Specific, on-the-ground actions to improve and/or protect habitats (e.g., chemical vegetation treatments, land acquisitions, conservation easements).

Compensatory mitigation sites: The durable areas where compensatory mitigation projects will occur.

Durability (protective and ecological): The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist. (BLM Manual Section 1794).

Minimization mitigation: Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

Residual impacts: Impacts from an authorized land use that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

Timeliness: The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun. (BLM Manual Section 1794)

APPENDIX Z

FEDERAL OIL AND GAS OPERATIONS ON SPLIT-ESTATE LANDS

1.0 PURPOSE

The purpose of this appendix is to summarize the Bureau of Land Management's (BLM) procedures for considering proposals to conduct exploration and production operations on split-estate federal oil and gas leases. This appendix is provided for information purposes only, and is not necessarily a complete statement of rights, obligations, or processes. This appendix is not a part of the BLM's land use plan decision for the Resource Management Plan (RMP). Any conflict with any statute or regulation is unintentional. In the event of a conflict, the statute or regulation controls. Federal oil and gas lessees and operators, and private surface owners, are advised to confer with the BLM at the time an action is proposed for BLM's consideration, in order to obtain information about the current regulations and policies that may apply to the proposal. Nothing in this appendix affects the authority of any tribe or of the Bureau of Indian Affairs in any way. This RMP applies to federal lands as defined by Federal Land Policy and Management Act, and does not apply to lands held in trust for any Tribe or for any individual Indian or Indians.

2.0 DEFINITIONS

Casual use (operations): "Casual use means activities involving practices that do not ordinarily lead to any appreciable disturbance or damage to lands, resources, or improvements. This term does not apply to private surface. Casual use includes surveying activities." (Onshore Oil and Gas Order No. 1, part II).

Lease: "means any contract, profit share arrangement, joint venture or other agreement issued or approved by the United States under a mineral leasing law that authorizes exploration for, extraction of or removal of oil or gas." (Onshore Oil and Gas Order No. 1, part II).

Lease facility or production facility: "Production facilities means a lessee's or lease operator's pipes and equipment used on the leasehold to aid in extracting, processing, and storing oil and gas..." (64 FR 32140). See also BLM Manual Section 2880 ("Mineral Leasing Act Rights-of-Way") at Page 9.

Lease site: "means any lands, including the surface of a severed mineral estate, on which exploration for, or extraction and removal of, oil or gas is authorized under a lease." (43 CFR 3160.0-5).

Lessee: "means any person holding record title or owning operating rights in a lease issued or approved by the United States." (43 CFR 3160.0-5).

Operator: "means any person or entity including but not limited to the lessee or operating rights owner, who has stated in writing to the authorized officer that it is responsible under the terms and conditions of the lease for the operations conducted on the leased lands or a portion thereof." (43 CFR 3160.0-5).

Public lands: "means any land and interest in land owned by the United States within the several States and administered by the Secretary of the Interior through the Bureau of Land Management..." (Federal Land Policy Management Act of 1976, Sec. 103(e)).

Private surface owner: "Private Surface Owner means a non-Federal or non-state owner of the surface estate and includes any Indian owner of surface estate not held in trust by the United States." (Onshore Oil and Gas Order No. 1, part II).

Split-estate: “Split-estate means lands where the surface is owned by an entity or person other than the owner of the Federal or Indian oil and gas.” (Onshore Oil and Gas Order No. 1, part II). “When tribal lands are held in trust or are subject to Federal restrictions against alienation the BIA is the Surface Managing Agency, but if lands are held in unrestricted fee, those lands are treated the same as private surface.” (Preamble to Onshore Oil and Gas Order No. 1 revisions, 72 FR 10322-10323, March 7, 2007).

Surface Managing Agency: “Surface Managing Agency means any Federal or state agency having jurisdiction over the surface overlying Federal or Indian oil and gas.” (Onshore Oil and Gas Order No. 1, part II).

3.0 GENERAL

In considering and authorizing exploration and development of split-estate federal oil and gas leases, the BLM prefers that the operator and split-estate surface owner reach a Surface Access Agreement for proposed oil and gas operations. The BLM coordinates with both the operator and surface owner, in accordance with the requirements of Onshore Oil and Gas Order No. 1, and generally provides the surface owner’s lands the same level of resource (soil, water, vegetation, air, visual, cultural, etc.) protection as would be required on BLM-administered public lands.

“The BLM will offer the surface owner the same level of surface protection that the BLM provides on Federal surface. The BLM will not apply standards or conditions that exceed those that would normally be applied to Federal surface, even when requested by the surface owner.” (The Gold Book, page 12).

Federal mineral lessees may enter onto a privately-owned surface to the extent necessary to explore and produce the federal minerals in compliance with the relevant statutes and BLM regulations and land use designations. The BLM does not have the authority to regulate a surface owner’s use of the surface estate, but does have the authority to regulate the activities of federal mineral lessees and mining claimants. The BLM adds lease stipulations to split-estate federal oil and gas leases, in order to ensure that leasing decisions conform to the approved RMP for the area.

4.0 OPERATIONS

4.1 Geophysical

The BLM’s authority to permit geophysical operations is described under 43 CFR §3150.0-1:

Geophysical exploration on public lands, the surface of which is administered by the Bureau, requires Bureau approval. The procedures in this part also apply to geophysical exploration conducted under the rights granted by any Federal oil and gas lease unless the surface is administered by the U.S. Forest Service. However, a lessee may elect to conduct exploration operations outside the rights granted by the lease, in which case authorization from the surface managing agency or surface owner may be required... The procedures of this part do not apply to... operations conducted on private surface overlying public lands unless such operations are conducted by a lessee under the rights granted by the Federal oil and gas lease...

As BLM Handbook H-3150-1¹ at pages 1–2 explains:

In those situations where Federal minerals are underlying private surface and the private surface owner's consent is obtained, the BLM is not to become involved. However, when landowner consent for access to the surface cannot be obtained for geophysical exploration operations on a Federal lease by the lease operator, the geophysical operation is to be authorized using the Sundry Notice process...²

When the geophysical exploration operator is the Federal lessee or designated operator of the lessee, it is to file a Sundry Notice... with the BLM and provide notification to the surface owner by certified mail that it intends to enter onto the lands and conduct lease operations. The lessee/operator must then submit proof to the BLM authorized officer that the surface owner has been notified. The lessee or operator must also submit proof to the BLM authorized officer that it has a current and adequate bond payable to the United States for use by the surface owner for damages caused during exploration operations. The authorized officer must give the surface owner 30 days to comment on the proposed action before approving the Sundry Notice.

When a surface access agreement is reached to conduct geophysical operations on split-estate lands with leased or unleased federal oil and gas, the BLM does not become involved. The BLM will not accept a Notice of Intent to Conduct Geophysical Operations (NOI), BLM Form 3150-4 or bond to permit entry to split-estate lands with unleased federal oil and gas, since the BLM has not issued an oil and gas lease to allow for operations under 43 CFR Part 3160 (see 43 CFR 3150.0-1).

In order to conduct geophysical operations on split-estate lands where a federal oil and gas lease has been issued and where an agreement with the surface owner has not been reached, the lessee or the operator must first obtain BLM authorization through an NOI that proposes entry to those lands in order to conduct geophysical operations. The lessee or designated operator must provide to the BLM a certification (see Attachment 1) that a good-faith effort was made to: (a) notify the landowner prior to entry; (b) obtain a Surface Access Agreement; and (c) deliver a copy of the proposed NOI to the surface owner.³ The NOI must also identify the surface owner and include the owner's name, address, and telephone number, if known. A good and sufficient bond to secure payment of applicable damages for the use and benefit of the surface owner must be provided to the BLM on BLM Form 3160-19. The lessee or designated operator must also submit to the BLM evidence of service of a copy of the bond upon the surface owner. Prior to authorizing the NOI proposing entry to the lands for which the bond has been submitted, the BLM notifies the surface owner and provides a 30-day period during which the surface owner may protest the sufficiency of the bond. If the sufficiency of the bond is protested, the BLM reviews the bond amount and determines if it is adequate. That decision by the BLM is subject to State Director Review upon a request by any adversely affected party and the State Director's decision is subject to appeal to the Interior Board of Land Appeals (IBLA).⁴

¹ *Onshore Oil and Gas Geophysical Exploration Surface Management Requirements. January 9, 2007.*

² *In BLM Washington Office Instruction Memorandum (IM) 2009-121, "Approval of Notice of Intent to Conduct Geophysical Exploration to Federal Oil and Gas Lessee on Split Estate", dated May 8, 2009, the BLM recognized that the Sundry Notice form (BLM Form 3160-5) is an imperfect form to use for permitting of geophysical operations. This policy clarified that the BLM will "no longer require the lessee or its operator to file a Sundry Notice" for the purpose of proposing entry to federal leases where a surface owner denies access to the lessee or its operator. In its place the BLM would use the NOI form (BLM Form 3150-4).*

³ *See Onshore Oil and Gas Order No. 1, Part VI.*

⁴ *See 43 CFR §3165.3(b). See, e.g., William P. Maycock, 176 IBLA 206 (2008).*

4.2 Notice of Staking/Application for Permit to Drill

4.2.1 Surveying and Staking Activities

The lessee or operator is encouraged to contact the surface owner of split-estate lands early in the process of planning for exploration and development of a federal lease. This facilitates early discussion about the goals and objectives of both the surface owner and operator. Communication between the lessee or operator and surface owner can reduce potential conflicts, thereby reducing misunderstandings and permit processing times.

For surveying and staking activities, “[t]he operator is responsible for making access arrangements with the appropriate Surface Managing Agency (other than the BLM and the FS) or private surface owner.” (Onshore Oil and Gas Order No. 1, part III.D.2.a).

“No entry on split-estate lands for surveying and staking should occur without the operator first making a good faith effort to notify the surface owner. Also, operators are encouraged to notify the BLM or the Forest Service, as appropriate, before entering private lands to stake for federal mineral estate locations.” (Onshore Oil and Gas Order No. 1, part III.D.2.b).

Aside from surveying and staking the proposed well location, road, pipeline, and/or other lease facilities, the operator may also be required to conduct resource condition surveys of the leased lands.

“As provided in the oil and gas lease, the BLM may request that the applicant conduct surveys or otherwise provide information needed for the BLM’s National Historic Preservation Act consultation with the State Historic Preservation Officer or Indian tribe or its Endangered Species Act consultation with the relevant fisheries agency. The federal mineral lessee has the right to enter the property for this purpose, since it is a necessary prerequisite to development of the dominant mineral estate. Nevertheless, the lessee or operator should seek to reach agreement with the surface owner about the time and method by which any survey would be conducted.” (Onshore Oil and Gas Order No. 1, part VI).

4.2.2 Onsite Inspection(s)

On split-estate lands, the onsite inspection provides the opportunity for the BLM, operator, and surface owner to evaluate and discuss the proposed well location or lease facility in the field.

“Within 10 days of receiving the application, the BLM, in coordination with the operator and Surface Managing Agency, including the private surface owner in the case of split-estate minerals, will schedule a date for the onsite inspection (unless the onsite inspection has already been conducted as part of a Notice of Staking).” (Onshore Oil and Gas Order No. 1, part III.E.2.a).

“On non-NFS lands, the BLM will invite the Surface Managing Agency and private surface owner, if applicable, to participate in the onsite inspection. If the surface is privately owned, the operator must furnish to the BLM the name, address, and telephone number of the surface owner if known.” (Onshore Oil and Gas Order No. 1, part III.C).

At the onsite inspection, the BLM will consider applicable Best Management Practices (BMPs) that would avoid or mitigate environmental impacts to natural resources. The onsite inspection provides the surface owner with the opportunity to review the proposed well location and/or lease facilities; provide information to the BLM and operator about resources, improvements, and land uses; and express preferences for BMPs to be used for lease operations.

“All parties who attend the onsite inspection will jointly develop a list of resource concerns that the operator must address in the Application for Permit to Drill (APD). The operator will be provided a list of these concerns either during the onsite inspection or within 7 days of the onsite inspection. Surface owner concerns will be considered to the extent practical within the law.” (Onshore Oil and Gas Order No. 1, part III.C).

“The BLM will invite the surface owner to the onsite inspection to assure that their concerns are considered.” (Onshore Oil and Gas Order No. 1, part VI).

4.2.3 Required Components of a Complete Application for Permit to Drill for Split-estate Operations

4.2.3.1 Description of Surface Ownership

A description of the surface ownership (with name, address, and telephone number, if known) along with a certification must be included in the APD submitted by the operator to the BLM.

“The operator must indicate (in a narrative) the surface ownership at the well location, and of all lands crossed by roads that the operator plans to construct or upgrade, including, if known, the name of the agency or owner, phone number, and address. The operator must certify that they have provided a copy of the Surface Use Plan of Operations required in this section to the private surface owner of the well site location, if applicable, or that they made a good faith effort if unable to provide the document to the surface owner.” (Onshore Oil and Gas Order No. 1, part III.D.4.k).

4.2.3.2 Surface Access Agreement or Waiver

For operations on leased split-estate lands, the operator must undertake a good faith effort to reach a Surface Access Agreement.

“[I]n the case of actual oil and gas operations, the operator must make a good faith effort to notify the private surface owner before entry and make a good faith effort to obtain a Surface Access Agreement from the surface owner... The Surface Access Agreement may include terms or conditions of use, be a waiver, or an agreement for compensation. The operator must certify to the BLM that: (1) It made a good faith effort to notify the surface owner before entry; and (2) That an agreement with the surface owner has been reached or that a good faith effort to reach an agreement failed.” (Onshore Oil and Gas Order No. 1, part VI).

“The operator must make a good faith effort to provide a copy of their Surface Use Plan of Operations to the surface owner.” (Onshore Oil and Gas Order No. 1, part VI). The operator must also provide a copy of any revisions to the SUPO to the surface owner. If required under Onshore Oil and Gas Order No. 6 (“Hydrogen Sulfide Operations”), the BLM requires the operator to provide a copy of the Public Protection Plan to the surface owner.

“The surface use agreement between the surface owner and the operator is confidential. However, the APD Surface Use Plan of Operations must contain sufficient detail about any aspects of the agreement necessary for NEPA documentation and to determine that the operations will be in compliance with laws, regulations, Onshore Orders, and agency policies.” (The Gold Book, page 12).

“If the BLM’s requirements conflict with provisions in the Surface [Access] Agreement, the operator or surface owner should disclose that conflict at the onsite or to the BLM in writing, and the BLM should

consider those conflicts in making its final decision.” (BLM’s Split Estate Report to Congress at page 15). Thus, to the extent terms of the agreement may conflict with Conditions of Approval, or COAs, to the APD, the BLM should be made aware of those terms, so that they can be considered in the BLM’s final decision.

“The BLM does not review the Surface Use Agreement and does not enforce portions of the Surface Use Agreement that are not contained within the approved APD.” (BLM’s Split Estate Report to Congress at page 17).

4.2.3.3 Bonding In Lieu of a Surface Access Agreement or Waiver

It is the preference of the BLM that the operator and surface owner reach a Surface Access Agreement. However, in those cases where an agreement is not reached, the BLM follows the procedural requirements in the BLM’s regulations and policies. A good and sufficient bond to secure payment of applicable damages for the use and benefit of the surface owner must be provided to the BLM on BLM Form 3160-19. The lessee or designated operator must also submit to the BLM evidence of service of a copy of the bond upon the surface owner. Prior to authorizing the APD proposing entry to the lands for which the bond has been submitted, the BLM notifies the surface owner and provides a 30-day period during which the surface owner may protest the sufficiency of the bond. If the sufficiency of the bond is protested, the BLM reviews the bond amount and determine if it is adequate. That decision by the BLM is subject to State Director Review upon a request by any adversely affected party and the State Director’s decision is subject to appeal to the IBLA.⁵

“If no agreement was reached with the surface owner, the operator must submit an adequate bond (minimum of \$1,000) to the BLM for the benefit of the surface owner sufficient to: (1) Pay for loss or damages; or (2) As otherwise required by the specific statutory authority under which the surface was patented and the terms of the lease. Surface owners have the right to appeal the sufficiency of the bond. Before the approval of the APD, the BLM will make a good faith effort to contact the surface owner to assure that they understand their rights to appeal.” (Onshore Oil and Gas Order No. 1, part VI).

“The bond amount will be reviewed by the BLM to assure that it is sufficient based on the appropriate law.” (Preamble to Onshore Oil and Gas Order No. 1 revisions, 72 FR 10323, March 7, 2007).

If operations under an approved APD result in loss or damages that are compensable under the statutes by which the lands were patented, the surface owner may obtain judgment from a court of competent jurisdiction. The BLM will then release from the bond the amount ordered by the court to the surface owner.

4.2.4 Approval of the Application for Permit to Drill

The BLM considers the views of the surface owner before approving the APD. The BLM must prepare an environmental record of review (43 CFR 3162.5-1(a)) to document its evaluation of potential resource impacts, including documentation of NEPA compliance.

“The BLM must comply with NEPA, the National Historic Preservation Act, the Endangered Species Act, and related Federal statutes when authorizing lease operations on split-estate lands where the surface is not federally owned and the oil and gas is Federal. For split-estate lands within FS administrative

⁵ See 43 CFR §3165.3(b). See, e.g., *William P. Maycock*, 176 IBLA 206 (2008).

boundaries, the BLM has the lead responsibility, unless there is a local BLM/FS agreement that gives the FS this responsibility.” (Onshore Oil and Gas Order No. 1, part VI).

“After the APD is approved the operator must make a good faith effort to provide a copy of the Conditions of Approval to the surface owner. The APD approval is not contingent upon delivery of a copy of the Conditions of Approval to the surface owner.” (Onshore Oil and Gas Order No. 1, part VI).

4.3 Sundry Notices

Operations proposed by Sundry Notice that will result in additional surface disturbance or re-disturbance of previously reclaimed areas require a Surface Use Plan of Operations.

“Prior to commencing any operation on the leasehold which will result in additional surface disturbance, other than those authorized under § 3162.3–1 or § 3162.3–2 of this title, the operator shall submit a proposal on Form 3160–5 to the authorized officer for approval. The proposal shall include a surface use plan of operations.” (43 CFR 3162.3-3).

“The operator must certify on Form 3160–5 that they have made a good faith effort to provide a copy of any proposal involving new surface disturbance to the private surface owner in the case of split-estate.” (Onshore Oil and Gas Order No. 1, part VIII.A).

For review of Final Abandonment Notices (FANs) submitted by an operator on split-estate lands, the BLM will consider the views of the surface owner.

“If applicable, the private surface owner will be notified and their views will be carefully considered.” (Onshore Oil and Gas Order No. 1, part XII).

“In cases where the Surface Managing Agency or private surface owner desires to acquire an oil and gas well and convert it to a water supply well or acquire a water supply well that was drilled by the operator to support lease operations, the Surface Managing Agency or private surface owner must inform the appropriate BLM office of its intent before the approval of the APD in the case of a dry hole and no later than the time a Notice of Intent to Abandon is submitted for a depleted production well... The Surface Managing Agency or private surface owner must reach agreement with the operator as to the satisfactory completion of reclamation operations before the BLM will approve any abandonment or reclamation. The BLM approval of the partial abandonment under this section, completion of any required reclamation operations, and the signed release agreement will relieve the operator of further obligation for the well. If the Surface Managing Agency or private surface owner acquires the well for water use purposes, the party acquiring the well assumes liability for the well.” (Onshore Oil and Gas Order No. 1, part IX.B).

“Completion of a well as plugged and abandoned may also include conditioning the well as water supply source for lease operations or for use by the surface owner or appropriate Government Agency, when authorized by the authorized officer. All costs over and above the normal plugging and abandonment expense will be paid by the party accepting the water well.” (43 CFR 3162.3-4(b)).

4.3.1 Emergency Operations

“In the event of an emergency, the operator may take immediate action without prior Surface Managing Agency approval to safeguard life or to prevent significant environmental degradation. The BLM or the FS must receive notification of the emergency situation and the remedial action taken by the operator as soon as possible, but not later than 24 hours after the emergency occurred. If the emergency only

affected drilling operations and had no surface impacts, only the BLM must be notified. If the emergency involved surface resources on other Surface Managing Agency lands, the operator should also notify the Surface Managing Agency and private surface owner within 24 hours.” (Onshore Oil and Gas Order No. 1, part IV.d).
